

LM4946 Boomer® Audio Power Amplifier Series Output Capacitor-Less Audio Subsystem with Programmable TI 3D

Check for Samples: [LM4946](#)

FEATURES

- I²C/SPI Control Interface
- I²C/SPI Programmable TI 3D Audio
- I²C/SPI Controlled 32 Step Digital Volume Control (-54dB to +18dB)
- Three Independent Volume Channels (Left, Right, Mono)
- Eight Distinct Output Modes
- WQFN and DSBGA Surface Mount Packaging
- “Click and Pop” Suppression Circuitry
- Thermal Shutdown Protection
- Low Shutdown Current (0.02uA, typ)
- RF Immunity Topology

APPLICATIONS

- Mobile Phones
- PDAs

KEY SPECIFICATIONS

- THD+N at 1kHz, 540mW into 8Ω BTL (3.3V) 1.0% (typ)
- THD+N at 1kHz, 35mW into 32Ω SE (3.3V) 1.0% (typ)
- Single Supply Operation (VDD) 2.7 to 5.5V
- I²C/SPI Single Supply Operation
 - WQFN 2.2 to 5.5V
 - DSBGA 1.7 to 5.5V

DESCRIPTION

The LM4946 is an audio power amplifier capable of delivering 540mW of continuous average power into a mono 8Ω bridged-tied load (BTL) with 1% THD+N, 35mW per channel of continuous average power into stereo 32Ω single-ended (SE) loads with 1% THD+N, or an output capacitor-less (OCL) configuration with identical specifications as the SE configuration, from a 3.3V power supply.

The LM4946 has three input channels: one pair for a two-channel stereo signal and the third for a differential single-channel mono input. The LM4946 features a 32-step digital volume control and eight distinct output modes. The digital volume control, 3D enhancement, and output modes (mono/SE/OCL) are programmed through a two-wire I²C or a three-wire SPI compatible interface that allows flexibility in routing and mixing audio channels.

The LM4946 is designed for cellular phone, PDA, and other portable handheld applications. It delivers high quality output power from a surface-mount package and requires only seven external components in the OCL mode (two additional components in SE mode).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

PIN DESCRIPTIONS

Pin Number (WQFN)	Bump (DSBGA)	Name	Description
1	B2	LHP3D2	Left Headphone 3D Input 1
2	A1	V _{OC}	Center Amplifier Output
3	A2	V _{DD}	Voltage Supply
4	A3	GND	Ground
5	A4	R _{OUT}	Right Headphone Output
6	A5	L _{OUT}	Left Headphone Output
7	B4	I ² C/SPI_V _{DD}	I ² C or SPI Interface Voltage Supply
8	B5	R _{IN}	Right Input Channel
9	B3	L _{IN}	Left Input Channel
10	C5	SDA	Data
11	C4	SCL	Clock
12	D5	GND	Ground
13	D4	ID_ENB	Address Identification/Enable Bar
14	E5	I ² C/SPI_SEL	I ² C or SPI Select
15	E4	MONO+	Loudspeaker Output Positive
16	D3	V _{DD}	Voltage Supply
17	E2	MONO-	Loudspeaker Output Negative
18	E1	LHP3D1	Left Headphone 3D Input 2
19	D2	RHP3D1	Right Headphone 3D Input 1
20	D1	GND	Ground
21	C3	BYPASS	Half-Supply Bypass
22	C1	MONO_IN-	Loudspeaker Negative Input
23	C2	MONO_IN+	Loudspeaker Positive Input
24	B1	RHP3D2	Right Headphone 3D Input 2
	E3	V _{DD}	Voltage Supply

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings⁽¹⁾⁽²⁾

Supply Voltage		6.0V
Storage Temperature		–65°C to +150°C
Input Voltage		–0.3 to $V_{DD} + 0.3$
ESD Susceptibility ⁽³⁾		2.0kV
ESD Machine model ⁽⁴⁾		200V
Junction Temperature		150°C
Soldering Information	Vapor Phase (60 sec.)	215°C
	Infrared (15 sec.)	220°C
Thermal Resistance ⁽⁵⁾	θ_{JA} (typ) - RTW0024A	46°C/W
	θ_{JA} (typ) - YFQ0025	49°C/W

- (1) Operating Ratings indicate conditions for which the device is functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the Electrical Characteristics. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) Human body model, 100pF discharged through a 1.5k Ω resistor.
- (4) Machine Model ESD test is covered by specification EIAJ IC-121-1981. A 200pF cap is charged to the specified voltage, then discharged directly into the IC with no external series resistor (resistance of discharge path must be under 50 Ω).
- (5) The given θ_{JA} for an LM4946SQ mounted on a demonstration board with a 9in² area of 1oz printed circuit board copper ground plane.

Operating Ratings

Temperature Range	–40°C to 85°C
Supply Voltage (V_{DD})	$2.7V \leq V_{DD} \leq 5.5V$
Supply Voltage (I^2C/SPI) ⁽¹⁾	$I^2CSPI_V_{DD} \leq V_{DD}$
WQFN	$2.2V \leq I^2CSPI_V_{DD} \leq 5.5V$
DSBGA	$1.7V \leq I^2CSPI_V_{DD} \leq 5.5V$

- (1) Refer to this [table](#).

Electrical Characteristics 3.3V⁽¹⁾⁽²⁾

The following specifications apply for $V_{DD} = 3.3V$, $T_A = 25^\circ C$, all volume controls set to 0dB, unless otherwise specified.

Symbol	Parameter	Conditions	LM4946		Units (Limits) ⁽³⁾
			Typical ⁽⁴⁾	Limits ⁽⁵⁾	
I_{DD}	Supply Current	Output Modes 2, 4, 6 $V_{IN} = 0V$; No load, SE Headphone	3.25		mA
		Output Modes 1, 3, 5, 7 $V_{IN} = 0V$; No load, SE Headphone	5.65		mA
		Output Modes 2, 4, 6 $V_{IN} = 0V$; No load, OCL Headphone	4	6.5	mA (max)
		Output Modes 1, 3, 5, $V_{IN} = 0V$; No load, OCL Headphone	5		mA
		Output Modes 7 $V_{IN} = 0V$; No load, OCL Headphone	6.5	10.5	mA (max)
I_{SD}	Shutdown Current	Output Mode 0	0.02	1	μA (max)
V_{OS}	Output Offset Voltage	$V_{IN} = 0V$, Mode 7 Mono	12	50	mV (max)
		$V_{IN} = 0V$, Mode 7 Headphones (Note 11)	3	15	
P_O	Output Power	MONO _{OUT} ; $R_L = 8\Omega$ THD+N = 1%; $f = 1kHz$, BTL, Mode 1	540	500	mW (min)
		R_{OUT} and L_{OUT} ; $R_L = 32\Omega$ THD+N = 1%; $f = 1kHz$, SE, Mode 4	35	30	mW (min)
THD+N	Total Harmonic Distortion + Noise	MONO _{OUT} $f = 1kHz$ $P_{OUT} = 250mW$; $R_L = 8\Omega$, BTL, Mode 1	0.05		%
		R_{OUT} and L_{OUT} $f = 1kHz$ $P_{OUT} = 12mW$; $R_L = 32\Omega$, SE, Mode 4	0.015		%
N_{OUT}	Output Noise	A-weighted, inputs terminated to GND, output referred			
		Speaker; Mode 1	17		μV
		Speaker; Mode 3, 7	27		μV
		Speaker; Mode 5	33		μV
		Headphone; SE, Mode 2	8		μV
		Headphone; SE, Mode 4, 7	8		μV
		Headphone; SE, Mode 6	12		μV
		Headphone; OCL, Mode 2	8		μV
		Headphone; OCL, Mode 4, 7	9		μV
		Headphone; OCL, Mode 6	12		μV

- (1) Operating Ratings indicate conditions for which the device is functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the Electrical Characteristics. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
- (2) All voltages are measured with respect to the ground pin, unless otherwise specified.
- (3) Datasheet min/max specifications are specified by design, test, or statistical analysis.
- (4) Typical specifications are specified at $+25^\circ C$ and represent the most likely parametric norm.
- (5) Tested limits are specified to TI's AOQL (Average Outgoing Quality Level).

Electrical Characteristics 3.3V⁽¹⁾⁽²⁾ (continued)

The following specifications apply for $V_{DD} = 3.3V$, $T_A = 25^\circ C$, all volume controls set to 0dB, unless otherwise specified.

Symbol	Parameter	Conditions	LM4946		Units (Limits) ⁽³⁾
			Typical ⁽⁴⁾	Limits ⁽⁵⁾	
PSRR	Power Supply Rejection Ratio MONO _{OUT}	$V_{RIPPLE} = 200mV_{PP}$; $f = 217Hz$, $R_L = 8\Omega$ $C_B = 2.2\mu F$, BTL All audio inputs terminated to GND; output referred			
		BTL, Output Mode 1	76		dB
		BTL, Output Mode 3, 7	65		dB
		BTL, Output Mode 5	63		dB
	Power Supply Rejection Ratio R _{OUT} and L _{OUT}	$V_{RIPPLE} = 200mV_{PP}$; $f = 217Hz$, $R_L = 32\Omega$ $C_B = 2.2\mu F$, All audio inputs terminated to GND output referred

APPLICATION INFORMATION

I²C PIN DESCRIPTION

SDA: This is the serial data input pin.

SCL: This is the clock input pin.

ID_ENB: This is the address select input pin.

I²CSPI_SEL: This is tied LOW for I²C mode.

I²C COMPATIBLE INTERFACE

The LM4946 uses a serial bus which conforms to the I²C protocol to control the chip's functions with two wires: clock (SCL) and data (SDA). The clock line is uni-directional. The data line is bi-directional (open-collector). The maximum clock frequency specified by the I²C standard is 400kHz. In this discussion, the master is the controlling microcontroller and the slave is the LM4946.

The I²C address for the LM4946 is determined using the ID_ENB pin. The LM4946's two possible I²C chip addresses are of the form 111110X₁0 (binary), where X₁ = 0, if ID_ENB is logic LOW; and X₁ = 1, if ID_ENB is logic HIGH. If the I²C interface is used to address a number of chips in a system, the LM4946's chip address can be changed to avoid any possible address conflicts.

The bus format for the I²C interface is shown in Figure 63. The bus format diagram is broken up into six major sections:

1. The "start" signal is generated by lowering the data signal while the clock signal is HIGH. The start signal will alert all devices attached to the I²C bus to check the incoming address against their own address.
2. The 8-bit chip address is sent next, most significant bit first. The data is latched in on the rising edge of the clock. Each address bit must be stable while the clock level is HIGH.

For I²C interface operation, the I²CSPI_SEL pin needs to be tied LOW (and tied high for SPI operation).

3. After the last bit of the address bit is sent, the master releases the data line HIGH (through a pull-up resistor). Then the master sends an acknowledge clock pulse. If the LM4946 has received the address correctly, then it holds the data line LOW during the clock pulse. If the data line is not held LOW during the acknowledge clock pulse, then the master should abort the rest of the data transfer to the LM4946.
4. The 8 bits of data are sent next, most significant bit first. Each data bit should be valid while the clock level is stable HIGH.
5. After the data byte is sent, the master must check for another acknowledge to see if the LM4946 received the data.

If the master has more data bytes to send to the LM4946, then the master can repeat the previous two steps until all data bytes have been sent.

6. The "stop" signal ends the transfer. To signal "stop", the data signal goes HIGH while the clock signal is HIGH. The data line should be held HIGH when not in use.

I²C INTERFACE POWER SUPPLY PIN (I²CSPI_V_{DD})

The LM4946's I²C interface is powered up through the I²CSPI_V_{DD} pin. The LM4946's I²C interface operates at a voltage level set by the I²CV_{DD} pin which can be set independent to that of the main power supply pin V_{DD}. This is ideal whenever logic levels for the I²C interface are dictated by a microcontroller or microprocessor that is operating at a lower supply voltage than the main battery of a portable system.

SPI DESCRIPTION

(For $2.2V \leq I^2CSPI_V_{DD} \leq 5.5V$, see [I2C/SPI WQFN/DSBGA](#) for more information).

0. I²CSPI_SEL: This pin is tied HIGH for SPI mode.
1. The data bits are transmitted with the MSB first.
2. The maximum clock rate is 1MHz for the CLK pin.
3. CLK must remain HIGH for at least 500ns (t_{CH}) after the rising edge of CLK, and CLK must remain LOW for at least 500ns (t_{CL}) after the falling edge of CLK.
4. The serial data bits are sampled at the rising edge of CLK. Any transition on DATA must occur at least 100ns (t_{DS}) before the rising edge of CLK. Also, any transition on DATA must occur at least 100ns (t_{DH}) after the rising edge of CLK and stabilize before the next rising edge of CLK.
5. ID_ENB should be LOW only during serial data transmission.
6. ID_ENB must be LOW at least 100ns (t_{ES}) before the first rising edge of CLK, and ID_ENB has to remain LOW at least 100ns (t_{EH}) after the eighth rising edge of CLK.
7. If ID_ENB remains HIGH for more than 100ns before all 8 bits are transmitted then the data latch will be aborted.
8. If ID_ENB is LOW for more than 8 CLK pulses then only the first 8 data bits will be latched and activated when ID_ENB transitions to logic-high.
9. ID_ENB must remain HIGH for at least 100ns (t_{EL}) to latch in the data.
10. Coincidental rising or falling edges of CLK and ID_ENB are not allowed. If CLK is to be held HIGH after the data transmission, the falling edge of CLK must occur at least 100ns (t_{CS}) before ID_ENB transitions to LOW for the next set of data.

TI 3D ENHANCEMENT

The LM4946 features a stereo headphone, 3D audio enhancement effect that widens the perceived soundstage from a stereo audio signal. The 3D audio enhancement creates a perceived spatial effect optimized for stereo headphone listening. The LM4946 can be programmed for a “narrow” or “wide” soundstage perception. The narrow soundstage has a more focused approaching sound direction, while the wide soundstage has a spatial, theater-like effect. Within each of these two modes, four discrete levels of 3D effect that can be programmed: low, medium, high, and maximum (Table 2, Table 3), each level with an ever increasing aural effect, respectively. The difference between each level is 3dB.

The external capacitors, shown in Figure 66, are required to enable the 3D effect. The value of the capacitors set the cutoff frequency of the 3D effect, as shown by Equation 1 and Equation 2. Note that the internal 20kΩ resistor is nominal.

Figure 66. External 3D Effect Capacitors

$$f_{3DL(-3dB)} = 1 / 2\pi * 20k\Omega * C_{3DL} \quad (1)$$

$$f_{3DR(-3dB)} = 1 / 2\pi * 20k\Omega * C_{3DR} \quad (2)$$

Optional resistors R_{3DL} and R_{3DR} can also be added (Figure 67) to affect the -3dB frequency and 3D magnitude.

Figure 67. External RC Network with Optional R_{3DL} and R_{3DR} Resistors

$$f_{3DL(-3dB)} = 1 / 2\pi * (20k\Omega + R_{3DL}) * C_{3DL} \quad (3)$$

$$f_{3DR(-3dB)} = 1 / 2\pi * (20k\Omega + R_{3DR}) * C_{3DR} \quad (4)$$

ΔAV (change in AC gain) = $1 / 1 + M$, where M represents some ratio of the nominal internal resistor, 20kΩ (see example below).

$$f_{3dB(3D)} = 1 / 2\pi (1 + M)(20k\Omega * C_{3D}) \quad (5)$$

$$C_{Equivalent(new)} = C_{3D} / 1 + M \quad (6)$$

Table 6. Pole Locations

PCB LAYOUT AND SUPPLY REGULATION CONSIDERATIONS FOR DRIVING 8Ω LOAD

Power dissipated by a load is a function of the voltage swing across the load and the load's impedance. As load impedance decreases, load dissipation becomes increasingly dependent on the interconnect (PCB trace and wire) resistance between the amplifier output pins and the load's connections. Residual trace resistance causes a voltage drop, which results in power dissipated in the trace and not in the load as desired. For example, 0.1Ω trace resistance reduces the output power dissipated by an 8Ω load from 158.3mW to 156.4mW. The problem of decreased load dissipation is exacerbated as load impedance decreases. Therefore, to maintain the highest load dissipation and widest output voltage swing, PCB traces that connect the output pins to a load must be as wide as possible.

Poor power supply regulation adversely affects maximum output power. A poorly regulated supply's output voltage decreases with increasing load current. Reduced supply voltage causes decreased headroom, output signal clipping, and reduced output power. Even with tightly regulated supplies, trace resistance creates the same effects as poor supply regulation. Therefore, making the power supply traces as wide as possible helps maintain full output voltage swing.

BRIDGE CONFIGURATION EXPLANATION

The LM4946 drives a load, such as a speaker, connected between outputs, MONO+ and MONO-.

This results in both amplifiers producing signals identical in magnitude, but 180° out of phase. Taking advantage of this phase difference, a load is placed between MONO- and MONO+ and driven differentially (commonly referred to as "bridge mode"). This results in a differential or BTL gain of:

$$A_{VD} = 2(R_f / R_i) = 2 \quad (7)$$

Bridge mode amplifiers are different from single-ended amplifiers that drive loads connected between a single amplifier's output and ground. For a given supply voltage, bridge mode has a distinct advantage over the single-ended configuration: its differential output doubles the voltage swing across the load. Theoretically, this produces four times the output power when compared to a single-ended amplifier under the same conditions. This increase in attainable output power assumes that the amplifier is not current limited and that the output signal is not clipped.

Another advantage of the differential bridge output is no net DC voltage across the load. This is accomplished by biasing MONO- and MONO+ outputs at half-supply. This eliminates the coupling capacitor that single supply, single-ended amplifiers require. Eliminating an output coupling capacitor in a typical single-ended configuration forces a single-supply amplifier's half-supply bias voltage across the load. This increases internal IC power dissipation and may permanently damage loads such as speakers.

POWER DISSIPATION

Power dissipation is a major concern when designing a successful single-ended or bridged amplifier.

A direct consequence of the increased power delivered to the load by a bridge amplifier is higher internal power dissipation. The LM4946 has a pair of bridged-tied amplifiers driving a handsfree speaker, MONO. The maximum internal power dissipation operating in the bridge mode is twice that of a single-ended amplifier. From [Equation 8](#), assuming a 5V power supply and an 8Ω load, the maximum MONO power dissipation is 634mW.

$$P_{\text{DMAX-SPKROUT}} = 4(V_{\text{DD}})^2 / (2\pi^2 R_L): \text{Bridge Mode} \quad (8)$$

The LM4946 also has a pair of single-ended amplifiers driving stereo headphones, R_{OUT} and L_{OUT}. The maximum internal power dissipation for R_{OUT} and L_{OUT} is given by [Equation 9](#) and [Equation 10](#). From [Equation 9](#) and [Equation 10](#), assuming a 5V power supply and a 32Ω load, the maximum power dissipation for L_{OUT} and R_{OUT} is 40mW, or 80mW total.

$$P_{\text{DMAX-LOUT}} = (V_{\text{DD}})^2 / (2\pi^2 R_L): \text{Single-ended Mode} \quad (9)$$

$$P_{\text{DMAX-ROUT}} = (V_{\text{DD}})^2 / (2\pi^2 R_L): \text{Single-ended Mode} \quad (10)$$

The maximum internal power dissipation of the LM4946 occurs when all three amplifiers pairs are simultaneously on; and is given by [Equation 11](#).

$$P_{\text{DMAX-TOTAL}} = P_{\text{DMAX-SPKROUT}} + P_{\text{DMAX-LOUT}} + P_{\text{DMAX-ROUT}} \quad (11)$$

The maximum power dissipation point given by [Equation 11](#) must not exceed the power dissipation given by [Equation 12](#):

$$P_{DMAX} = (T_{JMAX} - T_A) / \theta_{JA} \quad (12)$$

The LM4946's $T_{JMAX} = 150^{\circ}\text{C}$. In the SQ package, the LM4946's θ_{JA} is 46°C/W . At any given ambient temperature T_A , use [Equation 12](#) to find the maximum internal power dissipation supported by the IC packaging. Rearranging [Equation 12](#) and substituting $P_{DMAX-TOTAL}$ for P_{DMAX} results in [Equation 13](#). This equation gives the maximum ambient temperature that still allows maximum stereo power dissipation without violating the LM4946's maximum junction temperature.

$$T_A = T_{JMAX} - P_{DMAX-TOTAL} \theta_{JA} \quad (13)$$

For a typical application with a 5V power supply and an 8Ω load, the maximum ambient temperature that allows maximum mono power dissipation without exceeding the maximum junction temperature is approximately 121°C for the SQ package.

$$T_{JMAX} = P_{DMAX-TOTAL} \theta_{JA} + T_A \quad (14)$$

[Equation 14](#) gives the maximum junction temperature T_{JMAX} . If the result violates the LM4946's 150°C , reduce the maximum junction temperature by reducing the power supply voltage or increasing the load resistance. Further allowance should be made for increased ambient temperatures.

The above examples assume that a device is a surface mount part operating around the maximum power dissipation point. Since internal power dissipation is a function of output power, higher ambient temperatures are allowed as output power or duty cycle decreases. If the result of [Equation 11](#) is greater than that of [Equation 12](#), then decrease the supply voltage, increase the load impedance, or reduce the ambient temperature. If these measures are insufficient, a heat sink can be added to reduce θ_{JA} . The heat sink can be created using additional copper area around the package, with connections to the ground pin(s), supply pin and amplifier output pins. External, solder attached SMT heatsinks such as the Thermalloy 7106D can also improve power dissipation. When adding a heat sink, the θ_{JA} is the sum of θ_{JC} , θ_{CS} , and θ_{SA} . (θ_{JC} is the junction-to-case thermal impedance, θ_{CS} is the case-to-sink thermal impedance, and θ_{SA} is the sink-to-ambient thermal impedance). Refer to the [Typical Performance Characteristics](#) curves for power dissipation information at lower output power levels.

POWER SUPPLY BYPASSING

As with any power amplifier, proper supply bypassing is critical for low noise performance and high power supply rejection. Applications that employ a 5V regulator typically use a $1\mu\text{F}$ in parallel with a $0.1\mu\text{F}$ filter capacitors to stabilize the regulator's output, reduce noise on the supply line, and improve the supply's transient response. However, their presence does not eliminate the need for a local $1.0\mu\text{F}$ tantalum bypass capacitor and a parallel $0.1\mu\text{F}$ ceramic capacitor connected between the LM4946's supply pin and ground. Keep the length of leads and traces that connect capacitors between the LM4946's power supply pin and ground as short as possible.

SELECTING EXTERNAL COMPONENTS

Input Capacitor Value Selection

Amplifying the lowest audio frequencies requires high value input coupling capacitor (C_i in [Figure 1](#) & [Figure 2](#)). A high value capacitor can be expensive and may compromise space efficiency in portable designs. In many cases, however, the speakers used in portable systems, whether internal or external, have little ability to reproduce signals below 150Hz. Applications using speakers with this limited frequency response reap little improvement by using large input capacitor.

The internal input resistor (R_i), minimum $10\text{k}\Omega$, and the input capacitor (C_i) produce a high pass filter cutoff frequency that is found using [Equation 15](#).

$$f_c = 1 / (2\pi R_i C_i) \quad (15)$$

As an example when using a speaker with a low frequency limit of 150Hz, C_i , using [Equation 15](#) is $0.106\mu\text{F}$. The $0.22\mu\text{F}$ C_i shown in [Figure 1](#) allows the LM4946 to drive high efficiency, full range speaker whose response extends below 40Hz.

Bypass Capacitor Value Selection

Besides minimizing the input capacitor size, careful consideration should be paid to value of C_B , the capacitor connected to the BYPASS pin. Since C_B determines how fast the LM4946 settles to quiescent operation, its value is critical when minimizing turn-on pops. The slower the LM4946's outputs ramp to their quiescent DC voltage (nominally $V_{DD}/2$), the smaller the turn-on pop. Choosing C_B equal to 2.2 μ F along with a small value of C_i (in the range of 0.1 μ F to 0.33 μ F), produces a click-less and pop-less shutdown function. As discussed above, choosing C_i no larger than necessary for the desired bandwidth helps minimize clicks and pops. C_B 's value should be in the range of 7 to 10 times the value of C_i . This ensures that output transients are eliminated when power is first applied or the LM4946 resumes operation after shutdown.

Demo Board Schematic Diagram

REVISION HISTORY

Rev	Date	Description
1.0	01/23/06	Initial release.
1.1	03/05/07	Added the YFQ0025XXX package.
1.2	03/13/07	Edited the 25-pin DSBGA connection diagram.
1.3	04/24/07	Added the I2C/SPI (1.7V 2.2V) table.
1.4	04/26/07	Added the numerical values for the X1, X2, and X3 in the Physical Dimension section.
1.5	05/02/07	Text edits. Added the YFQ package.
1.6	05/15/07	Added the TM board schematic and input some text edits.
1.7	05/16/07	More text edits.
1.8	06/06/07	Added Note 11 and more text edits.
1.9	07/31/07	Edited the 5.0V EC table (MONO_IN Input Impedance and Rin/Lin Input Impedance).

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LM4946SQ/NOPB	ACTIVE	WQFN	RTW	24	1000	RoHS & Green	SN	Level-1-260C-UNLIM	-40 to 85	L4946SQ	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
