

## Automotive fully integrated H-bridge motor driver

Datasheet - production data

## Features

Type	$R_{DS(on)}$	$I_{out}$	$V_{CCmax}$
VNH7100BAS	100 mΩ typ (per leg)	12 A	38 V

- AEC-Q100 qualified
- Output current: 15 A
- 3 V CMOS-compatible inputs
- Undervoltage shutdown
- Overvoltage clamp
- Thermal shutdown
- Cross-conduction protection
- Current and power limitation
- Very low standby power consumption
- Protection against loss of ground and loss of  $V_{CC}$
- PWM operation up to 20 kHz
- MultiSense diagnostic functions
  - Analog motor current feedback
  - Output short to ground detection
  - Thermal shutdown indication
  - OFF-state open-load detection
  - Output short to  $V_{CC}$  detection
- Output protected against short to ground and short to  $V_{CC}$
- Standby Mode
- Half Bridge Operation
- Package: ECOPACK®

## Description

The device is a full bridge motor driver intended for a wide range of automotive applications. The device incorporates a dual monolithic high-side driver and two low-side switches.

Both switches are designed using STMicroelectronics' well known and proven proprietary VIPower® M0 technology that allows to efficiently integrate on the same die a true Power MOSFET with an intelligent signal/protection circuitry. The three dies are assembled in SO-16N package on electrically isolated leadframes.

Moreover, its fully symmetrical mechanical design allows superior manufacturability at board level. The input signals  $IN_A$  and  $IN_B$  can directly interface the microcontroller to select the motor direction and the brake condition. A SEL0 pin is available to address the information available on the MultiSense to the microcontroller. The MultiSense pin allows to monitor the motor current by delivering a current proportional to the motor current value.

The PWM, up to 20 kHz, allows to control the speed of the motor in all possible conditions. In all cases, a low level state on the PWM pin turns off both the  $LS_A$  and  $LS_B$  switches.

# 1 Block diagram and pin description

**Figure 1. Block diagram**

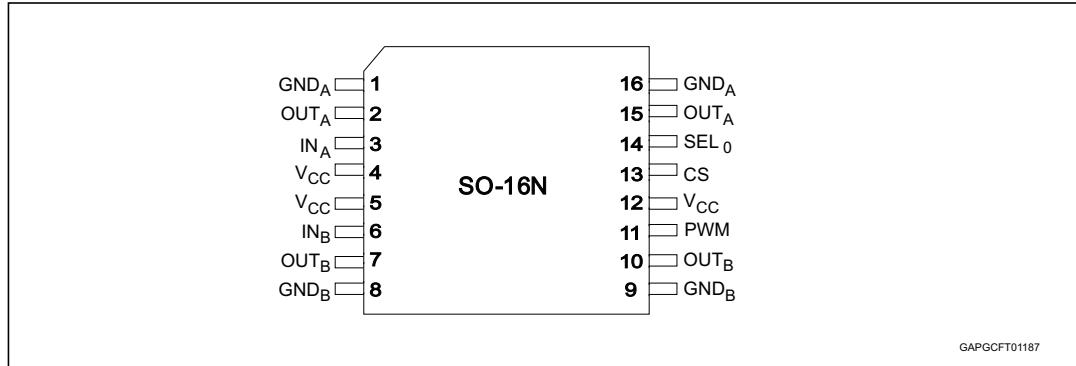

**Table 2. Block description**

Name	Description
Logic control	Allows the turn-on and the turn-off of the high-side and the low-side switches according to the truth table.
Undervoltage	Shuts down the device for battery voltage lower than 4 V.
High-side and low-side clamp voltage	Protect the high-side and the low-side switches from the high voltage on the battery line.
High-side and low-side driver	Drive the gate of the concerned switch to allow a proper R <sub>on</sub> for the leg of the bridge.
Current limitation	Limits the motor current in case of short circuit.
High-side and low-side overtemperature protection	In case of short-circuit with the increase of the junction temperature, it shuts down the concerned driver to prevent degradation and to protect the die.
Low-side overload detector	Detects when low side current exceeds shutdown current and latches off the concerned Low side.

**Table 2. Block description (continued)**

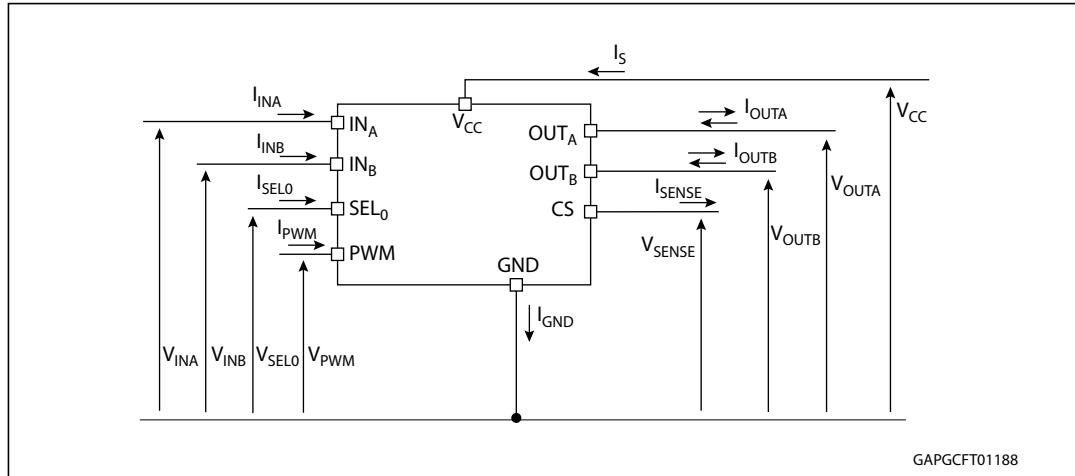

Name	Description
Fault detection	Signalizes the abnormal behavior of the switch through MultiSense pin.
Power limitation	Limits the power dissipation of the high-side driver inside safe range in case of short to ground condition.

**Figure 2. Configuration diagram (top view)****Table 3. Pin definitions and functions**

Pin N°	Symbol	Function
1, 16	GND <sub>A</sub>	Source of low-side switch A
2, 15	OUT <sub>A</sub>	Source of high-side switch A / drain of low-side switch A
3	IN <sub>A</sub>	Clockwise input
4, 5, 12	V <sub>CC</sub>	Power supply voltage
6	IN <sub>B</sub>	Counter clockwise input
7, 10	OUT <sub>B</sub>	Source of high-side switch B / drain of low-side switch B
8, 9	GND <sub>B</sub>	Source of low-side switch B
11	PWM	Voltage controlled input pin with hysteresis, CMOS compatible. Gates of low-side FETs get modulated by the PWM signal during their on phase allowing speed control of the motor. Active high.
13	CS	Multiplexed analog sense output pin; it delivers a current proportional to the motor current.
14	SEL <sub>0</sub>	Active high compatible with 3 V and 5 V CMOS outputs pin; in combination with IN <sub>A</sub> , IN <sub>B</sub> , it addresses the CurrentSense information delivered to the micro according to the operative truth table.

## 2 Electrical specifications

Figure 3. Current and voltage conventions

### 2.1 Absolute maximum ratings

Stressing the device above the rating listed in *Table 4: Absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Table 4. Absolute maximum ratings

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	38	V
$-V_{CC}$	Reverse DC Supply Voltage	0.3	V
$I_{max}$	Maximum output current (continuous)	Internally limited	A
$I_R$	Reverse output current (continuous)	-15	A
$V_{CCPK}$	Maximum transient supply voltage (ISO 16750-2:2010 Test B clamped to 40 V; $R_L = 4 \Omega$ )	40	V
$V_{CCJS}$	Maximum jump start voltage for single pulse short circuit protection	28	V
$I_{IN}$	Input current ( $IN_A$ and $IN_B$ pins)	-1 to 10	mA
$I_{SEL0}$	$SEL_0$ DC input current	-1 to 10	mA
$I_{PWM}$	PWM input current	-1 to 10	mA
$I_{SENSE}$	CS pin DC output current ( $V_{GND} = V_{CC}$ and $V_{SENSE} < 0$ V)	10	mA
	CS pin DC output current in reverse ( $V_{CC} < 0$ V)	-20	

**Table 4. Absolute maximum ratings (continued)**

Symbol	Parameter	Value	Unit
$V_{ESD}$	Electrostatic discharge (Human body model: $R = 1.5 \text{ k}\Omega$ ; $C = 100 \text{ pF}$ ) – $\text{IN}_A, \text{IN}_B$ , PWM – $\text{SEL}_0$ – CS – $V_{CC}$ – Output	2 2 2 4 4	kV
$V_{ESD}$	Charge device model (CDM-AEC-Q100-011)	750	V
$T_c$	Junction operating temperature	-40 to 150	°C
$T_{STG}$	Storage temperature	-55 to 150	°C

## 2.2 Thermal data

**Table 5. Thermal data**

Symbol	Parameter	Max. value	Unit
$R_{thj-pin}$	Thermal resistance junction-pin	HSD	32
		LSD	45
$R_{thj-amb}$	Thermal resistance junction-ambient (JEDEC JESD 51-2) <sup>(1)</sup>	See <a href="#">Figure 24</a>	°C/W
$R_{thj-amb}$	Thermal resistance junction-ambient (JEDEC JESD 51-2) <sup>(2)</sup>	HSD	40.7
		LSD	55.4

1. Device mounted on two-layers 2s0p PCB.
2. Device mounted on four-layers 2s2p PCB.

## 2.3 Electrical characteristics

Values specified in this section are for  $V_{CC} = 7\text{ V}$  up to  $28\text{ V}$ ;  $-40^\circ\text{C} < T_j < 150^\circ\text{C}$ , unless otherwise specified.

**Table 6. Power section**

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$V_{CC}$	Operating supply voltage		4		28	V
$I_S$	Supply current	Off-state (standby) $IN_A = IN_B = 0$ ; $SEL_0 = 0$ ; $PWM = 0$ ; $T_j = 25^\circ\text{C}$ ; $V_{CC} = 13\text{ V}$			1	$\mu\text{A}$
		Off-state (standby) $IN_A = IN_B = 0$ ; $SEL_0 = 0$ ; $PWM = 0$ ; $V_{CC} = 13\text{ V}$ ; $T_j = 85^\circ\text{C}$			1	$\mu\text{A}$
		Off-state (standby) $IN_A = IN_B = 0$ ; $SEL_0 = 0$ ; $PWM = 0$ ; $V_{CC} = 13\text{ V}$ ; $T_j = 125^\circ\text{C}$			3	$\mu\text{A}$
		Off-state (no standby) $IN_A = IN_B = 0$ ; $SEL_0 = 5\text{ V}$ ; $PWM = 0$		2	4	mA
		On-state: $IN_A$ or $IN_B = 5\text{ V}$ ; $PWM = 0$ or $PWM = 5$ ; $SEL_0 = X$		3.5	6	mA
$t_{D\_STBY}^{(1)}$	Standby mode blanking time	$V_{CC} = 13\text{ V}$ ; $IN_A = IN_B = PWM = 0\text{ V}$ ; $V_{SEL_0}$ from $5\text{ V}$ to $0\text{ V}$	0.2	1	1.8	ms
$R_{ONHS}$	Static high-side resistance	$I_{OUT} = 2.5\text{ A}$ ; $T_j = 25^\circ\text{C}$		60		$\text{m}\Omega$
		$I_{OUT} = 2.5\text{ A}$ ; $T_j = -40$ to $150^\circ\text{C}$			120	$\text{m}\Omega$
$R_{ONLS}$	Static low-side resistance	$I_{OUT} = 2.5\text{ A}$ ; $T_j = 25^\circ\text{C}$		40		$\text{m}\Omega$
		$I_{OUT} = 2.5\text{ A}$ ; $T_j = -40^\circ\text{C}$ to $150^\circ\text{C}$			80	$\text{m}\Omega$
$V_f$	Free-wheeling diode forward voltage	$I_{OUT} = -2.5\text{ A}$ ; $T_j = 150^\circ\text{C}$		0.7	0.9	V
$I_{L(off)}$	Off-state output current of one leg	$IN_A = IN_B = 0$ ; $PWM = 0$ ; $V_{CC} = 13\text{ V}$ ; $T_j = 25^\circ\text{C}$	0		0.5	$\mu\text{A}$
		$IN_A = IN_B = 0$ ; $PWM = 0$ ; $V_{CC} = 13\text{ V}$ ; $T_j = 125^\circ\text{C}$	0		3	$\mu\text{A}$
$I_{L(off\_h)}$	Off-state output current of one leg with other HSD on	$IN_A = 0$ ; $IN_B = 5\text{ V}$ ; $PWM = 0$ ; $V_{CC} = 13\text{ V}$	20		60	$\mu\text{A}$

1. To power on the device from the standby, it is recommended to:
  - toggle  $IN_A$  or  $IN_B$  or  $SEL_0$  from 0 to 1 first to come out from STBY mode
  - toggle  $PWM$  from 0 to 1 with a delay of  $20\text{ }\mu\text{s}$
 this avoids any over-stress on the device in case of existing short-to-battery.

$I_{SENSE\_SAT}^{(2)}$	MultiSense saturation current	$V_{CC} = 13 \text{ V}; V_{SENSE} = 4 \text{ V};$ $V_{INA} = 5 \text{ V}; V_{INB} = 0 \text{ V};$ $V_{SEL0} = 5 \text{ V}; T_j = 150^\circ\text{C}$	5.8			mA
$I_{OUT\_SAT}^{(2)}$	Output saturation current	$V_{CC} = 13 \text{ V}; V_{SENSE} = 4 \text{ V};$ $V_{INA} = 5 \text{ V}; V_{INB} = 0 \text{ V};$ $V_{SEL0} = 5 \text{ V}; I_{OUT} = 7 \text{ A}; T_j = 150^\circ\text{C}$	7			A
$I_{SENSEH}$	MultiSense output voltage in fault condition	$9 \text{ V} < V_{CC} < 18 \text{ V};$ $V_{SENSE} = V_{SENSEH}$	10	20	30	mA

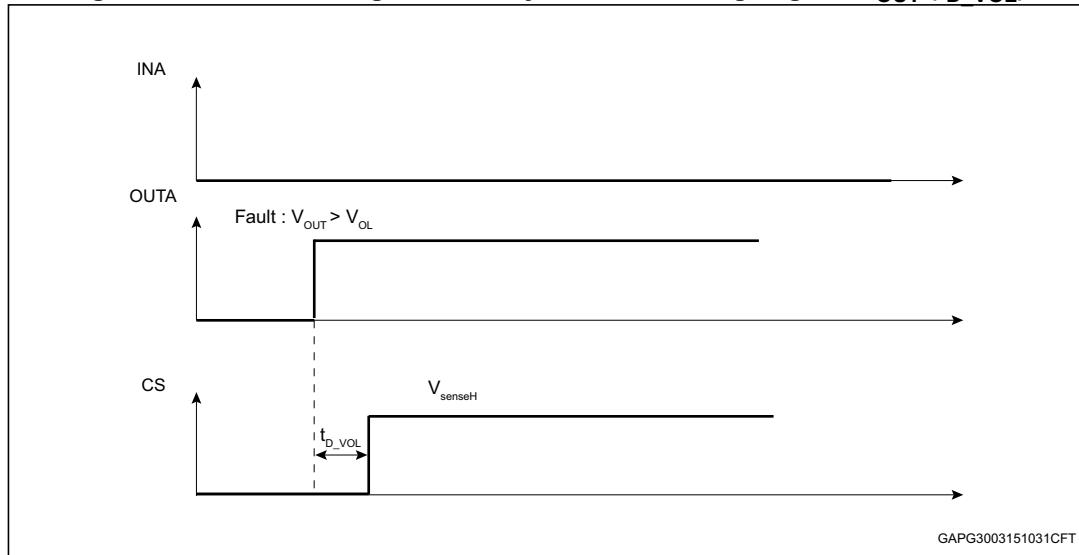

1. Analog sense current drift is deviation of factor K for a given device over ( $-40^\circ\text{C}$  to  $150^\circ\text{C}$  and  $9 \text{ V} < V_{CC} < 18 \text{ V}$ ) with respect to its value measured at  $T_j = 25^\circ\text{C}$ ,  $V_{CC} = 13 \text{ V}$ .
2. Parameter guaranteed by design and characterization; not subjected to production test.

0	0	1	0	x <sup>(1)</sup>		Off	Off	Off	Off
						Off	Off	Off	Off

1. Refer to [Table 13: Off-state - truth table](#)2. For IN<sub>A</sub> =IN<sub>B</sub>=SEL<sub>0</sub> = PWM = 0, the device enters in standby after t<sub>D\_STBY</sub>**Table 12. On-state fault conditions - truth table**

Digital Input pins				CS	Comment	
IN <sub>A</sub>	IN <sub>B</sub>	PWM	SEL <sub>0</sub>			
0	0	1	0	VsenseH	LSB protection triggered; LSB latched off	
0	0	1	1	VsenseH	LSA protection triggered; LSA latched off	
0	1	X	0	VsenseH	HSB protection triggered; HSB latched off	
0	1	1	1	VsenseH	LSA protection triggered; LSA latched off	
1	0	1	0	VsenseH	LSB protection triggered; LSB latched off	
1	0	X	1	VsenseH	HSA protection triggered; HSA latched off	
1	1	X	0	VsenseH	HSB protection triggered; HSB latched off	
1	1	X	1	VsenseH	HSA protection triggered; HSA latched off	

**Note:** Other logic combinations on digital input pins not reported on the above table don't allow to detect a latched off channel.

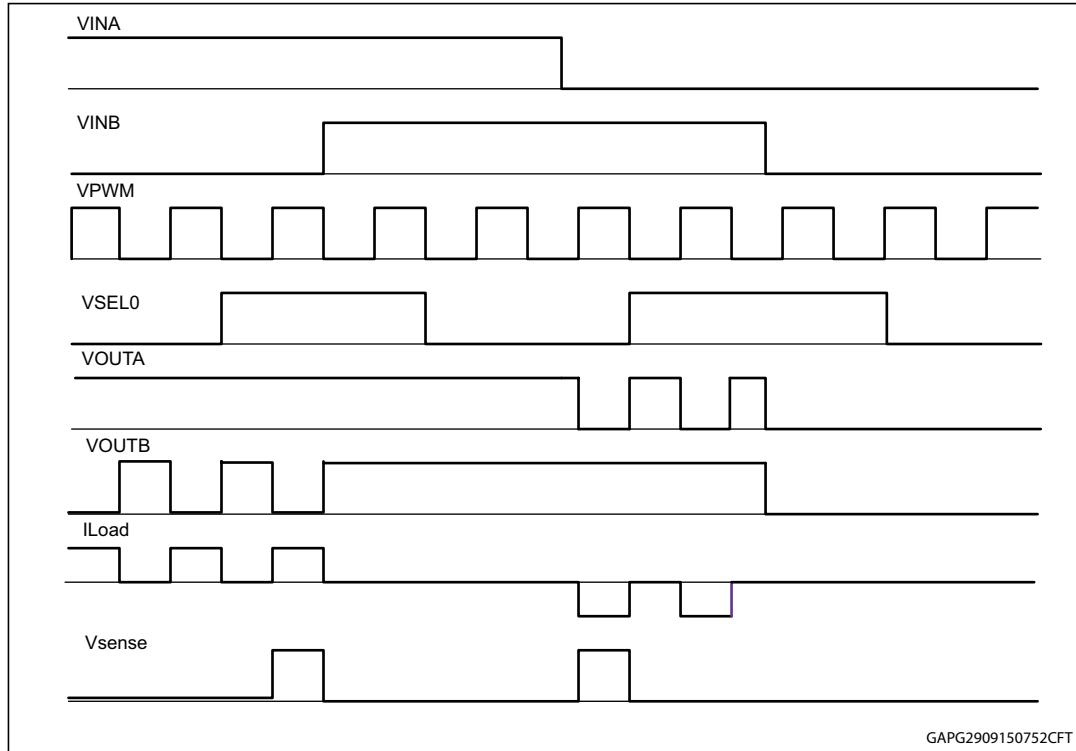

Table 13. Off-state - truth table

<b>IN<sub>A</sub></b>	<b>IN<sub>B</sub></b>	<b>SEL<sub>0</sub></b>	<b>PWM</b>	<b>Out<sub>A</sub></b>	<b>Out<sub>B</sub></b>	<b>CS</b>	<b>Description</b>
Off-state diagnostic							
0	0	1	0	$V_{outA} > V_{OL}$	x	$V_{SENSEH}$	Case 1. Out <sub>A</sub> shorted to $V_{CC}$ if no pull-up is applied Case 2. No open-load in full bridge configuration with an external pull-up on Out <sub>B</sub> Case 3. open-load in half bridge configuration with an external pull-up on Out <sub>A</sub> (motor connected between Out <sub>A</sub> and Ground)
				$V_{outA} < V_{OL}$	x	Hi-Z	Case 1. Open-load in full Bridge configuration with an external pull-up on Out <sub>B</sub> Case 2. No open-load in half Bridge configuration with external pull-up on Out <sub>A</sub> (motor connected between Out <sub>A</sub> and Ground)
		$0^{(1)(2)}$	0	x	$V_{outB} > V_{OL}$	$V_{SENSEH}$	Case 1. Out <sub>B</sub> shorted to $V_{CC}$ if no pull-up is applied Case 2. No open-load in full bridge configuration with external pull-up on Out <sub>A</sub> Case 3. Open-load in half bridge configuration with external pull-up on Out <sub>B</sub> (motor connected between Out <sub>B</sub> and Ground)
				x	$V_{outB} < V_{OL}$	Hi-Z	Case1. Open-load in full Bridge configuration with an external pull-up on Out <sub>A</sub> Case 2. No open-load in half Bridge configuration with external pull-up on Out <sub>B</sub> (motor connected between Out <sub>B</sub> and Ground)

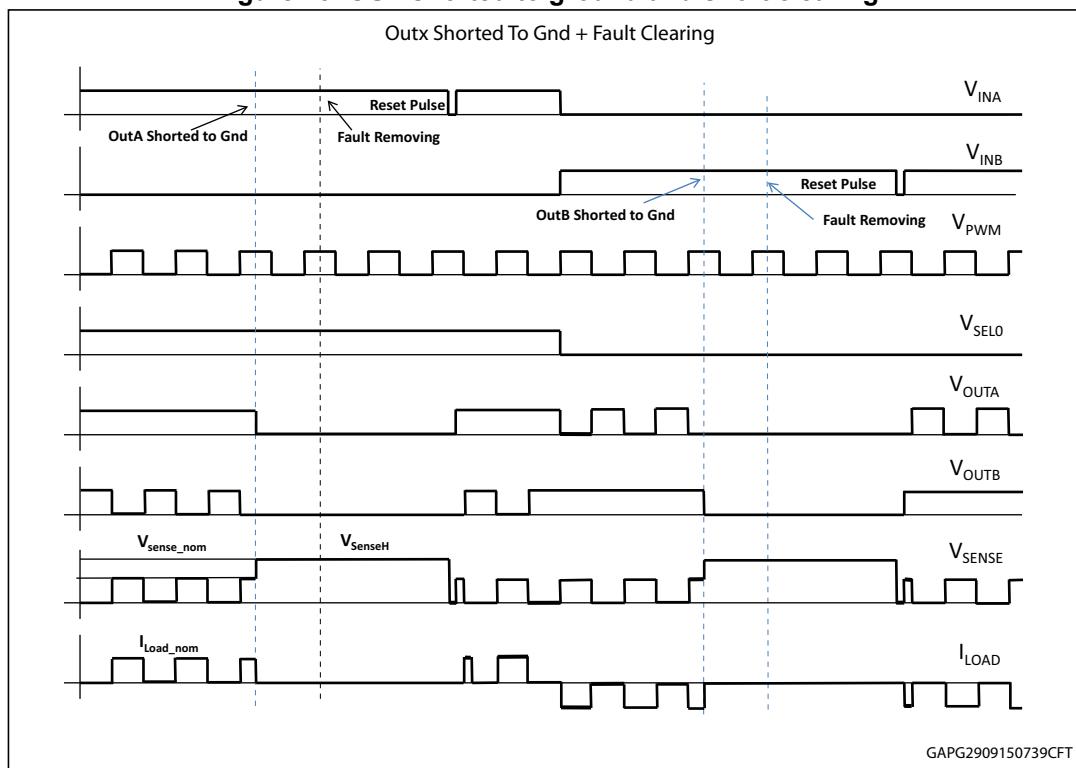

1. The device enters standby mode after  $t_{D\_STBY}$
2. To power on the device from the standby, it is recommended to toggle IN<sub>A</sub> or IN<sub>B</sub> from 0 to 1 first and then PWM from 0 to 1 to avoid any over-stress on the device in case of short-to-battery.

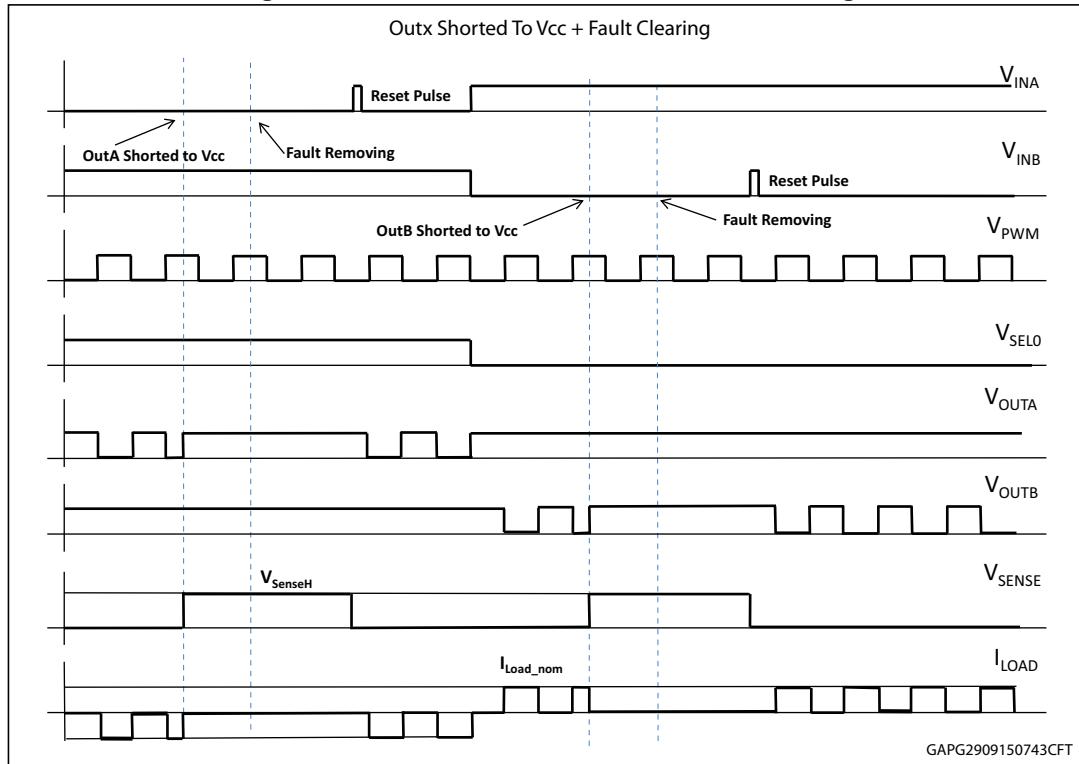

## 2.4 Waveforms

**Figure 12. Normal operative conditions**

**Figure 13. OUT shorted to ground and short clearing**

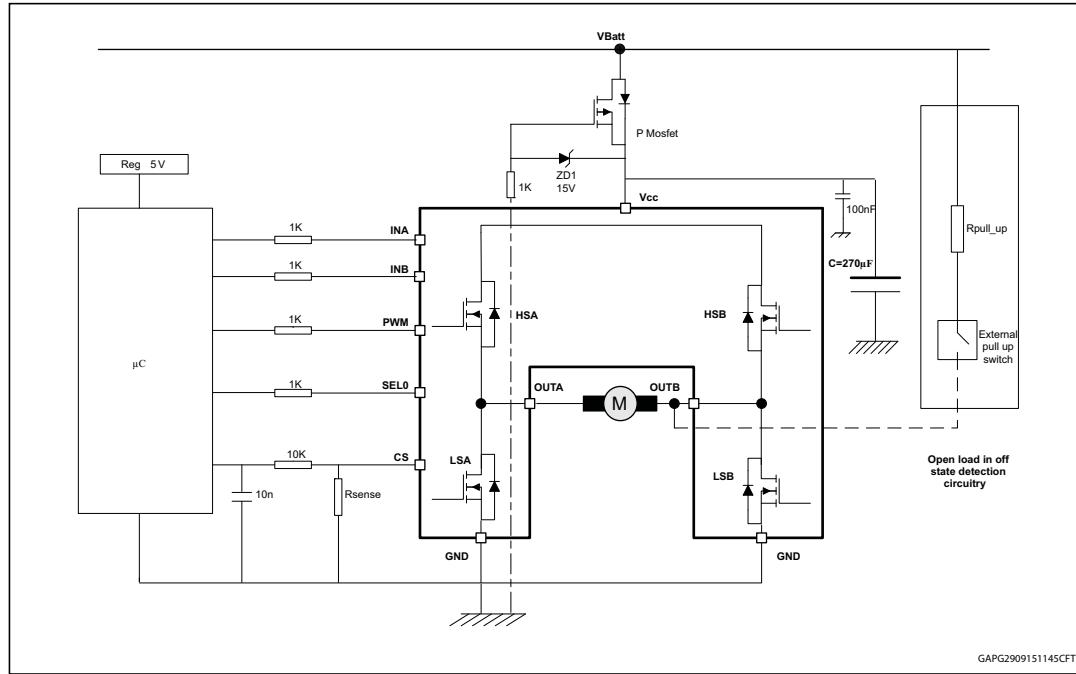

**Figure 14. OUT shorted to Vcc and short clearing**

### 3 Application information

Here following there is the typical application schematic suggested for a proper operation of the device in DC or PWM conditions.

**Figure 15. Application schematic with reverse battery protection connected to Vbatt**

**Figure 16. Application schematic with reverse battery protection connected to GND**

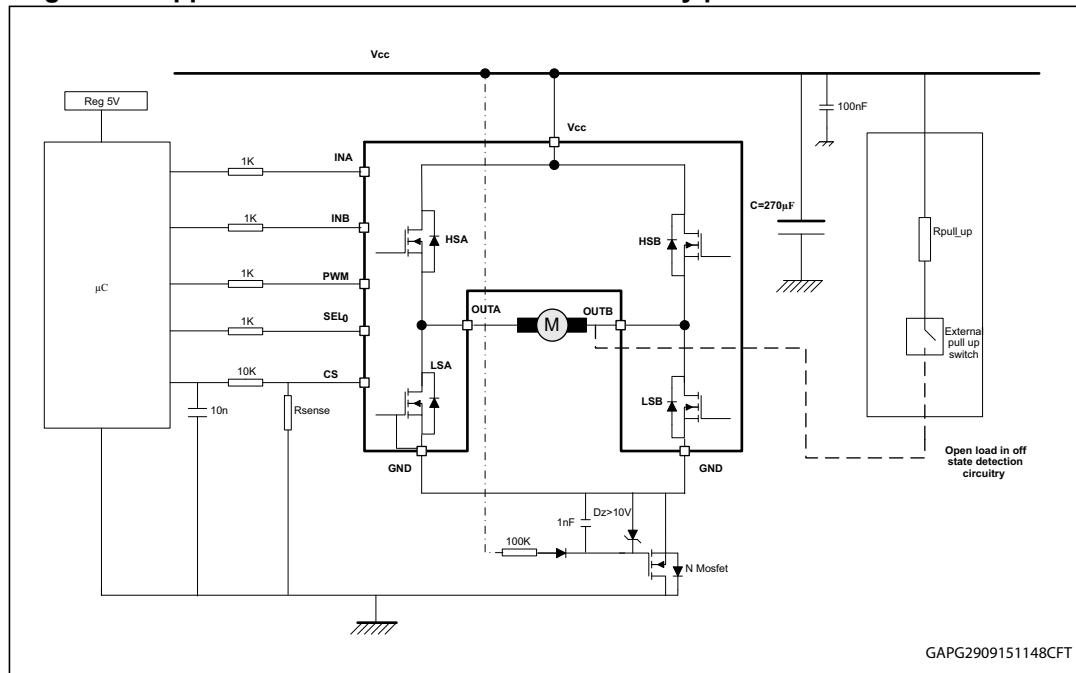

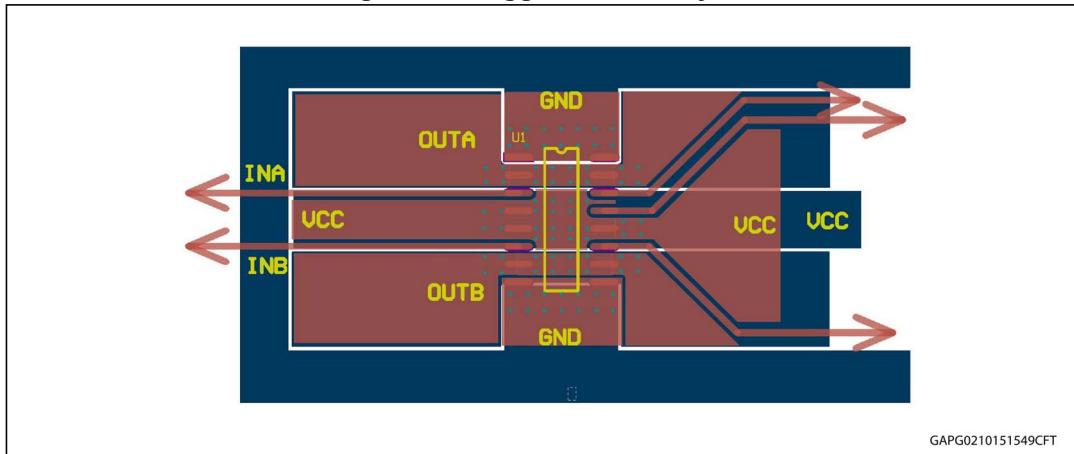

Figure 17. Suggested PCB layout

Note:

*PCB layout recommendation:*

*Optimized connection (short) between Drain LSD and Source HSD  
Optimized GND<sub>a</sub> and GND<sub>b</sub> connection (symmetric connection)*

### 3.1 Reverse battery protection

Three possible solutions can be considered:

- A Schottky diode D connected to V<sub>CC</sub> pin
- An N-channel MOSFET connected to the GND pin
- A P-channel MOSFET connected to the V<sub>CC</sub> pin

In case the reverse battery protection is not present, the device sustains no more than -15 A because of the two Body diodes of the Power MOSFETs. Additionally, in reverse battery condition the I/Os of the device is pulled down to the V<sub>CC</sub> line (approximately -1.5 V).

Series resistor must be inserted to limit the current sunk from the microcontroller I/Os. If I<sub>Rmax</sub> is the maximum target reverse current through microcontroller I/Os, series resistor is:

$$R = \frac{V_{IOs} - V_{CC}}{I_{Rmax}}$$

### 3.2 OFF-state open-load detection – External circuitry dimensioning

The detection of an open-load in off state requires an external circuitry to be connected between Output and V<sub>BATT</sub>.

For the detection it is necessary to put one network on each leg in case of Half Bridge operation or one network on one of the output in case of full bridge (see [Table 13: Off-state - truth table](#)).

The external circuitry is made up by an external pull-up resistor R<sub>pull\_up</sub> connecting the output to a positive supply voltage V<sub>PU</sub> (V<sub>Batt</sub>).

It is preferable to switch-off  $V_{PU}$  by using an external pull\_up switch to reduce the overall standby current during he module standby mode.

$R_{pull\_up}$  must be dimensioned to ensure that in normal operative conditions  $V_{OUT} > V_{OLmax}$ .

To satisfy this condition the  $R_{pull\_up}$  must be selected according to:

- if the device is used in half bridge configuration, the equation is:

$$R_{pull\_up} < \frac{V_{BATTmin} - V_{OLmax}}{I_{L(off2)min}[@VOLmax]}$$

- if the device is used in H-bridge configuration, the equation is:

$$R_{pull\_up} < \frac{V_{BATTmin} - V_{OLmax}}{2 \times I_{L(off2)min}[@VOLmax]}$$

### 3.3 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the  $V_{CC}$  pin, is tested in accordance with ISO7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in *Table 14*.

Test pulses are applied directly to DUT (Device Under Test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), chapter 4. The DUT is intended as the present device only, without components and accessed through  $V_{CC}$  and GND terminals.

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: "The function does not perform as designed during the test but returns automatically to normal operation after the test".

**Table 14. ISO 7637-2 - electrical transient conduction along supply line**

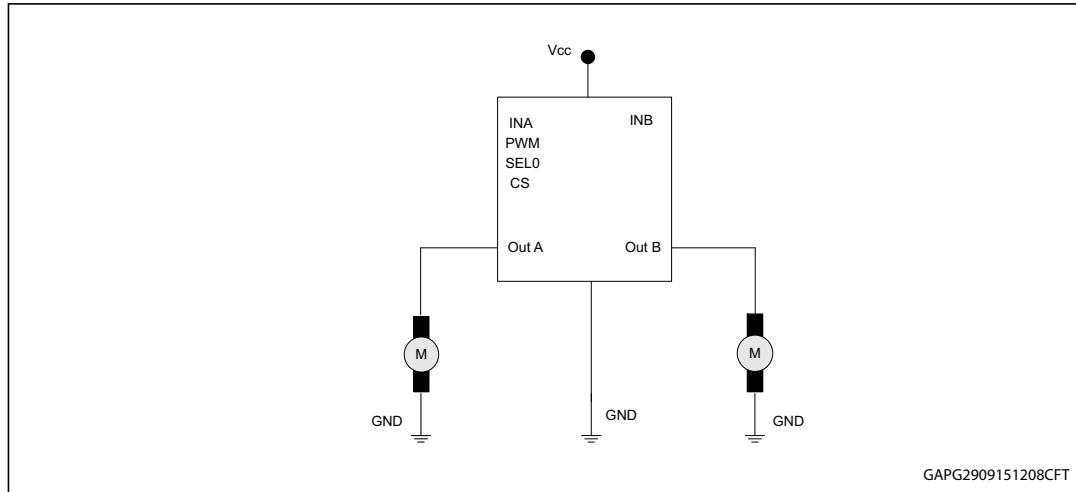

Test Pulse 2011(E)	Test pulse severity level with Status II functional performance status		Minimum number of pulses or test time	Burst cycle / pulse repetition time		Pulse duration and pulse generator internal impedance
	Level	$U_S^{(1)}$		min	max	
1	III	-112 V	500 pulses	0,5 s		2ms, 10 Ω
2a	III	+55 V	500 pulses	0,2 s	5 s	50μs, 2 Ω
3a	IV	-220 V	1h	90 ms	100 ms	0.1μs, 50 Ω
3b	IV	+150 V	1h	90 ms	100 ms	0.1μs, 50 Ω
4 <sup>(2)</sup>	IV	-7 V	1 pulse			100ms, 0.0 1Ω
<b>Load dump according to ISO 16750-2:2010</b>						
Test B <sup>(3)</sup>		40 V	5 pulse	1 min		400 ms, 2 Ω

1.  $U_S$  is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E), chapter 5.6.

2. Test pulse from ISO 7637-2:2004(E).
3. With 40 V external suppressor referred to ground (-40°C < T<sub>j</sub> < 150°C).

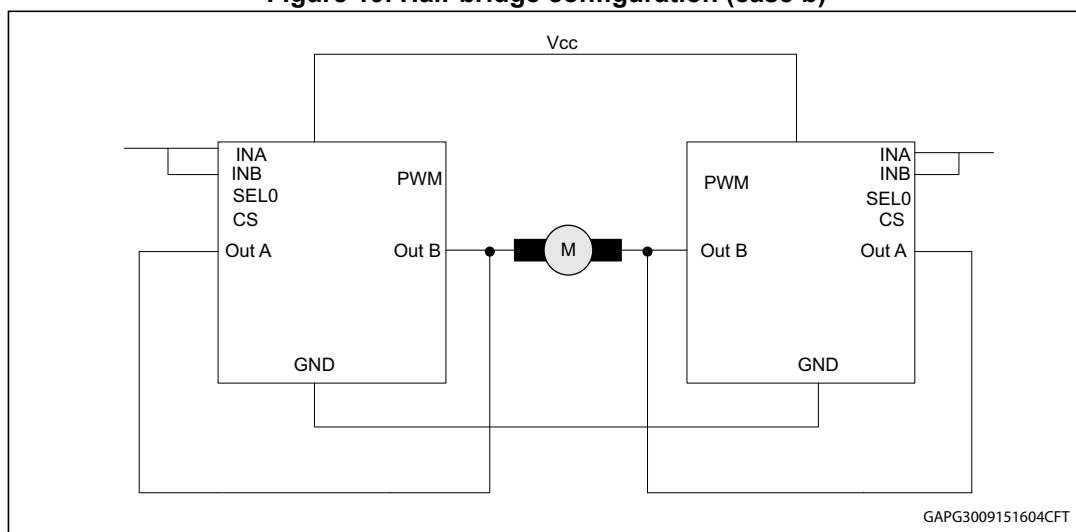

### 3.4 Device configurations

**Figure 18. Half-bridge configuration (case a)**

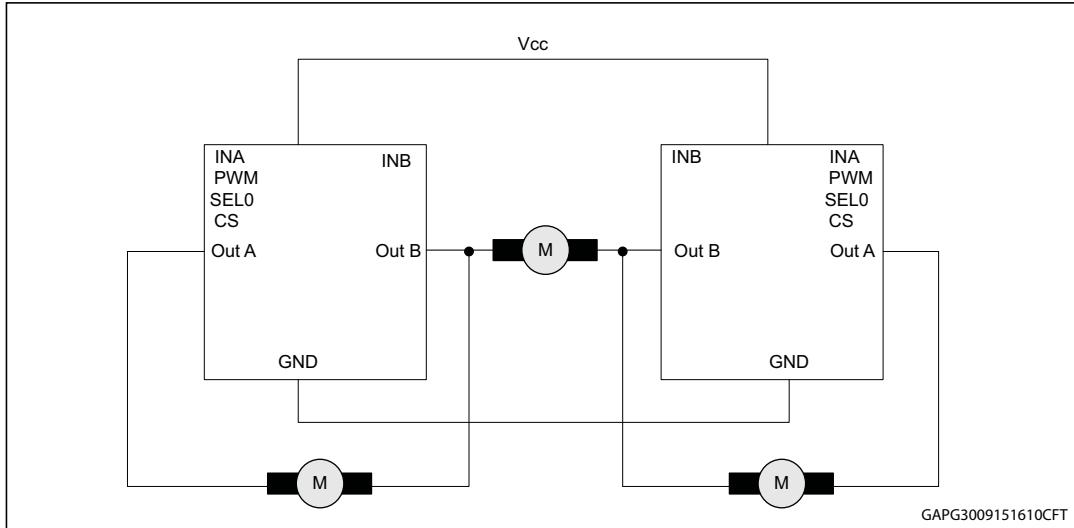

**Note:** The VNH7100BAS can be used in half bridge configuration as the two legs can be independently driven. The SEL0 pin can be used to address the diagnostic on the CS according to the operative truth table.

**Figure 19. Half-bridge configuration (case b)**

**Note:** The VNH7100BAS can be used in applications where an half-bridge with a resistance of 50 mΩ per leg is needed.

**Figure 20. Multi-motors configuration**

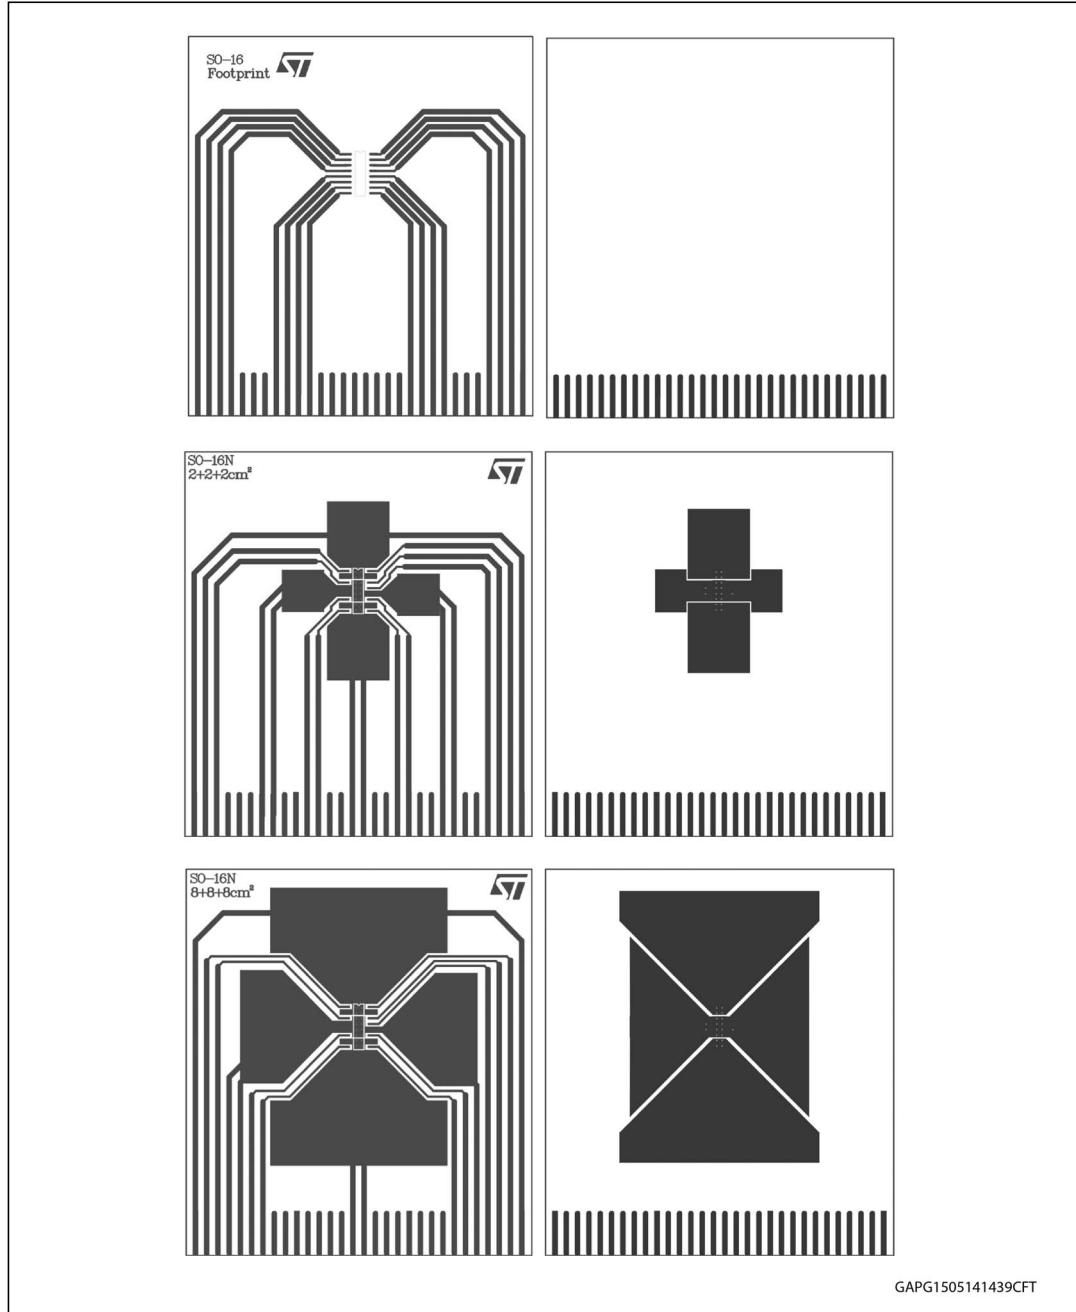

Note:

*The VNH7100BAS can easily be designed in multi motor driving configuration in the applications where only one motor at a time must be activated. The SEL0 pin can be used to read the diagnostic on the CS according to the operative truth table.*

## 4 Package and PCB thermal data
