description

These devices are monolithic BIDFET[†] integrated circuits designed to drive the row electrodes of an electroluminescent display. All inputs are CMOS-compatible and all outputs are high-voltage open-collector n-p-n transistors. The SN65558 and SN75558 output sequences are reversed from the SN65557 and SN75557 for ease in printed circuit board layout.

The devices consist of a 32-bit shift register, 32 AND gates, and 32 output OR gates. Typically, a composite row drive signal is externally generated by a high-voltage switching circuit and applied to the SUBSTRATE COMMON terminal. Serial data is entered into the shift register on the high-to-low transition of the clock input. A high ENABLE allows those outputs with a high in their associated register to be turned on causing the corresponding row to be connected to the composite row drive signal. When STROBE is low, all output transistors are turned on. The Serial Data output (SERIAL OUT) from the shift register may be used to cascade additional devices. This output is not affected by the ENABLE or STROBE inputs.

The SN65557 and SN65558 are characterized for operation from -40°C to 85°C. The SN75557 and SN75558 are characterized for operation from 0°C to 70°C.
