GENERAL DESCRIPTION

The MACH130 is a member of AMD's high-performance EE CMOS MACH 1 family. This device has approximately six times the logic macrocell capability of the popular PAL22V10 with no loss of speed.

The MACH130 consists of four PAL blocks interconnected by a programmable switch matrix. The switch matrix connects the PAL blocks to each other and to all input pins, providing a high degree of connectivity between the fully-connected PAL blocks. This allows designs to be placed and routed efficiently.

The MACH130 macrocell provides either registered or combinatorial outputs with programmable polarity. If a registered configuration is chosen, the register can be configured as D-type or T-type to help reduce the number of product terms. The register type decision can be made by the designer or by the software. All macrocells can be connected to an I/O cell. If a buried macrocell is desired, the internal feedback path from the macrocell can be used, which frees up the I/O pin for use as an input.

FUNCTIONAL DESCRIPTION

The MACH130 consists of four PAL blocks connected by a switch matrix. There are 64 I/O pins and 2 dedicated input pins feeding the switch matrix. These signals are distributed to the four PAL blocks for efficient design implementation. There are 4 clock pins that can also be used as dedicated inputs.

The PAL Blocks

Each PAL block in the MACH130 (figure 10) contains a 64-product-term logic array, a logic allocator, 16 macrocells and 16 I/O cells. The switch matrix feeds each PAL block with 26 inputs. This makes the PAL block look effectively like an independent "PAL26V16".

There are four additional output enable product terms in each PAL block. For purposes of output enable, the 16 I/O cells are divided into 2 banks of 8 macrocells. Each bank is allocated two of the output enable product terms.

An asynchronous reset product term and an asynchronous preset product term are provided for flip-flop initialization. All flip-flops within the PAL block are initialized together.

The Switch Matrix

The MACH130 switch matrix is fed by the inputs and feedback signals from the PAL blocks. Each PAL block provides 16 internal feedback signals and 16 I/O feedback signals. The switch matrix distributes these signals back to the PAL blocks in an efficient manner that also provides for high performance. The design software automatically configures the switch matrix when fitting a design into the device.

The Product-Term Array

The MACH130 product-term array consists of 64 product terms for logic use, and 6 special-purpose product terms. Four of the special-purpose product terms provide programmable output enable, one provides asynchronous reset, and one provides asynchronous preset. Two of the output enable product terms are used for the first eight I/O cells; the other two control the last eight macrocells.

The Logic Allocator

The logic allocator in the MACH130 takes the 64 logic product terms and allocates them to the 16 macrocells as needed. Each macrocell can be driven by up to 12 product terms. The design software automatically configures the logic allocator when fitting the design into the device.

Table 7 illustrates which product term clusters are available to each macrocell within a PAL block. Refer to Figure 10 for cluster and macrocell numbers.

Table 7. Logic Allocation

Output Macrocell	Available Clusters
M ₀	C ₀ , C ₁
M ₁	C ₀ , C ₁ , C ₂
M ₂	C ₁ , C ₂ , C ₃
M ₃	C ₂ , C ₃ , C ₄

M ₅	C ₄ , C ₅ , C ₆
M ₆	C ₅ , C ₆ , C ₇
M ₇	C ₆ , C ₇ , C ₈
M ₈	C ₇ , C ₈ , C ₉
M ₉	C ₈ , C ₉ , C ₁₀
M ₁₀	C ₉ , C ₁₀ , C ₁₁
M ₁₁	C ₁₀ , C ₁₁ , C ₁₂
M ₁₂	C ₁₁ , C ₁₂ , C ₁₃
M ₁₃	C ₁₂ , C ₁₃ , C ₁₄
M ₁₄	C ₁₃ , C ₁₄ , C ₁₅
M ₁₅	C ₁₄ , C ₁₅

The Macrocell

The MACH130 macrocells can be configured as either registered or combinatorial, with programmable polarity. The macrocell provides internal feedback whether configured as registered or combinatorial. The flip-flops can be configured as D-type or T-type, allowing for product-term optimization.

The flip-flops can individually select one of four global clock pins, which are also available as logic inputs. The registers are clocked on the LOW-to-HIGH transition of the clock signal. The flip-flops can also be asynchronously initialized with the common asynchronous reset and preset product terms.

The I/O Cell

The I/O cell in the MACH130 consists of a three-state output buffer. The three-state buffer can be configured in one of three ways: always enabled, always disabled, or controlled by a product term. If product term control is chosen, one of two product terms may be used to provide the control. The two product terms that are available are common to eight I/O cells. Within each PAL block, two product terms are available for selection by the first eight three-state outputs; two other product terms are available for selection by the last eight three-state outputs.

These choices make it possible to use the macrocell as an output, an input, a bidirectional pin, or a three-state output for use in driving a bus.

Notes:

- These are absolute values with respect to device ground and all overshoots due to system and/or tester noise are included.
- I/O pin leakage is the worst case of I_{IL} and I_{OZL} (or I_{IH} and I_{OZH}).
- Not more than one output should be shorted at a time. Duration of the short-circuit should not exceed one second.
 $V_{OUT} = 0.5$ V has been chosen to avoid test problems caused by tester ground degradation.
- This parameter is guaranteed worst case. An actual I_{CC} value can be calculated by using the "Typical Dynamic I_{CC} Characteristics" Chart towards the end of this data sheet.

Derating for Number of Outputs Switching

Note:

Applies to t_{PD} , t_{CO} . Calculate as:

$$t_{\text{derated}} = t_{32\text{ O/P}} + \Delta t_{OS}$$

Datasheet numbers ($t_{32\text{ O/P}}$) are specified at 32 outputs switching

14131F-5

Capacitive Load Derating

Note:

Applies to all AC specifications and rise and fall times. Calculate as:

$$t_{\text{derated}} = t_{35\text{ pF}} + \Delta t_{DL}$$

Datasheet numbers ($t_{35\text{ pF}}$) are specified with 35 pF.

For typical rise and fall rates, use 1V/ns at 35 pF.

TYPICAL DATA DESIGN GUIDELINES

The following parameters are provided in response to questions from designers. They are intended only as design guidelines, and should be used with care. They are not guaranteed or tested.

Parameter Description	Typ	Unit
Delay Minims (Note 1)		
Combinatorial propagation delay minimum	3	ns
Clock-to-output delay minimum	2	ns
Edge Rates (Note 2)		
Rise rate	1	V/ns
Fall rate	1	V/ns
Skew (Note 3)		
Clock-to-output skew, same clock polarity and same output polarity	1	ns
Clock-to-output skew, same clock polarity only	2	ns
Clock-to-output skew, same output polarity only	2	ns
Clock-to-output skew, different clock polarity and different output polarity	2	ns
Internal Delay Savings (Note 4)		
Propagation delay savings	2	ns
Clock-to-output delay savings	3	ns
Ground Bounce (Note 5)		
Ground bounce noise level on low output	0.5	V

Notes:

1. Minimum delays shown anticipate some future technology improvements, but it cannot be guaranteed that process and design changes will not increase the best-case performance beyond the values below.
2. Rise and fall rates are for unloaded outputs.
3. Skew values assume equal output loading.
4. Internal delay savings gives the typical amount of delay saved by not going through an output buffer.
5. The ground bounce noise level should be added to the static V_{OL} under normal load conditions as applied to a silent low output when all other I/O pins are switching from high to low.

		400 lfpm air	20	°C/W
		600 lfpm air	19	°C/W
		800 lfpm air	17	°C/W

Plastic θ_{jc} Considerations

The data listed for plastic θ_{jc} are for reference only and are not recommended for use in calculating junction temperatures. The heat-flow paths in plastic-encapsulated devices are complex, making the θ_{jc} measurement relative to a specific location on the package surface. Tests indicate this measurement reference point is directly below the die-attach area on the bottom center of the package. Furthermore, θ_{jc} tests on packages are performed in a constant-temperature bath, keeping the package surface at a constant temperature. Therefore, the measurements can only be used in a similar environment.
