PROM VERSION of M37450M4-XXXSP/FP

DESCRIPTION

The M37450E4-XXXSP is a single-chip microcomputer designed with CMOS silicon gate technology. It is housed in a 64-pin shrink plastic molded DIP. The features of this chip are similar to those of the M37450M4-XXXSP except that this chip has a 8192-byte PROM built-in. This single-chip microcomputer is useful for office automation appliances and consumer appliance controllers.

In addition to its simple instruction sets, the PROM, RAM and I/O addresses are placed on the same memory map to enable easy programming. Since general purpose PROM writes can be used for small quantity production runs. It also has a unique feature that enables it to be used as a slave microcomputer.

The M37450E4SS and the M37450E4FS are the window type. The differences between the M37450E4-XXXSP and the M37450E4-XXXFP, and between the M37450E4SS and the M37450E4FS are the package outline and the power dissipation ability (absolute maximum ratings).

EPROM MODE

The M37450E4-XXXSP/FP, M37450E4SS/FS features an EPROM mode in addition to its normal modes. When the $\overline{\text{RESET}}$ signal level is low ("L") and $\text{CNV}_{\text{SS}}/\text{V}_{\text{PP}}$ signal level is high ("H"), the chip automatically enters the EPROM mode. Table 1 list the correspondence between pins and Figure 1 and Figure 2 give the pin connections in the EPROM mode. When in the EPROM mode, ports P0, P1, P2, P5₀ to P5₂ and CNV_{SS} are used for the PROM (equivalent to the M5L2764). When in this mode, the built-in PROM can be written to or read from using these pins in the same way as with the M5L2764. The oscillator should be connected to the X_{IN} and X_{OUT} pins, or external clock should be connected to the X_{IN} pin.

PROM READING, WRITING AND ERASING
Reading

To read the PROM, set the $\overline{\text{CE}}$ and $\overline{\text{OE}}$ pins to a "L" level, and supply 0V to the $\overline{\text{RESET}}$ pin, and 5V to the V_{CC} and the CNV_{SS} (V_{PP}) pins. Input the address of the data (A_0 to A_{12}) to be read and the data will be output to the I/O pins D_0 to D_7 . The data I/O pins will be floating when either the $\overline{\text{CE}}$ or $\overline{\text{OE}}$ pins are in the "H" state.

Writing

To write to the PROM, set the $\overline{\text{CE}}$ pin to a "L" level and the $\overline{\text{OE}}$ pin to a "H" level, and supply 0V to the $\overline{\text{RESET}}$ pin, 6V to the V_{CC} pin and 21V to the V_{PP} pin. The CPU will enter the program mode when V_{PP} is applied to the V_{PP} pin. The address to be written to is selected with pins A_0 to A_{12} , and the data to be written is input to pins D_0 to D_7 . Set the $\overline{\text{PGM}}$ pin to a "L" level to begin writing.

Erasing

Data can only be erased on the M37450E4SS/FS ceramic package, which includes a window. To erase data on this chip, use an ultraviolet light source with a 2537 Angstrom wave length. The minimum radiation power necessary for erasing is $15\text{W}\cdot\text{s}/\text{cm}^2$.

NOTES ON HANDLING

- (1) Sunlight and fluorescent light contain wave lengths capable of erasing data. For ceramic package types, cover the transparent window with a seal (provided) when this chip is in use. However, this seal must not contact the lead pins.

- (2) Before erasing, the glass should be cleaned and stains such as finger prints should be removed thoroughly. If these stains are not removed, complete erasure of the data could be prevented.
- (3) Since a high voltage (21V) is used to write data, care should be taken when turning on the PROM writer's power.
- (4) For the programmable microcomputer (shipped in blank or OTP type), Mitsubishi does not perform PROM write test and screening in the assembly process and following process. To improve reliability after write, performing write and test according to the flow below before use is recommended.

Note : Since the screening temperature is higher than storage temperature, never expose to 150°C exceeding 100 hours.

Table 2. I/O signal in each mode
