1 GENERAL DESCRIPTION

The NuMicro®ML51/ML54/ML56 series is a Flash embedded 1T 8051-based microcontroller. The instruction set of the ML51 series is fully compatible with the standard 80C51 with enhanced performance; This series is a three-to-one single microcontrollers, intergrated with up to 14 channels of capacitive touch and LCD driver.

The ML51/ML54/ML56 series is 1T 8051 core based low-power microcontrollers running at less 80μA/MHz in normal run mode, and power down current is below 1uA. It Provides operating frequency up to 24 MHz. 16KB and 32KB Flash of ML51 series voltage range supports 1.8V to 5.5V, and 64KB Flash of ML51 series supports 1.8 to 3.6V voltage range.

The ML51/ML54/ML56 series microcontroller provides 3 power modes to reduce power consumption –Low power run mode, Low power Idle mode, and Power-down mode. In Low power run mode, the power consumption can be down to 15 uA at 38.4 kHz LIRC. In Low power idle mode, CPU processing is suspended by holding the Program Counter. No program code is fetched and run in low power idle mode if the power consumption does not exceed 13 uA. Power-down mode stops the whole system clock for minimum power consumption with the leakage current less than 1 uA. The system clock of the ML51 series can also be slowed down by software clock divider, which allows for flexibility between execution performance and power consumption.

The ML51/ML54/ML56 series provides rich peripherals including 256 bytes of SRAM, 4 Kbytes of auxiliary RAM (XRAM), up to 56 general purpose I/O, two 16-bit Timers/Counters 0/1, one 16-bit Timer2 with three-channel input capture module, one Watchdog Timer (WDT), one Self Wake-up Timer (WKT), one 16-bit auto-reload Timer3 for general purpose or baud rate generator, two UARTs with frame error detection and automatic address recognition, two ISO7816 Smartcard interface, two SPI, two I2C, six enhanced PWM output channels with dead zone control, six PWM output channels with three individual configurable period, two analog comparators, eight-channel shared pin interrupt for all I/O ports, and one 12-bit ADC at 500 ksps.

All series contains up to 64 Kbytes Flash, called APROM designed for programming. Flash supports In-Application-Programming (IAP) function, which supports on-chip firmware upgrade. Partial flash can be configured as Data Flash programmed by IAP and read by IAP or MOVX instruction. The ML51/ML54/ML56 series includes an additional configurable up to 4/3/2/1 Kbytes Flash area called LDROM, in which the Boot Code normally resides for carrying out the In-System-Programming (ISP). To facilitate mass production programming and verification, the Flash is allowed to be programmed and read electronically by parallel Writer/Programmer or In-Circuit-Programming (ICP) with Nu-Link. Once programmed and verified, the programmed code can be protected by the Flash lock mechanism from being read out by external programming tool.

Through the high performance and low power features of ML51/ML54/ML56 series, this series benefits for low-power, battery powered devices, general purpose, home appliances, and motor control system.
