

1. Introduction

1.1 Features

- Fully integrated battery management solution with battery capacity measurement and programmable protection capability.
- Supports up to 10 Li-ion or Li-Polymer battery cells in series. RAJ240090 supports 3 to 8 series cells, RAJ240100 supports 3 to 10 series cells.
- Integrated with Renesas Ultra Low Power RL78 CPU core for multi-function process
- Memory
 - Code flash memory: 128KB
 - Data flash memory (up to 100,000 erase/write cycles): 4 KB
 - SRAM: 7KB
- Clock generator
 - High speed on-chip oscillator: up to 32 MHz
 - Low speed on-chip oscillator: 32 KHz
 - AFE high speed on-chip oscillator: 4.194 MHz
 - AFE low speed on-chip oscillator: 131.072 KHz
- General Purpose I/O Ports
 - Total: 31 pins
 - CMOS input/output: 20
 - CMOS input: 4
 - N-ch open drain Input/output [6V tolerance]: 4
 - High voltage input/output [VCC tolerance]: 3
- Serial interface
 - CSI (SPI): 2 channels
 - I2C: 1 channel
 - UART: 2 channels
 - Simplified I2C: 2 channels
 - CAN interface (RS-CAN lite): 1 channel
- Timer
 - MCU 16-bit timer: 6 channels
 - MCU 12-bit interval timer: 1 channel
 - MCU Real time clock: 1 channel
 - AFE timer: 2 channels
 - AFE timer A: setting range: 125 ms to 64 s
 - AFE timer B: setting range : 30.52 us to 125 ms
- Embedded A/D converter

1.2 Applications

- E-Bike, E-Scooter, Pedal-Assist Bicycle
- Power Tool, Vacuum Cleaner, Drone
- Battery Backup System, Energy Storage System (ESS)

1.3 Description

RAJ240090 / RAJ240100 are Renesas Li-ion battery fuel gauge IC (FGIC) which consist of a MCU device and an AFE device in a single package. Pack with a variety of battery management features and Renesas RL78 CPU core which has multiple low power modes and capable of achieving high performance in ultra-low power operation. RAJ240090 / RAJ240100 fuel gauge IC have control firmware stored in embedded flash memory to control attached embedded analog and digital circuits to execute battery voltage / current / temperature measurement, remaining capacity estimation, over current / voltage / temperature protection and other battery management operations.

3.2 Pin Functions

3.2.1 Pin type and alternate functions

Function name	Pin Type	I/O	After Reset Release	Alternate Function	Function
P00	7-1-7	I/O	Input port	TRDIOB0	Port 0. 8-bit I/O port. Input/output can be specified in 1-bit unit. Use of an on-chip pull-up resistor can be specified by a software setting at input port. Input of P03 and P04 can be set to TTL input buffer. Output of P03 and P04 can be set to N-ch open-drain output (VDD tolerance).
P01	7-1-7			TRDIOC0	
P02	7-1-7			TRDIOD0	
P03	8-1-4			CTXD0	
P04	8-1-4			CRXD0

P15	7-1-4			SO10/TXD10	
P16	7-1-4			INTP0	
P20	4-3-3	I/O	Analog function	ANI3	Port 2. 4-bit I/O port. Input/output can be specified in 1-bit unit. Can be set to analog input Note 1.
P21	4-3-3			ANI2	
P22	4-3-3			ANI1/AVREFM	
P23	4-3-3			ANI0/AVREFP	
P30	7-1-3	I/O	Input port	INTP13	Port 3. Note 2. 4-bit I/O port. Input/output can be specified in 1-bit unit. Use of an on-chip pull-up resistor can be specified by a software setting at input port.
P31	7-1-3			INTP12	
P32	7-1-3			INTP11	
P33	7-1-3			INTP10	
P40	7-1-3	I/O	Input port	TOOL0	Port 4. 1-bit I/O port. Input/output can be specified in 1-bit unit. Use of an on-chip pull-up resistor can be specified by a software setting at input port.
P60	12-1-2	I/O	Input port	INTP7/SCLA0	Port 6. 4-bit I/O port. Input/output can be specified in 1-bit unit. Output of P60 to P63 can be set to N-ch open-drain output (6.0V tolerance).
P61	12-1-2			INTP6/SDAA0	
P62	12-1-2			INTP5/(SI00)/(SDA00)/(RXD0)	
P63	12-1-2			INTP4/(SI10)/(SDA10)/(RXD1)	
P70	7-1-3	I/O	Input port	INTP9	Port 7. Note 2. 8-bit I/O port. Input/output can be specified in 1-bit unit. Use of an on-chip pull-up resistor can be specified by a software setting at input port.
P71	7-1-3			INTP8	
P72	7-1-3			EXBSEL	
P73	7-1-3			EXBCK	
P74	7-1-3			EXB00/EXB10	
P75	7-1-3			EXB01/EXB11	
P76	7-1-3			EXB02/EXB12	
P77	7-1-3			EXB03/EXB13	
P122	2-2-2	input	Input port	EXCLK	Port 12. 3-bit input-only port.
P123	2-2-1			XT1	
P124	2-2-1			XT2/EXCLKS	
P137	2-1-2	input	Input port	INTP3	Port 13. 1-bit input-only port.
RESET	2-1-1	input	-	-	Input-only pin for external reset. Connect to VDD directly or via a resistor when external reset is not used.

Note 1. Each pin can be configured as digital or analog pin by setting the port mode in the control register x (PMCx)
(Can be specified in 1-bit units).

Note 2. Connected to internal AFE circuit.

3.2.2 External Pin Functions

(1/2)

Category	Pin name	I/O	Function
Power supply	VCC	—	Power supply input Apply power supply voltage to VCC pin from a charger or battery.
	GND0、GND1	—	Device ground input. Connect the negative input terminal of lithium-ion battery 1 to the GND0 and GND1 pins
	CREG2F	—	Series regulator force port
	CREG2S	—	Series regulator sense port Connect to GND0 and GND1 via a capacitor (1uF to 4.7uF)
	VDD	—	Positive power supply for MCU Connect to CREG2
	VSS	—	Ground input for MCU Connect the negative input terminal of lithium-ion battery 1 to the GND0 and GND1 pins
RESET	RESET	Input	This is the active-low system reset input pin for MCU.
	RESETOUT	output	This is the active-low system reset output pin for AFE.
TOOL0	TOOL0 Note 2	input	Data I/O for flash memory programmer/debugger. Connect to the VDD via an external pull-up resistor in the on chip debug mode
Serial interface (UART0, UART1)	RxD0, RxD1	input	Serial data input pins of serial interface UART0 to UART1
	TxD0, TxD1	output	Serial data output pins of serial interface UART0 to UART1
Serial interface (CSI00, CSI10)	SCK00,SCK10	I/O	Serial clock I/O pins of serial interface CSI00 and CSI10
	SI00, SI10	input	Serial data input pins of serial interface CSI00 and CSI10
	SO00, SO10	output	Serial data output pins of serial interface CSI00 and CSI10
Serial interface (IIC00, IIC10)	SCL00, SCL10	output	Serial clock output pins of serial interface IIC00 and IIC10
	SDA00, SDA10	I/O	Serial data I/O pins of serial interface IIC00 and IIC10
Serial interface (IICA0)	SCLA0	I/O	Serial clock I/O pins of serial interface IICA0
	SDAA0	I/O	Serial data I/O pins of serial interface IICA0,
CAN-BUS interface	CRXD0	input	CAN serial data input
	CTXD0	output	CAN serial data output
A/D converter	AN0, AN1, AN2	input	AFE A/D converter analog input
	AN10, AN11, AN12, AN13	input	MCU A/D converter analog input
	AVREFP	input	A/D converter reference voltage (+ side).
	AVREFM	input	A/D converter reference voltage (- side).
Current integration circuit and overcurrent detection circuit	ISENS0、ISENS1	input	Analog input for current integration circuit and over current detection circuit
Timer	TI00-TI02	input	The pins for inputting an external count clock/capture trigger to 16-bit timers 00 to 02
	TO00-TO02	output	Timer output pins of 16-bit timers 00 to 02
	TRDIOB0 TRDIOC0 TRDIOD0	I/O	Timer RD input/output
	RTC1HZ	output	Real-time clock supports clock (1 Hz) output

(2/2)

Category	Pin name	I/O	Function
High voltage I/O port	HVP0, HVP1, HVP2	I/O	High voltage I/O in correspondence with VCC tolerance
Subsystem clock	XT1, XT2 ^{Note 3}	—	Resonator connection for subsystem clock
External clock	EXCLK	Input	External clock input for main system clock
	EXCLKS	input	External clock input for subsystem clock
External interrupt input	INTP0 to INTP13	input	Interrupt request input pin. INTP8 to INTP13 connects interrupt request signal of AFE in the package and do not connect to any pin
Power on circuit	PON	input	Power on input for release from power down state
Charger connection detect	PACK	Input	Charger voltage input and source voltage of discharge FET drive port (DFOUT)
Battery connection detect	VBAT	input	Sense voltage input pin for most positive cell and source voltage for charge FET drive port (CFOUT)
Battery voltage detection circuit	VIN10 ^{Note 4}	input	The positive input terminal of lithium-ion battery 10.
	VIN9 ^{Note 4}	Input	The negative input terminal of lithium-ion battery 10 and the positive input terminal of lithium-ion battery 9
	VIN8	Input	The negative input terminal of lithium-ion battery 9 and the positive input terminal of lithium-ion battery 8
	VIN7	Input	The negative input terminal of lithium-ion battery 8 and the positive input terminal of lithium-ion battery 7
	VIN6	Input	The negative input terminal of lithium-ion battery 7 and the positive input terminal of lithium-ion battery 6
	VIN5	Input	The negative input terminal of lithium-ion battery 6 and the positive input terminal of lithium-ion battery 5
	VIN4	Input	The negative input terminal of lithium-ion battery 5 and the positive input terminal of lithium-ion battery 4
	VIN3	Input	The negative input terminal of lithium-ion battery 4 and the positive input terminal of lithium-ion battery 3
	VIN2	Input	The negative input terminal of lithium-ion battery 3 and the positive input terminal of lithium-ion battery 2
	VIN1	Input	The negative input terminal of lithium-ion battery 2 and the positive input terminal of lithium-ion battery 1
	VIN0	Input	The negative input terminal of lithium-ion battery 1
FET control output	DFOUT	Output	ON/OFF signal output pin for discharge FET.
	CFOUT	Output	ON/OFF signal output pin for charge FET.
Communication between AFE and MCU	P72	input	Control signal of communication between AFE and MCU with setting to output port. P72 is connected to AFE in a package and not external pin.
	EXBCK	Output	Clock signal of communication between AFE and MCU
	EXBD0-3	I/O	Data signal of communication between AFE and MCU

Note 1. REGC is not external power supply pin. (Do not draw current from REGC.)

Note 2. After reset release, the connection between P40/TOOL0 and the operating mode are as follows.

4. ELECTRICAL SPECIFICATIONS

Caution This product has an on-chip debug function, which is provided for development and evaluation. Do not use the on-chip debug function in products designated for mass production because the guaranteed number of rewritable times of the flash memory may be exceeded when this function is used, and product reliability therefore cannot be guaranteed. Renesas Electronics is not liable for problems occurring when the on-chip debug function is used.

Remark 1. Specifications for VIN10 pin and VIN9 pin are only applicable to RAJ240100.

Remark 2. Operating ambient temperature is configurable by REG2T6 bit of REG2T register setting.

In case of setting REG2T6 bit of REG2T register to "0", this device is available in range of TA= -20 to 85C.

In case of setting REG2T6 bit of REG2T register to "1", this device is available in range of TA= -40 to 85C.

However, even if REG2T6 bit of REG2T register set to "1", the electrical characteristics which is guaranteed in range of TA = -20 to 85C is not changed.

(Note, Caution and Remark are listed on next page.)

- Note 1.** Connect the REGC pin to VSS via a capacitor (0.47 to 1uF). This value regulates the absolute maximum rating of the REGC pin. Do not use this pin with voltage applied to it.
- Note 2.** Connect the CREG2 pin to GND0 or GND1 via a capacitor (2.2uF). This value regulates the absolute maximum rating of the CREG2 pin.
- Note 3.** Must be 6.5V or lower.
- Note 4.** Do not exceed AVREF (+) + 0.3V in case of A/D conversion target pin.
- Note 5.** Must be 60V or lower.
- Caution** **Product quality may degrade if the absolute maximum rating has been exceeded. The absolute maximum ratings are rated values where the product is on the verge of suffering physical damage, therefore the product must be used within conditions that ensure the absolute maximum ratings are not exceeded.**

Remark 1. Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

		Total of all pins (When duty $\leq 70\%$ Note 3)	2.7V $\leq \text{VDD} \leq 5.5\text{V}$			-1.5	mA

Note 1. Value of current at which the device operation is guaranteed even if the current flows from the VDD pins to an output pin.

Note 2. Do not exceed the total current value.

Note 3. Specification under conditions where duty factor $\leq 70\%$.

The output current value that has changed to the duty factor $> 70\%$ the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

- Total output current from pins = $(I_{OH} \times 0.7)/(n \times 0.01)$

<Example> Where n = 80% and I_{OH} = -10.0 mA

$$\text{Total output current from pins} = (-10.0 \times 0.7)/(80 \times 0.01) \approx -8.7 \text{ mA}$$

However, the allowable current flow into one pin does not change with the duty factor.

A current higher than the absolute maximum rating must not flow into any one pin.

Caution P03, P04, and P10 to P16 do not output high level in N-ch open-drain mode.

Remark Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

$(T_A = -40/-20 \text{ to } +85C, 4.0V \leq VCC \leq 50V, 2.7V \leq VDD \leq 5.5V, GND0 = GND1 = VSS = 0V)$

		Total of all pins (When duty \leq 70% ^{Note 3})	2.7V \leq VDD \leq 5.5V			5.0	mA

Note 1. Value of current at which the device operation is guaranteed even if the current flows from an output pin to the VSS pins.

Note 2. Do not exceed the total current value.

Note 3. Specification under conditions where the duty factor \leq 70%.

The output current value that has changed to the duty factor $>$ 70% the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

- Total output current of pins = $(I_{OL} \times 0.7)/(n \times 0.01)$

<Example> Where n = 80% and I_{OL} = 10.0 mA

$$\text{Total output current of pins} = (10.0 \times 0.7)/(80 \times 0.01) \approx 8.7 \text{ mA}$$

5. Detailed description

5.1 Overview

RAJ240090 / RAJ240100 are Renesas fuel gauge ICs which consist of a MCU block and an AFE block in a single package and accomplish various protection mechanisms. These IC's incorporates advanced battery management features such as primary and secondary protection, voltage and current measurement, current integration, host communication interface. By using the battery management controlled firmware and data are stored in the embedded flash memory to control the embedded analog and digital hardware circuits, optimum battery management operation including high accuracy remaining capacity estimation and battery safety can be achieved.

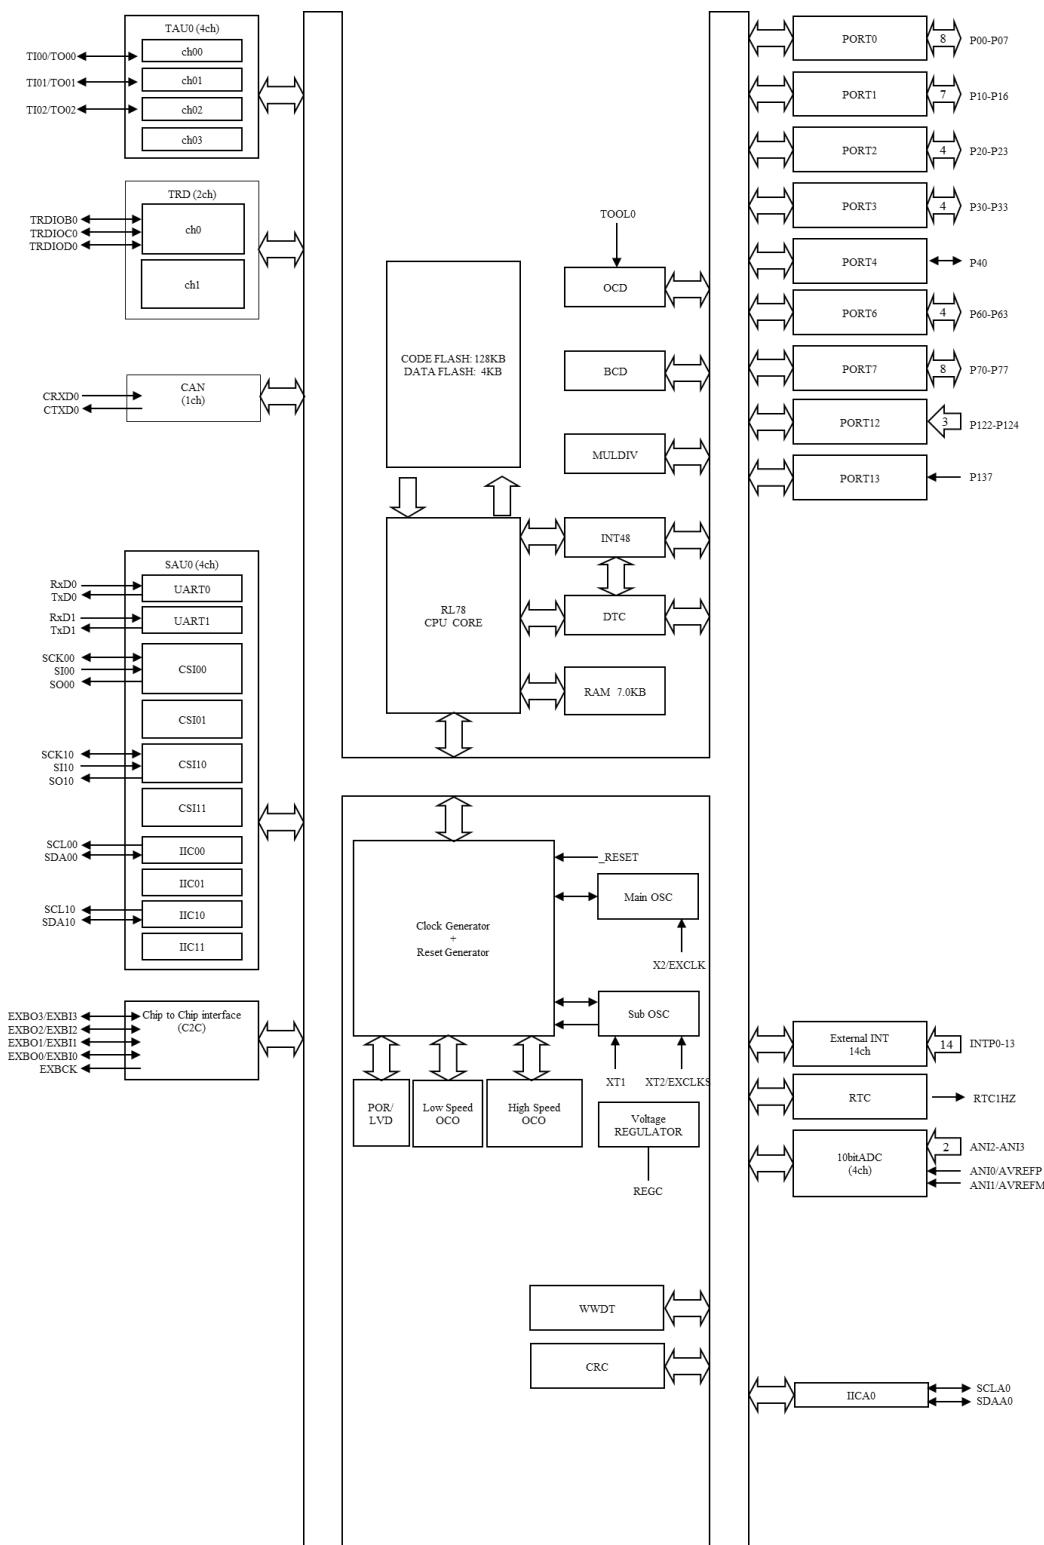

5.2 System block diagram

Note VIN10 pin and VIN9 pin are only applicable to RAJ240100.

Caution The example peripheral circuit does not guarantee proper operation. Please perform sufficient evaluation using the actual application to determine the circuits and peripherals.

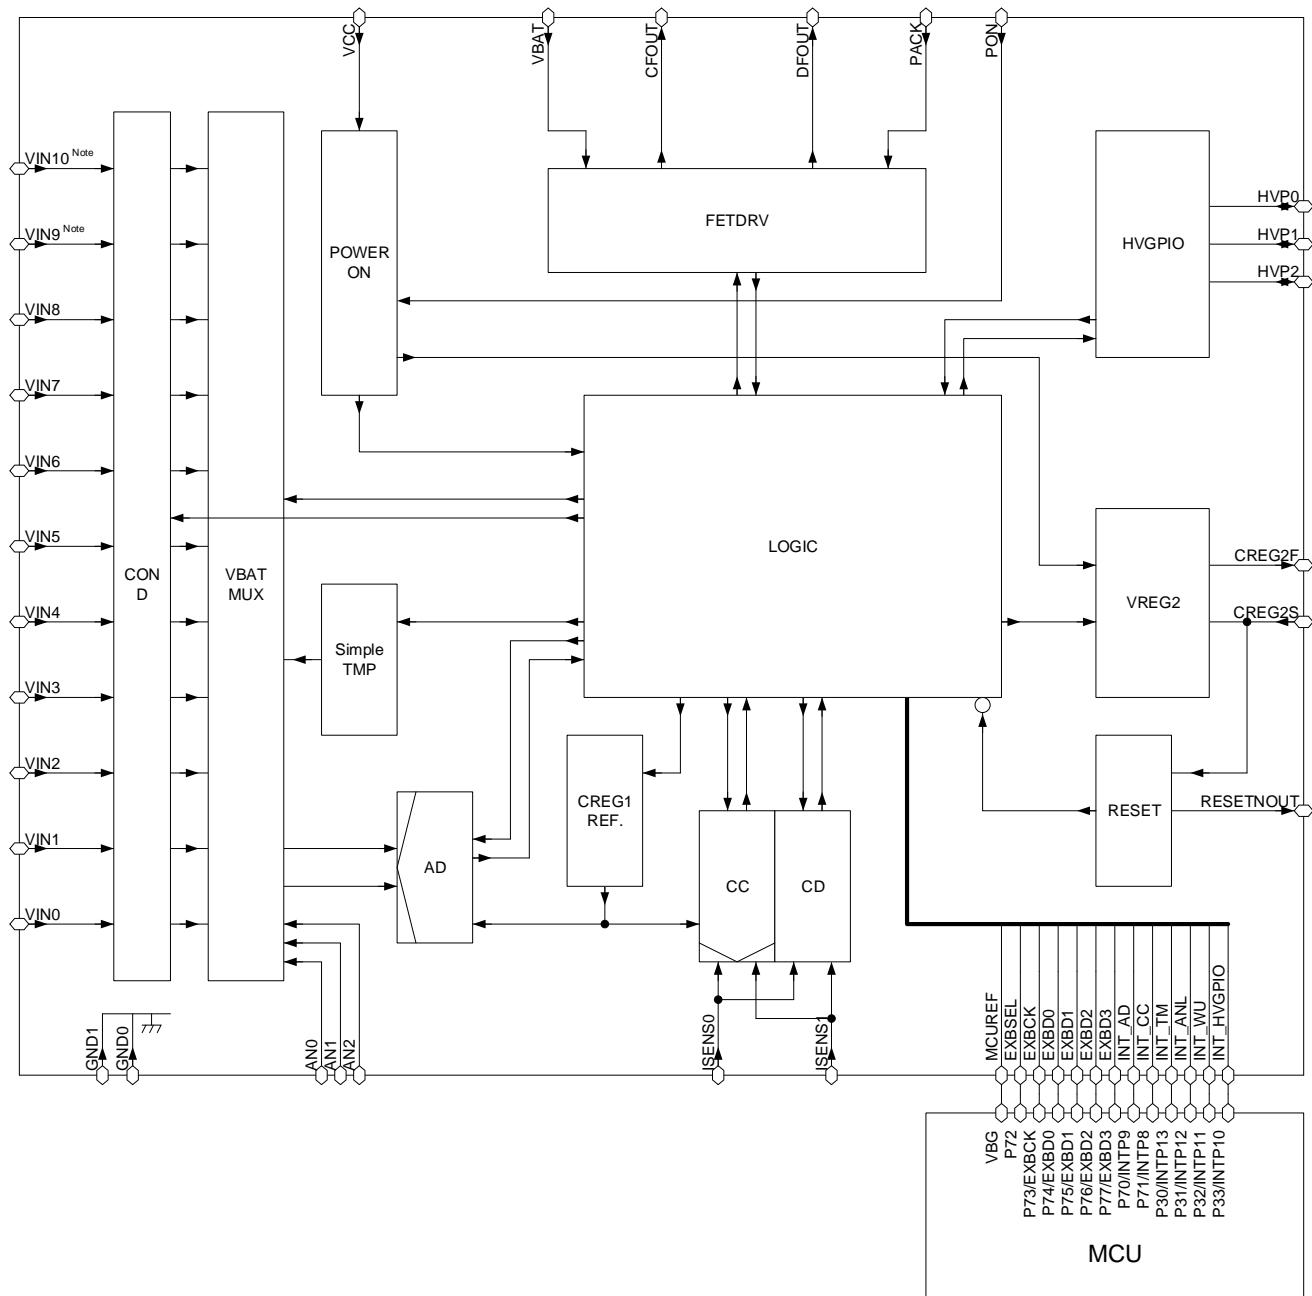

5.3 MCU block diagram

Caution 1. P30, P31, P32, P33, P70, P72, P73, P74, P75, P76 and P77 are connected to the internal AFE chip and not connected to the package external pins.

Caution 2. Each interrupt request of AFE are assigned to P30/INTP13, P31/INTP12, P32/INTP11, P33/INTP10, P70/INTP9 and P71/INTP8.

6. Application Guideline

6.1 Typical Application Specification

A typical specification example of Li-ion battery management unit as shown below.

From the next page, the typical application guideline is explained for RAJ240100 (10 series cells application).

Battery cell assembly : 8S1P (8 cells in series and 1 cell in parallel) for RAJ240090
: 10S1P (10 cells in series and 1 cell in parallel) for RAJ240100

Host interface : System Management Bus (SMBus) Specification, version 1.1.
: UART
: CAN

Primary protection : charge FET and discharge FET

Secondary protection : Fuse blow by FGIC (RAJ240090 and RAJ240100) or a secondary protection device.

Connector pins:

Pack+ Positive battery pack terminal

SCL SMBus clock

SDA SMBus data

CANH CAN high

CANL CAN low

UART UART communication port

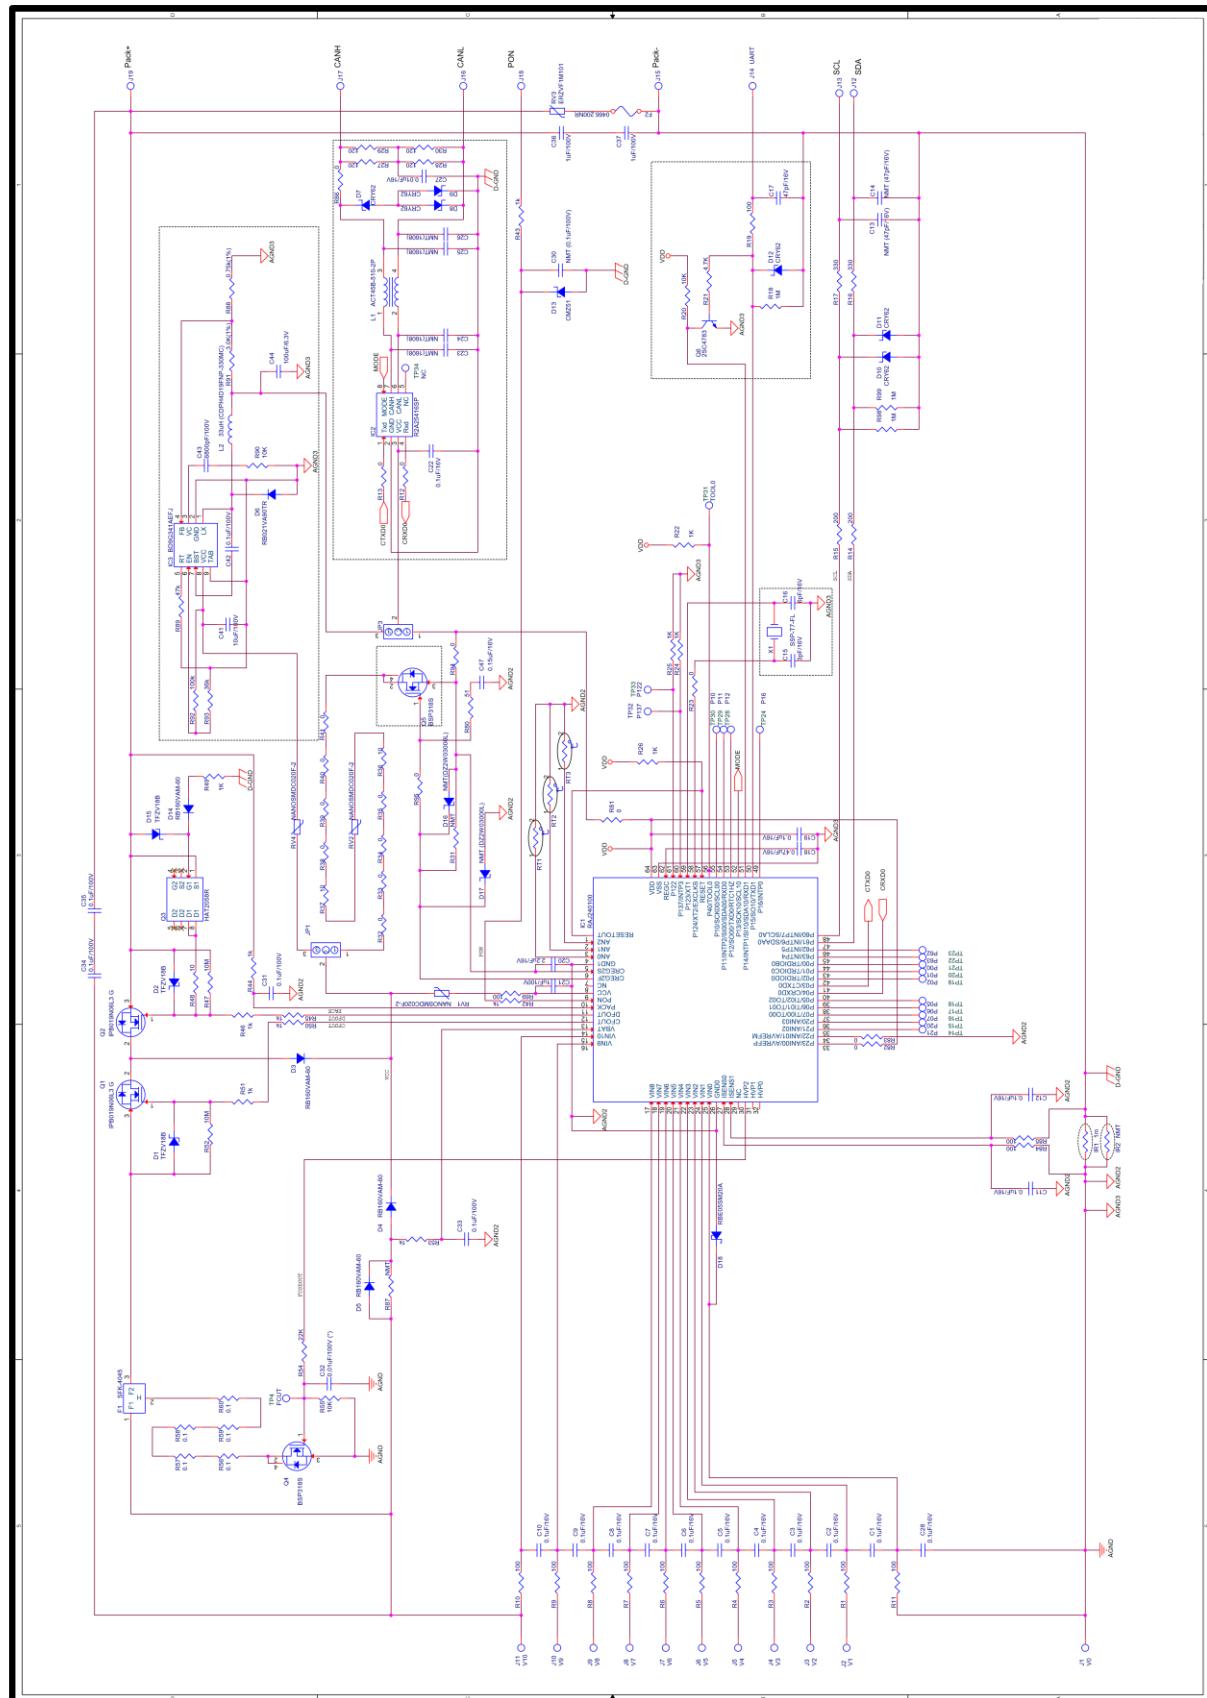

PON High voltage port for battery power on

Pack- Negative battery pack terminal

External reverse charge protection circuit

Battery and charge/discharge MOSFET temperature measurement with three thermistors

6.2 Typical Application Circuit

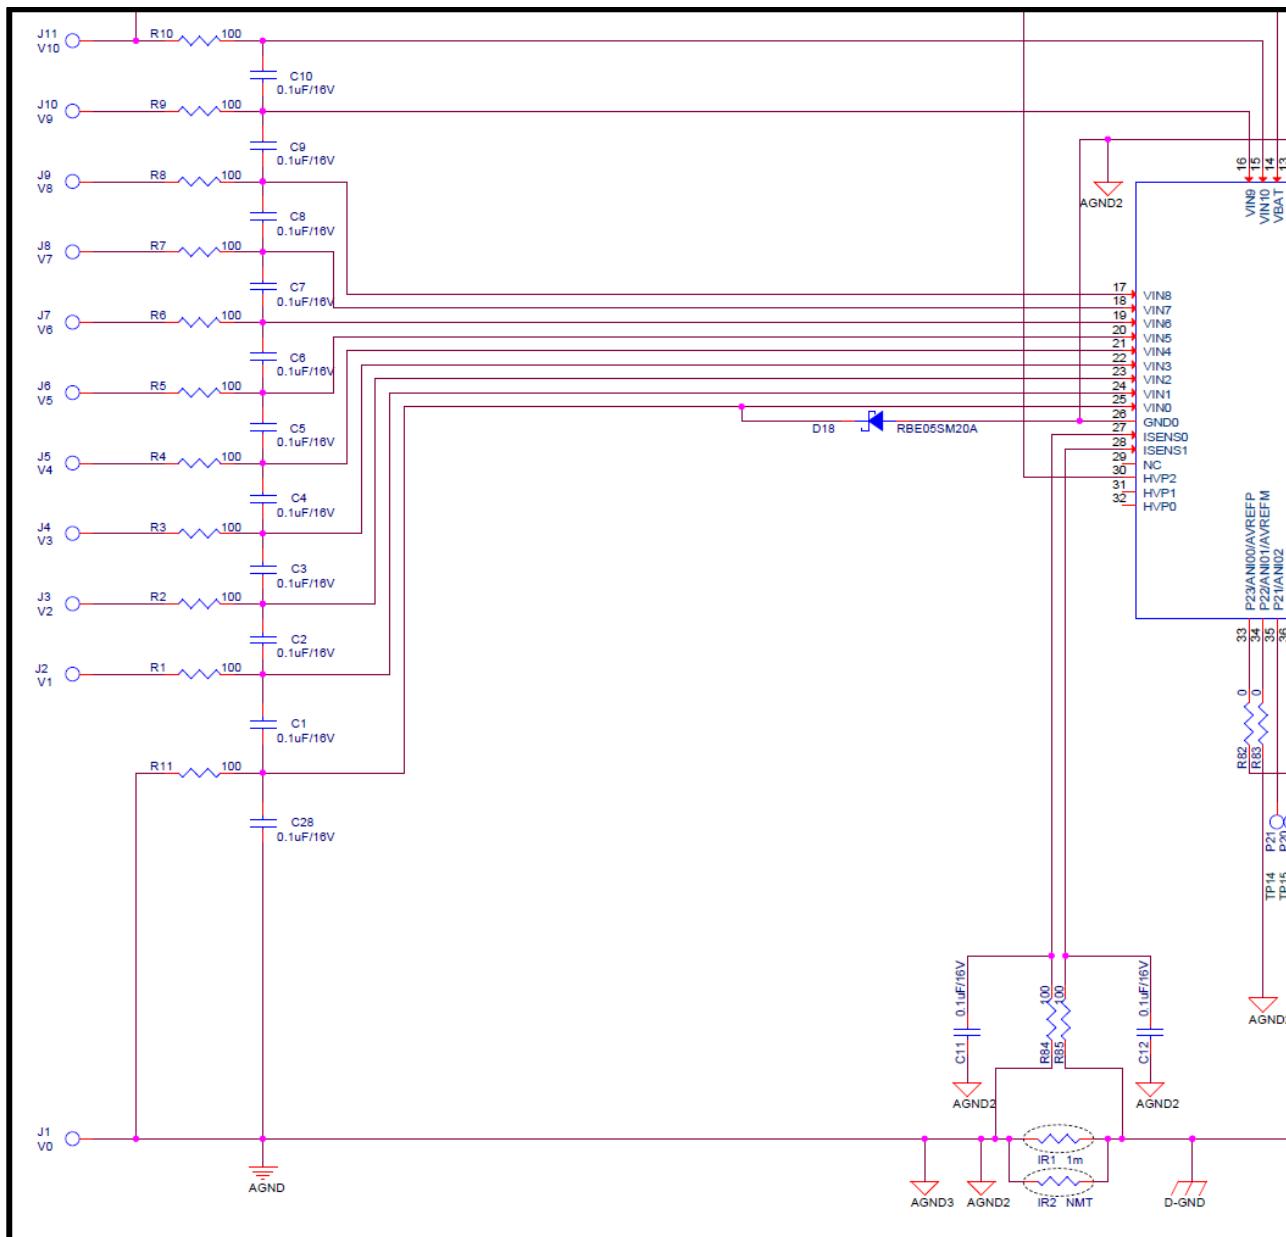

Typical Application Circuit Schematic

6.3 Circuit Design Guideline

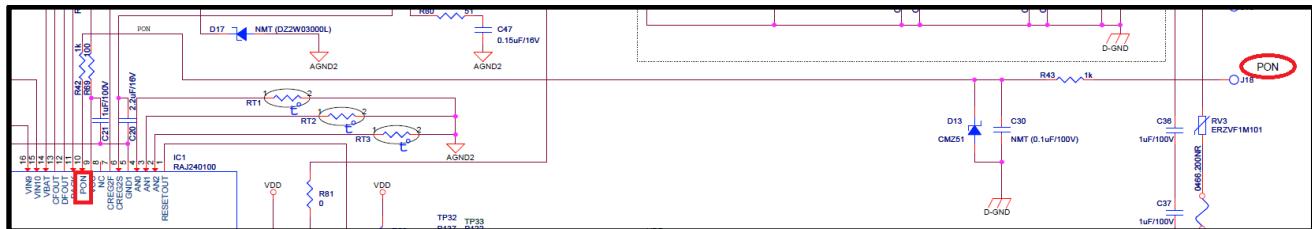

6.3.1 Cell voltage monitor circuit

- Place an input filter between FGIC's VIN port and each of the cells.
- Place resistors valued around 100Ω and capacitors valued around $0.1\mu F$ to $VIN_1 - VIN_{10}$ for surge protection. It is necessary to calculate the cut-off frequency and use correct resistance and capacitance value based on application.

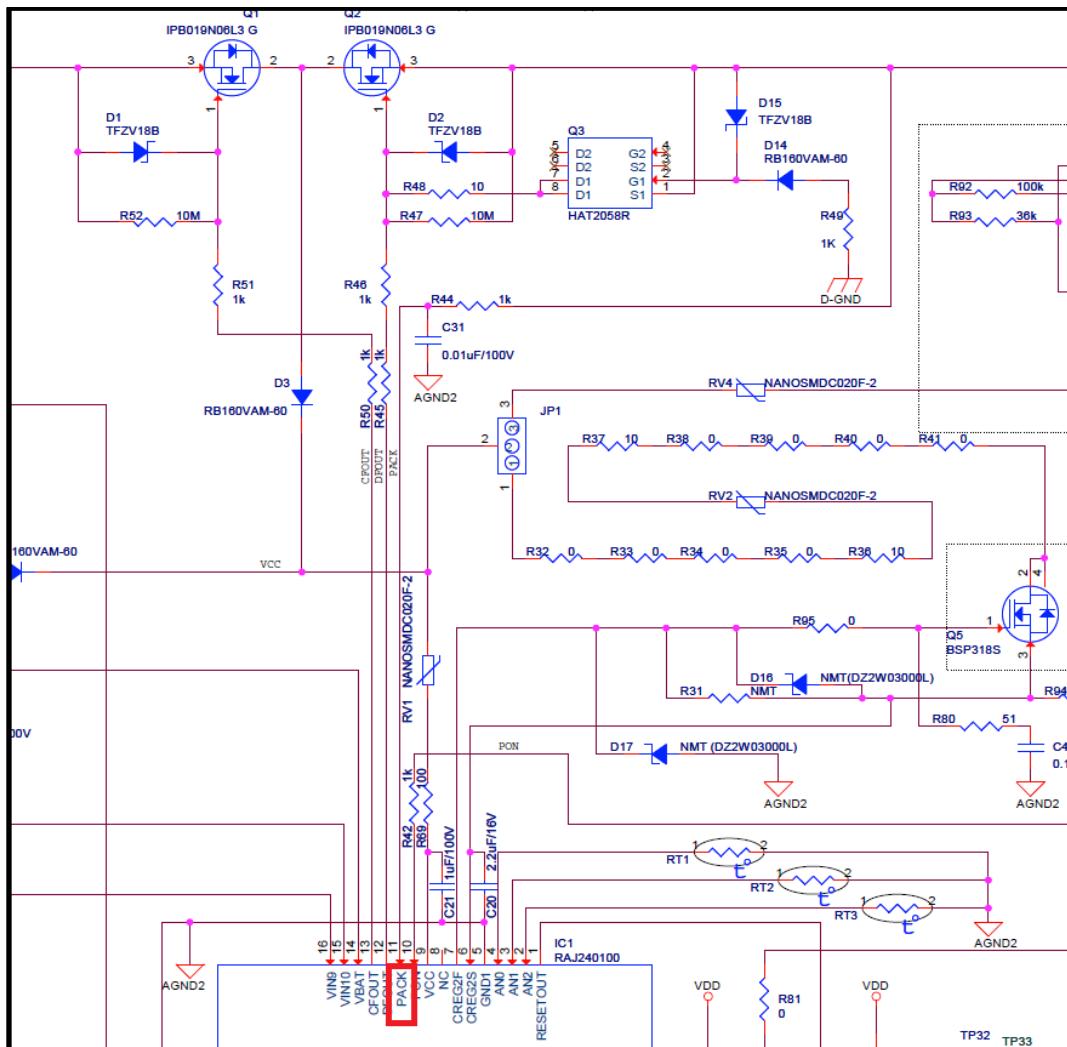

6.3.2 Battery power on circuit

- Place resistors value around $2\text{k}\Omega$ ($1\text{k}\Omega+1\text{k}\Omega$), capacitor $0.1\mu\text{F}$ and zener diode to PON for surge protection. It is necessary to calculate cut-off frequency and use correct resistance and capacitance value based on application.

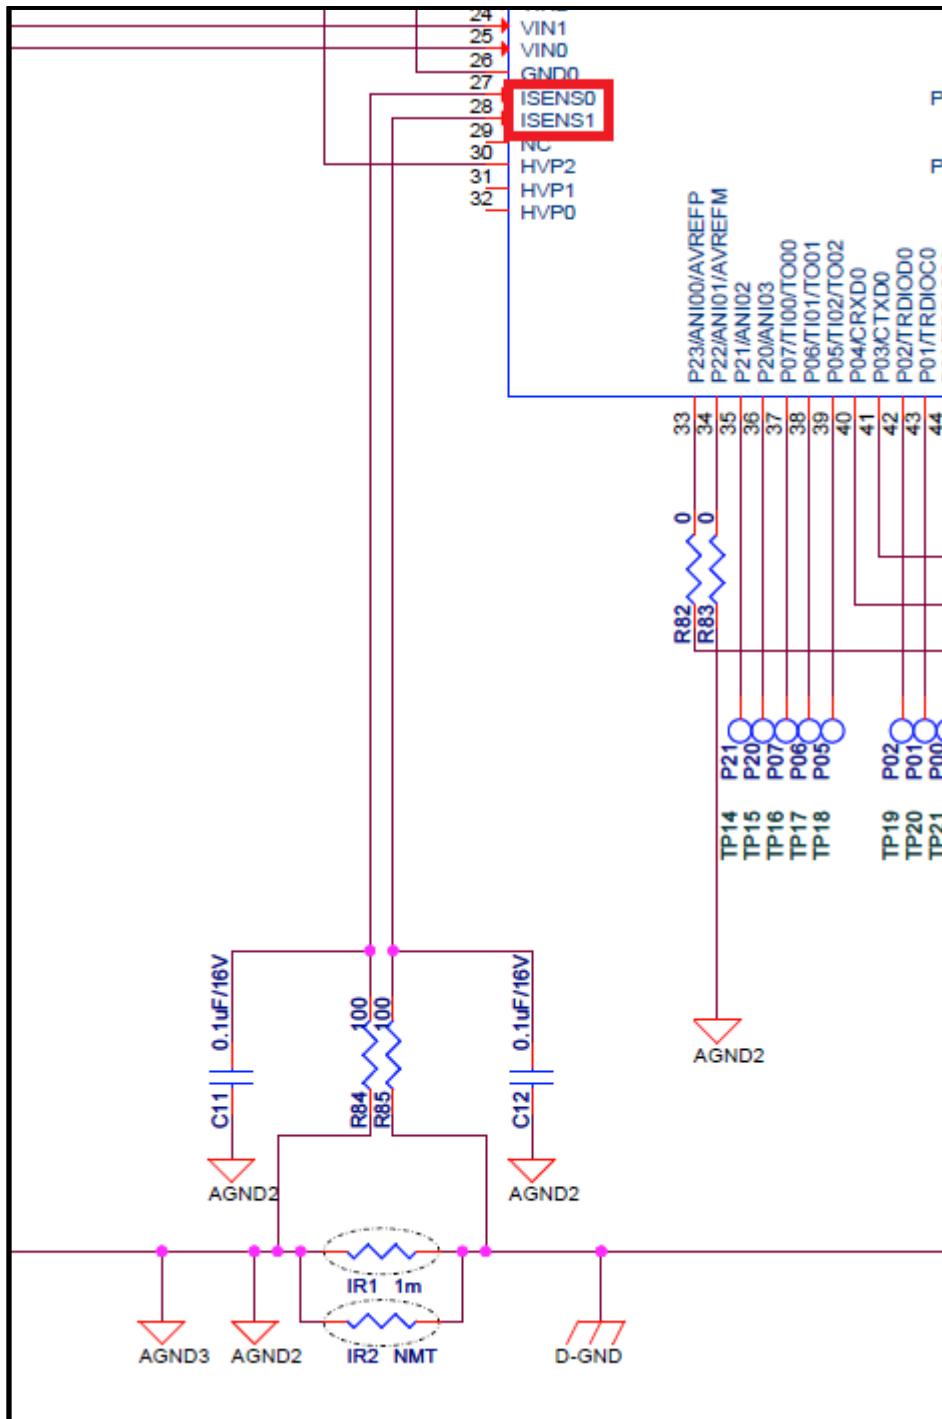

6.3.3 PACK port

- PACK port is source voltage of DFOUT (D-FET gate control signal). R44 plays a role in limiting the current limit when charger is reverse-charged. $1\text{k}\Omega$ is recommended, if it is too large, the D-FET turn off speed will becomes too slow.
- C31 helps provide stable D-FET boost operation. $0.01\mu\text{F}$ is recommended. If it is too large, the D-FET turn off speed will becomes too slow.

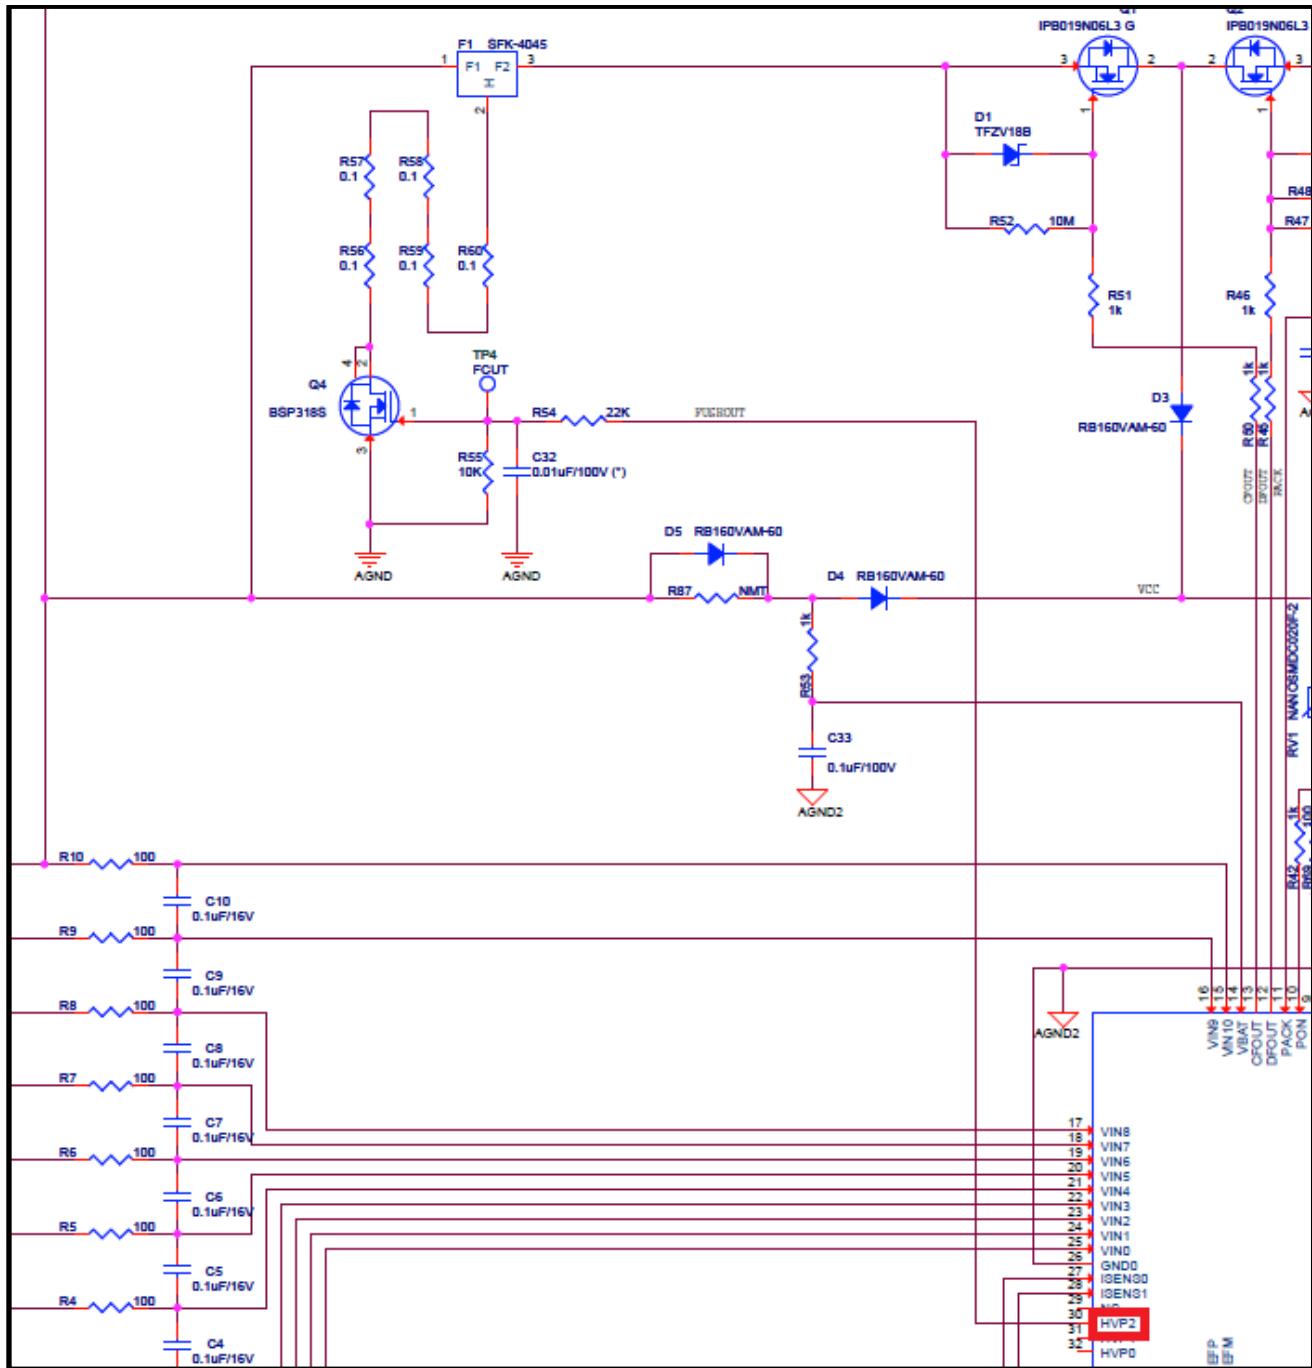

6.3.4 Current monitor

- Potential difference on the sense resistor is monitored by current integration circuit.
- Place a Low Pass Filter (100 Ω, 0.1μF) at input stage.
- Sense lines should be shielded if small voltage difference is detected to ensure high accurate current sensing.

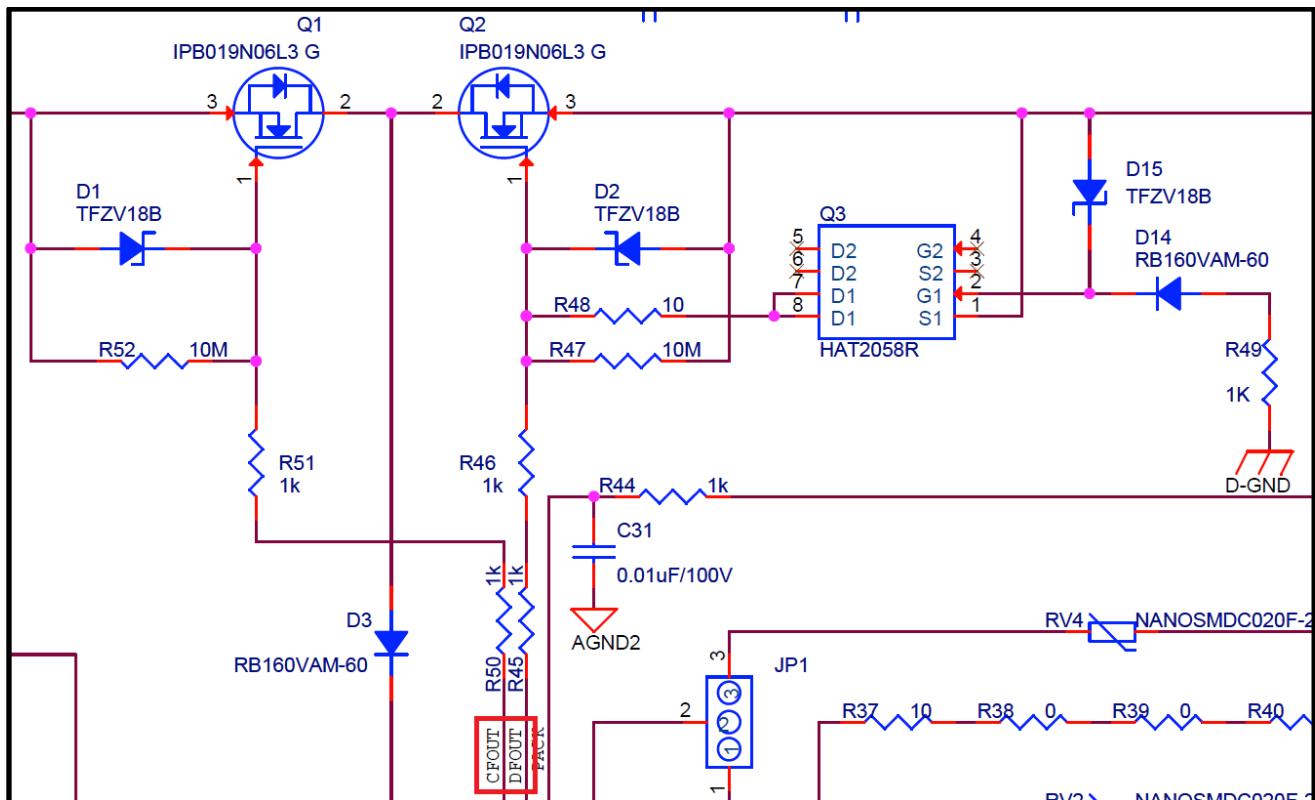

6.3.5 Fuse control

- Self-control protector (SCP) is used for fuse in reference circuit.
- The fuse will blow when RAJ240100 drives HVP2 (High voltage GPIO) pin high to make Q4 ON.
- The fuse will blow when overcurrent exceeds the limit of SCP.
- R56-R60 are used for battery electrochemical migration short circuit countermeasures.

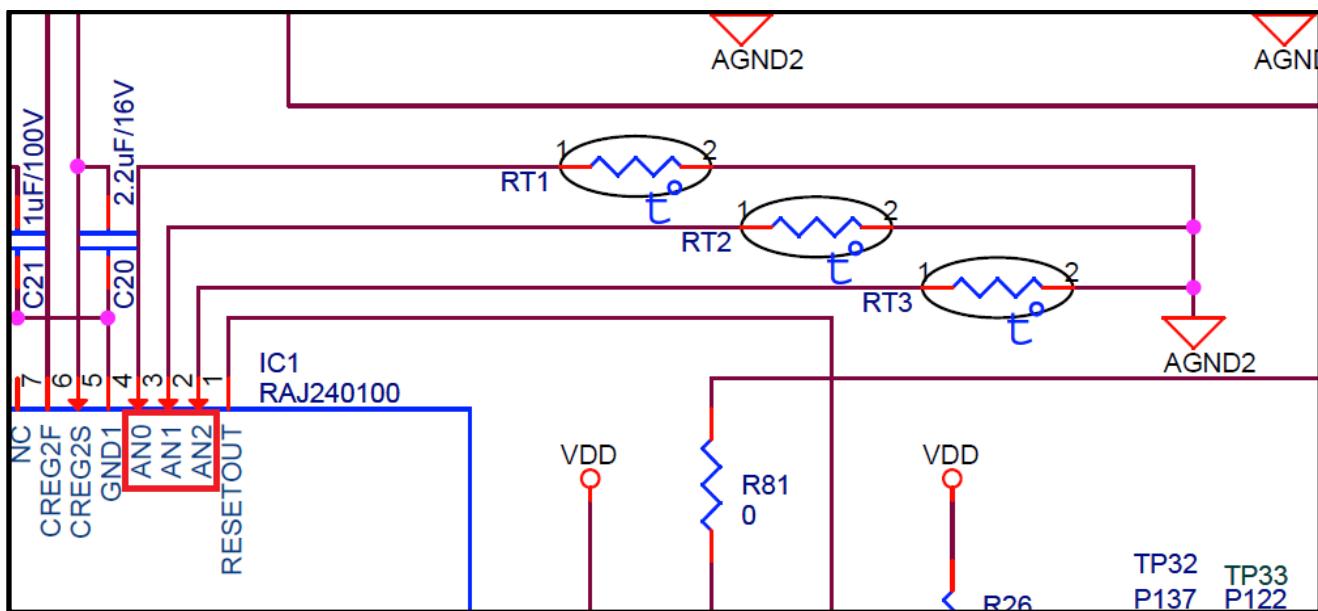

6.3.6 C-FET and D-FET control

- Q3 is located between gate and source of Q2 to make D-FET turn off when charger is reverse connected.
- R49 is for Q3 gate protection. (1kΩ is recommended.)
- R45, R46 and R50, R51 are use as gate protection and C-FET/D-FET noise reduction. (2kΩ is recommended.)
- R47 and R52 are used to fix C-FET/D-FET gate voltage in order to keep stable off state when FET is turn off. 10MΩ is recommended to prevent voltage drop.

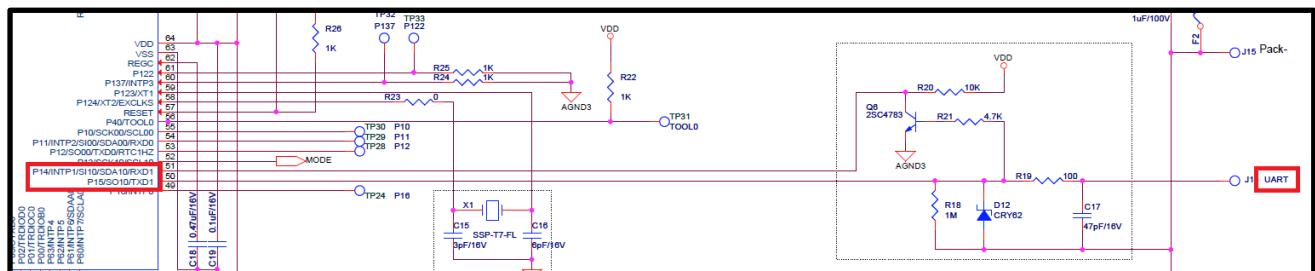

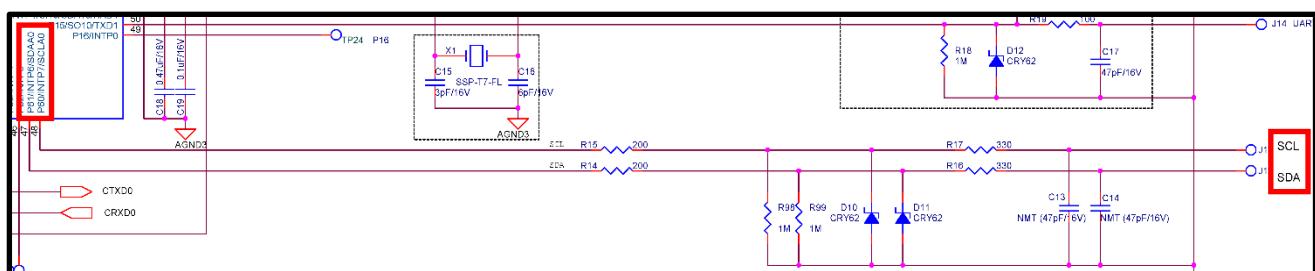

6.3.7 Thermistor

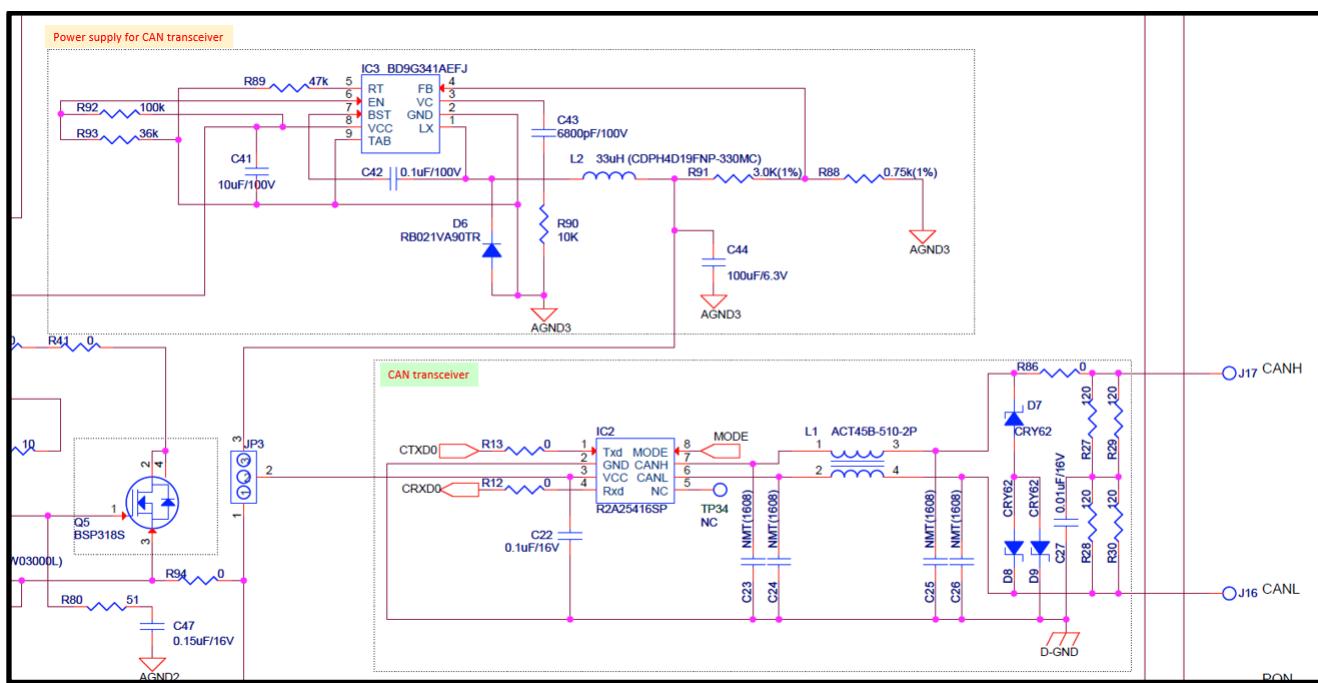

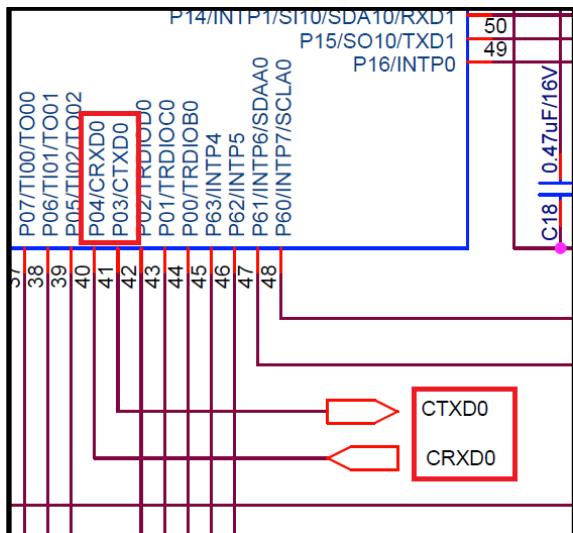

- ADC voltage measurement pins (AN0, AN1, AN2) are assigned for thermistor.

6.3.8 Communication line

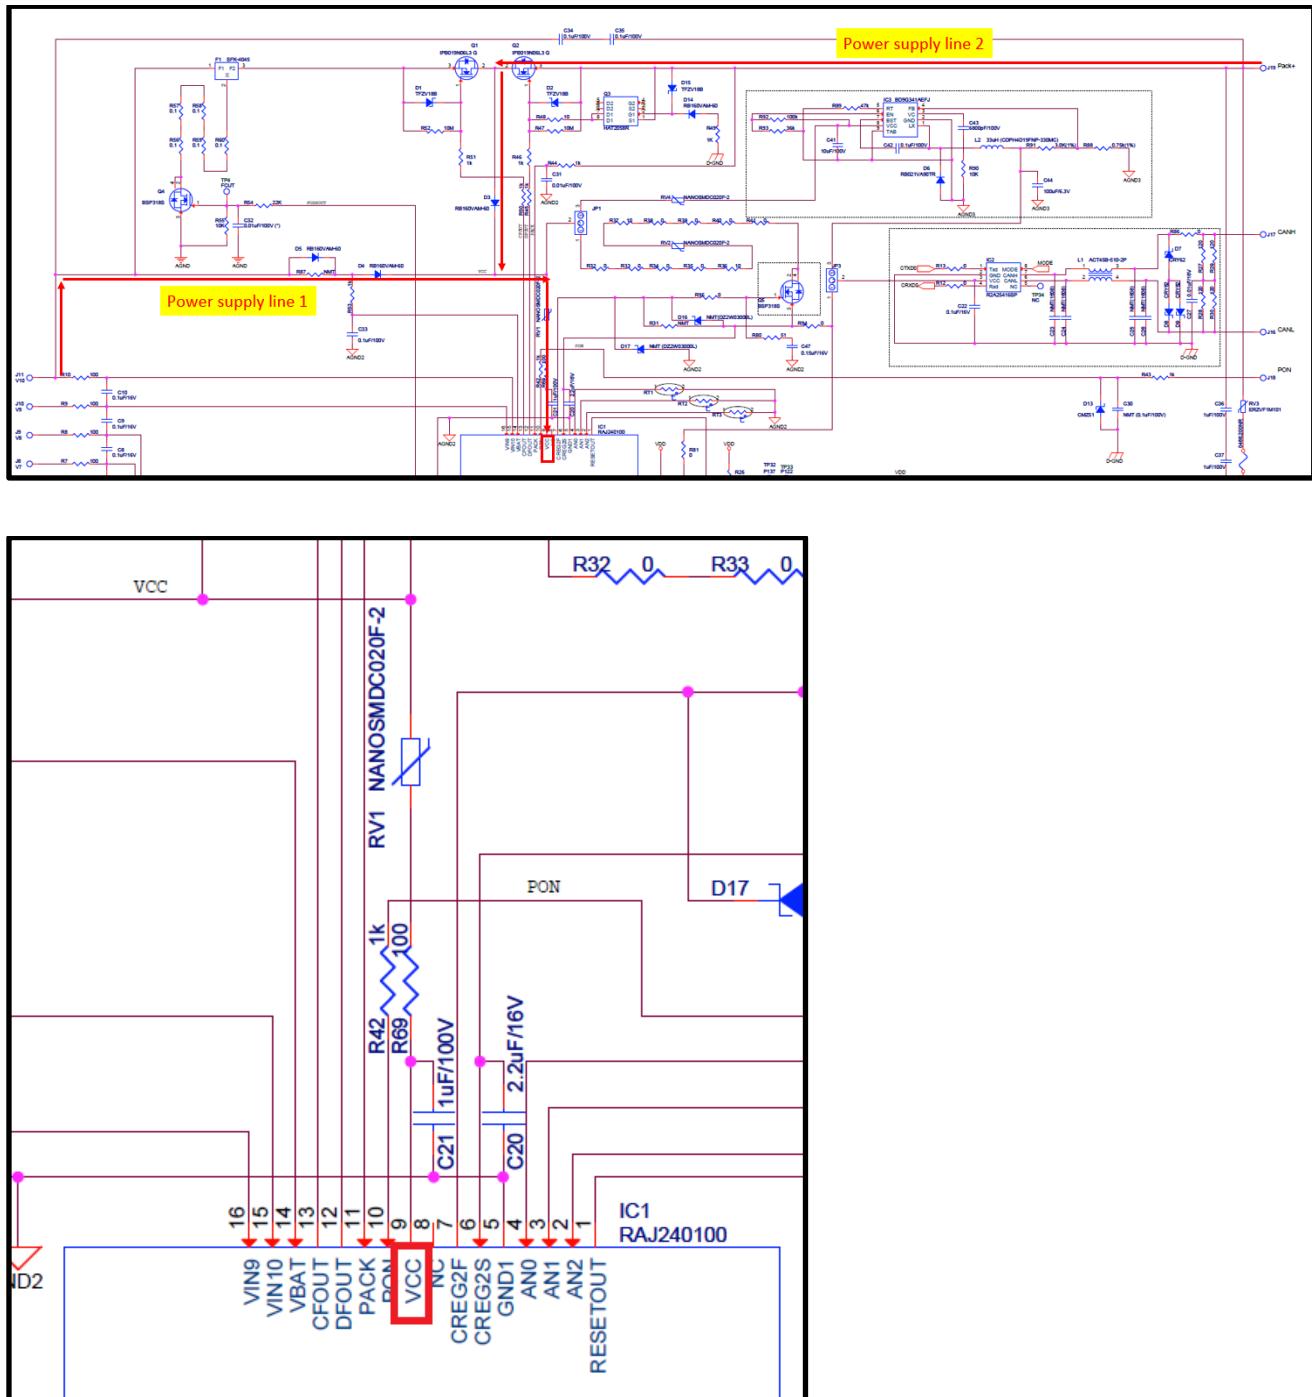

- RAJ240090 / RAJ240100 support 3 kinds of communication, SMBus, UART and CAN.
- For electrical over stress countermeasure, input 200 Ω , 330 Ω resistance, zener diode and capacitance are recommended in SMBus communication line.
- For UART communication, P14 and P15 pins have VDD output circuit, therefore RXD/TXD line pull up voltage should be the same as VDD.
- CAN communication is made possible by adding CAN transceiver externally. It is necessary to adapt external power supply for CAN transceiver.

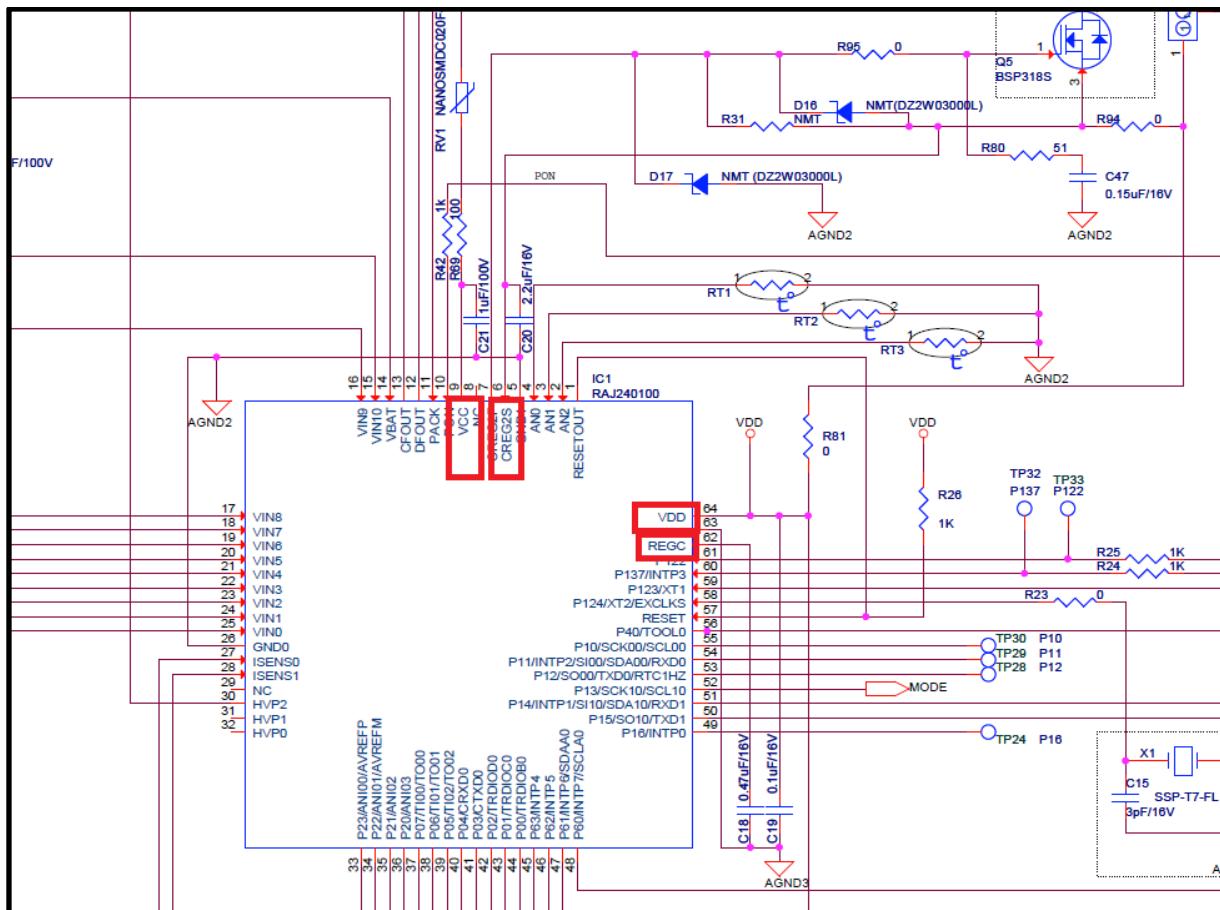

6.3.9 Power supply path

- Power is supplied to VCC through the following two paths depending on circumstance.
- Power supplied from battery side when fuse is blown. See power supply line 1.
- Higher output voltage from battery and charger is used as power supply. See power supply line 2.
- For protection of the VCC pin, it is recommended to add resistor and PTC for current limit.

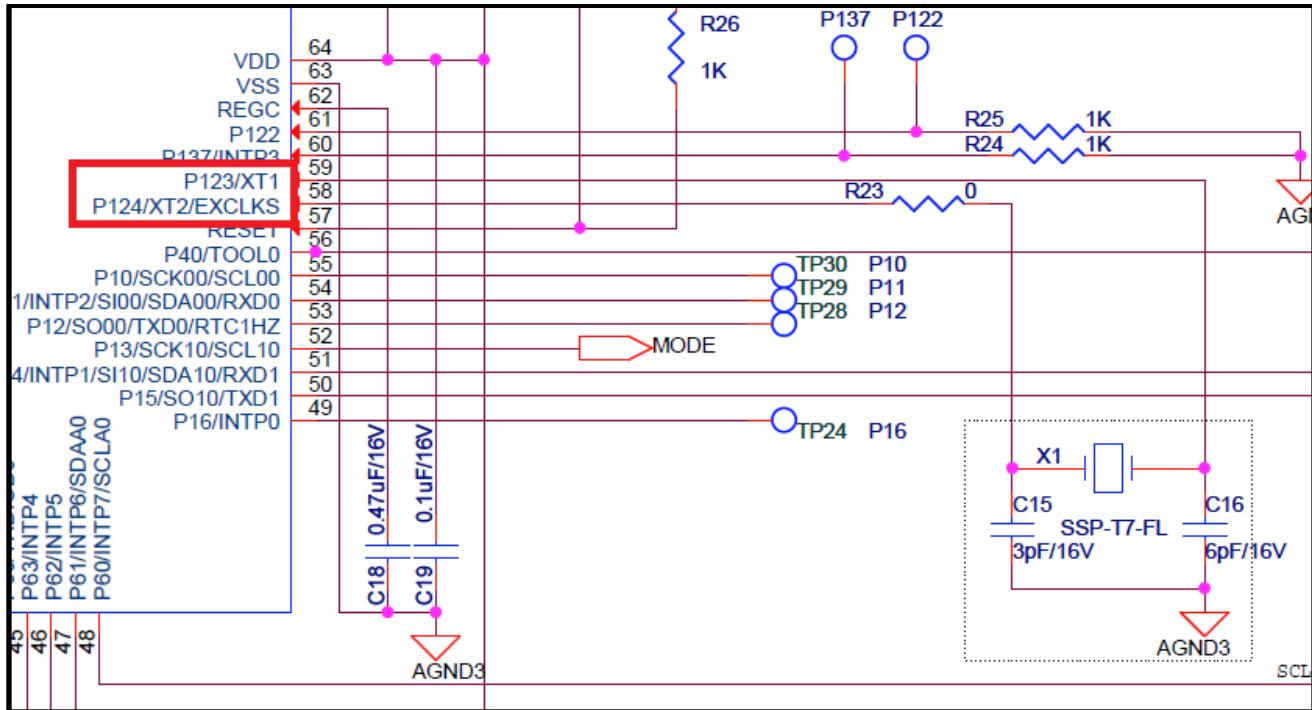

6.3.10 VCC, CREG2S, VDD and REGC capacitance

- The following decoupling capacitors must be located adjacent to each terminal.
- C21: VCC (1μF is recommended.)
- C20: CREG2 (2.2μF is recommended.)
- C19: VDD (0.1μF is recommended.)
- C18: REGC (0.47μF is recommended.)

6.3.11 Crystal oscillators port XT1 and XT2 for RTC

- RAJ240090 / RAJ240100 support RTC (Real time clock).
- XT1 and XT2 are used for an external crystal oscillator's port. It is recommended to set the XT1 and XT2 line length as short as possible.
- Shield pattern is necessary to XT1 line.

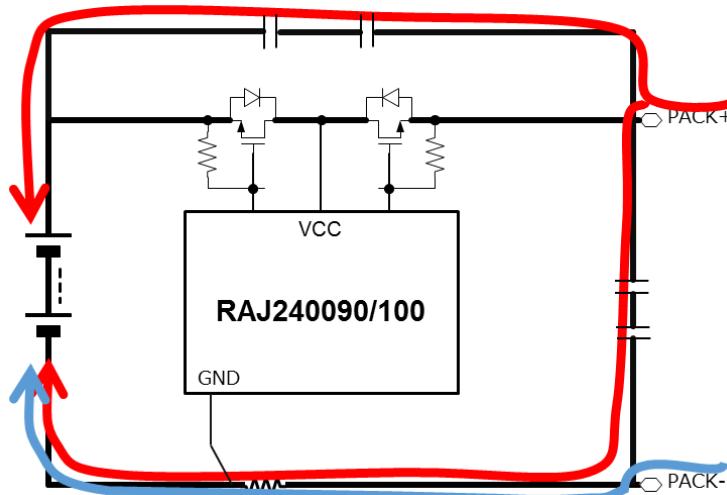

6.4 Layout Guidelines

6.4.1 Summary

- Large current patterns must be wide and short to minimize voltage drop and heat generation.
- Bypass capacitors must be mounted as close as possible to the device VCC / VBAT and GND pins to prevent erroneous operation due to noise from power supply.
- Capacitors for voltage regulators must be located close to regulator pins to ensure loop stability and ESD tolerance.
- All IC ground must be connected to the negative terminal of battery cells except ground for communication lines.
- Communication lines must be away from small signal current sense line to prevent the input signal from being disturbed by the incoming radiation noise.
- FGIC (RAJ240090 and RAJ240100) must be located away from any heat source (FET, current sense resistor and large current patterns) to minimize the influence of heat.

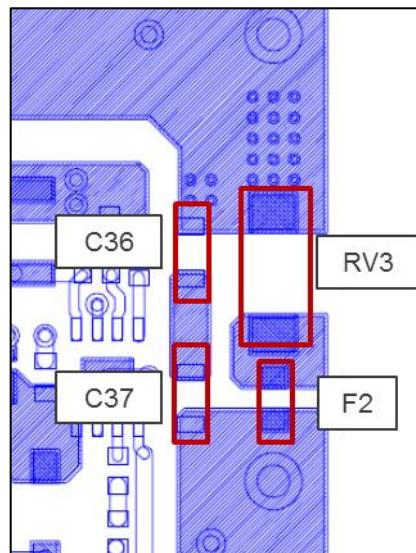

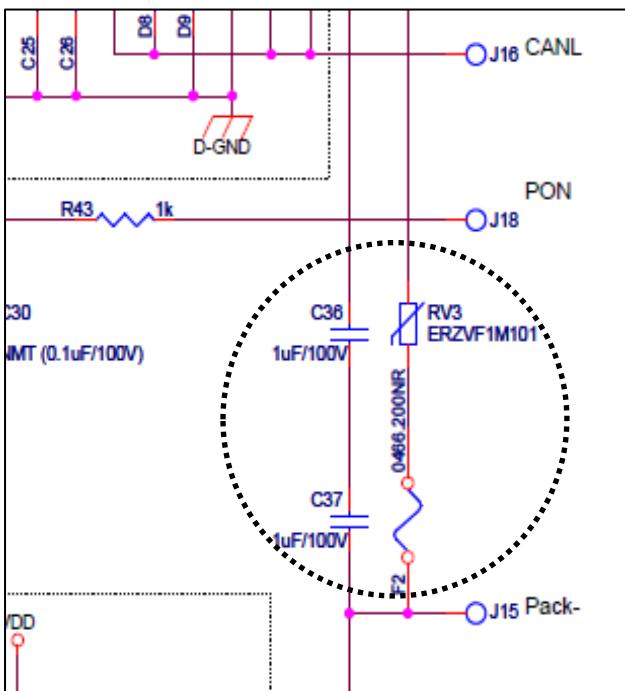

6.4.2 ESD protections on each terminal (basic policy)

- ESD on Pack+ terminal must be discharged to the top side of the cell or to Pack- terminal through a capacitor.
- ESD on Pack- terminal must be discharged to the GND side of the cell.
- ESD on communication terminals and other GPIOs must be discharged to the GND side of the cell via Pack- terminal.
- The noise from PACK+ or PACK- must be discharged to the battery cells so that it will not interfere with FGIC functions and measurements.

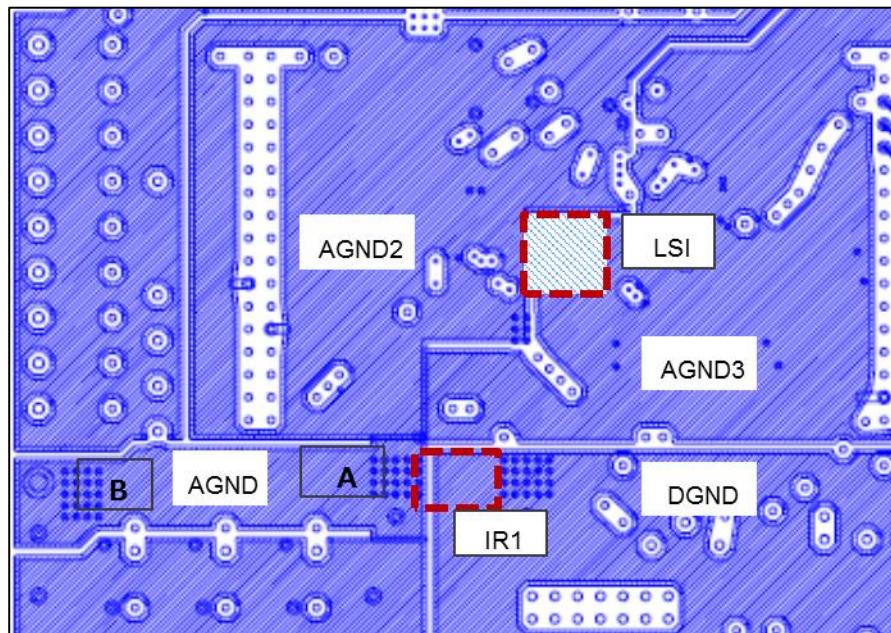

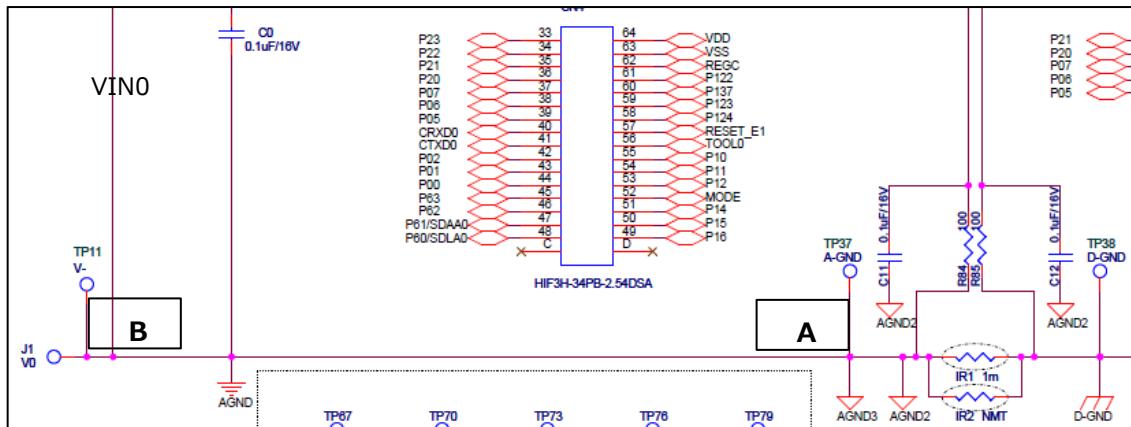

6.4.3 Pack+, Pack- (Noise protection element)

- A bypass capacitor must be placed between Pack+ and Pack-. (Countermeasure against ESD)
- A bypass capacitor must be located adjacent to Pack+, Pack-. (Minimize the ESD influence)
- Capacitors must be placed in series. (Countermeasure against short-circuit of capacitors)
- Don't use tantalum capacitor. (Tantalum capacitor can end up with short-circuited failure when damaged.)
- For the terminal protection against noise and overvoltage, It is recommended that it carries varistor or TVS diode .(RV3)
- It is recommended to add Fuse to prevent short circuit.(F2)
- C36, C37, RV3, F2 must be placed as short as possible between PACK + and PACK-. However, be careful not to narrow the distance between Pack + and Pack-.

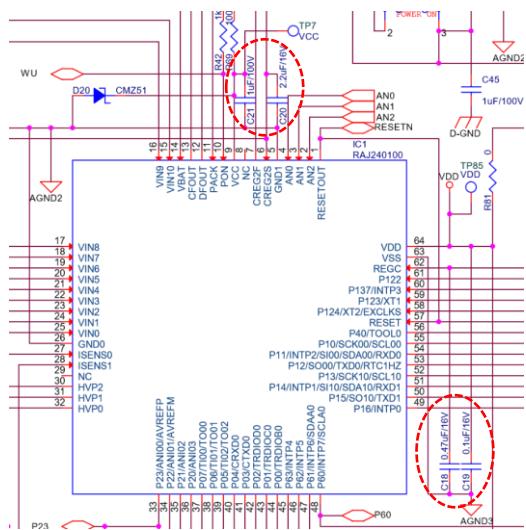

6.4.4 GND connection

- Each analog GND of FGIC should be connected to the point (A) of current detection resistor of the cell side by the pattern with an adequate width. (Prevent potential variation by large current.)
- VIN0 should be connected near point V0 (B).
- The patterns between AGND, AGND2 and AGND3 must not be divided. (Keeping the GND potential of MCU and AFE equal)

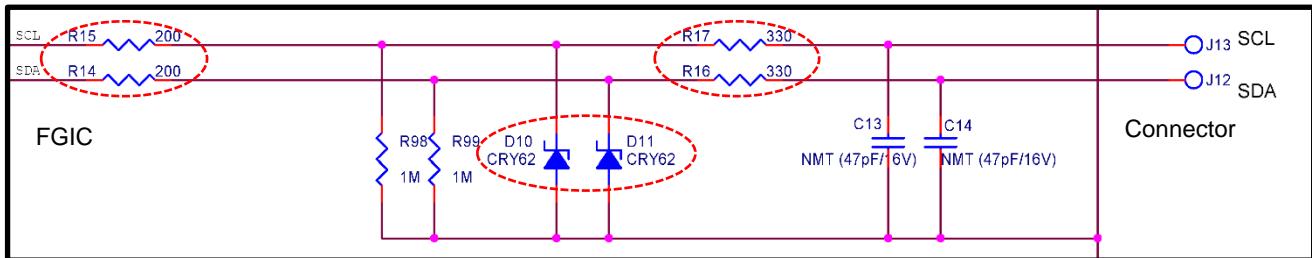

<R> 6.4.5 Bypass capacitor between VCC/VDD/CREG2S/REGC and GND1/VSS

- The patterns between VCC/CREG2S pin and GND1 pin, and VDD/REGC pin and VSS pin, a bypass capacitor is connected and the path must be as short as possible. (Countermeasure for ESD)
The FGIC and bypass capacitor must be placed on the same side of the PCB without through-holes and the maximum loop length must be about 20mm.
- The lines to bypass capacitor must be wide and short. (To keep bypass capacitor effective in suppressing the potential variation.)

6.4.7 Communication line (SMBus)

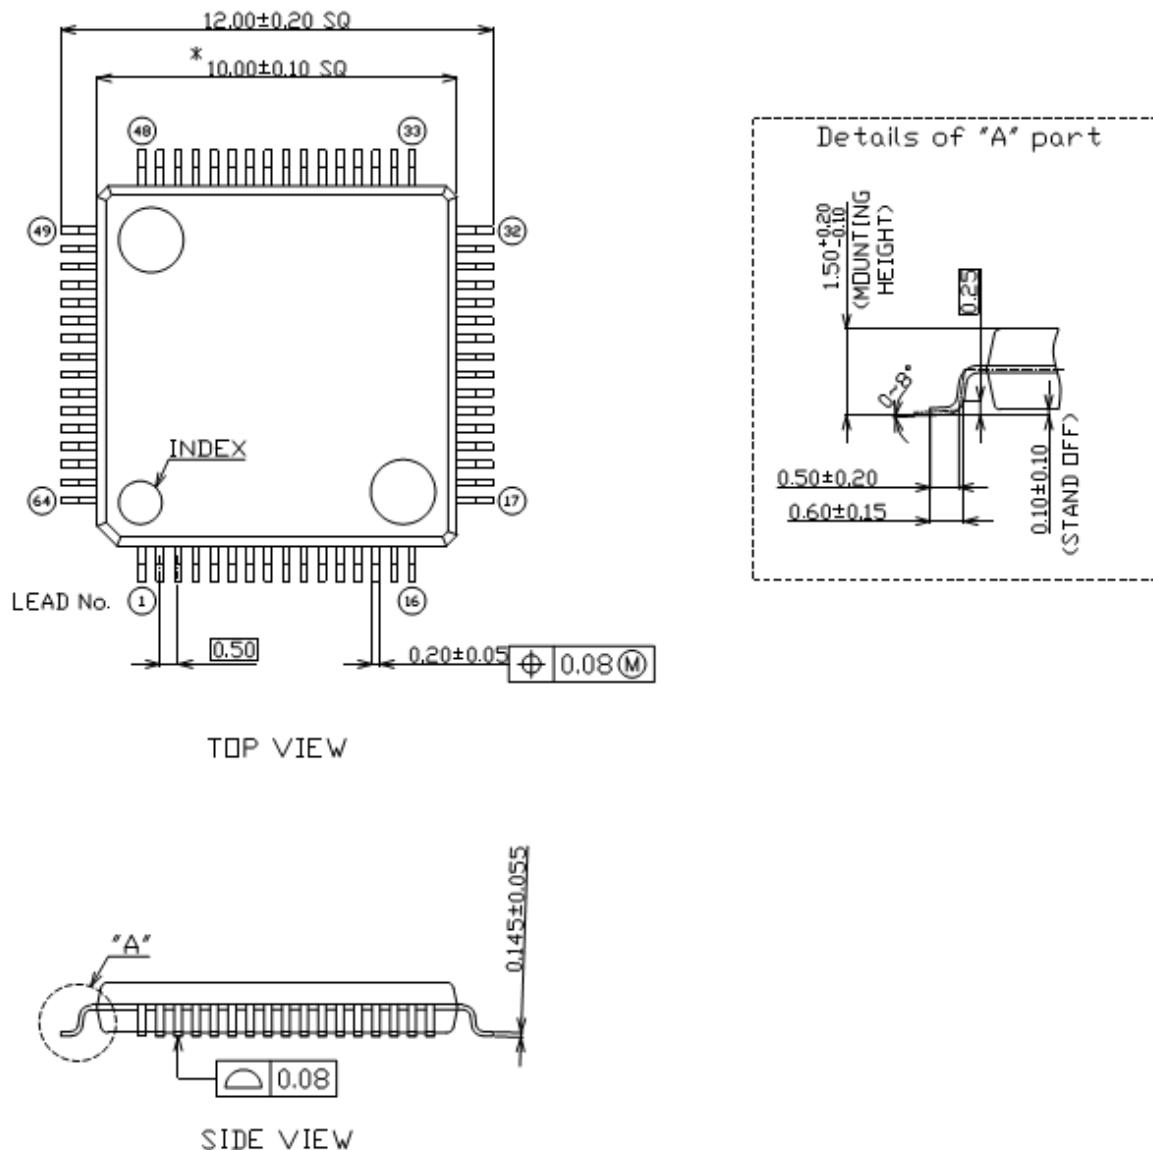

- SMBus lines must be equipped with zener diodes. And it is necessary to mount resistors on the side of FGIC and pack connector. (Zener diode and the resistor on the side of connector are for surge countermeasures, the resistor on the side of FGIC for noise countermeasure.)
- The resistor on the side of the FGIC must be located as close to the FGIC as possible

6.4.8 Unused Pins

- Unused pins are recommended to be connected to GND via resistors as ESD countermeasure. (Setting low output by software prevents the terminal from becoming indefinite).

General cautions for Handling Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins

Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.

- The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on Processing during Power-on

The state of the product is undefined at the moment when power is supplied.

- The states of internal circuits in the LSI are indeterminate undetermined and the states of register settings and pins are undefined at the moment when power is supplied.
In a finished product where the reset signal is applied to the external reset pin, the states state of pins are not guaranteed from the moment when power is supplied until the reset process is completed.

In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

- The reserved addresses are provided for possible future expansion of functions only. Do not access these addresses; the correct operation of LSI will not guaranteed if they are accessed.

4. Clock Signals

After applying a reset, the reset line will only be released after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products

Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.

- The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, system-evaluation test needs to be implemented for the given product.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc. Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
