

MC14049B, MC14050B

Hex Buffer

The MC14049B Hex Inverter/Buffer and MC14050B Noninverting Hex Buffer are constructed with MOS P-Channel and N-Channel enhancement mode devices in a single monolithic structure. These complementary MOS devices find primary use where low power dissipation and/or high noise immunity is desired. These devices provide logic level conversion using only one supply voltage, V_{DD} .

The input-signal high level (V_{IH}) can exceed the V_{DD} supply voltage for logic level conversions. Two TTL/DTL loads can be driven when the devices are used as a CMOS-to-TTL/DTL converter ($V_{DD} = 5.0\text{ V}$, $V_{OL} \leq 0.4\text{ V}$, $I_{OL} \geq 3.2\text{ mA}$).

Note that pins 13 and 16 are not connected internally on these devices; consequently connections to these terminals will not affect circuit operation.

- High Source and Sink Currents
- High-to-Low Level Converter
- Supply Voltage Range = 3.0 V to 18 V
- V_{IN} can exceed V_{DD}
- Meets JEDEC B Specifications
- Improved ESD Protection On All Inputs

MAXIMUM RATINGS (Voltages Referenced to V_{SS}) (Note 2.)

Symbol	Parameter	Value	Unit
V_{DD}	DC Supply Voltage Range	-0.5 to +18.0	V
V_{in}	Input Voltage Range (DC or Transient)	-0.5 to +18.0	V
V_{out}	Output Voltage Range (DC or Transient)	-0.5 to $V_{DD} + 0.5$	V
I_{in}	Input Current (DC or Transient) per Pin	± 10	mA
I_{out}	Output Current (DC or Transient) per Pin	± 45	mA
P_D	Power Dissipation, per Package (Note 3.) (Plastic) (SOIC)	825 740	mW
T_A	Ambient Temperature Range	-55 to +125	°C
T_{stg}	Storage Temperature Range	-65 to +150	°C
T_L	Lead Temperature (8-Second Soldering)	260	°C

2. Maximum Ratings are those values beyond which damage to the device may occur.

3. Temperature Derating: See Figure 3.

This device contains protection circuitry to protect the inputs against damage due to high static voltages or electric fields referenced to the V_{SS} pin only. Extra precautions must be taken to avoid applications of any voltage higher than the maximum rated voltages to this high-impedance circuit. For proper operation, the ranges $V_{SS} \leq V_{in} \leq 18\text{ V}$ and $V_{SS} \leq V_{out} \leq V_{DD}$ are recommended.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}). Unused outputs must be left open.

Device MC14049B
Hex Buffer

The SMC series is designed to protect voltage sensitive components from high vol They have excellent clamping capability, high surge capability, low zener impedan SMC series is supplied in ON Semiconductor's exclusive, cost-effective, highly reli ideally suited for use in communication systems, numerical controls, process contr business machines, power supplies and many other industrial/consumer applicatio

Features:

- Standard Zener Breakdown Voltage Range - 6.8 to 91 V
- Stand-off Voltage Range - 5 to 78 V
- Peak Power - 1500 Watts @ 1 ms
- Maximum Clamp Voltage @ Peak Pulse Current
- Low Leakage < 5 μ A Above 10 V
- UL Recognition
- Maximum Temperature Coefficient Specified
- Available in Tape and Reel
- Response Time Typically < 1 ns
- **CASE:** Void-free, transfer-molded, thermosetting plastic
- **FINISH:** All external surfaces are corrosion resistant and leads are readily solderable
- **POLARITY:** Cathode indicated by molded polarity notch. When operated in zener mode, will be positive with respect to anode

- **MOUNTING POSITION:** Any
- **LEADS:** Modified L–Bend providing more contact area to bond pads
- **MAXIMUM CASE TEMPERATURE FOR SOLDERING PURPOSES:** 260°C for 10 Seconds
- **WAFER FAB LOCATION:** Phoenix, Arizona
- **ASSEMBLY/TEST LOCATION:** Seremban, Malaysia

Device MC14050B
Hex Non-Inverter Buffer

The MC14049B Hex Inverter/Buffer and MC14050B Noninverting Hex Buffer are CMOS devices in a single monolithic structure. CMOS devices find primary use where low power dissipation and/or high noise immunity are required. These devices provide logic level conversion using only one supply voltage, V_{DD} .

The input-signal high level (V_{IH}) can exceed the V_{DD} supply voltage for logic level conversion. The output loads can be driven when the devices are used as a CMOS-to-TTL/DTL converter ($V_{OL} \geq 3.2 \text{ mA}$).

Note that pins 13 and 16 are not connected internally on these devices; consequently, these terminals will not affect circuit operation.

Features:

- High Source and Sink Currents
- High-to-Low Level Converter
- Supply Voltage Range = 3.0 V to 18 V
- V_{IN} can exceed V_{DD}
- Meets JEDEC B Specifications

- Improved ESD Protection On All Inputs
