

Multi-output driver for automotive applications

Datasheet - production data

- Device contains temperature warning and protection
- Open-load detection for all outputs
- Over-current protection for all outputs
- PWM control of all outputs
- Charge pump output for reverse polarity protection
- ST standard serial peripheral interface (ST-SPI 3.0)

Features

- AEC-Q100 qualified
- Two half bridges for 6 A load ($R_{DSon} = 150 \text{ m}\Omega$)
- Two half bridges for 3 A load ($R_{DSon} = 300 \text{ m}\Omega$)
- Two half bridges for 0.75 A load ($R_{DSon} = 1600 \text{ m}\Omega$)
- One high-side driver for 6 A load ($R_{DSon} = 90 \text{ m}\Omega$)
- Two configurable high-side drivers for up to 1.5A load ($R_{DSon} = 500 \text{ m}\Omega$) or 0.4 A load ($R_{DSon} = 1800 \text{ m}\Omega$)
- Two high-side drivers for 0.5 A load ($R_{DSon} = 1600 \text{ m}\Omega$)
- Programmable soft start function to drive loads with higher inrush currents as current limitation value
- Very low current consumption in standby mode ($I_S < 6 \text{ }\mu\text{A typ}$; $T_j \leq 85 \text{ }^\circ\text{C}$; $I_{CC} < 5 \text{ }\mu\text{A typ}$; $T_j \leq 85 \text{ }^\circ\text{C}$)
- Current monitor output for all high-side drivers

Applications

L99MOD devices are recommended for those applications that need multiple motors control with additional loads in high-side configuration, such as bulbs/LEDs or requiring protected supply, like sensors or cameras.

Description

The L99MOD50XP is a microcontroller-driven multifunctional actuator driver for automotive applications.

Up to five DC motors and five grounded resistive loads can be driven with six half bridges and five high-side drivers.

The integrated SPI controls all operating modes (forward, reverse, brake and high impedance).

Also all diagnostic information is available via SPI read.

Table 1. Device summary

1 Block diagram and pin description

Figure 1. Block diagram

Figure 2. Configuration diagram (top view)

Note: All pins with the same name must be externally connected.

Table 2. Pin definition and functions

Pin	Symbol	Function
1, 18, 19, 36	GND	Ground: reference potential. <i>Important:</i> For the capability of driving the full current at the outputs all pins of GND must be externally connected!
2, 35	OUT11	High-side driver output 11. The output is built by a high-side switch and is intended for resistive loads, therefore the internal reverse diode from GND to the output is missing. For ESD reason a diode to GND is present, but the energy which can be dissipated is limited. The high-side driver is a power DMOS transistor with an internal parasitic reverse diode from the output to VS (bulk-drain-diode). The output is over-current protected. <i>Important:</i> for the capability of driving the full current at the outputs both pins of OUT11 must be externally connected!
3 4 5	OUT1, OUT2, OUT3	Halfbridge outputs 1,2,3. The output is built by a high-side and a low-side switch, which are internally connected. The output stage of both switches is a power DMOS transistor. Each driver has an internal parasitic reverse diode (bulk-drain-diode: high-side driver from output to VS, low-side driver from GND to output). This output is over-current protected.
6, 7, 14, 15, 23, 24, 25, 28, 29, 32	V _S	Power supply voltage (external reverse protection required). For this input a ceramic capacitor as close as possible to GND is recommended. <i>Important:</i> For the capability of driving the full current at the outputs all pins of VS must be externally connected! Pins 25 and 32 can be connected to VS to maintain compatibility with other L99MOD products; otherwise they should be left Not Connected
8	DI	Serial data input. The input requires CMOS logic levels and receives serial data from the microcontroller. The data is a 24 bit control word and the most significant bit (MSB, bit 23) is transferred first.
9	CM/ PWM2	Current monitor output/PWM2 input. Depending on the selected multiplexer bits of the control register this output sources an image of the instant current through the corresponding high-side driver with a ratio of 1/10.000 or 1/2000. This pin is bidirectional. The microcontroller can overdrive the current monitor signal to provide a second PWM input for the outputs OUT5, OUT8 and OUT10.
10	CSN	Chip Select Not input This input is low active and requires CMOS logic levels. The serial data transfer between L99MOD50XP and the microcontroller is enabled by pulling the input CSN to low level.
11	DO	Serial data output. The diagnosis data is available via the SPI and this tristate-output. The output will remain in tristate, if the chip is not selected by the input CSN (CSN = high)
12	VCC	Supply voltage. For this input a ceramic capacitor as close as possible to GND is recommended.
13	CLK	Serial clock input. This input controls the internal shift register of the SPI and requires CMOS logic levels.
16,17 20,21 22	OUT4, OUT5, OUT6	Half-bridge outputs 4,5,6: see OUT1 (pin 3). <i>Important:</i> For the capability of driving the full current at the outputs both pins of OUT4 (OUT5, respectively) must be externally connected!

Table 2. Pin definition and functions (continued)

Pin	Symbol	Function
26	CP	Charge pump output. This output is provided to drive the gate of an external n-channel power MOS used for reverse polarity protection (see Figure 1.).
27	PWM1	PWM1 input. This input signal can be used to control the drivers OUT1-4, OUT6-7, OUT9 and OUT11 by an external PWM signal.
30 31	OUT7, OUT8,	High-side driver outputs 7,8: see OUT9. By selection of one of the 2 power DMOS at same output is it possible to supply a bulb with low on-resistance or a LED with higher on-resistance in a different application.
33	OUT9	High-side driver output 9. The output is built by a high-side switch and is intended for resistive loads, hence the internal reverse diode from GND to the output is missing. For ESD reason a diode to GND is present but the energy which can be dissipated is limited. The high-side driver is a power DMOS transistor with an internal parasitic reverse diode from the output to VS (bulk-drain-diode). The output is over-current and open load protected.
34	OUT10	High-side driver output 10: see OUT9. <i>Important:</i> beside the bit10 in control register 1 this output can be switched on setting bit1 for electrochromic control mode with higher priority.

2 Electrical specifications

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the “Absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality document.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V _S	DC supply voltage	-0.3...28	V
	Single pulse t _{max} < 400 ms	40	V
V _{CC}	Stabilized supply voltage, logic supply	-0.3 to 5.5	V
V _{DI} , V _{DO} , V _{CLK} , V _{CSN} , V _{PWM}	Digital input / output voltage	-0.3 to V _{CC} + 0.3	V
V _{CM}	Current monitor output	-0.3 to V _{CC} + 0.3	V
V _{CP}	Charge pump output	-25 to V _S + 11	V
V _{OUTn}	Static output voltage (n= 1 to 11)	-0.3 to V _S + 0.3	V
I _{OUT,2,3,9,10}	Output current	±1.25	A
I _{OUT1,6,7,8}	Output current	±5	A
I _{OUT4,5,11}	Output current	±10	A

2.2 ESD protection

Table 4. ESD protection

Parameter	Value	Unit
All pins	± 2 ⁽¹⁾	kV
Output pins: OUT1 - OUT6	± 4 ⁽²⁾	kV

1. HBM according to MIL 883C, Method 3015.7 or EIA/JESD22-A114-A.

2. HBM with all unzapped pins grounded.

2.3 Thermal data

Table 5. Operating junction temperature

Symbol	Parameter	Value	Unit
T_j	Operating junction temperature	-40 to 150	°C

Table 6. Temperature warning and thermal shutdown

Symbol	Parameter		Min.	Typ.	Max.	Unit
$T_{jTW\ ON}$	Temperature warning threshold junction temperature	T_j	130		150	°C
$T_{jSD\ ON}$	Thermal shutdown threshold junction temperature	T_j increasing			170	°C
$T_{jSD\ OFF}$	Thermal shutdown threshold junction temperature	T_j decreasing	150			°C
$T_{jSD\ HYS}$	Thermal shutdown hysteresis			5		°K

2.4 Electrical characteristics

$V_S = 8$ to 16 V, $V_{CC} = 4.5$ to 5.3 V, $T_j = -40$ to 150 °C, unless otherwise specified.

The voltages are referred to GND and currents are assumed positive, when the current flows into the pin.

Table 7. Supply

Item	Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit
7.1	VS	Operating voltage range		7		28	V
7.2	I_S	V_S DC supply current	$V_S = 16$ V, $V_{CC} = 5.3$ V active mode OUT1 - OUT11		7	20	mA
7.3		V_S quiescent supply current	$V_S = 16$ V, $V_{CC} = 0$ V standby mode OUT1 - OUT11 $T_{test} = -40^\circ\text{C}, 25^\circ\text{C}$		4	12	μA
7.4 ⁽¹⁾			$T_{test} = 85^\circ\text{C}$		6	25	
7.5	I_{CC}	V_{CC} DC supply current	$V_S = 16$ V, $V_{CC} = 5.3$ V $CSN = V_{CC}$, active mode OUT1 - OUT11		1	3	mA
7.6 ⁽²⁾		V_{CC} quiescent supply current	$V_S = 16$ V, $V_{CC} = 5.3$ V $CSN = V_{CC}$ standby mode OUT1 - OUT11 $T_{test} = -40^\circ\text{C}, 25^\circ\text{C}$		3	6	μA
7.7 ⁽¹⁾			$T_{test} = 85^\circ\text{C}$		5	10	

1. This parameter is guaranteed by design.

2. CM/ PWM 2 = V_{CC} or 0 V.

Table 8. Overvoltage and under voltage detection

Item	Symbol	Parameter	Test condition	Min.	Typ.	Max.	Unit

3 Application information

3.1 Dual power supply: V_S and V_{CC}

The power supply voltage V_S supplies the half bridges and the high-side drivers. An internal charge-pump is used to drive the high-side switches. The logic supply voltage V_{CC} is used for the logic part and the SPI of the device.

Due to the independent logic supply voltage the control and status information is not lost, if there are temporary spikes or glitches on the power supply voltage.

3.2 Wake up and active mode / standby mode

After power up of V_S and V_{CC} the device operates in standby-mode. Pulling the signal CSN to low level wakes the device up and the analog part is activated (active mode).

After at least 10 μ s, the first SPI communication is valid and bit 0 of the Control Register 0 can be used to set the EN-mode. If bit 0 is not set to 1, the device doesn't remain in the active mode. After at least 256 μ s all latched data are cleared and the inputs and outputs are switched to high impedance. In standby mode the current at V_S (V_{CC}) is less than 6 μ A (5 μ A) for CSN = high (DO in tristate).

3.3 Charge pump

In standby mode the charge-pump is turned off. After enabling the device by SPI command (bit0=1 Control Register 0) the oscillator starts and the voltage begins to increase. The output drivers are enabled after at least 256 μ s after CSN went to high.

3.4 Diagnostic functions

All diagnostic functions (over/under-current, power supply over-/undervoltage, temperature warning and thermal shutdown) are internally filtered. The condition has to be valid for at least 32 μ s (open load: 1 ms) before the corresponding status bit in the status registers is set.

The filters are used to improve the noise immunity of the device. The under-current and temperature warning functions are intended for information purpose and don't change the state of the output drivers. On the contrary, the over-current condition disables the corresponding driver and thermal shutdown disables all drivers. Without setting the over-current recovery bits in the input data register, the microcontroller has to clear the over-current status bits to reactivate the corresponding drivers.

3.5 Overvoltage and undervoltage detection at V_S

If the power supply voltage V_S rises above the overvoltage threshold $V_{SOV\ OFF}$ (typical 21 V), the outputs OUT1 to OUT11 are switched to high impedance state to protect the load. When the voltage V_S drops below the undervoltage threshold $V_{SUV\ OFF}$ (UV-switch-OFF voltage), the output stages are switched to high impedance to avoid the operation of the power devices without sufficient gate driving voltage (increased power dissipation). If the

supply voltage V_S recovers (control register 3: bit 4=0) to normal operating voltage then the outputs stages return to the programmed state. If the undervoltage/overvoltage recovery disable bit is set (control register 3: bit 4=1), the automatic turn-on of the drivers is deactivated.

The microcontroller needs to clear the status bits to reactivate the drivers. It is recommended to set bit1 control register 3 to avoid a possible high current oscillation in case of a shorted output to GND and low battery voltage.

3.6 Overvoltage and undervoltage detection at V_{CC}

In case of power-on (V_{CC} increases from undervoltage to $V_{POR\ OFF} = 2.9\text{ V}$) the circuit is initialized by an internally generated power-on-reset (POR). If the voltage V_{CC} decreases below the minimum threshold ($V_{POR\ ON} = 2.0\text{ V}$), the outputs are switched to tristate (high impedance) and the status registers are cleared.

3.7 Temperature warning and thermal shutdown

If the junction temperature rises above $T_{j\ TW}$, a temperature warning flag is set after at least $32\ \mu\text{s}$ and it can be read via the SPI. If the junction temperature increases above the second threshold $T_{j\ SD}$, the thermal shutdown bit is set and the power DMOS transistors of all output stages are switched off to protect the device after at least $32\ \mu\text{s}$.

The temperature warning and thermal shutdown flags are latched and the bits must be cleared by the microcontroller. This is possible only if the temperature has decreased below trigger temperature. If the thermal shutdown bit has been cleared the output stages are reactivated.

3.8 Inductive loads

Each half bridge is built by internally connected high-side and low-side power DMOS transistors. Due to the built-in reverse diodes of the output transistors, inductive loads can be driven at the outputs OUT1 to OUT6 without external free-wheeling diodes. The high-side drivers OUT7 to OUT11 are intended to drive resistive loads. Therefore only a limited energy ($E < 1\text{ mJ}$) can be dissipated by the internal ESD-diodes in freewheeling condition. For inductive loads ($L > 100\ \mu\text{H}$) an external free-wheeling diode connected between GND and the corresponding output is required.

3.9 Open load detection

The open load detection monitors the load current in each activated output stage. If the load current is below the open load detection threshold for at least 1 ms (t_{dOL}) the corresponding open load bit is set in the status register. Due to mechanical/electrical inertia of typical loads a short activation of the outputs (e.g. 3 ms) can be used to test the open load status without changing the mechanical/electrical state of the loads.

3.10 Over-load detection

In case of an over-current condition a flag is set in the status register in the same way as during open load detection. If the over-current signal is valid for at least $t_{ISC}(typ) = 55 \mu s$, the over-current flag is set and the corresponding driver is switched off to reduce the power dissipation and to protect the integrated circuit. If the over-current recovery bit of the output is zero, the microcontroller has to clear the status bits to reactivate the corresponding driver.

3.11 Current monitor

The current monitor output sources a current image at the current monitor output which has two fixed ratios of the instantaneous current of the selected high-side driver. Outputs with a resistance of 500 m Ω and higher have a ratio of 1/2000 and those with a lower resistance of 1/10000. The signal at output CM is blanked after switching on the driver until correct settlement of the circuitry (at least for 64 μs). The bits 0 to 3 of the control register 3 define which of the outputs are multiplexed to the current monitor output CM/PWM2. The current monitor output allows a more precise analysis of the actual state of the load rather than the detection of an open- or overload condition. For example it can be used to detect the motor state (starting, free-running, stalled). Moreover, it is possible to control the power of the defroster more precisely by measuring the load current. The current monitor output is bidirectional (PWM inputs).

3.12 PWM inputs

Each driver has a corresponding PWM enable bit, which can be programmed by the SPI interface. If the PWM enable bit is set in control registers 2 or 3, the output is controlled by the logically AND-combination of the PWM signal and the output control bit in Control Registers 0 and 1. The outputs OUT1-4, 6, 7, 9, OUT11 are controlled by the PWM1 input and the outputs OUT5, 8 and OUT10 are controlled by the bidirectional input CM/PMW2. For example, the two PWM inputs can be used to dim two lamps independently by external PWM signals. In case of switching off a high/low side switch in PWM mode a minimum off time of appr. (256 $\mu s - t_{don} + t_{doff}$) is predefined by the state machine, to avoid switching on the high/low side again during the negative slope. For a PWM frequency of 100Hz this means the maximum duty cycle is about 98%. Larger duty cycles can be realized by applying pulse skipping.

3.13 Cross-current protection

The six half bridges of the device are cross-current protected by an internal delay time. If one driver (LS or HS) is turned off, the activation of the other driver of the same half bridge is automatically delayed by the cross-current protection time. After the cross-current protection time is expired the slew-rate limited switch-off phase of the driver is changed to a fast turn-off phase and the opposite driver is turned-on with slew-rate limitation. Due to this behavior it is always guaranteed that the previously activated driver is completely turned off before the opposite driver starts to conduct.

3.14 Programmable soft-start function to drive loads with higher inrush current

Loads with start-up currents higher than the over-current limits (e.g. inrush current of lamps, start current of motors and cold resistance of heaters) can be driven by using the programmable softstart function (i.e. overcurrent recovery mode). Each driver has a corresponding over-current recovery bit. If this bit is set, the device automatically switches the outputs on again after a programmable recovery time. The duty cycle in over-current condition can be programmed by the SPI interface to about 12% or 25%. The PWM modulated current provides sufficient average current to power up the load (e.g. heat up the bulb) until the load reaches operating condition. The PWM frequency settles at 1.7 kHz and 3 kHz. The device itself cannot distinguish between a real overload and a non linear load like a light bulb. A real overload condition can only be qualified by time. For over-load detection the microcontroller can switch on the light bulbs by setting the over-current recovery bit for the first e.g. 50 ms. After clearing the recovery bit the output is automatically switched off, if the overload condition remains. This over-load detection procedure has to be followed in order make it possible to switch on the low-side driver of a bridge output, if the associated high-side driver has been used in recovery mode before.

Figure 8. Example of programmable soft-start function for inductive loads

4 Functional description of the SPI

4.1 General description

Standard ST-SPI Interface Version 3.0.

The SPI communication is based on a Serial Peripheral Interface structure using CSN (Chip Select Not), DI (Serial Data In), DO (Serial Data Out/Error) and CLK (Serial Clock) signal lines.

4.1.1 Chip Select Not (CSN)

The input pin is used to select the serial interface of this device. When CSN is high, the output pin (DO) is in high impedance state. A low signal wakes up the device and a serial communication can be started. The state when CSN is going low until the rising edge of CSN is called a communication frame.

Note: The device includes a test mode. This mode is activated by a dedicated sequence which includes a high voltage at the CSN pin. The CSN pin must be kept at nominal voltage levels in order to avoid accidental activation of the test mode.

4.1.2 Serial Data In (DI)

The input pin is used to transfer data serially into the device. The data applied to the DI is sampled at the rising edge of the CLK signal.

4.1.3 Serial Clock (CLK)

This input signal provides the timing of the serial interface. The Data Input (DI) is latched at the rising edge of Serial Clock CLK. The SPI can be driven by a micro controller with its SPI peripheral running in following mode: CPOL = 0 and CPHA = 0. Data on Serial Data Out (DO) is shifted out at the falling edge of the serial clock (CLK). The serial clock CLK must be active only during a frame (CSN low). Any other switching of CLK close to any CSN edge could generate set up/hold violations in the SPI logic of the device.

The clock monitor counts the number of clock pulses during a communication frame (while CSN is low). If the number of CLK pulses does not correspond to the frame width indicated in the <SPI-frame-ID> (ROM address 03H) the frame is ignored and the <frame error> bit in the <Global Status Byte> is set.

Note: Due to this safety functionality, daisy chaining the SPI is not possible. Instead, a parallel operation of the SPI bus by controlling the CSN signal of the connected ICs is recommended.

4.1.4 Serial Data Out (DO)

The data output driver is activated by a logical low level at the CSN input and goes from high impedance to a low or high level depending on the global status bit 7 (Global Error Flag). The first rising edge of the CLK input after a high to low transition of the CSN pin transfers the content of the selected status register into the data out shift register. Each subsequent falling edge of the CLK shifts the next bit out.

4.1.5 SPI communication flow

At the beginning of each communication the master can read the contents of the *<SPI-frame-ID>* register (ROM address 03H) of the slave device. This 8-bit register indicates the SPI frame length (24 bit) and the availability of additional features.

Each communication frame consists of a command byte which is followed by 2 data bytes.

The data returned on DO within the same frame always starts with the *<Global Status>* Byte. It provides general status information about the device. It is followed by 2 data bytes (i. e. 'In-frame-response').

For Write cycles the *<Global Status>* Byte is followed by the previous content of the addressed register.

Figure 9. Write and read SPI

Table 19. SPI frame

	Command byte								Data byte															
Bit	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	OC ₁	OC ₀	A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0	D7	D6	D5	D4	D3	D2	D1	D0

Ocx: Operation code

Ax: Address

Dx: Data Bit

4.2 Command byte

Each communication frame starts with a command byte. It consists of an operating code which specifies the type of operation (*<Read>*, *<Write>*, *<Read and Clear>*, *<Read Device Information>*) and a 6 bit address. If less than 6 address bits are required, the remaining bits are unused but are reserved.

4.2.1 Operation code definition

Table 20. Operation code definition

OC1	OC0	Meaning
0	0	<Write Mode>
0	1	<Read Mode>
1	0	<Read and Clear Mode>
1	1	<Read Device Information>

The <Write Mode> and <Read Mode> operations allow access to the RAM of the device.

A <Read and Clear Mode> operation is used to read a status register and subsequently clear its content.

The <Read Device Information> allows access to the ROM area which contains device related information such as <ID-Header>, <Product Code>, <Silicon Version and Category> and <SPI-frame-ID>.

4.3 Global status byte

Table 21. Global status byte

Bit	7	6	5	4	3	2	1	0
Name	GL_ER	CO_ER	C_RESET	TSD	TW	UOV_OC	OL	NR
Reset	0	0	1	0	0	0	0	0

Description:

- **GL_ER:** Global Error Flag. Failures of Bits 0-6 are always linked to the Global Error Flag. This flag is generated by an OR combination of all failure events of the device. It is reflected via the DO pin while CSN is held low and no clock signal is available. The flag remains as long as CSN is low. This operation does not cause the Communication Error bit in the <Global Status> to be set. The signal TW bit3 and OL bit1 can be masked.
- **CO_ER:** Communication Error. If the number of clock pulses within the previous frame is not 24 the frame is ignored and this bit is set.
- **C_RESET:** Chip RESET. If a stuck at '1' on input DI during any SPI frame occurs, or if a Power On Reset (VCC monitor) occurs. C_RESET resets ('1') with any SPI command. When C_RESET is active ('0'), the Gate drivers are switched off (resistive path to source).
After a startup of the circuit the C_RESET is active because of the POR pulse and the Gate drivers are switched off. The Gate drivers can only be activated after the C_RESET has been reset with a SPI command.
- **TSD:** Thermal shutdown due to an internal sensor. All the gate drivers and the charge pump are switched off (resistive path to source). The TSD bit has to be cleared through a software reset to reactivate the gate drivers and the charge pump.
- **TW:** Thermal Warning. This bit is maskable by configuration register.
- **UOV_OC:** Logical OR among the filtered under-/over-voltage signals and over-current signals.
- **OL:** Open Load. Logical OR among the filtered under-current signals. This bit is maskable by configuration register.
- **NR:** Not Ready. After switching the device from standby mode to active mode an internal timer is started to allow charge-pump to settle before the outputs can be activated. This bit is cleared automatically after start up time has finished.

5 SPI - control and status registers

5.1 Control register 0

Table 24. Control register 0 (read/write)

Bit	Name	Comment
15	OUT1 – HS on/off	If a bit is set the selected output driver is switched on. If the corresponding PWM enable bit is set the driver is only activated if PWM1 (PWM2) input signal is high. The outputs of OUT1-OUT6 are half bridges. If the bits of HS- and LS-driver of the same half bridge are set, the internal logic prevents that both drivers of this output stage can be switched on simultaneously in order to avoid a high internal current from Vs to GND.
14	OUT1 – LS on/off	
13	OUT2 – HS on/off	
12	OUT2 – LS on/off	
11	OUT3 – HS on/off	
10	OUT3 – LS on/off	
9	OUT4 – HS on/off	
8	OUT4 – LS on/off	
7	OUT5 – HS on/off	
6	OUT5 – LS on/off	
5	OUT6 – HS on/off	
4	OUT6 – LS on/off	
3	0	Reserved (has to be set to '0')
2	0	
1	0	
0	Enable bit	If enable bit is set the device will be switched in active mode. If enable bit is cleared, the device enters standby mode and all bits are cleared.

5.2 Control register 1

13	OUT8 – HS1 on/off		1	0	Low on-resistance	
			0	1	High on-resistance	
12	OUT8 – HS2 on/off		0	0	Off	

Table 25. Control register 1 (read/write) (continued)

Bit	Name	Comment
11	OUT9 – HS on/off	If a bit is set, the selected output driver is switched on. If the corresponding PWM enable bit is set the driver is only activated if PWM1 (PWM2) input signal is high. The outputs of OUT1-OUT6 are half bridges. If the bits of HS- and LS-driver of the same half bridge are set, the internal logic prevents that both drivers of this output stage can be switched on simultaneously in order to avoid a high internal current from VS to GND.
10	OUT10 – HS on/off	
9	OUT11 – HS on/off	
8-1	Reserved	Reserved (has to be set to '0')
0	0	Reserved (has to be set to '0')

5.3 Control register 2

Table 26. Control register 2 (read/write)

Bit	Name	Comment
15	OUT1 – OCR enable	In case of an over-current event the over-current status bit (Status Register 0) is set and the output is switched off. If the Over-current Recovery Enable bit (OCR) is set, the output will be automatically reactivated after a delay time resulting in a PWM modulated current with a programmable duty cycle (bit 5 of control register 3). Depending on occurrence of over-current event and internal clock phase it is possible that one recovery cycle is executed even if this bit is set to zero.
14	OUT2 – OCR enable	
13	OUT3 – OCR enable	
12	OUT4 – OCR enable	
11	OUT5 – OCR enable	
10	OUT6 – OCR enable	
9	0	Reserved (has to be set to '0')
8	0	Reserved (has to be set to '0')
7	OUT1 PWM1 enable	If the PWM1/2 Enable bit is set and the output is enabled (control register 0 or 1) the output is switched on if PWM1/2 input is high and switched off if PWM1/2 input is low. OUT5, 8 and OUT10 are controlled by PWM2 input, all other outputs are controlled by PWM1 input.
6	OUT2 PWM1 enable	
5	OUT3 PWM1 enable	
4	OUT4 PWM1 enable	
3	OUT5 PWM2 enable	
2	OUT6 PWM1 enable	
1	Reserved	Reserved
0	Reserved	

5.4 Control register 3

Table 27. Control register 3 (read/write)

Bit	Name	Comment																																																												
15	OUT7-OCR enable	In case of an over-current event the over-current status bit (Status register 1) is set and the output is switched off. If the Over-current Recovery Enable bit (OCR) is set the output will be automatically reactivated after a delay time resulting in a PWM modulated current with a programmable duty cycle (bit 5). Depending on the occurrence of the over-current event and the internal clock phase it is possible that one recovery cycle is executed even if this bit is set to zero.																																																												
14	OUT8-OCR enable																																																													
13	OUT9-OCR enable																																																													
12	OUT10-OCR enable																																																													
11	OUT11-OCR enable																																																													
10	OUT7 PWM1 enable	If the PWM1/2 Enable bit is set and the output is enabled (control register 0 or 1) the output is switched on if PWM1/2 input is high and switched off if PWM1/2 input is low. OUT5, 8 and OUT10 are controlled by PWM2 input all other outputs are controlled by PWM1 input.																																																												
9	OUT8 PWM2 enable																																																													
8	OUT9 PWM1 enable																																																													
7	OUT10 PWM2 enable																																																													
6	OUT11 PWM1 enable																																																													
5	OCR frequency 0: 1.7 kHz 1: 3 kHz	This bit defines in combination with the over-current recovery bit (Input Register 1) the over-current recovery frequency of an activated driver.																																																												
4	OV/UVR disable	If this bit is set the microcontroller has to clear the status register after undervoltage/overvoltage event to enable the outputs.																																																												
3	CM select bit 3	Depending on combination of bit 3 to 0 the current image of the selected high-side output OUTn will be multiplexed to the CM/PWM2 output (see table below). Other combinations deactivate the current monitor. <table><tr><th>Bit 3</th><th>Bit 2</th><th>Bit 1</th><th>Bit 0</th><th>Current image of</th></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>OUT1</td></tr><tr><td>0</td><td>0</td><td>0</td><td>1</td><td>OUT2</td></tr><tr><td>0</td><td>0</td><td>1</td><td>0</td><td>OUT3</td></tr><tr><td>0</td><td>0</td><td>1</td><td>1</td><td>OUT4</td></tr><tr><td>0</td><td>1</td><td>0</td><td>0</td><td>OUT5</td></tr><tr><td>0</td><td>1</td><td>0</td><td>1</td><td>OUT6</td></tr><tr><td>0</td><td>1</td><td>1</td><td>0</td><td>OUT7</td></tr><tr><td>0</td><td>1</td><td>1</td><td>1</td><td>OUT8</td></tr><tr><td>1</td><td>0</td><td>0</td><td>0</td><td>OUT9</td></tr><tr><td>1</td><td>0</td><td>0</td><td>1</td><td>OUT10</td></tr><tr><td>1</td><td>0</td><td>1</td><td>0</td><td>OUT11</td></tr></table>	Bit 3	Bit 2	Bit 1	Bit 0	Current image of	0	0	0	0	OUT1	0	0	0	1	OUT2	0	0	1	0	OUT3	0	0	1	1	OUT4	0	1	0	0	OUT5	0	1	0	1	OUT6	0	1	1	0	OUT7	0	1	1	1	OUT8	1	0	0	0	OUT9	1	0	0	1	OUT10	1	0	1	0	OUT11

1	0	
0	0	

5.6 Status register 1

Table 29. Status register 1 (read)

Bit	Name	Comment
15	OUT1 – HS UC	Maskable by the configuration register
14	OUT1 – LS UC	
13	OUT2 – HS UC	The open load detection monitors the load current in each activated output stage. If the load current is below the under-current detection threshold for at least 1 ms (t_{dOL}), the corresponding under-current bit UC is set. Due to mechanical/electrical inertia of typical loads a short activation of the outputs (e.g. 3ms) can be used to test the open load status without changing the mechanical/electrical state of the loads.
12	OUT2 – LS UC	
11	OUT3 – HS UC	
10	OUT3 – LS UC	
9	OUT4 – HS UC	
8	OUT4 – LS UC	
7	OUT5 – HS UC	
6	OUT5 – LS UC	
5	OUT6 – HS UC	
4	OUT6 – LS UC

7	0	
6	0	
5	Mask for bit 15 of status reg. 1	Open-load event (under-current status bit of OUT1 HS) is not considered in open-load bit 1 of global status register.
4	Mask for bit 14 of status reg. 1	Open-load event (under-current status bit of OUT1 LS) is not considered in open-load bit 1 of global status register.
3	Mask for bit 3 of global status reg.	Temperature warning event is not considered in the 'Global Error Flag'.
2	0	Reserved (has to be set to '0')
1	Mask for bit 1 of global status reg.	Open-load event (under-current status bit of OUTn) is not considered in the 'Global Error Flag'.
0	0	Reserved (has to be set to '0')

6 Package and PCB thermal data

6.1 PowerSSO-36 thermal data

Figure 11. PowerSSO-36 2 layer PCB

Figure 12. PowerSSO-36 4 layer PCB

Note: Layout condition of R_{th} and Z_{th} measurements (board finish thickness $1.6 \text{ mm} \pm 10\%$, board double layer and four layers, board dimension $129 \text{ mm} \times 60 \text{ mm}$, board material FR4, Cu thickness 0.070 mm (outer layers), Cu thickness 0.035 mm (inner layers), thermal vias separation 1.2 mm , thermal via diameter $0.3 \text{ mm} \pm 0.08 \text{ mm}$, Cu thickness on vias 0.025 mm , footprint dimension $4.1 \text{ mm} \times 6.5 \text{ mm}$). 4-layer PCB: Cu on mid1 and mid2 layer: 76.45 cm^2 . Cu on bottom layer: 68.8 cm^2 . Z_{th} measured on the major power dissipator contributor.

7 Package and packing information

7.1 ECOPACK

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com.

ECOPACK is an ST trademark.

8 Revision history

Table 33. Document revision history

Date	Revision	Description of changes
18-Sep-2018	1	Initial release.
07-Nov-2018	2	Added Section 6: Package and PCB thermal data .
17-Jun-2019	3	Updated the maturity from target specification to production data.
08-Oct-2019	4	Updated Applications on cover page. Updated Table 2: Pin definition and functions . Updated Section 4.1.1: Chip Select Not (CSN) and Section 4.3: Global status byte . Minor text changes
