## NTE74HC123 Integrated Circuit TTL – High Speed CMOS, Dual Retriggerable Monostable Multivibrator w/Resets

**Description:**

The NTE74HC123 is a dual monostable multivibrator with resets in a 16-Lead plastic DIP type package triggered by a negative to positive reset pulse. An external resistor ( $R_X$ ) and an external capacitor ( $C_X$ ) control the timing and the accuracy for the circuit. Adjustment of  $R_X$  and  $C_X$  provides a wide range of output pulse widths from the Q and  $\bar{Q}$  terminals. Pulse triggering on the  $\bar{A}$  and B inputs occur at a particular voltage level and is not related to the rise and fall times of the trigger pulses.

Once triggered, the output pulse width may be extended by retriggering inputs  $\bar{A}$  and B. The output pulse can be terminated by a LOW level on the Reset (R) pin. Trailing edge triggering ( $\bar{A}$ ) and leading edge triggering (B) inputs are provided for triggering from either edge of the input pulse. If either Mono is no used each input on the unused device ( $\bar{A}$ , B, and  $\bar{R}$ ) must be terminated high or low.

The minimum value of external resistance,  $R_X$ , is typically 5k $\Omega$ . The minimum value external capacitance,  $C_X$ , is 0pF. The calculation for the pulse width is  $t_W = 0.45 R_X C_X$  at  $V_{CC} = 5V$ .
