

FEATURES

- 200mV Max Dropout at 10mA Output Current
- 4 μ A Typical Quiescent Current
- 0.15% Max Initial Accuracy
- No Output Capacitor Required
- Output Sources 10mA, Sinks 2mA
- 40ppm/ $^{\circ}$ C Max Drift
- Voltage Options: 2.5V, 3V, 4.1V, 5V and Adjustable

APPLICATIONS

- Battery-Powered Systems
- Handheld Instruments
- Precision Power Supplies
- A/D and D/A Converters
- Available in the SO-8 Package

DESCRIPTION

The LTC[®]1798/LTC1798-2.5/LTC1798-3/LTC1798-4.1/LTC1798-5 are micropower bandgap references that combine high accuracy and low drift with very low supply current and small package size. The combination of ultralow quiescent current and low dropout voltage of only 200mV (max) makes them ideal for battery-powered equipment. The output voltage is set by an external resistor divider for the adjustable LTC1798.

This series of references uses curvature compensation to obtain low temperature coefficient and trimmed thin-film resistors to achieve high output accuracy. These references can source up to 10mA and sink up to 2mA, making them ideal for precision regulator applications. They are stable without an output bypass capacitor, but are also stable with capacitance up to 1 μ F. This feature is important in critical applications where PC board space is a premium and fast settling is demanded.

The LTC1798 series references provided power dissipation advantages over shunt references. In addition to supply current, shunt references must also idle the entire load current to operate.

The LTC1798 series is available in the SO-8 package.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: The LTC1798 is guaranteed functional over the operating temperature range of -40°C to 100°C .

Note 3: If the part is stored outside of the specified operating temperature range, the output may shift due to hysteresis.

Note 4: ESD (Electrostatic Discharge) sensitive device. Extensive use of ESD protection devices are used internal to the LTC1798, however, high electrostatic discharge can damage or degrade the device. Use proper ESD handling precautions.

Note 5: Peak-to-peak noise is measured with a single pole highpass filter at 0.1Hz and 2-pole lowpass filter at 10Hz.

Note 6: Temperature coefficient is the change in output voltage divided by the nominal output voltage divided by the specified temperature range.

Note 7: Load regulation is measured on a pulse basis from no load to the specified load current. Output changes due to die temperature change must be taken into account separately.

Note 8: Dropout voltage is $(V_{IN} - V_{OUT})$ when V_{OUT} falls to 0.1% below its nominal value at $V_{IN} = V_{OUT} + 0.5\text{V}$.

Note 9: Hysteresis in output voltage is created by package stress that differs depending on whether the IC was previously at a higher or lower temperature. Output voltage is always measured at 25°C , but the IC is cycled hot or cold before successive measurements. Hysteresis is not normally a problem for operational temperature excursions where the instrument might be stored at high or low temperature.

PIN FUNCTIONS

DNC (Pins 1, 5, 7, 8): Do Not Connect. Connected internally for post package trim. These pins must be left unconnected.

IN (Pin 2): Positive Supply. Bypassing with a 0.1µF capacitor is recommended if the output loading changes. ($V_{OUT} + 0.2V \leq V_{IN} \leq 12.6V$).

DNC (Pin 3): (LTC1798-2.5/LTC1798-3/LTC1798-4.1/LTC1798-5) Do Not Connect. Connected internally for post package trim. This pin must be left unconnected.

FB (Pin 3): (LTC1798) Resistor Divider Feedback Pin. Connect a resistor divider from OUT to GND and the center tap to FB. This pin sets the output potential.

$$V_{OUT} = 2.385V \left(\frac{R1 + R2}{R2} \right)$$
; R1 is connected from OUT to FB and R2 from FB to GND. Selecting $R2 \geq 10k$ will make $I_{OUT} < 250\mu A$.

GND (Pin 4): Negative Supply or Ground Connection.

OUT (Pin 6): Reference Output. The output can source up to 10mA and sink up to 2mA. It is stable with output bypass capacitor ranging from 0µF to 1µF.

BLOCK DIAGRAM

NOTE: R1 AND R2 ARE NOT CONNECTED FOR LTC1798

APPLICATIONS INFORMATION

Longer Battery Life

Series references have an advantage over shunt style references. To operate, shunt references require a resistor between the power supply and the output. This resistor must be chosen to supply the maximum current that is demanded by the circuit being regulated. When the circuit being controlled is not operating at this maximum current, the shunt reference must always sink this current, resulting in high power dissipation and short battery life.

The LTC1798 series low dropout references do not require a current setting resistor and can operate with any supply voltage from ($V_{OUT(NOMINAL)} + 0.2V$) to 12.6V. When the circuitry being regulated does not demand current, the LTC1798 series reduces its dissipation and battery life is extended. If the reference is not delivering load current it

dissipates only 10.8 μ W when operating on a 2.7V supply for LTC1798-2.5, yet the same connection can deliver 10mA of load current when demanded.

Output Bypass Capacitor

The LTC1798 series is designed to be stable with or without capacitive loads. With no capacitive load, the reference is ideal for fast settling applications, or where PC board space is at a premium.

In applications with significant output loading changes, an output bypass capacitor of up to 1 μ F can be used to improve the output transient response. Figure 1 shows the response of the reference to a 1mA to 0 μ A load step with a 1 μ F output capacitor. If more than 1 μ F of output capacitance is required, a resistor in series with the capacitor is recommended

Figure 1. Reference Output Load Transient Response, 1 μ F Output Capacitor

1798fc

APPLICATIONS INFORMATION

to reduce the output ringing. Figure 2 illustrates the use of a damping resistor for capacitive loads greater than $1\mu\text{F}$. Figure 3 shows the resistor and capacitor values required to achieve critical damping.

Internal P-Channel Pass Transistor

The LTC1798 series features an internal P-channel MOSFET pass transistor. This provides several advantages over similar designs using a PNP bipolar pass transistor.

Figure 2. Adding a Damping Resistor with Output Capacitors Greater Than $1\mu\text{F}$

These references consume only $4\mu\text{A}$ of quiescent current under light and heavy loads as well as in dropout; whereas, PNP-based references waste considerable amounts of current when the pass transistor is saturated. In addition, the LTC1798 series provides a lower dropout voltage (200mV max) than PNP-based references.

TYPICAL APPLICATION

Supply Splitter

The schematic diagram illustrates the connection of the LTC1096L and LTC1798-3 components. The LTC1096L (top) is configured with its CS/SHDN pin (1) to VCC, +IN pin (2) to the ANALOG INPUT (0V TO 3V RANGE), -IN pin (3) to GND, and DOUT pin (5) to VREF. Its CLK pin (4) is connected to the SERIAL DATA LINK. The LTC1798-3 (bottom) has its IN pin (2) connected to VIN (3.2V TO 12.6V) with a 0.1µF capacitor, and its OUT pin (6) connected to the SERIAL DATA LINK. Its GND pin (4) is connected to GND. A 1µF capacitor is connected between VCC (pin 8) and GND. The MPU is connected to the SERIAL DATA LINK and VCC.
