

**FEATURES**

- Fast Response Time ..... 180ns Max
- High Input Slew Rate ..... 92V/ $\mu$ s
- Low Offset Voltage ..... 0.3mV Typical, 0.8mV Max
- Low Offset Current ..... 4nA Typical, 25nA Max
- Low Offset Drift ..... 1 $\mu$ V/ $^{\circ}$ C, 30pA/ $^{\circ}$ C
- Standard Power Supplies ..... +5V or  $\pm$ 5V to  $\pm$ 18V
- Guaranteed Operation from Single +5V Supply
- No Pull-Up Resistor Required for TTL Drive
- Wired OR Capability
- Fits 111, 106, 710 Sockets
- Easy Offset Nulling ..... Single 2k $\Omega$  Potentiometer
- Easy to Use ..... Free from Oscillations
- Available In Die Form

\* For devices processed in total compliance to MIL-STD-883, add /883 after part number. Consult factory for 883 data sheet.

† Burn-in is available on commercial and industrial temperature range parts in CerDIP, plastic DIP, and TO-can packages.

**GENERAL DESCRIPTION**

The CMP-01 is a monolithic fast precision voltage comparator using an advanced NPN-Schottky Barrier Diode process. It features fast response time to both large and small input signals, while maintaining excellent input characteristics. The CMP-01 is capable of operating over a wide range of supply voltages including single ended 5 volt supply. The large output current sinking and high output voltage capability assure good application flexibility, while the combination of fast response, high accuracy, and freedom from oscillation assure performance in precision level detectors and 12 and 13-bit A/D converters. The CMP-01 is pin-compatible to earlier 111, 106, and 710 types. For applications requiring lower input offset and bias currents, refer to the CMP-02 data sheet.

**SIMPLIFIED SCHEMATIC**

# CMP-01

## ABSOLUTE MAXIMUM RATINGS (Note 1)

|  |                 |
|--|-----------------|
| Total Supply Voltage, $V_+$ to $V_-$       | 36V             |
| Output to Ground                           | -5V to +32V     |
| Output to Negative Supply Voltage          | 50V             |
| Ground to Negative Supply Voltage          | 30V             |
| Positive Supply Voltage to Ground          | +30V            |
| Positive Supply Voltage to Offset Null     | 0 to 2V         |
| Differential Input Voltage                 | $\pm 11V$       |
| Input Voltage ( $V_S = \pm 15V$ )          | $\pm 15V$       |
| Output Sink Current (Continuous Operation) | 75mA            |
| Operating Temperature Range                |                 |
| CMP-01                                     | -55°C to +125°C |
| CMP-01E, CMP-01C                           | 0°C to +70°C    |
| Junction Temperature ( $T_J$ )             | -65°C to +150°C |
| Storage Temperature Range                  | -65°C to +150°C |
| P-Suffix                                   | -65°C to +125°C |

Lead Temperature (Soldering, 60 sec) ..... 300°C  
 Output Short-Circuit Duration

To Ground ..... Indefinite  
 To  $V_+$  ..... 1 Minute

| PACKAGE TYPE          | $\Theta_{JA}$ (Note 2) | $\Theta_{JC}$ | UNITS |
|-----------------------|------------------------|---------------|-------|
| TO-99 (J)             | 150                    | 18            | °C/W  |
| 8-Pin Plastic DIP (P) | 148                    | 16            | °C/W  |
| 8-Pin SO (S)          | 103                    | 43            | °C/W  |

### NOTES:

- Absolute ratings apply to both DICE and packaged parts, unless otherwise noted.
- $\Theta_{JA}$  is specified for worst case mounting conditions, i.e.,  $\Theta_{JA}$  is specified for device in socket for TO and P-DIP packages.

## ELECTRICAL CHARACTERISTICS at $V_S = \pm 15V$ , $T_A = 25^\circ C$ , unless otherwise noted.

### NOTES:

- These parameters are specified as the maximum values required to drive the output between the logic levels of 0.4V and 2.4V with a  $1k\Omega$  load tied to +5V; thus, these parameters define an error band which takes into

account the worst case effects of voltage gain and input impedance.

- Guaranteed by design.
- Sample tested.

## TYPICAL PERFORMANCE CHARACTERISTICS

# CMP-01

## APPLICATIONS INFORMATION

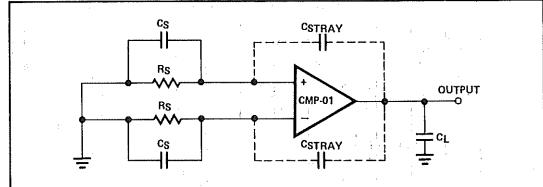

The CMP-01 provides fast response times even with small overdrives; to achieve this performance requires very high gain at high frequencies. The CMP-01 is completely free of oscillations; however, small values of stray capacitance from output to input when combined with high-source resistances can cause an unstable condition. DC characteristics are not affected, but when the input is within a few microvolts of the transition level, certain conditions can create an oscillation region. The width of this oscillatory region and the size of source resistance where oscillations begin is a strong function of the stray coupling present. The following suggestions are offered as a guide towards minimizing the conditions for oscillation: matched source resistors, minimized stray capacitances (e.g., a ground plane between output and input), or capacitive output loading ( $C_{L}$ ). The capacitive loading techniques will eliminate the oscillations, but result in slower response time. Matched bypass capacitors across the input resistors also can eliminate the instability,

$$\text{and if } C_S \geq 20\text{pF} \quad \frac{\text{maximum step size}}{\text{minimum overdrive}}$$

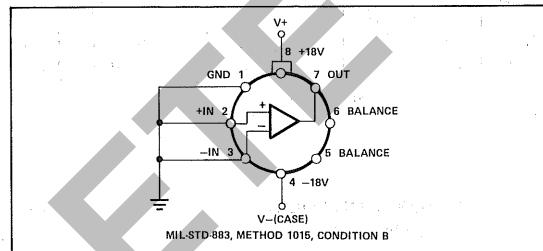

the response time will approximate the response time for low values of  $R_S$ . It should be noted that the offset nulling terminals do not require bypassing for stability. As with all

wideband circuits, it is recommended that the supplies be bypassed near the socket of the device.
