

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

[MEMO]

① VOLTAGE APPLICATION WAVEFORM AT INPUT PIN

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (MAX) and V_{IH} (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (MAX) and V_{IH} (MIN).

② HANDLING OF UNUSED INPUT PINS

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

③ PRECAUTION AGAINST ESD

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

④ STATUS BEFORE INITIALIZATION

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

⑤ POWER ON/OFF SEQUENCE

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current.

The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

⑥ INPUT OF SIGNAL DURING POWER OFF STATE

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

Caution: μ PD70F3217H, 70F3217HY, 70F3218H, and 70F3218HY use SuperFlash® technology licensed from Silicon Storage Technology, Inc.

IECUBE is a registered trademark of NEC Electronics Corporation in Japan and Germany.

MINICUBE is a registered trademark of NEC Electronics Corporation in Japan and Germany or a trademark in the United States of America.

EEPROM is a trademark of NEC Electronics Corporation.

Windows and Windows NT are either registered trademarks or trademarks of Microsoft Corporation in the United States and/or other countries.

SuperFlash is a registered trademark of Silicon Storage Technology, Inc. in several countries including the United States and Japan.

PC/AT is a trademark of International Business Machines Corporation.

SPARCstation is a trademark of SPARC International, Inc.

Solaris and SunOS are trademarks of Sun Microsystems, Inc.

These commodities, technology or software, must be exported in accordance with the export administration regulations of the exporting country.
Diversion contrary to the law of that country is prohibited.

- **The information in this document is current as of January, 2006. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**
- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.
- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.
- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".
The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.
 - "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.
 - "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).
 - "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)

- (1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).

PREFACE

Readers

This manual is intended for users who wish to understand the functions of the V850ES/KJ1 and design application systems using these products.

The target products are as follows.

- Standard products: μ PD703216, 703216Y, 703217, 703217Y, 70F3217, 70F3217H, 70F3217HY, 70F3217Y, 70F3218H, 70F3218HY
- Special products: μ PD703216(A), 703216Y(A), 703217(A), 703217Y(A), 70F3217(A), 70F3217Y(A)

Purpose

This manual is intended to give users an understanding of the hardware functions of the V850ES/KJ1 shown in the **Organization** below.

Organization

This manual is divided into two parts: Hardware (this manual) and Architecture (**V850ES Architecture User's Manual**).

Hardware	Architecture
• Pin functions • CPU function • On-chip peripheral functions • Flash memory programming • Electrical specifications	• Data types • Register set • Instruction format and instruction set • Interrupts and exceptions • Pipeline operation

How to Read This Manual It is assumed that the readers of this manual have general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

- Cautions**
1. The application examples in this manual apply to “standard” quality grade products for general electronic systems. When using an example in this manual for an application that requires a “special” quality grade product, thoroughly evaluate the component and circuit to be actually used to see if they satisfy the special quality grade.
 2. When using this manual as a manual for a special grade product, read the part numbers as follows.

μ PD703216 → μ PD703216(A)
 μ PD703216Y → μ PD703216Y(A)
 μ PD703217 → μ PD703217(A)
 μ PD703217Y → μ PD703217Y(A)
 μ PD70F3217 → μ PD70F3217(A)
 μ PD70F3217Y → μ PD70F3217Y(A)

To find the details of a register where the name is known
→ Refer to **APPENDIX C REGISTER INDEX**.

To understand the details of an instruction function
→ Refer to the **V850ES Architecture User's Manual**.

Register format

→ The name of the bit whose number is in angle brackets (< >) in the figure of the register format of each register is defined as a reserved word in the device file.

To understand the overall functions of the V850ES/KJ1
→ Read this manual according to the **CONTENTS**.

To know the electrical specifications of the V850ES/KJ1
→ Refer to **CHAPTER 29 ELECTRICAL SPECIFICATIONS (SINGLE-POWER FLASH MEMORY VERSION)** and **CHAPTER 30 ELECTRICAL SPECIFICATIONS (STANDARD PRODUCTS (MASK ROM VERSION AND TWO-POWER FLASH MEMORY VERSION), (A) GRADE PRODUCTS)**.

The “yyy bit of the xxx register” is described as the “xxx.yyy bit” in this manual. Note with caution that even if “xxx.yyy” is described as is in a program, however, the compiler/assembler cannot recognize it correctly.

The mark <R> shows major revised points. The revised points can be easily searched by copying an “<R>” in the PDF file and specifying it in the “Find what:” field.

Conventions

Data significance:	Higher digits on the left and lower digits on the right
Active low representation:	$\overline{\text{xxx}}$ (overscore over pin or signal name)
Memory map address:	Higher addresses on the top and lower addresses on the bottom
Note:	Footnote for item marked with Note in the text
Caution:	Information requiring particular attention
Remark:	Supplementary information
Numeric representation:	Binary ... xxxx or xxxxB
	Decimal ... xxxx
	Hexadecimal ... xxxxH
Prefix indicating power of 2 (address space, memory capacity):	
K (kilo): $2^{10} = 1,024$	
M (mega): $2^{20} = 1,024^2$	
G (giga): $2^{30} = 1,024^3$

13.5	Usage	453
13.6	Cautions.....	453
13.7	Security Function.....	454
CHAPTER 14 A/D CONVERTER.....		456
14.1	Function.....	456
14.2	Configuration	457
14.3	Registers.....	459
14.4	Operation	466
14.4.1	Basic operation.....	466
14.4.2	A/D conversion operation	467
14.4.3	Power fail monitoring function.....	467
14.4.4	Setting procedure	468
14.5	Cautions.....	469
14.6	How to Read A/D Converter Characteristics Table	475
CHAPTER 15 D/A CONVERTER		479
15.1	Functions.....	479
15.2	Configuration	480
15.3	Registers.....	481
15.4	Operation	482
15.4.1	Operation in normal mode	482
15.4.2	Operation in real-time output mode	482
15.4.3	Cautions	483
CHAPTER 16 ASYNCHRONOUS SERIAL INTERFACE (UART).....		484
16.1	Selecting UART2 or I ² C1 Mode.....	484
16.2	Features.....	485
16.3	Configuration	486
16.4	Registers.....	488
16.5	Interrupt Requests	494
16.6	Operation	495
16.6.1	Data format.....	495
16.6.2	Transmit operation.....	496
16.6.3	Continuous transmission operation	498
16.6.4	Receive operation.....	502
16.6.5	Reception error.....	503
16.6.6	Parity types and corresponding operation	505
16.6.7	Receive data noise filter	506
16.7	Dedicated Baud Rate Generator n (BRGn)	507
16.7.1	Baud rate generator n (BRGn) configuration	507
16.7.2	Serial clock generation	508
16.7.3	Baud rate setting example.....	511
16.7.4	Allowable baud rate range during reception	512
16.7.5	Transfer rate during continuous transmission.....	514

16.8	Cautions	514
CHAPTER 17 CLOCKED SERIAL INTERFACE 0 (CSI0)		515
17.1	Features	515
17.2	Configuration.....	516
17.3	Registers.....	519
17.4	Operation	528
17.4.1	Transmission/reception completion interrupt request signal (INTCSI0n)	528
17.4.2	Single transfer mode.....	530
17.4.3	Continuous transfer mode.....	533
17.5	Output Pins	541
CHAPTER 18 CLOCKED SERIAL INTERFACE A (CSIA) WITH AUTOMATIC TRANSMIT/RECEIVE FUNCTION		542
18.1	Functions	542
18.2	Configuration.....	543
18.3	Registers.....	545
18.4	Operation	554
18.4.1	3-wire serial I/O mode.....	554
18.4.2	3-wire serial I/O mode with automatic transmit/receive function	558
CHAPTER 19 I²C BUS.....		574
19.1	Selecting UART2 or I ² C1 Mode	574
19.2	Features	575
19.3	Configuration.....	578
19.4	Registers.....	580
19.5	Functions	594
19.5.1	Pin configuration	594
19.6	I ² C Bus Definitions and Control Methods.....	595
19.6.1	Start condition.....	595
19.6.2	Addresses.....	596
19.6.3	Transfer direction specification	597
19.6.4	ACK	598
19.6.5	Stop condition	599
19.6.6	Wait state.....	600
19.6.7	Wait state cancellation method	602
19.7	I ² C Interrupt Request Signals (INTIICn)	603
19.7.1	Master device operation.....	604
19.7.2	Slave device operation (when receiving slave address data (address match)).....	607
19.7.3	Slave device operation (when receiving extension code)	611
19.7.4	Operation without communication.....	615
19.7.5	Arbitration loss operation (operation as slave after arbitration loss)	616
19.7.6	Operation when arbitration loss occurs (no communication after arbitration loss)	618
19.8	Interrupt Request Signal (INTIICn) Generation Timing and Wait Control.....	625
19.9	Address Match Detection Method.....	626
19.10	Error Detection	626
19.11	Extension Code	627

<R>

19.12	Arbitration.....	628
19.13	Wakeup Function	629
19.14	Communication Reservation	630
19.14.1	When communication reservation function is enabled (IICFn.IICRSVn bit = 0).....	630
19.14.2	When communication reservation function is disabled (IICFn.IICRSVn bit = 1)	633
19.15	Cautions.....	634
19.16	Communication Operations	635
19.16.1	Master operation in single master system	636
19.16.2	Master operation in multimaster system	637
19.16.3	Slave operation.....	640
19.17	Timing of Data Communication	643
CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION		650
20.1	Overview	650
20.1.1	Features	650
20.2	Non-Maskable Interrupts	654
20.2.1	Operation.....	657
20.2.2	Restore	658
20.2.3	NP flag.....	659
20.3	Maskable Interrupts	660
20.3.1	Operation.....	660
20.3.2	Restore	662
20.3.3	Priorities of maskable interrupts	663
20.3.4	Interrupt control register (xxICn)	667
20.3.5	Interrupt mask registers 0 to 3 (IMR0 to IMR3).....	670
20.3.6	In-service priority register (ISPR).....	672
20.3.7	ID flag	673
20.3.8	Watchdog timer mode register 1 (WDTM1)	674
20.4	External Interrupt Request Input Pins (NMI, INTP0 to INTP6)	675
20.4.1	Noise elimination	675
20.4.2	Edge detection.....	675
20.5	Software Exceptions.....	678
20.5.1	Operation.....	678
20.5.2	Restore	679
20.5.3	EP flag	680
20.6	Exception Trap	681
20.6.1	Illegal opcode	681
20.6.2	Debug trap.....	683
20.7	Multiple Interrupt Servicing Control.....	685
20.8	Interrupt Response Time.....	687
20.9	Periods in Which Interrupts Are Not Acknowledged by CPU	688
20.10	Cautions.....	688
CHAPTER 21 KEY INTERRUPT FUNCTION		689
21.1	Function.....	689
21.2	Register.....	690
CHAPTER 22 STANDBY FUNCTION.....		691

22.1	Overview	691
22.2	Registers.....	694
22.3	HALT Mode	697
22.3.1	Setting and operation status	697
22.3.2	Releasing HALT mode.....	697
22.4	IDLE Mode.....	699
22.4.1	Setting and operation status	699
22.4.2	Releasing IDLE mode	700
22.5	STOP Mode	702
22.5.1	Setting and operation status	702
22.5.2	Releasing STOP mode	703
22.5.3	Securing oscillation stabilization time when STOP mode is released	705
22.6	Subclock Operation Mode	706
22.6.1	Setting and operation status	706
22.6.2	Releasing subclock operation mode	706
22.7	Sub-IDLE Mode.....	708
22.7.1	Setting and operation status	708
22.7.2	Releasing sub-IDLE mode	709
CHAPTER 23	RESET FUNCTION	711
23.1	Overview	711
23.2	Configuration.....	711
23.3	Operation	712
CHAPTER 24	REGULATOR	716
24.1	Overview	716
24.2	Operation	716
CHAPTER 25	ROM CORRECTION FUNCTION.....	718
25.1	Overview	718
25.2	Registers.....	719
25.3	ROM Correction Operation and Program Flow.....	720
CHAPTER 26	FLASH MEMORY (SINGLE POWER).....	722
26.1	Features	722
26.2	Memory Configuration	723
26.3	Functional Outline.....	724
26.4	Rewriting by Dedicated Flash Programmer	728
26.4.1	Programming environment.....	728
26.4.2	Communication mode	729
26.4.3	Flash memory control	734
26.4.4	Selection of communication mode	735
26.4.5	Communication commands	736
26.4.6	Pin connection	737
26.5	Rewriting by Self Programming	742
26.5.1	Overview.....	742
26.5.2	Features.....	743

26.5.3	Standard self programming flow	744
26.5.4	Flash functions	745
26.5.5	Pin processing	745
26.5.6	Internal resources used	746
CHAPTER 27 FLASH MEMORY (TWO POWER)		747
27.1	Features	747
27.2	Writing with Flash Programmer	748
27.3	Programming Environment	752
27.4	Communication Mode	752
27.5	Pin Processing	755
27.5.1	V _{PP} pin	755
27.5.2	Serial interface pins	756
27.5.3	RESET pin	758
27.5.4	Port pins	758
27.5.5	Other signal pins	758
27.5.6	Power supply	758
27.6	Programming Method	759
27.6.1	Controlling flash memory	759
27.6.2	Flash memory programming mode	760
27.6.3	Selecting communication mode	760
27.6.4	Communication commands	761
<R>	CHAPTER 28 ON-CHIP DEBUG FUNCTION	762

CHAPTER 1 INTRODUCTION

1.1 K1 Series Product Lineup

1.1.1 V850ES/Kx1+, V850ES/Kx1 products lineup

- 64-pin plastic LQFP (10 × 10 mm, 0.5 mm pitch)
- 64-pin plastic TQFP (12 × 12 mm, 0.65 mm pitch)

V850ES/KE1

- 80-pin plastic TQFP (12 × 12 mm, 0.5 mm pitch)
- 80-pin plastic QFP (14 × 14 mm, 0.65 mm pitch)

V850ES/KF1

- 100-pin plastic LQFP (14 × 14 mm, 0.5 mm pitch)
- 100-pin plastic QFP (14 × 20 mm, 0.65 mm pitch)

V850ES/KG1

- 144-pin plastic LQFP (20 × 20 mm, 0.5 mm pitch)

V850ES/KJ1

V850ES/KE1+

V850ES/KF1+

V850ES/KG1+

V850ES/KJ1+

The function list of the V850ES/Kx1+ is shown below.

Product Name		V850ES/KE1+		V850ES/KF1+			V850ES/KG1+			V850ES/KJ1+	
Number of pins		64 pins		80 pins			100 pins			144 pins	
Internal memory (KB)	Mask ROM	128	—	—	256	—	—	256	—	—	—
	Flash memory	—	128	128	—	256	128	—	256	128	256
	RAM	4		6	12		6	16		6	16
Supply voltage		2.7 to 5.5 V									
Minimum instruction execution time		50 ns @20 MHz									
Clock	X1 input	2 to 10 MHz									
	Subclock	32.768 kHz									
	Internal oscillation	240 kHz (TYP.)									
Port	CMOS input	8		8		8		16			
	CMOS I/O	41 (4) ^{Note 1}		57 (6) ^{Note 1}		72 (8) ^{Note 1}		106 (12) ^{Note 1}			
	N-ch open-drain I/O	2		2		4		6			
Timer	16-bit (TMP)	1 ch		1 ch		1 ch		1 ch			
	16-bit (TM0)	1 ch		2 ch		4 ch		6 ch			
	8-bit (TM5)	2 ch		2 ch		2 ch		2 ch			
	8-bit (TMH)	2 ch		2 ch		2 ch		2 ch			
	Interval timer	1 ch		1 ch		1 ch		1 ch			
	Watch	1 ch		1 ch		1 ch		1 ch			
	WDT1	1 ch		1 ch		1 ch		1 ch			
	WDT2	1 ch		1 ch		1 ch		1 ch			
RTO		6 bits × 1 ch		6 bits × 1 ch		6 bits × 1 ch		6 bits × 2 ch			
Serial interface	CSI	2 ch		2 ch		2 ch		3 ch			
	Automatic transmit/receive 3-wire CSI	—		1 ch		2 ch		2 ch			
	UART	1 ch		1 ch		2 ch		2 ch			
	UART supporting LIN-bus	1 ch		1 ch		1 ch		1 ch			
	I ² C ^{Note 2}	1 ch		1 ch		1 ch		2 ch			
External bus	Address space	—		128 KB		3 MB		15 MB			
	Address bus	—		16 bits		22 bits		24 bits			
	Mode	—		Multiplex only		Multiplex/separate					
DMA controller		—		—		4 ch		4 ch			
10-bit A/D converter		8 ch		8 ch		8 ch		16 ch			
8-bit D/A converter		—		—		2 ch		2 ch			
Interrupt	External	9		9		9		9			
	Internal	26/27 ^{Note 2}		29/30 ^{Note 2}		41/42 ^{Note 2}		46/48 ^{Note 2}			
Key return input		8 ch		8 ch		8 ch		8 ch			
Reset	RESET pin	Provided									
	POC	2.7 V or less fixed									
	LVI	3.1 V/3.3 V ±0.15 V or 3.5 V/3.7 V/3.9 V/4.1 V/4.3 V ±0.2 V (selectable by software)									
	Clock monitor	Provided (monitor by internal oscillator)									
	WDT1	Provided									
	WDT2	Provided									
ROM correction		4							None		
Regulator		None			Provided						
Standby function		HALT/IDLE/STOP/sub-IDLE mode									
Operating ambient temperature		T _A = -40 to +85°C									

Notes 1. Figures in parentheses indicate the number of pins for which the N-ch open-drain output can be selected by software.

2. Only in products with an I²C bus (Y products)

The function list of the V850ES/Kx1 is shown below.

Product Name		V850ES/KE1		V850ES/KF1				V850ES/KG1				V850ES/KJ1				
Number of pins		64 pins		80 pins				100 pins				144 pins				
Internal memory (KB)	Mask ROM	128	–	64/96	128	–	256	–	64/96	128	–	256	–	96/128	–	–
	Flash memory	–	128	–	–	128	–	256	–	–	128	–	256	–	128	256
	RAM	4		4	6		12		4	6		16		6		16
Supply voltage		2.7 to 5.5 V														
Minimum instruction execution time		50 ns @20 MHz														
Clock	X1 input	2 to 10 MHz														
	Subclock	32.768 kHz														
	Internal oscillation	–														
Port	CMOS input	8		8				8				16				
	CMOS I/O	41 (4) ^{Note 1}		57 (6) ^{Note 1}				72 (8) ^{Note 1}				106 (12) ^{Note 1}				
	N-ch open-drain I/O	2		2				4				6				
Timer	16-bit (TMP)	1 ch		–		1 ch		–		1 ch		–		1 ch		
	16-bit (TM0)	1 ch		2 ch				4 ch				6 ch				
	8-bit (TM5)	2 ch		2 ch				2 ch				2 ch				
	8-bit (TMH)	2 ch		2 ch				2 ch				2 ch				
	Interval timer	1 ch		1 ch				1 ch				1 ch				
	Watch	1 ch		1 ch				1 ch				1 ch				
	WDT1	1 ch		1 ch				1 ch				1 ch				
	WDT2	1 ch		1 ch				1 ch				1 ch				
RTO		6 bits × 1 ch		6 bits × 1 ch				6 bits × 1 ch				6 bits × 2 ch				
Serial interface	CSI	2 ch		2 ch				2 ch				3 ch				
	Automatic transmit/receive 3-wire CSI	–		1 ch				2 ch				2 ch				
	UART	2 ch		2 ch				2 ch				3 ch				
	UART supporting LIN-bus	–		–				–				–				
	I ² C ^{Note 2}	1 ch		1 ch				1 ch				2 ch				
External bus	Address space	–		128 KB				3 MB				15 MB				
	Address bus	–		16 bits				22 bits				24 bits				
	Mode	–		Multiplex only				Multiplex/separate								
DMA controller		–		–				–				–				
10-bit A/D converter		8 ch		8 ch				8 ch				16 ch				
8-bit D/A converter		–		–				2 ch				2 ch				
Interrupt	External	8		8				8				8				
	Internal	25/26 ^{Note 2}		25/26 ^{Note 2}		28/29 ^{Note 2}		30/31 ^{Note 2}		33/34 ^{Note 2}		38/40 ^{Note 2}		41/43 ^{Note 2}		
Key return input		8 ch		8 ch				8 ch				8 ch				
Reset	RESET pin	Provided														
	POC	None														
	LVI	None														
	Clock monitor	None														
	WDT1	Provided														
	WDT2	Provided														
ROM correction		4														
Regulator		None			Provided											
Standby function		HALT/IDLE/STOP/sub-IDLE mode														
Operating ambient temperature		T _A = –40 to +85°C														

- Notes**
- Figures in parentheses indicate the number of pins for which the N-ch open-drain output can be selected by software.
 - Only in products with an I²C bus (Y products)

1.1.2 78K0/Kx1+, 78K0/Kx1 products lineup

Note Products with an on-chip function

The list of functions in the 78K0/Kx1 is shown below.

Part Number		78K0/KB1			78K0/KC1			78K0/KD1			78K0/KE1				78K0/KF1			
Item																		
Number of pins		30 pins			44 pins			52 pins			64 pins				80 pins			
Internal memory (KB)	Mask ROM	8	16/24	–	8/16	24/32	–	8/16	24/32	–	8/16	24/32	–	48/60	–	24/32	48/60	–
	Flash memory	–		24	–		32	–		32	–		32	–	60	–		60
	RAM	0.5	0.75		0.5	1		0.5	1		0.5	1		2		1	2	
Power supply voltage		V _{DD} = 2.5 to 5.5 V ^{Notes 1, 2}																
Minimum instruction execution time		0.166 μs (when 12 MHz, V _{DD} = 4.0 to 5.5 V) 0.2 μs (when 10 MHz, V _{DD} = 3.5 to 5.5 V) 0.238 μs (when 8.38 MHz, V _{DD} = 3.0 to 5.5 V) 0.4 μs (when 5 MHz, V _{DD} = 2.5 to 5.5 V)						<Connect REGC pin to V _{DD} > 0.166 μs (when 12 MHz, V _{DD} = 4.0 to 5.5 V) 0.2 μs (when 10 MHz, V _{DD} = 3.5 to 5.5 V) 0.238 μs (when 8.38 MHz, V _{DD} = 3.0 to 5.5 V) 0.4 μs (when 5 MHz, V _{DD} = 2.5 to 5.5 V)										
Clock	X1 input	2 to 12 MHz																
	Subclock	–			32.768 kHz													
	Internal oscillation	240 kHz (TYP.)																
Port	CMOS I/O	17			19			26			38				54			
	CMOS input	4			8													
	CMOS output	1																
	N-ch open-drain I/O	–			4													
Timer	16 bits (TM0)	1 ch										2 ch				1 ch	2 ch	
	8 bits (TM5)	1 ch			2 ch													
	8 bits (TMH)	2 ch																
	For watch	–			1 ch													
	WDT	1 ch																
Serial interface	3-wire CSI ^{Note 3}	1 ch										2 ch				1 ch	2 ch	
	Automatic transmit/receive 3-wire CSI	–														1 ch		
	UART ^{Note 3}	–	1 ch															
	UART supporting LIN-bus	1 ch																
10-bit A/D converter		4 ch			8 ch													
Interrupt	External	6			7			8			9				9			
	Internal	11	12		15					16	19			17	20			
Key return input		–			4 ch			8 ch										
Reset	RESET pin	Provided																
	POC	2.85 V ±0.15 V/3.5 V ±0.20 V (selectable by mask option)																
	LVI	2.85 V/3.1 V/3.3 V ±0.15 V/3.5 V/3.7 V/3.9 V/4.1 V/4.3 V ±0.2 V (selectable by software)																
	Clock monitor	Provided																
	WDT	Provided																
Clock output/buzzer output		–						Clock output only			Provided							
Multiplier/divider		–										16 bits × 16 bits, 32 bits ÷ 16 bits						
ROM correction		–													Provided		–	
Standby function		HALT/STOP mode																
Operating ambient temperature		Standard and special (A) grade products: –40 to +85°C Special (A1) grade products: –40 to +110°C (mask ROM version), –40 to +105°C (flash memory version) Special (A2) grade products: –40 to +125°C (mask ROM version)																

- Notes**
1. If the POC circuit detection voltage (V_{POC}) is used with 2.85 V $\pm 0.15 \text{ V}$, then use the products in the voltage range of 3.0 to 5.5 V.
 2. If the POC circuit detection voltage (V_{POC}) is used with 3.5 V $\pm 0.2 \text{ V}$, then use the products in the voltage range of 3.7 to 5.5 V.
 3. Select either of the functions of these alternate-function pins.

The list of functions in the 78K0/Kx1+ is shown below.

Part Number		78K0/KB1+		78K0/KC1+		78K0/KD1+		78K0/KE1+			78K0/KF1+
Item											
Number of pins		30 pins		44 pins		52 pins		64 pins			80 pins
Internal memory (KB)	Flash memory	8	16/24	16	24/32	16	24/32	16	24/32	48/60	60
	RAM	0.5	0.75	0.5	1	0.5	1	0.5	1	2	2
Power supply voltage		V _{DD} = 2.5 to 5.5 V (with internal oscillation clock or subclock: V _{DD} = 2.0 to 5.5 V ^{Note 1})									
Minimum instruction execution time		0.125 μs (when 16 MHz, V _{DD} = 4.0 to 5.5 V), 0.2 μs (when 10 MHz, V _{DD} = 3.5 to 5.5 V), 0.238 μs (when 8.38 MHz, V _{DD} = 3.0 to 5.5 V), 0.4 μs (when 5 MHz, V _{DD} = 2.5 to 5.5 V)									
Clock	Crystal/ceramic	2 to 16 MHz									
	RC	3 to 4 MHz				–					
	Subclock	–		32.768 kHz							
	Internal oscillation	240 kHz (TYP.)									
Ports	CMOS I/O	17		19		26		38			54
	CMOS input	4		8							
	CMOS output	1									
	N-ch open-drain I/O	–		4							
Timer	16 bits (TM0)	1 ch						2 ch			
	8 bits (TM5)	1 ch		2 ch							
	8 bits (TMH)	2 ch									
	For watch	–		1 ch							
	WDT	1 ch									
Serial interface	3-wire CSI ^{Note 2}	1 ch						2 ch			
	Automatic transmit/receive 3-wire CSI	–								1 ch	
	UART ^{Note 2}	–	1 ch								
	UART supporting LIN-bus	1 ch									
10-bit A/D converter		4 ch		8 ch							
Interrupts	External	6		7		8		9			9
	Internal	11	12	15				16	19		20
Key return input		–		4 ch		8 ch					
Reset	RESET pin	Provided									
	POC	2.1 V ±0.1 V (detection voltage is fixed)									
	LVI	2.35 V/2.6 V/2.85 V/3.1 V/3.3 V ±0.15 V/3.5 V/3.7 V/3.9 V/4.1 V/4.3 V ±0.2 V (selectable by software)									
	Clock monitor	Provided									
	WDT	Provided									
Clock output/buzzer output		–				Clock output only		Provided			
External bus interface		–								Provided	
Multiplier/divider		–						16 bits × 16 bits, 32 bits ÷ 16 bits			
ROM correction		–								Provided	–
Self-programming function		Provided									
Product with on-chip debug function		μPD78F0114HD, 78F0124HD, 78F0138HD, 78F0148HD									
Standby function		HALT/STOP mode									
Operating ambient temperature		T _A = –40 to +85°C									

- Notes 1.** Because the POC circuit detection voltage (V_{POC}) is 2.1 V $\pm$ 0.1 V, use the products in the voltage range of 2.2 to 5.5 V.
- 2.** Select either of the functions of these alternate-function pins.

1.2 Features

- Minimum instruction execution time: 50 ns (operation at main clock (f_{xx}) = 20 MHz)
- General-purpose registers: 32 bits × 32 registers
- CPU features:
 - Signed multiplication (16 × 16 → 32): 1 to 2 clocks
(Instructions without creating register hazards can be continuously executed in parallel)
 - Saturated operations (overflow and underflow detection functions are included)
 - 32-bit shift instruction: 1 clock
 - Bit manipulation instructions
 - Load/store instructions with long/short format
- Memory space: 64 MB of linear address space
 - Memory block division function: 2 MB, 2 MB, 4 MB, 8 MB (Total of 4 blocks)
 - Internal memory
 - μPD703216, 703216Y (Mask ROM: 96 KB/RAM: 6 KB)
 - μPD703217, 703217Y (Mask ROM: 128 KB/RAM: 6 KB)
 - μPD70F3217, 70F3217Y, 70F3217H, 70F3217HY (Flash memory: 128 KB/RAM: 6 KB)
 - μPD70F3218H, 70F3218HY (Flash memory: 256 KB/RAM: 16 KB)
 - External bus interface
 - Separate bus/multiplex bus output selectable
 - 8-/16-bit data bus sizing function
 - Wait function
 - Programmable wait function
 - External wait function
 - Idle state function
 - Bus hold function
- Interrupts and exceptions
 - Non-maskable interrupts: 3 sources
 - Maskable interrupts:
 - 43 sources (μPD703216, 703217, 70F3217, 70F3217H)
 - 45 sources (μPD703216Y, 703217Y, 70F3217Y, 70F3217HY)
 - 46 sources (μPD70F3218H)
 - 48 sources (μPD70F3218HY)
 - Software exceptions: 32 sources
 - Exception trap: 1 source
- I/O lines: Total: 128
- Key interrupt function
- Timer function
 - 16-bit timer/event counter P: 1 channel (μPD70F3218H, 70F3218HY only)
 - 16-bit timer/event counter 0: 6 channels
 - 8-bit timer/event counter 5: 2 channels
 - 8-bit timer H: 2 channels
 - 8-bit interval timer BRG: 1 channel
 - Watch timer/interval timer: 1 channel
 - Watchdog timers
 - Watchdog timer 1 (also usable as oscillation stabilization timer): 1 channel
 - Watchdog timer 2: 1 channel

- Serial interface
 - Asynchronous serial interface (UART): 3 channels
 - 3-wire serial I/O (CSI0): 3 channels
 - 3-wire serial I/O (with automatic transmit/receive function) (CSIA): 2 channels
 - I²C bus interface (I²C): 2 channels
 - (μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, 70F3218HY)
- A/D converter: 10-bit resolution $\times$ 16 channels
- D/A converter: 8-bit resolution $\times$ 2 channels
- Real-time output port: 6 bits $\times$ 2 channels
- Standby functions: HALT/IDLE/STOP modes, subclock/sub-IDLE modes
- ROM correction: 4 correction addresses specifiable
- <R> ○ On-chip debug function: JTAG interface (only in the μ PD70F3218H, 70F3218HY)
- Clock generator
 - Main clock oscillation (f_x)/subclock oscillation (f_{XT})
 - CPU clock (f_{CPU}) 7 steps (f_{xx}, f_{xx}/2, f_{xx}/4, f_{xx}/8, f_{xx}/16, f_{xx}/32, f_{XT})
 - Clock-through mode/PLL mode selectable
- Reset
 - Reset by $\overline{\text{RESET}}$ pin
 - Reset by overflow of watchdog timer 1 (WDTRES1)
 - Reset by overflow of watchdog timer 2 (WDTRES2)
- Package: 144-pin plastic LQFP (fine pitch) (20 $\times$ 20)

1.3 Applications

- Automotive
 - System control of body electrical system (power windows, keyless entry reception, etc.)
 - Submicrocontroller of control system
- Home audio, car audio
- AV equipment
- PC peripheral devices (keyboards, etc.)
- Household appliances
 - Outdoor units of air conditioners
 - Microwave ovens, rice cookers
- Industrial devices
 - Pumps
 - Vending machines
 - FA

1.4 Ordering Information

	Part Number	Package	Quality Grade
	μ PD703216GJ-xxx-UEN	144-pin plastic LQFP (fine pitch) (20 × 20)	Standard

- Notes**
1. IC pin: Connect directly to Vss (μ PD703216, 703216Y, 703217, 703217Y).
VPP pin: Connect to Vss in normal operation mode (μ PD70F3217, 70F3217Y).
FLMD0 pin: Connect to Vss in normal operation mode (μ PD70F3217H, 70F3217HY, 70F3218H, 70F3218HY).
FLMD1 pin: Used only in the μ PD70F3217H, 70F3217HY, 70F3218H, and 70F3218HY.
 2. When using a regulator, connect the REGC pin to Vss via a 10 μ F capacitor.
When not using a regulator, connect the REGC pin directly to VDD.
 3. In the μ PD70F3218H and 70F3218HY, care must be exercised in processing the P05 pin when reset is released. For details, refer to **4.6.3 Cautions on on-chip debug pins**.
 4. The TIP00, TOP00, TIP01, TOP01, DRST, DDI, DDO, DCK, and DMS pins can be used only in the μ PD70F3218H and 70F3218HY.
 5. The SCL0, SDA0, SCL1, and SDA1 pins can be used only in the μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, and 70F3218HY.

Caution Make EVDD the same potential as VDD.
BVDD can be used when VDD = EVDD $\geq$ BVDD.

Pin identification

	A0 to A23:	Address bus	PCT0 to PCT7:	Port CT
	AD0 to AD15:	Address/data bus	PDH0 to PDH7:	Port DH

FLMD0, FLMD1 : μ PD70F3217H, 70F3217HY, 70F3218H, 70F3218HY

(2) Internal units**(a) CPU**

The CPU uses five-stage pipeline control to enable single-clock execution of address calculations, arithmetic logic operations, data transfers, and almost all other types of instruction processing.

Other dedicated on-chip hardware, such as a multiplier (16 bits $\times$ 16 bits $\rightarrow$ 32 bits) and a barrel shifter (32 bits) help accelerate complex processing.

(b) Bus control unit (BCU)

The BCU starts a required external bus cycle based on the physical address obtained by the CPU.

When an instruction is fetched from external memory space and the CPU does not send a bus cycle start request, the BCU generates a prefetch address and prefetches the instruction code. The prefetched instruction code is stored in an internal instruction queue.

(c) ROM

This consists of a 256 KB, 128 KB, or 96 KB mask ROM or flash memory mapped to the address spaces from 0000000H to 003FFFFH, 0000000H to 001FFFFH, or 0000000H to 0017FFFFH, respectively.

ROM can be accessed by the CPU in one clock cycle during instruction fetch.

(d) RAM

This consists of a 16 KB or 6 KB RAM mapped to the address spaces from 3FFB000H to 3FFEFFFH or 3FFD800H to 3FFEFFFH.

RAM can be accessed by the CPU in one clock cycle during data access.

(e) Interrupt controller (INTC)

This controller handles hardware interrupt requests (NMI, INTP0 to INTP6) from on-chip peripheral hardware and external hardware. Eight levels of interrupt priorities can be specified for these interrupt requests, and multiplexed servicing control can be performed.

(f) Clock generator (CG)

A main clock oscillator and subclock oscillator are provided and generate the main clock oscillation frequency (f_x) and subclock frequency (f_{xT}), respectively.

There are two modes: In the clock-through mode, f_x is used as the main clock frequency (f_{xx}) as is. In the PLL mode, f_x is used multiplied by 4.

The CPU clock frequency (f_{CPU}) can be selected from among f_{xx} , $f_{xx}/2$, $f_{xx}/4$, $f_{xx}/8$, $f_{xx}/16$, $f_{xx}/32$, and f_{xT} .

(g) Timer/counter

Six 16-bit timer/event counter 0 channels, one 16-bit timer/event counter P channel^{Note}, and two 8-bit timer/event counter 5 channels are incorporated, enabling measurement of pulse intervals and frequency as well as programmable pulse output.

Two 8-bit timer/event counter 5 channels can be connected in cascade to configure a 16-bit timer.

Two 8-bit timer H channels enabling programmable pulse output are provided on chip.

Note μ PD70F3218H, 70F3218HY only

(h) Watch timer

This timer counts the reference time (0.5 seconds) for counting the clock from the subclock (32.768 kHz) or f_{BRG} (32.768 kHz) from the clock generator. At the same time, the watch timer can be used as an interval timer.

(i) Watchdog timer

Two watchdog timer channels are provided on chip to detect program loops and system abnormalities. Watchdog timer 1 can be used as an interval timer. When used as a watchdog timer, it generates a non-maskable interrupt request signal (INTWDT1) or system reset signal (WDTRES1) after an overflow occurs. When used as an interval timer, it generates a maskable interrupt request signal (INTWDTM1) after an overflow occurs.

Watchdog timer 2 operates by default following reset release.

It generates a non-maskable interrupt request signal (INTWDT2) or system reset signal (WDTRES2) after an overflow occurs.

(j) Serial interface (SIO)

The V850ES/KJ1 includes four kinds of serial interfaces: an asynchronous serial interface (UARTn), a clocked serial interface (CSI0n), a clocked serial interface with an automatic transmit/receive function (CSIAm), and an I²C bus interface (I²Cm). The μ PD703216, 703217, 70F3217, 70F3217H, and 70F3218H can simultaneously use up to eight channels, and the μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, and 70F3218HY up to nine channels.

For UARTn, data is transferred via the TXDn and RXDn pins.

For CSI0n, data is transferred via the SO0n, SI0n, and $\overline{SCK0n}$ pins.

For CSIAm, data is transferred via the SOAm, SIAm, and $\overline{SCKAm}$ pins.

For I²Cm, data is transferred via the SDAm and SCLm pins.

I²Cm is provided only in the μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, and 70F3218HY.

Remark n = 0 to 2
 m = 0, 1

(k) A/D converter

This high-speed, high-resolution 10-bit A/D converter includes 16 analog input pins. Conversion is performed using the successive approximation method.

(l) D/A converter

Two 8-bit resolution D/A converter channels are included on chip. The D/A converter uses the R-2R ladder method.

(m) ROM correction

This function is used to replace part of a program in the mask ROM with that contained in the internal RAM. Up to four correction addresses can be specified.

(n) Key interrupt function

A key interrupt request signal (INTKR) can be generated by inputting a falling edge to the eight key input pins.

(o) Real-time output function

This function transfers 6-bit data set beforehand to output latches upon occurrence of a timer compare register match signal.

A 2-channel 6-bit data real-time output function is provided on chip.

<R>

(p) On-chip debug function

An on-chip debug function that uses the JTAG (Joint Test Action Group) communication specifications is provided. Switching between the normal port function and on-chip debug function is done with the control pin input level and the on-chip debug mode register (OCDM).

The on-chip debug function is available only in the μ PD70F3218H and 70F3218HY.

(q) Ports

As shown below, the following ports have general-purpose port functions and control pin functions.

Port	I/O	Alternate Function
P0	7-bit I/O	NMI, external interrupt, timer output
P1	2-bit I/O	D/A converter analog output
P3	10-bit I/O	Serial interface, timer I/O
P4	3-bit I/O	Serial interface
P5	6-bit I/O	Serial interface, timer I/O, key interrupt function, real-time output function
P6	16-bit I/O	Serial interface, timer I/O, real-time output function
P7	16-bit input	A/D converter analog input
P8	2-bit I/O	Serial interface
P9	16-bit I/O	External address bus, serial interface, timer I/O, external interrupt, key interrupt function
PCD	4-bit I/O	—
PCM	6-bit I/O	External bus control signal
PCS	8-bit I/O	Chip select output
PCT	8-bit I/O	External bus control signal
PDH	8-bit I/O	External address bus
PDL	16-bit I/O	External address/data bus

1.7 Overview of Functions

Part Number		μ PD703216/ μ PD703216Y	μ PD703217/ μ PD703217Y	μ PD70F3217/ μ PD70F3217Y	μ PD70F3217H/ μ PD70F3217HY	μ PD70F3218H/ μ PD70F3218HY
Internal memory	ROM	96 KB	128 KB	128 KB (two-power flash memory)	128 KB (single-power flash memory)	256 KB (single-power flash memory)
	High-speed RAM	6 KB				16 KB
Buffer RAM		64 bytes				
Memory space	Logical space	64 MB				
	External memory area	15 MB				
External bus interface		Address bus: 24 bits Data bus: 8/16 bits Multiplex bus mode/separate bus mode				
General-purpose registers		32 bits $\times$ 32 registers				
Main clock (oscillation frequency)		Ceramic/crystal/external clock				
		When PLL not used		2 to 10 MHz: 2.7 to 5.5 V		
		When PLL used	REGC pin connected directly to V _{DD}	2 to 5 MHz: 4.5 to 5.5 V, 2 to 4 MHz: 4.0 to 5.5 V, 2 to 2.5 MHz: 2.7 to 5.5 V

DSP function		32 $\times$ 32 = 64: 200 to 250 ns (at 20 MHz) 32 $\times$ 32 + 32 = 32: 300 ns (at 20 MHz) 16 $\times$ 16 = 32: 50 to 100 ns (at 20 MHz) 16 $\times$ 16 + 32 = 32: 150 ns (at 20 MHz)				
I/O ports		128 - Input: 16 - I/O: 112 (among these, N-ch open-drain output selectable: 12, fixed to N-ch open-drain output: 6)				
Timer		16-bit timer/event counter 0: 6 channels 8-bit timer/event counter 5: 2 channels (16-bit timer/event counter: usable as 1 channel) 8-bit timer H: 2 channels Watch timer: 1 channel 8-bit interval timer: 1 channel Watchdog timer: 2 channels				16-bit timer/event counter P: 1 channel
Real-time output port		2 channels: 4 bits $\times$ 1, 2 bits $\times$ 1, or 6 bits $\times$ 1				
A/D converter		10-bit resolution $\times$ 16 channels				
D/A converter		8-bit resolution $\times$ 2 channels				
DMA controller		4 channels				
Serial interface		CSI: 3 channels CSIA (with automatic transmit/receive function): 2 channels UART: 3 channels/2 channels ^{Note 1} UART/I ² C bus: 1 channel ^{Note 1} I ² C bus: 1 channel ^{Note 1} Dedicated baud rate generator: 3 channels				
Interrupt sources		External: 9 (9) ^{Note 2} , internal: 38/40 ^{Note 1}				External: 9 (9) ^{Note 2} , internal: 41/43 ^{Note 1}
Power save function		STOP/IDLE/HALT/sub-IDLE mode				
On-chip debug function		None				Provided
Operating supply voltage		4.5 to 5.5 V (at 20 MHz)/4.0 to 5.5 V (at 16 MHz)/2.7 to 5.5 V (at 10 MHz)				
Package		144-pin plastic LQFP (fine pitch) (20 $\times$ 20 mm)				

Notes 1. Only in products with an I²C bus (Y products).

2. The figure in parentheses indicates the number of external interrupts for which STOP mode can be released.

<R>

CHAPTER 2 PIN FUNCTIONS

The names and functions of the pins of the V850ES/KJ1 are described below, divided into port pins and non-port pins.

The pin I/O buffer power supplies are divided into three systems; AV_{REF0}/AV_{REF1} , BV_{DD} , and EV_{DD} . The relationship between these power supplies and the pins is shown below.

Table 2-1. Pin I/O Buffer Power Supplies

Power Supply	Corresponding Pins
AV_{REF0}	Port 7
AV_{REF1}	Port 1
BV_{DD}	Ports CD, CM, CS, CT, DH, DL
EV_{DD}	$\overline{RESET}$, ports 0, 3 to 6, 8, 9

2.1 List of Pin Functions

(1) Port pins

(1/4)

Pin Name	Pin No.	I/O	Pull-up Resistor	Function	Alternate Function
P00	6	I/O	Yes	Port 0 I/O port Input/output can be specified in 1-bit units.	TOH0
P01	7				TOH1
P02	17				NMI
P03	18				INTP0
P04	19				INTP1
P05 ^{Note 1}	20				INTP2/DRST ^{Note 2}
P06	21				INTP3
P10	3	I/O	Yes	Port 1 I/O port Input/output can be specified in 1-bit units.	ANO0
P11	4				ANO1
P30	25	I/O	Yes	Port 3 I/O port Input/output can be specified in 1-bit units. P36 to P39 are fixed to N-ch open-drain output.	TXD0
P31	26				RXD0
P32	27				ASCK0
P33	28				TI000/TO00/TIP00 ^{Note 2} / TOP00 ^{Note 2}
P34	29				TI001/TIP01 ^{Note 2} /TOP01 ^{Note 2}
P35	30				TI010/TO01
P36	31		No ^{Note 3}		—
P37	32				—
P38	35				SDA0 ^{Note 4}
P39	36				SCL0 ^{Note 4}

Notes 1. In the μ PD70F3218H and 70F3218HY, care must be exercised in processing the P05 pin when reset is released. For details, refer to **4.6.3 Cautions on on-chip debug pins**.

2. Only in the μ PD70F3218H and 70F3218HY

3. An on-chip pull-up resistor can be provided by a mask option (only in the mask ROM versions).

4. Only in products with an I²C bus (Y products)

(2/4)

Pin Name	Pin No.	I/O	Pull-up Resistor	Function	Alternate Function
P40	22	I/O	Yes	Port 4 I/O port Input/output can be specified in 1-bit units. P41 and P42 can be specified as N-ch open-drain output in 1-bit units.	SI00
P41	23				SO00
P42	24				$\overline{\text{SCK00}}$
P50	37	I/O	Yes	Port 5 I/O port Input/output can be specified in 1-bit units. P54 and P55 can be specified as N-ch open-drain output in 1-bit units.	TI011/RTP00/KR0
P51	38				TI50/RTP01/KR1
P52	39				TO50/RTP02/KR2/DDI ^{Note 1}
P53	40				SIA0/RTP03/KR3/DDO ^{Note 1}
P54	41				SOA0/RTP04/KR4/DCK ^{Note 1}
P55	42				$\overline{\text{SCKA0}}$ /RTP05/KR5/DMS ^{Note 1}
P60	43	I/O	Yes	Port 6 I/O port Input/output can be specified in 1-bit units. P67 and P68 can be specified as N-ch open-drain output in 1-bit units. P614 and P615 are fixed to N-ch open-drain output.	RTP10
P61	44				RTP11
P62	45				RTP12
P63	46				RTP13
P64	47				RTP14
P65	48				RTP15
P66	49				SI02
P67	50				SO02
P68	51				$\overline{\text{SCK02}}$
P69	52				TI040
P610	53				TI041
P611	54				TO04
P612	55				TI050
P613	56				TI051/TO05
P614	57				No ^{Note 2}
P615	58		—		
P70	144	Input	No	Port 7 Input port	ANI0

X2	13	–	No		–
XT1	15	Input	No	Connecting resonator for subclock	–
XT2	16	–	No		–

- Notes**
1. Only in the μ PD70F3218H and 70F3218HY
 2. Only in products with an I²C bus (Y products)
 3. Only in the μ PD70F3217 and 70F3217Y

2.2 Pin Status

The address bus becomes undefined during accesses to the internal RAM and ROM. The data bus goes into the high-impedance state without data output. The external bus control signal becomes inactive.

During peripheral I/O access, the address bus outputs the addresses of the on-chip peripheral I/Os that are accessed. The data bus goes into the high-impedance state without data output. The external bus control signal becomes inactive.

Table 2-2. Pin Operation Status in Operation Modes

Pin \ Operating Status	Reset ^{Note 1}	HALT Mode	IDLE Mode/ STOP Mode	Idle State ^{Note 2}	Bus Hold
AD0 to AD15 (PDL0 to PDL15)	Hi-Z	Note 3	Hi-Z	Held	Hi-Z
A0 to A15 (P90 to P915)	Hi-Z	Undefined ^{Note 4}	Hi-Z	Held	Hi-Z

HLDK (PCM2)	Hi-Z	Operating	H	H	L
HLDRQ (PCM3)	Hi-Z	Operating	–	–	Operating

- Notes**
1. Since the bus control pin is also used as a port pin, it is initialized to the port mode (input) after reset.
 2. The pin statuses in the idle state inserted after the T3 state in the multiplex bus mode and after the T2 state in the separate bus mode are listed.
 3. In separate bus mode: Hi-Z
In multiplex bus mode: Undefined
 4. Only in separate bus mode

Remark

Hi-Z: High impedance
H: High-level output
L: Low-level output
–: Input without sampling (input acknowledgment not possible)

Remark Read V_{DD} as EV_{DD} or BV_{DD}. Also, read V_{SS} as EV_{SS} or BV_{SS}.

CHAPTER 3 CPU FUNCTIONS

The CPU of the V850ES/KJ1 is based on the RISC architecture and executes most instructions in one clock cycle by using 5-stage pipeline control.

3.1 Features

- Number of instructions: 83
- Minimum instruction execution time: 50.0 ns (@ 20 MHz operation: 4.5 to 5.5 V, REGC = V_{DD})
62.5 ns (@ 16 MHz operation: 4.0 to 5.5 V, REGC = 10 μ F)
<R> 100 ns (@ 10 MHz operation: 2.7 to 5.5 V, REGC = V_{DD})
- Memory space Program (physical address) space: 64 MB linear
 Data (logical address) space: 4 GB linear
 - Memory block division function: 2 MB, 2 MB, 4 MB, 8 MB/Total of 4 blocks
- General-purpose registers: 32 bits $\times$ 32
- Internal 32-bit architecture
- 5-stage pipeline control
- Multiply/divide instructions
- Saturated operation instructions
- 32-bit shift instruction: 1 clock
- Load/store instruction with long/short format
- Four types of bit manipulation instructions
 - SET1
 - CLR1
 - NOT1
 - TST1

3.2 CPU Register Set

The CPU registers of the V850ES/KJ1 can be classified into two categories: a general-purpose program register set and a dedicated system register set. All the registers have 32-bit width.

For details, refer to the **V850ES Architecture User's Manual**.

(1) Program register set		(2) System register set	
31	0	31	0
r0	(Zero register)	EIPC	(Interrupt status saving register)
r1	(Assembler-reserved register)	EIPSW	(Interrupt status saving register)
r2			
r3	(Stack pointer (SP))	FEPC	(NMI status saving register)
r4	(Global pointer (GP))	FEPSW	(NMI status saving register)
r5	(Text pointer (TP))		
r6		ECR	(Interrupt source register)
r7			
r8		PSW	(Program status word)
r9			
r10		CTPC	(CALLT execution status saving register)
r11		CTPSW	(CALLT execution status saving register)
r12			
r13		DBPC	(Exception/debug trap status saving register)
r14		DBPSW	(Exception/debug trap status saving register)
r15			
r16			
r17		CTBP	(CALLT base pointer)
r18			
r19			
r20			
r21			
r22			
r23			
r24			
r25			
r26			
r27			
r28			
r29			
r30	(Element pointer (EP))		
r31	(Link pointer (LP))		
31	0		
PC	(Program counter)		

3.2.1 Program register set

The program register set includes general-purpose registers and a program counter.

(1) General-purpose registers (r0 to r31)

Thirty-two general-purpose registers, r0 to r31, are available. All of these registers can be used as a data variable or address variable.

However, r0 and r30 are implicitly used by instructions and care must be exercised when using these registers. r0 always holds 0 and is used for operations that use 0 and offset 0 addressing. r30 is used as a base pointer when performing memory access with the SLD and SST instructions.

Also, r1, r3 to r5, and r31 are implicitly used by the assembler and C compiler. Therefore, before using these registers, their contents must be saved so that they are not lost, and they must be restored to the registers after the registers have been used. There are cases when r2 is used by the real-time OS. If r2 is not used by the real-time OS, r2 can be used as a variable register.

Table 3-1. Program Registers

Name	Usage	Operation
r0	Zero register	Always holds 0
r1	Assembler-reserved register	Working register for generating 32-bit immediate
r2	Address/data variable register (when r2 is not used by the real-time OS to be used)	
r3	Stack pointer	Used to generate stack frame when function is called
r4	Global pointer	Used to access global variable in data area
r5	Text pointer	Register to indicate the start of the text area (area for placing program code)
r6 to r29	Address/data variable register	
r30	Element pointer	Base pointer when memory is accessed
r31	Link pointer	Used by compiler when calling function
PC	Program counter	Holds instruction address during program execution

(2) Program counter (PC)

This register holds the address of the instruction under execution. The lower 26 bits of this register are valid, and bits 31 to 26 are fixed to 0. If a carry occurs from bit 25 to bit 26, it is ignored.

Bit 0 is fixed to 0, and branching to an odd address cannot be performed.

3.2.2 System register set

System registers control the status of the CPU and hold interrupt information.

Read from and write to system registers are performed by setting the system register numbers shown below with the system register load/store instructions (LDSR, STSR instructions).

Table 3-2. System Register Numbers

System Register No.	System Register Name	Operand Specification Enabled	
		LDSR Instruction	STSR Instruction
0	Interrupt status saving register (EIPC) ^{Note 1}	Yes	Yes
1	Interrupt status saving register (EIPSW) ^{Note 1}	Yes	Yes
2	NMI status saving register (FEPC) ^{Note 1}	Yes	Yes
3	NMI status saving register (FEPSW) ^{Note 1}	Yes	Yes
4	Interrupt source register (ECR)	No	Yes
5	Program status word (PSW)	Yes	Yes
6 to 15	Reserved numbers for future function expansion (The operation is not guaranteed if accessed.)	No	No
16	CALLT execution status saving register (CTPC)	Yes	Yes
17	CALLT execution status saving register (CTPSW)	Yes	Yes
18	Exception/debug trap status saving register (DBPC)	Yes ^{Note 2}	Yes ^{Note 2}
19	Exception/debug trap status saving register (DBPSW)	Yes ^{Note 2}	Yes ^{Note 2}
20	CALLT base pointer (CTBP)	Yes	Yes
21 to 31	Reserved numbers for future function expansion (The operation is not guaranteed if accessed.)	No	No

Notes 1. Since only one set of these registers is available, the contents of this register must be saved by the program when multiple interrupt servicing is enabled.

2. These registers can be accessed only during the interval between the execution of the DBTRAP instruction or illegal opcode and the DBRET instruction.

Caution Even if bit 0 of EIPC, FEPC, or CTPC is set (1) by the LDSR instruction, bit 0 is ignored during return with the RETI instruction following interrupt servicing (because bit 0 of PC is fixed to 0). When setting a value to EIPC, FEPC, and CTPC, set an even number (bit 0 = 0).

(1) Interrupt status saving registers (EIPC, EIPSW)

There are two interrupt status saving registers, EIPC and EIPSW.

Upon occurrence of a software exception or a maskable interrupt, the contents of the program counter (PC) are saved to EIPC and the contents of the program status word (PSW) are saved to EIPSW (upon occurrence of a non-maskable interrupt (NMI), the contents are saved to the NMI status saving registers (FEPC, FEPSW)). The address of the next instruction following the instruction executed when a software exception or maskable interrupt occurs is saved to EIPC, except for some instructions (refer to **20.9 Period in Which Interrupts Are Not Acknowledged by CPU**).

The current PSW contents are saved to EIPSW.

Since there is only one set of interrupt status saving registers, the contents of these registers must be saved by the program when multiple interrupt servicing is enabled.

Bits 31 to 26 of EIPC and bits 31 to 8 of EIPSW are reserved (fixed to 0) for future function expansion.

When the RETI instruction is executed, the values in EIPC and EIPSW are restored to the PC and PSW, respectively.

(2) NMI status saving registers (FEPC, FEPSW)

There are two NMI status saving registers, FEPC and FEPSW.

Upon occurrence of a non-maskable interrupt (NMI), the contents of the program counter (PC) are saved to FEPC and the contents of the program status word (PSW) are saved to FEPSW.

The address of the next instruction following the instruction executed when a non-maskable interrupt occurs is saved to FEPC, except for some instructions.

The current PSW contents are saved to FEPSW.

Since there is only one set of NMI status saving registers, the contents of these registers must be saved by the program when multiple interrupt servicing is performed.

Bits 31 to 26 of FEPC and bits 31 to 8 of FEPSW are reserved (fixed to 0) for future function expansion.

(3) Interrupt source register (ECR)

Upon occurrence of an interrupt or an exception, the interrupt source register (ECR) holds the source of an interrupt or an exception. The value held by ECR is the exception code coded for each interrupt source. This register is a read-only register, and thus data cannot be written to it using the LDSR instruction.

(4) Program status word (PSW)

The program status word (PSW) is a collection of flags that indicate the program status (instruction execution result) and the CPU status.

When the contents of this register are changed using the LDSR instruction, the new contents become valid immediately following completion of LDSR instruction execution. Interrupt request acknowledgment is held pending while a write to the PSW is being executed by the LDSR instruction.

Bits 31 to 8 are reserved (fixed to 0) for future function expansion.

(1/2)

Bit position	Flag name	Description
31 to 8	RFU	Reserved field. Fixed to 0.
7	NP	Indicates that non-maskable interrupt (NMI) servicing is in progress. This flag is set to 1 when an NMI request is acknowledged, and disables multiple interrupts. 0: NMI servicing not in progress 1: NMI servicing in progress
6	EP	Indicates that exception processing is in progress. This flag is set to 1 when an exception occurs. Moreover, interrupt requests can be acknowledged even when this bit is set. 0: Exception processing not in progress 1: Exception processing in progress
5	ID	Indicates whether maskable interrupt request acknowledgment is enabled. 0: Interrupt enabled 1: Interrupt disabled
4	SAT ^{Note}	Indicates that the result of executing a saturated operation instruction has overflowed and that the calculation result is saturated. Since this is a cumulative flag, it is set to 1 when the result of a saturated operation instruction becomes saturated, and it is not cleared to 0 even if the operation results of successive instructions do not become saturated. This flag is neither set nor cleared when arithmetic operation instructions are executed. 0: Not saturated 1: Saturated
3	CY	Indicates whether carry or borrow occurred as the result of an operation. 0: No carry or borrow occurred 1: Carry or borrow occurred
2	OV ^{Note}	Indicates whether overflow occurred during an operation. 0: No overflow occurred 1: Overflow occurred.
1	S ^{Note}	Indicates whether the result of an operation is negative. 0: Operation result is positive or 0. 1: Operation result is negative.
0	Z	Indicates whether operation result is 0. 0: Operation result is not 0. 1: Operation result is 0.

Remark Note is explained on the following page.

(2/2)

Note During saturated operation, the saturated operation results are determined by the contents of the OV flag and S flag. The SAT flag is set (to 1) only when the OV flag is set (to 1) during saturated operation.

Operation result status	Flag status			Saturated operation result
	SAT	OV	S	
Maximum positive value exceeded	1	1	0	7FFFFFFFH
Maximum negative value exceeded	1	1	1	80000000H
Positive (maximum value not exceeded)	Holds value before operation	0	0	Actual operation result
Negative (maximum value not exceeded)			1	

(5) CALLT execution status saving registers (CTPC, CTPSW)

There are two CALLT execution status saving registers, CTPC and CTPSW.

When the CALLT instruction is executed, the contents of the program counter (PC) are saved to CTPC, and the program status word (PSW) contents are saved to CTPSW.

The contents saved to CTPC consist of the address of the next instruction after the CALLT instruction.

The current PSW contents are saved to CTPSW.

Bits 31 to 26 of CTPC and bits 31 to 8 of CTPSW are reserved (fixed to 0) for future function expansion.

There are two exception/debug trap status saving registers, DBPC and DBPSW. Upon occurrence of an exception trap or debug trap, the contents of the program counter (PC) are saved to DBPC, and the program status word (PSW) contents are saved to DBPSW. The contents saved to DBPC consist of the address of the next instruction after the instruction executed when an exception trap or debug trap occurs. The current PSW contents are saved to DBPSW. Bits 31 to 26 of DBPC and bits 31 to 8 of DBPSW are reserved (fixed to 0) for future function expansion.

Bits 31 to 26 are reserved (fixed to 0) for future function expansion.

3.3 Operating Modes

The V850ES/KJ1 has the following operating modes.

(1) Normal operating mode

After the system has been released from the reset state, the pins related to the bus interface are set to the port mode, execution branches to the reset entry address of the internal ROM, and instruction processing is started.

(2) Flash memory programming mode

This mode is valid only in flash memory versions (μ PD70F3217, 70F3217Y, 70F3217H, 70F3217HY, 70F3218H, and 70F3218HY).

When this mode is specified, the internal flash memory can be programmed by using a flash programmer.

(a) Specifying operating mode

(i) μ PD70F3217, 70F3217Y

The internal flash memory can be written or erased when $10\text{ V} \pm 0.3\text{ V}$ is applied to the V_{PP} pin.

V_{PP}	Operating Mode
0	Normal operating mode
$10\text{ V} \pm 0.3\text{ V}$	Flash memory programming mode
V_{DD}	Setting prohibited

(ii) μ PD70F3217H, 70F3217HY, 70F3218H, 70F3218HY

The operating mode is specified according to the status (input level) of the FLMD0 and FLMD1 pins.

In the normal operating mode, input a low level to the FLMD0 pin during the reset period.

A high level is input to the FLMD0 pin by the flash programmer in the flash memory programming mode if a flash programmer is connected. In the self-programming mode, input a high level to this pin from an external circuit.

Fix the specification of these pins in the application system and do not change the setting of these pins during operation.

FLMD0	FLMD1	Operating Mode
L	×	Normal operating mode
H	L	Flash memory programming mode
H	H	Setting prohibited

Remark H: High level
L: Low level
×: don't care

3.4 Address Space

3.4.1 CPU address space

For instruction addressing, up to a combined total of 16 MB of external memory area and internal ROM area, plus an internal RAM area, are supported in a linear address space (program space) of up to 64 MB. For operand addressing (data access), up to 4 GB of a linear address space (data space) is supported. The 4 GB address space, however, is viewed as 64 images of a 64 MB physical address space. This means that the same 64 MB physical address space is accessed regardless of the value of bits 31 to 26.

Figure 3-1. Address Space Image

3.4.2 Wraparound of CPU address space

(1) Program space

Of the 32 bits of the program counter (PC), the higher 6 bits are fixed to 0 and only the lower 26 bits are valid. Even if a carry or borrow occurs from bit 25 to bit 26 as a result of branch address calculation, the higher 6 bits ignore this and remain 0.

Therefore, the lower-limit address of the program space, 00000000H, and the upper-limit address, 03FFFFFFH, are contiguous addresses, and the program space is wrapped around at the boundary of these addresses.

Caution No instructions can be fetched from the 4 KB area of 03FFF000H to 03FFFFFFH because this area is an on-chip peripheral I/O area. Therefore, do not execute any branch operation instructions in which the destination address will reside in any part of this area.

(2) Data space

The result of an operand address calculation that exceeds 32 bits is ignored.

Therefore, the lower-limit address of the data space, address 00000000H, and the upper-limit address, FFFFFFFFH, are contiguous addresses, and the data space is wrapped around at the boundary of these addresses.

3.4.3 Memory map

The V850ES/KJ1 has reserved areas as shown below.

Figure 3-2. Data Memory Map (Physical Addresses)

Figure 3-3. Program Memory Map

3.4.4 Areas

(1) Internal ROM area

An area of 1 MB from 0000000H to 00FFFFFFH is reserved for the internal ROM area.

(a) Internal ROM (256 KB)

A 256 KB area from 0000000H to 003FFFFH is provided in the following products.

Addresses 0040000H to 00FFFFFFH are an access-prohibited area.

- μ PD70F3218H, 70F3218HY

Figure 3-4. Internal ROM Area (256 KB)

(b) Internal ROM (128 KB)

A 128 KB area from 0000000H to 001FFFFH is provided in the following products.

Addresses 0020000H to 00FFFFFFH are an access-prohibited area.

- μ PD703217, 703217Y, 70F3217, 70F3217Y, 70F3217H, 70F3217HY

Figure 3-5. Internal ROM Area (128 KB)

**(c) Internal ROM (96 KB)**

A 96 KB area from 0000000H to 0017FFFFH is provided in the following products.

Addresses 0018000H to 00FFFFFFH are an access-prohibited area.

- μ PD703216, 703216Y

Figure 3-6. Internal ROM Area (96 KB)

(2) Internal RAM area

An area of 60 KB maximum from 3FF0000H to 3FFFFFFFFH is reserved for the internal RAM area.

(a) Internal RAM (16 KB)

A 16 KB area from 3FFB000H to 3FFFFFFFFH is provided as physical internal RAM.

Addresses 3FF0000H to 3FFAFFFFH are an access-prohibited area.

Figure 3-7. Internal RAM Area (16 KB)

(b) Internal RAM (6 KB)

A 6 KB area from 3FFD800H to 3FFEFFFH is provided as physical internal RAM.

Addresses 3FF0000H to 3FFD7FFH are an access-prohibited area.

- μ PD703216, 703216Y, 703217, 703217Y, 70F3217, 70F3217Y, 70F3217H, 70F3217HY

Figure 3-8. Internal RAM Area (6 KB)

(3) On-chip peripheral I/O area

A 4 KB area from 3FFF000H to 3FFFFFFH is reserved as the on-chip peripheral I/O area.

Figure 3-9. On-Chip Peripheral I/O Area

Peripheral I/O registers assigned with functions such as on-chip peripheral I/O operation mode specification and state monitoring are mapped to the on-chip peripheral I/O area. Program fetches are not allowed in this area.

- Cautions**
1. If word access of a register is attempted, halfword access to the word area is performed twice, first for the lower bits, then for the higher bits, ignoring the lower 2 address bits.
 2. If a register that can be accessed in byte units is accessed in halfword units, the higher 8 bits become undefined if the access is a read operation. If a write access is performed, only the data in the lower 8 bits is written to the register.
 3. Addresses that are not defined as registers are reserved for future expansion. If these addresses are accessed, the operation is undefined and not guaranteed.

(4) External memory area

15 MB (0100000H to 0FFFFFFH) are provided as the external memory area. For details, refer to **CHAPTER 5 BUS CONTROL FUNCTION**.

3.4.5 Recommended use of address space

The architecture of the V850ES/KJ1 requires that a register that serves as a pointer be secured for address generation when operand data in the data space is accessed. The address stored in this pointer ± 32 KB can be directly accessed by an instruction for operand data. Because the number of general-purpose registers that can be used as a pointer is limited, however, by keeping the performance from dropping during address calculation when a pointer value is changed, as many general-purpose registers as possible can be secured for variables, and the program size can be reduced.

(1) Program space

Of the 32 bits of the PC (program counter), the higher 6 bits are fixed to 0, and only the lower 26 bits are valid. Regarding the program space, therefore, a 64 MB space of contiguous addresses starting from 00000000H unconditionally corresponds to the memory map.

To use the internal RAM area as the program space, access following addresses.

RAM Size	Access Address
6 KB	3FFD800H to 3FFEFFFFH
16 KB	3FFB000H to 3FFEFFFFH

(2) Data space

With the V850ES/KJ1, it seems that there are sixty-four 64 MB address spaces on the 4 GB CPU address space. Therefore, the least significant bit (bit 25) of a 26-bit address is sign-extended to 32 bits and allocated as an address.

(a) Application example of wraparound

If R = r0 (zero register) is specified for the LD/ST disp16 [R] instruction, a range of addresses 00000000H $\pm$ 32 KB can be addressed by sign-extended disp16. All the resources, including the internal hardware, can be addressed by one pointer.

The zero register (r0) is a register fixed to 0 by hardware, and practically eliminates the need for registers dedicated to pointers.

Example: μ PD703217, 703217Y

Figure 3-10. Recommended Memory Map

Note Access to this area is prohibited. To access the on-chip peripheral I/O in this area, specify addresses FFFF000H to FFFFFFFFH.

Remarks 1. ↑ indicates the recommended area.

2. This figure is the recommended memory map of the μPD703217 and 703217Y.

3.4.6 Peripheral I/O registers

(1/12)

Address	Function Register Name	Symbol	R/W	Operable Bit Unit			After Reset
				1	8	16

3.4.7 Special registers

Special registers are registers that prevent invalid data from being written when an inadvertent program loop occurs.

The V850ES/KJ1 has the following four special registers.

- Power save control register (PSC)
- Processor clock control register (PCC)
- Watchdog timer mode register (WDTM1)
- <R> • On-chip debug mode register (OCDM): μ PD70F3218H, 70F3218HY only

Moreover, there is also the PRCMD register, which is a protection register for write operations to the special registers that prevents the application system from unexpectedly stopping due to an inadvertent program loop. Write access to the special registers is performed with a special sequence and illegal store operations are notified to the SYS register.

(1) Setting data to special registers

Setting data to a special registers is done in the following sequence.

- <1> Prepare the data to be set to the special register in a general-purpose register.
- <2> Write the data prepared in step <1> to the PRCMD register.
- <3> Write the setting data to the special register (using following instructions).
 - Store instruction (ST/SST instruction)
 - Bit manipulation instruction (SET1/CLR1/NOT1 instruction)
- <4> to <8> Insert NOP instructions (5 instructions)^{Note}.

[Description Example] When using PSC register (standby mode setting)

```

    ST.B r11,PSMR[r0]    ; PSMR register setting (IDLE, STOP mode setting)
<1> MOV 0x02,r10
<2> ST.B r10,PRCMD[r0]   ; PRCMD register write
<3> ST.B r10,PSC[r0]     ; PSC register setting
<4> NOPNote              ; Dummy instruction
<5> NOPNote              ; Dummy instruction
<6> NOPNote              ; Dummy instruction
<7> NOPNote              ; Dummy instruction
<8> NOPNote              ; Dummy instruction
(next instruction)
```

No special sequence is required to read special registers.

Note When switching to the IDLE mode or the STOP mode (PSC.STP bit = 1), 5 NOP instructions must be inserted immediately after switching is performed.

- Cautions**
1. Interrupts are not acknowledged for the store instruction for the PRCMD register. This is because continuous execution of store instructions by the program in steps <2> and <3> above is assumed. If another instruction is placed between step <2> and <3>, the above sequence may not be realized when an interrupt is acknowledged for that instruction, which may cause malfunction.
 2. The data written to the PRCMD register is dummy data, but use the same register as the general-purpose register used for setting data to the special register (step <3>) when writing to the PRCMD register (step <2>). The same applies to when using a general-purpose register for addressing.

(2) Command register (PRCMD)

The PRCMD register is an 8-bit register used to prevent data from being written to registers that may have a large influence on the system, possibly causing the application system to unexpectedly stop, when an inadvertent program loop occurs. Only the first write operation to the special register following the execution of a previously executed write operation to the PRCMD register, is valid.

As a result, register values can be overwritten only using a preset sequence, preventing invalid write operations.

This register can only be written in 8-bit units (if it is read, an undefined value is returned).

After reset: Undefined		W	Address: FFFFF1FCH					
	7	6	5	4	3	2	1	0
PRCMD	REG7	REG6	REG5	REG4	REG3	REG2	REG1	REG0

(3) System status register (SYS)

This register is allocated with status flags showing the operating state of the entire system.

This register can be read or written in 8-bit or 1-bit units.

After reset: 00H		R/W		Address: FFFFF802H				
	7	6	5	4	3	2	1	<0>
SYS	0	0	0	0	0	0	0	PRERR
PRERR		Detection of protection error						
0		Protection error has not occurred						
1		Protection error has occurred						

The operation conditions of the PRERR flag are described below.

(a) Set conditions (PRERR = 1)

- (i) When a write operation to the special register takes place without write operation being performed to the PRCMD register (when step <3> is performed without performing step <2> as described in **3.4.7 (1) Setting data to special registers**).
- (ii) When a write operation (including bit manipulation instruction) to an on-chip peripheral I/O register other than a special register is performed following write to the PRCMD register (when <3> in **3.4.7 (1) Setting data to special registers** is not a special register).

Remark Regarding the special registers other than the WDTM register (PCC and PSC registers), even if on-chip peripheral I/O register read (except bit manipulation instruction) (internal RAM access, etc.) is performed in between write to the PRCMD register and write to a special register, the PRERR flag is not set and setting data can be written to the special register.

(b) Clear conditions (PRERR = 0)

- (i) When 0 is written to the PRERR flag
- (ii) When system reset is performed

- Cautions**
1. If 0 is written to the PRERR bit of the SYS register that is not a special register immediately following write to the PRCMD register, the PRERR bit becomes 0 (write priority).
 2. If data is written to the PRCMD register that is not a special register immediately following write to the PRCMD register, the PRERR bit becomes 1.

3.4.8 Cautions

(1) Waits on register access

Be sure to set the following register before using the V850ES/KJ1.

- System wait control register (VSWC)

After setting the VSWC register, set the other registers as required.

When using an external bus, set the VSWC register and then set the various pins to the control mode by setting the port-related registers.

(a) System wait control register (VSWC)

The VSWC register controls the bus access wait time for the on-chip peripheral I/O registers.

Access to the on-chip peripheral I/O register lasts 3 clocks (during no wait), but in the V850ES/KJ1, waits are required according to the internal system clock frequency. Set the values shown below to the VSWC register according to the internal system clock frequency that is used.

This register can be read or written in 8-bit units (Address: FFFFF06EH, After reset: 77H).

<R>

Operation Conditions	Internal System Clock Frequency (f_{CLK})	VSWC Register Setting	Number of Waits
$4.5\text{ V} \leq \text{REGC} = V_{DD} \leq 5.5\text{ V}$	$32\text{ kHz} \leq f_{CLK} < 16.6\text{ MHz}$	00H	0 (no waits)
	$16.6\text{ MHz} \leq f_{CLK} \leq 20\text{ MHz}$	01H	1
$4.0\text{ V} \leq \text{REGC} = V_{DD} < 4.5\text{ V}$	$32\text{ kHz} \leq f_{CLK} \leq 16\text{ MHz}$	00H	0 (no waits)
$\text{REGC} = 10\text{ }\mu\text{F},$ $4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$	$32\text{ kHz} \leq f_{CLK} < 8.3\text{ MHz}$	00H	0 (no waits)
	$8.3\text{ MHz} \leq f_{CLK} \leq 16\text{ MHz}$	01H	1
$2.7\text{ V} \leq \text{REGC} = V_{DD} < 4.0\text{ V}$	$32\text{ kHz} \leq f_{CLK} < 8.3\text{ MHz}$	00H	0 (no waits)
	$8.3\text{ MHz} \leq f_{CLK} \leq 10\text{ MHz}$	01H	1

(b) Access to special on-chip peripheral I/O register

This product has two types of internal system buses.

One type is for the CPU bus and the other is for the peripheral bus to interface with low-speed peripheral hardware.

Since the CPU bus clock and peripheral bus clock are asynchronous, if a conflict occurs during access between the CPU and peripheral hardware, illegal data may be passed unexpectedly. Therefore, when accessing peripheral hardware that may cause a conflict, the number of access cycles is changed so that the data is received/passed correctly in the CPU. As a result, the CPU does not shift to the next instruction processing and enters the wait status. When this wait status occurs, the number of execution clocks of the instruction is increased by the number of wait clocks.

Note this with caution when performing real-time processing.

When accessing a special on-chip peripheral I/O register, additional waits may be required further to the waits set by the VSWC register.

The access conditions at that time and the method to calculate the number of waits to be inserted (number of CPU clocks) are shown below.

Number of waits to be inserted = $(2 + m) \times k$ (clocks)

Number of accesses to special on-chip peripheral I/O register = $3 + m + (2 + m) \times k$ (clocks)

Peripheral Function	Register Name	Access	k
Watchdog timer 1 (WDT1)	WDTM1	Write	1 to 5
	$\langle \text{Calculation of number of waits}^{\text{Note 1}} \rangle$ $k = \{(1/f_x) \times 2 / ((2 + m)/f_{CPU})\} + 1$ f_x : Main clock oscillation frequency		
Watchdog timer 2 (WDT2)	WDTM2	Write	3 (fixed)
16-bit timer/event counter P0 (TMP0) ^{Note 2}	TP0CCR0, TP0CCR1, TP0CNT	Read	1
	$\langle \text{Calculation of number of waits}^{\text{Note 1}} \rangle$ $k = \{(1/f_{xx}) / ((2 + m)/f_{CPU})\} + 1$		
	TP0CCR0, TP0CCR1	Write	0 to 2
	$\langle \text{Calculation of number of waits}^{\text{Note 1}} \rangle$ $k = \{(1/f_{xx}) \times 5 / ((2 + m)/f_{CPU})\}$ A wait occurs when performing continuous write to same register		
16-bit timer/event counters 00 to 05 (TM00 to TM05)	TMC00 to TMC05	Read-modify-write	1 (fixed) A wait occurs during write
Clocked serial interfaces 0 and 1 with automatic transmit/receive function (CSIA0, CSIA1)	CSIA0B0 to CSIA0BF, CSIA1B0 to CSIA1BF	Write	0 to 18 (when performing continuous write via write instruction)
	$\langle \text{Calculation of number of waits}^{\text{Note 1}} \rangle$ $k = \{(1/f_{SCKA}) \times 5 - (4 + m)/f_{CPU}\} / \{((2 + m)/f_{CPU})\}$ However, 1 wait if $f_{CPU} = f_{xx}$ if the CSISn.CKSAn1 and CSISn.CKSAn0 bits are 00. f_{SCKA} : CSIA selection clock frequency		
	CSIA0B0 to CSIA0BF, CSIA1B0 to CSIA1BF	Write	0 to 20 (when conflict occurs between write instruction and write via receive operation)
	$\langle \text{Calculation of number of waits}^{\text{Note 1}} \rangle$ $k = \{((1/f_{SCKA}) \times 5) / ((2 + m)/f_{CPU})\}$ f_{SCKA} : CSIA selection clock frequency		
I ² C0 ^{Note 3} , I ² C1 ^{Note 3}	IICS0, IICS1	Read	1 (fixed)
Asynchronous serial interfaces 0 to 2 (UART0 to UART2)	ASIS0 to ASIS2	Read	1 (fixed)
Real-time output functions 0 and 1 (RTO0, RTO1)	RTBL0, RTBL1, RTBH0, RTBH1	Write (when RTPCn.RTPOEn bit = 0)	1
<R> <R> A/D converter	ADM, ADS, PFM, PFT	Write	1 to 5 (1 to 2) ^{Note 4}
	ADCR, ADCRH	Read	1 to 5 (1 to 2) ^{Note 4}
	$\langle \text{Calculation of number of waits}^{\text{Note 1}} \rangle$ $\{(1/f_{AD}) \times 2 / ((2 + m)/f_{CPU})\} + 1^{\text{Note 5}}$ f_{AD} : A/D selection clock frequency		

- Notes**
1. In the calculation of number of waits, the fractional part of its result must be multiplied by $(1/f_{CPU})$ and rounded down if $(1/f_{CPU})/(2 + m)$ or lower, and rounded up if $(1/f_{CPU})/(2 + m)$ is exceeded.
 2. Only in the μ PD70F3218H, 70F3218HY
 3. I²C0 and I²C1 are available only in the products with I²C bus (Y products).
 4. Values in the parentheses are available only in the μ PD70F3217H, 70F3217HY, 70F3218H, and 70F3218HY.
 5. In the μ PD70F3217H, 70F3217HY, 70F3218H, and 70F3218HY, the calculation is as shown below.

$$\{(1/f_{xx}) \times 2 / [(2 + m)/f_{CPU}]\} + 1$$

- Cautions**
1. If fetched from the internal ROM or internal RAM, the number of waits is as shown above. If fetched from the external memory, the number of waits may be decreased below these. The effect of the external memory access cycles varies depending on the wait settings and the like. However, the number of waits shown above is the maximum value, so no higher value is generated.
 2. When the CPU operates on the subclock and no clock is input to the X1 pin, do not access a register in which a wait occurs using an access method that causes a wait. If a wait occurs, it can only be released by a reset.

- Remarks**
1. In the calculation for the number of waits:

f_{CPU} : CPU clock frequency

f_{xx} : Main clock frequency

m : Set value of bits 2 to 0 of the VSWC register

When the VSWC register = 00H: $m = 0$

When the VSWC register = 01H: $m = 1$

2. $n = 0, 1$

<R> (2) Restriction on conflict between sld instruction and interrupt request**(a) Description**

If a conflict occurs between the decode operation of an instruction in <2> immediately before the sld instruction following an instruction in <1> and an interrupt request before the instruction in <1> is complete, the execution result of the instruction in <1> may not be stored in a register.

Instruction <1>

- ld instruction: ld.b, ld.h, ld.w, ld.bu, ld.hu
- sld instruction: sld.b, sld.h, sld.w, sld.bu, sld.hu
- Multiplication instruction: mul, mulh, mulhi, mulu

Instruction <2>

mov reg1, reg2	not reg1, reg2	satsubr reg1, reg2	satsub reg1, reg2
satadd reg1, reg2	satadd imm5, reg2	or reg1, reg2	xor reg1, reg2
and reg1, reg2	tst reg1, reg2	subr reg1, reg2	sub reg1, reg2
add reg1, reg2	add imm5, reg2	cmp reg1, reg2	cmp imm5, reg2
mulh reg1, reg2	shr imm5, reg2	sar imm5, reg2	shl imm5, reg2

<Example>

<i> ld.w [r11], r10 If the decode operation of the mov instruction <ii> immediately before the sld instruction <iii> and an interrupt request conflict before execution of the ld instruction <i> is complete, the execution result of instruction <i> may not be stored in a register.

•
•
•

<ii> mov r10, r28

<iii> sld.w 0x28, r10

(b) Countermeasure

<1> When compiler (CA850) is used

Use CA850 Ver. 2.61 or later because generation of the corresponding instruction sequence can be automatically suppressed.

<2> Countermeasure by assembler

When executing the sld instruction immediately after instruction <ii>, avoid the above operation using either of the following methods.

- Insert a nop instruction immediately before the sld instruction.
- Do not use the same register as the sld instruction destination register in the above instruction <ii> executed immediately before the sld instruction.

CHAPTER 4 PORT FUNCTIONS

4.1 Features

- Input-only ports: 16 pins
- I/O ports: 112 pins
 - Fixed to N-ch open-drain output: 6 (medium: 4)
 - Switchable to N-ch open-drain output: 12
- Input/output can be specified in 1-bit units

4.2 Basic Port Configuration

The V850ES/KJ1 incorporates a total of 128 I/O port pins consisting of ports 0, 1, 3 to 9, CD, CM, CS, CT, DH, and DL (including 16 input-only port pins). The port configuration is shown below.

Table 4-1. Pin I/O Buffer Power Supplies

Power Supply	Corresponding Pins
AV_{REF0}	Port 7
AV_{REF1}	Port 1
BV_{DD}	Port CD, port CM, port CS, port CT, port DH, port DL
EV_{DD}	$\overline{RESET}$, port 0, port 3 to port 6, port 8, port 9

4.3 Port Configuration

Table 4-2. Port Configuration

Item	Configuration
Control registers	Port n register (Pn: n = 0, 1, 3 to 9, CD, CM, CS, CT, DL, DH) Port n mode register (PMn: n = 0, 1, 3 to 6, 8, 9, CD, CM, CS, CT, DL, DH) Port n mode control register (PMCn: n = 0, 3 to 6, 8, 9, CM, CS, CT, DL, DH) Port n function control register (PFCn: n = 3, 5, 6, 8, 9) Port n function register (PFn: n = 3 to 6, 8, 9) Pull-up resistor option register (PUn: n = 0, 1, 3 to 6, 8, 9)
Ports	Input only: 16 I/O: 112
Pull-up resistors	Software control: 56

(1) Port n register (Pn)

Data I/O with external devices is performed by writing to and reading from the Pn register. The Pn register is configured of a port latch that retains the output data and a circuit that reads the pin status.

Each bit of the Pn register corresponds to one pin of port n and can be read or written in 1-bit units.

After reset: 00H^{Note} (output latch) R/W

	7	6	5	4	3	2	1	0
Pn	Pn7	Pn6	Pn5	Pn4	Pn3	Pn2	Pn1	Pn0

Pnm	Control of output data (in output mode)
0	0 is output
1	1 is output

Note Input-only port pins are undefined.

Writing to and reading from the Pn register is executed as follows depending on the setting of each register.

<R>

Table 4-3. Writing to/Reading from Pn Register

Setting of PMCn Register	Setting of PMn Register	Writing to Pn Register	Reading from Pn Register
Port mode (PMCnm bit = 0)	Output mode (PMnm bit = 0)	Write to the output latch ^{Note} . The contents of the output latch are output from the pin.	The value of the output latch is read.
	Input mode (PMnm bit = 1)	Write to the output latch ^{Note} . The status of the pin is not affected.	The pin status is read.
Alternate-function mode (PMCnm bit = 1)	Output mode (PMnm bit = 0)	Write to the output latch ^{Note} . The status of the pin is not affected. The pin operates as an alternate-function pin.	- When alternate function is output The output status of the alternate function is read. - When alternate function is input The output latch value is read.
	Input mode (PMnm bit = 1)	Write to the output latch ^{Note} . The status of the pin is not affected. The pin operates as an alternate-function pin.	The pin status is read.

Note The value written to the output latch is retained until a new value is written to the output latch.

(2) Port n mode register (PMn)

PMn specifies the input mode/output mode of the port.

Each bit of the PMn register corresponds to one pin of port n and can be specified in 1-bit units.

After reset: FFH R/W

	7	6	5	4	3	2	1	0
PMn	PMn7	PMn6	PMn5	PMn4	PMn3	PMn2	PMn1	PMn0

PMnm	Control of I/O mode
0	Output mode
1	Input mode

(3) Port n mode control register (PMCn)

PMCn specifies the port mode/alternate function.

Each bit of the PMCn register corresponds to one pin of port n and can be specified in 1-bit units.

After reset: 00H		R/W									
				7	6	5	4	3	2	1	0
PMCn		PMCn7	PMCn6	PMCn5	PMCn4	PMCn3	PMCn2	PMCn1	PMCn0		
		PMCnm	Specification of operation mode								
		0	Port mode								
		1	Alternate function mode								

(4) Port n function control register (PFCn)

PFCn is a register that specifies the alternate function to be used when one pin has two or more alternate functions.

Each bit of the PFCn register corresponds to one pin of port n and can be specified in 1-bit units.

After reset: 00H R/W

	7	6	5	4	3	2	1	0
PFCn	PFCn7	PFCn6	PFCn5	PFCn4	PFCn3	PFCn2	PFCn1	PFCn0

PFCnm	Specification of alternate function
0	Alternate function 1
1	Alternate function 2

(5) Port n function control expansion register (PFCEn)

PFCEn is a register that specifies the alternate function to be used when one pin has three or more alternate functions.

Each bit of the PFCEn register corresponds to one pin of port n and can be specified in 1-bit units.

After reset: 00H		R/W									
				7	6	5	4	3	2	1	0
PFCEn		PFCEn7	PFCEn6	PFCEn5	PFCEn4	PFCEn3	PFCEn2	PFCEn1	PFCEn0		
				7	6	5	4	3	2	1	0
PFCn		PFCn7	PFCn6	PFCn5	PFCn4	PFCn3	PFCn2	PFCn1	PFCn0		
PFCEnm	PFCnm	Specification of alternate-function									
0	0	Alternate function 1									
0	1	Alternate function 2									
1	0	Alternate function 3									
1	1	Alternate function 4									

(6) Port n function register (PFn)

PFn is a register that specifies normal output/N-ch open-drain output.

Each bit of the PFn register corresponds to one pin of port n and can be specified in 1-bit units.

After reset: 00H		R/W											
				7	6	5	4	3	2	1	0		
PFn		PFn7	PFn6	PFn5	PFn4	PFn3	PFn2	PFn1	PFn0				
PFnm ^{Note}	Control of normal output/N-ch open-drain output												
0	Normal output (CMOS output)												
1	N-ch open-drain output												

Note The PFnm bit is valid only when the PMn.PMnm bit is 0 (output mode) regardless of the setting of the PMCn register. When the PMnm bit is 1 (input mode), the set value in the PFn register is invalid.

- Example** <1> When the value of the PFn register is valid
 PFnm bit = 1 ... N-ch open-drain output is specified.
 PMnm bit = 0 ... Output mode is specified.
 PMCnm bit = 0 or 1
- <2> When the value of the PFn register is invalid
 PFnm bit = 0 ... N-ch open-drain output is specified.
 PMnm bit = 1 ... Input mode is specified.
 PMCnm bit = 0 or 1

(7) Pull-up resistor option register (PUn)

PUn is a register that specifies the connection of an on-chip pull-up resistor.

Each bit of the PUn register corresponds to one pin of port n and can be specified in 1-bit units.

After reset: 00H R/W

	7	6	5	4	3	2	1	0
PUn	PUn7	PUn6	PUn5	PUn4	PUn3	PUn2	PUn1	PUn0

PUnm	Control of on-chip pull-up resistor connection
0	Not connected
1	Connected

(8) Port settings

Set the ports as follows.

Figure 4-1. Register Settings and Pin Functions

4.3.1 Port 0

Port 0 is a 7-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port 0 includes the following alternate functions.

Table 4-4. Alternate-Function Pins of Port 0

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note 1}	Remark	Block Type
P00	6	TOH0	Output	Yes	–	D-2
P01	7	TOH1	Output			D-2
P02	17	NMI	Input		Analog noise elimination	H-1
P03	18	INTP0	Input			H-1
P04	19	INTP1	Input			H-1
P05 ^{Note 2}	20	INTP2/ $\overline{\text{DRST}}$ ^{Note 3}	Input			O-1
P05 ^{Note 4}		INTP2	Input			H-1
P06	21	INTP3	Input			H-1

Notes 1. Software pull-up function

2. Only in the $\mu\text{PD70F3218H}$ and 70F3218HY .

3. The $\overline{\text{DRST}}$ pin is for on-chip debugging ($\mu\text{PD70F3218H}$, 70F3218HY only).

If on-chip debugging is not used, fix the P05/INTP2/ $\overline{\text{DRST}}$ pin to low level between reset release by the $\overline{\text{RESET}}$ pin and when the OCDM.OCDM0 bit is cleared to 0.

For details, see **4.6.3 Cautions on on-chip debug pins**.

4. Only in V850ES/KJ1 products other than the $\mu\text{PD70F3218H}$ and 70F3218HY

Caution P02 to P06 have hysteresis characteristics when the alternate function is input, but not in the port mode.

(1) Port 0 register (P0)

After reset: 00H (output latch) R/W Address: FFFFF400H

	7	6	5	4	3	2	1	0
P0	0	P06	P05 ^{Note}	P04	P03	P02	P01	P00

P0n	Control of output data (in output mode) (n = 0 to 6)
0	0 is output
1	1 is output

Note In the $\mu\text{PD70F3218H}$ and 70F3218HY , care must be exercised in processing the P05 pin when reset is released. For details, refer to **4.6.3 Cautions on on-chip debug pins**.

(2) Port 0 mode register (PM0)

After reset: FFH R/W Address: FFFFF420H

	7	6	5	4	3	2	1	0
PM0	1	PM06	PM05 ^{Note}	PM04	PM03	PM02	PM01	PM00

PM0n	Control of I/O mode (n = 0 to 6)
0	Output mode
1	Input mode

Note In the μ PD70F3218H and 70F3218HY, care must be exercised in processing the P05 pin when reset is released. For details, refer to **4.6.3 Cautions on on-chip debug pins**.

(3) Port 0 mode control register (PMC0)

After reset: 00H R/W Address: FFFFF440H

	7	6	5	4	3	2	1	0
PMC0	0	PMC06	PMC05 ^{Note}	PMC04	PMC03	PMC02	PMC01	PMC00

PMC06	Specification of P06 pin operation mode
0	I/O port
1	INTP3 input

PMC05	Specification of P05 pin operation mode
0	I/O port
1	INTP2 input

PMC04	Specification of P04 pin operation mode
0	I/O port
1	INTP1 input

PMC03	Specification of P03 pin operation mode
0	I/O port
1	INTP0 input

PMC02	Specification of P02 pin operation mode
0	I/O port
1	NMI input

PMC01	Specification of P01 pin operation mode
0	I/O port
1	TOH1 output

PMC00	Specification of P00 pin operation mode
0	I/O port
1	TOH0 output

Note In the μ PD70F3218H and 70F3218HY, care must be exercised in processing the P05 pin when reset is released. For details, refer to **4.6.3 Cautions on on-chip debug pins**.

(4) Pull-up resistor option register 0 (PU0)

After reset: 00H R/W Address: FFFFC40H

	7	6	5	4	3	2	1	0
PU0	0	PU06	PU05 ^{Note}	PU04	PU03	PU02	PU01	PU00

PU0n	Control of on-chip pull-up resistor connection (n = 0 to 6)
0	Not connected
1	Connected

Note In the μ PD70F3218H and 70F3218HY, care must be exercised in processing the P05 pin when reset is released. For details, refer to **4.6.3 Cautions on on-chip debug pins**.

PU05 is valid only when the OCDM.OCDM0 bit = 0.

4.3.2 Port 1

Port 1 is a 2-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port 1 includes the following alternate functions.

Table 4-5. Alternate-Function Pins of Port 1

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note}	Remark	Block Type
P10	3	ANO0	Output	Yes	—	A-2
P11	4	ANO1	Output			A-2

Note Software pull-up function

(1) Port 1 register (P1)

After reset: 00H (output latch) R/W Address: FFFFF402H

	7	6	5	4	3	2	1	0
P1	0	0	0	0	0	0	P11	P10

P1n	Control of output data (in output mode) (n = 0, 1)
0	0 is output
1	1 is output

(2) Port 1 mode register (PM1)

Caution When used as the ANO0 and ANO1 pins, set PM1 = FFH all together.

After reset: FFH R/W Address: FFFFF422H

	7	6	5	4	3	2	1	0
PM1	1	1	1	1	1	1	PM11	PM10

PM1n	Control of I/O mode (n = 0, 1)
0	Output mode
1	Input mode

(3) Pull-up resistor option register 1 (PU1)

After reset: 00H R/W Address: FFFFC42H

	7	6	5	4	3	2	1	0
PU1	0	0	0	0	0	0	PU11	PU10

PU1n	Control of on-chip pull-up resistor connection (n = 0, 1)
0	Not connected
1	Connected

4.3.3 Port 3

Port 3 is a 10-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port 3 includes the following alternate functions.

Table 4-6. Alternate-Function Pins of Port 3

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note 1}	Remark	Block Type
P30	25	TXD0	Output	Yes	—	D-2
P31	26	RXD0	Input			D-1-1
P32	27	ASCK0	Input			D-1-2
P33	28	TI000/TO00/TIP00 ^{Note 2} / TOP00 ^{Note 2}	I/O			E-6 ^{Note 3} / G-7-1 ^{Note 2}
P34	29	TI001/TIP01 ^{Note 2} / TOP01 ^{Note 2}	I/O			D-1-2 ^{Note 3} / G-7-2 ^{Note 2}
P35	30	TI010/TO01	I/O			E-6
P36	31	—	—	No ^{Note 4}	N-ch open-drain output	J
P37	32	—	—			J
P38	35	SDA0 ^{Note 5}	I/O			K
P39	36	SCL0 ^{Note 5}	I/O			K

Notes 1. Software pull-up function

2. Only in the μ PD70F3218H and 70F3218HY

3. Only in the μ PD703216, 703216Y, 703217, 703217Y, 70F3217, 70F3217Y, 70F3217H, and 70F3217HY

4. An on-chip pull-up resistor can be provided by a mask option (only in the mask ROM versions).

5. Only in products with an I²C bus (Y products)

Caution P31 to P35, P38, and P39 have hysteresis characteristics when the alternate function is input, but not in the port mode.

(1) Port 3 register (P3)

After reset: 00H (output latch) R/W Address: P3 FFFFF406H,
P3L FFFFF406H, P3H FFFFF407H

	15	14	13	12	11	10	9	8
P3 (P3H ^{Note})	0	0	0	0	0	0	P39	P38
	7	6	5	4	3	2	1	0
(P3L)	P37	P36	P35	P34	P33	P32	P31	P30

P3n	Control of output data (in output mode) (n = 0 to 9)
0	0 is output
1	1 is output

Note When reading from or writing to bits 8 to 15 of the P3 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the P3H register.

Remark The P3 register can be read or written in 16-bit units.
However, when the higher 8 bits and the lower 8 bits of the P3 register are used as the P3H register and as the P3L register, respectively, this register can be read or written in 8-bit or 1-bit units.

(2) Port 3 mode register (PM3)

After reset: FFFFH R/W Address: PM3 FFFFF426H,
PM3L FFFFF426H, PM3H FFFFF427H

	15	14	13	12	11	10	9	8
PM3 (PM3H ^{Note})	1	1	1	1	1	1	PM39	PM38
	7	6	5	4	3	2	1	0
(PM3L)	PM37	PM36	PM35	PM34	PM33	PM32	PM31	PM30

PM3n	Control of I/O mode (n = 0 to 9)
0	Output mode
1	Input mode

Note When reading from or writing to bits 8 to 15 of the PM3 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PM3H register.

Remark The PM3 register can be read or written in 16-bit units.
When the higher 8 bits and the lower 8 bits of the PM3 register are used as the PM3H register and as the PM3L register, respectively, this register can be read or written in 8-bit or 1-bit units.

(3) Port 3 mode control register (PMC3)

After reset: 0000H R/W Address: PMC3 FFFFF446H,
 PMC3L FFFFF446H, PMC3H FFFFF447H

PMC3 (PMC3H ^{Note 1})	15	14	13	12	11	10	9	8
	0	0	0	0	0	0	PMC39 ^{Note 2}	PMC38 ^{Note 2}
(PMC3L)	7	6	5	4	3	2	1	0
	0	0	PMC35	PMC34	PMC33	PMC32	PMC31	PMC30

PMC39	Specification of P39 pin operation mode
0	I/O port
1	SCL0 I/O

PMC38	Specification of P38 pin operation mode
0	I/O port
1	SDA0 I/O

PMC35	Specification of P35 pin operation mode
0	I/O port
1	TI010 input/TO01 output

PMC34	Specification of P34 pin operation mode
0	I/O port
1	TI001 input/TIP01 input ^{Note 3} /TOP01 output ^{Note 3}

PMC33	Specification of P33 pin operation mode
0	I/O port
1	TI000 input/TO00 output/TIP00 input ^{Note 3} /TOP00 output ^{Note 3}

PMC32	Specification of P32 pin operation mode
0	I/O port
1	ASCK0 input

PMC31	Specification of P31 pin operation mode
0	I/O port
1	RXD0 input

PMC30	Specification of P30 pin operation mode
0	I/O port
1	TXD0 output

- Notes**
1. When reading from or writing to bits 8 to 15 of the PMC3 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PMC3H register.
 2. Valid only in products with an I²C bus (Y products). In all other products, set this bit to 0.
 3. Only in the μ PD70F3218H and 70F3218HY

Remark The PMC3 register can be read or written in 16-bit units.
 When the higher 8 bits and the lower 8 bits of the PMC3 register are used as the PMC3H register and as the PMC3L register, respectively, this register can be read or written in 8-bit or 1-bit units.

(4) Port 3 function register H (PF3H)

After reset: 00H R/W Address: FFFFC67H

	7	6	5	4	3	2	1	0
PF3H	0	0	0	0	0	0	PF39	PF38

PF3n	Specification of normal port/alternate function (n = 8, 9)
0	When used as normal port (N-ch open-drain output)
1	When used as alternate-function (N-ch open-drain output)

Caution When using P38 and P39 as N-ch open-drain-output alternate-function pins, set in the following sequence.

Be sure to set the port latch to 1 before setting the pin to N-ch open-drain output.

P3n bit = 1 → PF3n bit = 1 → PMC3n bit = 1

(5) Port 3 function control register (PFC3)**(a) μ PD703216, 703216Y, 703217, 703217Y, 70F3217, 70F3217Y, 70F3217H, 70F3217HY**

After reset: 00H R/W Address: FFFFF466H

	7	6	5	4	3	2	1	0
PFC3	0	0	PFC35	0	PFC33	0	0	0

PFC35	Specification of alternate-function pin of P35 pin
0	TI010 input
1	TO01 output

PFC33	Specification of alternate-function pin of P33 pin
0	TI000 input
1	TO00 output

Caution Always clear bits 0 to 2, 4, 6, and 7 of the PFC3 register to 0.

(b) μ PD70F3218H, 70F3218HY

After reset: 00H R/W Address: FFFFF466H

	7	6	5	4	3	2	1	0
PFC3	0	0	PFC35	PFC34	PFC33	0	0	0

Caution Always clear bits 0 to 2, 6, and 7 of the PFC3 register to 0.

Remark For details of specification of alternate-function pins, refer to **4.3.3 (8) Specifying alternate-function pins of port 3**.

(6) Port 3 function control expansion register (PFCE3)^{Note}

Note Only in the μ PD70F3218H, 70F3218HY

After reset: 00H R/W Address: FFFFF706H

	7	6	5	4	3	2	1	0
PFCE3	0	0	0	PFCE34	PFCE33	0	0	0

Remark For details of specification of alternate-function pins, refer to **4.3.3 (8) Specifying alternate-function pins of port 3**.

(7) Pull-up resistor option register 3 (PU3)

After reset: 00H R/W Address: FFFFFC46H

	7	6	5	4	3	2	1	0
PU3	0	0	PU35	PU34	PU33	PU32	PU31	PU30

PU3n	Control of on-chip pull-up resistor connection (n = 0 to 5)
0	Not connected
1	Connected

Caution An on-chip pull-up resistor can be provided for P36 to P39 by a mask option (only in the mask ROM versions).

(8) Specifying alternate-function pins of port 3^{Note}

Note Only in the μ PD70F3218H and 70F3218HY

PFC35	Specification of Alternate-Function Pin of P35 Pin
0	TI010 input
1	TO01 output

PFCE34	PFC34	Specification of Alternate-Function Pin of P34 Pin
0	0	TI001 input
0	1	Setting prohibited
1	0	TIP01 input
1	1	TOP01 output

PFCE33	PFC33	Specification of Alternate-Function Pin of P33 Pin
0	0	TI000 input
0	1	TO00 output
1	0	TIP00 input
1	1	TOP00 output

4.3.4 Port 4

Port 4 is a 3-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port 4 includes the following alternate functions.

Table 4-7. Alternate-Function Pins of Port 4

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note}	Remark	Block Type
P40	22	SI00	Input	Yes	–	D-1-2
P41	23	SO00	Output		N-ch open-drain output can be selected.	F-1
P42	24	SCK00	I/O			F-2

Note Software pull-up function

Caution P40 and P42 have hysteresis characteristics when the alternate function is input, but not in the port mode.

(1) Port 4 register (P4)

After reset: 00H (output latch) R/W Address: FFFFF408H

	7	6	5	4	3	2	1	0
P4	0	0	0	0	0	P42	P41	P40

P4n	Control of output data (in output mode) (n = 0 to 2)
0	0 is output
1	1 is output

(2) Port 4 mode register (PM4)

After reset: FFH R/W Address: FFFFF428H								
	7	6	5	4	3	2	1	0
PM4	1	1	1	1	1	PM42	PM41	PM40
	PM4n	Control of I/O mode (n = 0 to 2)						
	0	Output mode						
	1	Input mode						

(3) Port 4 mode control register (PMC4)

After reset: 00H R/W Address: FFFFF448H

	7	6	5	4	3	2	1	0
PMC4	0	0	0	0	0	PMC42	PMC41	PMC40

PMC42	Specification of P42 pin operation mode
0	I/O port
1	SCK00 I/O

PMC41	Specification of P41 pin operation mode
0	I/O port
1	SO00 output

PMC40	Specification of P40 pin operation mode
0	I/O port
1	SI00 input

(4) Port 4 function register (PF4)

After reset: 00H R/W Address: FFFFC68H

	7	6	5	4	3	2	1	0
PF4	0	0	0	0	0	PF42	PF41	0

PF4n	Control of normal output/N-ch open-drain output (n = 1, 2)
0	Normal output
1	N-ch open-drain output

Caution When using P41 and P42 as N-ch open-drain-output alternate-function pins, set in the following sequence.

Be sure to set the port latch to 1 before setting the pin to N-ch open-drain output.

P4n bit = 1 → PF4n bit = 1 → PMC4n bit = 1

(5) Pull-up resistor option register 4 (PU4)

After reset: 00H R/W Address: FFFFC48H

	7	6	5	4	3	2	1	0
PU4	0	0	0	0	0	PU42	PU41	PU40

PU4n	Control of on-chip pull-up resistor connection (n = 0 to 2)
0	Not connected
1	Connected

4.3.5 Port 5

Port 5 is a 6-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port 5 includes the following alternate functions.

Table 4-8. Alternate-Function Pins of Port 5

	Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note 1}	Remark	Block Type
	P50	37	TI011/RTP00/KR0	I/O	Yes	—	E-5
	P51	38	TI50/RTP01/KR1	I/O			E-5
<R>	P52 ^{Note 2}	39	TO50/RTP02/KR2/DDI ^{Note 4}	I/O			O-3
	P52 ^{Note 3}		TO50/RTP02/KR2	I/O			E-4
<R>	P53 ^{Note 2}	40	SIA0/RTP03/KR3/DDO ^{Note 4}	I/O		N-ch open-drain output can be selected.	O-4
	P53 ^{Note 3}		SIA0/RTP03/KR3	I/O			E-5
<R>	P54 ^{Note 2}	41	SOA0/RTP04/KR4/DCK ^{Note 4}	I/O			O-2
	P54 ^{Note 3}		SOA0/RTP04/KR4	I/O			G-1
<R>	P55 ^{Note 2}	42	SCKA0/RTP05/KR5/DMS ^{Note 4}	I/O			O-5
	P55 ^{Note 3}		SCKA0/RTP05/KR5	I/O			G-2

Notes 1. Software pull-up function

<R> 2. Only in the μ PD70F3218H and 70F3218HY

3. Only in V850ES/KJ1 products other than the μ PD70F3218H and 70F3218HY

<R> 4. The DDI, DDO, DCK, and DMS pins are for on-chip debugging (μ PD70F3218H, 70F3218HY only).

If on-chip debugging is not used, fix the P05/INTP2/ $\overline{\text{DRST}}$ pin to low level between when the reset signal of the $\overline{\text{RESET}}$ pin is released and when the OCDM.OCDM0 bit is cleared to 0.

For details, see 4.6.3 Cautions on on-chip debug pins.

(1) Port 5 register (P5)

After reset: 00H (output latch) R/W Address: FFFFF40AH

	7	6	5	4	3	2	1	0
P5	0	0	P55	P54	P53	P52	P51	P50

P5n	Control of output data (in output mode) (n = 0 to 5)
0	0 is output
1	1 is output

(2) Port 5 mode register (PM5)

After reset: FFH R/W Address: FFFFF42AH								
	7	6	5	4	3	2	1	0
PM5	1	1	PM55	PM54	PM53	PM52	PM51	PM50
PM5n	Control of I/O mode (n = 0 to 5)							
0	Output mode							
1	Input mode							

(3) Port 5 mode control register (PMC5)

After reset: 00H R/W Address: FFFFF44AH

	7	6	5	4	3	2	1	0
PMC5	0	0	PMC55	PMC54	PMC53	PMC52	PMC51	PMC50

PMC55	Specification of P55 pin operation mode
0	I/O port/KR5 input
1	SCKA0 I/O/RTP05 output

PMC54	Specification of P54 pin operation mode
0	I/O port/KR4 input
1	SOA0 output/RTP04 output

PMC53	Specification of P53 pin operation mode
0	I/O port/KR3 input
1	SIA0 input/RTP03 output

PMC52	Specification of P52 pin operation mode
0	I/O port/KR2 input
1	TO50 output/RTP02 output

PMC51	Specification of P51 pin operation mode
0	I/O port/KR1 input
1	TI50 input/RTP01 output

PMC50	Specification of P50 pin operation mode
0	I/O port/KR0 input
1	TI011 input/RTP00 output

(4) Port 5 function register 5 (PF5)

After reset: 00H R/W Address: FFFFFC6AH

	7	6	5	4	3	2	1	0
PF5	0	0	PF55	PF54	0	0	0	0

PF5n	Control of normal output/N-ch open-drain output (n = 4, 5)
0	Normal output
1	N-ch open-drain output

- Cautions**
1. Always set bits 0 to 3, 6, and 7 of the PF5 register to 0.
 2. When using P54 and P55 as N-ch open-drain-output alternate-function pins, set in the following sequence.
Be sure to set the port latch to 1 before setting the pin to N-ch open-drain output.
P5n bit = 1 → PF5n bit = 1 → PMC5n bit = 1

(5) Port 5 function control register (PFC5)

After reset: 00H R/W Address: FFFFF46AH

	7	6	5	4	3	2	1	0
PFC5	0	0	PFC55	PFC54	PFC53	PFC52	PFC51	PFC50

0	SOA0 output
1	RTP04 output

PFC53	Specification of alternate-function pin of P53 pin
0	SIA0 input
1	RTP03 output

PFC52	Specification of alternate-function pin of P52 pin
0	TO50 output
1	RTP02 output

PFC51	Specification of alternate-function pin of P51 pin
0	TI50 input
1	RTP01 output

PFC50	Specification of alternate-function pin of P50 pin
0	TI011 input
1	RTP00 output

(6) Pull-up resistor option register 5 (PU5)

After reset: 00H R/W Address: FFFFFC4AH

	7	6	5	4	3	2	1	0
PU5	0	0	PU55	PU54	PU53	PU52	PU51	PU50

PU5n	Control of on-chip pull-up resistor connection (n = 0 to 5)
0	Not connected
1	Connected

4.3.6 Port 6

Port 6 is a 16-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port 6 includes the following alternate functions.

Table 4-9. Alternate-Function Pins of Port 6

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note 1}	Remark	Block Type
P60	43	RTP10	Output	Yes	—	D-2
P61	44	RTP11	Output			D-2
P62	45	RTP12	Output			D-2
P63	46	RTP13	Output			D-2
P64	47	RTP14	Output			D-2
P65	48	RTP15	Output			D-2
P66	49	SI02	Input			D-1-2
P67	50	SO02	Output		N-ch open-drain output	F-1
P68	51	$\overline{\text{SCK02}}$	I/O			F-2
P69	52	TI040	Input		—	D-1-2
P610	53	TI041	Input			D-1-2
P611	54	TO04	Output			D-2
P612	55	TI050	Input			D-1-2
P613	56	TI051/TO05	I/O			E-6
P614	57	—	—	No ^{Note 2}		J
P615	58	—	—			J

Notes 1. Software pull-up function

2. An on-chip pull-up resistor can be provided by a mask option (only in the mask ROM versions).

Caution P66, P68, P69, P610, P612, and P613 have hysteresis characteristics when the alternate function is input, but not in the port mode.

(1) Port 6 register (P6)

After reset: 00H (output latch) R/W Address: P6 FFFF40CH,
P6L FFFF40CH, P6H FFFF40DH

	15	14	13	12	11	10	9	8
P6 (P6H ^{Note})	P615	P614	P613	P612	P611	P610	P69	P68

	7	6	5	4	3	2	1	0
(P6L)	P67	P66	P65	P64	P63	P62	P61	P60

P6n	Control of output data (in output mode) (n = 0 to 15)
0	0 is output
1	1 is output

Note When reading from or writing to bits 8 to 15 of the P6 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the P6H register.

Remark The P6 register can be read or written in 16-bit units.
However, when the higher 8 bits and the lower 8 bits of the P6 register are used as the P6H register and as the P6L register, respectively, this register can be read or written in 8-bit or 1-bit units.

(2) Port 6 mode register (PM6)

After reset: FFFFH R/W Address: PM6 FFFF42CH,
PM6L FFFF42CH, PM6H FFFF42DH

	15	14	13	12	11	10	9	8
PM6 (PM6H ^{Note})	PM615	PM614	PM613	PM612	PM611	PM610	PM69	PM68

	7	6	5	4	3	2	1	0
(PM6L)	PM67	PM66	PM65	PM64	PM63	PM62	PM61	PM60

PM6n	Control of I/O mode (n = 0 to 15)
0	Output mode
1	Input mode

Note When reading from or writing to bits 8 to 15 of the PM6 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PM6H register.

Remark The PM6 register can be read or written in 16-bit units.
However, when the higher 8 bits and the lower 8 bits of the PM6 register are used as the PM6H register and as the PM6L register, respectively, this register can be read or written in 8-bit or 1-bit units.

(3) Port 6 mode control register (PMC6)

After reset: 0000H R/W Address: PMC6 FFFFF44CH,
PMC6L FFFFF44CH, PMC6H FFFFF44DH

PMC6 (PMC6H ^{Note})	15	14	13	12	11	10	9	8
	0	0	PMC613	PMC612	PMC611	PMC610	PMC69	PMC68
(PMC6L)	7	6	5	4	3	2	1	0
	PMC67	PMC66	PMC65	PMC64	PMC63	PMC62	PMC61	PMC60
PMC613		Specification of P613 pin operation mode						
0		I/O port						
1		TI051 input/TO05 output						
PMC612		Specification of P612 pin operation mode						
0		I/O port						
1		TI050 input						
PMC611		Specification of P611 pin operation mode						
0		I/O port						
1		TO04 output						
PMC610		Specification of P610 pin operation mode						
0		I/O port						
1		TI041 input						
PMC69		Specification of P69 pin operation mode						
0		I/O port						
1		TI040 input						
PMC68		Specification of P68 pin operation mode						
0		I/O port						
1		SCK02 I/O						
PMC67		Specification of P67 pin operation mode						
0		I/O port						
1		SO02 output						
PMC66		Specification of P66 pin operation mode						
0		I/O port						
1		SI02 input						
PMC6n		Specification of P6n pin operation mode (n = 0 to 5)						
0		I/O port						
1		RTP1n output						

Note When reading from or writing to bits 8 to 15 of the PMC6 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PMC6H register.

Remark The PMC6 register can be read or written in 16-bit units.
However, when the higher 8 bits and the lower 8 bits of the PMC6 register are used as the PMC6H register and as the PMC6L register, respectively, this register can be read or written in 8-bit or 1-bit units.

(4) Port 6 function register (PF6)

After reset: 0000H R/W Address: PF6 FFFFC6CH,
PF6L FFFFC6CH, PF6H FFFFC6DH

	15	14	13	12	11	10	9	8
PF6 (PF6H ^{Note})	0	0	0	0	0	0	0	PF68
	7	6	5	4	3	2	1	0
(PF6L)	PF67	0	0	0	0	0	0	0
PF6n	Control of normal output/N-ch open-drain output (n = 7, 8)							
0	Normal output							
1	N-ch open-drain output							

Note When reading from or writing to bits 8 to 15 of the PF6 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PF6H register.

Caution Always set PF6 register bits 0 to 6 and 9 to 15 to “0”.

Remark The PF6 register can be read or written in 16-bit units.
However, when the higher 8 bits and the lower 8 bits of the PF6 register are used as the PF6H register and as the PF6L register, respectively, this register can be read or written in 8-bit or 1-bit units.

(5) Port 6 function control register (PFC6H)

After reset: 00H R/W Address: FFFFF46DH

	7	6	5	4	3	2	1	0
PFC6H	0	0	PFC613	0	0	0	0	0
PFC613	Specification of alternate-function pin of P613 pin							
0	TI051 input							
1	TO05 output							

(6) Pull-up resistor option register 6 (PU6)

After reset: 0000H R/W Address: PU6 FFFFC4CH,
 PU6L FFFFC4CH, PU6H FFFFC4DH

	15	14	13	12	11	10	9	8
PU6 (PU6H ^{Note})	0	0	PU613	PU612	PU611	PU610	PU69	PU68
	7	6	5	4	3	2	1	0
(PU6L)	PU67	PU66	PU65	PU64	PU63	PU62	PU61	PU60

PU6n	Control of on-chip pull-up resistor connection (n = 0 to 13)
0	Not connected
1	Connected

Note When reading from or writing to bits 8 to 15 of the PU6 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PU6H register.

Caution An on-chip pull-up resistor can be provided for P614 and P615 (only in the mask ROM version).

Remark The PU6 register can be read or written in 16-bit units.
 However, when the higher 8 bits and the lower 8 bits of the PU6 register are used as the PU6H register and as the PU6L register, respectively, this register can be read or written in 8-bit or 1-bit units.

4.3.7 Port 7

Port 7 is a 16-bit input-only port for which all the pins are fixed to input.

Port 7 includes the following alternate functions.

Table 4-10. Alternate-Function Pins of Port 7

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note}	Remark	Block Type
P70	144	ANI0	Input	No	—	A-1
P71	143	ANI1	Input			A-1
P72	142	ANI2	Input			A-1
P73	141	ANI3	Input			A-1
P74	140	ANI4	Input			A-1
P75	139	ANI5	Input			A-1
P76	138	ANI6	Input			A-1
P77	137	ANI7	Input			A-1
P78	136	ANI8	Input			A-1
P79	135	ANI9	Input			A-1
P710	134	ANI10	Input			A-1
P711	133	ANI11	Input			A-1
P712	132	ANI12	Input			A-1
P713	131	ANI13	Input			A-1
P714	130	ANI14	Input			A-1
P715	129	ANI15	Input			A-1

Note Software pull-up function

(1) Port 7 register (P7)

After reset: Undefined R Address: P7 FFFF40EH, P7L FFFF40EH, P7H FFFF40FH							
P7 (P7H ^{Note})	15	14	13	12	11	10	9
	P715	P714	P713	P712	P711	P710	P79
(P7L)	7	6	5	4	3	2	1
	P77	P76	P75	P74	P73	P72	P71
P7n		Input data read (n = 0 to 15)					
0		Input low level					
1		Input high level					

Note When reading from bits 8 to 15 of the P7 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the P7H register.

Remark The P7 register can be read only in 16-bit units.
However, when the higher 8 bits of the P7 register are used as the P7H register and the lower 8 bits as the P7L register, they can be read only in 8-bit units.

4.3.8 Port 8

Port 8 is a 2-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port 8 includes the following alternate functions.

Table 4-11. Alternate-Function Pins of Port 8

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note 1}	Remark	Block Type
P80	59	RXD2/SDA1 ^{Note 2}	I/O	Yes	N-ch open-drain output can be selected.	G-5
P81	60	TXD2/SCL1 ^{Note 2}	I/O			G-6

- Notes**
1. Software pull-up function
 2. Only in products with an I²C bus (Y products)

Caution P80 and P81 have hysteresis characteristics when the alternate function is input, but not in the port mode.

(1) Port 8 register (P8)

After reset: 00H (output latch) R/W Address: FFFFF410H							
	7	6	5	4	3	2	1 0
P8	0	0	0	0	0	0	P81 P80
P8n	Control of output data (in output mode) (n = 0, 1)						
0	0 is output						
1	1 is output						

(2) Port 8 mode register (PM8)

After reset: FFH R/W Address: FFFFF430H							
	7	6	5	4	3	2	1 0

0	TXD2 output
1	SCL1 ^{Note} I/O

PFC80	Specification of alternate-function pin of P80 pin
0	RXD2 input
1	SDA1 ^{Note} I/O

Note Only in products with an I²C bus (Y products). Clear to 0 for all other products.**(6) Pull-up resistor option register 8 (PU8)**

After reset: 00H R/W Address: FFFFFC50H

	7	6	5	4	3	2	1	0
PU8	0	0	0	0	0	0	PU81	PU80

PU8n	Control of on-chip pull-up resistor connection (n = 0, 1)
0	Not connected
1	Connected

4.3.9 Port 9

Port 9 is a 16-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port 9 includes the following alternate functions.

Table 4-12. Alternate-Function Pins of Port 9

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note}	Remark	Block Type
P90	61	A0/TXD1/KR6	I/O	Yes	–	E-3
P91	62	A1/RXD1/KR7	I/O			E-1
P92	63	A2/TI020/TO02	I/O			E-3
P93	64	A3/TI021	I/O			E-2
P94	65	A4/TI030/TO03	I/O			E-3
P95	66	A5/TI031	I/O			E-2
P96	67	A6/TI51/TO51	I/O			E-3
P97	68	A7/SI01	I/O			E-2
P98	69	A8/SO01	Output		N-ch open-drain output can be specified.	G-4
P99	70	A9/SCK01	I/O			G-3
P910	71	A10/SIA1	I/O		–	E-2
P911	72	A11/SOA1	Output		N-ch open-drain output can be specified.	G-4
P912	73	A12/SCKA1	I/O			G-3
P913	74	A13/INTP4	I/O		Analog noise elimination	H-2
P914	75	A14/INTP5	I/O			H-2
P915	76	A15/INTP6	I/O			H-2

Note Software pull-up function

Caution P93, P95, P97, P99, P910, and P912 to P915 have hysteresis characteristics when the alternate function is input, but not in the port mode.

(1) Port 9 register (P9)

After reset: 00H (output latch) R/W Address: P9H FFFF412H,
P9L FFFF412H, P9H FFFF413H

	15	14	13	12	11	10	9	8
P9 (P9H ^{Note})	P915	P914	P913	P912	P911	P910	P99	P98

	7	6	5	4	3	2	1	0
(P9L)	P97	P96	P95	P94	P93	P92	P91	P90

P9n	Control of output data (in output mode) (n = 0 to 15)
0	0 is output
1	1 is output

Note When reading from or writing to bits 8 to 15 of the P9 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the P9H register.

Remark The P9 register can be read or written in 16-bit units.
However, when the higher 8 bits and the lower 8 bits of the P9 register are used as the P9H register and as the P9L register, respectively, these registers can be read or written in 8-bit or 1-bit units.

(2) Port 9 mode register (PM9)

After reset: FFFFH R/W Address: PM9 FFFF432H,
PM9L FFFF432H, PM9H FFFF433H

	15	14	13	12	11	10	9	8
PM9 (PM9H ^{Note})	PM915	PM914	PM913	PM912	PM911	PM910	PM99	PM98

	7	6	5	4	3	2	1	0
(PM9L)	PM97	PM96	PM95	PM94	PM93	PM92	PM91	PM90

PM9n	Control of I/O mode (n = 0 to 5)
0	Output mode
1	Input mode

Note When reading from or writing to bits 8 to 15 of the PM9 register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PM9H register.

Remark The PM9 register can be read or written in 16-bit units.
However, when the higher 8 bits and the lower 8 bits of the PM9 register are used as the PM9H register and as the PM9L register, respectively, this register can be read or written in 8-bit or 1-bit units.

(3) Port 9 mode control register (PMC9)

Caution When using port 9 as the A0 to A15 pins, set the PMC9 register to FFFFH in 16-bit units.

After reset: 0000H R/W Address: PMC9 FFFFF452H,
PMC9L FFFFF452H, PMC9H FFFFF453H

PMC9 (PMC9H ^{Note})	15	14	13	12	11	10	9	8

0	I/O port
1	$\overline{\text{HLDAK}}$ output

PMCCM1	Specification of PCM1 pin operation mode
0	I/O port
1	CLKOUT output

PMCCM0	Specification of PCM0 pin operation mode
0	I/O port
1	$\overline{\text{WAIT}}$ input

4.3.12 Port CS

Port CS is an 8-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port CS includes the following alternate functions.

Table 4-15. Alternate-Function Pins of Port CS

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note}	Remark	Block Type
PCS0	81	$\overline{CS0}$	Output	No	—	C-3
PCS1	82	$\overline{CS1}$	Output			C-3
PCS2	83	$\overline{CS2}$	Output			C-3
PCS3	84	$\overline{CS3}$	Output			C-3
PCS4	91	—	—			B-1
PCS5	92	—	—			B-1
PCS6	93	—	—			B-1
PCS7	94	—	—			B-1

Note Software pull-up function

(1) Port CS register (PCS)

PMCCT1	Specification of PCT1 pin operation mode
0	I/O port
1	$\overline{\text{WR1}}$ output

PMCCT0	Specification of PCT0 pin operation mode
0	I/O port
1	$\overline{\text{WR0}}$ output

4.3.14 Port DH

Port DH is an 8-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port DH includes the following alternate functions.

Table 4-17. Alternate-Function Pins of Port DH

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note}	Remark	Block Type
PDH0	121	A16	Output	No	—	C-3
PDH1	122	A17	Output			C-3
PDH2	123	A18	Output			C-3
PDH3	124	A19	Output			C-3
PDH4	125	A20	Output			C-3
PDH5	126	A21	Output			C-3
PDH6	127	A22	Output			C-3
PDH7	128	A23	Output			C-3

Note Software pull-up function

(1) Port DH register (PDH)

After reset: 00H (output latch)									R/W	Address: FFFFF006H								
PDH	7	6	5	4	3	2	1	0										
	PDH7	PDH6	PDH5	PDH4	PDH3	PDH2	PDH1	PDH0										
PDHn		Control of output data (in output mode) (n = 0 to 7)																
0		0 is output																
1		1 is output																

(2) Port DH mode register (PMDH)

After reset: FFH R/W Address: FFFFF026H								
PMDH	7	6	5	4	3	2	1	0
	PMDH7	PMDH6	PMDH5	PMDH4	PMDH3	PMDH2	PMDH1	PMDH0
PMDHn		Control of I/O mode (n = 0 to 7)						
0		Output mode						
1		Input mode						

(3) Port DH mode control register (PMCDH)

After reset: 00H R/W Address: FFFFF046H

	7	6	5	4	3	2	1	0
PMCDH	PMCDH7	PMCDH6	PMCDH5	PMCDH4	PMCDH3	PMCDH2	PMCDH1	PMCDH0

PMCDHn	Specification of PDHn pin operation mode (n = 0 to 7)
0	I/O port
1	Am output (address bus output) (m = 16 to 23)

Caution When specifying the port/alternate function for each bit, pay careful attention to the operation of the alternate functions.

4.3.15 Port DL

Port DL is a 16-bit I/O port for which I/O settings can be controlled in 1-bit units.

Port DL includes the following alternate functions.

Table 4-18. Alternate-Function Pins of Port DL

Pin Name	Pin No.	Alternate Function	I/O	PULL ^{Note}	Remark	Block Type
PDL0	105	AD0	I/O	No	—	C-4
PDL1	106	AD1	I/O			C-4
PDL2	107	AD2	I/O			C-4
PDL3	108	AD3	I/O			C-4
PDL4	109	AD4	I/O			C-4
PDL5	110	AD5	I/O			C-4
PDL6	111	AD6	I/O			C-4
PDL7	112	AD7	I/O			C-4
PDL8	113	AD8	I/O			C-4
PDL9	114	AD9	I/O			C-4
PDL10	115	AD10	I/O			C-4
PDL11	116	AD11	I/O			C-4
PDL12	117	AD12	I/O			C-4
PDL13	118	AD13	I/O			C-4
PDL14	119	AD14	I/O			C-4
PDL15	120	AD15	I/O			C-4

Note Software pull-up function

(1) Port DL register (PDL)

After reset: 00H (output latch) R/W Address: PDL FFFF004H,
PDLL FFFF004H, PDLH FFFF005H

	15	14	13	12	11	10	9	8
PDL (PDLH ^{Note})	PDL15	PDL14	PDL13	PDL12	PDL11	PDL10	PDL9	PDL8

	7	6	5	4	3	2	1	0
(PDLL)	PDL7	PDL6	PDL5	PDL4	PDL3	PDL2	PDL1	PDL0

PDLn	Control of output data (in output mode) (n = 0 to 15)
0	0 is output
1	1 is output

Note When reading from or writing to bits 8 to 15 of the PDL register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PDLH register.

Remark The PDL register can be read or written in 16-bit units.
However, when the higher 8 bits and the lower 8 bits of the PDL register are used as the PDLH register and as the PDLL register, respectively, these registers can be read or written in 8-bit or 1-bit units.

(2) Port DL mode register (PMDL)

After reset: FFFFH R/W Address: PMDL FFFF024H,
PMDLL FFFF024H, PMDLH FFFF025H

	15	14	13	12	11	10	9	8
PMDL (PMDLH ^{Note})	PMDL15	PMDL14	PMDL13	PMDL12	PMDL11	PMDL10	PMDL9	PMDL8

	7	6	5	4	3	2	1	0
(PMDLL)	PMDL7	PMDL6	PMDL5	PMDL4	PMDL3	PMDL2	PMDL1	PMDL0

PMDLn	Control of I/O mode (n = 0 to 15)
0	Output mode
1	Input mode

Note When reading from or writing to bits 8 to 15 of the PMDL register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PMDLH register.

Remark The PMDL register can be read or written in 16-bit units.
However, when the higher 8 bits and the lower 8 bits of the PMDL register are used as the PMDLH register and as the PMDLL register, respectively, these registers can be read or written in 8-bit or 1-bit units.

(3) Port DL mode control register (PMCDL)

After reset: 0000H R/W Address: PMCDL FFFF044H,
 PMCDLL FFFF044H, PMCDLH FFFF045H

	15	14	13	12	11	10	9	8
PMCDL (PMCDLH ^{Note})	PMCDL15	PMCDL14	PMCDL13	PMCDL12	PMCDL11	PMCDL10	PMCDL9	PMCDL8
	7	6	5	4	3	2	1	0
(PMCDLL)	PMCDL7	PMCDL6	PMCDL5	PMCDL4	PMCDL3	PMCDL2	PMCDL1	PMCDL0
	Specification of PDLn pin operation mode (n = 0 to 15)							
PMCDLn								
0	I/O port							
1	ADn I/O (address/data bus I/O)							

Note When reading from or writing to bits 8 to 15 of the PMCDL register in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the PMCDLH register.

Caution When specifying the port/alternate function for each bit, pay careful attention to the operation of the alternate functions.

Remark The PMCDL register can be read or written in 16-bit units.
 However, when the higher 8 bits and the lower 8 bits of the PMCDL register are used as the PMCDLH register and as the PMCDLL register, respectively, these registers can be read or written in 8-bit or 1-bit units.

4.5 Port Register Setting When Alternate Function Is Used

Table 4-19 shows the port register settings when each port is used for an alternate function.

When using a port pin as an alternate-function pin, refer to description of each pin.

Table 4-19. Settings When Port Pins Are Used for Alternate Functions (1/7)

Pin Name	Alternate Function		Pnx Bit of Pn Register	PMnx Bit of PMn Register	PMCnx Bit of PMcN Register	PFCnx Bit of PFCn Register	Other Bits (Registers)
	Function Name	I/O					
P00	TOH0	Output	P00 = Setting not required	PM00 = Setting not required	PMC00 = 1	–	–
P01	TOH1	Output	P01 = Setting not required	PM01 = Setting not required	PMC01 = 1	–	–
P02	NMI	Input	P02 = Setting not required	PM02 = Setting not required	PMC02 = 1	–	–
P03	INTP0	Input	P03 = Setting not required	PM03 = Setting not required	PMC03 = 1	–	–
P04	INTP1	Input	P04 = Setting not required	PM04 = Setting not required	PMC04 = 1	–	–
P05	INTP2	Input	P05 = Setting not required	PM05 = Setting not required	PMC05 = 1	–	OCDM0 (OCDM) = 0 ^{Note 1}
	DRST ^{Note 1}	Input	P05 = Setting not required	PM05 = Setting not required	PMC05 = Setting not required	–	OCDM0 (OCDM) = 1
P06	INTP3	Input	P06 = Setting not required	PM06 = Setting not required	PMC06 = 1	–	–
P10	ANO0	Output	P10 = Setting not required	PM1 register = FFH ^{Note 2}	–	–	–
P11	ANO1	Output	P11 = Setting not required	PM1 register = FFH ^{Note 2}	–	–	–
P30	TXD0	Output	P30 = Setting not required	PM30 = Setting not required	PMC30 = 1	–	–
P31	RXD0	Input	P31 = Setting not required	PM31 = Setting not required	PMC31 = 1	–	–
P32	ASCK0	Input	P32 = Setting not required	PM32 = Setting not required	PMC32 = 1	–	–
P33	TI000	Input	P33 = Setting not required	PM33 = Setting not required	PMC33 = 1	PFC33 = 0	PFCE33 (PFCE3) = 0 ^{Note 1}
	TO00	Output	P33 = Setting not required	PM33 = Setting not required	PMC33 = 1	PFC33 = 1	PFCE33 (PFCE3) = 0 ^{Note 1}
	TIP00 ^{Note 1}	Input	P33 = Setting not required	PM33 = Setting not required	PMC33 = 1	PFC33 = 0	PFCE33 (PFCE3) = 1
	TOP00 ^{Note 1}	Output	P33 = Setting not required	PM33 = Setting not required	PMC33 = 1	PFC33 = 1	PFCE33 (PFCE3) = 1
P34	TI001	Input	P34 = Setting not required	PM34 = Setting not required	PMC34 = 1	PFC34 = 0 ^{Note 1}	PFCE34 (PFCE3) = 0 ^{Note 1}
	TIP01 ^{Note 1}	Input	P34 = Setting not required	PM34 = Setting not required	PMC34 = 1	PFC34 = 0	PFCE34 (PFCE3) = 1
	TOP01 ^{Note 1}	Output	P34 = Setting not required	PM34 = Setting not required	PMC34 = 1	PFC34 = 1	PFCE34 (PFCE3) = 1
P35	TI010	Input	P35 = Setting not required	PM35 = Setting not required	PMC35 = 1	PFC35 = 0	–
	TO01	Output	P35 = Setting not required	PM35 = Setting not required	PMC35 = 1	PFC35 = 1	–
P38	SDA0 ^{Note 3}	I/O	P38 = 1	PM38 = Setting not required	PMC38 = 1	–	PF38 (PF3H) = 1
P39	SCL0 ^{Note 3}	I/O	P39 = 1	PM39 = Setting not required	PMC39 = 1	–	PF39 (PF3H) = 1

Notes 1. Only in the μ PD70F3218H and 70F3218HY

2. When setting the ANO0 and ANO1 pins, set PM1 register = FFH all together.

3. Only in products with an I²C bus (Y products)

Table 4-19. Settings When Port Pins Are Used for Alternate Functions (2/7)

Pin Name	Alternate Function		Pnx Bit of Pn Register	PMnx Bit of PMn Register	PMCnx Bit of PMCn Register	PFCnx Bit of PFCn Register	Other Bits (Registers)

4.6 Cautions

4.6.1 Cautions on bit manipulation instruction for port n register (Pn)

When a 1-bit manipulation instruction is executed on a port that provides both input and output functions, the value of the output latch of an input port that is not subject to manipulation may be written in addition to the targeted bit.

Therefore, it is recommended to rewrite the output latch when switching a port from input mode to output mode.

<Example> When P90 is an output port, P91 to P97 are input ports (all pin statuses are high level), and the value of the port latch is 00H, if the output of output port P90 is changed from low level to high level via a bit manipulation instruction, the value of the port latch is FFH.

Explanation: The targets of writing to and reading from the Pn register of a port whose PMnm bit is 1 are the output latch and pin status, respectively.

A bit manipulation instruction is executed in the following order in the V850ES/KJ1.

- <1> The Pn register is read in 8-bit units.
- <2> The targeted one bit is manipulated.
- <3> The Pn register is written in 8-bit units.

In step <1>, the value of the output latch (0) of P90, which is an output port, is read, while the pin statuses of P91 to P97, which are input ports, are read. If the pin statuses of P91 to P97 are high level at this time, the read value is FEH.

The value is changed to FFH by the manipulation in <2>.

FFH is written to the output latch by the manipulation in <3>.

Figure 4-37. Bit Manipulation Instruction (P90)

4.6.2 Hysteresis characteristics

In port mode, the following ports do not have hysteresis characteristics.

P02 to P06
 P31 to P35, P38, P39
 P40, P42
 P66, P68 to P610, P612, P613
 P80, P81
 P93, P95, P97, P99, P910, P912 to P915

<R> 4.6.3 Cautions on on-chip debug pins

The $\overline{\text{DRST}}$, DCK, DMS, DDI, and DDO pins are on-chip debug pins (these pins are available only in the $\mu\text{PD70F3218H}$ and $70F3218\text{HY}$).

After reset by the $\overline{\text{RESET}}$ pin, the P05/INTP2/ $\overline{\text{DRST}}$ pin is initialized to function as an on-chip debug pin ($\overline{\text{DRST}}$). If a high level is input to the $\overline{\text{DRST}}$ pin at this time, the on-chip debug mode is set, and the DCK, DMS, DDI, and DDO pins can be used.

The following action must be taken if on-chip debugging is not used.

- Clear the OCDM0 bit of the OCDM register (special register) to 0

At this time, fix the P05/INTP2/ $\overline{\text{DRST}}$ pin to low level from when reset by the $\overline{\text{RESET}}$ pin is released until the above action is taken.

If a high level is input to the $\overline{\text{DRST}}$ pin before the above action is taken, it may cause a malfunction (CPU deadlock). Handle the P05 pin with the utmost care.

Caution After reset by the WDTRES1 or WDTRES2 signal, the P05/INTP2/ $\overline{\text{DRST}}$ pin is not initialized to function as an on-chip debug pin ($\overline{\text{DRST}}$). The OCDM register holds the current value.

<R> 4.6.4 Cautions on P05/INTP2/ $\overline{\text{DRST}}$ pin

The P05/INTP2/ $\overline{\text{DRST}}$ pin has an internal pull-down resistor (30 k Ω TYP.). After a reset by the $\overline{\text{RESET}}$ pin, a pull-down resistor is connected. The pull-down resistor is disconnected when the OCDM0 bit is cleared to 0.

CHAPTER 5 BUS CONTROL FUNCTION

The V850ES/KJ1 is provided with an external bus interface function by which external memories such as ROM and RAM, and I/O can be connected.

5.1 Features

- 16-bit data bus
- Output is selectable from a multiplex bus with a minimum of 3 bus cycles and a separate bus with a minimum of 2 bus cycles
- Chip select function for up to 4 spaces
- 8-bit/16-bit data bus selectable (for each area selected by chip select function)
- Wait function
 - Programmable wait function of up to 7 states (selectable for each area selected by chip select function)
 - External wait function using $\overline{\text{WAIT}}$ pin
- Idle state function
- Bus hold function
- The bus can be controlled using a different voltage from the operating voltage by setting $BV_{DD} \leq V_{DD} = EV_{DD}$ (however, only in multiplex bus mode).
- Can be connected to the external device with port alternate-function pins.
- Misalign access possible

5.2 Bus Control Pins

The pins used to connect an external device are listed in the table below.

Table 5-1. Bus Control Pins (When Multiplex Bus Selected)

Bus Control Pin	Alternate-Function Pin	I/O	Function	Register to Switch Between Port Mode/ Alternate-Function Mode
AD0 to AD15	PDL0 to PDL15	I/O	Address/data bus	PMCDL register
A16 to A23	PDH0 to PDH7	Output	Address bus	PMCDH register
$\overline{\text{WAIT}}$	PCM0	Input	External wait control	PMCCM register
CLKOUT	PCM1	Output	Internal system clock output	PMCCM register
$\overline{\text{CS0}}$ to $\overline{\text{CS3}}$	PCS0 to PCS3	Output	Chip select	PMCCS register
$\overline{\text{WR0}}$, $\overline{\text{WR1}}$	PCT0, PCT1	Output	Write strobe signal	PMCCCT register
$\overline{\text{RD}}$	PCT4	Output	Read strobe signal	PMCCCT register
ASTB	PCT6	Output	Address strobe signal	PMCCCT register
$\overline{\text{HLDRQ}}$	PCM3	Input	Bus hold control	PMCCM register
$\overline{\text{HLDK}}$	PCM2	Output		

Table 5-2. Bus Control Pins (When Separate Bus Selected)

Bus Control Pin	Alternate-Function Pin	I/O	Function	Register to Switch Between Port Mode/ Alternate-Function Mode
AD0 to AD15	PDL0 to PDL15	I/O	Data bus	PMCDL register
A0 to A15	P90 to P915	Output	Address bus	PMC9 register
A16 to A23	PDH0 to PDH7	Output	Address bus	PMCDH register
$\overline{\text{WAIT}}$	PCM0	Input	External wait control	PMCCM register
CLKOUT	PCM1	Output	Internal system clock output	PMCCM register
$\overline{\text{CS0}}$ to $\overline{\text{CS3}}$	PCS0 to PCS3	Output	Chip select	PMCCS register
$\overline{\text{WR0}}$, $\overline{\text{WR1}}$	PCT0, PCT1	Output	Write strobe signal	PMCCCT register
$\overline{\text{RD}}$	PCT4	Output	Read strobe signal	PMCCCT register
$\overline{\text{HLDRQ}}$	PCM3	Input	Bus hold control	PMCCM register
$\overline{\text{HLDK}}$	PCM2	Output		

5.2.1 Pin status when internal ROM, internal RAM, or on-chip peripheral I/O is accessed

When the internal ROM, internal RAM, or on-chip peripheral I/O are accessed, the status of each pin is as follows.

Table 5-3. Pin Statuses When Internal ROM, Internal RAM, or On-Chip Peripheral I/O Is Accessed

Separate Bus Mode		Multiplex Bus Mode	
Address bus (A23 to A0)	Undefined	Address bus (A23 to A16)	Undefined
Data bus (AD15 to AD0)	Hi-Z	Address/data bus (AD15 to AD0)	Undefined
Control signal	Inactive	Control signal	Inactive

Caution When a write access is performed to the internal ROM area, address, data, and control signals are activated in the same way as access to the external memory area.

5.2.2 Pin status in each operation mode

For the pin status of the V850ES/KJ1 in each operation mode, refer to **2.2 Pin Status**.

5.3 Memory Block Function

The 64 MB memory space is divided into memory blocks of (lower) 2 MB, 2 MB, 4 MB, and 8 MB. The programmable wait function and bus cycle operation mode for each of these blocks can be independently controlled in one-block units.

Figure 5-1. Data Memory Map: Physical Address

5.3.1 Chip select control function

Of the 64 MB (linear) address space, the lower 16 MB (0000000H to 0FFFFFFH) include four chip select control functions, $\overline{CS0}$ to $\overline{CS3}$. The areas that can be selected by $\overline{CS0}$ to $\overline{CS3}$ are fixed.

By using these chip select control functions, the memory space can be used effectively. The allocation of the chip select areas is shown in the table below.

$\overline{CS0}$	0000000H to 01FFFFFFH (2 MB)
$\overline{CS1}$	0200000H to 03FFFFFFH (2 MB)
$\overline{CS2}$	0400000H to 07FFFFFFH (4 MB)
$\overline{CS3}$	0800000H to 0FFFFFFFH (8 MB)

5.4 External Bus Interface Mode Control Function

The V850ES/KJ1 includes the following two external bus interface modes.

- Multiplex bus mode
- Separate bus mode

These two modes can be selected by using the EXIMC register.

(1) External bus interface mode control register (EXIMC)

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

After reset: 00H R/W Address: FFFFFFFBEH

	7	6	5	4	3	2	1	0
EXIMC	0	0	0	0	0	0	0	SMSEL

SMSEL	Mode selection
0	Multiplex bus mode
1	Separate bus mode

Caution Set the EXIMC register from the internal ROM or internal RAM area before external access.
After setting the EXIMC register, be sure to set a NOP instruction.

5.5 Bus Access

5.5.1 Number of clocks for access

The following table shows the number of basic clocks required for accessing each resource.

Area (Bus Width) Bus Cycle Type	Internal ROM (32 Bits)	Internal RAM (32 Bits)	External Memory (16 Bits)	On-Chip Peripheral I/O (16 Bits)
Instruction fetch (normal access)	1	1 ^{Note 1}	3 + n ^{Note 2}	—
Instruction fetch (branch)	2	2 ^{Note 1}	3 + n ^{Note 2}	—
Operand data access	3	1	3 + n ^{Note 2}	3 ^{Note 3}

- Notes**
1. If the access conflicts with a data access, the number of clock is increased by 1.
 2. Value when the multiplexed bus is selected. 2 + n clocks (n: Number of wait states) when the separate bus mode is selected.
 3. This value varies depending on the setting of the VSWC register.

Remark Unit: Clocks/access

5.5.2 Bus size setting function

The bus size of each external memory area selected by $\overline{CSn}$ can be set (to 8 bits or 16 bits) by using the BSC register.

The external memory area of the V850ES/KJ1 is selected by $\overline{CS0}$ to $\overline{CS3}$.

(1) Bus size configuration register (BSC)

This register can be read or written in 16-bit units.

Reset sets this register to 5555H.

Caution Write to the BSC register after reset, and then do not change the set values. Also, do not access an external memory area until the initial settings of the BSC register are complete.

After reset: 5555H R/W Address: FFFFF066H

	15	14	13	12	11	10	9	8
BSC	0	1	0	1	0	1	0	1
	7	6	5	4	3	2	1	0
	0	BS30	0	BS20	0	BS10	0	BS00
$\overline{CSn}$ signal		$\overline{CS3}$		$\overline{CS2}$		$\overline{CS1}$		$\overline{CS0}$
BSn0	Data bus width of CSn space (n = 0 to 3)							
0	8 bits							
1	16 bits							

Caution Be sure to set bits 14, 12, 10, and 8 to “1”, and clear bits 15, 13, 11, 9, 7, 5, 3, and 1 to “0”.

5.5.3 Access by bus size

The V850ES/KJ1 accesses the on-chip peripheral I/O and external memory in 8-bit, 16-bit, or 32-bit units. The bus size is as follows.

- The bus size of the on-chip peripheral I/O is fixed to 16 bits.
- The bus size of the external memory is selectable from 8 bits or 16 bits (by using the BSC register).

The operation when each of the above is accessed is described below. All data is accessed starting from the lower side.

The V850ES/KJ1 supports only the little endian format.

Figure 5-2. Little Endian Address in Word

(1) Data space

The V850ES/KJ1 has an address misalign function.

With this function, data can be placed at all addresses, regardless of the format of the data (word data or halfword data). However, if the word data or halfword data is not aligned at the boundary, a bus cycle is generated at least twice, causing the bus efficiency to drop.

(a) Halfword-length data access

A byte-length bus cycle is generated twice if the least significant bit of the address is 1.

(b) Word-length data access

- A byte-length bus cycle, halfword-length bus cycle, and byte-length bus cycle are generated in that order if the least significant bit of the address is 1.
- A halfword-length bus cycle is generated twice if the lower 2 bits of the address are 10.

(2) Byte access (8 bits)**(a) 16-bit data bus width****(b) 8-bit data bus width**

(3) Halfword access (16 bits)

(a) With 16-bit data bus width

(b) 8-bit data bus width

(4) Word access (32 bits)

(a) 16-bit data bus width (1/2)

<1> Access to address ($4n$)

First access

Second access

<2> Access to address ($4n + 1$)

First access

Second access

Third access

(a) 16-bit data bus width (2/2)

<3> Access to address $(4n + 2)$

<4> Access to address $(4n + 3)$

(b) 8-bit data bus width (1/2)

(b) 8-bit data bus width (2/2)

5.6 Wait Function

5.6.1 Programmable wait function

(1) Data wait control register 0 (DWC0)

To realize interfacing with a low-speed memory or I/O, up to seven data wait states can be inserted in the bus cycle that is executed for each CS space.

The number of wait states can be programmed by using the DWC0 register. Immediately after system reset, 7 data wait states are inserted for all the chip select areas.

The DWC0 register can be read or written in 16-bit units.

Reset sets this register to 7777H.

- Cautions**
1. The internal ROM and internal RAM areas are not subject to programmable wait, and are always accessed without a wait state. The on-chip peripheral I/O area is also not subject to programmable wait, and only wait control from each peripheral function is performed.
 2. Write to the DWC0 register after reset, and then do not change the set values. Also, do not access an external memory area until the initial settings of the DWC0 register are complete.

Caution Be sure to clear bits 15, 11, 7, and 3 to “0”.

5.6.2 External wait function

To synchronize an extremely slow memory, I/O, or asynchronous system, any number of wait states can be inserted in the bus cycle by using the external wait pin ($\overline{\text{WAIT}}$).

Access to each area of the internal ROM, internal RAM, and on-chip peripheral I/O is not subject to control by the external wait function, in the same manner as the programmable wait function.

The $\overline{\text{WAIT}}$ signal can be input asynchronously to CLKOUT, and is sampled at the falling edge of the clock in the T2 and TW states of the bus cycle in the multiplex bus mode. In the separate bus mode, it is sampled at the rising edge of the clock immediately after the T1 and TW states of the bus cycle. If the setup/hold time of the sampling timing is not satisfied, a wait state is inserted in the next state, or not inserted at all.

5.6.3 Relationship between programmable wait and external wait

Wait cycles are inserted as the result of an OR operation between the wait cycles specified by the set value of the programmable wait and the wait cycles controlled by the $\overline{\text{WAIT}}$ pin.

For example, if the timing of the programmable wait and the $\overline{\text{WAIT}}$ pin signal is as illustrated below, three wait states will be inserted in the bus cycle.

Figure 5-3. Example of Inserting Wait States

5.6.4 Programmable address wait function

Address-setup or address-hold waits to be inserted in each bus cycle can be set by using the AWC register. Address wait insertion is set for each chip select area ($\overline{CS0}$ to $\overline{CS3}$).

If an address setup wait is inserted, it seems that the high-clock period of T1 state is extended by 1 clock. If an address hold wait is inserted, it seems that the low-clock period of T1 state is extended by 1 clock.

(1) Address wait control register (AWC)

This register can be read or written in 16-bit units.

Reset sets this register to FFFFH.

- Cautions**
1. The internal ROM, internal RAM, and on-chip peripheral I/O areas are not subject to address setup wait or address hold wait insertion.
 2. Write the AWC register after reset, and then do not change the set values. Also, do not access an external memory area until the initial settings of the AWC register are complete.

Caution Be sure to set bits 15 to 8 to “1”.

5.7 Idle State Insertion Function

To facilitate interfacing with low-speed memories, one idle state (TI) can be inserted after the T3 state in the bus cycle that is executed for each space selected by $\overline{CS}_n$ in the multiplex address/data bus mode. In the separate bus mode, one idle state (TI) can be inserted after the T2 state. By inserting idle states, the data output float delay time of the memory can be secured during read access (an idle state cannot be inserted during write access).

Whether the idle state is to be inserted can be programmed by using the BCC register.

An idle state is inserted for all the areas immediately after system reset.

(1) Bus cycle control register (BCC)

This register can be read or written in 16-bit units.

Reset sets this register to AAAAH.

- Cautions**
1. The internal ROM, internal RAM, and on-chip peripheral I/O areas are not subject to idle state insertion.
 2. Write to the BCC register after reset, and then do not change the set values. Also, do not access an external memory area until the initial settings of the BCC register are complete.

Caution Be sure to set bits 15, 13, 11, and 9 to “1”, and clear bits 14, 12, 10, 8, 6, 4, 2, and 0 to “0”.

5.8 Bus Hold Function

5.8.1 Functional outline

The $\overline{\text{HLDRQ}}$ and $\overline{\text{HLDK}}$ functions are valid if the PCM2 and PCM3 pins are set in the control mode.

When the $\overline{\text{HLDRQ}}$ pin is asserted (low level), indicating that another bus master has requested bus mastership, the external address/data bus goes into a high-impedance state and is released (bus hold status). If the request for the bus mastership is cleared and the $\overline{\text{HLDRQ}}$ pin is deasserted (high level), driving these pins is started again.

During the bus hold period, execution of the program in the internal ROM and internal RAM is continued until a peripheral I/O register or the external memory is accessed.

The bus hold status is indicated by assertion (low level) of the $\overline{\text{HLDK}}$ pin. The bus hold function enables the configuration of multi-processor type systems in which two or more bus masters exist.

Note that the bus hold request is not acknowledged during a multiple-access cycle initiated by the bus sizing function or a bit manipulation instruction.

Status	Data Bus Width	Access Type	Timing in Which Bus Hold Request Not Acknowledged
CPU bus lock	16 bits	Word access to even address	Between first and second access
		Word access to odd address	Between first and second access
			Between second and third access
		Halfword access to odd address	Between first and second access
	8 bits	Word access	Between first and second access
			Between second and third access
			Between third and fourth access
		Halfword access	Between first and second access
Read-modify-write access of bit manipulation instruction	—	—	Between read access and write access

5.8.2 Bus hold procedure

The bus hold status transition procedure is shown below.

5.8.3 Operation in power save mode

Because the internal system clock is stopped in the STOP and IDLE modes, the bus hold status is not entered even if the $\overline{\text{HLDQRQ}}$ pin is asserted.

In the HALT mode, the $\overline{\text{HLDARQ}}$ pin is asserted as soon as the $\overline{\text{HLDQRQ}}$ pin has been asserted, and the bus hold status is entered. When the $\overline{\text{HLDQRQ}}$ pin is later deasserted, the $\overline{\text{HLDARQ}}$ pin is also deasserted, and the bus hold status is cleared.

5.9 Bus Priority

Bus hold, instruction fetch (branch), instruction fetch (successive), and operand data accesses are executed in the external bus cycle.

Bus hold has the highest priority, followed by operand data access, instruction fetch (branch), and instruction fetch (successive).

An instruction fetch may be inserted between the read access and write access in a read-modify-write access.

If an instruction is executed for two or more accesses, an instruction fetch and bus hold are not inserted between accesses due to bus size limitations.

Table 5-4. Bus Priority

Priority	External Bus Cycle	Bus Master
High ↑ ↓ Low	Bus hold	External device
	Operand data access	CPU
	Instruction fetch (branch)	CPU
	Instruction fetch (successive)	CPU

5.10 Bus Timing

AD7 to AD0	Undefined	Active
WR1, WR0	01	10

Remark The broken lines indicate high impedance.

Figure 5-12. Separate Bus Write Timing (Bus Size: 8 Bits)

Remark The broken lines indicate high impedance.

Figure 5-13. Separate Bus Hold Timing (Bus Size: 8 Bits, Write)

Figure 5-14. Address Wait Timing (Separate Bus Read, Bus Size: 16 Bits, 16-Bit Access)

5.11 Cautions

With the external bus function, signals may not be output at the correct timing under the following conditions.

<Operating conditions>

○ Multiplex bus mode

<1> CLKOUT asynchronous ($2.7\text{ V} \leq V_{DD} = EV_{DD} = AV_{REF0} < 4.0\text{ V}$, $2.7\text{ V} \leq BV_{DD} < 4.0\text{ V}$)

When $1/f_{CPU} < 84\text{ ns}$

○ Separate bus mode

<1> Read cycle, CLKOUT asynchronous ($4.0\text{ V} \leq V_{DD} = BV_{DD} = EV_{DD} = AV_{REF0} \leq 5.5\text{ V}$)

When $1/f_{CPU} < 100\text{ ns}$

<2> Write cycle, CLKOUT asynchronous ($4.0\text{ V} \leq V_{DD} = BV_{DD} = EV_{DD} = AV_{REF0} \leq 5.5\text{ V}$)

When $1/f_{CPU} < 60\text{ ns}$

<3> Read cycle, CLKOUT asynchronous ($2.7\text{ V} \leq V_{DD} = BV_{DD} = EV_{DD} = AV_{REF0} < 4.0\text{ V}$)

When $1/f_{CPU} < 200\text{ ns}$

<4> Write cycle, CLKOUT asynchronous ($2.7\text{ V} \leq V_{DD} = BV_{DD} = EV_{DD} = AV_{REF0} < 4.0\text{ V}$)

When $1/f_{CPU} < 100\text{ ns}$

<Countermeasure>

When used under the above conditions, be sure to insert an address setup/hold wait using the AWC register ($n = 0$ to 3).

○ When used in multiplex bus mode and under condition <1>

- $70\text{ ns} < 1/f_{CPU} < 84\text{ ns}$

Set an address setup wait (ASWn bit = 1).

- $62.5\text{ ns} < 1/f_{CPU} < 70\text{ ns}$

Set an address setup wait (ASWn bit = 1) and address hold wait (AHWn bit = 1).

○ When used in separate bus mode and under conditions <1> to <4>

Set an address setup wait (ASWn bit = 1).

CHAPTER 6 CLOCK GENERATION FUNCTION

6.1 Overview

The following clock generation functions are available.

<R>

○ Main clock oscillator

<In PLL (×4) mode>

- $f_x = 2$ to 5 MHz ($f_{xx} = 8$ to 20 MHz: $4.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $REGC = V_{DD}$)
- $f_x = 2$ to 4 MHz ($f_{xx} = 8$ to 16 MHz: $4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $REGC = V_{DD}$)
- $f_x = 2$ to 4 MHz ($f_{xx} = 8$ to 16 MHz: $4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $REGC = 10\text{ }\mu\text{F}$)
- $f_x = 2$ to 2.5 MHz ($f_{xx} = 8$ to 10 MHz: $2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $REGC = V_{DD}$)

<In clock through mode>

- $f_x = 2$ to 10 MHz ($f_{xx} = 2$ to 10 MHz: $2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $REGC = V_{DD}$)
- $f_x = 2$ to 10 MHz ($f_{xx} = 2$ to 10 MHz: $4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $REGC = 10\text{ }\mu\text{F}$)

○ Subclock oscillator

- $f_{XT} = 32.768\text{ kHz}$

○ Multiplication (×4) function by PLL (Phase Locked Loop)

- Clock-through mode/PLL mode selectable
- Usable voltage: $V_{DD} = 2.7$ to 5.5 V

○ Internal system clock generation

- 7 steps (f_{xx} , $f_{xx}/2$, $f_{xx}/4$, $f_{xx}/8$, $f_{xx}/16$, $f_{xx}/32$, f_{XT})

○ Peripheral clock generation

○ Clock output function

Remark f_x : Main clock oscillation frequency

f_{xx} : Main clock frequency

f_{XT} : Subclock frequency

6.2 Configuration

Figure 6-1. Clock Generator

<R>

(1) Main clock oscillator

The main clock oscillator oscillates the following frequencies (f_x):

- $f_x = 2$ to 5 MHz (REGC = $V_{DD} = 4.5$ to 5.5 V, in PLL mode)
- $f_x = 2$ to 4 MHz (REGC = $V_{DD} = 4.0$ to 5.5 V, in PLL mode)
- $f_x = 2$ to 4 MHz (REGC = 10 μ F, $V_{DD} = 4.0$ to 5.5 V, in PLL mode)
- $f_x = 2$ to 2.5 MHz (REGC = $V_{DD} = 2.7$ to 5.5 V, in PLL mode)
- $f_x = 2$ to 10 MHz (REGC = $V_{DD} = 2.7$ to 5.5 V, in clock through mode)
- $f_x = 2$ to 10 MHz (REGC = 10 μ F, $V_{DD} = 4.0$ to 5.5 V, in clock through mode)

(2) Subclock oscillator

The subclock oscillator oscillates a frequency of 32.768 kHz (f_{XT}).

(3) Main clock oscillator stop control

This circuit generates a control signal that stops oscillation of the main clock oscillator.

Oscillation of the main clock oscillator is stopped in the STOP mode or when the PCC.MCK bit = 1 (valid only when the PCC.CLS bit = 1).

(4) Prescaler 1

This prescaler generates the clock (f_{xx} to $f_{xx}/1024$) to be supplied to the following on-chip peripheral functions: TMP0^{Note}, TM00 to TM05, TM50, TM51, TMH0, TMH1, CSI00 to CSI02, CSIA0, CSIA1, UART0 to UART2, I²C0, I²C1, ADC, DAC, and WDT2

Note Only in the μ PD70F3218H, 70F3218HY

(5) Prescaler 2

This circuit divides the main clock (f_{xx}).

The clock generated by prescaler 2 (f_{xx} to $f_{xx}/32$) is supplied to the selector that generates the CPU clock (f_{CPU}) and internal system clock (f_{CLK}).

f_{CLK} is the clock supplied to the INTC, ROM correction, ROM, and RAM blocks, and can be output from the CLKOUT pin.

(6) Interval timer BRG

This circuit divides the clock (f_x) generated by the main clock oscillator to a specific frequency (32.768 kHz) and supplies that clock to the watch timer block.

For details, refer to **CHAPTER 11 INTERVAL TIMER, WATCH TIMER**.

(7) PLL

This circuit multiplies the clock (f_x) generated by the main clock oscillator.

It operates in two modes: clock-through mode in which f_x is output as is, and PLL mode in which a multiplied clock is output. These modes can be selected by using the PLLCTL.SELPLL bit.

Operation of the PLL can be started or stopped by the PLLCTL.PLLON bit.

6.3 Registers

(1) Processor clock control register (PCC)

The PCC register is a special register. Data can be written to this register only in combination of specific sequences (refer to **3.4.7 Special registers**).

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 03H.

(1/2)

After reset: 03H R/W After reset: FFFFF828H

	7	<6>	5	<4>	<3>	2	1	0
PCC	FRC	MCK	MFRC	CLS ^{Note}	CK3	CK2	CK1	CK0

FRC	Use of subclock on-chip feedback resistor
0	Used
1	Not used

MCK	Control of main clock oscillator
0	Oscillation enabled
1	Oscillation stopped
• Even if the MCK bit is set to 1 while the system is operating with the main clock as the CPU clock, the operation of the main clock does not stop. It stops after the CPU clock has been changed to the subclock. • When the main clock is stopped and the device is operating on the subclock, clear the MCK bit to 0 and wait until the oscillation stabilization time has been secured by the program before switching back to the main clock.	

MFRC	Use of main clock on-chip feedback resistor
0	Used
1	Not used

CLS ^{Note}	Status of CPU clock (f _{CPU})
0	Main clock operation
1	Subclock operation

Note The CLS bit is a read-only bit.

CK3	CK2	CK1	CK0	Clock selection (f_{CLK}/f_{CPU})
0	0	0	0	f_{XX}
0	0	0	1	$f_{XX}/2$
0	0	1	0	$f_{XX}/4$
0	0	1	1	$f_{XX}/8$ (default value)
0	1	0	0	$f_{XX}/16$
0	1	0	1	$f_{XX}/32$
0	1	1	×	Setting prohibited
1	×	×	×	f_{XT}

- Cautions**
1. Do not change the CPU clock (by using the CK3 to CK0 bits) while CLKOUT is being output.
 2. Use a bit manipulation instruction to manipulate the CK3 bit. When using an 8-bit manipulation instruction, do not change the set values of the CK2 to CK0 bits.
 3. When the CPU operates on the subclock and no clock is input to the X1 pin, do not access a register in which a wait occurs using an access method that causes a wait (refer to 3.4.8 (1) (b) Access to special on-chip peripheral I/O register for details of the access methods). If a wait occurs, it can only be released by a reset.

Remark ×: don't care

(a) Example of setting main clock operation → subclock operation

<1> CK3 bit ← 1: Use of a bit manipulation instruction is recommended. Do not change the CK2 to CK0 bits.

<2> Subclock operation: Read the CLS bit to check if subclock operation has started. It takes the following time after the CK3 bit is set until subclock operation is started.

Max.: $1/f_{XT}$ (1/subclock frequency)

<3> MCK bit ← 1: Set the MCK bit to 1 only when stopping the main clock.

Cautions 1. When stopping the main clock, stop the PLL.

2. If the following conditions are not satisfied, change the CK2 to CK0 bits so that the conditions are satisfied, then change to the subclock operation mode.

Internal system clock (f_{CLK}) > Subclock (f_{XT} : 32.768 kHz) × 4

Remark Internal system clock (f_{CLK}): Clock generated from the main clock (f_{XX}) by setting bits CK2 to CK0

[Description example]

```
<1> _SET_SUB_RUN :
    st.b      r0, PRCMD[r0]
    set1      3, PCC[r0]          -- CK3 bit ← 1

<2> _CHECK_CLS :
    tst1      4, PCC[r0]          -- Wait until subclock operation starts.
    bz        _CHECK_CLS

<3> _STOP_MAIN_CLOCK :
    st.b      r0, PRCMD[r0]
    set1      6, PCC[r0]          -- MCK bit ← 1, main clock is stopped
```

Remark The above description is an example. Note with caution that the CLS bit is read in a closed loop in <2>.

(b) Example of setting subclock operation → main clock operation

- <1> MCK bit ← 0: Main clock starts oscillating
- <2> Insert waits by the program and wait until the oscillation stabilization time of the main clock elapses.
- <3> CK3 bit ← 0: Use of a bit manipulation instruction is recommended. Do not change the CK2 to CK0 bits.
- <4> Main clock operation: It takes the following time after the CK3 bit is set until main clock operation is started.

Max.: $1/f_{XT}$ (1/subclock frequency)

Therefore, insert one NOP instruction immediately after setting the CK3 bit to 0 or read the CLS bit to check if main clock operation has started.

[Description example]

```

<1> _START_MAIN_OSC :
    st.b      r0, PRCMD[r0]      -- Release of protection of special registers
    clr.l     6, PCC[r0]         -- Main clock starts oscillating
<2> movea     0x55, r0, r11      -- Wait for oscillation stabilization time
    _WAIT_OST :
    nop
    nop
    nop
    addi      -1, r11, r11
    mp        r0, r11
    bne       _PROGRAM_WAIT
<3> st.b      r0, PRCMD[r0]
    clr.l     3, PCC[r0]         -- CK3 ← 0
<4> _CHECK_CLS :
    tst.l     4, PCC[r0]         -- Wait until main clock operation starts
    bnz       _CHECK_CLS

```

Remark The above description is an example. Note with caution that the CLS bit is read in a closed loop in <4>.

6.4 Operation

6.4.1 Operation of each clock

The following table shows the operation status of each clock.

Table 6-1. Operation Status of Each Clock

Register Setting and Operation Status Target Clock	PCC Register								
	CLS bit = 0, MCK bit = 0					CLS bit = 1, MCK bit = 0		CLS bit = 1, MCK bit = 1	
	During reset	During oscillation stabilization time count	HALT mode	IDLE mode	STOP mode	Subclock mode	Sub-IDLE mode	Subclock mode	Sub-IDLE mode
Main clock oscillator (fx)	×	○	○	○	×	○	○	×	×
Subclock oscillator (fxT)	○	○	○	○	○	○	○	○	○
CPU clock (f _{cpu})	×	×	×	×	×	○	×	○	×
Internal system clock (f _{clk})	×	×	○	×	×	○	×	○	×
Peripheral clock (f _{xx} to f _{xx} /1024)	×	×	○	×	×	○	×	×	×
WT clock (main)	×	○	○	○	×	○	○	×	×
WT clock (sub)	○	○	○	○	○	○	○	○	○
WDT1 clock (f _w)	×	○	○	○	×	○	○	×	×
WDT2 clock (main)	×	×	○	×	×	○	×	×	×
WDT2 clock (sub)	○	○	○	○	○	○	○	○	○

Remark ○: Operable

×: Stopped

6.4.2 Clock output function

The clock output function is used to output the internal system clock (f_{clk}) from the CLKOUT pin.

The internal system clock (f_{clk}) is selected by using the PCC.CK3 to PCC.CK0 bits.

The CLKOUT pin functions alternately as the PCM1 pin and functions as a clock output pin if so specified by the control register of port CM.

The status of the CLKOUT pin is the same as the internal system clock in Table 6-1 and the pin can output the clock when it is in the operable status. It outputs a low level in the stopped status. However, the port mode (PCM1: input mode) is selected until the CLKOUT pin output is set after reset. Consequently, the CLKOUT pin goes into a high-impedance state.

6.4.3 External clock input function

An external clock can be directly input to the oscillator. Input the clock to the X1 pin and its inverse signal to the X2 pin. Set the PCC.MFRC bit to 1 (on-chip feedback resistor not used). Note, however, that oscillation stabilization time is inserted even in the external clock mode. Connect V_{DD} directly to the REGC pin.

6.5 PLL Function

6.5.1 Overview

The PLL function is used to output the operating clock of the CPU and on-chip peripheral function at a frequency 4 times higher than the oscillation frequency, and select the clock-through mode.

When PLL function is used: Input clock = 2 to 5 MHz (f_{xx}: 8 to 20 MHz)

Clock-through mode: Input clock = 2 to 10 MHz (f_{xx}: 2 to 10 MHz)

6.5.2 Register

(1) PLL control register (PLLCTL)

The PLLCTL register is an 8-bit register that controls the security function of PLL and RTO.

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 01H.

After reset: 01H		R/W	Address: FFFFF806H					
PLLCTL	7	6	5	4	<3>	<2>	<1>	<0>
	0	0	0	0	RTOST1 ^{Note}	RTOST0 ^{Note}	SELPLL	PLLON
PLLON		PLL operation control						
0		PLL stopped						
1		PLL operating						
SELPLL		PLL clock selection						
0		Clock-through operation						
1		PLL operation						

Note For the RTOST1 and RTOST0 bits, refer to **CHAPTER 13 REAL-TIME OUTPUT FUNCTION (RTO)**.

Caution Be sure to clear bits 4 to 7 to “0”.

6.5.3 Usage

(1) When PLL is used

- After reset has been released, the PLL operates (PLLCTL.PLLON bit = 1), but because the default mode is the clock-through mode (PLLCTL.SELPLL bit = 0), select the PLL mode (SELPLL bit = 1).
- To set the STOP mode in which the main clock is stopped, or to set the IDLE mode, first select the clock-through mode and then stop the PLL. To return from the IDLE or STOP mode, first enable PLL operation (PLLON bit = 1), and then select the PLL mode (SELPLL bit = 1).
- To enable the PLL operation, first set the PLLON bit to 1, wait for 200 μ s, and then set the SELPLL bit to 1. To stop the PLL, first select the clock-through mode (SELPLL bit = 0), wait for 8 clocks or more, and then stop the PLL (PLLON bit = 0).

(2) When PLL is not used

- The clock-through mode (SELPLL bit = 0) is selected after reset has been released, but the PLL is operating (PLLON bit = 1) and must therefore be stopped (PLLON bit = 0).

Remark The PLL is operable in the IDLE mode. To realize low power consumption, stop the PLL. Be sure to stop the PLL when shifting to the STOP mode.

CHAPTER 7 16-BIT TIMER/EVENT COUNTER P (TMP)

Timer P (TMP) is a 16-bit timer/event counter.

The following products have TMP0 of the V850ES/KJ1.

μPD70F3218H, 70F3218HY

7.1 Overview

An outline of TMP0 is shown below.

- Clock selection: 8 ways
- Capture trigger input pins: 2
- External event count input pins: 1
- External trigger input pins: 1
- Timer/counters: 1
- Capture/compare registers: 2
- Capture/compare match interrupt request signals: 2
- Timer output pins: 2

7.2 Functions

TMP0 has the following functions.

- Interval timer
- External event counter
- External trigger pulse output
- One-shot pulse output
- PWM output
- Free-running timer
- Pulse width measurement

7.3 Configuration

TMP0 includes the following hardware.

Table 7-1. Configuration of TMP0

Item	Configuration
Timer register	16-bit counter
Registers	TMP0 capture/compare registers 0, 1 (TP0CCR0, TP0CCR1) TMP0 counter read buffer register (TP0CNT) CCR0, CCR1 buffer registers
Timer inputs	2 (TIP00 ^{Note} , TIP01 pins)
Timer outputs	2 (TOP00, TOP01 pins)
Control registers	TMP0 control registers 0, 1 (TP0CTL0, TP0CTL1) TMP0 I/O control registers 0 to 2 (TP0IOC0 to TP0IOC2) TMP0 option register 0 (TP0OPT0)

Note The TIP00 pin functions alternately as a capture trigger input signal, external event count input signal, and external trigger input signal.

Figure 7-1. Block Diagram of TMP0

(1) 16-bit counter

This 16-bit counter can count internal clocks or external events.

The count value of this counter can be read by using the TP0CNT register.

When the TP0CTL0.TP0CE bit = 0, the value of the 16-bit counter is FFFFH. If the TP0CNT register is read at this time, 0000H is read.

Reset sets the TP0CE bit to 0. Therefore, the 16-bit counter is set to FFFFH.

(2) CCR0 buffer register

This is a 16-bit compare register that compares the count value of the 16-bit counter.

When the TP0CCR0 register is used as a compare register, the value written to the TP0CCR0 register is transferred to the CCR0 buffer register. When the count value of the 16-bit counter matches the value of the CCR0 buffer register, a compare match interrupt request signal (INTTP0CC0) is generated.

The CCR0 buffer register cannot be read or written directly.

The CCR0 buffer register is cleared to 0000H after reset, as the TP0CCR0 register is cleared to 0000H.

(3) CCR1 buffer register

This is a 16-bit compare register that compares the count value of the 16-bit counter.

When the TP0CCR1 register is used as a compare register, the value written to the TP0CCR1 register is transferred to the CCR1 buffer register. When the count value of the 16-bit counter matches the value of the CCR1 buffer register, a compare match interrupt request signal (INTTP0CC1) is generated.

The CCR1 buffer register cannot be read or written directly.

The CCR1 buffer register is cleared to 0000H after reset, as the TP0CCR1 register is cleared to 0000H.

(4) Edge detector

This circuit detects the valid edges input to the TIP00 and TIP01 pins. No edge, rising edge, falling edge, or both the rising and falling edges can be selected as the valid edge by using the TP0IOC1 and TP0IOC2 registers.

(5) Output controller

This circuit controls the output of the TOP00 and TOP01 pins. The output controller is controlled by the TP0IOC0 register.

(6) Selector

This selector selects the count clock for the 16-bit counter. Eight types of internal clocks or an external event can be selected as the count clock.

(7) Digital noise eliminator

This circuit is valid only when the TIP0a pin is used as a capture trigger input pin.

This circuit is controlled by the TIP0a noise elimination register (PaNFC).

Remark a = 0, 1

7.4 Registers

(1) TMP0 control register 0 (TP0CTL0)

The TP0CTL0 register is an 8-bit register that controls the operation of TMP0.

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

The same value can always be written to the TP0CTL0 register by software.

After reset: 00H

R/W

Address: FFFFF5A0H

Note TP0OPT0.TP0OVF bit, 16-bit counter, timer output (TOP00, TOP01 pins)

- Cautions**
1. Set the TP0CKS2 to TP0CKS0 bits when the TP0CE bit = 0.
When the value of the TP0CE bit is changed from 0 to 1, the TP0CKS2 to TP0CKS0 bits can be set simultaneously.
 2. Be sure to clear bits 3 to 6 to "0".

Remark fxx: Main clock frequency

(2) TMP0 control register 1 (TP0CTL1)

The TP0CTL1 register is an 8-bit register that controls the operation of TMP0.

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

After reset: 00H R/W Address: FFFFF5A1H

	7	<6>	<5>	4	3	2	1	0
TP0CTL1	0	TP0EST	TP0EEE	0	0	TP0MD2	TP0MD1	TP0MD0

TP0EST	Software trigger control
0	—
1	Generate a valid signal for external trigger input. - In one-shot pulse output mode: A one-shot pulse is output with writing 1 to the TP0EST bit as the trigger. - In external trigger pulse output mode: A PWM waveform is output with writing 1 to the TP0EST bit as the trigger.

TP0EEE	Count clock selection
0	Disable operation with external event count input. (Perform counting with the count clock selected by the TP0CTL0.TP0CK0 to TP0CTL0.TP0CK2 bits.)
1	Enable operation with external event count input. (Perform counting at the valid edge of the external event count input signal.)
The TP0EEE bit selects whether counting is performed with the internal count clock or the valid edge of the external event count input.	

TP0MD2	TP0MD1	TP0MD0	Timer mode selection
0	0	0	Interval timer mode
0	0	1	External event count mode
0	1	0	External trigger pulse output mode
0	1	1	One-shot pulse output mode
1	0	0	PWM output mode
1	0	1	Free-running timer mode
1	1	0	Pulse width measurement mode
1	1	1	Setting prohibited

- Cautions**
1. The TP0EST bit is valid only in the external trigger pulse output mode or one-shot pulse output mode. In any other mode, writing 1 to this bit is ignored.
 2. External event count input is selected in the external event count mode regardless of the value of the TP0EEE bit.
 3. Set the TP0EEE and TP0MD2 to TP0MD0 bits when the TP0CTL0.TP0CE bit = 0. (The same value can be written when the TP0CE bit = 1.) The operation is not guaranteed when rewriting is performed with the TP0CE bit = 1. If rewriting was mistakenly performed, clear the TP0CE bit to 0 and then set the bits again.
 4. Be sure to clear bits 3, 4, and 7 to “0”.

(3) TMP0 I/O control register 0 (TP0IOC0)

The TP0IOC0 register is an 8-bit register that controls the timer output (TOP00, TOP01 pins).

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

After reset: 00H R/W Address: FFFF5A2H

	7	6	5	4	3	<2>	1	<0>
TP0IOC0	0	0	0	0	TP0OL1	TP0OE1	TP0OL0	TP0OE0

TP0OL1	TOP01 pin output level setting
0	TOP01 pin output inversion disabled
1	TOP01 pin output inversion enabled

TP0OE1	TOP01 pin output setting
0	Timer output disabled • When TP0OL1 bit = 0: Low level is output from the TOP01 pin • When TP0OL1 bit = 1: High level is output from the TOP01 pin
1	Timer output enabled (a square wave is output from the TOP01 pin).

TP0OL0	TOP00 pin output level setting
0	TOP00 pin output inversion disabled
1	TOP00 pin output inversion enabled

TP0OE0	TOP00 pin output setting
0	Timer output disabled • When TP0OL0 bit = 0: Low level is output from the TOP00 pin • When TP0OL0 bit = 1: High level is output from the TOP00 pin
1	Timer output enabled (a square wave is output from the TOP00 pin).

- Cautions**
1. Rewrite the TP0OL1, TP0OE1, TP0OL0, and TP0OE0 bits when the TP0CTL0.TP0CE bit = 0. (The same value can be written when the TP0CE bit = 1.) If rewriting was mistakenly performed, clear the TP0CE bit to 0 and then set the bits again.
 2. Even if the TP0OLa bit is manipulated when the TP0CE and TP0OEa bits are 0, the TOP0a pin output level varies (a = 0, 1).

(4) TMP0 I/O control register 1 (TP0IOC1)

The TP0IOC1 register is an 8-bit register that controls the valid edge of the capture trigger input signals (TIP00, TIP01 pins).

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

After reset: 00H R/W Address: FFFFF5A3H

	7	6	5	4	3	2	1	0
TP0IOC1	0	0	0	0	TP0IS3	TP0IS2	TP0IS1	TP0IS0

TP0IS3	TP0IS2	Capture trigger input signal (TIP01 pin) valid edge setting
0	0	No edge detection (capture operation invalid)
0	1	Detection of rising edge
1	0	Detection of falling edge
1	1	Detection of both edges

TP0IS1	TP0IS0	Capture trigger input signal (TIP00 pin) valid edge setting
0	0	No edge detection (capture operation invalid)
0	1	Detection of rising edge
1	0	Detection of falling edge
1	1	Detection of both edges

- Cautions**
1. Rewrite the TP0IS3 to TP0IS0 bits when the TP0CTL0.TP0CE bit = 0. (The same value can be written when the TP0CE bit = 1.) If rewriting was mistakenly performed, clear the TP0CE bit to 0 and then set the bits again.
 2. The TP0IS3 to TP0IS0 bits are valid only in the free-running timer mode and the pulse width measurement mode. In all other modes, a capture operation is not possible.

(5) TMP0 I/O control register 2 (TP0IOC2)

The TP0IOC2 register is an 8-bit register that controls the valid edge of the external event count input signal (TIP00 pin) and external trigger input signal (TIP00 pin).

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

After reset: 00H R/W Address: FFFFF5A4H

	7	6	5	4	3	2	1	0
TP0IOC2	0	0	0	0	TP0EES1	TP0EES0	TP0ETS1	TP0ETS0

TP0EES1	TP0EES0	External event count input signal (TIP00 pin) valid edge setting
0	0	No edge detection (external event count invalid)
0	1	Detection of rising edge
1	0	Detection of falling edge
1	1	Detection of both edges

TP0ETS1	TP0ETS0	External trigger input signal (TIP00 pin) valid edge setting
0	0	No edge detection (external trigger invalid)
0	1	Detection of rising edge
1	0	Detection of falling edge
1	1	Detection of both edges

- Cautions**
1. Rewrite the TP0EES1, TP0EES0, TP0ETS1, and TP0ETS0 bits when the TP0CTL0.TP0CE bit = 0. (The same value can be written when the TP0CE bit = 1.) If rewriting was mistakenly performed, clear the TP0CE bit to 0 and then set the bits again.
 2. The TP0EES1 and TP0EES0 bits are valid only when the TP0CTL1.TP0EEE bit = 1 or when the external event count mode (TP0CTL1.TP0MD2 to TP0CTL1.TP0MD0 bits = 001) has been set.
 3. The TP0ETS1 and TP0ETS0 bits are valid only when the external trigger pulse output mode (TP0MD2 to TP0MD0 bits = 010) or the one-shot pulse output mode (TP0MD2 to TP0MD0 bits = 011) is set.

<R>

(6) TMP0 option register 0 (TP0OPT0)

The TP0OPT0 register is an 8-bit register used to set the capture/compare operation and detect an overflow.

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

After reset: 00H R/W Address: FFFF5A5H

	7	6	5	4	3	2	1	<0>
TP0OPT0	0	0	TP0CCS1	TP0CCS0	0	0	0	TP0OVF

TP0CCS1	TP0CCR1 register capture/compare selection
0	Compare register selected
1	Capture register selected
The TP0CCS1 bit setting is valid only in the free-running timer mode.	

TP0CCS0	TP0CCR0 register capture/compare selection
0	Compare register selected
1	Capture register selected
The TP0CCS0 bit setting is valid only in the free-running timer mode.	

TP0OVF	TMP0 overflow detection flag
Set (1)	Overflow occurred
Reset (0)	TP0OVF bit 0 written or TP0CTL0.TP0CE bit = 0
- The TP0OVF bit is set when the 16-bit counter count value overflows from FFFFH to 0000H in the free-running timer mode or the pulse width measurement mode. - An interrupt request signal (INTTP0OV) is generated at the same time that the TP0OVF bit is set to 1. The INTTP0OV signal is not generated in modes other than the free-running timer mode and the pulse width measurement mode. - The TP0OVF bit is not cleared even when the TP0OVF bit or the TP0OPT0 register are read when the TP0OVF bit = 1. - The TP0OVF bit can be both read and written, but the TP0OVF bit cannot be set to 1 by software. Writing 1 has no influence on the operation of TMP0.	

- Cautions**
1. Rewrite the TP0CCS1 and TP0CCS0 bits when the TP0CE bit = 0. (The same value can be written when the TP0CE bit = 1.) If rewriting was mistakenly performed, clear the TP0CE bit to 0 and then set the bits again.
 2. Be sure to clear bits 1 to 3, 6, and 7 to "0".

(7) TMP0 capture/compare register 0 (TP0CCR0)

The TP0CCR0 register can be used as a capture register or a compare register depending on the mode.

This register can be used as a capture register or a compare register only in the free-running timer mode, depending on the setting of the TP0OPT0.TP0CCS0 bit. In the pulse width measurement mode, the TP0CCR0 register can be used only as a capture register. In any other mode, this register can be used only as a compare register.

The TP0CCR0 register can be read or written during operation.

This register can be read or written in 16-bit units.

Reset sets this register to 0000H.

Caution Accessing the TP0CCR0 register is disabled during subclock operation with the main clock stopped. For details, refer to 3.4.8 (1) (b).

(a) Function as compare register

The TP0CCR0 register can be rewritten even when the TP0CTL0.TP0CE bit = 1.

The set value of the TP0CCR0 register is transferred to the CCR0 buffer register. When the value of the 16-bit counter matches the value of the CCR0 buffer register, a compare match interrupt request signal (INTTP0CC0) is generated. If TOP00 pin output is enabled at this time, the output of the TOP00 pin is inverted.

When the TP0CCR0 register is used as a cycle register in the interval timer mode, external event count mode, external trigger pulse output mode, one-shot pulse output mode, or PWM output mode, the value of the 16-bit counter is cleared (0000H) if its count value matches the value of the CCR0 buffer register.

(b) Function as capture register

When the TP0CCR0 register is used as a capture register in the free-running timer mode, the count value of the 16-bit counter is stored in the TP0CCR0 register if the valid edge of the capture trigger input pin (TIP00 pin) is detected. In the pulse width measurement mode, the count value of the 16-bit counter is stored in the TP0CCR0 register and the 16-bit counter is cleared (0000H) if the valid edge of the capture trigger input pin (TIP00 pin) is detected.

Even if the capture operation and reading the TP0CCR0 register conflict, the correct value of the TP0CCR0 register can be read.

The following table shows the functions of the capture/compare register in each mode, and how to write data to the compare register.

Table 7-2. Function of Capture/Compare Register in Each Mode and How to Write Compare Register

Operation Mode	Capture/Compare Register	How to Write Compare Register
Interval timer	Compare register	Anytime write
External event counter	Compare register	Anytime write
External trigger pulse output	Compare register	Batch write
One-shot pulse output	Compare register	Anytime write
PWM output	Compare register	Batch write
Free-running timer	Capture/compare register	Anytime write
Pulse width measurement	Capture register	—

(8) TMP0 capture/compare register 1 (TP0CCR1)

The TP0CCR1 register can be used as a capture register or a compare register depending on the mode.

This register can be used as a capture register or a compare register only in the free-running timer mode, depending on the setting of the TP0OPT0.TP0CCS1 bit. In the pulse width measurement mode, the TP0CCR1 register can be used only as a capture register. In any other mode, this register can be used only as a compare register.

The TP0CCR1 register can be read or written during operation.

This register can be read or written in 16-bit units.

Reset sets this register to 0000H.

Caution Accessing the TP0CCR1 register is disabled during subclock operation with the main clock stopped. For details, refer to 3.4.8 (1) (b).

(a) Function as compare register

The TP0CCR1 register can be rewritten even when the TP0CTL0.TP0CE bit = 1.

The set value of the TP0CCR1 register is transferred to the CCR1 buffer register. When the value of the 16-bit counter matches the value of the CCR1 buffer register, a compare match interrupt request signal (INTTP0CC1) is generated. If TOP01 pin output is enabled at this time, the output of the TOP01 pin is inverted.

(b) Function as capture register

When the TP0CCR1 register is used as a capture register in the free-running timer mode, the count value of the 16-bit counter is stored in the TP0CCR1 register if the valid edge of the capture trigger input pin (TIP01 pin) is detected. In the pulse width measurement mode, the count value of the 16-bit counter is stored in the TP0CCR1 register and the 16-bit counter is cleared (0000H) if the valid edge of the capture trigger input pin (TIP01 pin) is detected.

Even if the capture operation and reading the TP0CCR1 register conflict, the correct value of the TP0CCR1 register can be read.

The following table shows the functions of the capture/compare register in each mode, and how to write data to the compare register.

Table 7-3. Function of Capture/Compare Register in Each Mode and How to Write Compare Register

Operation Mode	Capture/Compare Register	How to Write Compare Register
Interval timer	Compare register	Anytime write
External event counter	Compare register	Anytime write
External trigger pulse output	Compare register	Batch write
One-shot pulse output	Compare register	Anytime write
PWM output	Compare register	Batch write
Free-running timer	Capture/compare register	Anytime write
Pulse width measurement	Capture register	–

(9) TMP0 counter read buffer register (TP0CNT)

The TP0CNT register is a read buffer register that can read the count value of the 16-bit counter.

If this register is read when the TP0CTL0.TP0CE bit = 1, the count value of the 16-bit timer can be read.

This register is read-only, in 16-bit units.

The value of the TP0CNT register is cleared to 0000H when the TP0CE bit = 0. If the TP0CNT register is read at this time, the value of the 16-bit counter (FFFFH) is not read, but 0000H is read.

The value of the TP0CNT register is cleared to 0000H after reset, as the TP0CE bit is cleared to 0.

Caution Accessing the TP0CNT register is disabled during subclock operation with the main clock stopped. For details, refer to 3.4.8 (1) (b).

7.5 Operation

TMP0 can perform the following operations.

Operation	TP0CTL1.TP0EST Bit (Software Trigger Bit)	TIP00 Pin (External Trigger Input)	Capture/Compare Register Setting	Compare Register Write
Interval timer mode	Invalid	Invalid	Compare only	Anytime write
External event count mode ^{Note 1}	Invalid	Invalid	Compare only	Anytime write
External trigger pulse output mode ^{Note 2}	Valid	Valid	Compare only	Batch write
One-shot pulse output mode ^{Note 2}	Valid	Valid	Compare only	Anytime write
PWM output mode	Invalid	Invalid	Compare only	Batch write
Free-running timer mode	Invalid	Invalid	Switching enabled	Anytime write
Pulse width measurement mode ^{Note 2}	Invalid	Invalid	Capture only	Not applicable

- Notes 1.** To use the external event count mode, specify that the valid edge of the TIP00 pin capture trigger input is not detected (by clearing the TP0IOC1.TP0IS1 and TP0IOC1.TP0IS0 bits to “00”).
- 2.** When using the external trigger pulse output mode, one-shot pulse output mode, and pulse width measurement mode, select the internal clock as the count clock (by clearing the TP0CTL1.TP0EEE bit to 0).

7.5.1 Interval timer mode (TP0MD2 to TP0MD0 bits = 000)

In the interval timer mode, an interrupt request signal (INTTP0CC0) is generated at the specified interval if the TP0CTL0.TP0CE bit is set to 1. A square wave whose half cycle is equal to the interval can be output from the TOP00 pin.

Usually, the TP0CCR1 register is not used in the interval timer mode.

Figure 7-2. Configuration of Interval Timer

Figure 7-3. Basic Timing of Operation in Interval Timer Mode

When the TP0CE bit is set to 1, the value of the 16-bit counter is cleared from FFFFH to 0000H in synchronization with the count clock, and the counter starts counting. At this time, the output of the TOP00 pin is inverted. Additionally, the set value of the TP0CCR0 register is transferred to the CCR0 buffer register.

When the count value of the 16-bit counter matches the value of the CCR0 buffer register, the 16-bit counter is cleared to 0000H, the output of the TOP00 pin is inverted, and a compare match interrupt request signal (INTTP0CC0) is generated.

The interval can be calculated by the following expression.

$$\text{Interval} = (\text{Set value of TP0CCR0 register} + 1) \times \text{Count clock cycle}$$

Figure 7-4. Register Setting for Interval Timer Mode Operation (1/2)

Figure 7-4. Register Setting for Interval Timer Mode Operation (2/2)

(d) TMP0 counter read buffer register (TP0CNT)

By reading the TP0CNT register, the count value of the 16-bit counter can be read.

(e) TMP0 capture/compare register 0 (TP0CCR0)

If the TP0CCR0 register is set to D_0 , the interval is as follows.

$$\text{Interval} = (D_0 + 1) \times \text{Count clock cycle}$$

(f) TMP0 capture/compare register 1 (TP0CCR1)

Usually, the TP0CCR1 register is not used in the interval timer mode. However, the set value of the TP0CCR1 register is transferred to the CCR1 buffer register. A compare match interrupt request signal (INTTP0CC1) is generated when the count value of the 16-bit counter matches the value of the CCR1 buffer register.

Therefore, mask the interrupt request by using the corresponding interrupt mask flag (TP0CCMK1).

Remark TMP0 I/O control register 1 (TP0IOC1), TMP0 I/O control register 2 (TP0IOC2), and TMP0 option register 0 (TP0OPT0) are usually not used in the interval timer mode. However, set the TP0IOC2 register to use the external event count input.

(1) Interval timer mode operation flow

Figure 7-5. Software Processing Flow in Interval Timer Mode

<1> Count operation start flow

<2> Count operation stop flow

(2) Interval timer mode operation timing**(a) Operation if TP0CCR0 register is cleared to 0000H**

If the TP0CCR0 register is cleared to 0000H, the INTTP0CC0 signal is generated at each count clock, and the output of the TOP00 pin is inverted.

The value of the 16-bit counter is always 0000H.

(b) Operation if TP0CCR0 register is set to FFFFH

If the TP0CCR0 register is set to FFFFH, the 16-bit counter counts up to FFFFH. The counter is cleared to 0000H in synchronization with the next count-up timing. The INTTP0CC0 signal is generated and the output of the TOP00 pin is inverted. At this time, an overflow interrupt request signal (INTTP0OV) is not generated, nor is the overflow flag (TP0OPT0.TP0OVF bit) set to 1.

(c) Notes on rewriting TP0CCR0 register

To change the value of the TP0CCR0 register to a smaller value, stop counting once and then change the set value.

If the value of the TP0CCR0 register is rewritten to a smaller value during counting, the 16-bit counter may overflow.

Remark Interval time (1): $(D_1 + 1) \times \text{Count clock cycle}$
Interval time (NG): $(10000H + D_2 + 1) \times \text{Count clock cycle}$
Interval time (2): $(D_2 + 1) \times \text{Count clock cycle}$

If the value of the TP0CCR0 register is changed from D₁ to D₂ while the count value is greater than D₂ but less than D₁, the count value is transferred to the CCR0 buffer register as soon as the TP0CCR0 register has been rewritten. Consequently, the value of the 16-bit counter that is compared is D₂.

Because the count value has already exceeded D₂, however, the 16-bit counter counts up to FFFFH, overflows, and then counts up again from 0000H. When the count value matches D₂, the INTTP0CC0 signal is generated and the output of the TOP00 pin is inverted.

Therefore, the INTTP0CC0 signal may not be generated at the interval time " $(D_1 + 1) \times \text{Count clock cycle}$ " or " $(D_2 + 1) \times \text{Count clock cycle}$ " originally expected, but may be generated at an interval of " $(10000H + D_2 + 1) \times \text{Count clock period}$ ".

(d) Operation of TP0CCR1 register

Figure 7-6. Configuration of TP0CCR1 Register

If the set value of the TP0CCR1 register is less than the set value of the TP0CCR0 register, the INTTP0CC1 signal is generated once per cycle. At the same time, the output of the TOP01 pin is inverted. The TOP01 pin outputs a square wave with the same cycle as that output by the TOP00 pin.

Figure 7-7. Timing Chart When $D_{01} \geq D_{11}$

If the set value of the TP0CCR1 register is greater than the set value of the TP0CCR0 register, the count value of the 16-bit counter does not match the value of the TP0CCR1 register. Consequently, the INTTP0CC1 signal is not generated, nor is the output of the TOP01 pin changed.

Figure 7-8. Timing Chart When $D_{01} < D_{11}$

7.5.2 External event count mode (TP0MD2 to TP0MD0 bits = 001)

In the external event count mode, the valid edge of the external event count input is counted when the TP0CTL0.TP0CE bit is set to 1, and an interrupt request signal (INTTP0CC0) is generated each time the specified number of edges have been counted. The timer output (TOP00, TOP01 pins) cannot be used.

Usually, the TP0CCR1 register is not used in the external event count mode.

Figure 7-9. Configuration in External Event Count Mode

<R>

Figure 7-10. Basic Timing in External Event Count Mode

When the TP0CE bit is set to 1, the value of the 16-bit counter is cleared from FFFFH to 0000H. The counter counts each time the valid edge of external event count input is detected. Additionally, the set value of the TP0CCR0 register is transferred to the CCR0 buffer register.

When the count value of the 16-bit counter matches the value of the CCR0 buffer register, the 16-bit counter is cleared to 0000H, and a compare match interrupt request signal (INTTP0CC0) is generated.

The INTTP0CC0 signal is generated each time the valid edge of the external event count input has been detected (set value of TP0CCR0 register + 1) times.

Figure 7-11. Register Setting for Operation in External Event Count Mode (1/2)

Figure 7-11. Register Setting for Operation in External Event Count Mode (2/2)**(e) TMP0 counter read buffer register (TP0CNT)**

The count value of the 16-bit counter can be read by reading the TP0CNT register.

(f) TMP0 capture/compare register 0 (TP0CCR0)

If D_0 is set to the TP0CCR0 register, the counter is cleared and a compare match interrupt request signal (INTTP0CC0) is generated when the number of external event counts reaches ($D_0 + 1$).

(g) TMP0 capture/compare register 1 (TP0CCR1)

Usually, the TP0CCR1 register is not used in the external event count mode. However, the set value of the TP0CCR1 register is transferred to the CCR1 buffer register. When the count value of the 16-bit counter matches the value of the CCR1 buffer register, a compare match interrupt request signal (INTTP0CC1) is generated.

Therefore, mask the interrupt signal by using the interrupt mask flag (TP0CCMK1).

Remark TMP0 I/O control register 1 (TP0IOC1) and TMP0 option register 0 (TP0OPT0) are not used in the external event count mode.

(1) External event count mode operation flow

Figure 7-12. Flow of Software Processing in External Event Count Mode

<1> Count operation start flow

<2> Count operation stop flow

(2) Operation timing in external event count mode

- <R> **Cautions** 1. In the external event count mode, do not set the TP0CCR0 and TP0CCR1 registers to 0000H.
- <R> 2. In the external event count mode, use of the timer output is disabled. If performing timer output using external event count input, set the interval timer mode, and select the operation enabled by the external event count input for the count clock (TP0CTL1.TP0MD2 to TP0CTL1.TP0MD0 bits = 000, TP0CTL1.TP0EEE bit = 1).

(a) Operation if TP0CCR0 register is set to FFFFH

If the TP0CCR0 register is set to FFFFH, the 16-bit counter counts to FFFFH each time the valid edge of the external event count signal has been detected. The 16-bit counter is cleared to 0000H in synchronization with the next count-up timing, and the INTTP0CC0 signal is generated. At this time, the TP0OPT0.TP0OVF bit is not set.

(b) Notes on rewriting the TP0CCR0 register

To change the value of the TP0CCR0 register to a smaller value, stop counting once and then change the set value.

If the value of the TP0CCR0 register is rewritten to a smaller value during counting, the 16-bit counter may overflow.

If the value of the TP0CCR0 register is changed from D_1 to D_2 while the count value is greater than D_2 but less than D_1 , the count value is transferred to the CCR0 buffer register as soon as the TP0CCR0 register has been rewritten. Consequently, the value that is compared with the 16-bit counter is D_2 .

Because the count value has already exceeded D_2 , however, the 16-bit counter counts up to FFFFH, overflows, and then counts up again from 0000H. When the count value matches D_2 , the INTTP0CC0 signal is generated.

Therefore, the INTTP0CC0 signal may not be generated at the valid edge count of “ $(D_1 + 1)$ times” or “ $(D_2 + 1)$ times” originally expected, but may be generated at the valid edge count of “ $(10000H + D_2 + 1)$ times”.

(c) Operation of TP0CCR1 register

Figure 7-13. Configuration of TP0CCR1 Register

If the set value of the TP0CCR1 register is smaller than the set value of the TP0CCR0 register, the INTTP0CC1 signal is generated once per cycle.

Figure 7-14. Timing Chart When $D_{01} \geq D_{11}$ 

If the set value of the TP0CCR1 register is greater than the set value of the TP0CCR0 register, the INTTP0CC1 signal is not generated because the count value of the 16-bit counter and the value of the TP0CCR1 register do not match.

Figure 7-15. Timing Chart When $D_{01} < D_{11}$

7.5.3 External trigger pulse output mode (TP0MD2 to TP0MD0 bits = 010)

In the external trigger pulse output mode, 16-bit timer/event counter P waits for a trigger when the TP0CTL0.TP0CE bit is set to 1. When the valid edge of an external trigger input signal is detected, 16-bit timer/event counter P starts counting, and outputs a PWM waveform from the TOP01 pin.

Pulses can also be output by generating a software trigger instead of using the external trigger. When using a software trigger, a square wave that has one cycle of the PWM waveform as half its cycle can also be output from the TOP00 pin.

Figure 7-16. Configuration in External Trigger Pulse Output Mode

Figure 7-17. Basic Timing in External Trigger Pulse Output Mode

16-bit timer/event counter P waits for a trigger when the TP0CE bit is set to 1. When the trigger is generated, the 16-bit counter is cleared from FFFFH to 0000H, starts counting at the same time, and outputs a PWM waveform from the TOP01 pin. If the trigger is generated again while the counter is operating, the counter is cleared to 0000H and restarted. (The output of the TOP00 pin is inverted. The TOP01 pin outputs a high level regardless of the status (high/low) when a trigger occurs.)

The active level width, cycle, and duty factor of the PWM waveform can be calculated as follows.

$$\text{Active level width} = (\text{Set value of TP0CCR1 register}) \times \text{Count clock cycle}$$

$$\text{Cycle} = (\text{Set value of TP0CCR0 register} + 1) \times \text{Count clock cycle}$$

$$\text{Duty factor} = (\text{Set value of TP0CCR1 register}) / (\text{Set value of TP0CCR0 register} + 1)$$

The compare match interrupt request signal INTTP0CC0 is generated when the 16-bit counter counts next time after its count value matches the value of the CCR0 buffer register, and the 16-bit counter is cleared to 0000H. The compare match interrupt request signal INTTP0CC1 is generated when the count value of the 16-bit counter matches the value of the CCR1 buffer register.

The value set to the TP0CCRa register is transferred to the CCRa buffer register when the count value of the 16-bit counter matches the value of the CCRa buffer register and the 16-bit counter is cleared to 0000H.

The valid edge of an external trigger input signal, or setting the software trigger (TP0CTL1.TP0EST bit) to 1 is used as the trigger.

Remark a = 0, 1

Figure 7-18. Setting of Registers in External Trigger Pulse Output Mode (1/2)

(a) TMP0 control register 0 (TP0CTL0)

Note The setting is invalid when the TP0CTL1.TP0EEE bit = 1.

(d) TMP0 I/O control register 2 (TP0IOC2)**(e) TMP0 counter read buffer register (TP0CNT)**

The value of the 16-bit counter can be read by reading the TP0CNT register.

(f) TMP0 capture/compare registers 0 and 1 (TP0CCR0 and TP0CCR1)

If D_0 is set to the TP0CCR0 register and D_1 to the TP0CCR1 register, the cycle and active level of the PWM waveform are as follows.

$$\text{Cycle} = (D_0 + 1) \times \text{Count clock cycle}$$

$$\text{Active level width} = D_1 \times \text{Count clock cycle}$$

Remark TMP0 I/O control register 1 (TP0IOC1) and TMP0 option register 0 (TP0OPT0) are not used in the external trigger pulse output mode.

(1) Operation flow in external trigger pulse output mode

Figure 7-19. Software Processing Flow in External Trigger Pulse Output Mode (1/2)

Figure 7-19. Software Processing Flow in External Trigger Pulse Output Mode (2/2)

(2) External trigger pulse output mode operation timing**(a) Note on changing pulse width during operation**

To change the PWM waveform while the counter is operating, write the TP0CCR1 register last.

Rewrite the TP0CCRa register after writing the TP0CCR1 register after the INTTP0CC0 signal is detected.

In order to transfer data from the TP0CCRa register to the CCRa buffer register, the TP0CCR1 register must be written.

To change both the cycle and active level width of the PWM waveform at this time, first set the cycle to the TP0CCR0 register and then set the active level width to the TP0CCR1 register.

To change only the cycle of the PWM waveform, first set the cycle to the TP0CCR0 register, and then write the same value to the TP0CCR1 register.

To change only the active level width (duty factor) of the PWM waveform, only the TP0CCR1 register has to be set.

After data is written to the TP0CCR1 register, the value written to the TP0CCRa register is transferred to the CCRa buffer register in synchronization with clearing of the 16-bit counter, and is used as the value compared with the 16-bit counter.

To write the TP0CCR0 or TP0CCR1 register again after writing the TP0CCR1 register once, do so after the INTTP0CC0 signal is generated. Otherwise, the value of the CCRa buffer register may become undefined because the timing of transferring data from the TP0CCRa register to the CCRa buffer register conflicts with writing the TP0CCRa register.

Remark a = 0, 1

(b) 0%/100% output of PWM waveform

To output a 0% waveform, clear the TP0CCR1 register to 0000H. If the set value of the TP0CCR0 register is FFFFH, the INTTP0CC1 signal is generated periodically.

To output a 100% waveform, set a value of (set value of TP0CCR0 register + 1) to the TP0CCR1 register. If the set value of the TP0CCR0 register is FFFFH, 100% output cannot be produced.

<R>

(c) Conflict between trigger detection and match with TP0CCR1 register

If the trigger is detected immediately after the INTTP0CC1 signal is generated, the 16-bit counter is immediately cleared to 0000H, the output signal of the TOP01 pin is asserted, and the counter continues counting. Consequently, the inactive period of the PWM waveform is shortened.

If the trigger is detected immediately before the INTTP0CC1 signal is generated, the INTTP0CC1 signal is not generated, and the 16-bit counter is cleared to 0000H and continues counting. The output signal of the TOP01 pin remains active. Consequently, the active period of the PWM waveform is extended.

(d) Conflict between trigger detection and match with TP0CCR0 register

If the trigger is detected immediately after the INTTP0CC0 signal is generated, the 16-bit counter is cleared to 0000H and continues counting up. Therefore, the active period of the TOP01 pin is extended by time from generation of the INTTP0CC0 signal to trigger detection.

If the trigger is detected immediately before the INTTP0CC0 signal is generated, the INTTP0CC0 signal is not generated. The 16-bit counter is cleared to 0000H, the TOP01 pin is asserted, and the counter continues counting. Consequently, the inactive period of the PWM waveform is shortened.

(e) Generation timing of compare match interrupt request signal (INTTP0CC1)

The timing of generation of the INTTP0CC1 signal in the external trigger pulse output mode differs from the timing of other INTTP0CC1 signals; the INTTP0CC1 signal is generated when the count value of the 16-bit counter matches the value of the TP0CCR1 register.

Usually, the INTTP0CC1 signal is generated in synchronization with the next count up, after the count value of the 16-bit counter matches the value of the TP0CCR1 register.

In the external trigger pulse output mode, however, it is generated one clock earlier. This is because the timing is changed to match the timing of changing the output signal of the TOP01 pin.

7.5.4 One-shot pulse output mode (TP0MD2 to TP0MD0 bits = 011)

In the one-shot pulse output mode, 16-bit timer/event counter P waits for a trigger when the TP0CTL0.TP0CE bit is set to 1. When the valid edge of an external trigger input is detected, 16-bit timer/event counter P starts counting, and outputs a one-shot pulse from the TOP01 pin.

Instead of the external trigger, a software trigger can also be generated to output the pulse. When the software trigger is used, the TOP00 pin outputs the active level while the 16-bit counter is counting, and the inactive level when the counter is stopped (waiting for a trigger).

Figure 7-20. Configuration in One-Shot Pulse Output Mode

Figure 7-21. Basic Timing in One-Shot Pulse Output Mode

When the TP0CE bit is set to 1, 16-bit timer/event counter P waits for a trigger. When the trigger is generated, the 16-bit counter is cleared from FFFFH to 0000H, starts counting, and outputs a one-shot pulse from the TOP01 pin. After the one-shot pulse is output, the 16-bit counter is set to FFFFH, stops counting, and waits for a trigger. If a trigger is generated again while the one-shot pulse is being output, it is ignored.

The output delay period and active level width of the one-shot pulse can be calculated as follows.

$$\text{Output delay period} = (\text{Set value of TP0CCR1 register}) \times \text{Count clock cycle}$$

$$\text{Active level width} = (\text{Set value of TP0CCR0 register} - \text{Set value of TP0CCR1 register} + 1) \times \text{Count clock cycle}$$

The compare match interrupt request signal INTTP0CC0 is generated when the 16-bit counter counts after its count value matches the value of the CCR0 buffer register. The compare match interrupt request signal INTTP0CC1 is generated when the count value of the 16-bit counter matches the value of the CCR1 buffer register.

The valid edge of an external trigger input or setting the software trigger (TP0CTL1.TP0EST bit) to 1 is used as the trigger.

Figure 7-22. Setting of Registers in One-Shot Pulse Output Mode (1/2)

(a) TMP0 control register 0 (TP0CTL0)

Note The setting is invalid when the TP0CTL1.TP0EEE bit = 1.

(b) TMP0 control register 1 (TP0CTL1)

(c) TMP0 I/O control register 0 (TP0IOC0)

• When TP0OL1 bit = 0

• When TP0OL1 bit = 1

Figure 7-22. Setting of Registers in One-Shot Pulse Output Mode (2/2)

The value of the 16-bit counter can be read by reading the TP0CNT register.

(f) TMP0 capture/compare registers 0 and 1 (TP0CCR0 and TP0CCR1)

If D_0 is set to the TP0CCR0 register and D_1 to the TP0CCR1 register, the active level width and output delay period of the one-shot pulse are as follows.

Active level width = $(D_1 - D_0 + 1) \times \text{Count clock cycle}$

Output delay period = $D_1 \times \text{Count clock cycle}$

Remark TMP0 I/O control register 1 (TP0IOC1) and TMP0 option register 0 (TP0OPT0) are not used in the one-shot pulse output mode.

(1) Operation flow in one-shot pulse output mode

<R>

Figure 7-23. Software Processing Flow in One-Shot Pulse Output Mode

(2) Operation timing in one-shot pulse output mode

(a) Note on rewriting TP0CCRa register

To change the set value of the TP0CCRa register to a smaller value, stop counting once, and then change the set value.

If the value of the TP0CCRa register is rewritten to a smaller value during counting, the 16-bit counter may overflow.

When the TP0CCR0 register is rewritten from D₀₀ to D₀₁ and the TP0CCR1 register from D₁₀ to D₁₁ where D₀₀ > D₀₁ and D₁₀ > D₁₁, if the TP0CCR1 register is rewritten when the count value of the 16-bit counter is greater than D₁₁ and less than D₁₀ and if the TP0CCR0 register is rewritten when the count value is greater than D₀₁ and less than D₀₀, each set value is reflected as soon as the register has been rewritten and compared with the count value. The counter counts up to FFFFH and then counts up again from 0000H. When the count value matches D₁₁, the counter generates the INTTP0CC1 signal and asserts the TOP01 pin. When the count value matches D₀₁, the counter generates the INTTP0CC0 signal, deasserts the TOP01 pin, and stops counting.

Therefore, the counter may output a pulse with a delay period or active period different from that of the one-shot pulse that is originally expected.

Remark a = 0, 1

(b) Generation timing of compare match interrupt request signal (INTTP0CC1)

The generation timing of the INTTP0CC1 signal in the one-shot pulse output mode is different from other INTTP0CC1 signals; the INTTP0CC1 signal is generated when the count value of the 16-bit counter matches the value of the TP0CCR1 register.

Usually, the INTTP0CC1 signal is generated when the 16-bit counter counts up next time after its count value matches the value of the TP0CCR1 register.

In the one-shot pulse output mode, however, it is generated one clock earlier. This is because the timing is changed to match the change timing of the TOP01 pin.

7.5.5 PWM output mode (TP0MD2 to TP0MD0 bits = 100)

In the PWM output mode, a PWM waveform is output from the TOP01 pin when the TP0CTL0.TP0CE bit is set to 1. In addition, a pulse with one cycle of the PWM waveform as half its cycle is output from the TOP00 pin.

Figure 7-24. Configuration in PWM Output Mode

Figure 7-25. Basic Timing in PWM Output Mode

When the TP0CE bit is set to 1, the 16-bit counter is cleared from FFFFH to 0000H, starts counting, and outputs a PWM waveform from the TOP01 pin.

The active level width, cycle, and duty factor of the PWM waveform can be calculated as follows.

$$\text{Active level width} = (\text{Set value of TP0CCR1 register}) \times \text{Count clock cycle}$$

$$\text{Cycle} = (\text{Set value of TP0CCR0 register} + 1) \times \text{Count clock cycle}$$

$$\text{Duty factor} = (\text{Set value of TP0CCR1 register}) / (\text{Set value of TP0CCR0 register} + 1)$$

The PWM waveform can be changed by rewriting the TP0CCRa register while the counter is operating. The newly written value is reflected when the count value of the 16-bit counter matches the value of the CCR0 buffer register and the 16-bit counter is cleared to 0000H.

The compare match interrupt request signal INTTP0CC0 is generated when the 16-bit counter counts next time after its count value matches the value of the CCR0 buffer register, and the 16-bit counter is cleared to 0000H. The compare match interrupt request signal INTTP0CC1 is generated when the count value of the 16-bit counter matches the value of the CCR1 buffer register.

The value set to the TP0CCRa register is transferred to the CCRa buffer register when the count value of the 16-bit counter matches the value of the CCRa buffer register and the 16-bit counter is cleared to 0000H.

Remark a = 0, 1

Figure 7-26. Register Setting in PWM Output Mode (1/2)

Figure 7-26. Register Setting in PWM Output Mode (2/2)

(d) TMP0 I/O control register 2 (TP0IOC2)**(e) TMP0 counter read buffer register (TP0CNT)**

The value of the 16-bit counter can be read by reading the TP0CNT register.

(f) TMP0 capture/compare registers 0 and 1 (TP0CCR0 and TP0CCR1)

If D_0 is set to the TP0CCR0 register and D_1 to the TP0CCR1 register, the cycle and active level of the PWM waveform are as follows.

$$\text{Cycle} = (D_0 + 1) \times \text{Count clock cycle}$$

$$\text{Active level width} = D_1 \times \text{Count clock cycle}$$

Remark TMP0 I/O control register 1 (TP0IOC1) and TMP0 option register 0 (TP0OPT0) are not used in the PWM output mode.

(1) Operation flow in PWM output mode

Figure 7-27. Software Processing Flow in PWM Output Mode (1/2)

Figure 7-27. Software Processing Flow in PWM Output Mode (2/2)

(2) PWM output mode operation timing**(a) Changing pulse width during operation**

To change the PWM waveform while the counter is operating, write the TP0CCR1 register last.

Rewrite the TP0CCRa register after writing the TP0CCR1 register after the INTTP0CC1 signal is detected.

To transfer data from the TP0CCRa register to the CCRa buffer register, the TP0CCR1 register must be written.

To change both the cycle and active level of the PWM waveform at this time, first set the cycle to the TP0CCR0 register and then set the active level to the TP0CCR1 register.

To change only the cycle of the PWM waveform, first set the cycle to the TP0CCR0 register, and then write the same value to the TP0CCR1 register.

To change only the active level width (duty factor) of the PWM waveform, only the TP0CCR1 register has to be set.

After data is written to the TP0CCR1 register, the value written to the TP0CCRa register is transferred to the CCRa buffer register in synchronization with clearing of the 16-bit counter, and is used as the value compared with the 16-bit counter.

To write the TP0CCR0 or TP0CCR1 register again after writing the TP0CCR1 register once, do so after the INTTP0CC0 signal is generated. Otherwise, the value of the CCRa buffer register may become undefined because the timing of transferring data from the TP0CCRa register to the CCRa buffer register conflicts with writing the TP0CCRa register.

Remark a = 0, 1

(b) 0%/100% output of PWM waveform

To output a 0% waveform, set the TP0CCR1 register to 0000H. If the set value of the TP0CCR0 register is FFFFH, the INTTP0CC1 signal is generated periodically.

To output a 100% waveform, set a value of (set value of TP0CCR0 register + 1) to the TP0CCR1 register. If the set value of the TP0CCR0 register is FFFFH, 100% output cannot be produced.

<R>

(c) Generation timing of compare match interrupt request signal (INTTP0CC1)

The timing of generation of the INTTP0CC1 signal in the PWM output mode differs from the timing of other INTTP0CC1 signals; the INTTP0CC1 signal is generated when the count value of the 16-bit counter matches the value of the TP0CCR1 register.

Usually, the INTTP0CC1 signal is generated in synchronization with the next counting up after the count value of the 16-bit counter matches the value of the TP0CCR1 register.

In the PWM output mode, however, it is generated one clock earlier. This is because the timing is changed to match the change timing of the output signal of the TOP01 pin.

7.5.6 Free-running timer mode (TP0MD2 to TP0MD0 bits = 101)

1. At this time, the TP0CCRa register can be used as a compare register or a capture register, depending on the setting of the TP0OPT0.TP0CCS0 and TP0OPT0.TP0CCS1 bits.

Figure 7-28. Configuration in Free-Running Timer Mode

When the TP0CE bit is set to 1, 16-bit timer/event counter P starts counting, and the output signals of the TOP00 and TOP01 pins are inverted. When the count value of the 16-bit counter later matches the set value of the TP0CCRa register, a compare match interrupt request signal (INTTP0CCa) is generated, and the output signal of the TOP0a pin is inverted.

The 16-bit counter continues counting in synchronization with the count clock. When it counts up to FFFFH, it generates an overflow interrupt request signal (INTTP0OV) at the next clock, is cleared to 0000H, and continues counting. At this time, the overflow flag (TP0OPT0.TP0OVF bit) is also set to 1. Clear the overflow flag to 0 by executing the CLR instruction by software.

The TP0CCRa register can be rewritten while the counter is operating. If it is rewritten, the new value is reflected at that time, and compared with the count value.

Figure 7-29. Basic Timing in Free-Running Timer Mode (Compare Function)

When the TP0CE bit is set to 1, the 16-bit counter starts counting. When the valid edge input to the TIP0a pin is detected, the count value of the 16-bit counter is stored in the TP0CCRa register, and a capture interrupt request signal (INTTP0CCa) is generated.

The 16-bit counter continues counting in synchronization with the count clock. When it counts up to FFFFH, it generates an overflow interrupt request signal (INTTP0OV) at the next clock, is cleared to 0000H, and continues counting. At this time, the overflow flag (TP0OPT0.TP0OVF bit) is also set to 1. Clear the overflow flag to 0 by executing the CLR instruction by software.

Figure 7-30. Basic Timing in Free-Running Timer Mode (Capture Function)

Figure 7-31. Register Setting in Free-Running Timer Mode (1/2)

Figure 7-31. Register Setting in Free-Running Timer Mode (2/2)

(d) TMP0 I/O control register 1 (TP0IOC1)**(e) TMP0 I/O control register 2 (TP0IOC2)****(f) TMP0 option register 0 (TP0OPT0)****(g) TMP0 counter read buffer register (TP0CNT)**

The value of the 16-bit counter can be read by reading the TP0CNT register.

(h) TMP0 capture/compare registers 0 and 1 (TP0CCR0 and TP0CCR1)

These registers function as capture registers or compare registers depending on the setting of the TP0OPT0.TP0CCSa bit.

When the registers function as capture registers, they store the count value of the 16-bit counter when the valid edge input to the TIP0a pin is detected.

When the registers function as compare registers and when D_a is set to the TP0CCRa register, the INTTP0CCa signal is generated when the counter reaches $(D_a + 1)$, and the output signal of the TOP0a pin is inverted.

Remark $a = 0, 1$

(1) Operation flow in free-running timer mode

(a) When using capture/compare register as compare register

Figure 7-32. Software Processing Flow in Free-Running Timer Mode (Compare Function) (1/2)

Figure 7-32. Software Processing Flow in Free-Running Timer Mode (Compare Function) (2/2)

(b) When using capture/compare register as capture register

Figure 7-33. Software Processing Flow in Free-Running Timer Mode (Capture Function) (1/2)

Figure 7-33. Software Processing Flow in Free-Running Timer Mode (Capture Function) (2/2)

(2) Operation timing in free-running timer mode

(a) Interval operation with compare register

When 16-bit timer/event counter P is used as an interval timer with the TP0CCRa register used as a compare register, software processing is necessary for setting a comparison value to generate the next interrupt request signal each time the INTTP0CCa signal has been detected.

When performing an interval operation in the free-running timer mode, two intervals can be set with one channel.

To perform the interval operation, the value of the corresponding TP0CCRa register must be re-set in the interrupt servicing that is executed when the INTTP0CCa signal is detected.

The set value for re-setting the TP0CCRa register can be calculated by the following expression, where “Da” is the interval period.

Compare register default value: $D_a - 1$

Value set to compare register second and subsequent time: Previous set value + D_a

(If the calculation result is greater than FFFFH, subtract 10000H from the result and set this value to the register.)

Remark a = 0, 1

(b) Pulse width measurement with capture register

When pulse width measurement is performed with the TP0CCRa register used as a capture register, software processing is necessary for reading the capture register each time the INTTP0CCa signal has been detected and for calculating an interval.

When executing pulse width measurement in the free-running timer mode, two pulse widths can be measured with one channel.

To measure a pulse width, the pulse width can be calculated by reading the value of the TP0CCRa register in synchronization with the INTTP0CCa signal, and calculating the difference between the read value and the previously read value.

Remark a = 0, 1

(c) Processing of overflow when two capture registers are used

Care must be exercised in processing the overflow flag when two capture registers are used. First, an example of incorrect processing is shown below.

Example of incorrect processing when two capture registers are used

The following problem may occur when two pulse widths are measured in the free-running timer mode.

- <1> Read the TP0CCR0 register (setting of the default value of the TIP00 pin input).
- <2> Read the TP0CCR1 register (setting of the default value of the TIP01 pin input).
- <3> Read the TP0CCR0 register.
Read the overflow flag. If the overflow flag is 1, clear it to 0.
Because the overflow flag is 1, the pulse width can be calculated by $(10000H + D_{01} - D_{00})$.
- <4> Read the TP0CCR1 register.
Read the overflow flag. Because the flag is cleared in <3>, 0 is read.
Because the overflow flag is 0, the pulse width can be calculated by $(D_{11} - D_{10})$ (incorrect).

When two capture registers are used, and if the overflow flag is cleared to 0 by one capture register, the other capture register may not obtain the correct pulse width.

Use software when using two capture registers. An example of how to use software is shown below.

Example when two capture registers are used (using overflow interrupt)

Note The TP0OVF0 and TP0OVF1 flags are set on the internal RAM by software.

- <1> Read the TP0CCR0 register (setting of the default value of the TIP00 pin input).
- <2> Read the TP0CCR1 register (setting of the default value of the TIP01 pin input).
- <3> An overflow occurs. Set the TP0OVF0 and TP0OVF1 flags to 1 in the overflow interrupt servicing, and clear the overflow flag to 0.
- <4> Read the TP0CCR0 register.
Read the TP0OVF0 flag. If the TP0OVF0 flag is 1, clear it to 0.
Because the TP0OVF0 flag is 1, the pulse width can be calculated by $(10000H + D_{01} - D_{00})$.
- <5> Read the TP0CCR1 register.
Read the TP0OVF1 flag. If the TP0OVF1 flag is 1, clear it to 0 (the TP0OVF0 flag is cleared in <4>, and the TP0OVF1 flag remains 1).
Because the TP0OVF1 flag is 1, the pulse width can be calculated by $(10000H + D_{11} - D_{10})$ (correct).
- <6> Same as <3>

Example when two capture registers are used (without using overflow interrupt)

Note The TP0OVF0 and TP0OVF1 flags are set on the internal RAM by software.

<1> Read the TP0CCR0 register (setting of the default value of the TIP00 pin input).

<2> Read the TP0CCR1 register (setting of the default value of the TIP01 pin input).

<3> An overflow occurs. Nothing is done by software.

<4> Read the TP0CCR0 register.

Read the overflow flag. If the overflow flag is 1, set only the TP0OVF1 flag to 1, and clear the overflow flag to 0.

Because the overflow flag is 1, the pulse width can be calculated by $(10000H + D_{01} - D_{00})$.

<5> Read the TP0CCR1 register.

Read the overflow flag. Because the overflow flag is cleared in <4>, 0 is read.

Read the TP0OVF1 flag. If the TP0OVF1 flag is 1, clear it to 0.

Because the TP0OVF1 flag is 1, the pulse width can be calculated by $(10000H + D_{11} - D_{10})$ (correct).

<6> Same as <3>

(d) Processing of overflow if capture trigger interval is long

If the pulse width is greater than one cycle of the 16-bit counter, care must be exercised because an overflow may occur more than once from the first capture trigger to the next. First, an example of incorrect processing is shown below.

Example of incorrect processing when capture trigger interval is long

The following problem may occur when long pulse width is measured in the free-running timer mode.

- <1> Read the TP0CCRa register (setting of the default value of the TIP0a pin input).
- <2> An overflow occurs. Nothing is done by software.
- <3> An overflow occurs a second time. Nothing is done by software.
- <4> Read the TP0CCRa register.
 Read the overflow flag. If the overflow flag is 1, clear it to 0.
 Because the overflow flag is 1, the pulse width can be calculated by $(10000H + D_{a1} - D_{a0})$ (incorrect).
 Actually, the pulse width must be $(20000H + D_{a1} - D_{a0})$ because an overflow occurs twice.

If an overflow occurs twice or more when the capture trigger interval is long, the correct pulse width may not be obtained.

If the capture trigger interval is long, slow the count clock to lengthen one cycle of the 16-bit counter, or use software. An example of how to use software is shown next.

Example when capture trigger interval is long

Note The overflow counter is set arbitrarily by software on the internal RAM.

- <1> Read the TP0CCRa register (setting of the default value of the TIP0a pin input).
 - <2> An overflow occurs. Increment the overflow counter and clear the overflow flag to 0 in the overflow interrupt servicing.
 - <3> An overflow occurs a second time. Increment (+1) the overflow counter and clear the overflow flag to 0 in the overflow interrupt servicing.
 - <4> Read the TP0CCRa register.
Read the overflow counter.
- When the overflow counter is “N”, the pulse width can be calculated by $(N \times 10000H + D_{a1} - D_{a0})$.
- In this example, the pulse width is $(20000H + D_{a1} - D_{a0})$ because an overflow occurs twice. Clear the overflow counter (0H).

(e) Clearing overflow flag

The overflow flag can be cleared to 0 by clearing the TP0OVF bit to 0 with the CLR instruction and by writing 8-bit data (bit 0 is 0) to the TP0OPT0 register. To accurately detect an overflow, read the TP0OVF bit when it is 1, and then clear the overflow flag by using a bit manipulation instruction.

(i) Operation to write 0 (without conflict with setting)

(iii) Operation to clear to 0 (without conflict with setting)

(ii) Operation to write 0 (conflict with setting)

(iv) Operation to clear to 0 (conflict with setting)

To clear the overflow flag to 0, read the overflow flag to check if it is set to 1, and clear it with the CLR instruction. If 0 is written to the overflow flag without checking if the flag is 1, the set information of overflow may be erased by writing 0 ((ii) in the above chart). Therefore, software may judge that no overflow has occurred even when an overflow actually has occurred.

If execution of the CLR instruction conflicts with occurrence of an overflow when the overflow flag is cleared to 0 with the CLR instruction, the overflow flag remains set even after execution of the clear instruction.

7.5.7 Pulse width measurement mode (TP0MD2 to TP0MD0 bits = 110)

In the pulse width measurement mode, 16-bit timer/event counter P starts counting when the TP0CTL0.TP0CE bit is set to 1. Each time the valid edge input to the TIP0a pin has been detected, the count value of the 16-bit counter is stored in the TP0CCRa register, and the 16-bit counter is cleared to 0000H.

The interval of the valid edge can be measured by reading the TP0CCRa register after a capture interrupt request signal (INTTP0CCa) occurs.

Select either the TIP00 or TIP01 pin as the capture trigger input pin. Specify “No edge detected” by using the TP0IOC1 register for the unused pins.

When an external clock is used as the count clock, measure the pulse width of the TIP01 pin because the external clock is fixed to the TIP00 pin. At this time, clear the TP0IOC1.TP0IS1 and TP0IOC1.TP0IS0 bits to 00 (capture trigger input (TIP00 pin): No edge detected).

Figure 7-34. Configuration in Pulse Width Measurement Mode

Figure 7-35. Basic Timing in Pulse Width Measurement Mode

When the TP0CE bit is set to 1, the 16-bit counter starts counting. When the valid edge input to the TIP0a pin is later detected, the count value of the 16-bit counter is stored in the TP0CCRa register, the 16-bit counter is cleared to 0000H, and a capture interrupt request signal (INTTP0CCa) is generated.

The pulse width is calculated as follows.

<R> $\text{Pulse width} = \text{Captured value} \times \text{Count clock cycle}$

If the valid edge is not input to the TIP0a pin even when the 16-bit counter counted up to FFFFH, an overflow interrupt request signal (INTTP0OV) is generated at the next count clock, and the counter is cleared to 0000H and continues counting. At this time, the overflow flag (TP0OPT0.TP0OVF bit) is also set to 1. Clear the overflow flag to 0 by executing the CLR instruction via software.

If the overflow flag is set to 1, the pulse width can be calculated as follows.

<R> $\text{Pulse width} = (10000\text{H} \times \text{TP0OVF bit set (1) count} + \text{Captured value}) \times \text{Count clock cycle}$

Remark a = 0, 1

Figure 7-36. Register Setting in Pulse Width Measurement Mode (1/2)

(a) TMP0 control register 0 (TP0CTL0)

Note Setting is invalid when the TP0EEE bit = 1.

(b) TMP0 control register 1 (TP0CTL1)

(c) TMP0 I/O control register 1 (TP0IOC1)

(d) TMP0 I/O control register 2 (TP0IOC2)

Figure 7-36. Register Setting in Pulse Width Measurement Mode (2/2)

(e) TMP0 option register 0 (TP0OPT0)**(f) TMP0 counter read buffer register (TP0CNT)**

The value of the 16-bit counter can be read by reading the TP0CNT register.

(g) TMP0 capture/compare registers 0 and 1 (TP0CCR0 and TP0CCR1)

These registers store the count value of the 16-bit counter when the valid edge input to the TIP0a pin is detected.

- Remarks**
1. TMP0 I/O control register 0 (TP0IOC0) is not used in the pulse width measurement mode.
 2. a = 0, 1

(1) Operation flow in pulse width measurement mode

Figure 7-37. Software Processing Flow in Pulse Width Measurement Mode

<1> Count operation start flow

<2> Count operation stop flow

(2) Operation timing in pulse width measurement mode**(a) Clearing overflow flag**

The overflow flag can be cleared to 0 by clearing the TP0OVF bit to 0 with the CLR instruction and by writing 8-bit data (bit 0 is 0) to the TP0OPT0 register. To accurately detect an overflow, read the TP0OVF bit when it is 1, and then clear the overflow flag by using a bit manipulation instruction.

(i) Operation to write 0 (without conflict with setting)**(iii) Operation to clear to 0 (without conflict with setting)****(ii) Operation to write 0 (conflict with setting)****(iv) Operation to clear to 0 (conflict with setting)**

To clear the overflow flag to 0, read the overflow flag to check if it is set to 1, and clear it with the CLR instruction. If 0 is written to the overflow flag without checking if the flag is 1, the set information of overflow may be erased by writing 0 ((ii) in the above chart). Therefore, software may judge that no overflow has occurred even when an overflow actually has occurred.

If execution of the CLR instruction conflicts with occurrence of an overflow when the overflow flag is cleared to 0 with the CLR instruction, the overflow flag remains set even after execution of the clear instruction.

7.5.8 Timer output operations

The following table shows the operations and output levels of the TOP00 and TOP01 pins.

Table 7-4. Timer Output Control in Each Mode

Operation Mode	TOP01 Pin	TOP00 Pin
Interval timer mode	Square wave output	
External event count mode	Square wave output	—
External trigger pulse output mode	External trigger pulse output	Square wave output
One-shot pulse output mode	One-shot pulse output	
PWM output mode	PWM output	
Free-running timer mode	Square wave output (only when compare function is used)	
Pulse width measurement mode	—	

Table 7-5. Truth Table of TOP00 and TOP01 Pins Under Control of Timer Output Control Bits

TP0IOC0.TP0OLa Bit	TP0IOC0.TP0OEa Bit	TP0CTL0.TP0CE Bit	Level of TOP0a Pin
0	0	×	Low-level output
	1	0	Low-level output
		1	Low level immediately before counting, high level after counting is started
1	0	×	High-level output
	1	0	High-level output
		1	High level immediately before counting, low level after counting is started

Remark a = 0, 1

7.6 Eliminating Noise on Capture Trigger Input Pin (TIP0a)

The TIP0a pin has a digital noise eliminator.

However, this circuit is valid only when the pin is used as a capture trigger input pin; it is invalid when the pin is used as an external event count input pin or external trigger input pin.

Digital noise can be eliminated by specifying the alternate function of the TIP0a pin using the PMC3, PFC3, and PFCE3 registers.

The number of times of sampling can be selected from three or two by using the PaNFC.PaNFSTS bit. The sampling clock can be selected from f_{xx} , $f_{xx}/2$, $f_{xx}/4$, $f_{xx}/16$, $f_{xx}/32$, or $f_{xx}/64$, by using the PaNFC.PaNFC2 to PaNFC.PaNFC0 bits.

(1) TIP0a noise elimination control register (PaNFC)

This register is used to select the sampling clock and the number of times of sampling for eliminating digital noise.

This register can be read or written in 8-bit or 1-bit units.

Reset input clears this register to 00H.

After reset: 00H R/W Address: P0NFC FFFFFB00H, P1NFC FFFFFB04H

	7	6	5	4	3	2	1	0
PaNFC (a = 0, 1)	0	PaNFSTS	0	0	0	PaNFC2	PaNFC1	PaNFC0

PaNFSTS	Setting of number of times of sampling for eliminating digital noise
0	Number of times of sampling = 3
1	Number of times of sampling = 2

PaNFC2	PaNFC1	PaNFC0	Sampling clock selection
0	0	0	f_{xx}
0	0	1	$f_{xx}/2$
0	1	0	$f_{xx}/4$
0	1	1	$f_{xx}/16$
1	0	0	$f_{xx}/32$
1	0	1	$f_{xx}/64$
Other than above			Setting prohibited

Cautions 1. Enable starting the 16-bit counter of TMP0 (TP0CTL.TP0CE bit = 1) after the lapse of the sampling clock period × number of times of sampling.

2. Be sure to clear bits 7, 5 to 3 to “0”.

<Setting procedure>

- <1> Select the number of times of sampling and the sampling clock by using the PaNFC register.
- <2> Select the alternate function (of the TIP0a pin) by using the PMC3, PFC3, and PFCE3 registers.
- <3> Set the operating mode of TMP0 (such as the capture mode or the valid edge of the capture trigger).
- <4> Enable the TMP0 count operation.

<Noise elimination width>

The digital noise elimination width (t_{WTIPa}) is as follows, where T is the sampling clock period and M is the number of times of sampling.

- $t_{WTIPa} < (M - 1)T$: Accurately eliminated as noise
- $(M - 1)T \leq t_{WTIPa} < MT$: Eliminated as noise or detected as valid edge
- $t_{WTIPa} \geq MT$: Accurately detected as valid edge

Therefore, a pulse width of MT or longer must be input so that the valid edge of the capture trigger input can be accurately detected.

<R> 7.7 Cautions

(1) Capture operation

When the capture operation is used and $f_{xx}/8$, $f_{xx}/16$, $f_{xx}/32$, $f_{xx}/64$, $f_{xx}/128$, or the external event counter (TP0CLT1.TP0EEE bit = 1) is selected as the count clock, FFFFH, not 0000H, may be captured in the TP0CCRn register if the capture trigger is input immediately after the TP0CE bit is set to 1.

(a) Free-running timer mode

(b) Pulse width measurement mode

In the V850ES/KJ1, six channels of 16-bit timer/event counter 0 are provided.

8.1 Functions

16-bit timer/event counter 0n has the following functions (n = 0 to 5).

(1) Interval timer

16-bit timer/event counter 0n generates an interrupt request at the preset time interval.

(2) Square-wave output

16-bit timer/event counter 0n can output a square wave with any selected frequency.

(3) External event counter

16-bit timer/event counter 0n can measure the number of pulses of an externally input signal.

(4) One-shot pulse output (16-bit timer/event counters 00, 01, 04 and 05 only)

16-bit timer/event counter 0n can output a one-shot pulse whose output pulse width can be set freely.

(5) PPG output

16-bit timer/event counter 0n can output a rectangular wave whose frequency and output pulse width can be set freely.

(6) Pulse width measurement

16-bit timer/event counter 0n can measure the pulse width of an externally input signal.

8.2 Configuration

16-bit timer/event counter 0n includes the following hardware.

Table 8-1. Configuration of 16-bit Timer/Event Counter 0n

Item	Configuration
Time/counter	16-bit timer counter 0n (TM0n)
Register	16-bit timer capture/compare registers: 16-bit × 2 (CR0n0, CR0n1)
Timer input	2 (TI0n0, TI0n1 pins)
Timer output	1 (TO0n pin), output controller
Control registers ^{Note}	16-bit timer mode control register 0n (TMC0n) Capture/compare control register 0n (CRC0n) 16-bit timer output control register 0n (TOC0n) Prescaler mode register 0n (PRM0n)

Note To use the TI0n0, TI0n1, and TO0n pin functions, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

The block diagram is shown below.

Figure 8-1. Block Diagram of 16-bit Timer/Event Counter 0n

(1) 16-bit timer counter 0n (TM0n)

The TM0n register is a 16-bit read-only register that counts count pulses.

The counter is incremented in synchronization with the rising edge of the count clock.

The count value of the TM0n register can be read by reading the TM0n register when the values of the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits are other than 00. The value of the TM0n register is 0000H if it is read when the TMC0n3 and TMC0n2 bits are 00.

The count value is reset to 0000H in the following cases.

- At reset signal generation
- If the TMC0n3 and TMC0n2 bits are cleared to 00
- If the valid edge of the TI0n0 pin is input in the mode in which the clear & start occurs when inputting the valid edge to the TI0n0 pin
- If the TM0n register and the CR0n0 register match in the mode in which the clear & start occurs when the TM0n register and the CR0n0 register match
- The TOC0n.OSPT0m bit is set to 1 in one-shot pulse output mode or the valid edge is input to the TI0k0 pin

Remark n = 0 to 5
 m = 0, 1, 4, 5
 k = 4, 5

(2) 16-bit timer capture/compare register 0n0 (CR0n0), 16-bit timer capture/compare register 0n1 (CR0n1)

The CR0n0 and CR0n1 registers are 16-bit registers that are used with a capture function or comparison function selected by using the CRC0n register.

Change of the value of the CR0n0 register while the timer is operating (TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = other than 00) is prohibited.

The value of the CR0n1 register can be changed during operation if the value has been set in a specific way. For details, see **8.5.1 Rewriting CR0n0 register during TM0n operation.**

These registers can be read or written in 16-bit units.

Reset sets these registers to 0000H.

(a) 16-bit timer capture/compare register 0n0 (CR0n0)

(i) When the CR0n0 register is used as a compare register

The value set in the CR0n0 register is constantly compared with the TM0n register count value, and an interrupt request signal (INTTM0n0) is generated if they match. The value is held until the CR0n0 register is rewritten.

(ii) When the CR0n0 register is used as a capture register

The count value of the TM0n register is captured to the CR0n0 register when a capture trigger is input.

As the capture trigger, an edge of a phase reverse to that of the TI0n0 pin or the valid edge of the TI0n1 pin can be selected by using the CRC0n or PRM0n register.

(b) 16-bit timer capture/compare register 0n1 (CR0n1)**(i) When using the CR0n1 register as a compare register**

The value set to the CR0n1 register and the count value of the TM0n register are always compared and when these values match, an interrupt request signal (INTTM0n1) is generated.

(ii) When using the CR0n1 register as a capture register

The TM0n register count value is captured to the CR0n1 register by inputting a capture trigger.

The valid edge of the TI0n0 pin can be selected as the capture trigger. The valid edge of the TI0n0 pin is set with the PRM0n register.

Cautions 1. When the P33, P35, P92, P94, and P613 pins are used as the valid edges of TI000, TI010, TI020, TI030, and TI051, these pins cannot be used as timer outputs (TO00 to TO03, TO05). When these pins are used as timer outputs (TO00 to TO03, TO05), they cannot be used as the valid edges of TI000, TI010, TI020, TI030, and TI051.

2. If clearing of the TMC0n3 and TMC0n2 bits to 00 and input of the capture trigger conflict, then the captured data is undefined.

3. To change the mode from the capture mode to the comparison mode, first clear the TMC0n3 and TMC0n2 bits to 00, and then change the setting.

A value that has been once captured remains stored in the CR0n0 and CR0n1 registers unless the device is reset. If the mode has been changed to the comparison mode, be sure to set a comparison value.

(c) Setting range when used as compare register

When the CR0n0 or CR0n1 register is used as a compare register, set it as shown below.

Operation	CR0n0 Register	CR0n1 Register
• Operation as interval timer • Operation as square-wave output • Operation as external event counter	$0000H < N \leq FFFFH$	$0000H^{Note} \leq M \leq FFFFH$ Normally, this setting is not used. Mask the match interrupt signal (INTTM0n1).
• Operation in the clear & start mode entered by TI0n0 pin valid edge input • Operation as free-running timer	$0000H^{Note} \leq N \leq FFFFH$	$0000H^{Note} \leq M \leq FFFFH$
• Operation as PPG output	$M < N \leq FFFFH$	$0000H^{Note} \leq M < N$
• Operation as one-shot pulse output	$0000H^{Note} \leq N \leq FFFFH (N \neq M)$	$0000H^{Note} \leq M \leq FFFFH (M \neq N)$

Note When 0000H is set, a match interrupt immediately after the timer operation does not occur and timer output is not changed, and the first match timing is as follows. A match interrupt occurs at the timing when the timer counter (TM0n register) is changed from 0000H to 0001H.

- When the timer counter is cleared due to overflow
- When the timer counter is cleared due to TI0n0 pin valid edge (when clear & start mode is entered by TI0n0 pin valid edge input)
- When the timer counter is cleared due to compare match (when clear & start mode is entered by match between TM0n and CR0n0 (CR0n0 = other than 0000H, CR0n1 = 0000H))

Remarks 1. N: CR0n0 register set value

M: CR0n1 register set value

2. For details of operation enable bits (TMC0n.TMC0n3, TMC0n.TMC0n2 bits), refer to **8.3 (1) 16-bit timer mode control register 0n (TMC0n)**.

Table 8-2. Capture Operation of CR0n0 and CR0n1 Registers

External Input Signal Capture Operation	TI0n0 Pin Input 		TI0n1 Pin Input 	
Capture operation of CR0n0 register	CRC0n1 bit = 1 TI0n0 pin input (reverse phase) 	Set values of ESn01 and ESn00 Position of edge to be captured	CRC0n1 bit = 0 TI0n1 pin input 	Set values of ESn11 and ESn10 Position of edge to be captured
		01: Rising 		01: Rising 
		00: Falling 		00: Falling 
		11: Both edges (cannot be captured)		11: Both edges 
	Interrupt signal	INTTM0n0 signal is not generated even if value is captured.	Interrupt signal	INTTM0n0 signal is generated each time value is captured.
Capture operation of CR0n1 register	TI0n0 pin input ^{Note} 	Set values of ESn01 and ESn00 Position of edge to be captured		
		01: Rising 		
		00: Falling 		
		11: Both edges 		
	Interrupt signal	INTTM0n1 signal is generated each time value is captured.		

Note The capture operation of the CR0n1 register is not affected by the setting of the CRC0n1 bit.

Caution To capture the count value of the TM0n register to the CR0n0 register by using the phase reverse to that input to the TI0n0 pin, the interrupt request signal (INTTM0n0) is not generated after the value has been captured. If the valid edge is detected on the TI0n1 pin during this operation, the capture operation is not performed but the INTTM0n0 signal is generated as an external interrupt signal. To not use the external interrupt, mask the INTTM0n0 signal.

Remarks 1. CRC0n1: See 8.3 (2) Capture/compare control register 0n (CRC0n).

ESn11, ESn10, ESn01, ESn00: See 8.3 (4) Prescaler mode register 0n (PRM0n).

2. n = 0 to 5

8.3 Registers

Registers used to control 16-bit timer/event counter 0n are shown below.

- 16-bit timer mode control register 0n (TMC0n)
- Capture/compare control register 0n (CRC0n)
- 16-bit timer output control register 0n (TOC0n)
- Prescaler mode register 0n (PRM0n)

Remark To use the TI0n0, TI0n1, and TO0n pin functions, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

(1) 16-bit timer mode control register 0n (TMC0n)

TMC0n is an 8-bit register that sets the 16-bit timer/event counter 0n operation mode, the TM0n register clear mode, and output timing, and detects an overflow.

Rewriting TMC0n is prohibited during operation (when the TMC0n3 and TMC0n2 bits = other than 00). However, it can be changed when the TMC0n3 and TMC0n2 bits are cleared to 00 (stopping operation) and when the OVF0n bit is cleared to 0.

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

- Cautions**
1. 16-bit timer/event counter 0n starts operation at the moment TMC0n2 and TMC0n3 are set to values other than 00 (operation stop mode), respectively. Set TMC0n2 and TMC0n3 to 00 to stop the operation.
 2. Accessing the TMC0n register is prohibited when the CPU operates on subclock and the main clock oscillation is stopped. For details, refer to 3.4.8 (1) (b) Access to special on-chip peripheral I/O register.

Remark n = 0 to 5

After reset: 00H R/W Address: TMC00 FFFFF606H, TMC01 FFFFF616H, TMC02 FFFFF626H
TMC03 FFFFF636H, TMC04 FFFFF646H, TMC05 FFFFF656H

	7	6	5	4	3	2	1	<0>
TMC0n	0	0	0	0	TMC0n3	TMC0n2	TMC0n1 ^{Note 1}	OVF0n

(n = 0 to 5)

TMC0n3	TMC0n2	Enable operation of 16-bit timer/event counter 0n
0	0	Disables TM0n operation. Stops supplying operating clock. Clears 16-bit timer counter (TM0n).
0	1	Free-running timer mode
1	0	Clear & start mode entered by TI0n0 pin valid edge input ^{Note 2}
1	1	Clear & start mode entered upon a match between TM0n and CR0n0

TMC0n1 ^{Note 1}	Condition to reverse timer output (TO0n)
0	Match between TM0n and CR0n0 or match between TM0n and CR0n1
1	- Match between TM0n and CR0n0 or match between TM0n and CR0n1 - Trigger input of TI0n0 pin valid edge

OVF0n	TM0n register overflow flag
Clear (0)	Clears OVF0n to 0 or TMC0n.TMC0n3 and TMC0n.TMC0n2 = 00
Set (1)	Overflow occurs.

OVF0n is set to 1 when the value of TM0n changes from FFFFH to 0000H in all the operation modes (free-running timer mode, clear & start mode entered by TI0n0 pin valid edge input, and clear & start mode entered upon a match between TM0n and CR0n0).
It can also be set to 1 by writing 1 to the OVF0n bit.

- Notes**
1. Be sure to clear the TMC001, TMC011, TMC021, and TMC031 bits to 0.
 2. The TI0n0 pin valid edge is set by the PRM0n register.

Table 8-3 shows the I/O configuration of each channel and selection of the TO0n output inversion timing (setting of the TMC0n1 bit).

Table 8-3. I/O Configuration of Each Channel

Channel	Output Pin	Input Pin	I/O Pin	TMC0n1 Bit Setting
TM00	–	TI001	TI000/TO00	Be sure to set to 0.
TM01	–	TI011	TI010/TO01	Be sure to set to 0.
TM02	–	TI021	TI020/TO02	0 (Read Only)
TM03	–	TI031	TI030/TO03	0 (Read Only)
TM04	TO04	TI040, TI041	–	1/0
TM05	–	TI050	TI051/TO05	1/0

(2) Capture/compare control register 0n (CRC0n)

The CRC0n register is the register that controls the operation of the CR0n0 and CR0n1 registers.

Changing the value of the CRC0n register is prohibited during operation (when the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = other than 00).

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

After reset: 00H R/W Address: CRC00 FFFFF608H, CRC01 FFFFF618H, CRC02 FFFFF628H
CRC03 FFFFF638H, CRC04 FFFFF648H, CRC05 FFFFF658H

	7	6	5	4	3	2	1	0
CRC0n	0	0	0	0	0	CRC0n2	CRC0n1	CRC0n0

(n = 0 to 5)

CRC0n2	CR0n1 register operating mode selection
0	Operates as compare register
1	Operates as capture register

CRC0n1	CR0n0 register capture trigger selection
0	Captures on valid edge of TI0n1 pin
1	Captures on valid edge of TI0n0 pin by reverse phase ^{Note}

The valid edge of the TI0n1 and TI0n0 pin is set by the PRM0n register.

If PRM0n.ESn01 and PRM0n.ESn00 are set to 11 (both edges) when CRC0n1 is 1, the valid edge of the TI0n0 pin cannot be detected.

CRC0n0	CR0n0 register operating mode selection
0	Operates as compare register
1	Operates as capture register

If TMC0n3 and TMC0n2 are set to 11 (clear & start mode entered upon a match between TM0n and CR0n0), be sure to set the CRC0n0 bit to 0.

Note When the valid edge is detected at the TI0n1 pin, the capture operation is not performed but the INTTM0n0 signal is generated as an external interrupt signal.

Caution To ensure that the capture operation is performed properly, the capture trigger requires a pulse two cycles longer than the count clock selected by the PRM0n register.

(3) 16-bit timer output control register 0n (TOC0n)

The TOC0n register is an 8-bit register that controls the TO0n pin output.

The TOC0n register can be rewritten while only the OSPT0n bit is operating (when the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = other than 00). Rewriting the other bits is prohibited during operation.

However, TOC0n4 can be rewritten during timer operation as a means to rewrite the CR0n1 register (see **8.5.1 Rewriting CR0n1 register during TM0n operation**).

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

Cautions 1. Be sure to set the TOC0n register using the following procedure.

<1> Set the TOC0n4 and TOC0n1 bits to 1.

<2> Set only the TOE0n bit to 1.

<3> Set either the LVS0n bit or LVR0n bit to 1.

2. Restrictions are applied to the channels (TM00 to TM03) in which the timer input and output share the same pin. For details, refer to 8.6 (1) Alternate functions of TI0n0/TO0n pins.

(1/2)

After reset: 00H R/W Address: TOC00 FFFFF609H, TOC01 FFFFF619H, TOC02 FFFFF629H,
TOC03 FFFFF639H, TOC04 FFFFF649H, TOC05 FFFFF659H

	7	<6>	<5>	4	<3>	<2>	1	<0>
TOC0n	0	OSPT0m ^{Note}	OSPE0m ^{Note}	TOC0n4	LVS0n	LVR0n	TOC0n1	TOE0n

(n = 0 to 5)
m = 0, 1, 4, 5)

OSPT0m ^{Note}	One-shot pulse output trigger via software
0	—
1	One-shot pulse output
The value of this bit is always “0” when it is read. If it is set to 1, TM0n is cleared and started.	

OSPE0m ^{Note}	One-shot pulse output operation control
0	Successive pulse output
1	One-shot pulse output If it is set to 1, TM0n is cleared and started.
One-shot pulse output operates correctly in the free-running timer mode or clear & start mode entered by TI0n0 pin valid edge input. The one-shot pulse cannot be output in the clear & start mode entered upon a match between the TM0n and CR0n0 registers.	

TOC0n4	TO0n pin output control on match between CR0n1 and TM0n registers
0	Disables inversion operation
1	Enables inversion operation
The interrupt signal (INTTM0n1) is generated even when the TOC0n4 bit = 0.	

Note Be sure to set the OSPE02, OSPE03, OSPT02, and OSPT03 bits to 0 because 16-bit timer/event counters 02 and 03 cannot output the one-shot pulses.

In 16-bit timer/event counters 00 and 01, since the timer input and output share the same pin, only the software trigger is valid as the one-shot pulse output. Therefore, set the TMC00.TMC001 and TMC01.TMC011 bits to 0.

(2/2)

LVS0n	LVR0n	Setting of TO0n pin output status
0	0	No change
0	1	Initial value of TO0n pin output is low level (TO0n pin output is cleared to 0).
1	0	Initial value of TO0n pin output is high level (TO0n pin output is set to 1).
1	1	Setting prohibited

- The LVS0n and LVR0n bits can be used to set the initial value of the output level of the TO0n pin. If the initial value does not have to be set, leave the LVS0n and LVR0n bits as 00n.
- Be sure to set the LVS0n and LVR0n bits when TOE0n = 1.
The LVS0n, LVR0n, and TOE0n bits being simultaneously set to 1 is prohibited.
- The LVS0n and LVR0n bits are trigger bits. By setting these bits to 1, the initial value of the output level of the TO0n pin can be set. Even if these bits are cleared to 0, output of the TO0n pin is not affected.
- The values of the LVS0n and LVR0n bits are always 0 when they are read.
- For how to set the LVS0n and LVR0n bits, see **8.5.2 Setting LVS0n and LVR0n bits**.

TOC0n1	TO0n pin output control on match between CR0n0 and TM0n registers
0	Disables inversion operation
1	Enables inversion operation

The interrupt signal (INTTM0n0) is generated even when the TOC0n1 bit = 0.

TOE0n	TO0n pin output control
0	Disables output (TO0n pin output fixed to low level)
1	Enables output

(4) Prescaler mode register 0n (PRM0n)

The PRM0n register is the register that sets the TM0n register count clock and TI0n0 and TI0n1 pin input valid edges.

Rewriting the PRM0n register is prohibited during operation (when the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = other than 00).

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 00H.

Cautions 1. Do not apply the following setting when setting the PRM0n1 and PRM0n0 bits to 11 (to specify the valid edge of the TI0n0 pin as a count clock).

- Clear & start mode entered by the TI0n0 pin valid edge
- Setting the TI0n0 pin as a capture trigger

2. If the operation of the 16-bit timer/event counter 0n is enabled when the TI0n0 or TI0n1 pin is at high level and when the valid edge of the TI0n0 or TI0n1 pin is specified to be the rising edge or both edges, the high level of the TI0n0 or TI0n1 pin is detected as a rising edge. Note this when the TI0n0 or TI0n1 pin is pulled up. However, the rising edge is not detected when the timer operation has been once stopped and is then enabled again.

3. When the P33, P35, P92, P94, and P613 pins are used as the valid edges of TI000, TI010, TI020, TI030, and TI051, these pins cannot be used as timer outputs (TO00 to TO03, TO05). When these pins are used as timer outputs (TO00 to TO03, TO05), they cannot be used as the valid edges of TI000, TI010, TI020, TI030, and TI051.

After reset: 00H R/W Address: PRM00 FFFFF607H, PRM01 FFFFF617H, PRM02 FFFFF627H, PRM03 FFFFF637H, PRM04 FFFFF647H, PRM05 FFFFF657H

	7	6	5	4	3	2	1	0

Notes 1. When the internal clock is selected, set so as to satisfy the following conditions:

$V_{DD} = \text{REGC} = 4.0 \text{ to } 5.5 \text{ V}$: Count clock $\leq 10 \text{ MHz}$

$V_{DD} = 4.0 \text{ to } 5.5 \text{ V}$, $\text{REGC} = 10 \text{ }\mu\text{F}$: Count clock $\leq 5 \text{ MHz}$

$V_{DD} = \text{REGC} = 2.7 \text{ to } 4.0 \text{ V}$: Count clock $\leq 5 \text{ MHz}$

2. The external clock requires a pulse longer than two cycles of the internal clock ($f_{xx}/4$).

8.4 Operation

8.4.1 Interval timer operation

If the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits are set to 11 (clear & start mode entered upon a match between the TM0n register and the CR0n0 register), the count operation is started in synchronization with the count clock.

When the value of the TM0n register later matches the value of the CR0n0 register, the TM0n register is cleared to 0000H and a match interrupt signal (INTTM0n0) is generated. This INTTM0n0 signal enables the TM0n register to operate as an interval timer.

- Remarks**
1. For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.
 2. For enabling the INTTM0n0 interrupt, refer to **CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION**.

ESn11	ESn10	ESn01	ESn00					PRM0n1	PRM0n0
0	0	0	0	0	0	0	0	0/1	0/1

Selects count clock.

(e) 16-bit timer counter 0n (TM0n)

By reading the TM0n register, the count value can be read.

(f) 16-bit capture/compare register 0n0 (CR0n0)

If M is set to the CR0n0 register, the interval time is as follows.

- Interval time = $(M + 1) \times \text{Count clock cycle}$

Setting the CR0n0 register to 0000H is prohibited.

(g) 16-bit capture/compare register 0n1 (CR0n1)

Usually, the CR0n1 register is not used for the interval timer function. However, a compare match interrupt (INTTM0n1) is generated when the set value of the CR0n1 register matches the value of the TM0n register. Therefore, mask the interrupt request by using the interrupt mask flag (TM0MKn1).

Remark n = 0 to 5

Figure 8-5. Example of Software Processing for Interval Timer Function

<1> Count operation start flow

<2> Count operation stop flow

Remark n = 0 to 5

8.4.2 Square wave output operation

When 16-bit timer/event counter 0n operates as an interval timer (see 8.4.1), a square wave can be output from the TO0n pin by setting the TOC0n register to 03H.

When the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits are set to 11 (count clear & start mode entered upon a match between the TM0n register and the CR0n0 register), the counting operation is started in synchronization with the count clock.

When the value of the TM0n register later matches the value of the CR0n0 register, the TM0n register is cleared to 0000H, an interrupt signal (INTTM0n0) is generated, and output of the TO0n pin is inverted. This TO0n pin output that is inverted at fixed intervals enables TO0n to output a square wave.

- Remarks**
1. For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.
 2. For enabling the INTTM0n0 interrupt, refer to **CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION**.
 3. Restrictions are applied to the channels (TM00 to TM03) in which the timer input and output share the same pin. For details, refer to **8.6 (1) Alternate functions of TI0n0/TO0n pins**.

Figure 8-6. Block Diagram of Square Wave Output Operation

Figure 8-7. Basic Timing Example of Square Wave Output Operation

Figure 8-8. Example of Register Settings for Square Wave Output Operation

(a) 16-bit timer mode control register 0n (TMC0n)

				TMC0n3	TMC0n2	TMC0n1	OVF0n
0	0	0	0	1	1	0	0

Clears and starts on match between TM0n and CR0n0.

(b) Capture/compare control register 0n (CRC0n)

				CRC0n2	CRC0n1	CRC0n0
0	0	0	0	0	0	0

CR0n0 used as compare register

(c) 16-bit timer output control register 0n (TOC0n)

OSPT0n	OSPE0n	TOC0n4	LVS0n	LVR0n	TOC0n1	TOE0n
0	0	0	0/1	0/1	1	1

Enables TO0n pin output.

Inverts TO0n pin output on match between TM0n and CR0n0.

Specifies the initial value of TO0n output F/F.

(d) Prescaler mode register 0n (PRM0n)

ESn11	ESn10	ESn01	ESn00	PRM0n1 PRM0n0	
0	0	0	0	0/1	0/1

Selects count clock.

(e) 16-bit timer counter 0n (TM0n)

By reading the TM0n register, the count value can be read.

(f) 16-bit capture/compare register 0n0 (CR0n0)

If M is set to the CR0n0 register, the square wave frequency is as follows.

$$1 / [2 \times (M + 1) \times \text{Count clock cycle}]$$

Setting the CR0n0 register to 0000H is prohibited.

(g) 16-bit capture/compare register 0n1 (CR0n1)

Usually, the CR0n1 register is not used for the square wave output function. However, a compare match interrupt (INTTM0n1) is generated when the set value of the CR0n1 register matches the value of the TM0n register.

Therefore, mask the interrupt request by using the interrupt mask flag (TM0MKn1).

Remark n = 0 to 5

Figure 8-9. Example of Software Processing for Square Wave Output Function

<1> Count operation start flow

<2> Count operation stop flow

Note Care must be exercised when setting the TOC0n register. For details, see **8.3 (3) 16-bit timer output control register 0n (TOC0n)**.

Remark n = 0 to 5

8.4.3 External event counter operation

When the PRM0n.PRM0n1 and PRM0n.PRM0n0 bits are set to 11 (for counting up with the valid edge of the TI0n0 pin) and the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits are set to 11, the valid edge of an external event input is counted, and a match interrupt signal indicating matching between the TM0n register and the CR0n0 register (INTTM0n0) is generated.

To input the external event, the TI0n0 pin is used. Therefore, the timer/event counter cannot be used as an external event counter in the clear & start mode entered by the TI0n0 pin valid edge input (when the TMC0n3 and TMC0n2 bits = 10).

The INTTM0n0 signal is generated with the following timing.

- Timing of generation of INTTM0n0 signal (second time or later)
= Number of times of detection of valid edge of external event $\times$ (Set value of the CR0n0 register + 1)

However, the first match interrupt immediately after the timer/event counter has started operating is generated with the following timing.

- Number of times of detection of valid edge of external event input $\times$ (Set value of the CR0n0 register + 2)

To detect the valid edge, the signal input to the TI0n0 pin is sampled during the clock cycle of $f_{xx}/4$. The valid edge is not detected until it is detected two times in a row. Therefore, a noise with a short pulse width can be eliminated.

- Remarks**
1. For the alternate-function pin (TI0n0) settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.
 2. For enabling the INTTM0n0 interrupts, refer to **CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION**.
 3. Restrictions are applied to the channels (TM00 to TM03) in which the timer input and output share the same pin. For details, refer to **8.6 (1) Alternate functions of TI0n0/TO0n pins**.

01: Rising edge detection
10: Setting prohibited
11: Both edges detection

(e) 16-bit timer counter 0n (TM0n)

By reading the TM0n register, the count value can be read.

(f) 16-bit capture/compare register 0n0 (CR0n0)

If M is set to the CR0n0 register, the interrupt signal (INTTM0n0) is generated when the number of external events reaches (M + 1).

Setting the CR0n0 register to 0000H is prohibited.

(g) 16-bit capture/compare register 0n1 (CR0n1)

When this register's value matches the count value of the TM0n register, an interrupt signal (INTTM0n1) is generated. The count value of the TM0n register is not cleared.

Remark n = 0 to 5

Figure 8-12. Example of Software Processing in External Event Counter Mode

<1> Count operation start flow

<2> Count operation stop flow

Note Care must be exercised when setting the TOC0n register. For details, see **8.3 (3) 16-bit timer output control register 0n (TOC0n)**.

Remark n = 0 to 5

8.4.4 Operation in clear & start mode entered by TI0n0 pin valid edge input

When the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits are set to 10 (clear & start mode entered by the TI0n0 pin valid edge input) and the count clock (set by the PRM0n register) is supplied to the timer/event counter, the TM0n register starts counting up. When the valid edge of the TI0n0 pin is detected during the counting operation, the TM0n register is cleared to 0000H and starts counting up again. If the valid edge of the TI0n0 pin is not detected, the TM0n register overflows and continues counting.

The valid edge of the TI0n0 pin is a cause to clear the TM0n register. Starting the counter is not controlled immediately after the start of the operation.

The CR0n0 and CR0n1 registers are used as compare registers and capture registers.

(a) When the CR0n0 and CR0n1 registers are used as compare registers

Signals INTTM0n0 and INTTM0n1 are generated when the value of the TM0n register matches the value of the CR0n0 and CR0n1 registers.

(b) When the CR0n0 and CR0n1 registers are used as capture registers

The count value of the TM0n register is captured to the CR0n0 register and the INTTM0n0 signal is generated when the valid edge is input to the TI0n1 pin (or when the phase reverse to that of the valid edge is input to the TI0n0 pin).

When the valid edge is input to the TI0n0 pin, the count value of the TM0n register is captured to the CR0n1 register and the INTTM0n1 signal is generated. As soon as the count value has been captured, the counter is cleared to 0000H.

Cautions 1. Do not set the count clock as the valid edge of the TI0n0 pin (RPM0n.PRM0n1 and RPM0n.PRM0n0 bits = 11). When the PRM0n1 and PRM0n0 bits = 11, the TM0n register is cleared.

2. Restrictions are applied to the channels (TM00 to TM03) in which the timer input and output share the same pin. For details, refer to 8.6 (1) Alternate functions of TI0n0/TO0n pins.

Remarks 1. For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

2. For enabling the INTTM0n0 interrupt, refer to **CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION**.

- (1) Operation in clear & start mode entered by TI0n0 pin valid edge input
(CR0n0 register: compare register, CR0n1 register: compare register)

Figure 8-13. Block Diagram of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 register: Compare Register, CR0n1 register: Compare Register)

Figure 8-14. Timing Example of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Compare Register, CR0n1 Register: Compare Register)

(a) and (b) differ as follows depending on the setting of the TMC0n register (TMC0n1 bit).

- (a) The output level of the TO0m pin is inverted when the TM0n register matches a compare register.
- (b) The output level of the TO0m pin is inverted when the TM0n register matches a compare register or when the valid edge of the TI0n0 pin is detected.

Remark n = 0 to 5
m = 4, 5

- (2) Operation in clear & start mode entered by TI0n0 pin valid edge input
(CR0n0 register: compare register, CR0n1 register: capture register)

Figure 8-15. Block Diagram of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Compare Register, CR0n1 Register: Capture Register)

Figure 8-16. Timing Example of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Compare Register, CR0n1 Register: Capture Register) (1/2)

This is an application example where the output level of the TO0m pin is inverted when the count value has been captured & cleared.

The count value is captured to the CR0n1 register and the TM0n register is cleared (to 0000H) when the valid edge of the TI0n0 pin is detected. When the count value of the TM0n register is 0000H, a compare match interrupt signal (INTTM0n0) is generated, and the output level of the TO0m pin is inverted.

Remark n = 0 to 5
m = 4, 5

- (3) Operation in clear & start mode entered by TI0n0 pin valid edge input
(CR0n0 register: capture register, CR0n1 register: compare register)

Figure 8-17. Block Diagram of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Capture Register, CR0n1 Register: Compare Register)

Figure 8-18. Timing Example of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Capture Register, CR0n1 Register: Compare Register) (1/2)

Figure 8-18. Timing Example of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Capture Register, CR0n1 Register: Compare Register) (2/2)

This is an application example where the width set to the CR0n1 register (4 clocks in this example) is to be output from the TO0m pin when the count value has been captured & cleared.

The TM0n register is cleared (to 0000H) at the rising edge detection of the TI0n0 pin and captured to the CR0n0 register at the falling edge detection of the TI0n0 pin. The output level of the TO0m pin is inverted when the TM0n register is cleared (to 0000H) because the rising edge of the TI0n0 pin has been detected or when the value of the TM0n register matches that of a compare register (CR0n1).

When the CRC0n.CRC0n1 bit is 1, the count value of the TM0n register is captured to the CR0n0 register in the phase reverse to that of the input signal of the TI0n0 pin, but the capture interrupt signal (INTTM0n0) is not generated. However, the INTTM0n0 interrupt is generated when the valid edge of the TI0n1 pin is detected. Mask the INTTM0n0 signal when it is not used.

Remark n = 0 to 5
m = 4, 5

- (4) Operation in clear & start mode entered by TI0n0 pin valid edge input
(CR0n0 register: capture register, CR0n1 register: capture register)

**Figure 8-19. Block Diagram of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Capture Register, CR0n1 Register: Capture Register)**

**Figure 8-20. Timing Example of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Capture Register, CR0n1 Register: Capture Register) (1/3)**

(a) TOC0m = 13H, PRM0n = 30H, CRC0n = 05H, TMC0n = 0AH

This is an application example where the count value is captured to the CR0n1 register, the TM0n register is cleared, and the TO0m pin output is inverted when the rising or falling edge of the TI0n0 pin is detected. When the edge of the TI0n1 pin is detected, an interrupt signal (INTTM0n0) is generated. Mask the INTTM0n0 signal when it is not used.

Remark n = 0 to 5
m = 4, 5

**Figure 8-20. Timing Example of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Capture Register, CR0n1 Register: Capture Register) (2/3)**

**Figure 8-20. Timing Example of Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input
(CR0n0 Register: Capture Register, CR0n1 Register: Capture Register) (3/3)**

This is an application example where the pulse width of the signal input to the TI0n0 pin is measured.

By setting the CRC0n register, the count value can be captured to the CR0n0 register in the phase reverse to the falling edge of the TI0n0 pin (i.e., rising edge) and to the CR0n1 register at the falling edge of the TI0n0 pin. The high- and low-level widths of the input pulse can be calculated by the following expressions.

- High-level width = [CR0n1 register value] – [CR0n0 register value] × [Count clock cycle]
- Low-level width = [CR0n0 register value] × [Count clock cycle]

If the reverse phase of the TI0n0 pin is selected as a trigger to capture the count value to the CR0n0 register, the INTTM0n0 signal is not generated. Read the values of the CR0n0 and CR0n1 registers to measure the pulse width immediately after the INTTM0n1 signal is generated.

However, if the valid edge specified by the PRM0n.ESn11 and PRM0n.ESn10 bits is input to the TI0n1 pin, the count value is not captured but the INTTM0n0 signal is generated. To measure the pulse width of the TI0n0 pin, mask the INTTM0n0 signal when it is not used.

When this register is used as a compare register and when its value matches the count value of the TM0n register, an interrupt signal (INTTM0n1) is generated. The count value of the TM0n register is not cleared. When this register is used as a capture register, the TI0n0 pin input is used as a capture trigger. When the valid edge of the capture trigger is detected, the count value of the TM0n register is stored in the CR0n1 register.

Remark n = 0 to 5

Figure 8-22. Example of Software Processing in Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input

8.4.5 Free-running timer operation

When the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits are set to 01 (free-running timer mode), 16-bit timer/event counter 0n continues counting up in synchronization with the count clock. When it has counted up to FFFFH, the overflow flag (TMC0n.OVF0n bit) is set to 1 at the next clock, and the TM0n register is cleared (to 0000H) and continues counting. Clear the OVF0n bit to 0 by executing the CLR instruction via software.

The following three types of free-running timer operations are available.

- Both the CR0n0 and CR0n1 registers are used as compare registers.
- Either the CR0n0 register or CR0n1 register is used as a compare register and the other is used as a capture register.
- Both the CR0n0 and CR0n1 registers are used as capture registers.

Remarks 1. For the alternate-function pin (TO0n) settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

2. For enabling the INTTM0n0 and INTTM0n1 interrupts, refer to **CHAPTER 20 INTERRUPT/ EXCEPTION PROCESSING FUNCTION**.

3. Restrictions are applied to the channels (TM00 to TM03) in which the timer input and output share the same pin. For details, refer to **8.6 (1) Alternate functions of TI0n0/TO0n pins**.

Note Care must be exercised when setting the TOC0n register. For details, see 8.3 (3) 16-bit timer output control register 0n (TOC0n).

Remark n = 0 to 5

8.4.6 PPG output operation

A rectangular wave having a pulse width set in advance by the CR0n1 register is output from the TO0n pin as a PPG (Programmable Pulse Generator) signal during a cycle set by the CR0n0 register when the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits are set to 11 (clear & start upon a match between the TM0n register and the CR0n0 register).

The pulse cycle and duty factor of the pulse generated as the PPG output are as follows.

- Pulse cycle = (Set value of the CR0n0 register + 1) × Count clock cycle
- Duty = (Set value of the CR0n1 register + 1) / (Set value of the CR0n0 register + 1)

Caution To change the duty factor (value of the CR0n1 register) during operation, see 8.5.1 Rewriting CR0n1 register during TM0n operation.

- Remarks**
1. For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.
 2. For enabling the INTTM0n0 and INTTM0n1 interrupts, refer to **CHAPTER 20 INTERRUPT/ EXCEPTION PROCESSING FUNCTION**.
 3. Restrictions are applied to the channels (TM00 to TM03) in which the timer input and output share the same pin. For details, refer to **8.6 (1) Alternate functions of TI0n0/TO0n pins**.

(f) 16-bit capture/compare register 0n0 (CR0n0)

An interrupt signal (INTTM0n0) is generated when the value of this register matches the count value of the TM0n register.

(g) 16-bit capture/compare register 0n1 (CR0n1)

An interrupt signal (INTTM0n1) is generated when the value of this register matches the count value of the TM0n register.

Caution Set values to the CR0n0 and CR0n1 registers such that the condition $0000H \leq CR0n1 < CR0n0 \leq FFFFH$ is satisfied.

Remark n = 0 to 5

Figure 8-33. Example of Software Processing for PPG Output Operation

8.4.7 One-shot pulse output operation

One-shot pulse output is valid only for 16-bit timer/event counters 00, 01, 04, and 05.

A one-shot pulse can be output by setting the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits to 01 (free-running timer mode) or to 10 (clear & start mode entered by the TI0n0 pin valid edge) and setting the TOC0n.OSPE0n bit to 1.

When the TOC0n.OSPT0n is set to 1 or when the valid edge is input to the TI0n0 pin during timer operation, clearing & starting of the TM0n register is triggered, and a pulse of the difference between the values of the CR0n0 and CR0n1 registers is output only once from the TO0n pin.

Cautions 1. Do not input the trigger again (setting OSPT0n to 1 or detecting the valid edge of the TI0n0 pin) while the one-shot pulse is output. To output the one-shot pulse again, generate the trigger after the current one-shot pulse output has completed.

2. Restrictions are applied to the channels (TM00 and TM01) in which the timer input and output share the same pin. For details, refer to 8.6 (1) Alternate functions of TI0n0/TO0n pins.

Remarks 1. For the alternate-function pin settings, refer to Table 4-19 Settings When Port Pins Are Used for Alternate Functions.

2. For enabling the INTTM0n0 and INTTM0n1 interrupts, refer to CHAPTER 20 INTERRUPT/ EXCEPTION PROCESSING FUNCTION.

Remark $n = 0, 1, 4, 5$

Figure 8-36. Example of Software Processing for One-Shot Pulse Output Operation (2/2)

8.4.8 Pulse width measurement operation

The TM0n register can be used to measure the pulse width of the signal input to the TI0n0 and TI0n1 pins.

Measurement can be accomplished by operating the 16-bit timer/event counter 0n in the free-running timer mode or by restarting the timer in synchronization with the signal input to the TI0n0 pin.

When an interrupt is generated, read the value of the valid capture register and measure the pulse width. Check the TMC0n.OVF0n flag. If it is set (to 1), clear it to 0 by software.

Figure 8-37. Block Diagram of Pulse Width Measurement (Free-Running Timer Mode)

Figure 8-38. Block Diagram of Pulse Width Measurement (Clear & Start Mode Entered by TI0n0 Pin Valid Edge Input)

A pulse width can be measured in the following three ways.

- Measuring the pulse width by using two input signals of the TI0n0 and TI0n1 pins (free-running timer mode)
- Measuring the pulse width by using one input signal of the TI0n0 pin (free-running timer mode)
- Measuring the pulse width by using one input signal of the TI0n0 pin (clear & start mode entered by the TI0n0 pin valid edge input)

Remarks 1. For the alternate-function pin (TO0n) settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

2. For enabling the INTTM0n0 and INTTM0n1 interrupts, refer to **CHAPTER 20 INTERRUPT/ EXCEPTION PROCESSING FUNCTION**.

3. Restrictions are applied to the channels (TM00 to TM03) in which the timer input and output share the same pin. For details, refer to **8.6 (1) Alternate functions of TI0n0/TO0n pins**.

(1) Measuring the pulse width by using two input signals of the TI0n0 and TI0n1 pins (free-running timer mode)

Set the free-running timer mode (the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = 01). When the valid edge of the TI0n0 pin is detected, the count value of the TM0n register is captured to the CR0n1 register. When the valid edge of the TI0n1 pin is detected, the count value of the TM0n register is captured to the CR0n0 register. Specify detection of both the edges of the TI0n0 and TI0n1 pins.

By this measurement method, the previous count value is subtracted from the count value captured by the edge of each input signal. Therefore, save the previously captured value to a separate register in advance.

If an overflow occurs, the value becomes negative if the previously captured value is simply subtracted from the current captured value and, therefore, a borrow occurs (the PSW.CY bit is set to 1). If this happens, ignore CY and take the calculated value as the pulse width. In addition, clear the TMC0n.OVF0n bit to 0.

Figure 8-39. Timing Example of Pulse Width Measurement (1)

(2) Measuring the pulse width by using one input signal of the TI0n0 pin (free-running timer mode)

Set the free-running timer mode (the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = 01). The count value of the TM0n register is captured to the CR0n0 register in the phase reverse to the valid edge detected on the TI0n0 pin. When the valid edge of the TI0n0 pin is detected, the count value of the TM0n register is captured to the CR0n1 register.

By this measurement method, values are stored in separate capture registers when a width from one edge to another is measured. Therefore, the capture values do not have to be saved. By subtracting the value of one capture register from that of another, a high-level width, low-level width, and cycle are calculated.

If an overflow occurs, the value becomes negative if one captured value is simply subtracted from another and, therefore, a borrow occurs (the PSW.CY bit is set to 1). If this happens, ignore CY and take the calculated value as the pulse width. In addition, clear the TMC0n.OVF0n bit to 0.

Figure 8-40. Timing Example of Pulse Width Measurement (2)

(3) Measuring the pulse width by using one input signal of the TI0n0 pin (clear & start mode entered by the TI0n0 pin valid edge input)

Set the clear & start mode entered by the TI0n0 pin valid edge (the TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = 10). The count value of the TM0n register is captured to the CR0n0 register in the phase reverse to the valid edge of the TI0n0 pin, and the count value of the TM0n register is captured to the CR0n1 register and the TM0n register is cleared (0000H) when the valid edge of the TI0n0 pin is detected. Therefore, a cycle is stored in the CR0n1 register if the TM0n register does not overflow.

If an overflow occurs, take the value that results from adding 10000H to the value stored in the CR0n1 register as a cycle. Clear the TMC0n.OVF0n bit to 0.

Figure 8-41. Timing Example of Pulse Width Measurement (3)

Figure 8-42. Example of Register Settings for Pulse Width Measurement (1/2)

Figure 8-42. Example of Register Settings for Pulse Width Measurement (2/2)

(e) 16-bit timer counter 0n (TM0n)

By reading the TM0n register, the count value can be read.

(f) 16-bit capture/compare register 0n0 (CR0n0)

This register is used as a capture register. Either the TI0n0 or TI0n1 pin is selected as a capture trigger. When a specified edge of the capture trigger is detected, the count value of the TM0n register is stored in the CR0n0 register.

(g) 16-bit capture/compare register 0n1 (CR0n1)

This register is used as a capture register. The signal input to the TI0n0 pin is used as a capture trigger. When the capture trigger is detected, the count value of the TM0n register is stored in the CR0n1 register.

Remark n = 0 to 5

Figure 8-43. Example of Software Processing for Pulse Width Measurement (1/2)

Figure 8-43. Example of Software Processing for Pulse Width Measurement (2/2)

<1> Count operation start flow

<2> Capture trigger input flow

<3> Count operation stop flow

Note The capture interrupt signal (INTTM0n0) is not generated when the reverse-phase edge of the TI0n0 pin input is selected to the valid edge of the CR0n0 register.

Remark n = 0 to 5

8.5 Special Use of TM0n

8.5.1 Rewriting CR0n1 register during TM0n operation

In principle, rewriting the CR0n0 and CR0n1 registers of the V850ES/KJ1 when they are used as compare registers is prohibited while the TM0n register is operating (TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = other than 00).

However, the value of the CR0n1 register can be changed, even while the TM0n register is operating, using the following procedure if the CR0n1 register is used for PPG output and the duty factor is changed (change the value of the CR0n1 register immediately after its value matches the value of the TM0n register. If the value of the CR0n1 register is changed immediately before its value matches the TM0n register, an unexpected operation may be performed).

Procedure for changing value of the CR0n1 register

- <1> Disable interrupt INTTM0n1 (TM0ICn0.TM0MKn1 bit = 1).
- <2> Disable reversal of the timer output when the value of the TM0n register matches that of the CR0n1 register (TOC0n.TOC0n4 bit = 0).
- <3> Change the value of the CR0n1 register.
- <4> Wait for one cycle of the count clock of the TM0n register.
- <5> Enable reversal of the timer output when the value of the TM0n register matches that of the CR0n1 register (TOC0n.TOC0n4 bit = 1).
- <6> Clear the interrupt flag of INTTM0n1 to 0 (TM0ICn0.TMIF0n1 bit = 0).
- <7> Enable interrupt INTTM0n1 (TM0ICn0.TM0MKn1 bit = 0).

Remark For the TM0ICn0 register, see **CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION**.

8.5.2 Setting LVS0n and LVR0n bits

(1) Usage of the LVS0n and LVR0n bits

The TOC0n.LVS0n and TOC0n.LVR0n bits are used to set the default value of the TO0n pin output and to invert the timer output without enabling the timer operation (TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = 00). Clear the LVS0n and LVR0n bits to 00 (default value: low-level output) when software control is unnecessary.

LVS0n Bit	LVR0n Bit	Timer Output Status
0	0	Not changed (low-level output)
0	1	Cleared (low-level output)
1	0	Set (high-level output)
1	1	Setting prohibited

Remark n = 0 to 5

(2) Setting the LVS0n and LVR0n bits

Set the LVS0n and LVR0n bits using the following procedure.

Figure 8-44. Example of Flow for Setting LVS0n and LVR0n Bits

Caution Be sure to set the LVS0n and LVR0n bits following steps <1>, <2>, and <3> above. Step <2> can be performed after <1> and before <3>.

Remark n = 0 to 5

Figure 8-45. Timing Example of LVR0n and LVS0n Bits

- <1> The TO0n pin output goes high when the LVS0n and LVR0n bits = 10.
- <2> The TO0n pin output goes low when the LVS0n and LVR0n bits = 01 (the pin output remains unchanged from the high level even if the LVS0n and LVR0n bits are cleared to 00).
- <3> The timer starts operating when the TMC0n3 and TMC0n2 bits are set to 01, 10, or 11. Because the LVS0n and LVR0n bits were set to 10 before the operation was started, the TO0n pin output starts from the high level. After the timer starts operating, setting the LVS0n and LVR0n bits is prohibited until the TMC0n3 and TMC0n2 bits = 00 (disabling the timer operation).
- <4> The output level of the TO0n pin is inverted each time an interrupt signal (INTTM0n0) is generated.

Remark n = 0 to 5

8.6 Cautions

(1) Alternate functions of TI0n0/TO0n pins

In the V850ES/KJ1, the timer input and output share the same pins shown in Table 8-4.

Restrictions are applied to each channel, as shown in Table 8-5.

Table 8-4. Timer I/O Pins

Channel	Pin	Alternate Function	Remarks
TM00	TI000	P33/TO00/TIP00 ^{Note} /TOP00 ^{Note}	Shares the pin with TO00.
	TI001	P34/TIP01/TOP01 ^{Note}	–
	TO00	P33/TI000/TIP00 ^{Note} /TOP00 ^{Note}	Shares the pin with TI000.
TM01	TI010	P35/TO01	Shares the pin with TO01.
	TI011	P50/KR0/RTP00	–
	TO01	P35/TI010	Shares the pin with TI010.
TM02	TI020	P92/A2/TO02	Shares the pin with TO02.
	TI021	P93/A3	–
	TO02	P92/TI020/A2	Shares the pin with TI020.
TM03	TI030	P94/A4/TO03	Shares the pin with TO03.
	TI031	P95/A5	–
	TO03	P94/TI030/A4	Shares the pin with TI030.
TM04	TI040	P69	–
	TI041	P610	–
	TO04	P611	–
TM05	TI050	P612	–
	TI051	P613/TO05	Shares the pin with TO05.
	TO05	P613/TI051	–

Note μ PD70F3218H and 70F3218HY only

Table 8-5. Restrictions for Each Channel of 16-bit Timer/Event Counter 0

Operation	Restriction				
Operation as interval timer	–				
Operation as square-wave output	Setting the TI0n0 valid edge (PRM0n.PRM0n1, PRM0n.PRM0n0 bits = 11) for the count clock is prohibited since the TI0n0 and TO0n share the same pin (only the internal clock can be used).				
Operation as external event counter	Use of the timer output (TO0n) is prohibited since the TI0n0 and TO0n share the same pin. Set the TOC0n register to 00H.				
Operation as clear & start mode by valid edge input of TI0n0 pin	Use of the timer output (TO0n) is prohibited since the TI0n0 and TO0n share the same pin. Set the TOC0n register to 00H.				
Operation as free-running timer	Use of the timer output (TO0n) is prohibited when TI0n0 valid edge (PRM0n.PRM0n1, PRM0n.PRM0n0 bits = 11) is set for the count clock, since the TI0n0 and TO0n share the same pin. When the timer output (TO0n) is used, setting the TI0n0 valid edge (PRM0n.PRM0n1, PRM0n.PRM0n0 bits = 11) for the count clock is prohibited (only the internal clock can be used).				
Operation as PPG output	Setting the TI0n0 valid edge (PRM0n.PRM0n1, PRM0n.PRM0n0 bits = 11) for the count clock is prohibited since the TI0n0 and TO0n share the same pin (only the internal clock can be used).				
Operation as one-shot pulse output	Restrictions differ depending on the channel. <table><tr><td>TM00, TM01</td><td>Use of the hardware trigger by the TI0n0 pin valid edge is prohibited. The software trigger (TOC0n.OSPT0n bit) can be used.</td></tr><tr><td>TM02, TM03</td><td>Operation as one-shot pulse output is prohibited.</td></tr></table>	TM00, TM01	Use of the hardware trigger by the TI0n0 pin valid edge is prohibited. The software trigger (TOC0n.OSPT0n bit) can be used.	TM02, TM03	Operation as one-shot pulse output is prohibited.
TM00, TM01	Use of the hardware trigger by the TI0n0 pin valid edge is prohibited. The software trigger (TOC0n.OSPT0n bit) can be used.				
TM02, TM03	Operation as one-shot pulse output is prohibited.				
Operation as pulse width measurement	Use of the timer output (TO0n) is prohibited since the TI0n0 and TO0n share the same pin. Set the TOC0n register to 00H.				

Remarks 1. n = 0 to 3

2. The TI040 and TO04 pins of TM04, and TI050 and TO05 pins of TM05 do not share the same pin.

(2) Error on starting timer

An error of up to 1 clock occurs before the match signal is generated after the timer has been started. This is because the count of the TM0n register is started asynchronously to the count pulse.

Figure 8-46. Count Start Timing of TM0n Register

**(3) Setting CR0n0 and CR0n1 registers (in the mode in which clear & start occurs upon match between TM0n register and CR0n0 register)**

Set the CR0n0 and CR0n1 registers to a value other than 0000H (when using these registers as external event counters, one-pulse count operation is not possible).

Remark n = 0 to 5

(4) Data hold timing of capture register

- (a) If the valid edge of the TI0n1/TI0n0 pin is input while the CR0n0/CR0n1 register is read, the CR0n0/CR0n1 register performs capture operation, but the read value at this time is not guaranteed. However, the interrupt request signal (INTTM0n0/INTTM0n1) is generated as a result of detection of the valid edge.

Figure 8-47. Data Hold Timing of Capture Register

- (b) The values of the CR0n0 and CR0n1 registers are not guaranteed after 16-bit timer/event counter 0n has stopped.

(5) Setting valid edge

Set the valid edge of the TI0n0 pin while the timer operation is stopped (TMC0n.TMC0n3 and TMC0n.TMC0n2 bits = 00). Set the valid edge by using the PRM0n.ESn00 and PRM0n.ESn01 bits.

(6) Re-triggering one-shot pulse

Make sure that the trigger is not generated while an active level is being output in the one-shot pulse output mode. Be sure to input the next trigger after the current active level is output.

Remark n = 0, 1, 4, 5

(7) Operation of OVF0n flag**(a) Setting of OVF0n flag**

The TMC0n.OVF0n flag is set to 1 in the following case in addition to when the TM0n register overflows.

Select the mode in which clear & start occurs upon match between the TM0n register and the CR0n0 register.

Set the CR0n0 register to FFFFH

When the TM0n register is cleared from FFFFH to 0000H upon match with the CR0n0 register

Figure 8-48. Operation Timing of OVF0n Flag

**(b) Clearing of OVF0n flag**

After the TM0n register overflows, clearing OVF0n flag is invalid and set (1) again even if the OVF0n flag is cleared (0) before the next count clock is counted (before TM0n register becomes 0001H).

Remark n = 0 to 5

(8) One-shot pulse output

One-shot pulse output operates normally in either the free-running timer mode or the mode in which clear & start occurs on the valid edge of the TI0n0 pin. In the mode in which clear & start occurs upon match between the TM0n register and the CR0n0 register, one-shot pulse output is not possible.

Remark n = 0 to 5

(9) Capture operation**(a) If valid edge of TI0n0 pin is specified for count clock**

If the valid edge of the TI0n0 pin is specified for the count clock, the capture register that specified the TI0n0 pin as the trigger does not operate normally.

(b) To ensure that signals input from TI0n1 and TI0n0 pins are correctly captured

To accurately capture the count value, the pulse input to the TI0n0 and TI0n1 pins as a capture trigger must be wider than two count clocks selected by the PRM0n register.

(c) Interrupt signal generation

Although a capture operation is performed at the falling edge of the count clock, an interrupt request signal (INTTM0n0, INTTM0n1) is generated at the rising edge of the next count clock.

(d) Caution when CRC0n.CRC0n1 bit is set to 1

When the count value of the TM0n register is captured to the CR0n0 register in the phase reverse to the signal input to the TI0n0 pin, the interrupt request signal (INTTM0n0) is not generated after the count value is captured. If the valid edge is detected on the TI0n1 pin during this operation, the capture operation is not performed but the INTTM0n0 signal is generated as an external interrupt signal. Mask the INTTM0n0 signal when the external interrupt is not used.

Remark n = 0 to 5

(10) Edge detection**(a) Specifying valid edge after reset**

If the operation of the 16-bit timer/event counter 0n is enabled after reset and while the TI0n0 or TI0n1 pin is at high level and when the rising edge or both the edges are specified as the valid edge of the TI0n0 or TI0n1 pin, then the high level of the TI0n0 or TI0n1 pin is detected as the rising edge. Note this when the TI0n0 or TI0n1 pin is pulled up. However, the rising edge is not detected when the operation is once stopped and then enabled again.

(b) Sampling clock for noise elimination

The sampling clock for noise elimination differs depending on whether the valid edge of TI0n0 is used for the count clock or as a capture trigger. In the former case, sampling is performed using $f_{xx}/4$, and in the latter case, sampling is performed using the count clock selected by the PRM0n register.

When the signal input to the TI0n0 pin is sampled and the valid level is detected two times in a row, the valid edge is detected. Therefore, noise having a short pulse width can be eliminated.

Remarks 1. f_{xx} : Main clock frequency

2. $n = 0$ to 5

CHAPTER 9 8-BIT TIMER/EVENT COUNTER 5

In the V850ES/KJ1, two channels of 8-bit timer/event counter 5 are provided.

9.1 Functions

8-bit timer/event counter 5n has the following two modes ($n = 0, 1$).

- Mode using 8-bit timer/event counter alone (individual mode)
- Mode using cascade connection (16-bit resolution: cascade connection mode)

These two modes are described below.

(1) Mode using 8-bit timer/event counter alone (individual mode)

8-bit timer/event counter 5n operates as an 8-bit timer/event counter.

The following functions can be used.

- Interval timer
- External event counter
- Square-wave output
- PWM output

(2) Mode using cascade connection (16-bit resolution: cascade connection mode)

8-bit timer/event counter 5n operates as a 16-bit timer/event counter by connecting the TM5n register in cascade. The following functions can be used.

- Interval timer with 16-bit resolution
- External event counter with 16-bit resolution
- Square-wave output with 16-bit resolution

The block diagram of 8-bit timer/event counter 5n is shown next.

8-bit timer/event counter 5n consists of the following hardware.

Note When using the functions of the TI5n and TO5n pins, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions.**

User's Manual U16889EJ2V0UD 385

(1) 8-bit timer counter 5n (TM5n)

The TM5n register is an 8-bit read-only register that counts the count pulses.

The counter is incremented in synchronization with the rising edge of the count clock.

Through cascade connection, the TM5n registers can be used as a 16-bit timer.

When using the TM50 register and the TM51 register in cascade as a 16-bit timer, these registers can be read only in 16-bit units. Therefore, read these registers twice and compare the values, taking into consideration that the reading occurs during a count change.

The count value is reset to 00H in the following cases.

<1> Reset

<2> When the TMC5n.TCE5n bit is cleared (0)

<3> The TM5n register and CR5n register match in the mode in which clear & start occurs on a match between the TM5n register and the CR5n register

Caution When connected in cascade, these registers become 0000H even when the TCE50 bit in the lowest timer (TM50) is cleared.

Remark n = 0, 1

(2) 8-bit timer compare register 5n (CR5n)

The CR5n register can be read and written in 8-bit units.

In a mode other than the PWM mode, the value set to the CR5n register is always compared to the count value of the TM5n register, and if the two values match, an interrupt request signal (INTTM5n) is generated.

In the PWM mode, TM5n register overflow causes the TO5n pin output to change to the active level, and when the values of the TM5n register and the CR5n register match, the TO5n pin output changes to the inactive level.

The value of the CR5n register can be set in the range of 00H to FFH.

When using the TM50 register and TM51 register in cascade as a 16-bit timer, the CR50 register and CR51 register operate as 16-bit timer compare register 5 (CR5). The counter value and register value are compared in 16-bit lengths, and if they match, an interrupt request signal (INTTM50) is generated.

- Cautions**
1. In the mode in which clear & start occurs upon a match of the TM5n register and CR5n register (TMC5n.TMC5n6 bit = 0), do not write a different value to the CR5n register during the count operation.
 2. In the PWM mode, set the CR5n register rewrite interval to three or more count clocks (clock selected with the TCL5n register).
 3. Before changing the value of the CR5n register when using a cascade connection, be sure to stop the timer operation.

Remark n = 0, 1

9.3 Registers

The following two registers are used to control 8-bit timer/event counter 5n.

- Timer clock selection register 5n (TCL5n)
- 8-bit timer mode control register 5n (TMC5n)

Remark To use the functions of the TI5n and TO5n pins, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

(1) Timer clock selection register 5n (TCL5n)

The TCL5n register sets the count clock of 8-bit timer/event counter 5n and the valid edge of the TI5n pin input.

The TCL5n register can be read or written in 8-bit units.

After reset, this register is cleared to 00H.

After reset: 00H R/W Address: TCL50 FFFFF5C4H, TCL51 FFFFF5C5H

	7	6	5	4	3	2	1	0
TCL5n	0	0	0	0	0	TCL5n2	TCL5n1	TCL5n0

(n = 0, 1)

TCL5n2	TCL5n1	TCL5n0	Count clock selection ^{Note}		
			Clock	f _{xx}	
				20 MHz	10 MHz
0	0	0	Falling edge of TI5n	—	—
0	0	1	Rising edge of TI5n	—	—
0	1	0	f _{xx}	Setting prohibited	100 ns
0	1	1	f _{xx} /2	100 ns	200 ns
1	0	0	f _{xx} /4	200 ns	0.4 μs
1	0	1	f _{xx} /64	3.2 μs	6.4 μs
1	1	0	f _{xx} /256	12.8 μs	25.6 μs
1	1	1	INTTM010	—	—

Note When the internal clock is selected, set so as to satisfy the following conditions.

REGC = V_{DD} = 4.0 to 5.5 V: Count clock ≤ 10 MHz

REGC = 10 μF, V_{DD} = 4.0 to 5.5 V: Count clock ≤ 5 MHz

REGC = V_{DD} = 2.7 to 4.0 V: Count clock ≤ 5 MHz

Caution Before overwriting the TCL5n register with different data, stop the timer operation.

Remark When the TM5n register is connected in cascade, the TCL51 register settings are invalid.

(2) 8-bit timer mode control register 5n (TMC5n)

The TMC5n register performs the following six settings.

- Controls counting by the TM5n register
- Selects the operation mode of the TM5n register
- Selects the individual mode or cascade connection mode
- Sets the status of the timer output flip-flop
- Controls the timer output flip-flop or selects the active level in the PWM (free-running timer) mode
- Controls timer output

The TMC5n register can be read or written in 8-bit or 1-bit units.

After reset, this register is cleared to 00H.

9.4 Operation

9.4.1 Operation as interval timer

8-bit timer/event counter 5n operates as an interval timer that repeatedly generates interrupts at the interval of the count value preset in the CR5n register. If the count value in the TM5n register matches the value set in the CR5n register, the value of the TM5n register is cleared to 00H and counting is continued, and at the same time, an interrupt request signal (INTTM5n) is generated.

Setting method

- <1> Set each register.
 - TCL5n register: Selects the count clock (t).
 - CR5n register: Compare value (N)
 - TMC5n register: Stops count operation and selects the mode in which clear & start occurs on a match between the TM5n register and CR5n register (TMC5n register = 0000xx00B, x: don't care).
- <2> When the TMC5n.TCE5n bit is set to 1, the count operation starts.
- <3> When the values of the TM5n register and CR5n register match, the INTTM5n signal is generated (TM5n register is cleared to 00H).
- <4> Then, the INTTM5n signal is repeatedly generated at the same interval. To stop counting, set the TCE5n bit = 0.

$$\text{Interval time} = (N + 1) \times t: N = 00\text{H to FFH}$$

Caution During interval timer operation, do not rewrite the value of the CR5n register.

Remark n = 0, 1

Figure 9-2. Timing of Interval Timer Operation (1/2)

Figure 9-2. Timing of Interval Timer Operation (2/2)

When CR5n register = 00H

**Remark** n = 0, 1

When CR5n register = FFH

**Remark** n = 0, 1

9.4.2 Operation as external event counter

The external event counter counts the number of clock pulses input to the TI5n pin from an external source by using the TM5n register.

Each time the valid edge specified by the TCL5n register is input to the TI5n pin, the TM5n register is incremented. Either the rising edge or the falling edge can be specified as the valid edge.

When the count value of the TM5n register matches the value of the CR5n register, the TM5n register is cleared to 00H and an interrupt request signal (INTTM5n) is generated.

Setting method

- <1> Set each register.
 - TCL5n register: Selects the TI5n pin input edge.
Falling edge of TI5n pin → TLC5n register = 00H
Rising edge of TI5n pin → TCL5n register = 01H
 - CR5n register: Compare value (N)
 - TMC5n register: Stops count operation, selects the mode in which clear & start occurs on a match between the TM5n register and CR5n register, disables timer output F/F inversion operation, and disables timer output.
(TMC5n register = 0000xx00B, x: don't care)
 - For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.
- <2> When the TMC5n.TCE5n bit is set to 1, the counter counts the number of pulses input from the TI5n pin.
- <3> When the values of the TM5n register and CR5n register match, the INTTM5n signal is generated (TM5n register is cleared to 00H).
- <4> Then, the INTTM5n signal is generated each time the values of the TM5n register and CR5n register match.

INTTM5n signal is generated when the valid edge of TI5n pin is input N + 1 times: N = 00H to FFH

Caution During external event counter operation, do not rewrite the value of the CR5n register.

Remark n = 0, 1

Figure 9-3. Timing of External Event Counter Operation (with Rising Edge Specified)

9.4.3 Square-wave output operation

A square wave with any frequency can be output at an interval determined by the value preset in the CR5n register.

By setting the TMC5n.TOE5n bit to 1, the output status of the TO5n pin is inverted at an interval determined by the count value preset in the CR5n register. In this way, a square wave of any frequency can be output (duty = 50%) (n = 0, 1).

Setting method

- <1> Set each register.
 - TCL5n register: Selects the count clock (t).
 - CR5n register: Compare value (N)
 - TMC5n register: Stops count operation, selects the mode in which clear & start occurs on a match between the TM5n register and CR5n register, sets initial value of timer output, enables timer output F/F inversion operation, and enables timer output.
(TMC5n register = 00001011B or 00000111B)
 - For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions.**
- <2> When the TMC5n.TCE5n bit is set to 1, counting starts.
- <3> When the values of the TM5n register and CR5n register match, the timer output F/F is inverted. Moreover, the INTTM5n signal is generated and the TM5n register is cleared to 00H.
- <4> Then, the timer output F/F is inverted during the same interval and a square wave is output from the TO5n pin.

$$\text{Frequency} = 1/2t(N + 1): N = 00H \text{ to } FFH$$

Caution Do not rewrite the value of the CR5n register during square-wave output.

Figure 9-4. Timing of Square-Wave Output Operation

Note The initial value of the TO5n pin output can be set using the TMC5n.LVS5n and TMC5n.LVR5n bits.

Remark $n = 0, 1$

9.4.4 8-bit PWM output operation

By setting the TMC5n.TMC5n6 bit to 1, 8-bit timer/event counter 5n performs PWM output.

Pulses with a duty factor determined by the value set in the CR5n register are output from the TO5n pin.

Set the width of the active level of the PWM pulse in the CR5n register. The active level can be selected using the TMC5n.TMC5n1 bit.

The count clock can be selected using the TCL5n register.

PWM output can be enabled/disabled by the TMC5n.TOE5n bit.

Caution The CR5n register rewrite interval must be three or more operation clocks (set by the TCL5n register).

Use method

- <1> Set each register.
 - TCL5n register: Selects the count clock (t).
 - CR5n register: Compare value (N)
 - TMC5n register: Stops count operation, selects PWM mode, and leave timer output F/F unchanged, sets active level, and enables timer output.
(TMC5n register = 01000001B or 01000011B)
 - For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.
- <2> When the TMC5n.TCE5n bit is set to 1, counting starts.

PWM output operation

- <1> When counting starts, PWM output (output from the TO5n pin) outputs the inactive level until an overflow occurs.
- <2> When an overflow occurs, the active level set by setting method <1> is output. The active level is output until the value of the CR5n register and the count value of the TM5n register match. An interrupt request signal (INTTM5n) is generated.
- <3> When the value of the CR5n register and the count value of the TM5n register match, the inactive level is output and continues to be output until an overflow occurs again.
- <4> Then, steps <2> and <3> are repeated until counting is stopped.
- <5> When counting is stopped by clearing TCE5n bit to 0, PWM output becomes inactive.

$$\text{Cycle} = 256t, \text{ active level width} = Nt, \text{ duty} = N/256: N = 00H \text{ to } FFH$$

Remarks 1. $n = 0, 1$

2. For the detailed timing, refer to **Figure 9-5 Timing of PWM Output Operation** and **Figure 9-6 Timing of Operation Based on CR5n Register Transitions**.

(a) Basic operation of PWM output

Figure 9-5. Timing of PWM Output Operation

(b) Operation based on CR5n register transitions

Figure 9-6. Timing of Operation Based on CR5n Register Transitions

When the value of the CR5n register changes from N to M before the rising edge of the FFH clock

→ The value of the CR5n register is transferred at the overflow that occurs immediately after.

When the value of the CR5n register changes from N to M after the rising edge of the FFH clock

→ The value of the CR5n register is transferred at the second overflow.

Caution In the case of reload from the CR5n register between <1> and <2>, the value that is actually used differs (Read value: M; Actual value of CR5n register: N).

Remark n = 0, 1

9.4.5 Operation as interval timer (16 bits)

The 16-bit resolution timer/event counter mode is selected by setting the TMC51.TMC514 bit to 1.

8-bit timer/event counter 5n operates as an interval timer by repeatedly generating interrupts using the count value preset in 16-bit timer compare register 5 (CR5) as the interval.

Setting method

- <1> Set each register.
- TCL50 register: Selects the count clock (t)
(The TCL51 register does not need to be set in cascade connection)
 - CR50 register: Compare value (N) ... Lower 8 bits (settable from 00H to FFH)
 - CR51 register: Compare value (N) ... Higher 8 bits (settable from 00H to FFH)
 - TMC50, TMC51 register: Selects the mode in which clear & start occurs on a match between TM5 register and CR5 register (x: don't care)

$$\left(\begin{array}{l} \text{TMC50 register} = 0000\text{xx}00\text{B} \\ \text{TMC51 register} = 0001\text{xx}00\text{B} \end{array} \right)$$
- <2> Set the TMC51.TCE51 bit to 1. Then set the TMC50.TCE50 bit to 1 to start the count operation.
- <3> When the values of the TM5 register and CR5 register connected in cascade match, the INTTM50 signal is generated (the TM5 register is cleared to 0000H).
- <4> The INTTM50 signal is then generated repeatedly at the same interval.

$$\text{Interval time} = (N + 1) \times t: N = 0000\text{H to FFFFH}$$

- Cautions**
1. To write using 8-bit access during cascade connection, set the TCE51 bit to 1 at operation start and then set the TCE50 bit to 1. When operation is stopped, clear the TCE50 bit to 0 and then clear the TCE51 bit to 0.
 2. During cascade connection, TI50 input, TO50 output, and the INTTM50 signal are used. Do not use TI51 input, TO51 output, and the INTTM51 signal; mask them instead (for details, refer to CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION). Clear the LVS51, LVR51, TMC511, and TOE51 bits to 0.
 3. Do not change the value of the CR5 register during timer operation.

Figure 9-7 shows a timing example of the cascade connection mode with 16-bit resolution.

Figure 9-7. Cascade Connection Mode with 16-bit Resolution

9.4.6 Operation as external event counter (16 bits)

The 16-bit resolution timer/event counter mode is selected by setting the TMC51.TMC514 bit to 1.

The external event counter counts the number of clock pulses input to the TI50 pin from an external source using 16-bit timer counter 5 (TM5).

Setting method

- <1> Set each register.
 - TCL50 register: Selects the TI50 pin input edge.
(The TCL51 register does not have to be set during cascade connection.)
Falling edge of TI50 pin → TCL50 register = 00H
Rising edge of TI50 pin → TCL50 register = 01H
 - CR50 register: Compare value (N) ... Lower 8 bits (settable from 00H to FFH)
 - CR51 register: Compare value (N) ... Higher 8 bits (settable from 00H to FFH)
 - TMC50, TMC51 registers: Stops count operation, selects the clear & stop mode entered on a match between the TM5 register and CR5 register, disables timer output F/F inversion, and disables timer output.
(x: don't care)

TMC50 register = 0000xx00B
 TMC51 register = 0001xx00B
 - For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions.**
- <2> Set the TMC51.TCE51 bit to 1. Then set the TMC50.TCE50 bit to 1 and count the number of pulses input from the TI50 pin.
- <3> When the values of the TM5 register and CR5 register connected in cascade match, the INTTM50 signal is generated (the TM5 register is cleared to 0000H).
- <4> The INTTM50 signal is then generated each time the values of the TM5 register and CR5 register match.

INTTM50 signal is generated when the valid edge of TI50 pin is input N + 1 times: N = 0000H to FFFFH

- Cautions**
1. During external event counter operation, do not rewrite the value of the CR5n register.
 2. To write using 8-bit access during cascade connection, set the TCE51 bit to 1 and then set the TCE50 bit to 1. When operation is stopped, clear the TCE50 bit to 0 and then clear the TCE51 bit to 0 (n = 0, 1).
 3. During cascade connection, TI50 input and the INTTM50 signal are used. Do not use TI51 input, TO51 output, and the INTTM51 signal; mask them instead (for details, refer to CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION). Clear the LVS51, LVR51, TMC511, and TOE51 bits to 0.
 4. Do not change the value of the CR5 register during external event counter operation.

9.4.7 Square-wave output operation (16-bit resolution)

The 16-bit resolution timer/event counter mode is selected by setting the TMC51.TMC514 bit to 1.

8-bit timer/event counter 5n outputs a square wave of any frequency using the interval preset in 16-bit timer compare register 5 (CR5).

Setting method

<1> Set each register.

- TCL50 register: Selects the count clock (t)
(The TCL51 register does not have to be set in cascade connection)
- CR50 register: Compare value (N) ... Lower 8 bits (settable from 00H to FFH)
- CR51 register: Compare value (N) ... Higher 8 bits (settable from 00H to FFH)
- TMC50, TCM51 registers: Stops count operation, selects the mode in which clear & start occurs on a match between the TM5 register and CR5 register.

LVS50	LVR50	Timer Output F/F Status Settings
1	0	High-level output
0	1	Low-level output

Enables timer output F/F inversion, and enables timer output.

(TMC50 register = 00001011B or 00000111B)
 (TMC51 register = 00010000B)

- For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions.**

<2> Set the TMC51.TCE51 bit to 1. Then set the TMC50.TCE50 bit to 1 to start the count operation.

<3> When the values of the TM5 register and the CR5 register connected in cascade match, the TO50 timer output F/F is inverted. Moreover, the INTTM50 signal is generated and the TM5 register is cleared to 0000H.

<4> Then, the timer output F/F is inverted during the same interval and a square wave is output from the TO50 pin.

$$\text{Frequency} = 1/2t(N + 1): N = 0000H \text{ to } FFFFH$$

Caution Do not write a different value to the CR5 register during operation.

9.4.8 Cautions

(1) Error on starting timer

An error of up to 1 clock occurs before the match signal is generated after the timer has been started. This is because the TM5n register is started asynchronously to the count pulse.

Figure 9-8. Count Start Timing of TM5n Register

CHAPTER 10 8-BIT TIMER H

In the V850ES/KJ1, two channels of 8-bit timer H are provided.

10.1 Functions

8-bit timer H_n has the following functions (n = 0, 1).

- Interval timer
- Square wave output
- PWM output
- Carrier generator

10.2 Configuration

8-bit timer H_n consists of the following hardware.

Table 10-1. Configuration of 8-bit Timer H_n

Item	Configuration
Timer registers	8-bit timer counter H _n : 1 each
Register	8-bit timer H compare register n0 (CMPn0): 1 each 8-bit timer H compare register n1 (CMPn1): 1 each
Timer outputs	TOH _n , output controller
Control registers ^{Note}	8-bit timer H mode register n (TMHMDn) 8-bit timer H carrier control register n (TMCYCn)

Note To use the TOH_n pin function, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

Remark n = 0, 1

The block diagram is shown below.

Figure 10-1. Block Diagram of 8-bit Timer Hn

(1) 8-bit timer H compare register n0 (CMPn0)

<R>

This register can be read or written in 8-bit units. This register is used in all of the timer operation modes. This register constantly compares the value set to the CMPn0 register with the count value of 8-bit timer counter Hn and, when the two values match, generates an interrupt request signal (INTTMHn) and inverts the output level of the TOHn pin.

Rewrite the value of the CMPn0 register while the timer is stopped (TMHMDn.TMHEn bit = 0).

Reset sets this register to 00H.

Caution Rewriting the CMPn0 register during timer count operation is prohibited.

(2) 8-bit timer H compare register n1 (CMPn1)

This register can be read or written in 8-bit units.

<R>

This register is used in the PWM output mode and carrier generator mode.

In the PWM output mode, this register constantly compares the value set to the CMPn1 register with the count value of 8-bit timer counter Hn and, when the two values match, inverts the output level of the TOHn pin. No interrupt request signal is generated.

In the carrier generator mode, the CMPn1 register always compares the value set to the CMPn1 register with the count value of 8-bit timer counter Hn and, when the two values match, generates an interrupt request signal (INTTMHn). At the same time, the count value is cleared.

The CMPn1 register can be rewritten during timer count operation.

If the value of the CMPn1 register is rewritten while the timer is operating, the new value is latched and transferred to the CMPn1 register when the count value of the timer matches the old value of the CMPn1 register, and then the value of the CMPn1 register is changed to the new value. If matching of the count value and the CMPn1 register value and writing a value to the CMPn1 register conflict, the value of the CMPn1 register is not changed.

Reset sets this register to 00H.

The CMPn1 register can be rewritten during timer count operation.

In the carrier generator mode, after the CMPn1 register is set, if the count value of 8-bit timer counter Hn and the set value of the CMPn1 register match, an interrupt request signal (INTTMHn) is generated. At the same time, the value of 8-bit timer counter Hn is cleared to 00H.

If the set value of the CMPn1 register is rewritten during timer operation, the reload timing is when the count value of 8-bit timer counter Hn and the set value of the CMPn1 register match. If the transfer timing and write to the CMPn1 register from the CPU conflict, transfer is not performed.

Caution In the PWM output mode and carrier generator mode, be sure to set the CMPn1 register when starting the timer count operation (TMHMDn.TMHEn bit = 1) after the timer count operation was stopped (TMHEn bit = 0) (be sure to set again even if setting the same value to the CMPn1 register).

10.3 Registers

The registers that control 8-bit timer Hn are as follows.

- 8-bit timer H mode register n (TMHMDn)
- 8-bit timer H carrier control register n (TMCYCn)

Remarks 1. To use the TOHn pin function, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

2. n = 0, 1

(1) 8-bit timer H mode register n (TMHMDn)

The TMHMDn register controls the mode of 8-bit timer Hn.

TMHMDn register can be read or written in 8-bit or 1-bit units.

After reset, TMHMDn is cleared to 00H.

Remark n = 0, 1

REGC = $10 \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V : Count clock $\leq 5 \text{ MHz}$

REGC = $V_{DD} = 2.7$ to 4.0 V : Count clock $\leq 5 \text{ MHz}$

- Cautions**
1. When the TMHE1 bit = 1, setting bits other than those of the TMHMD1 register is prohibited.
 2. In the PWM output mode and carrier generator mode, be sure to set the CMP11 register when starting the timer count operation (TMHE1 bit = 1) after the timer count operation was stopped (TMHE1 bit = 0) (be sure to set again even if setting the same value to the CMP11 register).
 3. When using the carrier generator mode, set 8-bit timer H1 count clock frequency to six times 8-bit timer/event counter 51 count clock frequency or higher.

(2) 8-bit timer H carrier control register n (TMCYCn)

This register controls the 8-bit timer Hn remote control output and carrier pulse output status.
 TMCYCn register can be read or written in 8-bit or 1-bit units. The NRZn bit is a read-only bit.
 After reset, TMCYCn is cleared to 00H.

Remark n = 0, 1

After reset: 00H R/W Address: TMCYC0 FFFFF581H, TMCYC1 FFFFF591H

	7	6	5	4	3	2	1	<0>

0	0	Low-level output
0	1	High-level output
1	0	Low-level output
1	1	Carrier pulse output

NRZn	Carrier pulse output status flag
0	Carrier output disabled status (low-level status)
1	Carrier output enable status

10.4 Operation

10.4.1 Operation as interval timer/square wave output

When the count value of 8-bit timer counter Hn and the set value of the CMPn0 register match, an interrupt request signal (INTTMHn) is generated and 8-bit timer counter Hn is cleared to 00H.

The CMPn1 register cannot be used in the interval timer mode. Even if the CMPn1 register is set, this has no effect on the timer output because matches between 8-bit timer counter Hn and the CMPn1 register are not detected.

A square wave of the desired frequency (duty = 50%) is output from the TOHn pin, by setting the TMHMDn.TOENn bit to 1.

- Remarks**
1. For the alternate-function pin (TOHn) settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.
 2. For INTTMHn interrupt enable, refer to **CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION**.

Setting

- <1> Set each register.

Figure 10-2. Register Settings in Interval Timer Mode

- <2> When the TMHEn bit is set to 1, counting starts.

- <3> When the count value of 8-bit timer counter Hn and the set value of the CMPn0 register match, the INTTMHn signal is generated and 8-bit timer counter Hn is cleared to 00H.

- <4> Then, the INTTMHn signal is generated in the same interval. To stop the count operation, clear the TMHEn bit to 0.

Figure 10-3. Timing of Interval Timer/Square Wave Output Operation (1/2)

Basic operation (operation when $01H \leq CMPn0 \leq FEH$)

- <1> When the TMHEn bit is set to 1, the count operation is enabled. The count clock starts counting no more than one clock after operation has been enabled.
- <2> When the count value of 8-bit timer counter Hn and the set value of the CMPn0 register match, the value of 8-bit timer counter Hn is cleared, the TOHn output level is inverted, and the INTTMHn signal is output at the rising edge of the count clock.
- <3> The INTTMHn signal and TOHn output are set to the default level when the TMHMDn.TMHEn bit is cleared to 0 during 8-bit timer Hn operation. If the level is already at the default level before the TMHMDn.TMHEn bit is cleared to 0, that level is maintained.

Remarks 1. $n = 0, 1$ **2.** $01H \leq N \leq FEH$

Figure 10-3. Timing of Interval Timer/Square Wave Output Operation (2/2)

<R>

10.4.2 PWM output mode operation

In the PWM output mode, a pulse of any duty and cycle can be output.

The CMPn0 register controls the timer output (TOHn) cycle. Rewriting the CMPn0 register during timer operation is prohibited.

The CMPn1 register controls the timer output (TOHn) duty. The CMPn1 register can be rewritten during timer operation.

The operation in the PWM output mode is as follows.

After timer counting starts, when the count value of 8-bit timer counter Hn and the set value of the CMPn0 register match, the TOHn output level is inverted and 8-bit timer counter Hn is cleared to 00H. When the count value of 8-bit timer counter Hn and the set value of the CMPn1 register match, the TOHn output level is inverted.

- Remarks 1.** For the alternate-function pin (TOHn) settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.
- 2.** For INTTMHn interrupt enable, refer to **CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION**.

Setting

<1> Set each register.

Figure 10-4. Register Settings in PWM Output Mode

<2> When the TMHEn bit is set to 1, counting starts.

- <3> After the count operation is enabled, the first compare register to be compared is the CMPn0 register. When the count value of 8-bit timer counter Hn and the set value of the CMPn0 register match, 8-bit timer counter Hn is cleared, an interrupt request signal (INTTMHn) is generated, and the TOHn output level is inverted. At the same time, the register that is compared with 8-bit timer counter Hn changes from the CMPn0 register to the CMPn1 register.
- <4> When the count value of 8-bit timer counter Hn and the set value of the CMPn1 register match, the TOHn output level is inverted, and at the same time the register that is compared with 8-bit timer counter Hn changes from the CMPn1 register to the CMPn0 register. At this time, 8-bit timer counter Hn is not cleared and the INTTMHn signal is not generated.
- <5> A pulse of any duty can be obtained through the repetition of steps <3> and <4> above.
- <6> To stop the count operation, clear the TMHEn bit to 0.

Designating the set value of the CMPn0 register as (N), the set value of the CMPn1 register as (M), and the count clock frequency as f_{CNT} , the PWM pulse output cycle and duty are as follows.

$$\begin{aligned} \text{PWM pulse output cycle} &= (N + 1)/f_{CNT} \\ \text{Duty} = \text{inactive width} : \text{Active width} &= (M + 1) : (N + 1) \end{aligned}$$

- Cautions**
1. The set value of the CMPn1 register can be changed while the timer counter is operating. However, this takes a duration of at least three operating clocks (signal selected by the CKSHn2 to CKSHn0 bits of the TMHMDn register) from when the value of the CMPn1 register is changed until the value is transferred to the register.
 2. Be sure to set the CMPn1 register when starting the timer count operation (TMHEn bit = 1) after the timer count operation was stopped (TMHEn bit = 0) (be sure to set again even if setting the same value to the CMPn1 register).
 3. Make sure that the CMPn1 register set value (M) and CMPn0 register set value (N) are within the following range.
 $00H \leq \text{CMPn1 (M)} < \text{CMPn0 (N)} \leq FFH$

Figure 10-5. Operation Timing in PWM Output Mode (1/4)

Figure 10-5. Operation Timing in PWM Output Mode (2/4)

Figure 10-5. Operation Timing in PWM Output Mode (3/4)

Operation when CMPn0 = 01H, CMPn1 = 00H

Remark n = 0, 1

Figure 10-5. Operation Timing in PWM Output Mode (4/4)

10.4.3 Carrier generator mode operation

The carrier clock generated by 8-bit timer Hn is output using the cycle set with 8-bit timer/event counter 5n.

In the carrier generator mode, 8-bit timer/event counter 5n is used to control the extent to which the carrier pulse of 8-bit timer Hn is output, and the carrier pulse is output from the TOHn output.

Remarks 1. For the alternate-function pin (TOHn) settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

2. For INTTMHn interrupt enable, refer to **CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION**.

(1) Carrier generation

In the carrier generator mode, the CMPn0 register generates a waveform with the low-level width of the carrier pulse and the CMPn1 register generates a waveform with the high-level width of the carrier pulse.

During 8-bit timer Hn operation, the CMPn1 register can be rewritten, but rewriting of the CMPn0 register is prohibited.

(2) Carrier output control

Carrier output control is performed with the interrupt request signal (INTTM5n) of 8-bit timer/event counter 5n and the TMCYCn.NRZBn and TMCYCn.RMCn bits. The output relationships are as follows.

RMCn Bit	NRZBn Bit	Output
0	0	Low level output
0	1	High level output
1	0	Low level output
1	1	Carrier pulse output

Remark n = 0, 1

To control carrier pulse output during count operation, the TMCYCn.NRZn and TMCYCn.NRZBn bits have a master and slave bit configuration. The NRZn bit is read-only while the NRZBn bit can be read and written. The INTTM5n signal is synchronized with the 8-bit timer Hn clock and output as the INTTM5Hn signal. The INTTM5Hn signal becomes the data transfer signal of the NRZn bit and the value of the NRZBn bit is transferred to the NRZn bit. The transfer timing from the NRZBn bit to the NRZn bit is as follows.

<R>

Figure 10-6. Transfer Timing

- <1> The INTTM5n signal is synchronized with the count clock of 8-bit timer Hn and is output as the INTTM5Hn signal.
- <2> The value of the NRZBn bit is transferred to the NRZn bit at the second clock from the rising edge of the INTTM5Hn signal.
- <3> Write the next value to the NRZBn bit in the interrupt servicing programming that has been started by the INTTM5Hn interrupt or after timing has been checked by polling the interrupt request flag. Write data to count the next time to the CR5n register.

- Cautions**
1. Do not rewrite the NRZBn bit again until at least the second clock after it has been rewritten, or else transfer from the NRZBn bit to the NRZn bit is not guaranteed.
 2. When using 8-bit timer/event counter 5n in the carrier generator mode, an interrupt occurs at the timing of <1>. An interrupt occurs at a different timing when it is used in other than the carrier generator mode.

Remark n = 0, 1

Setting

<1> Set each register.

Figure 10-7. Register Settings in Carrier Generator Mode

<2> When the TMHEn bit is set to 1, 8-bit timer Hn count operation starts.

<3> When the TMC5n.TCE5n bit is set to 1, 8-bit timer/event counter 5n count operation starts.

<4> After the count operation is enabled, the first compare register to be compared is the CMPn0 register. When the count value of 8-bit timer counter Hn and the set value of the CMPn0 register match, the INTTMHn signal is generated, 8-bit timer counter Hn is cleared, and at the same time, the register that is compared with 8-bit timer counter Hn changes from the CMPn0 register to the CMPn1 register.

<5> When the count value of 8-bit timer counter Hn and the set value of the CMPn1 register match, the INTTMHn signal is generated, 8-bit timer counter Hn is cleared, and at the same time, the register that is compared with 8-bit timer counter Hn changes from the CMPn1 register to the CMPn0 register.

<6> The carrier clock is obtained through the repetition of steps <4> and <5> above.

<7> The INTTM5n signal is synchronized with 8-bit timer Hn and output as the INTTM5Hn signal. This signal becomes the data transfer signal of the NRZBn bit and the value of the NRZBn bit is transferred to the NRZn bit.

<R> <8> Write the next value to the NRZBn bit in the interrupt servicing programming that has been started by the INTTM5Hn interrupt or after timing has been checked by polling the interrupt request flag. Write data to count the next time to the CR5n register.

<9> When the NRZn bit becomes high level, the carrier clock is output from the TOHn pin.

<10> Any carrier clock can be obtained through the repetition of the above steps. To stop the count operation, clear the TMHEn bit to 0.

Designating the set value of the CMPn0 register as (N), the set value of the CMPn1 register as (M), and the count clock frequency as f_{CNT} , the carrier clock output cycle and duty are as follows.

$$\text{Carrier clock output cycle} = (N + M + 2) / f_{CNT}$$

$$\text{Duty} = \text{High level width: Carrier clock output width} = (M + 1) : (N + M + 2)$$

- Cautions**
1. Be sure to set the CMPn1 register when starting the timer count operation (TMHEn bit = 1) after the timer count operation was stopped (TMHEn bit = 0) (be sure to set again even if setting the same value to the CMPn1 register).
 2. Set the values of the CMPn0 and CMPn1 registers in the range of 01H to FFH.
 3. In the carrier generator mode, three operating clocks (signal selected by the TMHMDn.CKSHn0 to TMHMDn.CKSHn2 bits) are required for actual transfer of the new value to the register after the CMPn1 register has been rewritten.
 4. Be sure to perform the TMCYCn.RMCn bit setting before the start of the count operation.
 5. When using the carrier generator mode, set the 8-bit timer Hn count clock frequency to six times the 8-bit timer/event counter 5n count clock frequency or higher.

Figure 10-8. Carrier Generator Mode (1/3)

Operation when the CMPn0 register = N, the CMPn1 register = N is set

- <1> When the TMHEn bit = 0 and the TCE5n bit = 0, the operation of 8-bit timer Hn is stopped.
- <2> When the TMHEn bit is set to 1, 8-bit timer Hn starts counting. The carrier clock remains the default level.
- <3> When the count value of 8-bit timer counter Hn and the set value of the CMPn0 register match, the first INTTMHn signal is generated, the carrier clock signal is inverted, and the register that is compared with 8-bit timer counter Hn changes from the CMPn0 register to the CMPn1 register. 8-bit timer counter Hn is cleared to 00H.
- <4> When the count value of 8-bit timer counter Hn and the set value of the CMPn1 register match, the INTTMHn signal is generated, the carrier clock signal is inverted, and the register that is compared with 8-bit timer counter Hn changes from the CMPn1 register to the CMPn0 register. 8-bit timer counter Hn is cleared to 00H. A carrier clock with a duty of 50% is generated through the repetition of steps <3> and <4>.
- <5> The INTTM5n signal is synchronized with 8-bit timer Hn and output as the INTTM5Hn signal.
- <6> The INTTM5Hn signal becomes the data transfer signal of the NRZBn bit, and the value of the NRZBn bit is transferred to the NRZn bit.
- <7> The TOHn output is made low level by clearing the NRZn bit = 0.

Remark n = 0, 1

Figure 10-8. Carrier Generator Mode (2/3)

Operation when the CMPn0 register = N, the CMPn1 register = M is set

Remark n = 0, 1

Figure 10-8. Carrier Generator Mode (3/3)

Operation based on the CMPn1 register transitions

- <1> When the TMHEn bit is set to 1, counting starts. The carrier clock remains the default level at this time.
- <2> When the count value of the 8-bit timer counter Hn matches the value of the CMPn0 register, the INTTMHn signal is output, the carrier signal is inverted, and the 8-bit timer counter is cleared to 00H. At the same time, the compare register whose value is to be compared with that of the 8-bit timer counter Hn is changed from the CMPn0 register to the CMPn1 register.
- <3> The CMPn1 register is asynchronous to the count clock, and its value can be changed while the 8-bit timer Hn is operating. The new value (L) to which the value of the register is to be changed is latched. When the count value of the 8-bit timer counter Hn matches the value (M) of the CMPn1 register before the change, the CMPn1 register is changed (<3>').
- However, it takes three count clocks or more since the value of the CMPn1 register has been changed until the value is transferred to the register. Even if a match signal is generated before the duration of three count clocks elapses, the new value is not transferred to the register.
- <4> When the count value of 8-bit timer counter Hn and the value (M) of the CMPn1 register match, the INTTMHn signal is output, the carrier signal is inverted, and 8-bit timer counter Hn is cleared to 00H. At the same time, the compare register whose value is to be compared with that of the 8-bit timer counter Hn is changed from the CMPn1 register to the CMPn0 register.
- <5> The timing at which the count value of 8-bit timer counter Hn and the value of the CMPn1 register match again is the changed value (L).

Remark n = 0, 1

CHAPTER 11 INTERVAL TIMER, WATCH TIMER

The V850ES/KJ1 includes interval timer BRG and a watch timer. Interval timer BRG can also be used as the source clock of the watch timer. The watch timer can also be used as interval timer WT.

Two interval timer channels and one watch timer channel can be used at the same time.

11.1 Interval Timer BRG

11.1.1 Functions

Interval timer BRG has the following functions.

- Interval timer BRG: An interrupt request signal (INTBRG) is generated at a specified interval.
- Generation of count clock for watch timer: When the main clock is used as the count clock for the watch timer, a count clock (f_{BRG}) is generated.

11.1.2 Configuration

The following shows the block diagram of interval timer BRG.

Figure 11-1. Block Diagram of Interval Timer BRG

(1) Clock control

The clock control controls supply/stop of the operation clock of interval timer BRG.

(2) 3-bit prescaler

The 3-bit prescaler divides f_x to generate $f_x/2$, $f_x/4$, and $f_x/8$.

(3) Selector

The selector selects the count clock (f_{BGCS}) for interval timer BRG from f_x , $f_x/2$, $f_x/4$, and $f_x/8$.

(4) 8-bit counter

The 8-bit counter counts the count clock (f_{BGCS}).

(5) Output control

The output control controls supply of the count clock (f_{BRG}) for the watch timer.

(6) PRSCM register

The PRSCM register is an 8-bit compare register that sets the interval time.

(7) PRSM register

The PRSM register controls the operation of interval timer BRG, the selector, and clock supply to the watch timer.

11.1.3 Registers

Interval timer BRG includes the following registers.

(1) Interval timer BRG mode register (PRSM)

PRSM controls the operation of interval timer BRG, selection of count clock, and clock supply to the watch timer.

This register can be read or written in 8-bit or 1-bit units.

After reset, PRSM is cleared to 00H.

After reset: 00H R/W Address: FFFFF8B0H

	7	6	5	<4>	3	2	1	0
PRSM	0	0	0	BGCE	0	TODIS	BGCS1	BGCS0

BGCE	Control of interval timer operation
0	Operation stopped, 8-bit counter cleared to 01H
1	Operate

TODIS	Control of clock supply for watch timer
0	Clock for watch timer supplied
1	Clock for watch timer not supplied

BGCS1	BGCS0	Selection of input clock (f_{BGCS}) ^{Note}			
			10 MHz	5 MHz	4 MHz
0	0	f_x	100 ns	200 ns	250 ns
0	1	$f_x/2$	200 ns	400 ns	500 ns
1	0	$f_x/4$	400 ns	800 ns	1 μs
1	1	$f_x/8$	800 ns	1.6 μs	2 μs

Note Set these bits so that the following conditions are satisfied.

$V_{DD} = 4.0$ to 5.5 V: $f_{BGCS} \leq 10$ MHz

$V_{DD} = 2.7$ to 4.0 V: $f_{BGCS} \leq 5$ MHz

- Cautions**
1. Do not change the values of the TODIS, BGCS1, and BGCS0 bits while interval timer BRG is operating (BGCE bit = 1). Set the TODIS, BGCS1, and BGCS0 bits before setting (1) the BGCE bit.
 2. When the BGCE bit is cleared (to 0), the 8-bit counter is cleared.

<R>

(2) Interval timer BRG compare register (PRSCM)

PRSCM is an 8-bit compare register.

This register can be read or written in 8-bit units.

After reset, PRSCM is cleared to 00H.

Caution Do not rewrite the PRSCM register while interval timer BRG is operating (PRSM.BGCE bit = 1). Set the PRSCM register before setting (1) the BGCE bit.

11.1.4 Operation

(1) Operation of interval timer BRG

Set the count clock by using the BGCS1 and BGCS0 bits of PRSM and the 8-bit compare value by using the PRSCM register.

When the PRSM.BGCE bit is set (1), interval timer BRG starts operating.

<R> Each time the count value of the 8-bit counter and the set value in the PRSCM register match, an interrupt request signal (INTBRG) is generated. At the same time, the 8-bit counter is cleared to 01H and counting is continued.

The interval time can be obtained from the following equation.

$$\text{Interval time} = 2^m \times N / f_x$$

Remark m: Division value (set values of BGCS1 and BGCS0 bits) = 0 to 3

N: Set value in PRSCM register^{Note} = 1 to 256 (when the set value in the PRSCM register is 00H, N = 256)

f_x: Main clock oscillation frequency

<R> **Note** When the set value of the PRSCM register = 01H, the INTBRG interrupt occurs only once.

(2) Count clock supply for watch timer

Set the count clock by using the BGCS1 and BGCS0 bits of PRSM and the 8-bit compare value by using the PRSCM register, so that the count clock frequency (f_{BRG}) of the watch timer is 32.768 kHz. Clear (0) the PRSM.TODIS bit at the same time.

When the PRSM.BGCE bit is set (1), f_{BRG} is supplied to the watch timer.

f_{BRG} is obtained from the following equation.

$$f_{\text{BRG}} = f_x / (2^{m+1} \times N)$$

To set f_{BRG} to 32.768 kHz, perform the following calculation to set the BGCS1 and BGCS0 bits and the PRSCM register.

<1> Set N = f_x/65,536 (round off the decimal) to set m = 0.

<2> If N is even, N = N/2 and m = m + 1

<3> Repeat step <2> until N is odd or m = 3

<4> Set N to the PRSCM register and m to the BGCS1 and BGCS0 bits.

Example: When f_x = 4.00 MHz

<1> N = 4,000,000/65,536 = 61 (round off the decimal), m = 0

<2>, <3> Since N is odd, the values remain as N = 61, m = 0

<4> The set value in the PRSCM register: 3DH (61), the set values in the BGCS1 and BGCS0 bits: 00

Remark m: Divided value (set value in the BGCS1 and BGCS0 bits) = 0 to 3

N: Set value in PRSCM register = 1 to 256 (when the set value in the PRSCM register is 00H, N = 256)

f_x: Main clock oscillation frequency

11.2 Watch Timer

11.2.1 Functions

The watch timer has the following functions.

- Watch timer: An interrupt request signal (INTWT) is generated at time intervals of 0.5 or 0.25 seconds by using the main clock or subclock.
- Interval timer: An interrupt request signal (INTWTI) is generated at the preset time interval.

The watch timer and interval timer functions can be used at the same time.

11.2.2 Configuration

The following shows the block diagram of the watch timer.

Figure 11-2. Block Diagram of Watch Timer

(1) 11-bit prescaler

The 11-bit prescaler generates a clock of $f_w/2^4$ to $f_w/2^{11}$ by dividing f_w .

(2) 5-bit counter

The 5-bit counter generates the watch timer interrupt request signal (INTWT) at intervals of $2^4/f_w$, $2^5/f_w$, $2^{13}/f_w$, or $2^{14}/f_w$ by counting f_w or $f_w/2^9$.

(3) Selectors

The watch timer has the following four selectors.

- Selector that selects the main clock (the clock from interval timer BRG (f_{BRG})) or the subclock (f_{XT}) as the clock for the watch timer.
- Selector that selects f_w or $f_w/2^9$ as the count clock frequency of the 5-bit counter
- Selector that selects $2^4/f_w$ or $2^{13}/f_w$, or $2^5/f_w$ or $2^{14}/f_w$ as the INTWT signal generation time interval.
- Selector that selects the generation time interval of the interval timer WT interrupt request signal (INTWTI) from $2^4/f_w$ to $2^{11}/f_w$.

(4) 8-bit counter

The 8-bit counter counts the count clock (f_{BGCS}).

(5) WTM register

The WTM register is an 8-bit register that controls the operation of the watch timer/interval timer WT and sets the interval of interrupt request signal generation.

11.2.3 Registers

The watch timer includes the following register.

(1) Watch timer operation mode register (WTM)

This register enables or disables the count clock and operation of the watch timer, sets the interval time of the 11-bit prescaler, controls the operation of the 5-bit counter, and sets the timer of watch timer interrupt request signal (INTWT) generation.

The WTM register can be read or written in 8-bit or 1-bit units.

After reset, WTM is cleared to 00H.

After reset: 00H R/W Address: FFFF680H

	7	6	5	4	3	2	<1>	<0>
WTM	WTM7	WTM6	WTM5	WTM4	WTM3	WTM2	WTM1	WTM0

WTM1	Control of 5-bit counter operation
0	Clear after operation stops
1	Start

WTM0	Watch timer operation enable
0	Stop operation (clear both prescaler and 5-bit counter)
1	Enable operation

Caution Rewrite the WTM2 to WTM7 bits while both the WTM0 and WTM1 bits are 0.

Remarks 1. f_w : Watch timer clock frequency
 2. Values in parentheses apply when $f_w = 32.768$ kHz

11.2.4 Operation

(1) Operation as watch timer

The watch timer generates an interrupt request at fixed time intervals. The watch timer operates using time intervals of 0.25 or 0.5 seconds with the subclock (32.768 kHz).

The count operation starts when the WTM.WTM0 and WTM.WTM1 bits are set to 11. When these bits are cleared to 00, the 10-bit prescaler and 5-bit counter are cleared and the count operation stops.

The 5-bit counter can be cleared to synchronize the time by clearing the WTM1 bit to 0 when the watch timer and interval timer WT operate simultaneously. At this time, an error of up to 15.6 ms may occur in the watch timer, but interval timer WT is not affected.

(2) Operation as interval timer

The watch timer can also be used as an interval timer that repeatedly generates an interrupt request signal (INTWTI) at intervals specified by a count value set in advance.

The interval time can be selected by the WTM.WTM4 to WTM.WTM7 bits.

Table 11-1. Interval Time of Interval Timer

WTM7	WTM6	WTM5	WTM4	Interval Time	
0	0	0	0	$2^4 \times 1/f_w$	488 μ s (operating at $f_w = f_{XT} = 32.768$ kHz)
0	0	0	1	$2^5 \times 1/f_w$	977 μ s (operating at $f_w = f_{XT} = 32.768$ kHz)
0	0	1	0	$2^6 \times 1/f_w$	1.95 ms (operating at $f_w = f_{XT} = 32.768$ kHz)
0	0	1	1	$2^7 \times 1/f_w$	3.91 ms (operating at $f_w = f_{XT} = 32.768$ kHz)
0	1	0	0	$2^8 \times 1/f_w$	7.81 ms (operating at $f_w = f_{XT} = 32.768$ kHz)
0	1	0	1	$2^9 \times 1/f_w$	15.6 ms (operating at $f_w = f_{XT} = 32.768$ kHz)
0	1	1	0	$2^{10} \times 1/f_w$	31.3 ms (operating at $f_w = f_{XT} = 32.768$ kHz)
0	1	1	1	$2^{11} \times 1/f_w$	62.5 ms (operating at $f_w = f_{XT} = 32.768$ kHz)
1	0	0	0	$2^4 \times 1/f_w$	488 μ s (operating at $f_w = f_{BRG} = 32.768$ kHz)
1	0	0	1	$2^5 \times 1/f_w$	977 μ s (operating at $f_w = f_{BRG} = 32.768$ kHz)
1	0	1	0	$2^6 \times 1/f_w$	1.95 ms (operating at $f_w = f_{BRG} = 32.768$ kHz)
1	0	1	1	$2^7 \times 1/f_w$	3.91 ms (operating at $f_w = f_{BRG} = 32.768$ kHz)
1	1	0	0	$2^8 \times 1/f_w$	7.81 ms (operating at $f_w = f_{BRG} = 32.768$ kHz)
1	1	0	1	$2^9 \times 1/f_w$	15.6 ms (operating at $f_w = f_{BRG} = 32.768$ kHz)
1	1	1	0	$2^{10} \times 1/f_w$	31.3 ms (operating at $f_w = f_{BRG} = 32.768$ kHz)
1	1	1	1	$2^{11} \times 1/f_w$	62.5 ms (operating at $f_w = f_{BRG} = 32.768$ kHz)

Remark f_w : Watch timer clock frequency

Figure 11-3. Operation Timing of Watch Timer/Interval Timer

Remarks 1. Assuming that the interrupt time of the watch timer is set to 0.5 seconds.

2. fw: Watch timer clock frequency

Values in parentheses apply when count clock fw = 32.768 kHz.

n: Number of interval timer WT operations

11.3 Cautions

(1) Operation as watch timer

Some time is required before the first watch timer interrupt request (INTWT) is generated after operation is enabled (WTM.WTM1 and WTM.WTM0 bits = 11).

**Figure 11-4. Example of Generation of Watch Timer Interrupt Request (INTWT)
(When Interrupt Period = 0.5 s)**

It takes 0.515625 (max.) seconds for the first INTWT to be generated ($2^9 \times 1/32768 = 0.015625$ (max.) s longer). INTWT is then generated every 0.5 seconds.

(2) When watch timer and interval timer BRG operate simultaneously

When using the subclock as the count clock for the watch timer, the interval time of interval timer BRG can be set to any value. Changing the interval time does not affect the watch timer (before changing the interval time, stop operation).

When using the main clock as the count clock for the watch timer, set the interval time of interval timer BRG to approximately 65.536 kHz. Do not change this value.

(3) When interval timer BRG and interval timer WT operate simultaneously

When using the subclock as the count clock for interval timer WT, the interval times of interval timers BRG and WT can be set to any values. They can also be changed later (before changing the value, stop operation).

When using the main clock as the count clock for interval timer WT, the interval time of interval timer BRG can be set to any value, but cannot be changed later (it can be changed only when interval timer WT stops operation). The interval time of interval timer WT can be set to $\times 2^5$ to $\times 2^{12}$ of the set value of interval timer BRG. It can also be changed later.

(4) When watch timer and interval timer WT operate simultaneously

The interval time of interval timer WT can be set to a value between 488 μ s and 62.5 ms. It cannot be changed later.

Do not stop interval timer WT (clear (0) the WTM.WTM0 bit) while the watch timer is operating. If the WTM0 bit is set (1) after it had been cleared (0), the watch timer will have a discrepancy of up to 0.5 or 0.25 seconds.

(5) When watch timer, interval timer BRG, and interval timer WT operate simultaneously

When using the subclock as the count clock for the watch timer, the interval times of interval timers BRG and WT can be set to any values. The interval time of interval timer BRG can be changed later (before changing the value, stop operation).

When using the main clock as the count clock for the watch timer, set the interval time of interval timer BRG to approximately 65.536 kHz. It cannot be changed later. The interval time of interval timer WT can be set to a value between 488 μ s and 62.5 ms. It cannot be changed later.

Do not stop interval timer BRG (clear (0) the PRSM.BGCE bit) or interval timer WT (clear (0) the WTM.WTM0 bit) while the watch timer is operating.

CHAPTER 12 WATCHDOG TIMER FUNCTIONS

12.1 Watchdog Timer 1

12.1.1 Functions

Watchdog timer 1 has the following operation modes.

- Watchdog timer
- Interval timer

The following functions are realized from the above-listed operation modes.

- Generation of non-maskable interrupt request signal (INTWDT1) upon overflow of watchdog timer 1^{Note}
- Generation of system reset signal (WDTRES1) upon overflow of watchdog timer 1
- Generation of maskable interrupt request signal (INTWDTM1) upon overflow of interval timer

Note For non-maskable interrupt servicing due to non-maskable interrupt request signal (INTWDT1, INTWDT2), refer to **20.10 Cautions**.

Remark Select whether to use watchdog timer 1 in the watchdog timer 1 mode or the interval timer mode with the WDTM1 register.

Figure 12-1. Block Diagram of Watchdog Timer 1

12.1.2 Configuration

Watchdog timer 1 consists of the following hardware.

Table 12-1. Configuration of Watchdog Timer 1

Item	Configuration
Control register	Watchdog timer clock selection register (WDCS) Watchdog timer mode register 1 (WDTM1)

12.1.3 Registers

The registers that control watchdog timer 1 are as follows.

- Watchdog timer clock selection register (WDCS)
- Watchdog timer mode register 1 (WDTM1)

(1) Watchdog timer clock selection register (WDCS)

This register sets the overflow time of watchdog timer 1 and the interval timer.

The WDCS register can be read or written in 8-bit or 1-bit units.

After reset, WDCS is cleared to 00H.

After reset: 00H R/W Address: FFFFF6C1H

	7	6	5	4	3	2	1	0
WDCS	0	0	0	0	0	WDCS2	WDCS1	WDCS0

WDCS2	WDCS1	WDCS0	Overflow time of watchdog timer 1/interval timer	f_{xw}		
				4 MHz	5 MHz	10 MHz
0	0	0	$2^{13}/f_{xw}$	2.048 ms	1.638 ms	0.819 ms
0	0	1	$2^{14}/f_{xw}$	4.096 ms	3.277 ms	1.638 ms
0	1	0	$2^{15}/f_{xw}$	8.192 ms	6.554 ms	3.277 ms
0	1	1	$2^{16}/f_{xw}$	16.38 ms	13.11 ms	6.554 ms
1	0	0	$2^{17}/f_{xw}$	32.77 ms	26.21 ms	13.11 ms
1	0	1	$2^{18}/f_{xw}$	65.54 ms	52.43 ms	26.2 ms
1	1	0	$2^{19}/f_{xw}$	131.1 ms	104.9 ms	52.43 ms
1	1	1	$2^{21}/f_{xw}$	524.3 ms	419.4 ms	209.7 ms

Remark $f_{xw} = f_x$: Watchdog timer 1 clock frequency

(2) Watchdog timer mode register 1 (WDTM1)

This register sets the watchdog timer 1 operation mode and enables/disables count operations.

This register is a special register that can be written only in a special sequence (refer to **3.4.7 Special registers**).

The WDTM1 register can be read or written in 8-bit or 1-bit units.

After reset, WDTM1 is cleared to 00H.

Caution When the main clock is stopped and the CPU is operating on the subclock, do not access the WDTM1 register using an access method that causes a wait.
For details, refer to 3.4.8 (1) (b).

After reset: 00H R/W Address: FFFFF6C2H

	<7>	6	5	4	3	2	1	0
WDTM1	RUN1	0	0	WDTM14	WDTM13	0	0	0

RUN1	Selection of operation mode of watchdog timer 1 ^{Note 1}
0	Stop counting
1	Clear counter and start counting

WDTM14	WDTM13	Selection of operation mode of watchdog timer 1 ^{Note 2}
0	0	Interval timer mode (Upon overflow, maskable interrupt INTWDTM1 is generated.)
0	1	
1	0	Watchdog timer mode 1 ^{Note 3} (Upon overflow, non-maskable interrupt INTWDT1 is generated.)
1	1	Watchdog timer mode 2 (Upon overflow, reset operation WDTRES1 is started.)

- Notes**
- Once the RUN1 bit is set (to 1), it cannot be cleared (to 0) by software.
Therefore, when counting is started, it cannot be stopped except reset.
 - Once the WDTM13 and WDTM14 bits are set (to 1), they cannot be cleared (to 0) by software and can be cleared only by reset.
 - For non-maskable interrupt servicing due to non-maskable interrupt request signal (INTWDT1), refer to **20.10 Cautions**.

12.1.4 Operation

(1) Operation as watchdog timer 1

Watchdog timer 1 operation to detect a program loop is selected by setting the WDTM1.WDTM14 bit to 1.

The count clock (program loop detection time interval) of watchdog timer 1 can be selected using the WDCS.WDCS0 to WDCS.WDCS2 bits. The count operation is started by setting the WDTM1.RUN1 bit to 1. When, after the count operation is started, the RUN1 bit is again set to 1 within the set program loop detection time interval, watchdog timer 1 is cleared and the count operation starts again.

If the program loop detection time is exceeded without RUN1 bit being set to 1, reset signal (WDTRES1) through the value of the WDTM1.WDTM13 bit or a non-maskable interrupt request signal (INTWDT1) is generated.

The count operation of watchdog timer 1 stops in the STOP mode and IDLE mode. Set the RUN1 bit to 1 before the STOP mode or IDLE mode is entered in order to clear watchdog timer 1.

Because watchdog timer 1 operates in the HALT mode, make sure that an overflow will not occur during HALT.

Cautions 1. When the subclock is selected for the CPU clock, the count operation of watchdog timer 1 is stopped (the value of watchdog timer 1 is maintained).

2. For non-maskable interrupt servicing due to the INTWDT1 signal, refer to 20.10 Cautions.

Table 12-2. Program Loop Detection Time of Watchdog Timer 1

Clock	Program Loop Detection Time		
	$f_{xw} = 4 \text{ MHz}$	$f_{xw} = 5 \text{ MHz}$	$f_{xw} = 10 \text{ MHz}$
$2^{13}/f_{xw}$	2.048 ms	1.638 ms	0.819 ms
$2^{14}/f_{xw}$	4.096 ms	3.277 ms	1.683 ms
$2^{15}/f_{xw}$	8.192 ms	6.554 ms	3.277 ms
$2^{16}/f_{xw}$	16.38 ms	13.11 ms	6.554 ms
$2^{17}/f_{xw}$	32.77 ms	26.21 ms	13.11 ms
$2^{18}/f_{xw}$	65.54 ms	52.43 ms	26.21 ms
$2^{19}/f_{xw}$	131.1 ms	104.9 ms	52.43 ms
$2^{21}/f_{xw}$	524.3 ms	419.4 ms	209.7 ms

Remark $f_{xw} = f_x$: Watchdog timer 1 clock frequency

(2) Operation as interval timer

Watchdog timer 1 can be made to operate as an interval timer that repeatedly generates interrupts using the count value set in advance as the interval, by clearing the WDTM1.WDTM14 bit to 0.

When watchdog timer 1 operates as an interval timer, the interrupt mask flag (WDTMK) and priority specification flags (WDTPR0 to WDTPR2) of the WDTIC register are valid and maskable interrupt request signals (INTWDTM1) can be generated. The default priority of the INTWDTM1 signal is set to the highest level among the maskable interrupt request signals.

The interval timer continues to operate in the HALT mode, but it stops operating in the STOP mode and the IDLE mode.

- Cautions**
1. Once the WDTM14 bit is set to 1 (thereby selecting the watchdog timer 1 mode), the interval timer mode is not entered as long as reset is not performed.
 2. When the subclock is selected for the CPU clock, the count operation of the watchdog timer 1 stops (the value of the watchdog timer is maintained).

Table 12-3. Interval Time of Interval Timer

Clock	Interval Time		
	$f_{xw} = 4 \text{ MHz}$	$f_{xw} = 5 \text{ MHz}$	$f_{xw} = 10 \text{ MHz}$
$2^{13}/f_{xw}$	2.048 ms	1.638 ms	0.819 ms
$2^{14}/f_{xw}$	4.096 ms	3.277 ms	1.638 ms
$2^{15}/f_{xw}$	8.192 ms	6.554 ms	3.277 ms
$2^{16}/f_{xw}$	16.38 ms	13.11 ms	6.554 ms
$2^{17}/f_{xw}$	32.77 ms	26.21 ms	13.11 ms
$2^{18}/f_{xw}$	65.54 ms	52.43 ms	26.21 ms
$2^{19}/f_{xw}$	131.1 ms	104.9 ms	52.43 ms
$2^{21}/f_{xw}$	524.3 ms	419.4 ms	209.7 ms

Remark $f_{xw} = f_x$: Watchdog timer 1 clock frequency

12.2 Watchdog Timer 2

12.2.1 Functions

Watchdog timer 2 has the following functions.

- Default start watchdog timer^{Note 1}
 - Reset mode: Reset operation upon overflow of watchdog timer 2 (generation of WDTRES2 signal)
 - Non-maskable interrupt request mode: NMI operation upon overflow of watchdog timer 2 (generation of INTWDT2 signal)^{Note 2}
- Input selectable from main clock and subclock as the source clock

Notes 1. Watchdog timer 2 automatically starts in the reset mode following reset release.

When watchdog timer 2 is not used, either stop its operation before reset is executed through this function, or clear once watchdog timer 2 and stop it within the next interval time.

Also, write to the WDTM2 register for verification purposes only once, even if the default settings (reset mode, interval time: $f_{xx}/2^{25}$) need not be changed.

2. For non-maskable interrupt servicing due to a non-maskable interrupt request signal (INTWDT2), refer to **20.10 Cautions**.

Figure 12-2. Block Diagram of Watchdog Timer 2

12.2.2 Configuration

Watchdog timer 2 consists of the following hardware.

Table 12-4. Configuration of Watchdog Timer 2

Item	Configuration
Control register	Watchdog timer mode register 2 (WDTM2) Watchdog timer enable register (WDTE)

12.2.3 Registers

(1) Watchdog timer mode register 2 (WDTM2)

This register sets the overflow time and operation clock of watchdog timer 2.

The WDTM2 register can be read or written in 8-bit units. This register can be read any number of times, but it can be written only once following reset release.

After reset, WDTM2 is set to 67H.

Caution When the main clock is stopped and the CPU is operating on the subclock, do not access the WDTM2 register using an access method that causes a wait.

For details, refer to 3.4.8 (1) (b).

After reset: 67H R/W Address: FFFFF6D0H

	7	6	5	4	3	2	1	0
WDTM2	0	WDM21	WDM20	WDCS24	WDCS23	WDCS22	WDCS21	WDCS20

WDM21	WDM20	Selection of operation mode of watchdog timer 2
0	0	Stops operation
0	1	Non-maskable interrupt request mode (generation of INTWDT2)
1	—	Reset mode (generation of WDTRES2)

- Cautions**
1. To stop the operation of watchdog timer 2, write “1FH” to the WDTM2 register.
 2. For details about bits WDCS0 to WDCS4, refer to Table 12-5 Watchdog Timer 2 Clock Selection.
 3. If the WDTM2 register is written twice after a reset, an overflow signal is forcibly output.
 4. To intentionally generate an overflow signal, write data to the WDTM2 register only twice, or write a value other than “ACH” to the WDTE register only once.

<R>

Table 12-5. Watchdog Timer 2 Clock Selection

WDCS24	WDCS23	WDCS22	WDCS21	WDCS20	Selected Clock	f _{xx} = 20 MHz	f _{xx} = 16 MHz	f _{xx} = 10 MHz
0	0	0	0	0	2 ¹⁸ /f _{xx}	13.1 ms	16.4 ms	26.2 ms
0	0	0	0	1	2 ¹⁹ /f _{xx}	26.2 ms	32.8 ms	52.4 ms
0	0	0	1	0	2 ²⁰ /f _{xx}	52.4 ms	65.5 ms	104.9 ms
0	0	0	1	1	2 ²¹ /f _{xx}	104.9 ms	131.1 ms	209.7 ms
0	0	1	0	0	2 ²² /f _{xx}	209.7 ms	262.1 ms	419.4 ms
0	0	1	0	1	2 ²³ /f _{xx}	419.4 ms	524.3 ms	838.9 ms
0	0	1	1	0	2 ²⁴ /f _{xx}	838.9 ms	1048.6 ms	1677.7 ms
0	0	1	1	1	2 ²⁵ /f _{xx}	1677.7 ms	2097.2 ms	3355.4 ms
0	1	0	0	0	2 ⁹ /f _{XT}	15.625 ms (f _{XT} = 32.768 kHz)		
0	1	0	0	1	2 ¹⁰ /f _{XT}	31.25 ms (f _{XT} = 32.768 kHz)		
0	1	0	1	0	2 ¹¹ /f _{XT}	62.5 ms (f _{XT} = 32.768 kHz)		
0	1	0	1	1	2 ¹² /f _{XT}	125 ms (f _{XT} = 32.768 kHz)		
0	1	1	0	0	2 ¹³ /f _{XT}	250 ms (f _{XT} = 32.768 kHz)		
0	1	1	0	1	2 ¹⁴ /f _{XT}	500 ms (f _{XT} = 32.768 kHz)		
0	1	1	1	0	2 ¹⁵ /f _{XT}	1000 ms (f _{XT} = 32.768 kHz)		
0	1	1	1	1	2 ¹⁶ /f _{XT}	2000 ms (f _{XT} = 32.768 kHz)		
1	×	×	×	×	Operation stopped			

(2) Watchdog timer enable register (WDTE)

The counter of watchdog timer 2 is cleared and counting restarted by writing “ACH” to the WDTE register.

The WDTE register can be read or written in 8-bit units.

After reset, WDTE is set to 9AH.

After reset: 9AH R/W Address: FFFFF6D1H

	7	6	5	4	3	2	1	0
WDTE								

- Cautions**
1. When a value other than “ACH” is written to the WDTE register, an overflow signal is forcibly output.
 2. When a 1-bit memory manipulation instruction is executed for the WDTE register, an overflow signal is forcibly output.
 3. The read value of the WDTE register is always “9AH” (value that differs from written value “ACH”).
 4. To intentionally generate an overflow signal, write a value other than “ACH” to the WDTE register only once, or write data to the WDTM2 register only twice.

<R>

12.2.4 Operation

Watchdog timer 2 automatically starts in the reset mode following reset release.

The WDTM2 register can be written to only once following reset through byte access. To use watchdog timer 2, write the operation mode and the interval time to the WDTM2 register using 8-bit memory manipulation instructions. After this is done, the operation of watchdog timer 2 cannot be stopped.

The watchdog timer 2 program loop detection time interval can be selected by the WDTM2.WDCS24 to WDTM2.WDCS20 bits. Writing ACH to the WDTE register clears the counter of watchdog timer 2 and starts the count operation again. After the count operation starts, write ACH to the WDTE register within the set program loop detection time interval.

If the program loop detection time is exceeded without ACH being written to the WDTE register, a reset signal (WDTRES2) or non-maskable interrupt request signal (INTWDT2) is generated depending on the set value of the WDTM2.WDM21 and WDTM2.WDM20 bits.

To not use watchdog timer 2, write 1FH to the WDTM2 register.

For non-maskable interrupt servicing when the non-maskable interrupt request mode is set, refer to **20.10**

Cautions.

If the main clock is selected as the source clock of watchdog timer 2, the watchdog timer stops operation in the IDLE/STOP mode. Therefore, clear watchdog timer 2 by writing ACH to the WDTE register before the IDLE/STOP mode is set.

Because watchdog timer 2 operates in the HALT mode or when the subclock is selected as its source clock in the IDLE/STOP mode, exercise care that the timer does not overflow in the HALT mode.

CHAPTER 13 REAL-TIME OUTPUT FUNCTION (RTO)

13.1 Function

The real-time output function (RTO) transfers preset data to the RTBLn and RTBHn registers, and then transfers this data with hardware to an external device via the real-time output latches, upon occurrence of a timer interrupt. The pins through which the data is output to an external device constitute a port called a real-time output port.

Because RTO can output signal without jitter, it is suitable for controlling a stepping motor.

In the V850ES/KJ1, two 6-bit real-time output port channels are provided.

The real-time output port can be set in the port mode or real-time output port mode in 1-bit units.

The block diagram of RTO is shown below.

Figure 13-1. Block Diagram of RTO

13.2 Configuration

RTO consists of the following hardware.

Table 13-1. Configuration of RTO

Item	Configuration
Registers	Real-time output buffer register n (RTBLn, RTBHn)
Control registers	Real-time output port mode register n (RTPMn) Real-time output port control register n (RTPCn)

(1) Real-time output buffer register n (RTBLn, RTBHn)

RTBLn and RTBHn are 4-bit registers that hold output data in advance.

These registers are mapped to independent addresses in the peripheral I/O register area.

They can be read or written in 8-bit or 1-bit units.

If an operation mode of 4 bits $\times$ 1 channel or 2 bits $\times$ 1 channel is specified (RTPCn.BYTEn bit = 0), data can be individually set to the RTBLn and RTBHn registers. The data of both these registers can be read at once by specifying the address of either of these registers.

If an operation mode of 6 bits $\times$ 1 channel is specified (BYTE n bit = 1), 8-bit data can be set to both the RTBLn and RTBHn registers by writing the data to either of these registers. Moreover, the data of both these registers can be read at once by specifying the address of either of these registers.

Table 13-2 shows the operation when the RTBLn and RTBHn registers are manipulated.

After reset: 00H R/W Address: RTBL0 FFFFF6E0H, RTBL1 FFFFF6F0
RTBH0 FFFFF6E2H, RTBH1 FFFFF6F2

	7	6	5	4	3	2	1	0
RTBLn					RTBLn3	RTBLn2	RTBLn1	RTBLn0
RTBHn	0	0	RTBHn5	RTBHn4				

- Cautions**
1. When writing to bits 6 and 7 of the RTBHn register, always write 0.
 2. When the main clock is stopped and the CPU is operating on the subclock, do not access the RTBLn and RTBHn registers using an access method that causes a wait. For details, refer to 3.4.8 (1) (b).

Remark n = 0, 1

Table 13-2. Operation During Manipulation of RTBLn and RTBHn Registers

Operation Mode	Register to Be Manipulated	Read		Write ^{Note}	
		Higher 4 Bits	Lower 4 Bits	Higher 4 Bits	Lower 4 Bits
4 bits × 1 channel, 2 bits × 1 channel	RTBLn	RTBHn	RTBLn	Invalid	RTBLn
	RTBHn	RTBHn	RTBLn	RTBHn	Invalid
6 bits × 1 channel	RTBLn	RTBHn	RTBLn	RTBHn	RTBLn
	RTBHn	RTBHn	RTBLn	RTBHn	RTBLn

Note After setting the real-time output port, set output data to the RTBLn and RTBHn registers by the time a real-time output trigger is generated.

13.3 Registers

RTO is controlled using the following two types of registers.

- Real-time output port mode register n (RTPMn)
- Real-time output port control register n (RTPCn)

(1) Real-time output port mode register n (RTPMn)

This register selects the real-time output port mode or port mode in 1-bit units.

The RTPMn register can be read or written in 8-bit or 1-bit units.

After reset, RTPMn is cleared to 00H.

After reset: 00H R/W Address: RTPM0 FFFFF6E4H, RTPM1 FFFFF6F4H

	7	6	5	4	3	2	1	0
RTPMn (n = 0, 1)	0	0	RTPMn5	RTPMn4	RTPMn3	RTPMn2	RTPMn1	RTPMn0
RTPMnm	Control of real-time output port (m = 0 to 5)							
0	Real-time output disabled							
1	Real-time output enabled							

- Cautions**
1. To reflect real-time output signals (RTPOUTn0 to RTPOUTn5) to the pins (RTPn0 to RTPn5), set them to the real-time output port with the PMC5, PMC6, PFC5, and PFC6 registers.
 2. By enabling real-time output operation (RTPCn.RTPOEn bit = 1), the bits specified as real-time output enabled perform real-time output, and the bits specified as real-time output disabled output 0.
 3. If real-time output is disabled (RTPOEn bit = 0), real-time output signals (RTPOUTn0 to RTPOUTn5) all output 0, regardless of the RTPMn register setting.

(2) Real-time output port control register n (RTPCn)

RTPCn are registers used to set the operation mode and output trigger of the real-time output port.

The relationship between the operation mode and output trigger of the real-time output port is as shown in Tables 13-3 and 13-4.

The RTPCn register can be read or written in 8-bit or 1-bit units.

After reset, RTPCn is cleared to 00H.

After reset: 00H R/W Address: RTPC0 FFFFF6E5H, RTPC1 FFFFF6F5H

	<7>	6	5	4	3	2	1	0
RTPCn (n = 0, 1)	RTPOEn	RTPEGn	BYTEn	EXTRn ^{Note 1}	0	0	0	0
	RTPOEn	Control of real-time output operation						
	0	Disables operation ^{Note 2}						
	1	Enables operation						
	RTPEGn	Valid edge of INTTM000 (n = 0), INTTM020 (n = 1) signal						
	0	Falling edge ^{Note 3}						
	1	Rising edge						
	BYTEn	Specification of channel configuration for real-time output						
	0	4 bits × 1 channel, 2 bits × 1 channel						
	1	6 bits × 1 channel						

Notes 1. For the EXTRn bit, refer to **Tables 13-3 and 13-4**.

2. When real-time output operation is disabled (RTPOEn bit = 0), real-time output signals (RTPOUTn0 to RTPOUTn5) all output 0.

3. The INTTM000 and INTTM020 signals are output for 1 clock of the count clock selected with the respective timers.

Caution Perform the settings for the RTPEGn, BYTEn, and EXTRn bits only when the RTPOEn bit = 0.

Table 13-3. Operation Modes and Output Triggers of Real-Time Output Port (n = 0)

BYTE0	EXTR0	Operation Mode	RTBH0 (RTP04, RTP05)	RTBL0 (RTP00 to RTP03)
0	0	4 bits × 1 channel,	INTTM51	INTTM50
	1	2 bits × 1 channel	INTTM50	INTTM000
1	0	6 bits × 1 channel	INTTM50	
	1		INTTM000	

Table 13-4. Operation Modes and Output Triggers of Real-Time Output Port (n = 1)

BYTE1	EXTR1	Operation Mode	RTBH1 (RTP14, RTP15)	RTBL1 (RTP10 to RTP13)
0	0	4 bits × 1 channel,	INTTM50	INTTM51
	1	2 bits × 1 channel	INTTM51	INTTM020
1	0	6 bits × 1 channel	INTTM51	
	1		INTTM020	

13.4 Operation

If the real-time output operation is enabled by setting the RTPCn.RTPOEn bit to 1, the data of the RTBHn and RTBLn registers is transferred to the real-time output latch in synchronization with the generation of the selected transfer trigger (set by the RTPCn.EXTRn and RTPCn.BYTEn bits). Of the transferred data, only the data of the bits specified as real-time output enabled by the RTPMn register is output from bits RTPOUTn0 to RTPOUTn5. The bits specified as real-time output disabled by the RTPMn register output 0.

If the real-time output operation is disabled by clearing the RTPOEn bit to 0, the RTPOUTn0 to RTPOUTn5 signals output 0 regardless of the setting of the RTPMn register.

Figure 13-2. Example of Operation Timing of RTO0 (When EXTR0 Bit = 0, BYTE0 Bit = 0)

Remark For the operation during standby, refer to **CHAPTER 22 STANDBY FUNCTION**.

13.5 Usage

- (1) Disable real-time output.
Clear the RTPCn.RTPOEn bit to 0.
- (2) Perform initialization as follows.
 - Specify the real-time output port mode or port mode in 1-bit units.
Set the RTPMn register.
 - Channel configuration: Select the trigger and valid edge.
Set the RTPCn.EXTRn, RTPCn.BYTEn, and RTPCn.RTPEGn bits.
 - Set the initial values to the RTBHn and RTBLn registers^{Note 1}.
- (3) Enable real-time output.
Set the RTPOEn bit to 1.
- (4) Set the next output value to the RTBHn and RTBLn registers by the time the selected transfer trigger is generated^{Note 2}.
- (5) Set the next real-time output value to the RTBHn and RTBLn registers through interrupt servicing corresponding to the selected trigger.

- Notes**
1. If write to the RTBHn and RTBLn registers is performed when the RTPOEn bit = 0, that value is transferred to real-time output latches nH and nL, respectively.
 2. Even if write is performed to the RTBHn and RTBLn registers when the RTPOEn bit = 1, data transfer to real-time output latches nH and nL is not performed.

Caution To reflect the real-time output signals (RTPOUTn0 to RTPOUTn5) to the pins, set the real-time output ports (RTPn0 to RTPn5) with the PMC5, PMC6, PFC5, and PFC6 registers.

13.6 Cautions

- (1) Prevent the following conflicts by software.
 - Conflict between real-time output disable/enable switching (RTPOEn bit) and selected real-time output trigger
 - Conflict between write to the RTBHn and RTBLn registers in the real-time output enabled status and the selected real-time output trigger.
- (2) Before performing initialization, disable real-time output (RTPOEn bit = 0).
- (3) Once real-time output has been disabled (RTPOEn bit = 0), be sure to initialize the RTBHn and RTBLn registers before enabling real-time output again (RTPOEn bit = 0 → 1).

13.7 Security Function

A circuit that sets the pin outputs to high impedance as a security function for when malfunctions of a stepping motor controlled by RTO occur is provided on chip. It forcibly resets the pins allocated to RTP00 to RTP05 via external interrupt INTP0 pin edge detection, and the pins allocated to RTP10 to RTP15 via INTP1 pin edge detection, placing them in the high-impedance state.

The ports (P50 to 55, P60 to 65 pins) placed in high impedance by INTP0^{Note 1} and INTP1^{Note 1} pins are initialized^{Note 2}, so settings for these ports must be performed again.

- Notes**
1. Regardless of the port settings, P50 to 55 and P60 to 65 pins are all placed in high impedance via INTP_n.
 2. The bits that are initialized are all the bits corresponding to P50 to 55 and P60 to 65 pins of the following registers.
 - P5, P6L registers
 - PM5, PM6L registers
 - PMC5, PMC6L registers
 - PU5, PU6L registers
 - PFC5 register
 - PF5 register

The block diagram of the security function is shown below.

Figure 13-3. Block Diagram of Security Function

This function is set with the PLLCTL.RTOST1 and PLLCTL.RTOST0 bits.

(1) PLL control register (PLLCTL)

The PLLCTL register is an 8-bit register that controls the RTO security function and PLL.

This register can be read or written in 8-bit or 1-bit units.

After reset, PLLCTL is set to 01H.

After reset: 01H		R/W	Address: FFFFF806H					
PLLCTL	7	6	5	4	<3>	<2>	<1>	<0>
	0	0	0	0	RTOST1	RTOST0	SELPLL ^{Note}	PLLON ^{Note}

RTOSTn	Control of RTPn0 to RTPn5 security function
0	INTPn pin is not used as trigger for security function
1	INTPn pin is used as trigger for security function

Note For details on the SELPLL and PLLON bits, refer to **CHAPTER 6 CLOCK GENERATION FUNCTION**.

Cautions 1. Before outputting a value to the real-time output ports (RTPn0 to RTPn5), select the INTPn pin interrupt edge detection and then set the RTOST0 and RTOST1 bits.

2. To set again the ports (P50 to P55, P60 to P65 pins) as real-time output ports after placing them in high impedance via the INTPn pin, first cancel the security function.

[Procedure to set ports again]

<1> Cancel the security function and enable port setting by clearing the RTOSTn bit to 0.

<2> Set the RTOSTn bit to 1 (only if required)

<3> Set again as real-time output port.

3. Be sure to clear bits 4 to 7 to "0".

Remark n = 0, 1

CHAPTER 14 A/D CONVERTER

14.1 Function

The A/D converter converts analog input signals into digital values with a resolution of 10 bits and has a 16-channel (ANI0 to ANI15) configuration.

The A/D converter has the following functions.

(1) 10-bit resolution A/D conversion

1 analog input channel is selected from ANI0 to ANI15, and an A/D conversion operation with resolution of 10 bits is repeatedly executed. Every time A/D conversion is completed, an interrupt request signal (INTAD) is generated.

(2) Power fail detection function

This is a function to detect low voltage in a battery. The results of A/D conversion (the value in the ADCRH register) and the PFT register are compared, and INTAD signal is generated only when the comparison conditions match.

14.2 Configuration

The A/D converter consists of the following hardware.

Figure 14-1. Block Diagram of A/D Converter

Table 14-1. Registers of A/D Converter Used by Software

Item	Configuration
Registers	A/D conversion result register (ADCR) A/D conversion result register H (ADCRH): Only higher 8 bits can be read Power fail compare threshold register (PFT) A/D converter mode register (ADM) Analog input channel specification register (ADS) Power fail compare mode register (PFM)

(1) ANI0 to ANI15 pins

These are analog input pins for the 16 channels of the A/D converter. They are used to input analog signals to be converted into digital signals. Pins other than those selected as analog input by the ADS register can be used as input ports.

(2) Sample & hold circuit

The sample & hold circuit samples the analog input signals selected by the input circuit and sends the sampled data to the voltage comparator. This circuit holds the sampled analog input voltage during A/D conversion.

(3) Series resistor string

The series resistor string is connected between AV_{REF0} and AV_{SS} and generates a voltage for comparison with the analog input signal.

(4) Voltage comparator

The voltage comparator compares the value that is sampled and held with the output voltage of the series resistor string.

(5) Successive approximation register (SAR)

This register compares the sampled analog voltage value with the voltage value from the series resistor string, and converts the comparison result starting from the most significant bit (MSB).

When the least significant bit (LSB) has been converted to a digital value (end of A/D conversion), the contents of the SAR register are transferred to the ADCR register.

The SAR register cannot be read or written directly.

(6) A/D conversion result register (ADCR), A/D conversion result register H (ADCRH)

Each time A/D conversion ends, the conversion results are loaded from the successive approximation register and the results of A/D conversion are held in the higher 10 bits of this register (the lower 6 bits are fixed to 0).

(7) Controller

The controller compares the A/D conversion results (the value of the ADCRH register) with the value of the PFT register when A/D conversion ends or the power fail detection function is used. It generates INTAD signal only when the comparison conditions match.

(8) AV_{REF0} pin

This is the analog power supply pin/reference voltage input pin of the A/D converter. Always use the same potential as the V_{DD} pin even when not using the A/D converter.

The signals input to the ANI0 to ANI15 pins are converted into digital signals based on the voltage applied across AV_{REF0} and AV_{SS} .

(9) AV_{SS} pin

This is the ground potential pin of the A/D converter. Always use the same potential as the V_{SS} pin even when not using the A/D converter.

(10) A/D converter mode register (ADM)

This register sets the conversion time of the analog input to be converted to a digital signal and the conversion operation start/stop.

(11) Analog input channel specification register (ADS)

This register specifies the input port for the analog voltage to be converted to a digital signal.

(12) Power fail compare mode register (PFM)

This register sets the power fail monitoring mode.

(13) Power fail compare threshold register (PFT)

This register sets the threshold to be compared with the ADCR register.

14.3 Registers

The A/D converter is controlled by the following registers.

- A/D converter mode register (ADM)
- Analog input channel specification register (ADS)
- Power fail compare mode register (PFM)
- Power fail compare threshold register (PFT)
- A/D conversion result register, A/D conversion result register H (ADCR, ADCRH)

<R> (1) A/D converter mode register (ADM)

This register sets the conversion time of the analog input signal to be converted into a digital signal as well as conversion start and stop.

The ADM register can be read or written in 8-bit or 1-bit units.

After reset, ADM is cleared to 00H.

After reset: 00H R/W Address: FFFFF200H

	<7>	6	5	4	3	2	1	<0>
ADM	ADCS	0	FR2	FR1	FR0	0	0	ADCS2

ADCS	Control of A/D conversion operation
0	Conversion operation stopped
1	Conversion operation enabled

FR2	FR1	FR0	Selection of conversion time			
			Conversion time ^{Note 1}	f _{xx}		
				20 MHz AV _{REF0} ≥ 4.5 V	16 MHz AV _{REF0} ≥ 4.0 V	10 MHz AV _{REF0} ≥ 2.7 V
0	0	0	288/f _{xx}	14.4 μs	18.0 μs	28.8 μs
0	0	1	240/f _{xx}	Setting prohibited	15.0 μs	24.0 μs

1	0	1	120/f _{xx}	Setting prohibited	Setting prohibited	Setting prohibited
1	1	0	96/f _{xx}	Setting prohibited	Setting prohibited	Setting prohibited
1	1	1	Setting prohibited	Setting prohibited	Setting prohibited	Setting prohibited

ADCS2	Control of reference voltage generator for boosting operation ^{Note 2}
0	Reference voltage generator operation stopped
1	Reference voltage generator operation enabled

Notes 1. Set the conversion time (time actually required for A/D conversion) as follows.

4.0 V ≤ AV_{REF0} ≤ 5.5 V: 14 to 100 μs

2.7 V ≤ AV_{REF0} < 4.0 V: 17 to 100 μs

2. The operation of the reference voltage generator for boosting is controlled by the ADCS2 bit and it takes 17 μs (14 μs when AV_{REF0} ≥ 4.0 V) after operation is started until it is stabilized. Therefore the ADCS bit is set to 1 (A/D conversion is started) at least 17 μs (14 μs when AV_{REF0} ≥ 4.0 V) after if the ADCS2 bit was set to 1 (reference voltage generator for boosting is on), the first conversion result is valid.

Cautions 1. Be sure to clear bits 6, 2, and 1 to “0”.

2. In the μPD70F3217H, 70F3217HY, 70F3218H, and 70F3218HY, writing of the ADM register other than the ADCS bit is prohibited while the ADCS bit = 1.

In V850ES/KJ1 products other than the above, if the same value is written to the ADM register while the ADCS bit = 1, A/D conversion is stopped and restarted from the top again. Rewriting the FR2 to FR0 bits is prohibited while the ADCS bit = 1.

3. When the main clock is stopped and the CPU is operating on the subclock, do not access the ADM register using an access method that causes a wait. For details, refer to 3.4.8 (1) (b).

Remark f_{xx}: Main clock frequency

Table 14-2. Setting of ADCS Bit and ADCS2 Bit

ADCS	ADCS2	A/D Conversion Operation
0	0	Stopped status (DC power consumption path does not exist)
0	1	Conversion standby mode (only the reference voltage generator for boosting consumes power)
1	0	Conversion mode (reference voltage generator stops operation ^{Note})
1	1	Conversion mode (reference voltage generator is operating)

Note The data obtained by the first conversion must not be used.

Figure 14-2. Operation Sequence

(2) Analog input channel specification register (ADS)

This register specifies the analog voltage input port for A/D conversion.

The ADS register can be read or written in 8-bit units.

After reset, ADS is cleared to 00H.

After reset: 00H R/W Address: FFFFF201H

	7	6	5	4	3	2	1	0
ADS	0	0	0	0	ADS3	ADS2	ADS1	ADS0

ADS3	ADS2	ADS1	ADS0	Specification of analog input channel
0	0	0	0	ANI0
0	0	0	1	ANI1
0	0	1	0	ANI2
0	0	1	1	ANI3
0	1	0	0	ANI4
0	1	0	1	ANI5
0	1	1	0	ANI6
0	1	1	1	ANI7
1	0	0	0	ANI8
1	0	0	1	ANI9
1	0	1	0	ANI10
1	0	1	1	ANI11
1	1	0	0	ANI12
1	1	0	1	ANI13
1	1	1	0	ANI14
1	1	1	1	ANI15

- Cautions**
1. Be sure to clear bits 7 to 4 to “0”.
 2. When the main clock is stopped and the CPU is operating on the subclock, do not access the ADS register using an access method that causes a wait. For details, refer to 3.4.8 (1) (b).
 3. Writing to the ADS register is prohibited during the A/D conversion (ADM.ADCS bit = 1) (only in the μ PD70F3217H, 70F3217HY, 70F3218H, and 70F3218HY).

<R>

(3) A/D conversion result register, A/D conversion result register H (ADCR, ADCRH)

The ADCR and ADCRH registers store the A/D conversion results.

These registers are read-only in 16-bit or 8-bit units. However, specify the ADCR register for 16-bit access, and the ADCRH register for 8-bit access. In the ADCR register, the 10 bits of conversion results are read in the higher 10 bits and 0 is read in the lower 6 bits. In the ADCRH register, the higher 8 bits of the conversion results are read.

After reset, these registers are undefined.

After reset: Undefined R Address: FFFFF204H

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADCR	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0	0	0	0	0	0	0

After reset: Undefined R Address: FFFFF205H

	7	6	5	4	3	2	1	0
ADCRH	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2

Caution When the main clock is stopped and the CPU is operating on the subclock, do not access the ADCR and ADCRH registers using an access method that causes a wait. For details, refer to 3.4.8 (1) (b).

The following shows the relationship between the analog input voltage input to the analog input pins (ANI0 to ANI15) and A/D conversion results (ADCR register).

$$SAR = \text{INT} \left(\frac{V_{IN}}{AV_{REF0}} \times 1024 + 0.5 \right)$$

$$ADCR^{Note} = SAR \times 64$$

Or,

$$(SAR - 0.5) \times \frac{AV_{REF0}}{1024} \leq V_{IN} < (SAR + 0.5) \times \frac{AV_{REF0}}{1024}$$

INT (): Function that returns the integer part of the value in parentheses

V_{IN} : Analog input voltage

AV_{REF0} : Voltage of AV_{REF0} pin

ADCR: Value in the ADCR register

Note The lower 6 bits of the ADCR register are fixed to 0.

The following shows the relationship between the analog input voltage and A/D conversion results.

Figure 14-3. Relationship Between Analog Input Voltage and A/D Conversion Results

(4) Power fail compare mode register (PFM)

This register sets the power fail monitoring mode.

The PFM register compares the value in the PFT register with the value of the ADCRH register.

The PFM register can be read or written in 8-bit or 1-bit units.

After reset, PFM is cleared to 00H.

After reset: 00H R/W Address: FFFFF202H

	<7>	<6>	5	4	3	2	1	0
PFM	PFEN	PCFM	0	0	0	0	0	0

PFEN	Selection of power fail comparison enable/disable
0	Power fail comparison disabled
1	Power fail comparison enabled

PCFM	Selection of power fail comparison mode
0	Interrupt request signal (INTAD) generated when $ADCR \geq PFT$
1	Interrupt request signal (INTAD) generated when $ADCR < PFT$

- Cautions**
1. When the main clock is stopped and the CPU is operating on the subclock, do not access the PFM register using an access method that causes a wait. For details, refer to 3.4.8 (1) (b).
 2. Writing to the PFM register is prohibited during the A/D conversion (ADM.ADCS bit = 1) (only in the μ PD70F3217H, 70F3217HY, 70F3218H, and 70F3218HY).

<R>

(5) Power fail compare threshold register (PFT)

The PFT register sets the comparison value in the power fail compare mode.

The 8-bit data set in the PFT register is compared with the value of the ADCRH register.

The PFT register can be read or written in 8-bit units.

After reset, PFT is cleared to 00H.

After reset: 00H R/W Address: FFFFF203H

	7	6	5	4	3	2	1	0
PFT								

- Cautions**
1. When the main clock is stopped and the CPU is operating on the subclock, do not access the PFT register using an access method that causes a wait. For details, refer to 3.4.8 (1) (b).
 2. Writing to the PFT register is prohibited during the A/D conversion (ADM.ADCS bit = 1) (only in the μ PD70F3217H, 70F3217HY, 70F3218H, and 70F3218HY).

<R>

14.4 Operation

14.4.1 Basic operation

- <1> Select the channel whose analog signal is to be converted into a digital signal using the ADS register.
- <2> Set (1) the ADM.ADCS2 bit and wait $17\ \mu\text{s}$ ($14\ \mu\text{s}$ when $AV_{\text{REF0}} \geq 4.0\ \text{V}$) or longer.
- <3> Set the ADM.ADCS bit to 1 to start A/D conversion.
(Steps <4> to <10> are executed by hardware.)
- <4> The sample & hold circuit samples the voltage input to the selected analog input channel.
- <5> After sampling for a specific time, the sample & hold circuit enters the hold status and holds the input analog voltage until it has been converted into a digital signal.
- <6> Set bit 9 of the successive approximation register (SAR). The tap selector sets the voltage tap of the series resistor string to $(1/2) \times AV_{\text{REF0}}$.
- <7> The voltage comparator compares the voltage difference between the voltage tap of the series resistor string and the analog input voltage. If the analog input voltage is greater than $(1/2) \times AV_{\text{REF0}}$, the MSB of the SAR register remains set. If the analog input voltage is less than $(1/2) \times AV_{\text{REF0}}$, the MSB is reset.
- <8> Next, bit 8 of the SAR register is automatically set and the next comparison starts. Depending on the value of bit 9 to which the result of the preceding comparison has been set, the voltage tap of the series resistor string is selected as follows.
 - Bit 9 = 1: $(3/4) \times AV_{\text{REF0}}$
 - Bit 9 = 0: $(1/4) \times AV_{\text{REF0}}$

The analog input voltage is compared with one of these voltage taps and bit 8 of the SAR register is manipulated as follows depending on the result of the comparison.

Analog input voltage $\geq$ voltage tap: Bit 8 = 1

Analog input voltage $\leq$ voltage tap: Bit 8 = 0
- <9> The above steps are repeated until bit 0 of the SAR register has been manipulated.
- <10> When comparison of all 10 bits of the SAR register has been completed, the valid digital value remains in the SAR register, and the value of the SAR register is transferred and latched to the ADCR register.
At the same time, an A/D conversion end interrupt request signal (INTAD) is generated.
- <11> Repeat steps <4> to <10> until the ADCS bit is cleared to 0.
For another A/D conversion, start at <3>. However, when operating the A/D converter with the ADCS2 bit cleared to 0, start at <2>.

14.4.2 A/D conversion operation

- Setting the ADM.ADCS bit to 1 starts conversion of the signal input to the channel specified by the ADS register. Upon completion of the conversion, the conversion result is stored in the ADCR register and a new conversion starts.
- The writing operation to the ADM, ADS, PFT, and PFM registers during A/D conversion operation differs depending on the products, as shown below.

μ PD70F3217H, 70F3217HY, 70F3218H, 70F3218HY	Writing to the ADM, ADS, PFT, and PFM registers during A/D conversion is prohibited.
μ PD703216, 703216Y, 703217, 703217Y, 70F3217, 70F3217Y	Writing to the ADM, ADS, PFT, and PFM registers during A/D conversion is enabled, however A/D conversion is stopped and restarted from the top again.

- If the ADCS bit is cleared to 0 during conversion, conversion is interrupted and the conversion operation is stopped.
- For whether or not the conversion end interrupt request signal (INTAD) is generated, refer to **14.4.3**.

14.4.3 Power fail monitoring function

The conversion end interrupt request signal (INTAD) can be controlled as follows using the PFM and PFT registers.

- If the PFM.PFEN bit = 0, the INTAD signal is generated each time conversion ends.
- If the PFEN bit = 1 and the PFM.PFCM bit = 0, the conversion result and the value of the PFT register are compared when conversion ends, and the INTAD signal is output only if $ADCRH \geq PFT$.
- If the PFEN and PFCM bits = 1, the conversion result and the value of the PFT register are compared when conversion ends and the INTAD signal is output only if $ADCRH < PFT$.
- Because, when the PFEN bit = 1, the conversion result is overwritten after the INTAD signal has been output, unless the conversion result is read by the time the next conversion ends, in some cases it may appear as if the actual operation differs from the operation described above (refer to **Figure 14-4**).

Figure 14-4. Power Fail Monitoring Function (PFCM Bit = 0)

14.4.4 Setting procedure

The following describes how to set registers.

- When using the A/D converter for A/D conversion
 - <1> Set (1) the ADM.ADCS2 bit.
 - <2> Select the channel and conversion time by setting the ADS.ADS3 to ADS.ADS0 bits and the ADM.FR2 to ADM.FR0 bits.
 - <3> Set (1) the ADM.ADCS bit.
 - <4> Transfer the A/D conversion data to the ADCR register.
 - <5> An interrupt request signal (INTAD) is generated.
- <Changing the channel>
 - <6> Change the channel by setting the ADS3 to ADS0 bits.
 - <7> Transfer the A/D conversion data to the ADCR register.
 - <8> An interrupt request signal (INTAD) is generated.
- <Ending A/D conversion>
 - <9> Clear (0) the ADCS bit.
 - <10> Clear (0) the ADCS2 bit.

Cautions

1. The time taken from <1> to <3> must be 17 μ s (14 μ s when $AV_{REF0} \geq 4.0$ V) or longer.
2. Steps <1> and <2> may be reversed.
3. Step <1> may be omitted. However, if omitted, do not use the first conversion result after <3>.
4. The time taken from <4> to <7> is different from the conversion time set by the FR2 to FR0 bits.
The time taken for <6> and <7> is the conversion time set by the FR2 to FR0 bits.

- When using the A/D converter for the power fail function
 - <1> Set (1) the PFM.PFEN bit.
 - <2> Set the power fail comparison conditions by using the PFM.PFCM bit.
 - <3> Set (1) the ADM.ADCS2 bit.
 - <4> Select the channel and conversion time by setting the ADS.ADS3 to ADS.ADS0 bits and the ADM.FR2 to ADM.FR0 bits.
 - <5> Set the threshold value in the PFT register.
 - <6> Set (1) the ADM.ADCS bit.
 - <7> Transfer the A/D conversion data to the ADCR register.
 - <8> Compare the ADCR register with the PFT register. An interrupt request signal (INTAD) is generated when the conditions match.
- <Changing the channel>
 - <9> Change the channel by setting the ADS3 to ADS0 bits.
 - <10> Transfer the A/D conversion data to the ADCR register.
 - <11> The ADCR register is compared with the PFT register. When the conditions match, an INTAD signal is generated.
- <Ending A/D conversion>
 - <12> Clear (0) the ADCS bit.
 - <13> Clear (0) the ADCS2 bit.

14.5 Cautions

(1) Power consumption in standby mode

The operation of the A/D converter stops in the standby mode. At this time, the power consumption can be reduced by stopping the conversion operation (the ADM.ADCS bit = 0) or stopping the reference voltage circuit (the ADM.ADCS2 bit = 0).

Figure 14-5 shows an example of how to reduce the power consumption in the standby mode.

<R>

Figure 14-5. Example of How to Reduce Power Consumption in Standby Mode

(2) Input range of ANI0 to ANI15 pins

Use the A/D converter with the ANI0 to ANI15 pin input voltages within the specified range. If a voltage of AVREF0 or higher or AVSS or lower (even if within the absolute maximum ratings) is input to these pins, the conversion value of the channel is undefined. Also, this may affect the conversion value of other channels.

(3) Conflicting operations

- (a) Conflict between writing to the ADCR register and reading from ADCR register upon the end of conversion
Reading the ADCR register takes precedence. After the register has been read, a new conversion result is written to the ADCR register.
- (b) Conflict between writing to the ADCR register and writing to the ADM register or writing to the ADS register upon the end of conversion
Writing to the ADM register or ADS register takes precedence. The ADCR register is not written, and neither is the conversion end interrupt request signal (INTAD) generated.

(4) Measures against noise

To keep a resolution of 10 bits, be aware of noise on the AV_{REF0} and ANI0 to ANI15 pins. The higher the output impedance of the analog input source, the greater the effect of noise. Therefore, it is recommended to connect external capacitors as shown in Figure 14-6 to reduce noise.

Figure 14-6. Handling of Analog Input Pins

**(5) ANI0/P70 to ANI15/P715 pins**

The analog input pins (ANI0 to ANI15) function alternately as input port pins (P70 to P715).

When performing A/D conversion by selecting any of the ANI0 to ANI15 pins, do not execute an input instruction to port 7 during conversion. This may decrease the conversion resolution.

If digital pulses are applied to the pin adjacent to the pin subject to A/D conversion, the value of the A/D conversion may differ from the expected value because of coupling noise. Therefore, do not apply pulses to the pin adjacent to the pin subject to A/D conversion.

(6) Input impedance of AV_{REF0} pin

A series resistor string of tens of $k\Omega$ is connected between the AV_{REF0} pin and AV_{SS} pin.

Therefore, if the output impedance of the reference voltage source is high, this will result in a series connection to the series resistor string between the AV_{REF0} pin and AV_{SS} pin, resulting in a large reference voltage error.

(7) Interrupt request flag (ADIC.ADIF bit)

Even when the ADS register is changed, the ADIF bit is not cleared (0).

Therefore, if the analog input pin is changed during A/D conversion, the ADIF bit may be set (1) because A/D conversion of the previous analog input pin ends immediately before the ADS register is rewritten. In a such case, note that if the ADIF bit is read immediately after the ADS register has been rewritten, the ADIF bit is set (1) even though A/D conversion of the analog input pin after the change has not been completed.

When stopping A/D conversion once and resuming it, clear the ADIF bit (0) before resuming A/D conversion.

Figure 14-7. A/D Conversion End Interrupt Request Occurrence Timing

**(8) Conversion results immediately after A/D conversion start**

If the ADM.ADCS bit is set to 1 within 17 μs (14 μs when $\text{AV}_{\text{REF0}} \geq 4.0 \text{ V}$) after the ADM.ADCS2 bit has been set to 1, or if the ADCS bit is set to 1 with the ADCS2 bit cleared to 0, the converted value immediately after the A/D conversion operation has started may not satisfy the rating. Take appropriate measures such as polling the A/D conversion end interrupt request signal (INTAD) and discarding the first conversion result.

(9) Reading A/D conversion result register (ADCR)

When the ADM or ADS register has been written, the contents of the ADCR register may become undefined. When the conversion operation is complete, read the conversion results before writing to the ADM or ADS register. A correct conversion result may not be able to be read at a timing other than the above.

When the CPU is operating on the subclock and main clock oscillation (fx) is stopped, do not read the ADCR register.

(10) A/D converter sampling time and A/D conversion start delay time

The A/D converter sampling time differs depending on the set value of the ADM register. A delay time exists until actual sampling is started after A/D converter operation is enabled.

When using a set in which the A/D conversion time must be strictly observed, care is required for the contents shown in Figure 14-8 and Table 14-3.

Figure 14-8. Timing of A/D Converter Sampling and A/D Conversion Start Delay

Table 14-3. A/D Converter Sampling Time and A/D Conversion Start Delay Time (ADM Register Set Value)

FR2	FR1	FR0	Conversion Time	Sampling Time	A/D Conversion Start Delay Time ^{Note 1}			
					Note 2		Note 3	
					MIN.	MAX.	MIN.	MAX.
0	0	0	$288/f_{xx}$	$40/f_{xx}$	$32/f_{xx}$	$36/f_{xx}$	$11/f_{xx}$	$12/f_{xx}$

1	1	0	$96/f_{xx}$	$12/f_{xx}$	$12/f_{xx}$	$14/f_{xx}$	$11/f_{xx}$	$12/f_{xx}$
Other than above			Setting prohibited	—	—	—	—	—

Notes 1. The A/D conversion start delay time is the time after the wait period. For the wait function, refer to 3.4.8

(1) (b) Access to special on-chip peripheral I/O register.

2. μ PD703216, 703216Y, 703217, 703217Y, 70F3217, 70F3217Y

3. μ PD70F3217H, 70F3217HY, 70F3218H, 70F3218HY

Remark f_{xx} : Main clock frequency

(11) Internal equivalent circuit

The following shows the equivalent circuit of the analog input block.

Figure 14-9. Internal Equivalent Circuit of ANIn Pin

<R>

(12) Variation of A/D conversion results

The results of the A/D conversion may vary depending on the fluctuation of the supply voltage, or may be affected by noise. To reduce the variation, take counteractive measures with the program such as averaging the A/D conversion results.

<R>

(13) A/D conversion result hysteresis characteristics

The successive approximation type A/D converter holds the analog input voltage in the internal sample & hold capacitor and then performs A/D conversion. After the A/D conversion has finished, the analog input voltage remains in the internal sample & hold capacitor. As a result, the following phenomena may occur.

- When the same channel is used for A/D conversions, if the voltage is higher or lower than the previous A/D conversion, then hysteresis characteristics may appear where the conversion result is affected by the previous value. Thus, even if the conversion is performed at the same potential, the result may vary.
- When switching the analog input channel, hysteresis characteristics may appear where the conversion result is affected by the previous channel value. This is because one A/D converter is used for the A/D conversions. Thus, even if the conversion is performed at the same potential, the result may vary.

Therefore, to obtain more accurate conversion result, perform A/D conversion twice successively for the same channel, and discard the first conversion result.

<R> **(14) Writing to register during A/D conversion**

The writing operation to the ADM, ADS, PFT, and PFM registers during A/D conversion (ADM.ADCS = 1) differs depending on the products, as shown below.

μPD70F3217H, 70F3217HY, 70F3218H, 70F3218HY	Writing to the ADM, ADS, PFT, and PFM registers during A/D conversion is prohibited.
μPD703216, 703216Y, 703217, 703217Y, 70F3217, 70F3217Y	Writing to the ADM, ADS, PFT, and PFM registers during conversion is enabled, however A/D conversion is stopped and restarted from the top again.

14.6 How to Read A/D Converter Characteristics Table

Here, special terms unique to the A/D converter are explained.

(1) Resolution

This is the minimum analog input voltage that can be identified. That is, the percentage of the analog input voltage per bit of digital output is called 1 LSB (Least Significant Bit). The percentage of 1 LSB with respect to the full scale is expressed by %FSR (Full Scale Range). %FSR indicates the ratio of analog input voltage that can be converted as a percentage, and is always represented by the following formula regardless of the resolution.

$$\begin{aligned} 1 \text{ \%FSR} &= (\text{Max. value of analog input voltage that can be converted} - \text{Min. value of analog input voltage that can be converted})/100 \\ &= (AV_{REF0} - 0)/100 \\ &= AV_{REF0}/100 \end{aligned}$$

1 LSB is as follows when the resolution is 10 bits.

$$\begin{aligned} 1 \text{ LSB} &= 1/2^{10} = 1/1024 \\ &= 0.098\% \text{FSR} \end{aligned}$$

Accuracy has no relation to resolution, but is determined by overall error.

(2) Overall error

This shows the maximum error value between the actual measured value and the theoretical value.

Zero-scale error, full-scale error, linearity error and errors that are combinations of these express the overall error.

Note that the quantization error is not included in the overall error in the characteristics table.

Figure 14-10. Overall Error

(3) Quantization error

When analog values are converted to digital values, a $\pm 1/2$ LSB error naturally occurs. In an A/D converter, an analog input voltage in a range of $\pm 1/2$ LSB is converted to the same digital code, so a quantization error cannot be avoided.

Note that the quantization error is not included in the overall error, zero-scale error, full-scale error, integral linearity error, and differential linearity error in the characteristics table.

Figure 14-11. Quantization Error**(4) Zero-scale error**

This shows the difference between the actual measurement value of the analog input voltage and the theoretical value ($1/2$ LSB) when the digital output changes from 0.....000 to 0.....001.

Figure 14-12. Zero-Scale Error

(5) Full-scale error

This shows the difference between the actual measurement value of the analog input voltage and the theoretical value (full scale – 3/2 LSB) when the digital output changes from 1.....110 to 1.....111.

Figure 14-13. Full-Scale Error**(6) Differential linearity error**

While the ideal width of code output is 1 LSB, this indicates the difference between the actual measurement value and the ideal value. This indicates the basic characteristics of the A/D conversion when the voltage applied to the analog input pins of the same channel is consistently increased bit by bit from AVSS to AVREF0. When the input voltage is increased or decreased, or when two or more channels are used, refer to **14.6 (2) Overall error**.

Figure 14-14. Differential Linearity Error

(7) Integral linearity error

This shows the degree to which the conversion characteristics deviate from the ideal linear relationship. It expresses the maximum value of the difference between the actual measurement value and the ideal straight line when the zero-scale error and full-scale error are 0.

Figure 14-15. Integral Linearity Error**(8) Conversion time**

This expresses the time from when the analog input voltage was applied to the time when the digital output was obtained.

The sampling time is included in the conversion time in the characteristics table.

(9) Sampling time

This is the time the analog switch is turned on for the analog voltage to be sampled by the sample & hold circuit.

Figure 14-16. Sampling Time

CHAPTER 15 D/A CONVERTER

15.1 Functions

In the V850ES/KJ1, two channels of D/A converter (DAC0, DAC1) are provided.
The D/A converter has the following functions.

- 8-bit resolution $\times$ 2 channels
- R-2R ladder string method
- Conversion time: 20 μ s (MAX.) ($AV_{REF1} = 2.7$ to 5.5 V)
- Analog output voltage: $AV_{REF1} \times m/256$ ($m = 0$ to 255; value set to DACSn register)
- Operation modes: Normal mode, real-time output mode

Remark $n = 0, 1$

15.2 Configuration

The D/A converter configuration is shown below.

Figure 15-1. Block Diagram of D/A Converter

The D/A converter consists of the following hardware.

Table 15-1. Configuration of D/A Converter

Item	Configuration
Control register	D/A converter mode register (DAM) D/A conversion value setting registers 0 and 1 (DACS0, DACS1)

15.3 Registers

The registers that control the D/A converter are as follows.

- D/A converter mode register (DAM)
- D/A conversion value setting registers 0 and 1 (DACS0, DACS1)

(1) D/A converter mode register (DAM)

This register controls the operation of the D/A converter.

The DAM register can be read or written in 8-bit or 1-bit units.

After reset, DAM is cleared to 00H.

After reset: 00H R/W Address: FFFFF284H

	7	6	5	4	3	<2>	1	<0>
DAM	0	0	0	0	DAMD1	DACE1	DAMD0	DACE0

DAMDn	Selection of D/A converter operation mode (n = 0, 1)
0	Normal mode
1	Real-time output mode ^{Note}

DACEn	D/A converter operation enable/disable control (n = 0, 1)
0	Disable operation
1	Enable operation

Note The output trigger in the real-time output mode (DAMDn bit = 1) is as follows.

- When n = 0: INTTMH0 signal (Refer to **CHAPTER 10 8-BIT TIMER H**)
- When n = 1: INTTMH1 signal (Refer to **CHAPTER 10 8-BIT TIMER H**)

(2) D/A conversion value setting registers 0 and 1 (DACS0, DACS1)

These registers set the analog voltage value output to the ANO0 and ANO1 pins.

These registers can be read or written in 8-bit units.

After reset, DACS0 and DACS1 are cleared to 00H.

After reset: 00H R/W Address: DACS0 FFFFF280H, DACS1 FFFFF282H

	7	6	5	4	3	2	1	0
DACS _n	DAn7	DAn6	DAn5	DAn4	DAn3	DAn2	DAn1	DAn0

(n = 0, 1)

Caution In the real-time output mode (DAM.DAMDn bit = 1), set the DACS0 and DACS1 registers before the INTTMH0 and INTTMH1 signals are generated. D/A conversion starts when the INTTMH0 and INTTMH1 signals are generated.

15.4 Operation

15.4.1 Operation in normal mode

D/A conversion is performed using a write operation to the DACSn register as the trigger.

The setting method is described below.

- <1> Clear the DAM.DAMDn bit to 0 (normal mode).
- <2> Set the analog voltage value to be output to the ANOn pin to the DACSn register.
Steps <1> and <2> above constitute the initial settings.
- <3> Set the DAM.DACEn bit to 1 (D/A conversion enable).
D/A converted analog voltage value is output from the ANOn pin when this setting is performed.
- <4> To change the analog voltage value, write to the DACSn register.
The analog voltage value immediately before set is held until the next write operation is performed.

Remarks 1. For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions.**

2. n = 0, 1

15.4.2 Operation in real-time output mode

D/A conversion is performed using the interrupt request signals (INTTMH0, INTTMH1) of 8-bit timers H0 and H1 as the trigger.

The setting method is described below.

- <1> Set the DAM.DAMDn bit to 1 (real-time output mode).
- <2> Set the analog voltage value to be output to the ANOn pin to the DACSn register.
- <3> Set the DAM.DACEn bit to 1 (D/A conversion enable).
Steps <1> to <3> above constitute the initial settings.
- <4> Operate 8-bit timers H0 and H1.
- <5> D/A converted analog voltage value is output from the ANOn pin when the INTTMH0 and INTTMH1 signals are generated.
Set the next output analog voltage value to the DACSn register, before the next INTTMH0 and INTTMH1 signals are generated.
- <6> After that, the value set in the DACSn register is output from the ANOn pin every time the INTTMH0 and INTTMH1 signals are generated.

Remarks 1. The output values of the ANO0 and ANO1 pins up to <5> above are undefined.

2. For the output values of the ANO0 and ANO1 pins in the IDLE, HALT, and STOP modes, refer to **CHAPTER 22 STANDBY FUNCTION.**

3. n = 0, 1

15.4.3 Cautions

Observe the following cautions when using the D/A converter.

- When using the D/A converter, set the port pins to the input mode (PM10, PM11 bits = 11)
- When using the D/A converter, reading of the port is prohibited.
- When using the D/A converter, use both P10 and P11 as D/A outputs.
Using one of the port 1 for D/A output and the other as a port is prohibited.
- In the real-time output mode, do not change the set value of the DACSn register while the trigger signal is output.
- Make sure that $AV_{REF1} \leq V_{DD}$ and $AV_{REF1} = 2.7$ to 5.5 V. The operation is not guaranteed if ranges other than the above are used.
- Because the output impedance of the D/A converter is high, a current cannot be supplied from the ANOn pin.
When connecting a resistor of $2\text{ M}\Omega$ or lower, take appropriate measures such as inserting a JFET input type operational amplifier between the resistor and the ANOn pin.

Remark $n = 0, 1$

Figure 15-2. Example of External Pin Connection

CHAPTER 16 ASYNCHRONOUS SERIAL INTERFACE (UART)

In the V850ES/KJ1, three channels of asynchronous serial interface (UART) are provided.

16.1 Selecting UART2 or I²C1 Mode

UART2 and I²C1 of the I²C bus version (Y product) share pins, and therefore these interfaces cannot be used at the same time. When UART2 is used, set with the PMC8 and PFC8 registers in advance (refer to 4.3.8 Port 8).

Caution UART2 or I²C1 transmission/reception operations are not guaranteed if the mode is changed during transmission or reception. Be sure to disable the operation of the unit that is not used.

Figure 16-1. Selecting Mode of UART2 or I²C1

After reset: 00H		R/W	Address: FFFFF450H							
			7	6	5	4	3	2	1	0
PMC8			0	0	0	0	0	0	PMC81	PMC80

After reset: 00H		R/W	Address: FFFFF470H							
			7	6	5	4	3	2	1	0
PFC8			0	0	0	0	0	0	PFC81	PFC80

PFC8n	PMC8n	Operation mode
0	0	Port I/O mode
0	1	UART2 mode
1	0	Port I/O mode
1	1	I ² C1 mode

Remark	n = 0, 1

16.2 Features

- Maximum transfer speed: 312.5 kbps
- Full-duplex communications
 - On-chip RXBn register
 - On-chip TXBn register
- Two-pin configuration^{Note}
 - TXDn: Transmit data output pin
 - RXDn: Receive data input pin
- Reception error detection functions
 - Parity error
 - Framing error
 - Overrun error
- Interrupt sources: 3 types
 - Reception error interrupt request signal (INTSREn): Interrupt is generated according to the logical OR of the three types of reception errors
 - Reception completion interrupt request signal (INTSRn): Interrupt is generated when receive data is transferred from the receive shift register to the RXBn register after serial transfer is completed during a reception enabled state
 - Transmission completion interrupt request signal (INTSTn): Interrupt is generated when the serial transmission of transmit data (8 or 7 bits) from the transmit shift register is completed
- Character length: 7 or 8 bits
- Parity functions: Odd, even, 0, or none
- Transmission stop bits: 1 or 2 bits
- On-chip dedicated baud rate generator

Note The ASCK0 pin (external clock input) is available only for UART0.

16.3 Configuration

Table 16-1. Configuration of UARTn

Item	Configuration
Registers	Receive buffer register n (RXBn) Transmit buffer register n (TXBn) Receive shift register Transmit shift register Asynchronous serial interface mode register n (ASIMn) Asynchronous serial interface status register n (ASISn) Asynchronous serial interface transmit status register n (ASIFn)
Other	Reception control parity check Addition of transmission control parity

Remark n = 0 to 2

Figure 16-2 shows the configuration of UARTn.

(1) Asynchronous serial interface mode register n (ASIMn)

The ASIMn register is an 8-bit register for specifying the operation of UARTn.

(2) Asynchronous serial interface status register n (ASISn)

The ASISn register consists of a set of flags that indicate the error contents when a reception error occurs. The various reception error flags are set (1) when a reception error occurs and are cleared (0) when the ASISn register is read.

(3) Asynchronous serial interface transmit status register n (ASIFn)

The ASIFn register is an 8-bit register that indicates the status when a transmit operation is performed. This register consists of a transmit buffer data flag, which indicates the hold status of the TXBn register data, and the transmit shift register data flag, which indicates whether transmission is in progress.

(4) Reception control parity check

The receive operation is controlled according to the contents set in the ASIMn register. A check for parity errors is also performed during a receive operation, and if an error is detected, a value corresponding to the error contents is set in the ASISn register.

(5) Receive shift register

This is a shift register that converts the serial data that was input to the RXDn pin to parallel data. One byte of data is received, and if a stop bit is detected, the receive data is transferred to the RXBn register. This register cannot be directly manipulated.

(6) Receive buffer register n (RXBn)

The RXBn register is an 8-bit buffer register for holding receive data. When 7 characters are received, 0 is stored in the MSB.

During a reception enabled state, receive data is transferred from the receive shift register to the RXBn register, synchronized with the end of the shift-in processing of one frame.

Also, the reception completion interrupt request signal (INTSRn) is generated by the transfer of data to the RXBn register.

(7) Transmit shift register

This is a shift register that converts the parallel data that was transferred from the TXBn register to serial data. When one byte of data is transferred from the TXBn register, the shift register data is output from the TXDn pin.

The transmission completion interrupt request signal (INTSTn) is generated synchronized with the completion of transmission of one frame.

This register cannot be directly manipulated.

(8) Transmit buffer register n (TXBn)

The TXBn register is an 8-bit buffer for transmit data. A transmit operation is started by writing transmit data to the TXBn register.

(9) Addition of transmission control parity

A transmit operation is controlled by adding a start bit, parity bit, or stop bit to the data that is written to the TXBn register, according to the contents that were set in the ASIMn register.

Figure 16-2. Block Diagram of UARTn

16.4 Registers

(1) Asynchronous serial interface mode register n (ASIMn)

The ASIMn register is an 8-bit register that controls the UARTn transfer operation.

This register can be read or written in 8-bit or 1-bit units.

Reset sets this register to 01H.

- Cautions**
1. When using UARTn, be sure to set the external pins related to UARTn functions to the control made before setting the CKSRn and BRGCn registers, and then set the UARTEn bit to 1. Then set the other bits.
 2. Set the UARTEn and RXEn bits to 1 while a high level is input to the RXDn pin. If these bits are set to 1 while a low level is input to the RXDn pin, reception will be started.

(1/2)

After reset: 01H R/W Address: ASIM0 FFFFFFFA00H, ASIM1 FFFFFFFA10H, ASIM2 FFFFFFFA20H

	<7>	<6>	<5>	4	3	2	1	0
ASIMn	UARTEn	TXEn	RXEn	PSn1	PSn0	CLn	SLn	ISRMn

(n = 0 to 2)

UARTEn	Control of operating clock
0	Stop clock supply to UARTn.
1	Supply clock to UARTn.
• If the UARTEn bit is cleared to 0, UARTn is asynchronously reset^{Note}. • If the UARTEn bit = 0, UARTn is reset. To operate UARTn, first set the UARTEn bit to 1. • If the UARTEn bit is cleared from 1 to 0, all the registers of UARTn are initialized. To set the UARTEn bit to 1 again, be sure to re-set the registers of UARTn. The output of the TXDn pin goes high when transmission is disabled, regardless of the setting of the UARTEn bit.	

TXEn	Transmission enable/disable
0	Disable transmission
1	Enable transmission
• Set the TXEn bit to 1 after setting the UARTEn bit to 1 at startup. Clear the UARTEn bit to 0 after clearing the TXEn bit to 0 to stop. • To initialize the transmission unit, clear (0) the TXEn bit, and after letting 2 Clock cycles (base clock) elapse, set (1) the TXEn bit again. If the TXEn bit is not set again, initialization may not be successful. (For details about the base clock, refer to 16.7.1 (1) Base clock.)	

Note The ASISn, ASIFn, and RXBn registers are reset.

RXEn	Reception enable/disable
0	Disable reception ^{Note}
1	Enable reception

- Set the RXEn bit to 1 after setting the UARTEn bit to 1 at startup. Clear the UARTEn bit to 0 after clearing the RXEn bit to 0 to stop.
- To initialize the reception unit status, clear (0) the RXEn bit, and after letting 2 Clock cycles (base clock) elapse, set (1) the RXEn bit again. If the RXEn bit is not set again, initialization may not be successful. (For details about the base clock, refer to **16.7.1 (1) Base clock.**)

PSn1	PSn0	Transmit operation	Receive operation
0	0	Don't output parity bit	Receive with no parity
0	1	Output 0 parity	Receive as 0 parity
1	0	Output odd parity	Judge as odd parity
1	1	Output even parity	Judge as even parity

- To overwrite the PSn1 and PSn0 bits, first clear (0) the TXEn and RXEn bits.
- If "0 parity" is selected for reception, no parity judgment is performed. Therefore, no error interrupt is generated because the ASISn.PEn bit is not set.

CLn	Specification of character length of 1 frame of transmit/receive data
0	7 bits
1	8 bits

- To overwrite the CLn bit, first clear (0) the TXEn and RXEn bits.

SLn	Specification of stop bit length of transmit data
0	1 bit
1	2 bits

- To overwrite the SLn bit, first clear (0) the TXEn bit.
- Since reception is always done with a stop bit length of 1, the SLn bit setting does not affect receive operations.

ISRMn	Enable/disable of generation of reception completion interrupt request signals when an error occurs
0	Generate a reception error interrupt request signal (INTSREn) as an interrupt when an error occurs. In this case, no reception completion interrupt request signal (INTSRn) is generated.
1	Generate a reception completion interrupt request signal (INTSRn) as an interrupt when an error occurs. In this case, no reception error interrupt request signal (INTSREn) is generated.

- To overwrite the ISRMn bit, first clear (0) the RXEn bit.

Note When reception is disabled, the receive shift register does not detect a start bit. No shift-in processing or transfer processing to the RXBn register is performed, and the contents of the RXBn register are retained.

When reception is enabled, the receive shift operation starts, synchronized with the detection of the start bit, and when the reception of one frame is completed, the contents of the receive shift register are transferred to the RXBn register. A reception completion interrupt request signal (INTSRn) is also generated in synchronization with the transfer to the RXBn register.

(2) Asynchronous serial interface status register n (ASISn)

The ASISn register, which consists of 3 error flag bits (PEn, FEn and OVEN), indicates the error status when UARTn reception is complete.

The ASISn register is cleared to 00H by a read operation. When a reception error occurs, the RXBn register should be read and the error flag should be cleared after the ASISn register is read.

This register is read-only in 8-bit units.

Reset sets this register to 00H.

- Cautions**
1. When the ASIMn.UARTEn bit or ASIMn.RXEn bit is cleared to 0, or when the ASISn register is read, the PEn, FEn, and OVEN bits are cleared (0).
 2. Operation using a bit manipulation instruction is prohibited.
 3. When the main clock is stopped and the CPU is operating on the subclock, do not access the ASISn register using an access method that causes a wait.
For details, refer to 3.4.8 (1) (b).

After reset: 00H R Address: ASIS0 FFFFA03H, ASIS1 FFFFA13H, ASIS2 FFFFA23H

	7	6	5	4	3	2	1	0
ASISn	0	0	0	0	0	PEn	FEn	OVEn

(n = 0 to 2)

PEn	Status flag indicating a parity error
0	When the UARTEn or RXEn bit is cleared to 0, or after the ASISn register has been read
1	When reception was completed, the receive data parity did not match the parity bit
The operation of the PEn bit differs according to the settings of the ASIMn.PSn1 and ASIMn.PSn0 bits.	

FEn	Status flag indicating framing error
0	When the UARTEn or RXEn bit is cleared to 0, or after the ASISn register has been read
1	When reception was completed, no stop bit was detected
For receive data stop bits, only the first bit is checked regardless of the stop bit length.	

OVEn	Status flag indicating an overrun error
0	When the UARTEn or RXEn bit is cleared to 0, or after the ASISn register has been read.
1	UARTn completed the next receive operation before reading receive data of the RXBn register.
When an overrun error occurs, the next receive data value is not written to the RXBn register and the data is discarded.	

(3) Asynchronous serial interface transmit status register n (ASIFn)

The ASIFn register, which consists of 2 status flag bits, indicates the status during transmission.

By writing the next data to the TXBn register after data is transferred from the TXBn register to the transmit shift register, transmit operations can be performed continuously without suspension even during an interrupt interval. When transmission is performed continuously, data should be written after referencing the TXBFn bit to prevent writing to the TXBn register by mistake.

This register is read-only in 8-bit or 1-bit units.

Reset sets this register to 00H.

After reset: 00H R Address: ASIF0 FFFFFFFA05H, ASIF1 FFFFFFFA15H, ASIF2 FFFFFFFA25H

	7	6	5	4	3	2	<1>	<0>
ASIFn	0	0	0	0	0	0	TXBFn	TXSFn

(n = 0 to 2)

TXBFn	Transmission buffer data flag
0	Data to be transferred next to TXBn register does not exist (When the ASIMn.UARTEn or ASIMn.TXEn bit is cleared to 0, or when data has been transferred to the transmission shift register)
1	Data to be transferred next exists in TXBn register (Data exists in TXBn register when the TXBn register has been written to)

- When transmission is performed continuously, data should be written to the TXBn register after confirming that this flag is 0. If writing to TXBn register is performed when this flag is 1, transmit data cannot be guaranteed.

TXSFn	Transmit shift register data flag (indicates the transmission status of UARTn)
0	Initial status or a waiting transmission (When the UARTEn or TXEn bit is cleared to 0, or when following transmission completion, the next data transfer from the TXBn register is not performed)
1	Transmission in progress (When data has been transferred from the TXBn register)

- When the transmission unit is initialized, initialization should be executed after confirming that this flag is 0 following the occurrence of a transmission completion interrupt request signal (INTSTn). If initialization is performed when this flag is 1, transmit data cannot be guaranteed.

(4) Receive buffer register n (RXBn)

The RXBn register is an 8-bit buffer register for storing parallel data that had been converted by the receive shift register.

When reception is enabled (ASIMn.RXEn bit = 1), receive data is transferred from the receive shift register to the RXBn register, synchronized with the completion of the shift-in processing of one frame. Also, a reception completion interrupt request signal (INTSRn) is generated by the transfer to the RXBn register. For information about the timing for generating this interrupt request, refer to **16.6.4 Receive operation**.

If reception is disabled (ASIMn.RXEn bit = 0), the contents of the RXBn register are retained, and no processing is performed for transferring data to the RXBn register even when the shift-in processing of one frame is completed. Also, the INTSRn signal is not generated.

When 7 bits is specified for the data length, bits 6 to 0 of the RXBn register are transferred for the receive data and the MSB (bit 7) is always 0. However, if an overrun error (ASISn.OVEn bit = 1) occurs, the receive data at that time is not transferred to the RXBn register.

The RXBn register becomes FFH when a reset is input or ASIMn.UARTEn bit = 0.

This register is read-only in 8-bit units.

After reset: FFH R Address: RXB0 FFFFA02H, RXB1 FFFFA12H, RXB2 FFFFA22H

	7	6	5	4	3	2	1	0
RXBn	RXBn7	RXBn6	RXBn5	RXBn4	RXBn3	RXBn2	RXBn1	RXBn0

(n = 0 to 2)

(5) Transmit buffer register n (TXBn)

The TXBn register is an 8-bit buffer register for setting transmit data.

When transmission is enabled (ASIMn.TXEn bit = 1), the transmit operation is started by writing data to TXBn register.

When transmission is disabled (TXEn bit = 0), even if data is written to TXBn register, the value is ignored.

The TXBn register data is transferred to the transmit shift register, and a transmission completion interrupt request signal (INTSTn) is generated, synchronized with the completion of the transmission of one frame from the transmit shift register. For information about the timing for generating this interrupt request, refer to **16.6.2 Transmit operation.**

When ASIFn.TXBFn bit = 1, writing must not be performed to TXBn register.

This register can be read or written in 8-bit units.

Reset sets this register to FFH.

After reset: FFH R/W Address: TXB0 FFFFA04H, TXB1 FFFFA14H, TXB2 FFFFA24H

16.5 Interrupt Requests

The following three types of interrupt request signals are generated from UARTn.

- Reception error interrupt request signal (INTSREn)
- Reception completion interrupt request signal (INTSRn)
- Transmission completion interrupt request signal (INTSTn)

The default priorities among these three types of interrupt request signals are, from high to low, reception error interrupt, reception completion interrupt, and transmission completion interrupt.

Table 16-2. Generated Interrupt Request Signals and Default Priorities

Interrupt Request Signal	Priority
Reception error interrupt request signal (INTSREn)	1
Reception completion interrupt request signal (INTSRn)	2
Transmission completion interrupt request signal (INTSTn)	3

(1) Reception error interrupt request signal (INTSREn)

When reception is enabled, the INTSREn signal is generated according to the logical OR of the three types of reception errors explained for the ASISn register. Whether the INTSREn signal or the INTSRn signal is generated when an error occurs can be specified according to the ASIMn.ISRMn bit.

When reception is disabled, the INTSREn signal is not generated.

(2) Reception completion interrupt request signal (INTSRn)

When reception is enabled, the INTSRn signal is generated when data is shifted in to the receive shift register and transferred to the RXBn register.

The INTSRn signal can be generated in place of the INTSREn signal according to the ASIMn.ISRMn bit even when a reception error has occurred.

When reception is disabled, the INTSRn signal is not generated.

(3) Transmission completion interrupt request signal (INTSTn)

The INTSTn signal is generated when one frame of transmit data containing 7-bit or 8-bit characters is shifted out from the transmit shift register.

16.6 Operation

16.6.1 Data format

Full-duplex serial data transmission and reception can be performed.

The transmit/receive data format consists of one data frame containing a start bit, character bits, a parity bit, and stop bits as shown in Figure 16-3.

The character bit length within one data frame, the type of parity, and the stop bit length are specified according to the ASIMn register.

Also, data is transferred LSB first.

Figure 16-3. Format of UARTn Transmit/Receive Data

16.6.2 Transmit operation

When the ASIMn.UARTEn bit is set to 1, a high level is output from the TXDn pin.

Then, when the ASIMn.TXEn bit is set to 1, transmission is enabled, and the transmit operation is started by writing transmit data to the TXBn register.

(1) Transmission enabled state

This state is set by the TXEn bit.

- TXEn bit = 1: Transmission enabled state
- TXEn bit = 0: Transmission disabled state

Since UARTn does not have a CTS (transmission enabled signal) input pin, a port should be used to confirm whether the destination is in a reception enabled state.

(2) Starting a transmit operation

In the transmission enabled state, a transmit operation is started by writing transmit data to the TXBn register. When a transmit operation is started, the data in the TXBn register is transferred to the transmit shift register. Then, the transmit shift register outputs data to the TXDn pin (the transmit data is transferred sequentially starting with the start bit). The start bit, parity bit, and stop bits are added automatically.

(3) Transmission interrupt

When the transmit shift register becomes empty, a transmission completion interrupt request signal (INTSTn) is generated. The timing for generating the INTSTn signal differs according to the specification of the stop bit length. The INTSTn signal is generated at the same time that the last stop bit is output.

If the data to be transmitted next has not been written to the TXBn register, the transmit operation is suspended.

Caution Normally, when the transmit shift register becomes empty, the INTSTn signal is generated. However, the INTSTn signal is not generated if the transmit shift register becomes empty due to reset.

Figure 16-4. UARTn Transmission Completion Interrupt Timing

16.6.3 Continuous transmission operation

UARTn can write the next transmit data to the TXBn register at the timing that the transmit shift register starts the shift operation. This enables an efficient transmission rate to be realized by continuously transmitting data even during the transmission completion interrupt service after the transmission of one data frame. In addition, reading the ASIFn.TXSFn bit after the occurrence of a transmission completion interrupt request signal (INTSTn) enables the TXBn register to be efficiently written twice (2 bytes) without waiting for the transmission of 1 data frame.

When continuous transmission is performed, data should be written after referencing the ASIFn register to confirm the transmission status and whether or not data can be written to the TXBn register.

Caution The values of the ASIF.TXBFn and ASIF.TXSFn bits change 10 → 11 → 01 in continuous transmission.

Therefore, do not confirm the status based on the combination of the TXBFn and TXSFn bits.

Read only the TXBFn bit during continuous transmission.

TXBFn	Whether or Not Writing to TXBn Register Is Enabled
0	Writing is enabled
1	Writing is not enabled

Caution When transmission is performed continuously, write the first transmit data (first byte) to the TXBn register and confirm that the TXBFn bit is 0, and then write the next transmit data (second byte) to TXBn register. If writing to the TXBn register is performed when the TXBFn bit is 1, transmit data cannot be guaranteed.

The communication status can be confirmed by referring to the TXSFn bit.

TXSFn	Transmission Status
0	Transmission is completed.
1	Under transmission.

- Cautions**
1. When initializing the transmission unit when continuous transmission is completed, confirm that the TXSFn bit is 0 after the occurrence of the transmission completion interrupt, and then execute initialization. If initialization is performed when the TXSFn bit is 1, transmit data cannot be guaranteed.
 2. While transmission is being performed continuously, an overrun error may occur if the next transmission is completed before the INTSTn interrupt servicing following the transmission of 1 data frame is executed. An overrun error can be detected by embedding a program that can count the number of transmit data and referencing TXSFn bit.

Figure 16-5. Continuous Transmission Processing Flow

(1) Starting procedure

The procedure to start continuous transmission is shown below.

Figure 16-6. Continuous Transmission Starting Procedure

Transmission Starting Procedure	Internal Operation	ASIFn Register	
		TXBFn	TXSFn
• Set transmission mode	<1> Start transmission unit	0	0
• Write data (1)		1	0
	<2> Generate start bit	1	1 ^{Note}
	Start data (1) transmission	0	1
• Read ASIFn register (confirm that TXBFn bit = 0)		0	1
• Write data (2)		1	1
	<<Transmission in progress>>		
	<3> INTSTn interrupt occurs	0	1
• Read ASIFn register (confirm that TXBFn bit = 0)		0	1
• Write data (3)		1	1
	<4> Generate start bit		
	Start data (2) transmission		
	<<Transmission in progress>>		
	<5> INTSTn interrupt occurs	0	1
• Read ASIFn register (confirm that TXBFn bit = 0)		0	1
• Write data (4)		1	1

Note Refer to 16.8 Cautions (2).

(2) Ending procedure

The procedure for ending continuous transmission is shown below.

Figure 16-7. Continuous Transmission End Procedure

Transmission End Procedure	Internal Operation	ASIFn Register	
		TXBFn	TXSFb
- Read ASIFn register (confirm that TXBFn bit = 0) ← - Write data (m) →	<6> Transmission of data (m - 2) is in progress	1	1
	<7> INTSTn interrupt occurs →	0	1
	←	<u>0</u>	1
	→	1	1
- Read ASIFn register (confirm that TXSFb bit = 1) ← - There is no write data	<8> Generate start bit Start data (m - 1) transmission <<Transmission in progress>>		
	<9> INTSTn interrupt occurs →	0	1
	←	0	<u>1</u>
	→		
- Read ASIFn register (confirm that TXSFb bit = 0) ← - Clear (0) the UARTEn bit or TXEn bit	<10> Generate start bit Start data (m) transmission <<Transmission in progress>>		
	<11> Generate INTSTn interrupt →	0	0
	←	0	<u>0</u>
	Initialize internal circuits		

16.6.4 Receive operation

The awaiting reception state is set by setting the ASIMn.UARTEn bit to 1 and then setting the ASIMn.RXEn bit to 1. To start the receive operation, start sampling at the falling edge when the falling of the RXDn pin is detected. If the RXDn pin is low level at a start bit sampling point, the start bit is recognized. When the receive operation begins, serial data is stored sequentially in the receive shift register according to the baud rate that was set. A reception completion interrupt request signal (INTSRn) is generated each time the reception of one frame of data is completed. Normally, the receive data is transferred from the RXBn register to memory by this interrupt servicing.

(1) Reception enabled state

The receive operation is set to the reception enabled state by setting the RXEn bit to 1.

- RXEn bit = 1: Reception enabled state
- RXEn bit = 0: Reception disabled state

In receive disabled state, the reception hardware stands by in the initial state. At this time, the contents of the RXBn register are retained, and no reception completion interrupt or reception error interrupt is generated.

(2) Starting a receive operation

A receive operation is started by the detection of a start bit.

The RXDn pin is sampled using the serial clock from baud rate generator n (BRGn).

(3) Reception completion interrupt

When the RXEn bit = 1 and the reception of one frame of data is completed (the stop bit is detected), the INTSRn signal is generated and the receive data within the receive shift register is transferred to the RXBn register at the same time.

Also, if an overrun error (ASISn.OVEn bit = 1) occurs, the receive data at that time is not transferred to the RXBn register, and either the INTSRn signal or a reception error interrupt request signal (INTSREn) is generated according to the ASIMn.ISRMn bit setting.

Even if a parity error (ASISn.PEn bit = 1) or framing error (ASISn.FEn bit = 1) occurs during a reception operation, the receive operation continues until stop bit is received, and after reception is completed, either the INTSRn signal or the INTSREn signal is generated according to the ISRMn bit setting (the receive data within the receive shift register is transferred to the RXBn register).

If the RXEn bit is cleared (0) during a receive operation, the receive operation is immediately stopped. The contents of the RXBn register and the ASISn register at this time do not change, and the INTSRn signal or the INTSREn signal is not generated.

The INTSRn signal or the INTSREn signal is not generated when the RXEn bit = 0 (reception is disabled).

Figure 16-8. UARTn Reception Completion Interrupt Timing

16.6.5 Reception error

The three types of errors that can occur during a receive operation are a parity error, framing error, and overrun error. As a result of data reception, the various flags of the ASISn register are set (1), and a reception error interrupt request signal (INTSREn) or a reception completion interrupt request signal (INTSRn) is generated at the same time. The ASIMn.ISRMn bit specifies whether the INTSREn signal or the INTSRn signal is generated.

The type of error that occurred during reception can be detected by reading the contents of the ASISn register during the INTSREn or INTSRn interrupt servicing.

The contents of the ASISn register are cleared (0) by reading the ASISn register.

Table 16-3. Reception Error Causes

Error Flag	Reception Error	Cause
PEn	Parity error	The parity specification during transmission did not match the parity of the reception data
FEn	Framing error	No stop bit was detected
OVEn	Overrun error	The reception of the next data was completed before data was read from the RXBn register

(1) Separation of reception error interrupt request signal

A reception error interrupt request signal can be separated from the INTSRn signal and generated as the INTSREn signal by clearing the ISRMn bit to 0.

Figure 16-9. When Reception Error Interrupt Request Signal Is Separated from INTSRn Signal (ISRMn Bit = 0)

Figure 16-10. When Reception Error Interrupt Request Signal Is Included in INTSRn Signal (ISRMn Bit = 1)

16.6.6 Parity types and corresponding operation

A parity bit is used to detect a bit error in communication data. Normally, the same type of parity bit is used on the transmission and reception sides.

(1) Even parity

(i) During transmission

The parity bit is controlled so that the number of bits with the value “1” within the transmit data including the parity bit is even. The parity bit value is as follows.

- If the number of bits with the value “1” within the transmit data is odd: 1
- If the number of bits with the value “1” within the transmit data is even: 0

(ii) During reception

The number of bits with the value “1” within the receive data including the parity bit is counted, and a parity error is generated if this number is odd.

(2) Odd parity

(i) During transmission

In contrast to even parity, the parity bit is controlled so that the number of bits with the value “1” within the transmit data including the parity bit is odd. The parity bit value is as follows.

- If the number of bits with the value “1” within the transmit data is odd: 0
- If the number of bits with the value “1” within the transmit data is even: 1

(ii) During reception

The number of bits with the value “1” within the receive data including the parity bit is counted, and a parity error is generated if this number is even.

(3) 0 parity

During transmission the parity bit is set to “0” regardless of the transmit data.

During reception, no parity bit check is performed. Therefore, no parity error is generated regardless of whether the parity bit is “0” or “1”.

(4) No parity

No parity bit is added to the transmit data.

During reception, the receive operation is performed as if there were no parity bit. Since there is no parity bit, no parity error is generated.

16.6.7 Receive data noise filter

The RXDn signal is sampled at the rising edge of the prescaler output base clock (f_{CLK}). If the same sampling value is obtained twice, the match detector output changes, and this output is sampled as input data. Therefore, data not exceeding one clock width is judged to be noise and is not delivered to the internal circuit (refer to **Figure 16-12**). Refer to **16.7.1 (1) Base clock** regarding the base clock.

Also, since the circuit is configured as shown in Figure 16-11, internal processing during a receive operation is delayed by up to 2 clocks according to the external signal status.

Figure 16-11. Noise Filter Circuit

Figure 16-12. Timing of RXDn Signal Judged as Noise

16.7 Dedicated Baud Rate Generator n (BRGn)

A dedicated baud rate generator, which consists of a source clock selector and an 8-bit programmable counter, generates serial clocks during transmission/reception by UARTn. The dedicated baud rate generator output can be selected as the serial clock for each channel.

Separate 8-bit counters exist for transmission and for reception.

16.7.1 Baud rate generator n (BRGn) configuration

Figure 16-13. Configuration of Baud Rate Generator n (BRGn)

(1) Base clock

When the ASIMn.UARTEn bit = 1, the clock selected according to the CKSRn.TPSn3 to CKSRn.TPSn0 bits is supplied to the transmission/reception unit. This clock is called the base clock (f_{UCLK}). When the UARTEn bit = 0, f_{UCLK} is fixed to low level.

16.7.2 Serial clock generation

A serial clock can be generated according to the settings of the CKSRn and BRGCn registers.

The base clock to the 8-bit counter is selected by the CKSRn.TPSn3 to CKSRn.TPSn0 bits.

The 8-bit counter divisor value can be set by the BRGCn.MDLn7 to BRGCn.MDLn0 bits.

(1) Clock select register n (CKSRn)

The CKSRn register is an 8-bit register for selecting the basic block using the TPSn3 to TPSn0 bits. The clock selected by the TPSn3 to TPSn0 bits becomes the base clock (f_{UCLK}) of the transmission/reception module.

This register can be read or written in 8-bit units.

Reset sets this register to 00H.

Caution Clear the ASIMn.UARTEn bit to 0 before rewriting the TPSn3 to TPSn0 bits.

After reset: 00H R/W Address: CKSR0 FFFFA06H, CKSR1 FFFFA16H, CKSR2 FFFFA26H

	7	6	5	4	3	2	1	0
CKSRn	0	0	0	0	TPSn3	TPSn2	TPSn1	TPSn0

(n = 0 to 2)

TPSn3	TPSn2	TPSn1	TPSn0	Base clock (f_{UCLK}) ^{Note 1}
0	0	0	0	f_{xx}
0	0	0	1	$f_{\text{xx}}/2$
0	0	1	0	$f_{\text{xx}}/4$
0	0	1	1	$f_{\text{xx}}/8$
0	1	0	0	$f_{\text{xx}}/16$
0	1	0	1	$f_{\text{xx}}/32$
0	1	1	0	$f_{\text{xx}}/64$
0	1	1	1	$f_{\text{xx}}/128$
1	0	0	0	$f_{\text{xx}}/256$
1	0	0	1	$f_{\text{xx}}/512$
1	0	1	0	$f_{\text{xx}}/1,024$
1	0	1	1	External clock ^{Note 2} (ASCK0 pin)
Other than above				Setting prohibited

Notes 1. Set f_{UCLK} so as to satisfy the following conditions.

- REGC = $V_{\text{DD}} = 4.5$ to 5.5 V: $f_{\text{UCLK}} \leq 12$ MHz
- REGC = $10 \mu\text{F}$, $V_{\text{DD}} = 4.0$ to 5.5 V: $f_{\text{UCLK}} \leq 6$ MHz
- REGC = $V_{\text{DD}} = 2.7$ to 4.5 V: $f_{\text{UCLK}} \leq 6$ MHz

2. ASCK0 pin input clock can be used only by UART0.

Setting of UART1 and UART2 is prohibited.

Remark f_{xx} : Main clock frequency

(2) Baud rate generator control register n (BRGCn)

The BRGCn register is an 8-bit register that controls the baud rate (serial transfer speed) of UARTn.

This register can be read or written in 8-bit units.

Reset sets this register to FFH.

Caution If the MDLn7 to MDLn0 bits are to be overwritten, the ASIMn.TXEn and ASIMn.RXEn bits should be cleared to 0 first.

After reset: FFH R/W Address: BRGC0 FFFFA07H, BRGC1 FFFFA17H, BRGC2 FFFFA27H

	7	6	5	4	3	2	1	0
BRGCn	MDLn7	MDLn6	MDLn5	MDLn4	MDLn3	MDLn2	MDLn1	MDLn0

(n = 0 to 2)

MDLn7	MDLn6	MDLn5	MDLn4	MDLn3	MDLn2	MDLn1	MDLn0	Set value (k)	Serial clock
0	0	0	0	0	×	×	×	—	Setting prohibited
0	0	0	0	1	0	0	0	8	f _{uclk} /8
0	0	0	0	1	0	0	1	9	f _{uclk} /9
0	0	0	0	1	0	1	0	10	f _{uclk} /10
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
1	1	1	1	1	0	1	0	250	f _{uclk} /250
1	1	1	1	1	0	1	1	251	f _{uclk} /251
1	1	1	1	1	1	0	0	252	f _{uclk} /252
1	1	1	1	1	1	0	1	253	f _{uclk} /253
1	1	1	1	1	1	1	0	254	f _{uclk} /254
1	1	1	1	1	1	1	1	255	f _{uclk} /255

- Remarks**
1. f_{uclk}: Frequency [Hz] of base clock selected by CKSR0.TPSn3 to CKSR0.TPSn0 bits
 2. k: Value set by MDLn7 to MDLn0 bits (k = 8, 9, 10, ..., 255)
 3. The baud rate is the output clock for the 8-bit counter divided by 2.
 4. ×: don't care

(3) Baud rate

The baud rate is the value obtained by the following formula.

$$\text{Baud rate [bps]} = \frac{f_{\text{CLK}}}{2 \times k}$$

f_{CLK} = Frequency [Hz] of base clock selected by CKSRn.TPSn3 to CKSRn.TPSn0 bits.

k = Value set by BRGCn.MDLn7 to BRGCn.MDLn0 bits ($k = 8, 9, 10, \dots, 255$)

(4) Baud rate error

The baud rate error is obtained by the following formula.

$$\text{Error (\%)} = \left(\frac{\text{Actual baud rate (baud rate with error)}}{\text{Target baud rate (normal baud rate)}} - 1 \right) \times 100 [\%]$$

- Cautions**
1. Make sure that the baud rate error during transmission does not exceed the allowable error of the reception destination.
 2. Make sure that the baud rate error during reception is within the allowable baud rate range during reception, which is described in 16.7.4 Allowable baud rate range during reception.

Example: Base clock frequency = 10 MHz = 10,000,000 Hz
 Setting of BRGCn.MDLn7 to BRGCn.MDLn0 bits = 00100001B ($k = 33$)
 Target baud rate = 153,600 bps

$$\begin{aligned} \text{Baud rate} &= 10,000,000 / (2 \times 33) \\ &= 151,515 [\text{bps}] \end{aligned}$$

$$\begin{aligned} \text{Error} &= (151,515 / 153,600 - 1) \times 100 \\ &= -1.357 [\%] \end{aligned}$$

16.7.3 Baud rate setting example

Table 16-4. Baud Rate Generator Setting Data

Baud Rate (bps)	f _{xx} = 20 MHz			f _{xx} = 16 MHz			f _{xx} = 10 MHz		
	f _{uCLK}	k	ERR	f _{uCLK}	k	ERR	f _{uCLK}	k	ERR
300	f _{xx} /512	41H (65)	0.16	f _{xx} /1024	1AH (26)	0.16	f _{xx} /256	41H (65)	0.16

48000	f _{xx} /16	0DH (13)	0.16	f _{xx} /2	53H (83)	0.40	f _{xx} /8	0DH (13)	0.16
56000	f _{xx} /2	59H (89)	0.32	f _{xx} /2	47H (71)	0.60	f _{xx}	59H (89)	0.32
62500	f _{xx} /16	0AH (10)	0.00	f _{xx} /16	08H (8)	0.00	f _{xx} /8	0AH (10)	0.00
76800	f _{xx} /2	41H (65)	0.16	f _{xx} /8	0DH (13)	0.16	f _{xx}	41H (65)	0.16
115200	f _{xx} /2	2BH (43)	0.94	f _{xx} /2	23H (35)	-0.79	f _{xx}	2BH (43)	0.94
153600	f _{xx} /2	21H (33)	-1.36	f _{xx} /4	0DH (13)	0.16	f _{xx}	21H (33)	-1.36
312500	f _{xx} /4	08H (8)	0	f _{xx} /2	0DH (13)	-1.54	f _{xx} /2	08H (8)	0.00

Caution The allowable frequency of the base clock (f_{uCLK}) is as follows.

- REGC = V_{DD} = 4.5 to 5.5 V: f_{uCLK} ≤ 12 MHz
- REGC = 10 μF, V_{DD} = 4.0 to 5.5 V: f_{uCLK} ≤ 6 MHz
- REGC = V_{DD} = 2.7 to 4.5 V: f_{uCLK} ≤ 6 MHz

Remark f_{xx}: Main clock frequency
f_{uCLK}: Base clock frequency
k: Set values of BRGCn.MDLn7 to BRGCn.MDLn0 bits
ERR: Baud rate error [%]
n = 0 to 2

16.7.4 Allowable baud rate range during reception

The degree to which a discrepancy from the transmission destination's baud rate is allowed during reception is shown below.

Caution The equations described below should be used to set the baud rate error during reception so that it always is within the allowable error range.

Figure 16-14. Allowable Baud Rate Range During Reception

As shown in Figure 16-14, after the start bit is detected, the receive data latch timing is determined according to the counter that was set by the BRGCn register. If all data up to the final data (stop bit) is in time for this latch timing, the data can be received normally.

If this is applied to 11-bit reception, the following is theoretically true.

$$FL = (\text{Brate})^{-1}$$

Brate: UARTn baud rate

k: BRGCn register set value

FL: 1-bit data length

When the latch timing margin is 2 base clocks, the minimum allowable transfer rate (FLmin) is as follows.

$$FL_{\min} = 11 \times FL - \frac{k-2}{2k} \times FL = \frac{21k+2}{2k} FL$$

Therefore, the transfer destination's maximum receivable baud rate (BRmax) is as follows.

$$BR_{\max} = (FL_{\min}/11)^{-1} = \frac{22k}{21k + 2} \text{ Brate}$$

Similarly, the maximum allowable transfer rate (FLmax) can be obtained as follows.

$$\begin{aligned} \frac{10}{11} \times FL_{\max} &= 11 \times FL - \frac{k+2}{2 \times k} \times FL = \frac{21k-2}{2 \times k} FL \\ FL_{\max} &= \frac{21k-2}{20k} FL \times 11 \end{aligned}$$

Therefore, the transfer destination's minimum receivable baud rate (BRmin) is as follows.

$$BR_{\min} = (FL_{\max}/11)^{-1} = \frac{20k}{21k - 2} \text{ Brate}$$

The allowable baud rate error of UARTn and the transfer destination can be obtained as follows from the expressions described above for computing the minimum and maximum baud rate values.

Table 16-5. Maximum and Minimum Allowable Baud Rate Error

Division Ratio (k)	Maximum Allowable Baud Rate Error	Minimum Allowable Baud Rate Error
8	+3.53%	-3.61%
20	+4.26%	-4.31%
50	+4.56%	-4.58%
100	+4.66%	-4.67%
255	+4.72%	-4.73%

- Remarks**
1. The reception precision depends on the number of bits in one frame, the base clock frequency, and the division ratio (k). The higher the base clock frequency and the larger the division ratio (k), the higher the precision.
 2. k: BRGCn register set value

16.7.5 Transfer rate during continuous transmission

During continuous transmission, the transfer rate from a stop bit to the next start bit is extended two clocks of the base clock longer than normal. However, on the reception side, the transfer result is not affected since the timing is initialized by the detection of the start bit.

Figure 16-15. Transfer Rate During Continuous Transmission

Representing the 1-bit data length by FL, the stop bit length by FLstp, and the base clock frequency by f_{UCLK} yields the following equation.

$$FL_{stp} = FL + 2/f_{UCLK}$$

Therefore, the transfer rate during continuous transmission is as follows (when the stop bit length = 1).

$$\text{Transfer rate} = 11 \times FL + (2/f_{UCLK})$$

16.8 Cautions

Cautions to be observed when using UARTn are shown below.

- (1) When the supply of clocks to UARTn is stopped (for example, in IDLE or STOP mode), operation stops with each register retaining the value it had immediately before the supply of clocks was stopped. The TXDn pin output also holds and outputs the value it had immediately before the supply of clocks was stopped. However, operation is not guaranteed after the supply of clocks is restarted. Therefore, after the supply of clocks is restarted, the circuits should be initialized by clearing the ASIMn.UARTEn, ASIMn.RXEn, and ASIMn.TXEn bits to 000.
- (2) UARTn has a 2-stage buffer configuration consisting of the TXBn register and the transmission shift register, and has status flags (ASIFn.TXBFn and ASIFn.TXSFn bits) that indicate the status of each buffer. If the TXBFn and TXSFn bits are read in continuous transmission, the value changes 10 → 11 → 01. For the timing to write the next data to the TXBn register, read only the TXBFn bit during continuous transmission.

CHAPTER 17 CLOCKED SERIAL INTERFACE 0 (CSI0)

In the V850ES/KJ1, three channels of clocked serial interface 0 (CSI0) are provided.

17.1 Features

- Maximum transfer speed: 5 Mbps
- Master mode/slave mode selectable
- Transmission data length: 8 bits or 16 bits can be set
- MSB/LSB-first selectable for transfer data
- Eight clock signals can be selected (7 master clocks and 1 slave clock)
- 3-wire type SO0n: Serial transmit data output
 SI0n: Serial receive data input
 SCK0n: Serial clock I/O
- Interrupt sources: 1 type
 - Transmission/reception completion interrupt request signal (INTCSI0n)
- Transmission/reception mode or reception-only mode selectable
- Two transmission buffer registers (SOTBFn/SOTBFLn, SOTBn/SOTBLn) and two reception buffer registers (SIRBn/SIRBLn, SIRBEn/SIRBELn) are provided on chip
- Single transfer mode/continuous transfer mode selectable

Remark n = 0 to 2

17.2 Configuration

CSI0n is controlled via the CSIM0n register.

(1) Clocked serial interface mode register 0n (CSIM0n)

The CSIM0n register is an 8-bit register that specifies the operation of CSI0n.

(2) Clocked serial interface clock selection register n (CSICn)

The CSICn register is an 8-bit register that controls the CSI0n serial transfer operation.

(3) Serial I/O shift register 0n (SIO0n)

The SIO0n register is a 16-bit shift register that converts parallel data into serial data.

The SIO0n register is used for both transmission and reception.

Data is shifted in (reception) and shifted out (transmission) from the MSB or LSB side.

The actual transmission/reception operations are started up by accessing the buffer register.

(4) Serial I/O shift register 0nL (SIO0nL)

The SIO0nL register is an 8-bit shift register that converts parallel data into serial data.

The SIO0nL register is used for both transmission and reception.

Data is shifted in (reception) and shifted out (transmission) from the MSB or LSB side.

The actual transmission/reception operations are started up by access of the buffer register .

(5) Clocked serial interface receive buffer register n (SIRBn)

The SIRBn register is a 16-bit buffer register that stores receive data.

(6) Clocked serial interface receive buffer register nL (SIRBnL)

The SIRBnL register is an 8-bit buffer register that stores receive data.

(7) Clocked serial interface read-only receive buffer register n (SIRBEn)

The SIRBEn register is a 16-bit buffer register that stores receive data.

The SIRBEn register is the same as the SIRBn register. It is used to read the contents of the SIRBn register.

(8) Clocked serial interface read-only receive buffer register nL (SIRBEnL)

The SIRBEnL register is an 8-bit buffer register that stores receive data.

The SIRBEnL register is the same as the SIRBnL register. It is used to read the contents of the SIRBnL register.

(9) Clocked serial interface transmit buffer register n (SOTBn)

The SOTBn register is a 16-bit buffer register that stores transmit data.

(10) Clocked serial interface transmit buffer register nL (SOTBLnL)

The SOTBLnL register is an 8-bit buffer register that stores transmit data.

(11) Clocked serial interface initial transmit buffer register n (SOTBFn)

The SOTBFn register is a 16-bit buffer register that stores the initial transmit data in the continuous transfer mode.

(12) Clocked serial interface initial transmit buffer register nL (SOTBFnL)

The SOTBFnL register is an 8-bit buffer register that stores initial transmit data in the continuous transfer mode.

(13) Selector

The selector selects the serial clock to be used.

(14) Serial clock controller

Controls the serial clock supply to the shift register. Also controls the clock output to the SCK0n pin when the internal clock is used.

(15) Serial clock counter

Counts the serial clock output or input during transmission/reception, and checks whether 8-bit or 16-bit data transmission/reception has been performed.

(16) Interrupt controller

Controls the interrupt request timing.

Remark n = 0 to 2

Figure 17-1. Block Diagram of Clocked Serial Interface

17.3 Registers

(1) Clocked serial interface mode register 0n (CSIM0n)

The CSIM0n register controls the CSI0n operation.

This register can be read or written in 8-bit or 1-bit units (however, CSOTn bit is read-only).

After reset, CSIM0n is cleared to 00H.

Caution Overwriting the CSIM0n.TRMDn, CSIM0n.CCLn, CSIM0n.DIRn, CSIM0n.CSITn, and CSIM0n.AUTOn bits can be done only when the CSOTn bit = 0. If these bits are overwritten at any other time, the operation cannot be guaranteed.

After reset: 00H R/W Address: CSIM00 FFFFFFFD00H, CSIM01 FFFFFFFD10H, CSIM02 FFFFFFFD20H

	<7>	<6>	5	<4>	3	2	1	<0>
CSIM0n	CSI0En	TRMDn	CCLn	DIRn	CSITn	AUTOn	0	CSOTn

(n = 0 to 2)

CSI0En	CSI0n operation enable/disable
0	Disable CSI0n operation.
1	Enable CSI0n operation.
The internal CSI0n circuit can be reset ^{Note} asynchronously by clearing the CSI0En bit to 0. For the SCK0n and SO0n pin output status when the CSI0En bit = 0, refer to 17.5 Output Pins .	

TRMDn	Specification of transmission/reception mode
0	Receive-only mode
1	Transmission/reception mode
When the TRMDn bit = 0, reception is performed and the SO0n pin outputs a low level. Data reception is started by reading the SIRBn register. When the TRMDn bit = 1, transmission/reception is started by writing data to the SOTBn register.	

CCLn	Specification of data length
0	8 bits
1	16 bits

DIRn	Specification of transfer direction mode (MSB/LSB)
0	First bit of transfer data is MSB
1	First bit of transfer data is LSB

CSITn	Control of delay of interrupt request signal
0	No delay
1	Delay mode (interrupt request signal is delayed 1/2 cycle compared to the serial clock)
The delay mode (CSITn bit = 1) is valid only in the master mode (CSICn.CKS0n2 to CSICn.CSK0n0 bits are not 111B). In the slave mode (CKS0n2 to CKS0n0 bits are 111B), do not set the delay mode.	

AUTOn	Specification of single transfer mode or continuous transfer mode
0	Single transfer mode
1	Continuous mode

CSOTn	Communication status flag
0	Communication stopped
1	Communication in progress
The CSOTn bit is cleared (0) by writing 0 to the CSI0En bit.	

Note The CSOTn bit and the SIRBn, SIRBnL, SIRBE, SIRBEnL, SION, and SIONL registers are reset.

(2) Clocked serial interface clock selection register n (CSICn)

The CSICn register is an 8-bit register that controls the CSI0n transfer operation.

This register can be read or written in 8-bit or 1-bit units.

After reset, CSICn is cleared to 00H.

Caution The CSICn register can be overwritten only when the CSIM0n.CSI0En bit = 0.

After reset: 00H R/W Address: CSIC0 FFFFFFFD01H, CSIC1 FFFFFFFD11H, CSIC2 FFFFFFFD21H

	7	6	5	4	3	2	1	0
CSICn	0	0	0	CKPn	DAPn	CKS0n2	CKS0n1	CKS0n0

(n = 0 to 2)

CKPn	DAPn	Specification of timing of transmitting/receiving data to/from $\overline{\text{SCK0n}}$
0	0	(Type 1)
0	1	(Type 2)
1	0	(Type 3)
1	1	(Type 4)

CKS0n2	CKS0n1	CKS0n0	Serial clock ^{Note 1}	Mode
0	0	0	$f_{xx}/2$	Master mode
0	0	1	$f_{xx}/2^2$	Master mode
0	1	0	$f_{xx}/2^3$	Master mode
0	1	1	$f_{xx}/2^4$	Master mode
1	0	0	$f_{xx}/2^5$	Master mode
1	0	1	$f_{xx}/2^6$	Master mode
1	1	0	Clock generated by TO50, TO51 ^{Note 2}	Master mode
1	1	1	External clock ($\overline{\text{SCK0n}}$ pin)	Slave mode

Notes 1. Set the serial clock so as to satisfy the following conditions.

- REGC = V_{DD} = 4.0 to 5.5 V: Serial clock $\leq$ 5 MHz
- REGC = 10 μ F, V_{DD} = 4.0 to 5.5 V: Serial clock $\leq$ 2.5 MHz
- REGC = V_{DD} = 2.7 to 4.0 V: Serial clock $\leq$ 2.5 MHz

2. CSI00: TO50

CSI01, CSI02: TO51

Remark f_{xx} : Main clock frequency

(3) Clocked serial interface receive buffer registers n, nL (SIRBn, SIRBnL)

The SIRBn register is a 16-bit buffer register that stores receive data.

When the receive-only mode is set (CSIM0n.TRMDn bit = 0), the reception operation is started by reading data from the SIRBn register.

This register is read-only in 16-bit units. When the lower 8 bits are used as the SIRBnL register, this register is read-only in 8-bit units.

In addition to reset input, this register can also be initialized by clearing (0) the CSIM0n.CSI0En bit.

Cautions 1. Read the SIRBn register only when a 16-bit data length has been set (CSIM0n.CCLn bit = 1).

Read the SIRBnL register only when an 8-bit data length has been set (CCLn bit = 0).

2. When the single transfer mode has been set (CSIM0n.AUTOn bit = 0), perform a read operation only in the idle state (CSIM0n.CSOTn bit = 0). If the SIRBn or SIRBnL register is read during data transfer, the data cannot be guaranteed.

(a) SIRBn register

After reset: 0000H R Address: SIRB0 FFFFD02H, SIRB1 FFFFD12H, SIRB2 FFFFD22H

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn	SIRBn
(n = 0 to 2)	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

(b) SIRBnL register

After reset: 00H R Address: SIRB0L FFFFD02H, SIRB1L FFFFD12H, SIRB2L FFFFD22H

	7	6	5	4	3	2	1	0
SIRBnL	SIRBn7	SIRBn6	SIRBn5	SIRBn4	SIRBn3	SIRBn2	SIRBn1	SIRBn0
(n = 0 to 2)								

(4) Clocked serial interface read-only receive buffer registers n, nL (SIRBEn, SIRBEnL)

The SIRBEn register is a 16-bit buffer register that stores receive data.

The SIRBEn register is the same as the SIRBn register. Even if the SIRBEn register is read, the next operation will not start. The SIRBEn register is used to read the contents of the SIRBn register when the serial reception is not continued.

This register is read-only in 16-bit units. However, when the lower 8 bits are used as the SIRBEnL register, the register is read-only in 8-bit units.

In addition to reset input, this register can also be initialized by clearing (0) the CSIM0n.CSI0En bit.

Cautions 1. The receive operation is not started even if data is read from the SIRBEn and SIRBEnL registers.

2. The SIRBEn register can be read only if a 16-bit data length has been set (CSIM0n.CCLn bit = 1).

The SIRBEnL register can be read only if an 8-bit data length has been set (CCLn bit = 0).

(a) SIRBEn register

After reset: 0000H R Address: SIRBE0 FFFFD06H, SIRBE1 FFFFD16H, SIRBE2 FFFFD26H

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn	SIRBEn
(n = 0 to 2)	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

(B) SIRBEnL register

After reset: 00H R Address: SIRBE0L FFFFD06H, SIRBE1L FFFFD16H, SIRBE2L FFFFD26H

	7	6	5	4	3	2	1	0
SIRBEnL	SIRBEn7	SIRBEn6	SIRBEn5	SIRBEn4	SIRBEn3	SIRBEn2	SIRBEn1	SIRBEn0
(n = 0 to 2)								

(5) Clocked serial interface transmit buffer registers n, nL (SOTBn, SOTBnL)

The SOTBn register is a 16-bit buffer register that stores transmit data.

When the transmission/reception mode is set (CSIM0n.TRMDn bit = 1), the transmission operation is started by writing data to the SOTBn register.

This register can be read or written in 16-bit units. However, when the lower 8 bits are used as the SOTBnL register, the register is read-only in 8-bit units.

After reset, this register is initialized.

Cautions 1. Access the SOTBn register only when a 16-bit data length has been set (CSIM0n.CCLn bit = 1).

Access the SOTBnL register only when an 8-bit data length has been set (CCLn bit = 0).

2. When the single transfer mode is set (CSIM0n.AUTOn bit = 0), perform access only in the idle state (CSIM0n.CSOTn bit = 0). If the SOTBn and SOTBnL registers are accessed during data transfer, the data cannot be guaranteed.

(a) SOTBn register

After reset: 0000H R/W Address: SOTB0 FFFFD04H, SOTB1 FFFFD14H, SOTB2 FFFFD24H

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn	SOTBn
(n = 0 to 2)	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

(b) SOTBnL register

After reset: 00H R/W Address: SOTB0L FFFFD04H, SOTB1L FFFFD14H, SOTB2L FFFFD24H

	7	6	5	4	3	2	1	0
SOTBnL	SOTBn7	SOTBn6	SOTBn5	SOTBn4	SOTBn3	SOTBn2	SOTBn1	SOTBn0
(n = 0 to 2)								

(6) Clocked serial interface initial transmit buffer registers n, nL (SOTBFn, SOTBFnL)

The SOTBFn register is a 16-bit buffer register that stores initial transmission data in the continuous transfer mode.

The transmission operation is not started even if data is written to the SOTBFn register.

This register can be read or written in 16-bit units. However, when the lower 8 bits are used as the SOTBFnL register, the register can be read or written in 8-bit units.

After reset, this register is initialized.

Caution Access the SOTBFn register and SOTBFnL register only when a 16-bit data length has been set (CSIM0n.CCLn bit = 1), and only when an 8-bit data length has been set (CCLn bit = 0), respectively, and only in the idle state (CSIM0n.CSOTn bit = 0). If the SOTBFn and SOTBFnL registers are accessed during data transfer, the data cannot be guaranteed.

(a) SOTBFn register

After reset: 0000H R/W Address: SOTBF0 FFFFD08H, SOTBF1 FFFFD18H, SOTBF2 FFFFD28H

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn	SOTBFn
(n = 0 to 2)	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

(b) SOTBFnL register

After reset: 00H R/W Address: SOTBF0L FFFFD08H, SOTBF1L FFFFD18H, SOTBF2L FFFFD28H

	7	6	5	4	3	2	1	0
SOTBFnL	SOTBFn7	SOTBFn6	SOTBFn5	SOTBFn4	SOTBFn3	SOTBFn2	SOTBFn1	SOTBFn0
(n = 0 to 2)								

(7) Serial I/O shift registers n, nL (SIO0n, SIO0nL)

The SIO0n register is a 16-bit shift register that converts parallel data into serial data.

The transfer operation is not started even if the SIO0n register is read.

This register is read-only in 16-bit units. However, when the lower 8 bits are used as the SIO0nL register, the register is read-only in 8-bit units.

In addition to reset input, this register can also be initialized by clearing (0) the CSIM0n.CSI0En bit.

Caution Read the SIO0n register and SIO0nL register only when a 16-bit data length has been set (CSIM0n.CCLn bit = 1), and only when an 8-bit data length has been set (CCLn bit = 0), respectively, and only in the idle state (CSIM0n.CSOTn bit = 0). If the SIO0n and SIO0nL registers are read during data transfer, the data cannot be guaranteed.

(a) SIO0n register

After reset: 0000H R Address: SIO00 FFFFD0AH, SIO01 FFFFD1AH, SIO02 FFFFD2AH

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SIO0n	SIO15	SIO14	SIO13	SIO12	SIO11	SIO10	SIO9	SIO8	SIO7	SIO6	SIO5	SIO4	SIO3	SIO2	SIO1	SIO0

(n = 0 to 2)

(b) SIO0nL register

After reset: 00H R Address: SIO00L FFFFD0AH, SIO01L FFFFD1AH, SIO02L FFFFD2AH

	7	6	5	4	3	2	1	0
SIO0nL	SIO7	SIO6	SIO5	SIO4	SIO3	SIO2	SIO1	SIO0

(n = 0 to 2)

Table 17-1. Use of Each Buffer Register

Register Name	R/W		Single Transfer		Continuous Transfer ^{Note 1}	
			Transmission/Reception Mode	Receive-Only Mode	Transmission/Reception Mode	Receive-Only Mode
SIRBn (SIRBnL)	Read	Function	Storing received data ^{Note 2}	- Reading starts reception - Storing received data	Storing up to the (N – 1)th received data (other than the last) ^{Note 2}	- Reading starts reception - Storing up to the (N – 2)th data (other than the last two)
		Use method	When transmission and reception are complete, read the received data from this register.	- First, read dummy data and start transfer. - To perform reception of the next data after reception is complete, read the received data from this register.	When reception is complete, read the received data from this register. Repeat this operation until the (N – 1)th data has been received.	When reception is complete, read the received data from this register. Repeat this operation until the (N – 2)th data has been received. (Supplement) Do not read the (N – 1)th data from this register. If read, a reception operation starts and continuous transfer cannot be completed.
SIRBEn (SIRBEnL)	Read	Function	–	Storing the data received last ^{Note 2}	–	Storing the (N – 1)th received data ^{Note 2}
		Use method	Not used.	If reception of the next data will not be performed after reception is complete, read the received data from this register.	Not used	Read the (N – 1)th received data from this register when the (N – 1)th or Nth (last) data has been received.
SIO0n (SIO0nL)	Read	Function	–	–	Storing the Nth (last) received data ^{Note 2}	Storing the Nth (last) received data ^{Note 2}
		Use method	Not used.	Not used	When the Nth (last) transmission/reception is complete, read the Nth (last) data.	When the Nth (last) data has been received, read the Nth (last) data.
SOTBn (SOTBnL)	Write	Function	- Starting transmission/reception when written - Storing the data to be transmitted	–	- Starting transmission/reception when written - Storing the data to be transmitted second and subsequently	–
		Use method	When transmission/reception is complete, write the data to be transmitted next to this register.	Not used	When transmission/reception is complete, write the data to be transmitted next to this register to start the next transmission/reception.	Not used
SOTBFn (SOTBFnL)	Write	Function	–	–	Storing the data to be transmitted first ^{Note 2}	–
		Use method	Not used	Not used	Before starting transmission/reception (writing to SOTBn), write the data to be transmitted first.	Not used

Notes 1. It is assumed that the number of data to be transmitted is N.

2. Neither reading nor writing will start communication.

Remark In the 16-bit mode, the registers not enclosed in parentheses are used; in the 8-bit mode, the registers in parentheses are used.

17.4 Operation

17.4.1 Transmission/reception completion interrupt request signal (INTCSI0n)

The INTCSI0n signal is set (1) upon completion of data transmission/reception.

Writing to the CSIM0n register clears (0) the INTCSI0n signal.

Caution The delay mode (CSIM0n.CSITn bit = 1) is valid only in the master mode (CSICn.CKS0n2 to CSICn.CKS0n0 bits are not 111B). The delay mode cannot be set when the slave mode is set (CKS0n2 to CKS0n0 bits = 111B).

Figure 17-2. Timing Chart of INTCSI0n Signal Output in Delay Mode

17.4.2 Single transfer mode

(1) Usage

In the receive-only mode (CSIM0n.TRMDn bit = 0), communication is started by reading the SIRBn/SIRBnL register.

In the transmission/reception mode (TRMDn bit = 1), communication is started by writing to the SOTBn/SOTBnL register.

In the slave mode, the operation must be enabled beforehand (CSIM0n.CSI0En bit = 1).

When communication is started, the value of the CSIM0n.CSOTn bit becomes 1 (transmission execution status).

Upon communication completion, the transmission/reception completion interrupt request signal (INTCSI0n) is generated, and the CSOTn bit is cleared (0). The next data communication request is then waited for.

Caution When the CSOTn bit = 1, do not manipulate the CSI0n register.

Remark n = 0 to 2

Figure 17-3. Timing Chart in Single Transfer Mode (1/2)

(a) In transmission/reception mode, data length: 8 bits, transfer direction: MSB first, no interrupt delay, single transfer mode, when AAH is received and 55H is transmitted, transmit/receive type 1

- Remarks**
1. Reg_R/W: Internal signal. This signal indicates that the SIRBn/SIRBnL register read or the SOTBn/SOTBnL register write was performed.
 2. For the transmit/receive types, refer to **17.3 (2) Clocked serial interface clock selection register n (CSICn)**.
 3. n = 0 to 2

Figure 17-3. Timing Chart in Single Transfer Mode (2/2)

(b) In transmission/reception mode, data length: 8 bits, transfer direction: MSB first, no interrupt delay, single transfer mode, when AAH is received and 55H is transmitted, transmit/receive type 2

- Remarks**
1. Reg_R/W: Internal signal. This signal indicates that the SIRBn/SIRBnL register read or the SOTBn/SOTBnL register write was performed.
 2. For the transmit/receive types, refer to **17.3 (2) Clocked serial interface clock selection register n (CSICn)**.
 3. n = 0 to 2

17.4.3 Continuous transfer mode

(1) Usage (receive-only: 8-bit data length)

- <1> Set the continuous transfer mode (CSIM0n.AUTOn bit = 1) and the receive-only mode (CSIM0n.TRMDn bit = 0).
- <2> Read the SIRBnL register (start transfer with dummy read).
- <3> When the transmission/reception completion interrupt request signal (INTCSI0n) has been generated, read the SIRBnL register^{Note} (reserve next transfer).
- <4> Repeat step <3> (N – 2) times. (N: Number of transfer data)
Ignore the interrupt triggered by reception of the (N – 1)th data (at this time, the SIRBEnL register can be read).
- <5> Following generation of the last INTCSI0n signal, read the SIRBEnL register and the SIO0nL register^{Note}.

Note When transferring N number of data, receive data is loaded by reading the SIRBnL register from the first data to the (N – 2)th data. The (N – 1)th data is loaded by reading the SIRBEnL register, and the Nth (last) data is loaded by reading the SIO0nL register (refer to **Table 17-1 Use of Each Buffer Register**).

Figure 17-4. Continuous Transfer (Receive-Only) Timing Chart

- Transmit/receive type 1, 8-bit data length

Remarks 1. Reg_RD: Internal signal. This signal indicates that the SIRBnL register has been read.

rq_clr: Internal signal. Transfer request clear signal.

trans_rq: Internal signal. Transfer request signal.

2. n = 0 to 2

In the case of the continuous transfer mode, two transfer requests are set at the start of the first transfer. Following the INTCSI0n signal, transfer is continued if the SIRBnL register can be read within the next transfer reservation period. If the SIRBnL register cannot be read, transfer ends and the SIRBnL register does not receive the new value of the SIO0nL register.

The last data can be obtained by reading the SIO0nL register following completion of the transfer.

(2) Usage (transmission/reception: 8-bit data length)

- <1> Set the continuous transfer mode (CSIM0n.AUTOn bit = 1) and the transmission/reception mode (CSIM0n.TRMDn bit = 1).
- <2> Write the first data to the SOTBFnL register.
- <3> Write the 2nd data to the SOTBnL register (start transfer).
- <4> When the transmission/reception completion interrupt request signal (INTCSI0n) has been generated, write the next data to the SOTBnL register (reserve next transfer). Read the SIRBnL register to load the receive data.
- <5> Repeat step <4> as long as data to be sent remains.
- <6> When the INTCSI0n signal is generated, read the SIRBnL register to load the (N – 1)th receive data (N: Number of transfer data).
- <7> Following the last INTCSI0n signal, read the SIO0nL register to load the Nth (last) receive data.

Figure 17-5. Continuous Transfer (Transmission/Reception) Timing Chart

- Transmit/receive type 1, 8-bit data length

- Remarks 1.** Reg_WR: Internal signal. This signal indicates that the SOTBnL register has been written.
 Reg_RD: Internal signal. This signal indicates that the SIRBnL register has been read.
 rq_clr: Internal signal. Transfer request clear signal.
 trans_rq: Internal signal. Transfer request signal.
- 2.** n = 0 to 2

In the case of the continuous transfer mode, two transfer requests are set at the start of the first transfer. Following the INTCSI0n signal, transfer is continued if the SOTBnL register can be written within the next transfer reservation period. If the SOTBnL register cannot be written, transfer ends and the SIRBnL register does not receive the new value of the SIO0nL register.

The last receive data can be obtained by reading the SIO0nL register following completion of the transfer.

(3) Next transfer reservation period

In the continuous transfer mode, the next transfer must be prepared with the period shown in Figure 17-6.

Figure 17-6. Timing Chart of Next Transfer Reservation Period (1/2)

Figure 17-6. Timing Chart of Next Transfer Reservation Period (2/2)

(4) Cautions

To continue continuous transfers, it is necessary to either read the SIRBn register or write to the SOTBn register during the transfer reservation period.

If access is performed to the SIRBn register or the SOTBn register when the transfer reservation period is over, the following occurs.

(i) In case of conflict between transfer request clear and register access

Since transfer request clear has higher priority, the next transfer request is ignored. Therefore, transfer is interrupted, and normal data transfer cannot be performed.

Figure 17-7. Transfer Request Clear and Register Access Conflict

(ii) **In case of conflict between transmission/reception completion interrupt request signal (INTCSI0n) generation and register access**

Since continuous transfer has stopped once, executed as a new continuous transfer.

In the slave mode, a bit phase error transfer error results (refer to **Figure 17-8**).

In the transmission/reception mode, the value of the SOTBFn register is retransmitted, and illegal data is sent.

Figure 17-8. Interrupt Request and Register Access Conflict

Remarks 1. rq_clr: Internal signal. Transfer request clear signal.

Reg_R/W: Internal signal. This signal indicates that the SIRBn/SIRBnL register read or the SOTBn/SOTBnL register write was performed.

2. n = 0 to 2

17.5 Output Pins

The following describes the output pins. For the setting of each pin, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

(1) $\overline{\text{SCK0n}}$ pin

When the CSI0n operation is disabled (CSIM0n.CSI0En bit = 0), the $\overline{\text{SCK0n}}$ pin output status is as follows.

Table 17-2. $\overline{\text{SCK0n}}$ Pin Output Status

CKPn	CKS0n2	CKS0n1	CKS0n0	$\overline{\text{SCK0n}}$ Pin Output
0	Don't care	Don't care	Don't care	Fixed to high level
1	1	1	1	High impedance
	Other than above			Fixed to low level

Remark n = 0 to 2

(2) SO0n pin

When the CSI0n operation is disabled (CSI0En bit = 0), the SO0n pin output status is as follows.

Table 17-3. SO0n Pin Output Status

TRMDn	DAPn	AUTO0n	CCLn	DIRn	SO0n Pin Output
0	Don't care	Don't care	Don't care	Don't care	Fixed to low level
1	0	Don't care	Don't care	Don't care	SO latch value (low level)
	1	0	0	0	SOTBn7 bit value
				1	SOTBn0 bit value
			1	0	SOTBn15 bit value
				1	SOTBn0 bit value
		1	0	0	SOTBFn7 bit value
				1	SOTBFn0 bit value
			1	0	SOTBFn15 bit value
				1	SOTBFn0 bit value

Remark n = 0 to 2

CHAPTER 18 CLOCKED SERIAL INTERFACE A (CSIA) WITH AUTOMATIC TRANSMIT/RECEIVE FUNCTION

In the V850ES/KJ1, two channels of clocked serial interface A (CSIA) with automatic transmit/receive function are provided.

18.1 Functions

CSIA_n has the following two modes.

- 3-wire serial I/O mode
- 3-wire serial I/O mode with automatic transmit/receive function

(1) 3-wire serial I/O mode

This mode is used to transfer 8-bit data using three lines: a serial clock pin ($\overline{\text{SCKAn}}$) and two serial data pins (SIA_n and SOA_n).

In addition, whether 8-bit data is transferred MSB or LSB first can be specified, so this interface can be connected to any device.

(2) 3-wire serial I/O mode with automatic transmit/receive function

This mode is used to transfer 8-bit data using three lines: a serial clock pin ($\overline{\text{SCKAn}}$) and two serial data pins (SIA_n and SOA_n).

In addition, whether 8-bit data is transferred MSB or LSB first can be specified, so this interface can be connected to any device.

Data can be transferred to/from a display driver etc. without using software since a 32-byte buffer RAM is incorporated for automatic transfer.

- Maximum transfer speed: 2 Mbps (in master mode)
- Master mode/slave mode selectable
- Transfer data length: 8 bits
- MSB/LSB-first selectable for transfer data
- Automatic transmit/receive function:
 - Number of transfer bytes can be specified between 1 and 32
 - Transfer interval can be specified (0 to 63 clocks)
 - Single transfer/repeat transfer selectable
- On-chip dedicated baud rate generator (6/8/16/32 divisions)
- 3-wire SOA_n: Serial data output
 - SIA_n: Serial data input
 - $\overline{\text{SCKAn}}$: Serial clock I/O
- Transmission/reception completion interrupt request signal: INTCSIA_n
- Internal 32-byte buffer RAM (used in 3-wire serial I/O mode with automatic transmit/receive function)

Remark $n = 0, 1$

18.2 Configuration

CSIA_n consists of the following hardware.

Table 18-1. Configuration of CSIA_n

Item	Configuration
Register	Serial I/O shift register A _n (SIOA _n) Automatic data transfer address count register n (ADTC _n) CSIA _n buffer RAM (CSIA _n B _m , CSIA _n B _m L, CSIA _n B _m H) (m = 0 to F)
Control registers	Serial operation mode specification register n (CSIMA _n) Serial status register n (CSIS _n) Serial trigger register n (CSIT _n) Divisor selection register n (BRGCA _n) Automatic data transfer address point specification register n (ADTP _n) Automatic data transfer interval specification register n (ADTI _n)

Remark For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

Figure 18-1. Block Diagram of CSIA_n

(1) Serial I/O shift register An (SIOAn)

This is an 8-bit register used to store transmit/receive data in 1-byte transfer mode (CSIMAn.ATEn bit = 0). Writing transmit data to the SIOAn register starts the transfer. In addition, after a transfer completion interrupt request signal (INTCSIA_n) is generated (CSISn.TSFn bit = 0), data can be received by reading data from the SIOAn register.

This register can be read or written in 8-bit units. However, writing to the SIOAn register is prohibited when the CSISn.TSFn bit = 1.

After reset, this register is cleared to 00H.

- Cautions**
1. A transfer operation is started by writing to SIOAn register. Consequently, when transmission is disabled (CSIMAn.TXEAn bit = 0), write dummy data to the SIOAn register to start the transfer operation, and then perform a receive operation.
 2. Do not write data to the SIOAn register while the automatic transmit/receive function is operating.

**(2) Automatic data transfer address count register n (ADTCn)**

This is a register used to indicate buffer RAM addresses during automatic transfer. When automatic transfer is stopped, the data position when transfer stopped can be ascertained by reading ADTCn register value.

This register is read-only in 8-bit units. However, reading from the ADTCn register is prohibited when the CSISn.TSFn bit = 1.

After reset, this register is cleared to 00H.

**18.3 Registers**

Serial interface CSIA_n is controlled by the following six registers.

- Serial operation mode specification register n (CSIMAn)
- Serial status register n (CSISn)
- Serial trigger register n (CSITn)
- Divisor selection register n (BRGCAn)
- Automatic data transfer address point specification register n (ADTPn)
- Automatic data transfer interval specification register n (ADTIn)

(1) Serial operation mode specification register n (CSIMAn)

This is an 8-bit register used to control the serial transfer operation.

This register can be read or written in 8-bit or 1-bit units.

After reset, this register is cleared to 00H.

After reset: 00H R/W Address: CSIMA0 FFFFFFFD40H, CSIMA1 FFFFFFFD50H								
	<7>	6	5	4	<3>	<2>	<1>	0
CSIMAn	CSIAEn	ATEn	ATMn	MASTERn	TXEAn	RXEAn	DIRAn	0
(n = 0, 1)								
CSIAEn	CSIA operation enable/disable control							
0	Disable CSIA operation (SOAn: Low level, $\overline{\text{SCKAn}}$: High level)							
1	Enable CSIA operation							
- When the CSIAEn bit is cleared to 0, the CSIA unit is reset^{Note} asynchronously. - When the CSIAEn bit = 0, the CSIA unit is reset, so to operate CSIA, first set the CSIAEn bit to 1. - If the CSIAEn bit is cleared from 1 to 0, all the registers in the CSIA unit are initialized. Before the CSIAEn bit is set to 1 again, first re-set the registers of the CSIA unit. - If the CSIAEn bit is cleared from 1 to 0, the buffer RAM value is not held. Also, when the CSIAEn bit = 0, the buffer RAM cannot be accessed.								
ATEn	Automatic transfer operation enable/disable control							
0	1-byte transfer mode							
1	Automatic transfer mode							
ATMn	Specification of automatic transfer mode							
0	Single transfer mode (stops at address specified with ADTPn register)							
1	Repeat transfer mode (Following transfer completion, the ADTCn register is cleared to 00H and transmission starts again.)							
MASTERn	Specification of CSIA master/slave mode							
0	Slave mode (synchronized with $\overline{\text{SCKAn}}$ input clock)							
1	Master mode (synchronized with internal clock)							
TXEAn	Transmission enable/disable control							
0	Disable transmission (SOAn: Low level)							
1	Enable transmission							
RXEAn	Reception enable/disable control							
0	Disable reception							
1	Enable reception							
DIRAn	Specification of transfer data direction							
0	MSB first							
1	LSB first							

Note The ADTCn, CSITn, and SIOAn registers and the CSIS.TSFn bit are reset.

(2) Serial status register n (CSISn)

This is an 8-bit register used to select the serial clock and to indicate the transfer status of CSIA_n.

This register can be read or written in 8-bit or 1-bit units.

After reset, this register is cleared to 00H. However, rewriting the CSIS_n register is prohibited when the TSF_n bit is 1.

After reset: 00H R/W Address: CSIS0 FFFFD41H, CSIS1 FFFFD51H

	7	6	5	4	3	2	1	0
CSIS _n	CKSA _n 1	CKSA _n 0	0	0	0	0	0	TSF _n

(n = 0, 1)

CKSA _n 1	CKSA _n 0	Serial clock (f _{SCKA}) selection ^{Note}			
			20 MHz	16 MHz	10 MHz
0	0	f _{xx}	Setting prohibited	Setting prohibited	100 ns
0	1	f _{xx} /2	100 ns	125 ns	200 ns
1	0	f _{xx} /4	200 ns	250 ns	400 ns
1	1	f _{xx} /8	400 ns	500 ns	800 ns

Rewriting CSIS_n is prohibited when the CSIMAn.CSIAEn bit is 1.

TSF _n	Transfer status
0	CSIAEn bit = 0 At reset input At completion of specified transfer When transfer has been suspended by setting the CSITn.ATSTPn bit to 1
1	From transfer start to completion of specified transfer

Note Set f_{SCKA} so as to satisfy the following conditions.

- REGC = V_{DD} = 4.0 to 5.5 V: f_{SCKA} ≤ 12 MHz
- REGC = 10 μF, V_{DD} = 4.0 to 5.5 V: f_{SCKA} ≤ 6 MHz
- REGC = V_{DD} = 2.7 to 4.0 V: f_{SCKA} ≤ 6 MHz

Cautions 1. The TSF_n bit is read-only.

2. When the TSF_n bit = 1, rewriting the CSIMAn, CSISn, BRGCAn, ADTPn, ADTIn, and SIOAn registers is prohibited.

However, the transfer buffer RAM can be rewritten.

3. Be sure to clear bits 1 to 5 to “0”.

(3) Serial trigger register n (CSITn)

The CSITn register between the buffer RAM and shift register is an 8-bit register used to control execution/stop of automatic data transfer.

This register can be read or written in 8-bit or 1-bit units. However, manipulate only when the CSIMAn.ATEn bit is 1 (manipulation prohibited when ATEn bit = 0).

After reset, this register is cleared to 00H.

After reset: 00H R/W Address: CSIT0 FFFFFFFD42H, CSIT1 FFFFD52H

	7	6	5	4	3	2	<1>	<0>
CSITn	0	0	0	0	0	0	ATSTPn	ATSTAn

(n = 0, 1)

ATSTPn	Automatic data transfer suspension
0	—
1	Stop automatic data transfer

Even when the ATSTPn bit is set to 1, transfer does not stop until 1 byte has been transferred.

1 is held until immediately before the transmission/reception completion interrupt request signal (INTCSIA_n) is generated, and ATSTPn is automatically cleared to 0 after that.

After automatic transfer has been suspended, the data address at the point of suspension is stored in the ADTCn register.

A function to resume automatic data transfer is not provided, so if transfer has been interrupted by setting the ATSTPn bit to 1, set each register again, and set the ATSTAn bit to 1 to start automatic data transfer.

ATSTAn	Automatic data transfer start
0	—
1	Start automatic data transfer

Even when the ATSTAn bit is set to 1, automatic data transfer does not start until 1 byte has been transferred.

1 is held until immediately before the INTCSIA_n signal is generated, and ATSTAn is automatically cleared to 0 after that.

(4) Divisor selection register n (BRGCAn)

This is an 8-bit register used to control the serial transfer speed (divisor of CSIA clock).

This register can be read or written in 8-bit units. However, when the CSISn.TSFn bit is 1, rewriting the BRGCAn register is prohibited.

After reset, this register is set to 03H.

After reset: 03H R/W Address: BRGCA0 FFFFFFFD43H, BRGCA1 FFFFD53H

	7	6	5	4	3	2	1	0
BRGCAn	0	0	0	0	0	0	BRGCn1	BRGCn0

(n = 0, 1)

BRGCn1	BRGCn0	Selection of CSIA _n serial clock (f _{SCKA} division ratio)
0	0	6 (f _{SCKA} /6)
0	1	8 (f _{SCKA} /8)
1	0	16 (f _{SCKA} /16)
1	1	32 (f _{SCKA} /32)

(5) Automatic data transfer address point specification register n (ADTPn)

This is an 8-bit register used to specify the buffer RAM address that ends transfer during automatic data transfer (CSIMAn.ATEN bit = 1).

This register can be read or written in 8-bit units. However, when the CSISn.TSFn bit is 1, rewriting the ADTPn register is prohibited.

After reset, this register is cleared to 00H.

In the V850ES/KJ1, 00H to 1FH can be specified because 32 bytes of buffer RAM are incorporated.

Example When the ADTP0 register is set to 07H

8 bytes of FFFFE00H to FFFFE07H are transferred.

In repeat transfer mode (CSIMAn.ATMn bit = 1), transfer is performed repeatedly up to the address value specified by ADTPn.

Example When the ADTP0 register is set to 07H (repeat transfer mode)

Transfer is repeated as FFFFE00H to FFFFE07H, ...

After reset: 00H	R/W	Address: ADTP0 FFFFFFFD44H, ADTP1 FFFFD54H							
		7	6	5	4	3	2	1	0
ADTPn		0	0	0	ADTPn4	ADTPn3	ADTPn2	ADTPn1	ADTPn0

(n = 0, 1)

Caution Be sure to clear bits 5 to 7 to “0”.

The relationship between buffer RAM address values and the ADTPn register setting values is shown below.

Table 18-2. Relationship Between Buffer RAM Address Values and ADTP0 Register Setting Values

Buffer RAM Address Value	ADTP0 Register Setting Value	Buffer RAM Address Value	ADTP0 Register Setting Value
FFFFFE00H	00H	FFFFFE10H	10H
FFFFFE01H	01H	FFFFFE11H	11H
FFFFFE02H	02H	FFFFFE12H	12H
FFFFFE03H	03H	FFFFFE13H	13H
FFFFFE04H	04H	FFFFFE14H	14H
FFFFFE05H	05H	FFFFFE15H	15H
FFFFFE06H	06H	FFFFFE16H	16H
FFFFFE07H	07H	FFFFFE17H	17H
FFFFFE08H	08H	FFFFFE18H	18H
FFFFFE09H	09H	FFFFFE19H	19H
FFFFFE0AH	0AH	FFFFFE1AH	1AH
FFFFFE0BH	0BH	FFFFFE1BH	1BH
FFFFFE0CH	0CH	FFFFFE1CH	1CH
FFFFFE0DH	0DH	FFFFFE1DH	1DH
FFFFFE0EH	0EH	FFFFFE1EH	1EH
FFFFFE0FH	0FH	FFFFFE1FH	1FH

Table 18-3. Relationship Between Buffer RAM Address Values and ADTP1 Register Setting Values

Buffer RAM Address Value	ADTP1 Register Setting Value	Buffer RAM Address Value	ADTP1 Register Setting Value
FFFFFE20H	00H	FFFFFE30H	10H
FFFFFE21H	01H	FFFFFE31H	11H
FFFFFE22H	02H	FFFFFE32H	12H
FFFFFE23H	03H	FFFFFE33H	13H
FFFFFE24H	04H	FFFFFE34H	14H
FFFFFE25H	05H	FFFFFE35H	15H
FFFFFE26H	06H	FFFFFE36H	16H
FFFFFE27H	07H	FFFFFE37H	17H
FFFFFE28H	08H	FFFFFE38H	18H
FFFFFE29H	09H	FFFFFE39H	19H
FFFFFE2AH	0AH	FFFFFE3AH	1AH
FFFFFE2BH	0BH	FFFFFE3BH	1BH
FFFFFE2CH	0CH	FFFFFE3CH	1CH
FFFFFE2DH	0DH	FFFFFE3DH	1DH
FFFFFE2EH	0EH	FFFFFE3EH	1EH
FFFFFE2FH	0FH	FFFFFE3FH	1FH

(6) Automatic data transfer interval specification register n (ADTIn)

This is an 8-bit register used to specify the interval period between 1-byte transfers during automatic data transfer (CSIMAn.ATEN bit = 1).

Set this register when in master mode (CSIMAn.MASTERn bit = 1) (setting is unnecessary in slave mode). Setting in 1-byte transfer mode (ATEN bit = 0) is also valid. When the interval time specified by the ADTIn register after the end of 1-byte transfer has elapsed, a transmission/reception completion interrupt request signal (INTCSIA_n) is output. The number of clocks for the interval can be set to between 0 and 63 clocks.

This register can be read or written in 8-bit units. However, when the CSISn.TSF_n bit is 1, rewriting the ADTIn register is prohibited.

After reset, this register is cleared to 00H.

The specified interval time is the transfer clock (specified by the BRGCAn register) multiplied by an integer value.

Example When ADTI_n register = 03H

**(7) CSIA_n buffer RAM (CSIA_nB_m)**

This area holds transmit/receive data (up to 32 bytes) in automatic transfer mode in 1-byte units.

This register can be read or written in 16-bit units. However, when the higher 8 bits and the lower 8 bits of the CSIA_nB_m register are used as the CSIA_nB_mH register and CSIA_nB_mL register, respectively, these registers can be read or written in 8-bit units.

After automatic transfer is started, only data equal to one byte more than the number of bytes stored in the ADTP_n register is transmitted/received in sequence from the CSIA_nB₀L register.

- Cautions**
1. To read the value of the CSIA_nB_m register after data is written to the register, wait for the duration of more than six clocks of f_{SCKA} (serial clock set by the CSIS_n.CKSA_n1 and CSIS_n.CKSA_n0 bits) or until data is written to the buffer RAM at another address.
 2. When the main clock stops and the CPU operates on the subclock, do not access the CSIA_nB_m register.
For details, refer to 3.4.8 (1) (b).

Remark n = 0, 1
m = 0 to F

18.4 Operation

CSIA_n can be used in the following two modes.

- 3-wire serial I/O mode
- 3-wire serial I/O mode with automatic transmit/receive function

18.4.1 3-wire serial I/O mode

The one-byte data transmission/reception is executed in the mode in which the CSIMAn.ATEn bit is cleared to 0.

In this mode, communication is executed by using three lines: serial clock ($\overline{\text{SCKAn}}$), serial data output (SOAn), and serial data input (SIAn) pins.

The 3-wire serial I/O mode is controlled by the following three registers.

- Serial operation mode specification register n (CSIMAn)
- Serial status register n (CSISn)
- Divisor selection register n (BRGCAn)

Remarks 1. For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

2. n = 0, 1

(1) 1-byte transmission/reception communication operation**(a) 1-byte transmission/reception**

When the CSIMAn.CSIAEn bit and the CSIMAn.ATEn bit = 1, 0, respectively, if transfer data is written to the SIOAn register, the data is output via the SOA0 pin in synchronization with the $\overline{\text{SCKAn}}$ pin falling edge, and then input via the SIA0 pin in synchronization with the falling edge of the $\overline{\text{SCKAn}}$ pin, and stored in the SIOAn register in synchronization with the rising edge 1 clock later.

Data transmission and data reception can be performed simultaneously.

If only reception is to be performed, transfer can only be started by writing a dummy value to the SIOAn register.

When transfer of 1 byte is complete, a transmission/reception completion interrupt request signal (INTCSIA_n) is generated.

In 1-byte transmission/reception, the setting of the CSIMAn.ATMn bit is invalid.

Be sure to read data after confirming that the CSISn.TSF_n bit = 0.

Caution Determine the setting procedure of alternate-function pins considering the relationship with the communication partner.

Figure 18-2. 3-Wire Serial I/O Mode Timing

(b) Data format

In the data format, data is changed in synchronization with the $\overline{\text{SCKAn}}$ pin falling edge as shown in Figure 18-3.

The data length is fixed to 8 bits and the data transfer direction can be switched by the specification of the CSIMAn.DIRAn bit.

Figure 18-3. Format of Transmit/Receive Data

(c) Switching MSB/LSB as start bit

Figure 18-4 shows the configuration of the SIOAn register and the internal bus. As shown in the figure, MSB/LSB can be read or written in reverse form.

Switching MSB/LSB as the start bit can be specified using the CSIMAn.DIRAn bit.

Start bit switching is realized by switching the bit order for data written to the SIOAn register. The SIOAn register shift order remains unchanged.

Thus, switching between MSB-first and LSB-first must be performed before writing data to the SIOAn register.

Figure 18-4. Transfer Bit Order Switching Circuit

**(d) Transfer start**

Serial transfer is started by setting transfer data to the SIOAn register when the following two conditions are satisfied.

- CSIAAn operation control bit (CSIMAn.CSIAEn) = 1
- Other than during serial communication

Caution If the CSIAEn bit is set to 1 after data is written to the SIOAn register, communication does not start.

Upon termination of 8-bit communication, serial communication automatically stops and the transmission/reception completion interrupt request signal (INTCSIAAn) is generated.

Remark $n = 0, 1$

18.4.2 3-wire serial I/O mode with automatic transmit/receive function

Up to 32 bytes of data can be transmitted/received without using software in the mode in which the CSIMAn.ATEn bit is set to 1. After communication is started, only data of the set number of bytes stored in RAM in advance can be transmitted, and only data of the set number of bytes can be received and stored in RAM.

The 3-wire serial I/O mode with automatic transmit/receive function is controlled by the following registers.

- Serial operation mode specification register n (CSIMAn)
- Serial status register n (CSISn)
- Serial trigger register n (CSITn)
- Divisor selection register n (BRGCAn)
- Automatic data transfer address point specification register n (ADTPn)
- Automatic data transfer interval specification register n (ADTIn)

Remarks 1. For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions.**

2. n = 0, 1

(1) Automatic transmit/receive data setting**(a) Transmit data setting**

- <1> Write transmit data from the least significant address FFFFFFFE00H/FFFFFFE20H of buffer RAM (up to FFFFFFFE1FH/FFFFFFE3FH at maximum). The transmit data should be in the order from lower address to higher address.
- <2> Set the ADTPn register to the value obtained by subtracting 1 from the number of transmit data bytes.

(b) Automatic transmission/reception mode setting

- <1> Set the CSIMAn.CSIAEn bit and the CSIMAn.ATEn bit to 11.
- <2> Set the CSIMAn.RXEAn bit and the CSIMAn.TXEAn bit to 11.
- <3> Set a data transfer interval in the ADTIn register.
- <4> Set the CSITn.ATSTAn bit to 1.

The following operations are automatically carried out when (a) and (b) are carried out.

- After the buffer RAM data indicated by the ADTCn register is transferred to the SIOAn register, transmission is carried out (start of automatic transmission/reception).
- The received data is written to the buffer RAM address indicated by the ADTCn register.
- ADTCn register is incremented and the next data transmission/reception is carried out. Data transmission/reception continues until the ADTCn register incremental output matches the set value of the ADTPn register (end of automatic transmission/reception). However, if the CSIMAn.ATMn bit is set to 1 (continuous transfer mode), the ADTCn register is cleared after a match between the ADTPn and ADTCn registers, and then repeated transmission/reception is started.
- When automatic transmission/reception is terminated, the CSISn.TSFn bit is cleared to 0.

Caution Determine the setting procedure of alternate-function pins considering the relationship with the communication partner.

Remark n = 0, 1

(2) Automatic transmission/reception communication operation**(a) Automatic transmission/reception mode**

Automatic transmission/reception can be performed using buffer RAM.

The data stored in the buffer RAM is output from the SOAn pin via the SIOAn register in synchronization with the SCKAn pin falling edge by performing (a) and (b) in **(1) Automatic transmit/receive data setting**.

The data is then input from the SIA_n pin via the SIOAn register in synchronization with the serial clock falling edge of the SCKAn pin and the receive data is stored in the buffer RAM in synchronization with the rising edge 1 clock later.

Data transfer ends if the CSIS_n.TSF_n bit is cleared to 0 when any of the following conditions is met.

- Reset by clearing the CSIMAn.CSIAEn bit to 0
- Transfer of 1 byte is complete by setting the CSIT_n.ATSTP_n bit to 1
- Transfer of the range specified by the ADTP_n register is complete

At this time, a transmission/reception completion interrupt request signal (INTCSIA_n) is generated except when the CSIAEn bit = 0.

If a transfer is terminated in the middle, transfer starting from the remaining data is not possible. Read the ADTC_n register to confirm how much of the data has already been transferred, set the transfer data again, and perform (a) and (b) in **(1) Automatic transmit/receive data setting**.

Figure 18-5 shows the operation timing in automatic transmission/reception mode and Figure 18-6 shows the operation flowchart. Figure 18-7 shows the operation of the buffer RAM when 6 bytes of data are transmitted/received.

Remark n = 0, 1

Figure 18-5. Automatic Transmission/Reception Mode Operation Timings

Cautions 1. Because, in the automatic transmission/reception mode, the automatic transmit/receive function reads/writes data from/to the buffer RAM after 1-byte transmission/reception, an interval is inserted until the next transmission/reception. As the buffer RAM read/write is performed at the same time as CPU processing, the interval is dependent upon the value of the ADTIn register.

2. When the TSFn bit is cleared, the SOAn pin becomes low level.

3. If CPU access to the buffer RAM conflicts with CSIAAn read/write during the interval time, the interval time becomes longer.

Remark n = 0, 1

Figure 18-6. Automatic Transmission/Reception Mode Flowchart

In 6-byte transmission/reception (CSIMAn.ATMn bit = 0, CSIMAn.RXEAn bit = 1, CSIMAn.TXEAn bit = 1) in automatic transmission/reception mode, buffer RAM operates as follows.

(i) When transmission/reception operation is started (refer to Figure 18-7 (a).)

When the CSITn.ATSTAn bit is set to 1, transmit data 1 (T1) is transferred from the buffer RAM to the SIOAn register. When transmission of the first byte is completed, receive data 1 (R1) is transferred from the SIOAn register to the buffer RAM, and the ADTCn register is incremented. Then transmit data 2 (T2) is transferred from the buffer RAM to the SIOAn register.

(ii) 4th byte transmission/reception point (refer to Figure 18-7 (b).)

Transmission/reception of the third byte is completed, and transmit data 4 (T4) is transferred from the buffer RAM to the SIOAn register. When transmission of the fourth byte is completed, the receive data 4 (R4) is transferred from the SIOAn register to the buffer RAM, and the ADTCn register is incremented.

(iii) Completion of transmission/reception (refer to Figure 18-7 (c).)

When transmission of the sixth byte is completed, receive data 6 (R6) is transferred from SIOAn register to the buffer RAM, and the transmission/reception completion interrupt request signal (INTCSIA_n) is generated.

**Figure 18-7. Buffer RAM Operation in 6-Byte Transmission/Reception
(in Automatic Transmission/Reception Mode) (1/2)**

Figure 18-7. Buffer RAM Operation in 6-Byte Transmission/Reception
(in Automatic Transmission/Reception Mode) (2/2)

(b) Automatic transmission mode

In this mode, the specified number of 8-bit unit data are transmitted.

Serial transfer is started when the CSITn.ATSTAn bit is set to 1 while the CSIMAn.CSIAEn, CSIMAn.ATEn, and CSIMAn.TXEAn bits are set to 1.

When the final byte has been transmitted, an interrupt request signal (INTCSIA_n) is generated.

Figure 18-8 shows the automatic transmission mode operation timing, and Figure 18-9 shows the operation flowchart. Figure 18-10 shows the operation of the buffer RAM when 6 bytes of data are transmitted.

Figure 18-8. Automatic Transmission Mode Operation Timing

- Cautions**
1. Because, in the automatic transmission mode, the automatic transmit/receive function reads data from the buffer RAM after 1-byte transmission, an interval is inserted until the next transmission. As the buffer RAM read is performed at the same time as CPU processing, the interval is dependent upon the value of the ADTIn register.
 2. When the TSFn bit is cleared, the SOAn pin becomes low level.
 3. If CPU access to the buffer RAM conflicts with CSIA_n read/write during the interval time, the interval time becomes longer.

Remark n = 0, 1

Figure 18-9. Automatic Transmission Mode Flowchart

In 6-byte transmission (CSIMAn.ATMn bit = 0, CSIMAn.RXEAn bit = 0, CSIMAn.TXEAn bit = 1, CSIMAn.ATEn bit = 1) in automatic transmission mode, buffer RAM operates as follows.

(i) When transmission is started (refer to Figure 18-10 (a).)

When the CSITn.ATSTAn bit is set to 1, transmit data 1 (T1) is transferred from the buffer RAM to the SIOAn register. When transmission of the first byte is completed, the ADTCn register is incremented. Then transmit data 2 (T2) is transferred from the buffer RAM to the SIOAn register.

(ii) 4th byte transmission point (refer to Figure 18-10 (b).)

Transmission of the third byte is completed, and transmit data 4 (T4) is transferred from the buffer RAM to the SIOAn register. When transmission of the fourth byte is completed, the ADTCn register is incremented.

(iii) Completion of transmission (refer to Figure 18-10 (c).)

When transmission of the sixth byte is completed, the interrupt request signal (INTCSIA_n) is generated, and the TFSn flag is cleared to 0.

**Figure 18-10. Buffer RAM Operation in 6-Byte Transmission
(in Automatic Transmission Mode) (1/2)**

Figure 18-10. Buffer RAM Operation in 6-Byte Transmission
(in Automatic Transmission Mode) (2/2)

(c) Repeat transmission mode

In this mode, data stored in the buffer RAM is transmitted repeatedly.

Serial transfer is started when the CSITn.ATSTAn bit is set to 1 while the CSIMAn.CSIAEn, CSIMAn.ATEn, CSIMAn.ATMn, and CSIMAn.TXEAn bits are set to 1.

Unlike the basic transmission mode, after the specified number of bytes has been transmitted, the transmission/reception completion interrupt request signal (INTCSIA_n) is not generated, the ADTCn register is reset to 0, and the buffer RAM contents are transmitted again.

The repeat transmission mode operation timing is shown in Figure 18-11, and the operation flowchart in Figure 18-12. Figure 18-13 shows the operation of the buffer RAM when 6 bytes of data are transmitted in the repeat transmission mode.

Figure 18-11. Repeat Transmission Mode Operation Timing

- Cautions**
1. Because, in the repeat transmission mode, a read is performed on the buffer RAM after the transmission of one byte, the interval is included in the period up to the next transmission. As the buffer RAM read is performed at the same time as CPU processing, the interval is dependent upon the ADTIn register.
 2. If CPU access to the buffer RAM conflicts with CSIA read/write during the interval time, the interval time becomes longer.

Remark n = 0, 1

Figure 18-12. Repeat Transmission Mode Flowchart

In 6-byte transmission (CSIMAn.ATMn bit = 1, CSIMAn.RXEAn bit = 0, CSIMAn.TXEAn bit = 1, CSIMAn.ATEn bit = 1) in repeat transmission mode, buffer RAM operates as follows.

(i) When transmission is started (refer to Figure 18-13 (a).)

When the CSITn.ATSTAn bit is set to 1, transmit data 1 (T1) is transferred from the buffer RAM to the SIOAn register. When transmission of the first byte is completed, the ADTCn register is incremented. Then transmit data 2 (T2) is transferred from the buffer RAM to the SIOAn register.

(ii) Upon completion of transmission of 6 bytes (refer to Figure 18-13 (b).)

When transmission of the sixth byte is completed, the interrupt request signal (INTCSIA_n) is not generated.

The ADTCn register is reset to 0.

(iii) 7th byte transmission point (refer to Figure 18-13 (c).)

Transmit data 1 (T1) is transferred from the buffer RAM to SIOAn register again. When transmission of the first byte is completed, the ADTCn register is incremented. Then transmit data 2 (T2) is transferred from the buffer RAM to the SIOAn register.

**Figure 18-13. Buffer RAM Operation in 6-Byte Transmission
(in Repeat Transmission Mode) (1/2)**

Figure 18-13. Buffer RAM Operation in 6-Byte Transmission
(in Repeat Transmission Mode) (2/2)

(d) Data format

In the data format, data is changed in synchronization with the $\overline{\text{SCKAn}}$ pin falling edge as shown in Figure 18-14.

The data length is fixed to 8 bits and the data transfer direction can be switched by the specification of the CSIMAn.DIRAn bit.

Figure 18-14. Format of CSIA_n Transmit/Receive Data

Remark $n = 0, 1$

(e) Automatic transmission/reception suspension and restart

Automatic transmission/reception can be temporarily suspended by setting the CSITn.ATSTPn bit to 1. During 8-bit data transfer, the transmission/reception is not suspended. It is suspended upon completion of 8-bit data transfer.

When suspended, the CSISn.TSFn bit is cleared to 0 after transfer of the 8th bit.

To restart automatic transmission/reception, set the CSITn.ATSTAn bit to 1. The remaining data can be transmitted in this way.

- Cautions**
1. If the IDLE instruction is executed during automatic transmission/reception, transfer is suspended and the IDLE mode is set if during 8-bit data transfer. When the IDLE mode is cleared, automatic transmission/reception is restarted from the suspended point.
 2. When suspending automatic transmission/reception, do not change the operating mode to 3-wire serial I/O mode while the TSFn bit = 1.

Figure 18-15. Automatic Transmission/Reception Suspension and Restart

CHAPTER 19 I²C BUS

To use the I²C bus function, use the P38/SDA0, P39/SCL0, P80/SDA1, and P81/SCL1 pins as the serial transmit/receive data I/O pin (SDA0, SDA1) and the serial clock I/O pin (SCL0, SCL1), respectively, and set them to N-ch open drain output.

In the V850ES/KJ1, two channels of I²C bus are provided.

The products with an on-chip I²C bus are shown below.

μPD703216Y, 703217Y, 70F3217Y, 70F3217HY, 70F3218HY

19.1 Selecting UART2 or I²C1 Mode

UART2 and I²C1 of the V850ES/KJ1 share pins, and therefore these interfaces cannot be used at the same time. When I²C1 is used, set with the PMC8 and PFC8 registers in advance (refer to **4.3.8 Port 8**).

Caution UART2 or I²C1 transmission/reception operations are not guaranteed if the mode is changed during transmission or reception. Be sure to disable the operation of the unit that is not used.

Figure 19-1. Selecting Mode of UART2 or I²C1

After reset: 00H R/W Address: FFFFF450H

	7	6	5	4	3	2	1	0
PMC8	0	0	0	0	0	0	PMC81	PMC80

After reset: 00H R/W Address: FFFFF470H

	7	6	5	4	3	2	1	0
PFC8	0	0	0	0	0	0	PFC81	PFC80

PFC8n	PMC8n	Operation mode
0	0	Port I/O mode
0	1	UART2 mode
1	0	Port I/O mode
1	1	I ² C1 mode

Remark n = 0, 1

19.2 Features

The I²C0 and I²C1 have the following two modes.

- Operation stop mode
- I²C (Inter IC) bus mode (multimaster supported)

(1) Operation stop mode

This mode is used when serial transfers are not performed. It can therefore be used to reduce power consumption.

(2) I²C bus mode (multimaster supported)

This mode is used for 8-bit data transfers with several devices via two lines: a serial clock (SCLn) line and a serial data bus (SDAn) line.

This mode complies with the I²C bus format and the master device can generate “start condition”, “address”, “transfer direction specification”, “data”, and “stop condition” data to the slave device, via the serial data bus. The slave device automatically detects these received state and data by hardware. This function can simplify the part of application program that controls the I²C bus.

Since the SCLn and SDAn pins are used for N-ch open drain outputs, I²Cn requires pull-up resistors for the serial clock line and the serial data bus line.

Remark n = 0, 1

<R>

Figure 19-2. Block Diagram of I²Cn

A serial bus configuration example is shown below.

Figure 19-3. Serial Bus Configuration Example Using I²C Bus

19.3 Configuration

I²Cn includes the following hardware.

Table 19-1. Configuration of I²Cn

Item	Configuration
Registers	IIC shift registers 0 and 1 (IIC0, IIC1) Slave address registers 0 and 1 (SVA0, SVA1)
Control registers	IIC control registers 0 and 1 (IICC0, IICC1) IIC status registers 0 and 1 (IICS0, IICS1) IIC flag registers 0 and 1 (IICCF0, IICCF1) IIC clock selection registers 0 and 1 (IICCL0, IICCL1) IIC function expansion registers 0 and 1 (IICX0, IICX1)

Remark n = 0, 1

(1) IIC shift registers 0 and 1 (IIC0, IIC1)

The IICn register is used to convert 8-bit serial data to 8-bit parallel data and to convert 8-bit parallel data to 8-bit serial data. The IICn register can be used for both transmission and reception.

Write and read operations to the IICn register are used to control the actual transmit and receive operations.

The IICn register can be read or written in 8-bit units.

After reset, IIC0 and IIC1 are cleared to 00H.

(2) Slave address registers 0 and 1 (SVA0, SVA1)

The SVAn register sets local addresses when in slave mode.

The SVAn register can be read or written in 8-bit units.

After reset, SVA0 and SVA1 are cleared to 00H.

(3) SO latch

The SO latch is used to retain the SDAn pin's output level.

(4) Wakeup controller

This circuit generates an interrupt request signal (INTIICn) when the address received by this register matches the address value set to the SVAn register or when an extension code is received.

(5) Prescaler

This selects the sampling clock to be used.

(6) Serial clock counter

This counter counts the serial clocks that are output and the serial clocks that are input during transmit/receive operations and is used to verify that 8-bit data was sent or received.

(7) Interrupt request signal generator

This circuit controls the generation of interrupt request signals (INTIICn).

An I²C interrupt is generated following either of two triggers.

- Falling of the eighth or ninth clock of the serial clock (set by IICn.WTIMn bit)
- Interrupt request generated when a stop condition is detected (set by IICn.SPIEn bit)

(8) Serial clock controller

In master mode, this circuit generates the clock output via the SCLn pin from a sampling clock.

(9) Serial clock wait controller

This circuit controls the wait timing.

(10) $\overline{\text{ACK}}$ generator, stop condition detector, start condition detector, and $\overline{\text{ACK}}$ detector

These circuits are used to generate and detect various statuses.

(11) Data hold time correction circuit

This circuit generates the hold time for data corresponding to the falling edge of the serial clock.

(12) Start condition generator

This circuit generates a start condition when the IICCn.STTn bit is set.

However, in the communication reservation disabled status (IICFn.IICRSVn bit = 1), when the bus is not released (IICFn.IICBSYn bit = 1), start condition requests are ignored and the IICFn.STCFn bit is set to 1.

(13) Stop condition generator

A stop condition is generated when the IICn.SPTn bit is set (1).

(14) Bus status detector

This circuit detects whether or not the bus is released by detecting start conditions and stop conditions.

However, as the bus status cannot be detected immediately following operation, the initial status is set by the IICFn.STCENn bit.

19.4 Registers

I²C0 and I²C1 are controlled by the following registers.

- IIC control registers 0, 1 (IICC0, IICC1)
- IIC status registers 0, 1 (IICS0, IICS1)
- IIC flag registers 0, 1 (IICF0, IICF1)
- IIC clock selection registers 0, 1 (IICCL0, IICCL1)
- IIC function expansion registers 0, 1 (IICX0, IICX1)

The following registers are also used.

- IIC shift registers 0, 1 (IIC0, IIC1)
- Slave address registers 0, 1 (SVA0, SVA1)

Remark For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

(1) IIC control registers 0, 1 (IICC0, IICC1)

The IICCn register is used to enable/stop I²Cn operations, set wait timing, and set other I²C operations.

<R> The IICCn register can be read or written in 8-bit or 1-bit units. However, set the SPIEn, WTIMn, and ACKEn bits when the IICEn bit is 0 or during the wait period. When setting the IICEn bit from “0” to “1”, these bits can also be set at the same time.

Reset sets these registers to 00H.

After reset: 00H R/W Address: IICC0 FFFFFFFD82H, IICC1 FFFFFFFD92H

	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>
IICcn	IICEn	LRELn	WRELn	SPIEn	WTIMn	ACKEn	STTn	SPTn

(n = 0, 1)

IICEn	I ² Cn operation enable/disable specification
0	Stop operation. Reset the IICSn register ^{Note 1} . Stop internal operation.
1	Enable operation.
Be sure to set this bit to 1 when the SCLn and SDAn lines are high level.	
Condition for clearing (IICEn bit = 0)	
• Cleared by instruction • Reset	
Condition for setting (IICEn bit = 1)	
• Set by instruction	

LRELn ^{Note 2}	Exit from communications
0	Normal operation
1	This exits from the current communications and sets standby mode. This setting is automatically cleared to 0 after being executed. Its uses include cases in which a locally irrelevant extension code has been received. The SCLn and SDAn lines are set to high impedance. The STTn, SPTn, IICSn.MSTS_n, IICSn.EXC_n, IICSn.COIn, IICSn.TRC_n, IICSn.ACKD_n, and IICSn.STD_n bits are cleared to 0.
The standby mode following exit from communications remains in effect until the following communications entry conditions are met. • After a stop condition is detected, restart is in master mode. • An address match or extension code reception occurs after the start condition.	
Condition for clearing (LRELn bit = 0)	
• Automatically cleared after execution • Reset	
Condition for setting (LRELn bit = 1)	
• Set by instruction	

WRELn ^{Note 2}	Wait cancellation control
0	Do not cancel wait
1	Cancel wait. This setting is automatically cleared to 0 after wait is canceled.
Condition for clearing (WRELn bit = 0)	
• Automatically cleared after execution • Reset	
Condition for setting (WRELn bit = 1)	
• Set by instruction	

Notes 1. The IICSn register, and the IICFn.STCFn, IICFn.IICBSYn, IICCLn.CLDn, and IICCLn.DADn bits are reset.

2. This flag's signal is invalid when the IICEn bit = 0.

Caution If the I²Cn operation is enabled (IICEn bit = 1) when the SCLn line is high level and the SDAn line is low level, the start condition is detected immediately. To avoid this, after enabling the I²Cn operation, immediately set the LRELn bit to 1 with a bit manipulation instruction.

SPIEn ^{Note}	Enable/disable generation of interrupt request when stop condition is detected	
0	Disable	
1	Enable	
Condition for clearing (SPIEn bit = 0)		Condition for setting (SPIEn bit = 1)
• Cleared by instruction • Reset		• Set by instruction

WTIMn ^{Note}	Control of wait and interrupt request generation
0	Interrupt request is generated at the eighth clock's falling edge. Master mode: After output of eight clocks, clock output is set to low level and wait is set. Slave mode: After input of eight clocks, the clock is set to low level and wait is set for master device.
1	Interrupt request is generated at the ninth clock's falling edge. Master mode: After output of nine clocks, clock output is set to low level and wait is set. Slave mode: After input of nine clocks, the clock is set to low level and wait is set for master device.
An interrupt is generated at the falling of the 9th clock during address transfer independently of the setting of this bit. The setting of this bit is valid when the address transfer is completed. When in master mode, a wait is inserted at the falling edge of the ninth clock during address transfers. For a slave device that has received a local address, a wait is inserted at the falling edge of the ninth clock after $\overline{\text{ACK}}$ is issued. However, when the slave device has received an extension code, a wait is inserted at the falling edge of the eighth clock.	
Condition for clearing (WTIMn bit = 0)	
Condition for setting (WTIMn bit = 1)	
• Cleared by instruction • Reset	• Set by instruction

ACKEn ^{Note}	Acknowledgment control
0	Disable acknowledgment.
1	Enable acknowledgment. During the ninth clock period, the SDA _n line is set to low level.
The ACKEn bit setting is invalid for address reception. In this case, $\overline{\text{ACK}}$ is generated when the addresses match. However, the ACKEn bit setting is valid for address reception of the extension code.	
Condition for clearing (ACKEn bit = 0)	Condition for setting (ACKEn bit = 1)
• Cleared by instruction • Reset	• Set by instruction

Note This flag's signal is invalid when the IICEn bit = 0.

STTn	Start condition trigger
0	Do not generate a start condition.
1	When bus is released (in STOP mode): Generate a start condition (for starting as master). The SDAn line is changed from high level to low level while the SCLn line is high level and then the start condition is generated. Next, after the rated amount of time has elapsed, the SCLn line is changed to low level (wait status). When a third party is communicating - When communication reservation function is enabled (IICFn.IICRSVn bit = 0) Functions as the start condition reservation flag. When set to 1, automatically generates a start condition after the bus is released. - When communication reservation function is disabled (IICRSVn bit = 1) The IICFn.STCFn bit is set to 1 and the information set (1) to the STTn bit is cleared. No start condition is generated. In the wait state (when master device): Generates a restart condition after releasing the wait.
Cautions concerning set timing For master reception: Cannot be set to 1 during transfer. Can be set to 1 only when the ACKEn bit has been cleared to 0 and slave has been notified of final reception. For master transmission: A start condition may not be generated normally during the acknowledgment period. Set to 1 during the wait period that follows output of the ninth clock. - Cannot be set to 1 at the same time as the SPTn bit. - When the STTn bit is set to 1, setting the STTn bit to 1 again is disabled until the setting is cleared to 0.	
Condition for clearing (STTn bit = 0)	Condition for setting (STTn bit = 1)
- When the STTn bit is set to 1 in the communication reservation disabled status - Cleared when start condition is generated by master device - When the LRELn bit = 1 (exit from communications) - When the IICEn bit changes from 1 to 0 (operation stop) - Reset	Set by instruction

Remark The STTn bit is 0 if it is read after data setting.

SPTn	Stop condition trigger				
0	Stop condition is not generated.				
1	Stop condition is generated (termination of master device's transfer). After the SDAn line goes to low level, either set the SCLn line to high level or wait until the SCLn pin goes to high level. Next, after the rated amount of time has elapsed, the SDAn line is changed from low level to high level and a stop condition is generated.				
Cautions concerning setting timing For master reception: Cannot be set to 1 during transfer. Can be set to 1 only when the ACKEn bit has been cleared to 0 and during the wait period after slave has been notified of final reception. For master transmission: A stop condition may not be generated normally during the acknowledgment period. Set to 1 during the wait period that follows output of the ninth clock. • Cannot be set to 1 at the same time as the STTn bit. • The SPTn bit can be set to 1 only when in master mode^{Note}. • When the WTIMn bit has been cleared to 0, if the SPTn bit is set to 1 during the wait period that follows output of eight clocks, note that a stop condition will be generated during the high-level period of the ninth clock. The WTIMn bit should be changed from 0 to 1 during the wait period following output of eight clocks, and the SPTn bit should be set to 1 during the wait period that follows output of the ninth clock. • When the SPTn bit is set to 1, setting the SPTn bit to 1 again is disabled until the setting is cleared to 0.					
<table border="1"> <thead> <tr> <th>Condition for clearing (SPTn bit = 0)</th><th>Condition for setting (SPTn bit = 1)</th></tr> </thead> <tbody> <tr> <td> • Cleared by loss in arbitration • Automatically cleared after stop condition is detected • When the LRELn bit = 1 (exit from communications) • When the IICEn bit changes from 1 to 0 (operation stop) • Reset </td><td> • Set by instruction </td></tr> </tbody> </table>		Condition for clearing (SPTn bit = 0)	Condition for setting (SPTn bit = 1)	• Cleared by loss in arbitration • Automatically cleared after stop condition is detected • When the LRELn bit = 1 (exit from communications) • When the IICEn bit changes from 1 to 0 (operation stop) • Reset	• Set by instruction
Condition for clearing (SPTn bit = 0)	Condition for setting (SPTn bit = 1)				
• Cleared by loss in arbitration • Automatically cleared after stop condition is detected • When the LRELn bit = 1 (exit from communications) • When the IICEn bit changes from 1 to 0 (operation stop) • Reset	• Set by instruction				

Note Set the SPTn bit to 1 only in master mode. However, the SPTn bit must be set to 1 and a stop condition generated before the first stop condition is detected following the switch to operation enable status. For details, refer to **19.15 Cautions**.

Caution When the IICSn.TRCn bit is set to 1, the WRELn bit is set to 1 during the ninth clock and wait is canceled, after which the TRCn bit is cleared to 0 and the SDAn line is set to high impedance.

Remark The SPTn bit is 0 if it is read after data setting.

(2) IIC status registers 0, 1 (IICS0, IICS1)

The IICS_n register indicates the status of the I²C_n bus.

The IICS_n register is read-only, in 8-bit or 1-bit units.

However, the IICS_n register can only be read when the IIC_n.STT_n bit is 1 or during the wait period.

Reset sets these registers to 00H.

Caution When the main clock is stopped and the CPU is operating on the subclock, do not access the IICS_n register using an access method that causes a wait.

For details, refer to 3.4.8 (1) (b).

(1/3)

After reset: 00H R Address: IICS0 FFFFFFFD86H, IICS1 FFFFFFFD96H

	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>
IICS _n	MSTS _n	ALD _n	EXC _n	COL _n	TRC _n	ACKD _n	STD _n	SPD _n

(n = 0, 1)

MSTS _n	Master device status
0	Slave device status or communication standby status
1	Master device communication status
Condition for clearing (MSTS _n bit = 0)	
- When a stop condition is detected - When the ALD_n bit = 1 (arbitration loss) - Cleared by the IIC_n.LREL_n bit = 1 (exit from communications) - When the IIC_n.IICEn bit changes from 1 to 0 (operation stop) - Reset	
Condition for setting (MSTS _n bit = 1)	
When a start condition is generated	

ALD _n	Detection of arbitration loss
0	This status means either that there was no arbitration or that the arbitration result was a "win".
1	This status indicates the arbitration result was a "loss". The MSTS _n bit is cleared to 0.
Condition for clearing (ALD _n bit = 0)	
- Automatically cleared after the IICS_n register is read^{Note} - When the IICEn bit changes from 1 to 0 (operation stop) - Reset	
Condition for setting (ALD _n bit = 1)	
When the arbitration result is a "loss".	

Note This bit is also cleared when a bit manipulation instruction is executed for another bit in the IICS_n register.

EXCn	Detection of extension code reception
0	Extension code was not received.
1	Extension code was received.
Condition for clearing (EXCn bit = 0)	
• When a start condition is detected • When a stop condition is detected • Cleared by the LRELn bit = 1 (exit from communications) • When the IICEn bit changes from 1 to 0 (operation stop) • Reset	
Condition for setting (EXCn bit = 1)	
• When the higher four bits of the received address data is either "0000" or "1111" (set at the rising edge of the eighth clock).	

COIn	Detection of matching addresses
0	Addresses do not match.
1	Addresses match.
Condition for clearing (COIn bit = 0)	
• When a start condition is detected • When a stop condition is detected • Cleared by the LRELn bit = 1 (exit from communications) • When the IICEn bit changes from 1 to 0 • Reset	
Condition for setting (COIn bit = 1)	
• When the received address matches the local address (SVAn register) (set at the rising edge of the eighth clock).	

TRCn	Detection of transmit/receive status
0	Receive status (other than transmit status). The SDAn line is set for high impedance.
1	Transmit status. The value in the SO latch is enabled for output to the SDAn line (valid starting at the rising edge of the first byte's ninth clock).
Condition for clearing (TRCn bit = 0)	
• When a stop condition is detected • Cleared by the LRELn bit = 1 (exit from communications) • When the IICEn bit changes from 1 to 0 (operation stop) • Cleared by the IICn.WRELn bit = 1^{Note} (wait release) • When the ALDn bit changes from 0 to 1 (arbitration loss) • Reset	
Condition for setting (TRCn bit = 1)	
Master • When a start condition is generated • When "0" is output to the first byte's LSB (transfer direction specification bit) Slave • When "1" is input in the first byte's LSB (transfer direction specification bit)	

Note The IICSn.TRcN bit is cleared to 0 and the SDAn line become high impedance when the IICn.WRELn bit is set to 1 and wait state is released at the ninth clock with the TRcN bit = 1.

<R>

ACKDn	Detection of $\overline{\text{ACK}}$	
0	$\overline{\text{ACK}}$ was not detected.	
1	$\overline{\text{ACK}}$ was detected.	
Condition for clearing (ACKDn bit = 0)		Condition for setting (ACKDn bit = 1)
• When a stop condition is detected • At the rising edge of the next byte's first clock • Cleared by the LRELn bit = 1 (exit from communications) • When the IICEn bit changes from 1 to 0 (operation stop) • Reset		• After the SDAn pin is set to low level at the rising edge of the SCLn pin's ninth clock

STDn	Detection of start condition	
0	Start condition was not detected.	
1	Start condition was detected. This indicates that the address transfer period is in effect	
Condition for clearing (STDn bit = 0)		Condition for setting (STDn bit = 1)
• When a stop condition is detected • At the rising edge of the next byte's first clock following address transfer • Cleared by the LRELn bit = 1 (exit from communications) • When the IICEn bit changes from 1 to 0 (operation stop) • Reset		• When a start condition is detected

SPDn	Detection of stop condition	
0	Stop condition was not detected.	
1	Stop condition was detected. The master device's communication is terminated and the bus is released.	
Condition for clearing (SPDn bit = 0)		Condition for setting (SPDn bit = 1)
• At the rising edge of the address transfer byte's first clock following setting of this bit and detection of a start condition • When the IICEn bit changes from 1 to 0 (operation stop) • Reset		• When a stop condition is detected

(3) IIC flag registers 0, 1 (IICF0, IICF1)

IICF0 and IICF1 are registers that set the operation mode of I²Cn and indicate the status of the I²C bus.

These registers can be read or written in 8-bit or 1-bit units. However, the STCFn and IICBSYn bits are read-only.

The IICRSVn bit can be used to enable/disable the communication reservation function (refer to **19.14 Communication Reservation**).

The STCENn bit can be used to set the initial value of the IICBSYn bit (refer to **19.15 Cautions**).

The IICRSVn and STCENn bits can be written only when the operation of I²Cn is disabled (IICCN.IICEn bit = 0).

When operation is enabled, the IICFn register can be read.

Reset sets these registers to 00H.

After reset: 00H R/W^{Note} Address: IICF0 FFFFFFFD8AH, IICF1 FFFFFFFD9AH

	<7>	<6>	5	4	3	2	<1>	<0>
IICFn	STCFn	IICBSYn	0	0	0	0	STCENn	IICRSVn

(n = 0, 1)

STCFn	IICn.STTn clear flag
0	Generate start condition
1	Start condition generation unsuccessful: clear STTn flag
Condition for clearing (STCFn bit = 0)	
• Clearing by setting the STTn bit = 1 • When the IICEn bit changes from 1 to 0 (operation stop) • Reset	
Condition for setting (STCFn bit = 1)	
• Generating start condition unsuccessful and the STTn bit cleared to 0 when communication reservation is disabled (IICRSVn bit = 1).	

<R>

IICBSYn	I ² Cn bus status flag
0	Bus release status (initial communication status when STCENn bit = 1)
1	Bus communication status (initial communication status when STCENn bit = 0)
Condition for clearing (IICBSYn bit = 0)	
• Detection of stop condition • When the IICEn bit changes from 1 to 0 (operation stop) • Reset	
Condition for setting (IICBSYn bit = 1)	
• Detection of start condition • Setting of the IICEn bit when the STCENn bit = 0	

<R>

STCENn	Initial start enable trigger
0	After operation is enabled (IICEn bit = 1), enable generation of a start condition upon detection of a stop condition.
1	After operation is enabled (IICEn bit = 1), enable generation of a start condition without detecting a stop condition.
Condition for clearing (STCENn bit = 0)	
• Detection of start condition • Reset	
Condition for setting (STCENn bit = 1)	
• Setting by instruction	

IICRSVn	Communication reservation function disable bit
0	Enable communication reservation
1	Disable communication reservation
Condition for clearing (IICRSVn bit = 0)	
• Clearing by instruction • Reset	
Condition for setting (IICRSVn bit = 1)	
• Setting by instruction	

Note Bits 6 and 7 are read-only bits.

- Cautions**
1. Write to the STCENn bit only when the operation is stopped (IICEn bit = 0).
 2. As the bus release status (IICBSYn bit = 0) is recognized regardless of the actual bus status when the STCENn bit = 1, when generating the first start condition (STTn bit = 1), it is necessary to verify that no third party communications are in progress in order to prevent such communications from being destroyed.
 3. Write to the IICRSVn bit only when the operation is stopped (IICEn bit = 0).

(4) IIC clock selection registers 0, 1 (IICCL0, IICCL1)

The IICCLn register is used to set the transfer clock for the I²C bus.

The IICCLn register can be read or written in 8-bit or 1-bit units. However, the CLDn and DADn bits are read-only. The SMCn, CLn1 and CLn0 bits are set in combination with the IICXn.CLXn bit (refer to **19.4 (6) I²Cn transfer clock setting method**).

<R> Set the IICCLn register when the IICCN.IICEn bit = 0.

Reset sets these registers to 00H.

After reset: 00H R/W^{Note} Address: IICCL0 FFFFFFFD84H, IICCL1 FFFFFFFD94H

	7	6	<5>	<4>	3	2	1	0
IICCLn	0	0	CLDn	DADn	SMCn	DFCn	CLn1	CLn0

(n = 0, 1)

CLDn	Detection of SCLn pin level (valid only when IICCN.IICEn bit = 1)
0	The SCLn pin was detected at low level.
1	The SCLn pin was detected at high level.
Condition for clearing (CLDn bit = 0)	
- When the SCLn pin is at low level - When the IICEn bit changes from 1 to 0 (operation stop) - Reset	
Condition for setting (CLDn bit = 1)	
When the SCLn pin is at high level	

DADn	Detection of SDAn pin level (valid only when IICEn bit = 1)
0	The SDAn pin was detected at low level.
1	The SDAn pin was detected at high level.
Condition for clearing (DADn bit = 0)	
- When the SDAn pin is at low level - When IICEn bit changes from 1 to 0 (operation stop) - Reset	
Condition for setting (DADn bit = 1)	
When the SDAn pin is at high level	

SMCn	Operation mode switching
0	Operates in standard mode.
1	Operates in high-speed mode.

DFCn	Digital filter operation control
0	Digital filter off.
1	Digital filter on.
Digital filter can be used only in high-speed mode. In high-speed mode, the transfer clock does not vary regardless of DFCn bit set/clear. The digital filter is used for noise elimination in high-speed mode.	

Note Bits 4 and 5 are read-only bits.

(5) IIC function expansion registers 0, 1 (IICX0, IICX1)

These registers set the function expansion of I²Cn (valid only in high-speed mode).

These registers can be read or written in 8-bit or 1-bit units. The CLXn bit is set in combination with the IICCLn.SMCn, IICCLn.CLn1, and IICCLn.CLn0 bits (refer to **19.4 (6) I²Cn transfer clock setting method**).

Set the IICXn register when the IICCN.IICEn bit = 0.

Reset sets these registers to 00H.

<R>

After reset: 00H	R/W	Address: IICX0 FFFFFFFD85H, IICX1 FFFFFFFD95H							
		7	6	5	4	3	2	1	<0>
IICXn		0	0	0	0	0	0	0	CLXn
(n = 0, 1)									

(6) I²Cn transfer clock setting method

The I²Cn transfer clock frequency (f_{SCL}) is calculated using the following expression (n = 0, 1).

$$f_{SCL} = 1/(m \times T + t_R + t_F)$$

m = 12, 24, 48, 54, 86, 88, 172, 198 (refer to **Table 19-2 Selection Clock Setting**.)

T: 1/f_{xx}

t_R: SCLn rise time

t_F: SCLn fall time

For example, the I²Cn transfer clock frequency (f_{SCL}) when f_{xx} = 20 MHz, m = 54, t_R = 200 ns, and t_F = 50 ns is calculated using following expression.

$$f_{SCL} = 1/(54 \times 50 \text{ ns} + 200 \text{ ns} + 50 \text{ ns}) \cong 339 \text{ kHz}$$

The selection clock is set using a combination of the IICCLn.SMCn, IICCLn.CLn1, and IICCLn.CLn0 bits and the IICXn.CLXn bit.

Table 19-2. Selection Clock Setting

IICXn	IICCLn			Selection Clock	Transfer Clock (f _{xx} /m)	Settable Internal System Clock Frequency (f _{xx}) Range	Operation Mode
Bit 0	Bit 3	Bit 1	Bit 0				
CLXn	SMCn	CLn1	CLn0				
0	0	0	0	f _{xx} /2	f _{xx} /88	4.0 MHz to 8.38 MHz	Normal mode (SMCn bit = 0)
0	0	0	1	f _{xx} /2	f _{xx} /172	8.38 MHz to 16.76 MHz	
0	0	1	0	f _{xx}	f _{xx} /86	4.19 MHz to 8.38 MHz	
0	0	1	1	f _{xx} /3	f _{xx} /198	16.0 MHz to 19.8 MHz	
0	1	0	x	f _{xx} /2	f _{xx} /48	8 MHz to 16.76 MHz	High-speed mode (SMCn bit = 1)
0	1	1	0	f _{xx}	f _{xx} /24	4 MHz to 8.38 MHz	
0	1	1	1	f _{xx} /3	f _{xx} /54	16 MHz to 20 MHz	
1	0	x	x	Setting prohibited			
1	1	0	x	f _{xx} /2	f _{xx} /24	8.00 MHz to 8.38 MHz	High-speed mode (SMCn bit = 1)
1	1	1	0	f _{xx}	f _{xx} /12	4.00 MHz to 4.19 MHz	
1	1	1	1	Setting prohibited			

Remarks 1. n = 0, 1
2. x: don't care

(7) IIC shift registers 0, 1 (IIC0, IIC1)

The IICn register is used for serial transmission/reception (shift operations) that is synchronized with the serial clock.

The IICn register can be read or written in 8-bit units, but data should not be written to the IICn register during a data transfer.

<R>

Access (read/write) the IICn register only during the wait period. Accessing this register in communication states other than the wait period is prohibited. However, for the master device, the IICn register can be written once only after the transmission trigger bit (IICn.STTn bit) has been set to 1.

When the IICn register is written during wait, the wait is cancelled and data transfer is started.

Reset sets these registers to 00H.

**(8) Slave address registers 0, 1 (SVA0, SVA1)**

The SVAn register holds the I²C bus's slave addresses.

However, rewriting these registers is prohibited when the IICSn.STDn bit = 1 (start condition detection).

The SVAn register can be read or written in 8-bit units, but bit 0 should be fixed as 0.

Reset sets these registers to 00H.

<R>

19.5 Functions

19.5.1 Pin configuration

The serial clock pin (SCLn) and serial data bus pin (SDAn) are configured as follows (n = 0, 1).

SCLn This pin is used for serial clock input and output.

This pin is an N-ch open-drain output for both master and slave devices. Input is Schmitt input.

SDAn This pin is used for serial data input and output.

This pin is an N-ch open-drain output for both master and slave devices. Input is Schmitt input.

Since outputs from the serial clock line and the serial data bus line are N-ch open-drain outputs, an external pull-up resistor is required.

Figure 19-4. Pin Configuration Diagram

19.6 I²C Bus Definitions and Control Methods

The following section describes the I²C bus's serial data communication format and the status generated by the I²C bus. The transfer timing for the “start condition”, “address”, “transfer direction specification”, “data”, and “stop condition” generated via the I²C bus's serial data bus is shown below.

Figure 19-5. I²C Bus's Serial Data Transfer Timing

The master device generates the start condition, slave address, and stop condition.

ACK can be generated by either the master or slave device (normally, it is generated by the device that receives 8-bit data).

The serial clock (SCLn) is continuously output by the master device. However, in the slave device, the SCLn's low-level period can be extended and a wait can be inserted ($n = 0, 1$).

19.6.1 Start condition

A start condition is met when the SCLn pin is at high level and the SDAn pin changes from high level to low level. The start conditions for the SCLn pin and SDAn pin are generated when the master device starts a serial transfer to the slave device. Start conditions can be detected when the device is used as a slave ($n = 0, 1$).

Figure 19-6. Start Conditions

A start condition is generated when the IICCN.STTn bit is set to 1 after a stop condition has been detected (IICSn.SPDn bit = 1). When a start condition is detected, IICSn.STDn bit is set to 1.

19.6.2 Addresses

The 7 bits of data that follow the start condition are defined as an address.

An address is a 7-bit data segment that is output in order to select one of the slave devices that are connected to the master device via bus lines. Therefore, each slave device connected via the bus lines must have a unique address.

The slave devices include hardware that detects the start condition and checks whether or not the 7-bit address data matches the data values stored in the SVAn register. If the address data matches the SVAn values, the slave device is selected and communicates with the master device until the master device generates a start condition or stop condition ($n = 0, 1$).

Figure 19-7. Address

The slave address and the eighth bit, which specifies the transfer direction as described in **19.6.3 Transfer direction specification** below, are together written to the IICn register and are then output. Received addresses are written to the IICn register.

The slave address is assigned to the higher 7 bits of the IICn register.

19.6.3 Transfer direction specification

In addition to the 7-bit address data, the master device sends 1 bit that specifies the transfer direction. When this transfer direction specification bit has a value of 0, it indicates that the master device is transmitting data to a slave device. When the transfer direction specification bit has a value of 1, it indicates that the master device is receiving data from a slave device.

Figure 19-8. Transfer Direction Specification

<R> 19.6.4 $\overline{\text{ACK}}$

$\overline{\text{ACK}}$ is used to confirm the serial data status of the transmitting and receiving devices.

The receiving device returns $\overline{\text{ACK}}$ for every 8 bits of data it receives.

The transmitting device normally receives $\overline{\text{ACK}}$ after transmitting 8 bits of data. When $\overline{\text{ACK}}$ is returned from the receiving device, the reception is judged as normal and processing continues. The detection of $\overline{\text{ACK}}$ is confirmed with the IICSn.ACKDn bit.

When the master device is the receiving device, after receiving the final data, it does not return $\overline{\text{ACK}}$ and generates the stop condition. When the slave device is the receiving device and does not return $\overline{\text{ACK}}$, the master device generates either a stop condition or a restart condition, and then stops the current transmission. Failure to return $\overline{\text{ACK}}$ may be caused by the following factors.

- (a) Reception was not performed normally.
- (b) The final data was received.
- (c) The receiving device (slave) does not exist for the specified address.

When the receiving device sets the SDA_n line to low level during the ninth clock, $\overline{\text{ACK}}$ is generated (normal reception).

When the IICCN.ACKEn bit is set to 1, automatic $\overline{\text{ACK}}$ generation is enabled. Transmission of the eighth bit following the 7 address data bits causes the IICSn.TRCn bit to be set. Normally, set the ACKEn bit to 1 for reception (TRCn bit = 0).

When the slave device is receiving (when TRCn bit = 0), if the slave device cannot receive data or does not need to receive any more data, clear the ACKEn bit to 0 to indicate to the master that no more data can be received.

Similarly, when the master device is receiving (when TRCn bit = 0) and the subsequent data is not needed, clear the ACKEn bit to 0 to prevent $\overline{\text{ACK}}$ from being generated. This notifies the slave device (transmitting device) of the end of the data transmission (transmission stopped).

Figure 19-9. $\overline{\text{ACK}}$

When the local address is received, $\overline{\text{ACK}}$ is automatically generated regardless of the value of the ACKEn bit. No $\overline{\text{ACK}}$ is generated if the received address is not a local address (NACK).

When receiving the extension code, set the ACKEn bit to 1 in advance to generate $\overline{\text{ACK}}$.

The $\overline{\text{ACK}}$ generation method during data reception is based on the wait timing setting, as described by the following.

- When 8-clock wait is selected (IICCN.WTIMn bit = 0):
 $\overline{\text{ACK}}$ is generated at the falling edge of the SCL0n pin's eighth clock if the ACKEn bit is set to 1 before the wait state cancellation.
- When 9-clock wait is selected (IICCN.WTIMn bit = 1):
 $\overline{\text{ACK}}$ is generated if the ACKEn bit is set to 1 in advance.

Remark n = 0, 1

19.6.5 Stop condition

When the SCLn pin is at high level, changing the SDA_n pin from low level to high level generates a stop condition ($n = 0, 1$).

A stop condition is generated when serial transfer from the master device to the slave device has been completed. Stop conditions can be detected when the device is used as a slave.

Figure 19-10. Stop Condition

A stop condition is generated when the IIC_n.SPT_n bit is set to 1. When the stop condition is detected, the IIC_n.SPD_n bit is set to 1 and the interrupt request signal (INTIIC_n) is generated when the IIC_n.SPIE_n bit is set to 1.

19.6.6 Wait state

The wait state is used to notify the communication partner that a device (master or slave) is preparing to transmit or receive data (i.e., is in a wait state).

Setting the SCLn pin to low level notifies the communication partner of the wait status. When wait status has been canceled for both the master and slave devices, the next data transfer can begin ($n = 0, 1$).

Figure 19-11. Wait State (1/2)

Figure 19-11. Wait State (2/2)

A wait state is automatically generated after a start condition is generated. Moreover, a wait state is automatically generated depending on the setting of the IICn.WTIMn bit.

Normally, when the IICn.WRELn bit is set to 1 or when FFH is written to the IICn register, the wait status is canceled and the transmitting side writes data to the IICn register to cancel the wait status.

The master device can also cancel the wait status via either of the following methods.

- By setting the IICn.STTn bit to 1
- By setting the IICn.SPTn bit to 1

<R> 19.6.7 Wait state cancellation method

In the case of I²Cn, wait state can be canceled normally in the following ways (n = 0 to 2).

- By writing data to the IICn register
- By setting the IICn.WRELn bit to 1 (wait state cancellation)
- By setting the IICn.STTn bit to 1 (start condition generation)^{Note}
- By setting the IICn.SPTn bit to 1 (stop condition generation)^{Note}

Note Master only

If any of these wait state cancellation actions is performed, I²Cn will cancel wait state and restart communication.

When canceling wait state and sending data (including address), write data to the IICn register.

To receive data after canceling wait state, or to complete data transmission, set the WRELn bit to 1.

To generate a restart condition after canceling wait state, set the STTn bit to 1.

To generate a stop condition after canceling wait state, set the SPTn bit to 1.

Execute cancellation only once for each wait state.

For example, if data is written to the IICn register following wait state cancellation by setting the WRELn bit to 1, conflict between the SDAn line change timing and IICn register write timing may result in the data output to the SDAn line may be incorrect.

Even in other operations, if communication is stopped halfway, clearing the IICn.IICEn bit to 0 will stop communication, enabling wait state to be cancelled.

If the I²C bus dead-locks due to noise, etc., setting the IICn.LRELn bit to 1 causes the communication operation to be exited, enabling wait state to be cancelled.

19.7 I²C Interrupt Request Signals (INTIICn)

The following shows the value of the IICSn register at the INTIICn interrupt request signal generation timing and at the INTIICn signal timing.

- Remarks**
1. ST: Start condition
AD6 to AD0: Address
 $\overline{R/W}$: Transfer direction specification
 $\overline{ACK}$: Acknowledge
D7 to D0: Data
SP: Stop condition
 2. n = 0, 1

19.7.1 Master device operation

(1) Start ~ Address ~ Data ~ Data ~ Stop (normal transmission/reception)

<1> When IICn.WTIMn bit = 0

<R>

▲1: IICSn register = 1000X110B

<R>

▲2: IICSn register = 1000X000B

<R>

▲3: IICSn register = 1000X000B (WTIMn bit = 1^{Note})

<R>

▲4: IICSn register = 1000XX00B

Δ5: IICSn register = 00000001B

Note To generate a stop condition, set the WTIMn bit to 1 and change the timing of the generation of the interrupt request signal (INTIICn).

Remarks 1. ▲: Always generated

Δ: Generated only when IICn.SPIEn bit = 1

X: don't care

2. n = 0, 1

<2> When WTIMn bit = 1

<R>

▲1: IICSn register = 1000X110B

<R>

▲2: IICSn register = 1000X100B

<R>

▲3: IICSn register = 1000XX00B

Δ4: IICSn register = 00000001B

Remarks 1. ▲: Always generated

Δ: Generated only when SPIEn bit = 1

X: don't care

2. n = 0, 1

SPT_n bit = 1

<R>	▲1: IICSn register = 1000X110B
<R>	▲2: IICSn register = 1000X000B (WTIMn bit = 1 ^{Note 1})
<R>	▲3: IICSn register = 1000XX00B (WTIMn bit = 0 ^{Note 2})
<R>	▲4: IICSn register = 1000X110B
<R>	▲5: IICSn register = 1000X000B (WTIMn bit = 1 ^{Note 3})
<R>	▲6: IICSn register = 1000XX00B
	△ 7: IICSn register = 00000001B

- Notes**
1. To generate a start condition, set the WTIMn bit to 1 and change the timing of the generation of the interrupt request signal (INTIICn).
 2. Clear the WTIMn bit to 0 to make the settings original.
 3. To generate a stop condition, set the WTIMn bit to 1 and change the timing of the generation of the interrupt request signal (INTIICn).

Remarks

1. ▲: Always generated
△: Generated only when SPIEn bit = 1
X: don't care
2. n = 0, 1

<2> When WTIMn bit = 1

<R>	▲1: IICSn register = 1000X110B
<R>	▲2: IICSn register = 1000XX00B
<R>	▲3: IICSn register = 1000X110B
<R>	▲4: IICSn register = 1000XX00B
	Δ 5: IICSn register = 00000001B

- Remarks**
- ▲: Always generated
Δ: Generated only when SPIEn bit = 1
X: don't care
 - n = 0, 1

(3) Start ~ Code ~ Data ~ Data ~ Stop (extension code transmission)

<1> When WTIMn bit = 0

19.8 Interrupt Request Signal (INTIICn) Generation Timing and Wait Control

The setting of the IICn.WTIMn bit determines the timing by which the INTIICn signal is generated and the corresponding wait control, as shown below.

Table 19-3. INTIICn Signal Generation Timing and Wait Control

WTIMn Bit	During Slave Device Operation			During Master Device Operation		
	Address	Data Reception	Data Transmission	Address	Data Reception	Data Transmission
0	9 ^{Notes 1, 2}	8 ^{Note 2}	8 ^{Note 2}	9	8	8
1	9 ^{Notes 1, 2}	9 ^{Note 2}	9 ^{Note 2}	9	9	9

Notes 1. The slave device's INTIICn signal and wait period occurs at the falling edge of the ninth clock only when there is a match with the address set to the SVAn register.

At this point, $\overline{ACK}$ is generated regardless of the value set to the IICn.ACKEn bit. For a slave device that has received an extension code, the INTIICn signal occurs at the falling edge of the eighth clock.

When the address does not match after restart, the INTIICn signal is generated at the falling edge of the ninth clock, but no wait occurs.

- 2.** If the received address does not match the contents of the SVAn register and extension codes have not been received, neither the INTIICn signal nor a wait occurs.

Remarks 1. The numbers in the table indicate the number of the serial clock's clock signals. Interrupt requests and wait control are both synchronized with the falling edge of these clock signals.

- 2.** n = 0, 1

(1) During address transmission/reception

- Slave device operation: Interrupt and wait timing are determined depending on the conditions in Notes 1 and 2 above regardless of the WTIMn bit.
- Master device operation: Interrupt and wait timing occur at the falling edge of the ninth clock regardless of the WTIMn bit.

(2) During data reception

- Master/slave device operation: Interrupt and wait timing are determined according to the WTIMn bit.

(3) During data transmission

- Master/slave device operation: Interrupt and wait timing are determined according to the WTIMn bit.

(4) Wait cancellation method

The four wait cancellation methods are as follows.

- By writing data to the IICn register
- By setting the IICn.WRELn bit (canceling wait state)
- By setting the IICn.STTn bit (generating start condition)^{Note}
- By setting the IICn.SPTn bit (generating stop condition)^{Note}

Note Master only

When an 8-clock wait has been selected (WTIMn bit = 0), whether or not $\overline{\text{ACK}}$ has been generated must be determined prior to wait cancellation.

Remark n = 0, 1

(5) Stop condition detection

The INTIICn signal is generated when a stop condition is detected.

Remark n = 0, 1

19.9 Address Match Detection Method

When in I²C bus mode, the master device can select a particular slave device by transmitting the corresponding slave address.

Address match detection is performed automatically by hardware. An INTIICn interrupt request signal occurs when a local address has been set to the SVAn register and when the address set to the SVAn register matches the slave address sent by the master device, or when an extension code has been received (n = 0, 1).

19.10 Error Detection

In I²C bus mode, the status of the serial data bus (SDAn) during data transmission is captured by the IICn register of the transmitting device, so the IICn register data prior to transmission can be compared with the transmitted IICn register data to enable detection of transmission errors. A transmission error is judged as having occurred when the compared data values do not match (n = 0, 1).

19.11 Extension Code

- (1) When the higher 4 bits of the receive address are either 0000 or 1111, the extension code flag (EXCn) is set for extension code reception and an interrupt request signal (INTIICn) is issued at the falling edge of the eighth clock. The local address stored in the SVAn register is not affected.
- (2) If 11110xx0 is set to the SVAn register by a 10-bit address transfer and 11110xx0 is transferred from the master device, the results are as follows. Note that the INTIICn signal occurs at the falling edge of the eighth clock.

- Higher 4 bits of data match: IICSn.EXCn bit = 1
- 7 bits of data match: IICSn.COIn bit = 1

- (3) Since the processing after the INTIICn signal occurs differs according to the data that follows the extension code, such processing is performed by software. The slave that has received an extension code is always under communication, even if the addresses mismatch.

For example, when operation as a slave is not desired after the extension code is received, set the IICn.LRELn bit to 1 and the CPU will enter the next communication wait state.

Remark n = 0, 1

Table 19-4. Extension Code Bit Definitions

Slave Address	R/W Bit	Description
0000 000	0	General call address
0000 000	1	Start byte
0000 001	X	CBUS address
0000 010	X	Address that is reserved for different bus format
1111 0xx	X	10-bit slave address specification

19.12 Arbitration

When several master devices simultaneously generate a start condition (when the IICn.STTn bit is set to 1 before the IICSn.STDn bit is set to 1), communication among the master devices is performed as the number of clocks is adjusted until the data differs. This kind of operation is called arbitration ($n = 0, 1$).

When one of the master devices loses in arbitration, an arbitration loss flag (IICSn.ALDn bit) is set (1) via the timing by which the arbitration loss occurred, and the SCLn and SDAn lines are both set for high impedance, which releases the bus.

The arbitration loss is detected based on the timing of the next interrupt request signal (INTIICn) (the eighth or ninth clock, when a stop condition is detected, etc.) and the ALDn bit = 1 setting that has been made by software.

For details of interrupt request timing, refer to **19.7 I²C Interrupt Request Signals (INTIICn)**.

Figure 19-12. Arbitration Timing Example

Table 19-5. Status During Arbitration and Interrupt Request Generation Timing

Status During Arbitration	Interrupt Request Generation Timing
During address transmission	At falling edge of eighth or ninth clock following byte transfer ^{Note 1}
Read/write data after address transmission	
During extension code transmission	
Read/write data after extension code transmission	
During data transmission	
During $\overline{\text{ACK}}$ transfer period after data reception	
When restart condition is detected during data transfer	
When stop condition is detected during data transfer	When stop condition is generated (when IICn.SPIEn bit = 1) ^{Note 2}
When the SDA _n pin is at low level while attempting to generate a restart condition	At falling edge of eighth or ninth clock following byte transfer ^{Note 1}
When stop condition is detected while attempting to generate a restart condition	When stop condition is generated (when SPIEn bit = 1) ^{Note 2}
When the SDA _n pin is at low level while attempting to generate a stop condition	At falling edge of eighth or ninth clock following byte transfer ^{Note 1}
When the SCL _n pin is at low level while attempting to generate a restart condition	

- Notes 1.** When the IICn.WTIMn bit = 1, an interrupt request occurs at the falling edge of the ninth clock. When the WTIMn bit = 0 and the extension code's slave address is received, an interrupt request occurs at the falling edge of the eighth clock.
- 2.** When there is a possibility that arbitration will occur, set the SPIEn bit = 1 for master device operation.

Remark n = 0, 1

19.13 Wakeup Function

The I²C bus slave function is a function that generates an interrupt request signal (INTIICn) when a local address or extension code has been received.

This function makes processing more efficient by preventing unnecessary interrupt requests from occurring when addresses do not match.

When a start condition is detected, wakeup standby mode is set. This wakeup standby mode is in effect while addresses are transmitted due to the possibility that an arbitration loss may change the master device (which has generated a start condition) to a slave device.

However, when a stop condition is detected, the IICn.SPIEn bit is set regardless of the wake up function, and this determines whether interrupt requests are enabled or disabled (n = 0, 1).

19.14 Communication Reservation

19.14.1 When communication reservation function is enabled (IICFn.IICRSVn bit = 0)

To start master device communications when not currently using a bus, a communication reservation can be made to enable transmission of a start condition when the bus is released. There are two modes under which the bus is not used.

- When arbitration results in neither master nor slave operation
- When an extension code is received and slave operation is disabled ($\overline{\text{ACK}}$ is not returned and the bus was released when the IICFn.LRELn bit was set to “1”).

If the IICFn.STTn bit is set (1) while the bus is not used, a start condition is automatically generated and wait status is set after the bus is released (after a stop condition is detected).

<R> A communication is automatically started as the master by setting the IICFn.SPIEn bit to 1, detecting the bus release due to an interrupt request (INTIICn) occurrence (detecting a stop condition), and then writing the address to the IICn register. Before detecting a stop condition, data written to the IICn register is set to invalid.

When the STTn bit has been set (1), the operation mode (as start condition or as communication reservation) is determined according to the bus status.

If the bus has been released a start condition is generated

If the bus has not been released (standby mode) communication reservation

To detect which operation mode has been determined for the STTn bit, set the STTn bit (1), wait for the wait period, then check the IICFn.MSTS bit.

Wait periods, which should be set via software, are listed in Table 19-6. These wait periods can be set via the settings for the IICFn.CLXn, IICFn.SMCn, IICFn.CLn1, and IICFn.CLn0 bits.

<R>

Table 19-6. Wait Periods

CLXn	SMCn	CLn1	CLn0	Selected Clock	Wait Period
0	0	0	0	$f_{xx}/2$	46 clocks
0	0	0	1	$f_{xx}/2$	86 clocks
0	0	1	0	f_{xx}	43 clocks
0	0	1	1	$f_{xx}/3$	102 clocks
0	1	0	1/0	$f_{xx}/2$	30 clocks
0	1	1	0	f_{xx}	15 clocks
0	1	1	1	$f_{xx}/3$	36 clocks
1	1	0	1/0	$f_{xx}/2$	18 clocks
1	1	1	0	f_{xx}	9 clocks

Remark n = 0, 1

The communication reservation timing is shown below.

Figure 19-13. Communication Reservation Timing

Communication reservations are accepted via the following timing. After the IICSn.STDn bit is set to 1, a communication reservation can be made by setting the IICCn.STTn bit to 1 before a stop condition is detected (n = 0, 1).

Figure 19-14. Timing for Accepting Communication Reservations

The communication reservation flowchart is illustrated below.

Figure 19-15. Communication Reservation Flowchart

Note The communication reservation operation executes a write to the IICn register when a stop condition interrupt request occurs.

Remark n = 0, 1

19.14.2 When communication reservation function is disabled (IICFn.IICRSVn bit = 1)

When the IICFn.STTn bit is set when the bus is not used in a communication during bus communication, this request is rejected and a start condition is not generated. The following two statuses are included in the status where bus is not used.

- When arbitration results in neither master nor slave operation
- When an extension code is received and slave operation is disabled ($\overline{ACK}$ is not returned and the bus was released when the IICFn.LRELn bit was set to 1)

To confirm whether the start condition was generated or request was rejected, check the IICFn.STCFn flag. The time shown in Table 19-7 is required until the STCFn flag is set after setting the STTn bit = 1. Therefore, secure the time by software.

<R>

Table 19-7. Wait Periods

CLn1	CLn0	Selected Clock	Wait Period
0	0	$f_{xx}/2$	6 clocks
0	1	$f_{xx}/2$	6 clocks
1	0	f_{xx}	3 clocks
1	1	$f_{xx}/3$	9 clocks

Remark n = 0, 1

19.15 Cautions

(1) When IICFn.STCENn bit = 0

Immediately after I²Cn operation is enabled, the bus communication status (IICFn.IICBSYn bit = 1) is recognized regardless of the actual bus status. To execute master communication in the status where a stop condition has not been detected, generate a stop condition and then release the bus before starting the master communication.

Use the following sequence for generating a stop condition.

<1> Set the IICCLn register.

<2> Set the IICn.IICEn bit.

<3> Set the IICn.SPTn bit.

(2) When IICFn.STCENn bit = 1

Immediately after I²Cn operation is enabled, the bus released status (IICBSYn bit = 0) is recognized regardless of the actual bus status. To generate the first start condition (IICn.STTn bit = 1), it is necessary to confirm that the bus has been released, so as to not disturb other communications.

Remark n = 0, 1

<R> (3) When the IICn.IICEn bit of the V850ES/KJ1 is set to 1 while communications with other devices are in progress, the start condition may be detected depending on the status of the communication line. Be sure to set the IICn.IICEn bit to 1 when the SCLn and SDAn lines are high level.

<R> (4) Determine the operation clock frequency by the IICCLn and IICXn registers before enabling the operation (IICn.IICEn bit = 1). To change the operation clock frequency, clear the IICn.IICEn bit to 0 once.

<R> (5) After the IICn.STTn and IICn.SPTn bits have been set to 1, they must not be re-set without being cleared to 0 first.

<R> (6) If transmission has been reserved, set the IICn.SPIEn bit to 1 so that an interrupt request is generated by the detection of a stop condition. After an interrupt request has been generated, the wait state will be released by writing communication data to I²Cn, then transferring will begin. If an interrupt is not generated by the detection of a stop condition, transmission will halt in the wait state because an interrupt request was not generated. However, it is not necessary to set the SPIEn bit to 1 for the software to detect the IICSn.MSTS bit.

Remark n = 0, 1

<R>

19.16 Communication Operations

The following shows three operation procedures with the flowchart.

(1) Master operation in single master system

The flowchart when using the V850ES/KJ1 as the master in a single master system is shown below.

This flowchart is broadly divided into the initial settings and communication processing. Execute the initial settings at startup. If communication with the slave is required, prepare the communication and then execute communication processing.

(2) Master operation in multimaster system

In the I²Cn bus multimaster system, whether the bus is released or used cannot be judged by the I²C bus specifications when the bus takes part in a communication. Here, when data and clock are at a high level for a certain period (1 frame), the V850ES/KJ1 takes part in a communication with bus released state.

This flowchart is broadly divided into the initial settings, communication waiting, and communication processing. The processing when the V850ES/KJ1 loses in arbitration and is specified as the slave is omitted here, and only the processing as the master is shown. Execute the initial settings at startup to take part in a communication. Then, wait for the communication request as the master or wait for the specification as the slave. The actual communication is performed in the communication processing, and it supports the transmission/reception with the slave and the arbitration with other masters.

(3) Slave operation

An example of when the V850ES/KJ1 is used as the I²Cn bus slave is shown below.

When used as the slave, operation is started by an interrupt. Execute the initial settings at startup, then wait for the INTIICn interrupt occurrence (communication waiting). When the INTIICn interrupt occurs, the communication status is judged and its result is passed as a flag over to the main processing.

By checking the flags, necessary communication processing is performed.

Remark $n = 0, 1$

19.16.2 Master operation in multimaster system

Figure 19-17. Master Operation in Multimaster System (1/3)

Figure 19-17. Master Operation in Multimaster System (2/3)

Figure 19-17. Master Operation in Multimaster System (3/3)

- Remarks**
1. For the transmission and reception formats, conform to the specifications of the product in communication.
 2. When using the V850ES/KJ1 as the master in the multimaster system, read the IICSn.MSTS_n bit for each INTIIC_n interrupt occurrence to confirm the arbitration result.
 3. When using the V850ES/KJ1 as the slave in the multimaster system, confirm the status using the IICSn and IICFn registers for each INTIIC_n interrupt occurrence to determine the next processing.
 4. n = 0, 1

19.16.3 Slave operation

The following shows the processing procedure of the slave operation.

Basically, the operation of the slave device is event-driven. Therefore, processing by an INTIICn interrupt (processing requiring a significant change of the operation status, such as stop condition detection during communication) is necessary.

The following description assumes that data communication does not support extension codes. Also, it is assumed that the INTIICn interrupt servicing performs only status change processing and that the actual data communication is performed during the main processing.

Figure 19-18. Software Outline During Slave Operation

Therefore, the following three flags are prepared so that the data transfer processing can be performed by transmitting these flags to the main processing instead of the INTIICn signal.

(1) Communication mode flag

This flag indicates the following communication statuses.

Clear mode: Data communication not in progress

Communication mode: Data communication in progress (valid address detection stop condition detection, $\overline{\text{ACK}}$ from master not detected, address mismatch)

(2) Ready flag

This flag indicates that data communication is enabled. This is the same status as an INTIICn interrupt during normal data transfer. This flag is set in the interrupt processing block and cleared in the main processing block. The ready flag for the first data for transmission is not set in the interrupt processing block, so the first data is transmitted without clearance processing (the address match is regarded as a request for the next data).

(3) Communication direction flag

This flag indicates the direction of communication and is the same as the value of the IICSn.TRCn bit.

The following shows the operation of the main processing block during slave operation.

Start I²Cn and wait for the communication enabled status. When communication is enabled, perform transfer using the communication mode flag and ready flag (the processing of the stop condition and start condition is performed by interrupts, conditions are confirmed by flags).

For transmission, repeat the transmission operation until the master device stops returning $\overline{\text{ACK}}$. When the master device stops returning $\overline{\text{ACK}}$, transfer is complete.

For reception, receive the required number of data and do not return $\overline{\text{ACK}}$ for the next data immediately after transfer is complete. After that, the master device generates the stop condition or restart condition. This causes exit from communications.

<R>

Figure 19-19. Slave Operation Flowchart (1)

The following shows an example of the processing of the slave device by an INTIICn interrupt (it is assumed that no extension codes are used here). During an INTIICn interrupt, the status is confirmed and the following steps are executed.

- <1> When a stop condition is detected, communication is terminated.
- <2> When a start condition is detected, the address is confirmed. If the address does not match, communication is terminated. If the address matches, the communication mode is set and wait is released, and operation returns from the interrupt (the ready flag is cleared).
- <3> For data transmission/reception, when the ready flag is set, operation returns from the interrupt while the I²Cn bus remains in the wait status.

Remark <1> to <3> in the above correspond to <1> to <3> in **Figure 19-20 Slave Operation Flowchart (2)**.

Figure 19-20. Slave Operation Flowchart (2)

19.17 Timing of Data Communication

When using I²C bus mode, the master device generates an address via the serial bus to select one of several slave devices as its communication partner.

After outputting the slave address, the master device transmits the IICSn.TRCn bit that specifies the data transfer direction and then starts serial communication with the slave device.

The IICn register's shift operation is synchronized with the falling edge of the serial clock (SCLn pin). The transmit data is transferred to the SO latch and is output (MSB first) via the SDAn pin.

Data input via the SDAn pin is captured by the IICn register at the rising edge of the SCLn pin.

The data communication timing is shown below.

Remark n = 0, 1

CHAPTER 20 INTERRUPT/EXCEPTION PROCESSING FUNCTION

20.1 Overview

The V850ES/KJ1 is provided with a dedicated interrupt controller (INTC) for interrupt servicing and realize an interrupt function that can service interrupt requests from a total of 46 to 51 sources.

An interrupt is an event that occurs independently of program execution, and an exception is an event whose occurrence is dependent on program execution.

The V850ES/KJ1 can process interrupt requests from the on-chip peripheral hardware and external sources. Moreover, exception processing can be started by the TRAP instruction (software exception) or by generation of an exception event (fetching of an illegal opcode) (exception trap).

20.1.1 Features

Interrupt Source			V850ES/KJ1	
Interrupt function	Non-maskable interrupt	External		1 channel (NMI pin)
		Internal		2 channels (WDT1, WDT2)
	Maskable interrupt	External		7 channels (all edge detection interrupts)
		Internal	WDT1	1 channel
			TMP ^{Note 1}	3 channels
			TM0	12 channels
			TMH	2 channels
			TM5	2 channels
			WT	2 channels
			BRG	1 channel
			UART	9 channels
			CSI0	3 channels
			CSIA	2 channels
			IIC ^{Note 2}	2 channels
			KR	1 channel
AD	1 channel			
Total	41 channels			
Exception function	Software exception		16 channels (TRAP00H to TRAP0FH)	
			16 channels (TRAP10H to TRAP1FH)	
	Exception trap		2 channels (ILGOP/DBG0)	

Notes 1. Only in the μ PD70F3218H and 70F3218HY

2. Only in products with an I²C bus (Y products)

Table 20-1 lists the interrupt/exception sources.

Table 20-1. Interrupt Source List (1/2)

Type	Classification	Default Priority	Name	Trigger	Interrupt Source	Exception Code	Handler Address	Restored PC	Interrupt Control Register

- Notes**
1. Only in the μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, and 70F3218HY
 2. Only in the μ PD70F3218H and 70F3218HY

Remarks 1. Default priority: The priority order when two or more maskable interrupt requests with the same priority level are generated at the same time. The highest priority is 0.

The priority of non-maskable interrupt request is as follows.

INTWDT2 > INTWDT1 > NMI

Restored PC: The value of the program counter (PC) saved to EIPC, FEPC, or DBPC when interrupt/exception processing is started. The restored PC when a non-maskable or maskable interrupt is acknowledged while either of the following instructions is being executed does not become nextPC (when an interrupt is acknowledged during the execution of an instruction, the execution of that instruction is stopped and is resumed following completion of interrupt servicing).

- Load instructions (SLD.B, SLD.BU, SLD.H, SLD.HU, SLD.W)
- Divide instructions (DIV, DIVH, DIVU, DIVHU)
- PREPARE, DISPOSE instructions (only when an interrupt occurs before stack pointer update)

nextPC: The PC value at which processing is started following interrupt/exception processing.

2. The execution address of the illegal opcode when an illegal opcode exception occurs is calculated with (Restored PC – 4).

20.2 Non-Maskable Interrupts

Non-maskable interrupt request signals are acknowledged unconditionally, even when interrupts are disabled (DI state). Non-maskable interrupts (NMI) are not subject to priority control and take precedence over all other interrupt request signals.

The following three types of non-maskable interrupt request signals are available in the V850ES/KJ1.

- NMI pin input (NMI)
- Non-maskable interrupt request signal (INTWDT1) due to overflow of watchdog timer 1
- Non-maskable interrupt request signal (INTWDT2) due to overflow of watchdog timer 2

There are four choices for the valid edge of an NMI pin, namely: rising edge, falling edge, both edges, and no edge detection.

The non-maskable interrupt request signal (INTWDT1) due to overflow of watchdog timer 1 functions by setting the WDTM1.WDTM14 and WDTM1.WDTM13 bits to 10.

The non-maskable interrupt request signal (INTWDT2) due to overflow of watchdog timer 2 functions by setting the WDTM2.WDM21 and WDTM2.WDM20 bits to 01.

When two or more non-maskable interrupts occur simultaneously, they are processed in a sequence determined by the following priority order (the interrupt request signals with low priority level are ignored).

INTWDT2 > INTWDT1 > NMI

If during NMI processing, an NMI, INTWDT1, or INTWDT2 request signal newly occurs, processing is performed as follows.

(1) If an NMI request signal newly occurs during NMI processing

The new NMI request signal is held pending regardless of the value of the PSW.NP bit. The NMI request signal held pending is acknowledged upon completion of processing of the NMI currently being executed (following RETI instruction execution).

(2) If an INTWDT1 request signal newly occurs during NMI processing

If the NP bit remains set (to 1) during NMI processing, the new INTWDT1 request signal is held pending. The INTWDT1 request signal held pending is acknowledged upon completion of processing of the NMI currently being executed (following RETI instruction execution).

If the NP bit is cleared (to 0) during NMI processing, a newly generated INTWDT1 request signal is executed (NMI processing is interrupted).

(3) If an INTWDT2 request signal newly occurs during NMI processing

A newly generated INTWDT2 request signal is executed regardless of the value of the NP bit (NMI processing is interrupted).

Caution For non-maskable interrupt servicing from non-maskable interrupt request signals (INTWDT1, INTWDT2), refer to 20.10 Cautions.

Figure 20-1. Acknowledging Non-Maskable Interrupt Request Signals (1/2)

Figure 20-1. Acknowledging Non-Maskable Interrupt Request Signals (2/2)

(b) If a new non-maskable interrupt request signal is generated during a non-maskable interrupt servicing

20.2.1 Operation

Upon generation of a non-maskable interrupt request signal, the CPU performs the following processing and transfers control to a handler routine.

- <1> Saves the restored PC to FEPC.
- <2> Saves the current PSW to FEPSW.
- <3> Writes the exception code (0010H, 0020H, 0030H) to the higher halfword (FECC) of ECR.
- <4> Sets the PSW.NP and PSW.ID bits to 1 and clears the PSW.EP bit to 0.
- <5> Loads the handler address (00000010H, 00000020H, 00000030H) of the non-maskable interrupt to the PC and transfers control.

Figure 20-2 shows the servicing flow for non-maskable interrupts.

Figure 20-2. Non-Maskable Interrupt Servicing

20.2.2 Restore

Execution is restored from non-maskable interrupt servicing by the RETI instruction.

(1) In case of NMI

Restore from NMI processing is done with the RETI instruction.

When the RETI instruction is executed, the CPU performs the following processing and transfers control to the address of the restored PC.

- (i) Loads the values of the restored PC and PSW from FEPC and FEPSW, respectively, because the PSW.EP bit and the PSW.NP bit are 0 and 1, respectively.
- (ii) Transfers control back to the loaded address of the restored PC and PSW.

Figure 20-3 shows the processing flow of the RETI instruction.

Figure 20-3. RETI Instruction Processing

(2) In case of INTWDT1, INTWDT2 signals

For non-maskable interrupt servicing by the non-maskable interrupt request signals (INTWDT1, INTWDT2), refer to **20.10 Cautions**.

20.2.3 NP flag

The NP flag is a status flag that indicates that non-maskable interrupt servicing is in progress. This flag is set when a non-maskable interrupt request has been acknowledged, and masks all non-maskable requests to prevent multiple interrupts.

After reset: 00000020H

PSW

31876543210

0NP EP ID SAT CY OV S Z

NP	NMI servicing status
0	No non-maskable interrupt servicing
1	Non-maskable interrupt serving in progress

20.3 Maskable Interrupts

Maskable interrupt request signals can be masked by interrupt control registers. The V850ES/KJ1 has 43 to 48 maskable interrupt sources (refer to **20.1.1 Features**).

If two or more maskable interrupt request signals are generated at the same time, they are acknowledged according to the default priority. In addition to the default priority, eight levels of interrupt priorities can be specified by using the interrupt control registers, allowing programmable priority control.

When an interrupt request signal has been acknowledged, the interrupt disabled (DI) status is set and the acknowledgment of other maskable interrupt request signals is disabled.

When the EI instruction is executed in an interrupt servicing routine, the interrupt enabled (EI) status is set, which enables acknowledgment of interrupt request signals having a priority higher than that of the interrupt request signal currently in progress. Note that only interrupt request signals with a higher priority have this capability; interrupt request signals with the same priority level cannot be nested.

To use multiple interrupts, it is necessary to save EIPC and EIPSW to memory or a register before executing the EI instruction, and restore EIPC and EIPSW to the original values by executing the DI instruction before the RETI instruction.

When the WDTM1.WDTM14 bit is cleared to 0, the watchdog timer 1 overflow interrupt functions as a maskable interrupt (INTWDTM1).

20.3.1 Operation

If a maskable interrupt request signal is generated, the CPU performs the following processing and transfers control to a handler routine.

- <1> Saves the restored PC to EIPC.
- <2> Saves the current PSW to EIPSW.
- <3> Writes an exception code to the lower halfword of ECR (EICC).
- <4> Sets the PSW.ID bit to 1 and clears the PSW.EP bit to 0.
- <5> Loads the corresponding handler address to the PC and transfers control.

The maskable interrupt request signal masked by INTC and the maskable interrupt request signal that occurs while another interrupt is being serviced (when PSW.NP bit = 1 or ID bit = 1) are held pending internally. When the interrupts are unmasked, or when the NP bit = 0 and the ID bit = 0 by using the RETI and LDSR instructions, a new maskable interrupt servicing is started in accordance with the priority of the pending maskable interrupt request signal.

Figure 20-4 shows the servicing flow for maskable interrupts.

Figure 20-4. Maskable Interrupt Servicing

20.3.2 Restore

Execution is restored from maskable interrupt servicing by the RETI instruction.

When the RETI instruction is executed, the CPU performs the following processing and transfers control to the address of the restored PC.

- (1) Loads the values of the restored PC and PSW from EIPC and EIPSW because the PSW.EP bit and the PSW.NP bit are both 0.
- (2) Transfers control to the loaded address of the restored PC and PSW.

Figure 20-5 shows the processing flow of the RETI instruction.

Figure 20-5. RETI Instruction Processing

20.3.3 Priorities of maskable interrupts

INTC provides a multiple interrupt servicing in which an interrupt can be acknowledged while another interrupt is being serviced. Multiple interrupts can be controlled by priority levels.

There are two types of priority level control: control based on the default priority levels, and control based on the programmable priority levels specified by the interrupt priority level specification bit (xxICn.xxPRn bit). When two or more interrupts having the same priority level specified by xxPRn are generated at the same time, interrupts are serviced in order depending on the priority level allocated to each interrupt request (default priority level) beforehand. For more information, refer to **Table 20-1 Interrupt Source List**. Programmable priority control divides interrupt requests into eight levels by setting the priority level specification flag.

Note that when an interrupt request signal is acknowledged, the PSW.ID flag is automatically set (1). Therefore, when multiple interrupts are to be used, clear (0) the ID flag beforehand (for example, by placing the EI instruction into the interrupt service program) to enable interrupts.

Remark xx: Identifying name of each peripheral unit (refer to **Table 20-2 Interrupt Control Registers (xxICn)**)

n: Peripheral unit number (refer to **Table 20-2 Interrupt Control Registers (xxICn)**)

Figure 20-6. Example of Interrupt Nesting (1/2)

Caution The values of EIPC and EIPSW must be saved before executing multiple interrupts.

Remarks

1. a to u in the figure are the names of interrupt request signals shown for the sake of explanation.
2. The default priority in the figure indicates the relative priority between two interrupt request signals.

Figure 20-6. Example of Interrupt Nesting (2/2)

Figure 20-7. Example of Servicing Simultaneously Generated Interrupt Request Signals

20.3.4 Interrupt control register (xxICn)

An interrupt control register is assigned to each maskable interrupt and sets the control conditions for each maskable interrupt request. The interrupt control registers can be read or written in 8-bit or 1-bit units.

After reset, xxICn is set to 47H.

Caution Be sure to read the xxICn.xxIFn bit while interrupts are disabled (DI). If the xxIFn bit is read while interrupts are enabled (EI), an incorrect value may be read if there is a conflict between acknowledgment of the interrupt and reading of the bit.

After reset: 47H R/W Address: FFFFF110H to FFFFF168H

	<7>	<6>	5	4	3	2	1	0

Notes 1. Only in the μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, and 70F3218HY

2. Only in the μ PD70F3218H and 70F3218HY

20.3.5 Interrupt mask registers 0 to 3 (IMR0 to IMR3)

These registers set the interrupt mask status for maskable interrupts. The xxMKn bit of the IMR0 to IMR3 registers and the xxMKn bit of the xxICn register are respectively linked.

The IMRm register can be read or written in 16-bit units (m = 0 to 3).

When the higher 8 bits of the IMRk register are treated as the IMRkH register and the lower 8 bits of the IMRk register as the IMRkL register, they can be read or written in 8-bit or 1-bit units (k = 0 to 2).

Caution In the device file, the xxMKn bit of the xxICn register is defined as a reserved word. Therefore, if bit manipulation is performed using the name xxMKn, the xxICn register, not the IMRm register, is rewritten (as a result, the IMRm register is also rewritten).

After reset: FFFFH R/W Address: IMR0 FFFFF100H,
IMR0L FFFFF100H, IMR0H FFFFF101H

	15	14	13	12	11	10	9	8

	7	6	5	4	3	2	1	0
(IMR2L)	TM0MK51	TM0MK50	TM0MK41	TM0MK40	CSIAMK1	TM0MK31	TM0MK30	TM0MK21

After reset: FFFFH R/W Address: IMR3, IMR3L FFFFF106H

	15	14	13	12	11	10	9	8
IMR3 ^{Note 2}	1	1	1	1	1	1	1	1
	7	6	5	4	3	2	1	0
(IMR3L)	1	1	1	TP0CCMK1	TP0CCMK0	TP0OVMK	1	1

xxMKn	Interrupt mask flag setting
0	Enables interrupt servicing
1	Disables interrupt servicing

- Notes**
1. When reading from or writing to bits 8 to 15 of the IMR0 to IMR2 registers in 8-bit or 1-bit units, specify these bits as bits 0 to 7 of the IMR0H to IMR2H registers.
 2. Only in the μ PD70F3218H and 70F3218HY

Caution Set bits 15 to 13 of the IMR2 register and bits 15 to 5, 1, and 0 of the IMR3 register to 1. The operation is not guaranteed if their value is changed.

Remark xx: Identifying name of each peripheral unit (refer to **Table 20-2 Interrupt Control Registers (xxICn)**)
n: Peripheral unit number (refer to **Table 20-2 Interrupt Control Registers (xxICn)**)

20.3.6 In-service priority register (ISPR)

This register holds the priority level of the maskable interrupt currently being acknowledged. When the interrupt request signal is acknowledged, the bit of this register corresponding to the priority level of that interrupt request signal is set (1) and remains set while the interrupt is being serviced.

When the RETI instruction is executed, the bit among those that are set (1) in the ISPR register that corresponds to the interrupt request signal having the highest priority is automatically cleared (0) by hardware. However, it is not cleared (0) when execution is returned from non-maskable interrupt servicing or exception processing.

This register is read-only in 8-bit or 1-bit units.

After reset, ISPR is cleared to 00H.

Caution If an interrupt is acknowledged while the ISPR register is being read in the interrupt enabled (EI) status, the value of the ISPR register after the bits of the register have been set to 1 by acknowledging the interrupt may be read. To accurately read the value of the ISPR register before an interrupt is acknowledged, read the register while interrupts are disabled (DI status).

After reset: 00H R Address: FFFFF1FAH

	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>
ISPR	ISPR7	ISPR6	ISPR5	ISPR4	ISPR3	ISPR2	ISPR1	ISPR0

ISPRn	Priority of interrupt currently being acknowledged
0	Interrupt request with priority n is not acknowledged
1	Interrupt request with priority n is being acknowledged

Remark n = 0 to 7 (priority level)

20.3.8 Watchdog timer mode register 1 (WDTM1)

This register is a special register that can be written to only in a special sequence. To generate a maskable interrupt (INTWDT1), clear the WDTM14 bit to 0.

This register can be read or written in 8-bit or 1-bit units (for details, refer to **CHAPTER 12 WATCHDOG TIMER FUNCTIONS**).

After reset: 00H

R/W

Address: FFFF6C2H

	<7>	6	5	4	3	2	1	0
WDTM1	RUN1	0	0	WDTM14	WDTM13	0	0	0

RUN1	Watchdog timer operation mode selection ^{Note 1}
0	Stop count operation
1	Clear counter and start count operation

WDTM14	WDTM13	Watchdog timer operation mode selection ^{Note 2}
0	0	Interval timer mode (Generate maskable interrupt INTWDTM1 when overflow occurs)
0	1	
1	0	Watchdog timer mode 1 ^{Note 3} (Generate non-maskable interrupt INTWDT1 when overflow occurs)
1	1	Watchdog timer mode 2 (Start WDTRES2 reset operation when overflow occurs)

- Notes**
1. Once the RUN1 bit has been set (1), it cannot be cleared (0) by software. Therefore, once counting starts, it cannot be stopped except reset.
 2. Once the WDTM14 and WDTM13 bits have been set (1), they cannot be cleared (0) by software. Reset is the only way to clear these bits.
 3. For non-maskable interrupt servicing due to a non-maskable interrupt request signal (INTWDT1), refer to **20.10 Cautions**.

20.4 External Interrupt Request Input Pins (NMI, INTP0 to INTP6)

20.4.1 Noise elimination

(1) Noise elimination for NMI pin

The NMI pin includes a noise eliminator that operates using analog delay. Therefore, a signal input to the NMI pin is not detected as an edge unless it maintains its input level for a certain period. The edge is detected only after a certain period has elapsed.

The NMI pin is used for releasing the STOP mode. In the STOP mode, noise elimination using the system clock is not performed because the internal system clock is stopped.

(2) Noise elimination for INTP0 to INTP6 pins

The INTP0 to INTP6 pins include a noise eliminator that operates using analog delay. Therefore, a signal input to each pin is not detected as an edge unless it maintains its input level for a certain period. The edge is detected only after a certain period has elapsed.

20.4.2 Edge detection

The valid edges of the NMI and INTP0 to INTP6 pins can be selected from the following four types for each pin.

- Falling edge
- Rising edge
- Both edges
- No edge detection

After reset, the edge detection for the NMI pin is set to “no edge detection”. Therefore, interrupt requests cannot be acknowledged (the NMI pin functions as a normal port) unless a valid edge is specified by the INTR0, INTF0, INTR9H, and INTF9H registers.

When using the P02/NMI pin as an output port, set the NMI pin valid edge to “no edge detection”.

(1) External interrupt rising and falling edge specification registers 0 (INTR0, INTF0)

These are 8-bit registers that specify detection of the rising and falling edges of the NMI and INTP0 to INTP3 pins.

These registers can be read or written in 8-bit or 1-bit units.

After reset, these registers are cleared to 00H.

Caution When switching to the port function from the external interrupt function (alternate function), edge detection may be performed. Therefore, set the port mode after setting the INTF0n and INTR0n bits = 00.

After reset: 00H R/W Address: INTR0 FFFFC20H, INTF0 FFFFC00H

Remark For specification of the valid edge, refer to **Table 20-3**.

Table 20-3. NMI and INTP0 to INTP3 Pins Valid Edge Specification

INTF0n	INTR0n	Valid edge specification (n = 2 to 6)
0	0	No edge detection
0	1	Rising edge
1	0	Falling edge
1	1	Both edges

Remark n = 2: Control of NMI pin
n = 3 to 6: Control of INTP0 to INTP3 pins

(2) External interrupt rising and falling edge specification registers 9H (INTR9H, INTF9H)

These are 8-bit registers that specify detection of the rising edge of the INTP4 to INTP6 pins.

These registers can be read or written in 8-bit or 1-bit units.

After reset, these registers are cleared to 00H.

Caution When switching to the port function from the external interrupt function (alternate function), edge detection may be performed. Therefore, set the port mode after setting the INTF9n and INTR9n bits = 00.

After reset: 00H R/W Address: INTR9H FFFFC33H, INTF9H FFFFC13H

Remark For specification of the valid edge, refer to **Table 20-4**.

Table 20-4. INTP4 to INTP6 Pins Valid Edge Specification

INTF9n	INTR9n	Valid edge specification (n = 13 to 15)
0	0	No edge detection
0	1	Rising edge
1	0	Falling edge
1	1	Both edges

Remark n = 13 to 15: Control of INTP4 to INTP6 pins

20.5 Software Exceptions

A software exception is generated when the CPU executes the TRAP instruction. Software exceptions can always be acknowledged.

20.5.1 Operation

If a software exception occurs, the CPU performs the following processing and transfers control to a handler routine.

- <1> Saves the restored PC to EIPC.
- <2> Saves the current PSW to EIPSW.
- <3> Writes an exception code to the lower 16 bits (EICC) of ECR (interrupt source).
- <4> Sets the PSW.EP and PSW.ID bits to 1.
- <5> Loads the handler address (00000040H or 00000050H) for the software exception routine to the PC and transfers control.

Figure 20-8 shows the software exception processing flow.

Figure 20-8. Software Exception Processing

The handler address is determined by the operand (vector) of the TRAP instruction. If the vector is 00H to 1FH, the handler address is 00000040H, and if the vector is 10H to 1FH, the handler address is 00000050H.

20.5.2 Restore

Execution is restored from software exception processing by the RETI instruction.

When the RETI instruction is executed, the CPU performs the following processing and transfers control to the address of the restored PC.

- <1> Loads the restored PC and PSW from EIPC and EIPSW because the PSW.EP bit is 1.
- <2> Transfers control to the address of the restored PC and PSW.

Figure 20-9 shows the processing flow of the RETI instruction.

Figure 20-9. RETI Instruction Processing

20.5.3 EP flag

The EP flag, which is bit 6 of the PSW, is a status flag that indicates that exception processing is in progress. It is set when an exception occurs.

After reset: 00000020H

EP	Exception processing status
0	Exception processing not in progress
1	Exception processing in progress

20.6 Exception Trap

The exception trap is an interrupt that is requested when the illegal execution of an instruction takes place. In the V850ES/KJ1, an illegal opcode trap (ILGOP: illegal opcode trap) is considered as an exception trap.

20.6.1 Illegal opcode

An illegal opcode is defined as an instruction with instruction opcode (bits 10 to 5) = 11111B, sub-opcode (bits 26 to 23) = 0111B to 1111B, and sub-opcode (bit 16) = 0B. When such an instruction is executed, an exception trap is generated.

Caution It is recommended not to use illegal opcode because instructions may newly be assigned in the future.

(1) Operation

Upon generation of an exception trap, the CPU performs the following processing and transfers control to a handler routine.

- <1> Saves the restored PC to DBPC.
- <2> Saves the current PSW to DBPSW.
- <3> Sets the PSW.NP, PSW.EP, and PSW.ID bits.
- <4> Loads the handler address (00000060H) for the exception trap routine to the PC and transfers control.

Figure 20-10 shows the exception trap processing flow.

Figure 20-10. Exception Trap Processing**(2) Restore**

Execution is restored from exception trap processing by the DBRET instruction. When the DBRET instruction is executed, the CPU performs the following processing and transfers control to the address of the restored PC.

- <1> Loads the restored PC and PSW from DBPC and DBPSW.
- <2> Transfers control to the loaded address of the restored PC and PSW.

Figure 20-11 shows the processing flow for restore from exception trap processing.

Figure 20-11. Processing Flow for Restore from Exception Trap

20.6.2 Debug trap

A debug trap is an exception that occurs upon execution of the DBTRAP instruction and that can be acknowledged at all times.

When a debug trap occurs, the CPU performs the following processing.

(1) Operation

- <1> Saves the restored PC to DBPC.
- <2> Saves the current PSW to DBPSW.
- <3> Sets the PSW.NP, PSW.EP, and PSW.ID bits to 1.
- <4> Sets the handler address (00000060H) for the debug trap routine to the PC and transfers control.

Figure 20-12 shows the debug trap processing flow.

Figure 20-12. Debug Trap Processing

(2) Restore

Execution is restored from debug trap processing by the DBRET instruction. When the DBRET instruction is executed, the CPU performs the following processing and transfers control to the address of the restored PC.

<1> Loads the restored PC and PSW from DBPC and DBPSW.

<2> Transfers control to the loaded address of the restored PC and PSW.

Figure 20-13 shows the processing flow for restore from debug trap processing.

Figure 20-13. Processing Flow for Restore from Debug Trap

20.7 Multiple Interrupt Servicing Control

Multiple interrupt servicing control is a function that stops an interrupt service routine currently in progress if a higher priority interrupt request signal is generated, and processes the acknowledgment operation of the higher priority interrupt request signal.

If an interrupt request signal with a lower or equal priority is generated and a service routine is currently in progress, the later interrupt request signal will be held pending.

Multiple interrupt servicing control is performed when interrupts are enabled (PSW.ID bit = 0). Even in an interrupt servicing routine, multiple interrupt control must be performed while interrupts are enabled (ID bit = 0). If a maskable interrupt or software exception is generated in a maskable interrupt or software exception service program, EIPC and EIPSW must be saved.

The following example illustrates the procedure.

(1) To acknowledge maskable interrupt request signals in service program

Service program for maskable interrupt or exception

```

...
...
• EIPC saved to memory or register
• EIPSW saved to memory or register
• EI instruction (enables interrupt acknowledgment)
...
...
...
...
• DI instruction (disables interrupt acknowledgment)
• Saved value restored to EIPSW
• Saved value restored to EIPC
• RETI instruction

```

← Acknowledges maskable interrupt

(2) To generate exception in service program

Service program for maskable interrupt or exception

```

...
...
• EIPC saved to memory or register
• EIPSW saved to memory or register
...
• TRAP instruction
...
• Saved value restored to EIPSW
• Saved value restored to EIPC
• RETI instruction

```

← Acknowledges exceptions such as TRAP instruction.

Priorities 0 to 7 (0 is the highest) can be set for each maskable interrupt request in multiple interrupt servicing control by software. To set a priority level, write values to the `xxICn.xxPRn0` to `xxICn.xxPRn2` bits corresponding to each maskable interrupt request. After reset, interrupt requests are masked by the `xxICn.xxMKn` bit, and the priority is set to level 7 by the `xxPRn0` to `xxPRn2` bits.

Priorities of maskable interrupts are as follows.

(High) Level 0 > Level 1 > Level 2 > Level 3 > Level 4 > Level 5 > Level 6 > Level 7 (Low)

Interrupt servicing that has been suspended as a result of multiple interrupt servicing control is resumed after the interrupt servicing of the higher priority has been completed and the RETI instruction has been executed. A pending interrupt request signal is acknowledged after the current interrupt servicing has been completed and the RETI instruction has been executed.

Caution In a non-maskable interrupt servicing routine (in the time until the RETI instruction is executed), maskable interrupts are not acknowledged and held pending.

20.8 Interrupt Response Time

Except in the following cases, the CPU interrupt response time is a minimum of 4 clocks. If inputting consecutive interrupt request signals, at least 4 clocks must be placed between each interrupt request signal.

- IDLE/STOP mode
- External bus access
- Consecutive interrupt request non-sample instruction (refer to 20.9 Periods in Which Interrupts Are Not Acknowledged by CPU)
- Access to interrupt control register
- Access to peripheral I/O register

Figure 20-14. Pipeline Operation During Interrupt Request Signal Acknowledgment (Outline)

(1) Minimum interrupt response time

(2) Maximum interrupt response time

Remark INT1 to INT4: Interrupt acknowledgment processing

IFX: Invalid instruction fetch

IDX: Invalid instruction decode

Interrupt response time (internal system clock)			Condition
	Internal interrupt	External interrupt	
Min.	4	4 + analog delay	The following cases are excluded. • IDLE/STOP mode • External bus access • Consecutive interrupt request non-sample instruction • Access to interrupt control register • Access to peripheral I/O register
Max.	6	6 + analog delay	

<R> 20.9 Periods in Which Interrupts Are Not Acknowledged by CPU

Interrupts are acknowledged by the CPU while an instruction is being executed. However, no interrupt is acknowledged between an interrupt request non-sample instruction and the next instruction (interrupt is held pending).

The following instructions are interrupt request non-sample instructions.

- EI instruction
- DI instruction
- LDSR reg2, 0x5 instructions (vs. PSW)
- Store instruction for the PRCMD register
- Store instruction and SET1, NOT1, and CLR1 manipulation instructions for the following registers
 - Interrupt-related registers:
 - Interrupt control register (xxICn), interrupt mask registers 0 to 3 (IMR0 to IMR3)
 - Power save control register (PSC)
 - On-chip debug mode register (OCDM): μ PD70F3218H and 70F3218HY only

20.10 Cautions

Design the system so that restoring by the RETI instruction is as follows after a non-maskable interrupt triggered by a non-maskable interrupt request signal (INTWDT1/INTWDT2) is serviced.

Figure 20-15. Restoring by RETI Instruction

CHAPTER 21 KEY INTERRUPT FUNCTION

21.1 Function

A key interrupt request signal (INTKR) can be generated by inputting a falling edge to the eight key input pins (KR0 to KR7) by setting the KRM register.

Caution If any of the KR0 to KR7 pins is at low level, the INTKR signal is not generated even if a falling edge is input to another pin.

Table 21-1. Assignment of Key Return Detection Pins

Flag	Pin Description
KRM0	Controls KR0 signal in 1-bit units
KRM1	Controls KR1 signal in 1-bit units
KRM2	Controls KR2 signal in 1-bit units
KRM3	Controls KR3 signal in 1-bit units
KRM4	Controls KR4 signal in 1-bit units
KRM5	Controls KR5 signal in 1-bit units
KRM6	Controls KR6 signal in 1-bit units
KRM7	Controls KR7 signal in 1-bit units

Figure 21-1. Key Return Block Diagram

21.2 Register

(1) Key return mode register (KRM)

The KRM register controls the KRM0 to KRM7 bits using the KR0 to KR7 signals.

This register can be read or written in 8-bit or 1-bit units.

After reset, KRM is cleared to 00H.

After reset: 00H R/W Address: FFFF300H

	7	6	5	4	3	2	1	0
KRM	KRM7	KRM6	KRM5	KRM4	KRM3	KRM2	KRM1	KRM0

KRMn	Key return mode control
0	Does not detect key return signal
1	Detects key return signal

Caution If the KRM register is changed, an interrupt request signal (INTKR) may be generated. To prevent this, change the KRM register after disabling interrupts (DI), and then enable interrupts (EI) after clearing the interrupt request flag (KRIC.KRIF bit) to 0.

Remark For the alternate-function pin settings, refer to **Table 4-19 Settings When Port Pins Are Used for Alternate Functions**.

CHAPTER 22 STANDBY FUNCTION

22.1 Overview

The power consumption of the system can be effectively reduced by using the standby modes in combination and selecting the appropriate mode for the application.

The available standby modes are listed in Table 22-1.

Table 22-1. Standby Modes

Mode	Functional Outline
HALT mode	Mode to stop only the operating clock of the CPU
IDLE mode	Mode to stop all the operations of the internal circuits except the oscillator ^{Note 1}
STOP mode	Mode to stop all the operations of the internal circuits except the subclock oscillator ^{Note 2}
Subclock operation mode	Mode to use the subclock as the internal system clock
Sub-IDLE mode	Mode to stop all the operations of the internal circuits, except the oscillator, in the subclock operation mode

- Notes**
1. The PLL does not stop. To realize low power consumption, stop the PLL and then shift to the IDLE mode.
 2. Change to the clock-through mode, stop the PLL, then shift to the STOP mode. For details, refer to **CHAPTER 6 CLOCK GENERATION FUNCTION**.

Figure 22-1. Status Transition (1/2)

- Notes**
1. Reset by $\overline{\text{RESET}}$ pin input, watchdog timer 1 overflow (WDTRES1), or watchdog timer 2 overflow (WDTRES2).
 2. Non-maskable interrupt request signal (NMI, INTWDT1, INTWDT2) or unmasked maskable interrupt request signal.
 3. Non-maskable interrupt request signal (NMI pin input, INTWDT2 (when the CPU is operating on the subclock)), unmasked external interrupt request signal (INTP0 to INTP6 pin input), or unmasked internal interrupt request signal from peripheral functions operable in IDLE mode.
 4. Non-maskable interrupt request signal (NMI pin input, INTWDT2 (when the CPU is operating on the subclock)), unmasked external interrupt request signal (INTP0 to INTP6 pin input), or unmasked internal interrupt request signal from peripheral functions operable in STOP mode.
 5. Reset by $\overline{\text{RESET}}$ pin input or watchdog timer 2 (when the CPU is operating on the subclock) overflow (WDTRES2).

Figure 22-1. Status Transition (2/2)

22.2 Registers

(1) Power save control register (PSC)

This is an 8-bit register that controls the standby function. The STP bit of this register is used to specify the standby mode. The PSC register is a special register that can be written to only in a special sequence (refer to 3.4.7 Special registers).

This register can be read or written in 8-bit or 1-bit units.

After reset, PSC is cleared to 00H.

After reset: 00H R/W Address: FFFFF1FEH

	<7>	6	<5>	<4>	3	2	<1>	0
PSC	NMI2M	0	NMI0M	INTM	0	0	STP	0

NMI2M	Control of releasing standby mode ^{Note} by INTWDT2 signal
0	Releasing standby mode ^{Note} by INTWDT2 signal enabled
1	Releasing standby mode ^{Note} by INTWDT2 signal disabled

NMI0M	Control of releasing standby mode ^{Note} by NMI pin input
0	Releasing standby mode ^{Note} by NMI pin input enabled
1	Releasing standby mode ^{Note} by NMI pin input disabled

INTM	Control of releasing standby mode ^{Note} by maskable interrupt request signals
0	Releasing standby mode ^{Note} by maskable interrupt request signals enabled
1	Releasing standby mode ^{Note} by maskable interrupt request signals disabled

STP	Standby mode ^{Note} setting
0	Normal mode
1	Standby mode ^{Note}

Note In this case, standby mode means the IDLE/STOP mode; it does not include the HALT mode.

Cautions 1. If the NMI2M, NMI0M, and INTM bits, and the STP bit are set to 1 at the same time, the setting of NMI2M, NMI0M, and INTM bits becomes invalid. If there is an unmasked interrupt request signal being held pending when the IDLE/STOP mode is set, set the bit corresponding to the interrupt request signal (NMI2M, NMI0M, or INTM) to 1, and then set the STP bit to 1.

2. When the IDLE/STOP mode is set, set the PSMR.PSM bit and then set the STP bit.

(2) Power save mode register (PSMR)

This is an 8-bit register that controls the operation status in the standby mode and the clock operation.

This register can be read or written in 8-bit or 1-bit units.

After reset, PSMR is cleared to 00H.

After reset: 00H R/W After reset: FFFF820H

	7	6	5	4	3	2	1	<0>
PSMR	XTSTP	0	0	0	0	0	0	PSM

XTSTP	Specification of subclock oscillator use
0	Subclock oscillator used
1	Subclock oscillator not used

PSM	Specification of operation in standby mode
0	IDLE mode
1	STOP mode

- Cautions**
1. Be sure to clear the XTSTP bit to 0 during subclock resonator connection.
 2. Be sure to clear bits 1 to 6 of the PSMR register to 0.
 3. The PSM bit is valid only when the PSC.STP bit is 1.

(3) Oscillation stabilization time selection register (OSTS)

The wait time until the oscillation stabilizes after the STOP mode is released is controlled by the OSTS register.

The OSTS register can be read or written in 8-bit units.

After reset, OSTS is set to 01H.

After reset: 01H R/W Address: FFFF6C0H

	7	6	5	4	3	2	1	0
OSTS	0	0	0	0	0	OSTS2	OSTS1	OSTS0

OSTS2	OSTS1	OSTS0	Selection of oscillation stabilization time	f_x		
				4 MHz	5 MHz	10 MHz
0	0	0	$2^{13}/f_x$	2.048 ms	1.638 ms	0.819 ms
0	0	1	$2^{15}/f_x$	8.192 ms	6.554 ms	3.277 ms
0	1	0	$2^{16}/f_x$	16.38 ms	13.11 ms	6.554 ms
0	1	1	$2^{17}/f_x$	32.77 ms	26.21 ms	13.11 ms
1	0	0	$2^{18}/f_x$	65.54 ms	52.43 ms	26.21 ms
1	0	1	$2^{19}/f_x$	131.1 ms	104.9 ms	52.43 ms
1	1	0	$2^{20}/f_x$	262.1 ms	209.7 ms	104.9 ms
1	1	1	$2^{21}/f_x$	524.3 ms	419.4 ms	209.7 ms

Cautions 1. The wait time following release of the STOP mode does not include the time until the clock oscillation starts (“a” in the figure below) following release of the STOP mode, regardless of whether the STOP mode is released by reset or the occurrence of an interrupt request signal.

2. Be sure to clear bits 3 to 7 to “0”.
3. The oscillation stabilization time following reset release is $2^{15}/f_x$ (because the initial value of the OSTS register = 01H).
4. The oscillation stabilization time is also inserted during external clock input.

Remark f_x : Main clock oscillation frequency

22.3 HALT Mode

22.3.1 Setting and operation status

The HALT mode is set when a dedicated instruction (HALT) is executed in the normal operation mode.

In the HALT mode, the clock oscillator continues operating. Only clock supply to the CPU is stopped; clock supply to the other on-chip peripheral functions continues.

As a result, program execution is stopped, and the internal RAM retains the contents before the HALT mode was set. The on-chip peripheral functions that are independent of instruction processing by the CPU continue operating.

Table 22-3 shows the operation status in the HALT mode.

The average power consumption of the system can be reduced by using the HALT mode in combination with the normal operation mode for intermittent operation.

- Cautions**
1. Insert five or more NOP instructions after the HALT instruction.
 2. If the HALT instruction is executed with an unmasked interrupt request signal held pending, the system shift to the HALT mode, but the HALT mode is immediately released by the pending interrupt request signal.

22.3.2 Releasing HALT mode

The HALT mode is released by a non-maskable interrupt request signal (NMI pin input, INTWDT1, INTWDT2 signal), an unmasked maskable interrupt request signal, and reset signal ($\overline{\text{RESET}}$ pin input, WDTRES1, WDTRES2 signal).

After the HALT mode has been released, the normal operation mode is restored.

(1) Releasing HALT mode by non-maskable interrupt request signal or unmasked maskable interrupt request signal

The HALT mode is released by a non-maskable interrupt request signal or an unmasked maskable interrupt request signal, regardless of the priority of the interrupt request. If the HALT mode is set in an interrupt servicing routine, however, an interrupt request that is issued later is serviced as follows.

- (a) If an interrupt request signal with a priority lower than that of the interrupt request currently being serviced is issued, only the HALT mode is released, and that interrupt request signal is not acknowledged. The interrupt request signal itself is retained.
- (b) If an interrupt request with a priority higher than that of the interrupt request signal currently being serviced is issued (including a non-maskable interrupt request signal), the HALT mode is released and that interrupt request signal is acknowledged.

Table 22-2. Operation After Releasing HALT Mode by Interrupt Request Signal

Release Source	Interrupt Enabled (EI) Status	Interrupt Disabled (DI) Status
Non-maskable interrupt request signal	Execution branches to the handler address	
Maskable interrupt request signal	Execution branches to the handler address or the next instruction is executed	The next instruction is executed

(2) Releasing HALT mode by reset

The same operation as the normal reset operation is performed.

Table 22-3. Operation Status in HALT Mode

Setting of HALT Mode Item		When CPU Is Operating with Main Clock	
		When Subclock Is Not Used	When Subclock Is Used
CPU		Stops operation	
ROM correction		Stops operation	
Main clock oscillator		Oscillation enabled	
Subclock oscillator		—	Oscillation enabled
Interrupt controller		Operable	
Timer P (TMP0) ^{Note 1}		Operable	
16-bit timers (TM00 to TM05)		Operable	
8-bit timers (TM50, TM51)		Operable	
Timer H (TMH0, TMH1)		Operable	
Watch timer		Operable when main clock output is selected as count clock	Operable
Watchdog timer 1		Operable	
Watchdog timer 2		Operable when main clock is selected as count clock	Operable
Serial interface	CSI00 to CSI02	Operable	
	CSIA0, CSIA1	Operable	
	I ² C0 ^{Note 2} , I ² C1 ^{Note 2}	Operable	
	UART0 to UART2	Operable	
Key interrupt function		Operable	
A/D converter		Operable	
D/A converter		Operable when real-time output mode is selected	
Regulator		Operation continues	
Real-time output		Operable	
Port function		Retains status before HALT mode was set.	
External bus interface		Refer to CHAPTER 5 BUS CONTROL FUNCTION .	
Internal data		The CPU registers, statuses, data, and all other internal data such as the contents of the internal RAM are retained as they were before the HALT mode was set.	

Notes 1. Only in the μ PD70F3218H, 70F3218HY

2. Only in the μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, 70F3218HY

<R>

22.4 IDLE Mode

22.4.1 Setting and operation status

The IDLE mode is set by clearing the PSMR.PSM bit to 0 and setting the PSC.STP bit to 1 in the normal operation mode.

In the IDLE mode, the clock oscillator continues operation but clock supply to the CPU and other on-chip peripheral functions stops.

As a result, program execution stops and the contents of the internal RAM before the IDLE mode was set are retained. The CPU and other on-chip peripheral functions stop operating. However, the on-chip peripheral functions that can operate with the subclock or an external clock continue operating.

Table 22-5 shows the operation status in the IDLE mode.

The IDLE mode can reduce the power consumption more than the HALT mode because it stops the operation of the on-chip peripheral functions. The main clock oscillator does not stop, so the normal operation mode can be restored without waiting for the oscillation stabilization time after the IDLE mode has been released, in the same manner as when the HALT mode is released.

Caution Insert five or more NOP instructions after the instruction that stores data in the PSC register to set the IDLE mode.

22.4.2 Releasing IDLE mode

The IDLE mode is released by a non-maskable interrupt request signal (NMI pin input, INTWDT2 signal (when the CPU is operating on the subclock)), unmasked external interrupt request signal (INTP0 to INTP6 pin input), unmasked internal interrupt request signal from the peripheral functions operable in the IDLE mode, or reset (RESET pin input, WDTRES2 signal (when the CPU is operating on the subclock)).

After the IDLE mode has been released, the normal operation mode is restored.

(1) Releasing IDLE mode by non-maskable interrupt request signal or unmasked maskable interrupt request signal

The IDLE mode is released by a non-maskable interrupt request signal or an unmasked maskable interrupt request signal, regardless of the priority of the interrupt request. If the IDLE mode is set in an interrupt servicing routine, however, an interrupt request that is issued later is processed as follows.

- (a) If an interrupt request signal with a priority lower than that of the interrupt request currently being serviced is issued, only the IDLE mode is released, and that interrupt request signal is not acknowledged. The interrupt request signal itself is retained.
- (b) If an interrupt request signal with a priority higher than that of the interrupt request currently being serviced is issued (including a non-maskable interrupt request signal), the IDLE mode is released and that interrupt request signal is acknowledged.

Table 22-4. Operation After Releasing IDLE Mode by Interrupt Request Signal

Release Source	Interrupt Enabled (EI) Status	Interrupt Disabled (DI) Status
Non-maskable interrupt request signal	Execution branches to the handler address	
Maskable interrupt request signal	Execution branches to the handler address or the next instruction is executed	The next instruction is executed

Caution The interrupt request signal that is disabled by setting the PSC.NMI2M, PSC.NMI0M, and PSC.INTM bits to 1 (interrupt disabled) becomes invalid and the IDLE mode is not released.

(2) Releasing IDLE mode by reset

The same operation as the normal reset operation is performed.

Table 22-5. Operation Status in IDLE Mode

Setting of IDLE Mode		When CPU Is Operating with Main Clock	
Item		When Subclock Is Not Used	When Subclock Is Used
CPU		Stops operation	
ROM correction		Stops operation	
Main clock oscillator		Oscillation enabled	
Subclock oscillator		–	Oscillation enabled
Interrupt controller		Stops operation

	UART1, UART2	Stops operation	
Key interrupt function		Operable	
A/D converter		Stops operation ^{Note 3}	
D/A converter		Operable However, the DACSn register cannot be updated because the CPU is stopped.	
Regulator		Operation continues	
Real-time output		Operable when INTTM5m is selected as real-time output trigger and TM5m is enabled in IDLE mode. However, the RTBHm and RTBLm registers cannot be updated because the CPU is stopped.	
Port function		Retains status before IDLE mode was set.	
External bus interface		Refer to CHAPTER 5 BUS CONTROL FUNCTION .	
Internal data		The CPU registers, statuses, data, and all other internal data such as the contents of the internal RAM are retained as they were before the IDLE mode was set.	

Notes 1. Only in the μ PD70F3218H, 70F3218HY

2. Only in the μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, 70F3218HY

3. Set the ADM.ADCS and ADM.ADCS2 bits to 00B.

Remark m = 0, 1

n = 0 to 2

22.5 STOP Mode

22.5.1 Setting and operation status

The STOP mode is set when the PSMR.PSM bit is set to 1 and the PSC.STP bit is set to 1 in the normal operation mode.

In the STOP mode, the subclock oscillator continues operating but the main clock oscillator stops. Clock supply to the CPU and the on-chip peripheral functions is stopped.

As a result, program execution is stopped, and the contents of the internal RAM before the STOP mode was set are retained. The on-chip peripheral functions that operate with the clock oscillated by the subclock oscillator or an external clock continue operating.

Table 22-7 shows the operation status in the STOP mode.

Because the STOP stops operation of the main clock oscillator, it reduces the power consumption to a level lower than the IDLE mode. If the subclock oscillator and external clock are not used, the power consumption can be minimized with only leakage current flowing.

Caution Insert five or more NOP instructions after the instruction that stores data in the PSC register to set the STOP mode.

22.5.2 Releasing STOP mode

The STOP mode is released by a non-maskable interrupt request signal (NMI pin input, INTWDT2 signal (when the CPU is operating on the subclock)), unmasked external interrupt request signal (INTP0 to INTP6 pin input), unmasked internal interrupt request signal from the peripheral functions operable in the STOP mode, or reset (RESET pin input, WDTRES2 signal (when the CPU is operating on the subclock)).

After the STOP mode has been released, the normal operation mode is restored after the oscillation stabilization time has been secured.

(1) Releasing STOP mode by non-maskable interrupt request signal or unmasked maskable interrupt request signal

The STOP mode is released by a non-maskable interrupt request signal or an unmasked maskable interrupt request signal, regardless of the priority of the interrupt request. If the software STOP mode is set in an interrupt servicing routine, however, an interrupt request that is issued later is serviced as follows.

- (a) If an interrupt request signal with a priority lower than that of the interrupt request currently being serviced is issued, only the STOP mode is released, and that interrupt request signal is not acknowledged. The interrupt request signal itself is retained.
- (b) If an interrupt request signal with a priority higher than that of the interrupt request currently being serviced is issued (including a non-maskable interrupt request signal), the STOP mode is released and that interrupt request signal is acknowledged.

Table 22-6. Operation After Releasing STOP Mode by Interrupt Request Signal

Release Source	Interrupt Enabled (EI) Status	Interrupt Disabled (DI) Status
Non-maskable interrupt request signal	Execution branches to the handler address	
Maskable interrupt request signal	Execution branches to the handler address or the next instruction is executed	The next instruction is executed

Caution The interrupt request signal that is disabled by setting the PSC.NMI2M, PSC.NMI0M, and PSC.INTM bits to 1 (interrupt disabled) becomes invalid and the STOP mode is not released.

(2) Releasing STOP mode by reset

The same operation as the normal reset operation is performed.

Table 22-7. Operation Status in STOP Mode

Setting of STOP Mode		When CPU Is Operating with Main Clock	
Item		When Subclock Is Not Used	When Subclock Is Used
CPU		Stops operation	
ROM correction		Stops operation	
Main clock oscillator		Oscillation stops	
Subclock oscillator		–	Oscillation enabled
Interrupt controller		Stops operation	
Timer P (TMP0) ^{Note 1}		Stops operation	
16-bit timers (TM00 to TM05)		Stops operation	TM00, TM02 to TM05: Stop operation TM01: Operable when INTWT is selected as count clock and f _{XT} is selected as count clock of WT
8-bit timers (TM50, TM51)		Operable when TI5m is selected as count clock	Operable when TI5m is selected as count clock or when INTTM010 is selected as count clock and TM01 is enabled in STOP mode
Timer H (TMH0)		Stops operation	
Timer H (TMH1)		Stops operation	Operable when f _{XT} is selected as count clock
Watch timer		Stops operation	Operable when f _{XT} is selected as count clock
Watchdog timer 1		Stops operation	
Watchdog timer 2		Stops operation	Operable when f _{XT} is selected as count clock

A/D converter		Stops operation ^{Note 3}	
<R> D/A converter		Operable However, the DACSn register cannot be updated because the CPU is stopped.	
<R> Regulator		Stops operation	
Real-time output		Operable when INTTM5m is selected as real-time output trigger and TM5m is enabled in STOP mode. However, the RTBHm and RTBLm registers cannot be updated because the CPU is stopped.	
Port function		Retains status before STOP mode was set.	
External bus interface		Refer to CHAPTER 5 BUS CONTROL FUNCTION .	
Internal data		The CPU registers, statuses, data, and all other internal data such as the contents of the internal RAM are retained as they were before the STOP mode was set.	

Notes 1. Only in the μ PD70F3218H, 70F3218HY

2. Only in the μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, 70F3218HY

<R> 3. Set the ADM.ADCS and ADM.ADCS2 bits to 00B.

Remark m = 0, 1
n = 0 to 2

22.5.3 Securing oscillation stabilization time when STOP mode is released

When the STOP mode is released, only the oscillation stabilization time set by the OSTS register elapses. If the STOP mode has been released by reset, however, the reset value of the OSTS register, $2^{15}/f_x$ (8.192 ms at $f_x = 4$ MHz) elapses.

The operation performed when the STOP mode is released by an interrupt request signal is shown below.

Figure 22-2. Oscillation Stabilization Time

Caution For details of the OSTS register, refer to 22.2 (3) Oscillation stabilization time selection register (OSTS).

22.6 Subclock Operation Mode

22.6.1 Setting and operation status

The subclock operation mode is set when the PCC.CK3 bit is set to 1 in the normal operation mode.

When the subclock operation mode is set, the internal system clock is changed from the main clock to the subclock.

When the PCC.MCK bit is set to 1, the operation of the main clock oscillator is stopped. As a result, the system operates only with the subclock.

Table 22-8 shows the operation status in subclock operation mode.

In the subclock operation mode, the power consumption can be reduced to a level lower than in the normal operation mode because the subclock is used as the internal system clock. In addition, the power consumption can be further reduced to the level of the STOP mode by stopping the operation of the main clock oscillator.

Cautions 1. When manipulating the CK3 bit, do not change the set values of the PCC.CK2 to PCC.CK0 bits (using a bit manipulation instruction to manipulate the bit is recommended). For details, refer to 6.3 (1) Processor clock control register (PCC).

2. If the following conditions are not satisfied, change the CK2 to CK0 bits so that the conditions are satisfied and set the subclock operation mode.

$$\text{Internal system clock (f}_{\text{CLK}}) > \text{Subclock (f}_{\text{XT}}: 32.768 \text{ kHz}) \times 4$$

Remark Internal system clock (f_{CLK}): Clock generated from the main clock (f_{xx}) by setting bits CK2 to CK0

22.6.2 Releasing subclock operation mode

The subclock operation mode is released when the CK3 bit is cleared to 0 or by reset ($\overline{\text{RESET}}$ pin input, WDTRES1, WDTRES2 signal). If the main clock is stopped (MCK bit = 1), set the MCK bit to 1, secure the oscillation stabilization time of the main clock by software, and clear the CK3 bit to 0.

The normal operation mode is restored when the subclock operation mode is released.

Caution When manipulating the CK3 bit, do not change the set values of the CK2 to CK0 bits (using a bit manipulation instruction to manipulate the bit is recommended). For details, refer to 6.3 (1) Processor clock control register (PCC).

Table 22-8. Operation Status in Subclock Operation Mode

Setting of Subclock Operation Mode		Operation Status	
		When Main Clock Is Oscillating	When Main Clock Is Stopped
CPU		Operable

Remark m = 0, 1
n = 0 to 2

22.7 Sub-IDLE Mode

22.7.1 Setting and operation status

The sub-IDLE mode is set when the PSMR.PSM bit is cleared to 0 and the PSC.STP bit is set to 1 in the subclock operation mode.

In this mode, the clock oscillator continues operation but clock supply to the CPU and the other on-chip peripheral functions is stopped.

As a result, program execution is stopped and the contents of the internal RAM before the sub-IDLE mode was set are retained. The CPU and the other on-chip peripheral functions are stopped. However, the on-chip peripheral functions that can operate with the subclock or an external clock continue operating.

Table 22-10 shows the operation status in the sub-IDLE mode.

Because the sub-IDLE mode stops operation of the CPU and other on-chip peripheral functions, it can reduce the power consumption more than the subclock operation mode. If the sub-IDLE mode is set after the main clock has been stopped, the power consumption can be reduced to a level as low as that in the STOP mode.

<R> **Caution** Following the store instruction to set the PSC register to the sub-IDLE mode, insert five or more NOP instructions.

22.7.2 Releasing sub-IDLE mode

The sub-IDLE mode is released by a non-maskable interrupt request signal (NMI pin input, INTWDT2 signal (when the CPU is operating on the subclock)), unmasked external interrupt request signal (INTP0 to INTP6 pin input), unmasked internal interrupt request signal from the peripheral functions operable in the sub-IDLE mode, or reset ($\overline{\text{RESET}}$ pin input, WDTRES2 signal (when the CPU is operating on the subclock)).

When the sub-IDLE mode is released by an interrupt request signal, the subclock operation mode is set. If it is released by reset, the normal operation mode is restored.

(1) Releasing sub-IDLE mode by non-maskable interrupt request signal or unmasked maskable interrupt request signal

The sub-IDLE mode is released by a non-maskable interrupt request signal or an unmasked maskable interrupt request signal, regardless of the priority of the interrupt request. If the sub-IDLE mode is set in an interrupt servicing routine, however, an interrupt request signal that is issued later is serviced as follows.

- (a) If an interrupt request signal with a priority lower than that of the interrupt request currently being serviced is issued, only the sub-IDLE mode is released, and that interrupt request signal is not acknowledged. The interrupt request signal itself is retained.
- (b) If an interrupt request signal with a priority higher than that of the interrupt request currently being serviced is issued (including a non-maskable interrupt request signal), the sub-IDLE mode is released and that interrupt request signal is acknowledged.

Table 22-9. Operation After Releasing Sub-IDLE Mode by Interrupt Request Signal

Release Source	Interrupt Enabled (EI) Status	Interrupt Disabled (DI) Status
Non-maskable interrupt request signal	Execution branches to the handler address	
Maskable interrupt request signal	Execution branches to the handler address or the next instruction is executed	The next instruction is executed

Caution The interrupt request signal that is disabled by setting the PSC.NMI2M, PSC.NMI0M, and PSC.INTM bits to 1 (interrupt disabled) becomes invalid and the sub-IDLE mode is not released.

(2) Releasing sub-IDLE mode by reset

The same operation as the normal reset operation is performed.

Table 22-10. Operation Status in Sub-IDLE Mode

Setting of Sub-IDLE Mode		Operation Status	
		When Main Clock Is Oscillating	When Main Clock Is Stopped
Item	Mode		
CPU		Stops operation	
ROM correction		Stops operation	
Subclock oscillator		Oscillation enabled

External bus interface		Refer to CHAPTER 5 BUS CONTROL FUNCTION .	
Internal data		The CPU registers, statuses, data, and all other internal data such as the contents of the internal RAM are retained as they were before the sub-IDLE mode was set.	

Notes 1. Only in the μ PD70F3218H, 70F3218HY

2. Only in the μ PD703216Y, 703217Y, 70F3217Y, 70F3217HY, 70F3218HY

<R> 3. Set the ADM.ADCS and ADM.ADCS2 bits to 00B.

Remark m = 0, 1
n = 0 to 2

CHAPTER 23 RESET FUNCTION

23.1 Overview

The following reset functions are available.

- Reset function by $\overline{\text{RESET}}$ pin input
- Reset function by overflow of watchdog timer 1 (WDTRES1)
- Reset function by overflow of watchdog timer 2 (WDTRES2)

If the $\overline{\text{RESET}}$ pin goes high, the reset status is released, and the CPU starts executing the program. Initialize the contents of each register in the program as necessary.

The $\overline{\text{RESET}}$ pin has a noise eliminator that operates by analog delay to prevent malfunction caused by noise.

23.2 Configuration

Figure 23-1. Reset Block Diagram

23.3 Operation

The system is reset, initializing each hardware unit, when a low level is input to the $\overline{\text{RESET}}$ pin or if watchdog timer 1 or watchdog timer 2 overflows (WDTRES1 or WDTRES2).

While a low level is being input to the $\overline{\text{RESET}}$ pin, the main clock oscillator stops. Therefore, the overall power consumption of the system can be reduced.

If the $\overline{\text{RESET}}$ pin goes high or if the WDTRES1 or WDTRES2 signal is received, the reset status is released.

If the reset status is released by $\overline{\text{RESET}}$ pin input or the WDTRES2 signal, the oscillation stabilization time elapses (reset value of OSTS register: $2^{15}/f_{\text{xx}}$) and then the CPU starts program execution.

If the reset status is released by the WDTRES1 signal, the oscillation stabilization time is not inserted because the main system clock oscillator does not stop.

<R>

Table 23-1. Hardware Status on RESET Pin Input or Occurrence of WDTRES2 Signal

Item	During Reset	After Reset
Main clock oscillator (f_x)	Oscillation stops	Oscillation starts
Subclock oscillator (f_{XT})	Oscillation continues	
Peripheral clock (f_{xx} to $f_{xx}/1024$)	Operation stops	Operation starts after securing oscillation stabilization time
Internal system clock (f_{CLK})	Operation stops	Operation starts after securing oscillation stabilization time (initialized to $f_{xx}/8$)
CPU clock (f_{CPU})	Operation stops	Operation starts after securing oscillation stabilization time (initialized to $f_{xx}/8$)
Watchdog timer 1 clock (f_{xw})	Operation stops	Operation starts
CPU	Initialized	Program execution starts after securing oscillation stabilization time
Internal RAM	Undefined if power-on reset or writing data to RAM (by CPU) and reset input conflict (data is damaged). Otherwise value immediately before reset input is retained.	
I/O lines	High impedance	
On-chip peripheral I/O registers	Initialized to specified status	
Watchdog timer 2	Operation stops	Operation starts after securing oscillation stabilization time
Other on-chip peripheral functions	Operation stops	Operation can be started after securing oscillation stabilization time

<R>

Table 23-2. Hardware Status on Occurrence of WDTRES1 Signal

Item	During Reset	After Reset
Main clock oscillator (f_x)	Oscillation continues	
Subclock oscillator (f_{XT})	Oscillation continues	
Peripheral clock (f_{xx} to $f_{xx}/1024$)	Operation stops	Operation starts
Internal system clock (f_{CLK})	Oscillation continues (initialized to $f_{xx}/8$)	
CPU clock (f_{CPU})	Oscillation continues (initialized to $f_{xx}/8$)	
Watchdog timer 1 clock (f_{xw})	Operation continues	
Internal RAM	Undefined if writing data to RAM (by CPU) and reset input conflict (data is damaged). Otherwise value immediately before reset input is retained.	
I/O lines	High impedance	
On-chip peripheral I/O registers	Initialized to specified status	
Watchdog timer 2	Operation stops	Operation starts
Other on-chip peripheral functions	Operation stops	Operation can be started

Figure 23-4. Timing of Reset Operation by Watchdog Timer 1

<R>

Figure 23-5. Timing of Reset Operation by Watchdog Timer 2

CHAPTER 24 REGULATOR

24.1 Overview

The V850ES/KJ1 includes a regulator to reduce the power consumption and noise.

This regulator supplies a stepped-down V_{DD} power supply voltage to the oscillator block and internal logic circuits (except the A/D converter, D/A converter, and output buffer). The regulator output voltage is set to 3.6 V (TYP.).

<R> **Caution** When using the regulator ($REGC = 10\ \mu F$), the external clock cannot be input to the main clock oscillator or subclock oscillator.

Figure 24-1. Regulator

24.2 Operation

The regulator stops operating in the following modes and the supply voltage to the oscillator is V_{DD} (but only when $REGC = 10\ \mu F$).

- During reset
- In STOP mode
- In sub-IDLE mode

When using the regulator, be sure to connect a capacitor ($10\ \mu F$) to the REGC pin to stabilize the regulator output. A diagram of the regulator pin connections is shown below.

Figure 24-2. REGC Pin Connection

CHAPTER 25 ROM CORRECTION FUNCTION

25.1 Overview

The ROM correction function is used to replace part of the program in the internal ROM with the program of an external memory or the internal RAM.

By using this function, program bugs found in the internal ROM can be corrected.

Up to four address can be specified for correction.

Figure 25-1. Block Diagram of ROM Correction

25.2 Registers

(1) Correction address registers 0 to 3 (CORAD0 to CORAD3)

These registers are used to set the first address of the program to be corrected.

The program can be corrected at up to four places because four CORADn registers are provided.

The CORADn register can be read or written in 32-bit units.

If the higher 16 bits of the CORADn register are used as the CORADnH register, and the lower 16 bits as the CORADnL register, these registers can be read or written in 16-bit units.

After reset, CORADn is cleared to 00000000H.

Because the ROM capacity differs depending on the product, set correction addresses in the following ranges.

μPD703216, 703216Y (96 KB): 0000000H to 0017FFEh

μPD703217, 703217Y, 70F3217, 70F3217Y, 70F3217H, 70F3217HY (128 KB):

0000000H to 001FFEh

μPD70F3218H, 70F3218HY (256 KB): 0000000H to 003FFEh

Bits 0 and 20 to 31 are fixed to 0.

After reset: 00000000H R/W Address: CORAD0 FFFF840H,
CORAD0L FFFF840H, CORAD0H FFFF842H,
CORAD1 FFFF844H,
CORAD1L FFFF844H, CORAD1H FFFF846H,
CORAD2 FFFF848H,
CORAD2L FFFF848H, CORAD2H FFFF84AH,
CORAD3 FFFF84CH,
CORAD3L FFFF84CH, CORAD3H FFFF84EH

(a) 96 KB, 128 KB

(n = 0 to 3)

(b) 256 KB

(n = 0 to 3)

Note Be sure to clear these bits to 0.

(2) Correction control register (CORCN)

This register disables or enables the correction operation at the address specified by the CORADn register.

Each channel can be enabled or disabled by this register.

This register can be read or written in 8-bit or 1-bit units.

After reset, CORCN is cleared to 00H.

After reset: 00H		R/W	Address: FFFF880H							
			7	6	5	4	<3>	<2>	<1>	<0>
CORCN			0	0	0	0	COREN3	COREN2	COREN1	COREN0

CORENn	Correction operation enable/disable
0	Disabled
1	Enabled

Remark n = 0 to 3

Table 25-1. Correspondence Between CORCN Register Bits and CORADn Registers

CORCN Register Bit	Corresponding CORADn Register
COREN3	CORAD3
COREN2	CORAD2
COREN1	CORAD1
COREN0	CORAD0

25.3 ROM Correction Operation and Program Flow

- <1> If the address to be corrected and the fetch address of the internal ROM match, the fetch code is replaced by the DBTRAP instruction.
- <2> When the DBTRAP instruction is executed, execution branches to address 00000060H.
- <3> Software processing after branching causes the result of ROM correction to be judged (the fetch address and ROM correction operation are confirmed) and execution to branch to the correction software.
- <4> After the correction software has been executed, the return address is set, and return processing is started by the DBRET instruction.

- Cautions**
1. The software that performs <3> and <4> must be executed in the external memory or internal RAM.
 2. When setting an address to be corrected to the CORADn register, clear the higher bits to 0 in accordance with the capacity of the internal ROM.
 3. The ROM correction function cannot be used to correct the data of the internal ROM. It can only be used to correct instruction codes. If ROM correction is used to correct data, that data is replaced with the DBTRAP instruction code.

Figure 25-2. ROM Correction Operation and Program Flow

CHAPTER 26 FLASH MEMORY (SINGLE POWER)

The following products are the flash memory versions (single power) of the V850ES/KJ1.

Caution There are differences in noise immunity and noise radiation between the flash memory and mask ROM versions. When pre-producing and application set with the flash memory version and then mass-producing it with the mask ROM version, be sure to conduct sufficient evaluation for the commercial samples (not engineering samples) of the mask ROM version.
For the electrical specifications related to the flash memory rewriting, refer to CHAPTER 29 ELECTRICAL SPECIFICATIONS (SINGLE-POWER FLASH MEMORY VERSION).

- μ PD70F3217H, 70F3217HY: 128 KB flash memory
- μ PD70F3218H, 70F3218HY: 256 KB flash memory

Flash memory versions are commonly used in the following development environments and mass production applications.

- For altering software after the V850ES/KJ1 is soldered onto the target system.
- For data adjustment when starting mass production.
- For differentiating software according to the specification in small scale production of various models.
- For facilitating inventory management.
- For updating software after shipment.

26.1 Features

- 4-byte/1-clock access (when instruction is fetched)
- Capacity: 256/128 KB
- Write voltage: Erase/write with a single power supply
- Rewriting method
 - Rewriting by communication with dedicated flash programmer via serial interface (on-board/off-board programming)
 - Rewriting flash memory by user program (self programming)
- Flash memory write prohibit function supported (security function)
- Safe rewriting of entire flash memory area by self programming using boot swap function
- Interrupts can be acknowledged during self programming.

Caution When writing/erasing the flash memory using a flash programmer, a single-power flash memory differs from a two-power flash memory in the following points.

- A flash programming mode setting pin (FLMD1 pin) must be connected in addition to the pins connected in a two-power flash memory.
- The pin used as a handshake signal differs when writing/erasing the flash memory with CSI + HS communication.

Two-power flash memory: PCS1/ $\overline{\text{CS1}}$

Single-power flash memory: PCM0/WAIT

26.2 Memory Configuration

The 256/128 KB internal flash memory area is divided into 128/64 blocks and can be programmed/erased in block units. All the blocks can also be erased at once.

When the boot swap function is used, the physical memory (blocks 0 to 3) located at the addresses of boot area 0 is replaced by the physical memory (blocks 4 to 7) located at the addresses of boot area 1. For details of the boot swap function, refer to **26.5 Rewriting by Self Programming**.

Figure 26-1. Flash Memory Mapping

26.3 Functional Outline

The internal flash memory of the V850ES/KJ1 can be rewritten by using the rewrite function of the dedicated flash programmer, regardless of whether the V850ES/KJ1 has already been mounted on the target system or not (on-board/off-board programming).

In addition, a security function that prohibits rewriting the user program written to the internal flash memory is also supported, so that the program cannot be changed by an unauthorized person.

The rewrite function using the user program (self programming) is ideal for an application where it is assumed that the program is changed after production/shipment of the target system. A boot swap function that rewrites the entire flash memory area safely is also supported. In addition, interrupt servicing is supported during self programming, so that the flash memory can be rewritten under various conditions, such as while communicating with an external device.

Table 26-1. Rewrite Method

Rewrite Method	Functional Outline	Operation Mode
On-board programming	Flash memory can be rewritten after the device is mounted on the target system, by using a dedicated flash programmer.	Flash memory programming mode
Off-board programming	Flash memory can be rewritten before the device is mounted on the target system, by using a dedicated flash programmer and a dedicated program adapter board (FA series).	
Self programming	Flash memory can be rewritten by executing a user program that has been written to the flash memory in advance by means of on-board/off-board programming. (During self-programming, instructions cannot be fetched from or data access cannot be made to the internal flash memory area. Therefore, the rewrite program must be transferred to the internal RAM or external memory in advance).	Normal operation mode

Remark The FA series is a product of Naito Densai Machida Mfg. Co., Ltd.

Table 26-2. Basic Functions

Function	Functional Outline	Support (○: Supported, ×: Not supported)	
		On-Board/Off-Board Programming	Self Programming
Block erasure	The contents of specified memory blocks are erased.	○	○
Chip erasure	The contents of the entire memory area are erased all at once.	○	×
Write	Writing to specified addresses, and a verify check to see if write level is secured are performed.	○	○
Verify/checksum	Data read from the flash memory is compared with data transferred from the flash programmer.	○	× (Can be read by user program)
Blank check	The erasure status of the entire memory is checked.	○	○
Security setting	Use of the block erase command, chip erase command, program command, and read command can be prohibited, and rewriting boot area can be prohibited.	○	× (Supported only when setting is changed from enable to disable)

The following table lists the security functions. The block erase command prohibit, chip erase command prohibit, and program command prohibit functions are enabled by default after shipment, and security can be set by rewriting via on-board/off-board programming. Each security function can be used in combination with the others at the same time.

Table 26-3. Security Functions

Function	Function Outline
Block erase command prohibit	Execution of a block erase command on all blocks is prohibited. Setting of prohibition can be initialized by execution of a chip erase command.
Chip erase command prohibit	Execution of block erase and chip erase commands on all the blocks is prohibited. Once prohibition is set, setting of prohibition cannot be initialized because the chip erase command cannot be executed.
Program command prohibit	Program and block erase commands on all the blocks are prohibited. Setting of prohibition can be initialized by execution of the chip erase command.
Read command prohibit	Read command on all the blocks is prohibited. Setting of prohibition can be initialized by execution of the chip erase command.
Boot area rewrite prohibit	Boot areas from block 0 to the specified last block can be protected. The protected boot area cannot be rewritten (erased and written). Setting of prohibition cannot be initialized by execution of the chip erase command.

<R>

Table 26-4. Security Setting

Function	Erase, Write, Read Operations When Each Security Is Set (√: Executable, ×: Not Executable, -: Not Supported)		Notes on Security Setting	
	On-Board/ Off-Board Programming	Self Programming	On-Board/ Off-Board Programming	Self Programming
Block erase command prohibit	Block erase command: × Chip erase command: √ Program command: √ Read command: √	Block erasure (FlashBlockErase): √ Chip erasure: – Write (FlashWordWrite): √ Read (FlashWordRead): √	Setting of prohibition can be initialized by chip erase command.	Supported only when setting is changed from enable to prohibit
Chip erase command prohibit	Block erase command: × Chip erase command: × Program command: √ Read command: √	Block erasure (FlashBlockErase): √ Chip erasure: – Write (FlashWordWrite): √ Read (FlashWordRead): √	Setting of prohibition cannot be initialized.	
Program command prohibit	Block erase command: × Chip erase command: √ ^{Note 1} Program command: × Read command: √	Block erasure (FlashBlockErase): √ Chip erasure: – Write (FlashWordWrite): √ Read (FlashWordRead): √	Setting of prohibition can be initialized by chip erase command.	
Read command prohibit	Block erase command: √ Chip erase command: √ Program command: √ Read command: ×	Block erasure (FlashBlockErase): √ Chip erasure: – Write (FlashWordWrite): √ Read (FlashWordRead): √	Setting of prohibition can be initialized by chip erase command.	
Boot area rewrite prohibit	Block erase command: √ ^{Note 2} Chip erase command: × Program command: √ ^{Note 2} Read command: √	Block erasure (FlashBlockErase): √ Chip erasure: – Write (FlashWordWrite): √ Read (FlashWordRead): √	Setting of prohibition cannot be initialized.	

Notes 1. In this case, since the erase command is invalid, data different from the data already written in the flash memory cannot be written.

2. The boot area for which rewriting is prohibited is invalid.

<R>

(1) Security setting by PG-FP4 (Security flag settings)

When disabling the read command (Disable Read), to raise the security level, it is recommended to also disable the block erase command (Disable Block Erase) and program command (Disable Program).

Furthermore, when rewriting program is not necessary similarly to the mask ROM products, additionally disable the chip erase command (Disable Chip Erase).

Notes 1. Set "Supply voltage", "Program download/upload", and "Command options" in broken lines in accordance with the use conditions.

2. To disable rewriting the boot area (Boot block cluster setting), select "Disable Boot block cluster reprogramming" in "Security flag settings" and select the last block of the boot area for which rewriting is to be disabled.

26.4 Rewriting by Dedicated Flash Programmer

The flash memory can be rewritten by using a dedicated flash programmer after the V850ES/KJ1 is mounted on the target system (on-board programming). The flash memory can also be rewritten before the device is mounted on the target system (off-board programming) by using a dedicated program adapter (FA series).

26.4.1 Programming environment

The following shows the environment required for writing programs to the flash memory of the V850ES/KJ1.

Figure 26-2. Environment Required for Writing Programs to Flash Memory

A host machine is required for controlling the dedicated flash programmer.

UART0 or CSI00 is used for the interface between the dedicated flash programmer and the V850ES/KJ1 to perform writing, erasing, etc. A dedicated program adapter (FA series) is required for off-board writing.

Remark The FA series is a product of Naito Densai Machida Mfg. Co., Ltd.

26.4.2 Communication mode

Communication between the dedicated flash programmer and the V850ES/KJ1 is performed by serial communication using the UART0 or CSI00 interfaces of the V850ES/KJ1.

(1) UART0

Transfer rate: 9,600 to 153,600 bps

Figure 26-3. Communication with Dedicated Flash Programmer (UART0)

(2) CSI00

Serial clock: 2.4 kHz to 2.5 MHz (MSB first)

Figure 26-4. Communication with Dedicated Flash Programmer (CSI00)

(3) CSI00 + HS

Serial clock: 2.4 kHz to 2.5 MHz (MSB first)

Figure 26-5. Communication with Dedicated Flash Programmer (CSI00 + HS)

The dedicated flash programmer outputs the transfer clock, and the V850ES/KJ1 operates as a slave.

When the PG-FP4 is used as the dedicated flash programmer, it generates the following signals to the V850ES/KJ1. For details, refer to the **PG-FP4 User's Manual (U15260E)**.

Table 26-5. Signal Connections of Dedicated Flash Programmer (PG-FP4)

PG-FP4			V850ES/KJ1	Processing for Connection		
Signal Name	I/O	Pin Function	Pin Name	UART0	CSI00	CSI00 + HS
FLMD0	Output	Write enable/disable	FLMD0	○	○	○
FLMD1	Output	Write enable/disable	FLMD1	○ ^{Note 1}	○ ^{Note 1}	○ ^{Note 1}
VDD	—	V _{DD} voltage generation/voltage monitor	V _{DD}	○	○	○
GND	—	Ground	V _{SS}	○	○	○
CLK	Output	Clock output to V850ES/KJ1	X1, X2	× ^{Note 2}	× ^{Note 2}	× ^{Note 2}
RESET	Output	Reset signal	RESET	○	○	○
SI/RxD	Input	Receive signal	SO00	○	○	○
SO/TxD	Output	Transmit signal	SI00	○	○	○
SCK	Output	Transfer clock	SCK00	×	○	○
HS	Input	Handshake signal for CSI00 + HS communication	PCM0	×	×	○

Notes 1. Wire the pin as shown in Figure 26-6, or connect it to GND on board via a pull-down resistor.

- 2.** Connect these pins to supply a clock from the PG-FP4 (wire as shown in Figure 26-6, or create an oscillator on board and supply the clock).

Remark ○: Must be connected.

×: Does not have to be connected.

Table 26-6. Wiring Between μ PD70F3217H, 70F3217HY, 70F3218H, and 70F3218HY, and PG-FP4

Pin Configuration of Flash Programmer (PG-FP4)			Pin Name on FA Board	With CSI00-HS		With CSI00		With UART0	
Signal Name	I/O	Pin Function		Pin Name	Pin No.	Pin Name	Pin No.	Pin Name	Pin No.
SI/RxD	Input	Receive signal	SI	P41/SO00	23	P41/SO00	23	P30/TXD0	25
SO/TxD	Output	Transmit signal	SO	P40/SI00	22	P40/SI00	22	P31/RXD0	26
SCK	Output	Transfer clock	SCK	P42/ $\overline{\text{SCK00}}$	24	P42/ $\overline{\text{SCK00}}$	24	Not needed	Not needed
CLK	Output	Clock to V850ES/KJ1	X1	X1	12	X1	12	X1	12
			X2	X2 ^{Note 1}	13	X2 ^{Note 1}	13	X2 ^{Note 1}	13
/RESET	Output	Reset signal	/RESET	$\overline{\text{RESET}}$	14	$\overline{\text{RESET}}$	14	$\overline{\text{RESET}}$	14
FLMD0	Input	Write voltage	FLMD0	FLMD0	8	FLMD0	8	FLMD0	8
FLMD1	Input	Write voltage	FLMD1	PDL5/AD5/ FLMD1	110	PDL5/AD5/ FLMD1	110	PDL5/AD5/ FLMD1	110
HS	Input	Handshake signal for CSI00 + HS communication	RESERVE /HS	PCM0/ $\overline{\text{WAIT}}$ ^{Note 2}	85	Not needed	Not needed	Not needed	Not needed
VDD	—	V _{DD} voltage generation/voltage monitor	VDD	V _{DD}	9	V _{DD}	9	V _{DD}	9
				BV _{DD}	104	BV _{DD}	104	BV _{DD}	104
				EV _{DD}	34	EV _{DD}	34	EV _{DD}	34
				AV _{REF0}	1	AV _{REF0}	1	AV _{REF0}	1
				AV _{REF1}	5	AV _{REF1}	5	AV _{REF1}	5
GND	—	Ground	GND	V _{SS}	11	V _{SS}	11	V _{SS}	11
				AV _{SS}	2	AV _{SS}	2	AV _{SS}	2
				BV _{SS}	103	BV _{SS}	69	BV _{SS}	69
				EV _{SS}	33	EV _{SS}	33	EV _{SS}	33

Notes 1. When using the clock out of the flash programmer, connect CLK of the programmer to X1, and connect its inverse signal to X2.

2. The pin differs when it is used in a two-power flash memory.

Cautions 1. Be sure to connect the REGC pin in either of the following ways.

- Connect to GND via a 10 μ F capacitor
- Directly connect to V_{DD}

2. When connecting the REGC pin to GND via a 10 μ F capacitor, the clock cannot be supplied from the CLK pin of the flash programmer.

Supply the clock by creating an oscillator on the board.

<R>

Figure 26-6. Wiring Example of V850ES/KJ1 Flash Writing Adapter (FA-144GJ-UEN-A) (1/2)

<R>

Figure 26-6. Wiring Example of V850ES/KJ1 Flash Writing Adapter (FA-144GJ-UEN-A) (2/2)

Notes 1. Wire the FLMD1 pin as shown in the figure, or connect it to GND on board via a pull-down resistor.

2. Be sure to connect the REGC pin in either of the following ways.

- Connect to GND via a 10 μ F capacitor.
- Directly connect to V_{DD} .

When connecting the REGC pin to GND via a 10 μ F capacitor, the clock cannot be supplied from the CLK pin of the flash programmer.

Supply the clock by creating an oscillator on the board.

3. The above figure shows an example of wiring when the clock is supplied from the PG-FP4.

Be sure to set and connect as follows when the clock is supplied from the PG-FP4.

- Set J1 of the flash adapter (FA) to the V_{DD} side.
- Connect CLKOUT of FA to CLKIN of FA.
- Connect X1 of FA to X1 of the device.
- Connect X2 of FA to X2 of the device.

If an oscillator is created on the flash adapter and a clock is supplied, the above setting and connections will not necessary. The following shows a circuit example.

4. Corresponding pin when using UART0

5. Unlike a two-power flash memory, a flash programming mode setting pin is required in a single-power flash memory.

6. The pin differs when it is used in a two-power flash memory.

Remarks 1. Handle the pins not described above in accordance with the specified handling of unused pins (refer to **2.3 Pin I/O Circuits and Recommended Connection of Unused Pins**).

When connecting to V_{DD} via a resistor, use of a resistor of 1 k Ω to 10 k Ω is recommended.

2. This adapter is for a 144-pin plastic LQFP (fine pitch) package.

3. This diagram shows the wiring when using a handshake-supporting CSI.

26.4.3 Flash memory control

The following shows the procedure for manipulating the flash memory.

Figure 26-7. Procedure for Manipulating Flash Memory

26.4.4 Selection of communication mode

In the V850ES/KJ1, the communication mode is selected by inputting pulses (12 pulses max.) to the FLMD0 pin after switching to the flash memory programming mode. The FLMD0 pulse is generated by the dedicated flash programmer.

The following shows the relationship between the number of pulses and the communication mode.

Figure 26-8. Selection of Communication Mode

26.4.5 Communication commands

The V850ES/KJ1 communicates with the dedicated flash programmer by means of commands. The signals sent from the dedicated flash programmer to the V850ES/KJ1 are called “commands”. The response signals sent from the V850ES/KJ1 to the dedicated flash programmer are called “response commands”.

Figure 26-9. Communication Commands

The following shows the commands for flash memory control in the V850ES/KJ1. All of these commands are issued from the dedicated flash programmer, and the V850ES/KJ1 performs the processing corresponding to the commands.

Table 26-7. Flash Memory Control Commands

Classification	Command Name	Support			Function
		CSI00	CSI00 + HS	UART0	
Blank check	Block blank check command	○	○	○	Checks if the contents of the memory in the specified block have been correctly erased.
Erase	Chip erase command	○	○	○	Erases the contents of the entire memory.
	Block erase command	○	○	○	Erases the contents of the memory of the specified block.
<R> Write	Program command	○	○	○	Writes the specified address range, and executes a contents verify check.
Verify	Verify command	○	○	○	Compares the contents of memory in the specified address range with data transferred from the flash programmer.
	Checksum command	○	○	○	Reads the checksum in the specified address range.
<R> System setting, control	Silicon signature command	○	○	○	Reads silicon signature information.
	Security setting command	○	○	○	Disables chip erase, block erase, program, and read commands and disables rewriting the boot area.

26.4.6 Pin connection

When performing on-board writing, mount a connector on the target system to connect to the dedicated flash programmer. Also, incorporate a function on-board to switch from the normal operation mode to the flash memory programming mode.

In the flash memory programming mode, all the pins not used for flash memory programming become the same status as that immediately after reset. Therefore, pin handling is required when the external device does not acknowledge the status immediately after a reset.

(1) FLMD0 pin

In the normal operation mode, input a voltage of V_{SS} level to the FLMD0 pin. In the flash memory programming mode, supply a write voltage of V_{DD} level to the FLMD0 pin.

Because the FLMD0 pin serves as a write protection pin in the self programming mode, a voltage of V_{DD} level must be supplied to the FLMD0 pin via port control, etc., before writing to the flash memory. For details, refer to 26.5.5 (1) FLMD0 pin.

Figure 26-10. FLMD0 Pin Connection Example

(2) FLMD1 pin

When 0 V is input to the FLMD0 pin, the FLMD1 pin does not function. When V_{DD} is supplied to the FLMD0 pin, the flash memory programming mode is entered, so 0 V must be input to the FLMD1 pin. The following shows an example of the connection of the FLMD1 pin.

Figure 26-11. FLMD1 Pin Connection Example**Table 26-8. Relationship Between FLMD0 and FLMD1 Pins and Operation Mode When Reset Is Released**

FLMD0	FLMD1	Operation Mode
0	don't care	Normal operation mode
V_{DD}	0	Flash memory programming mode
V_{DD}	V_{DD}	Setting prohibited

(3) Serial interface pin

The following shows the pins used by each serial interface.

Table 26-9. Pins Used by Serial Interfaces

Serial Interface	Pins Used
UART0	TXD0, RXD0
CSI00	SO00, SI00, $\overline{\text{SCK00}}$
CSI00 + HS	SO00, SI00, $\overline{\text{SCK00}}$, PCM0

When connecting a dedicated flash programmer to a serial interface pin that is connected to another device on-board, care should be taken to avoid conflict of signals and malfunction of the other device.

(a) Conflict of signals

When the dedicated flash programmer (output) is connected to a serial interface pin (input) that is connected to another device (output), a conflict of signals occurs. To avoid the conflict of signals, isolate the connection to the other device or set the other device to the output high-impedance status.

Figure 26-12. Conflict of Signals (Serial Interface Input Pin)

(b) Malfunction of other device

When the dedicated flash programmer (output or input) is connected to a serial interface pin (input or output) that is connected to another device (input), the signal is output to the other device, causing the device to malfunction. To avoid this, isolate the connection to the other device.

Figure 26-13. Malfunction of Other Device

(4) RESET pin

When the reset signals of the dedicated flash programmer are connected to the $\overline{\text{RESET}}$ pin that is connected to the reset signal generator on-board, a conflict of signals occurs. To avoid the conflict of signals, isolate the connection to the reset signal generator.

When a reset signal is input from the user system in the flash memory programming mode, the programming operation will not be performed correctly. Therefore, do not input signals other than the reset signals from the dedicated flash programmer.

Figure 26-14. Conflict of Signals ($\overline{\text{RESET}}$ Pin)

**(5) Port pins (including NMI)**

When the system shifts to the flash memory programming mode, all the pins that are not used for flash memory programming are in the same status as that immediately after reset. If the external device connected to each port does not recognize the status of the port immediately after reset, pins require appropriate processing, such as connecting to V_{DD} via a resistor or connecting to V_{SS} via a resistor.

(6) Other signal pins

Connect X1, X2, XT1, XT2, and REGC in the same status as that in the normal operation mode.

(7) Power supply

Supply the same power (V_{DD} , V_{SS} , EV_{DD} , EV_{SS} , AV_{SS} , BV_{DD} , BV_{SS} , AV_{REF0} , AV_{REF1}) as in normal operation mode.

26.5 Rewriting by Self Programming

26.5.1 Overview

The V850ES/KJ1 supports a flash macro service that allows the user program to rewrite the internal flash memory by itself. By using this interface and a self programming library that is used to rewrite the flash memory with a user application program, the flash memory can be rewritten by a user application transferred in advance to the internal RAM or external memory. Consequently, the user program can be upgraded and constant data can be rewritten in the field.

Figure 26-15. Concept of Self Programming

26.5.2 Features

(1) Secure self programming (boot swap function)

The V850ES/KJ1 supports a boot swap function that can exchange the physical memory (blocks 0 to 3) of boot area 0 with the physical memory (blocks 4 to 7) of boot area 1. By writing the start program to be rewritten to boot area 1 in advance and then swapping the physical memory, the entire area can be safely rewritten even if a power failure occurs during rewriting because the correct user program always exists in boot area 0.

Figure 26-16. Rewriting Entire Memory Area (Boot Swap)

<R>

(2) Interrupt support

Instructions cannot be fetched from the flash memory during self programming. Conventionally, therefore, a user handler written to the flash memory could not be used even if an interrupt occurred. Therefore, in the V850ES/KJ1, to use an interrupt during self programming, processing transits to the specific address^{Note} in the internal RAM. Allocate the jump instruction that transits processing to the user interrupt servicing at the specific address^{Note} in the internal RAM.

Note NMI interrupt: Start address of internal RAM
Maskable interrupt: Start address of internal RAM + 4 addresses

26.5.3 Standard self programming flow

The entire processing to rewrite the flash memory by flash self programming is illustrated below.

<R>

Figure 26-17. Standard Self Programming Flow

26.5.4 Flash functions

Table 26-10. Main Flash Function List

Function Name	Outline	Support
FlashEnv	Initialization of flash control macro	√
FlashBlockErase	Erasure of only specified one block	√
FlashWordWrite	Writing from specified address	√
FlashBlockVerify	Internal verification of specified block	√
FlashBlockBlankCheck	Blank check of specified block	√
FlashFLMDCheck	Check of FLMD pin	√
FlashGetInfo	Reading of flash information	√
FlashSetInfo	Setting of flash information	√
FlashBootSwap	Swapping of boot area	√
FlashWordRead	Reading data from specified address	√

Remark For details, refer to the **V850 Series Flash Memory Self Programming (Single Power Supply Flash Memory) User's Manual**.
Contact an NEC Electronics sales representative for the above manual.

26.5.5 Pin processing

(1) FLMD0 pin

The FLMD0 pin is used to set the operation mode when reset is released and to protect the flash memory from being written during self rewriting. It is therefore necessary to keep the voltage applied to the FLMD0 pin at 0 V when reset is released and a normal operation is executed. It is also necessary to apply a voltage of V_{DD} level to the FLMD0 pin during the self programming mode period via port control before the memory is rewritten.

When self programming has been completed, the voltage on the FLMD0 pin must be returned to 0 V.

Figure 26-18. Mode Change Timing

Caution Make sure that the FLMD0 pin is at 0 V when reset is released.

<R> 26.5.6 Internal resources used

The following table lists the internal resources used for self programming. These internal resources can also be used freely for purposes other than self programming.

Table 26-10. Internal Resources Used

Resource Name	Description
Entry RAM area (internal RAM/external RAM size: 136 bytes)	Routines and parameters used for the flash macro service are located in this area. The entry program and default parameters are copied by calling a library initialization function.
Stack area (stack size: 600 bytes)	An extension of the stack used by the user is used by the library (can be used in both the internal RAM and external RAM).
Library code (code size: Approx. 1600 bytes)	Program entity of library (can be used anywhere other than the flash memory block to be manipulated).
Application program	Executed as user application. Calls flash functions.
Maskable interrupt	Can be used in user application execution status or self programming status. To use this interrupt in the self-programming status, since the processing transits to the address of the internal RAM start address + 4 addresses ^{Note 1} , allocate the jump instruction that transits the processing to the user interrupt servicing at the address of the internal RAM start address + 4 addresses ^{Note 1} in advance.
NMI interrupt	Can be used in user application execution status or self programming status. To use this interrupt in the self-programming status, since the processing transits to the address of the internal RAM start address ^{Note 2} , allocate the jump instruction that transits the processing to the user interrupt servicing at the internal RAM start address ^{Note 2} in advance.
TM50, TM51	Because TM50 and TM51 are used in the flash macro service, do not use them in the self programming status. When using TM50 and TM51 after self programming, set them again.

- Notes** 1. μ PD70F3218H, 70F3218HY: 3FFD804H
 μ PD70F3217H, 70F3217HY: 3FFB004H
2. μ PD70F3218H, 70F3218HY: 3FFD800H
 μ PD70F3217H, 70F3217HY: 3FFB000H

Remark For details, refer to the **V850 Series Flash Memory Self Programming (Single Power Supply Flash Memory) User's Manual**.

Contact an NEC Electronics sales representative for the above manual.

CHAPTER 27 FLASH MEMORY (TWO POWER)

The following products are the on-chip flash memory versions (two power) of the V850ES/KJ1.

Caution There are differences in noise immunity and noise radiation between the flash memory and mask ROM versions. When pre-producing and application set with the flash memory version and then mass-producing it with the mask ROM version, be sure to conduct sufficient evaluation for the commercial samples (not engineering samples) of the mask ROM version.
For the electrical specifications related to the flash memory rewriting, refer to CHAPTER 30 ELECTRICAL SPECIFICATIONS (STANDARD PRODUCTS (MASK ROM VERSION AND TWO-POWER FLASH MEMORY VERSION), (A) GRADE PRODUCTS).

- μ PD70F3217, 70F3217Y: Products with 128 KB flash memory

When an instruction is fetched from this flash memory, 4 bytes can be accessed with 1 clock, in the same manner as the mask ROM versions.

Data can be written to the flash memory with the flash memory mounted on the target system (on-board). Connect a dedicated flash programmer to the target system to write the flash memory.

The following are the assumed environments and applications of flash memory.

- Changing software after soldering the V850ES/KJ1 onto the target system
- Producing many variations of a product in small quantities by changing the software
- Adjusting data when mass production is started

27.1 Features

- 4-byte/1-clock access (during instruction fetch access)
- Erasing all areas at once
- Communication with dedicated flash programmer via serial interface
- Erase/write voltage: $V_{PP} = 10\text{ V}$
- On-board programming

Remark For the differences between a two-power flash memory and single-power flash memory, refer to **Caution** in 26.1 Features.

27.2 Writing with Flash Programmer

Data can be written to the flash memory on-board or off-board, by using a dedicated flash programmer.

(1) On-board programming

The contents of the flash memory can be rewritten after the V850ES/KJ1 has been mounted on the target system. The connectors that connect the dedicated flash programmer must be mounted on the target system.

(2) Off-board programming

Data can be written to the flash memory with a dedicated program adapter (FA series) before the V850ES/KJ1 is mounted on the target system.

Remark The FA series is a product of Naito Densei Machida Mfg. Co., Ltd.

Table 27-1. Wiring Between μ PD70F3217 and 70F3217Y, and PG-FP4

Pin Configuration of Flash Programmer (PG-FP4)			Pin Name on FA Board	With CSI00-HS		With CSI00		With UART0

GND	—	Ground	GND	V _{SS}	11	V _{SS}	11	V _{SS}	11
				AV _{SS}	2	AV _{SS}	2	AV _{SS}	2
				BV _{SS}	103	BV _{SS}	69	BV _{SS}	69
				EV _{SS}	33	EV _{SS}	33	EV _{SS}	33

Notes 1. When using the clock out of the flash programmer, connect CLK of the programmer to X1, and connect its inverse signal to X2.

2. The pin differs when it is used in a single-power flash memory.

Cautions 1. Be sure to connect the REGC pin in either of the following ways.

- Connect to GND via a 10 μ F capacitor
- Directly connect to V_{DD}

2. When connecting the REGC pin to GND via a 10 μ F capacitor, the clock cannot be supplied from the CLK pin of the flash programmer.

Supply the clock by creating an oscillator on the board.

<R>

Figure 27-1. Wiring Example of V850ES/KJ1 Flash Writing Adapter (FA-144GJ-UEN-A) (1/2)

Notes 1. Be sure to connect the REGC pin in either of the following ways.

- Connect to GND via a 10 μF capacitor.
- Directly connect to VDD.

When connecting the REGC pin to GND via a 10 μF capacitor, the clock cannot be supplied from the CLK pin of the flash programmer.

Supply the clock by creating an oscillator on the board.

<R>

Figure 27-1. Wiring Example of V850ES/KJ1 Flash Writing Adapter (FA-144GJ-UEN-A) (2/2)

Notes 2. The above figure shows a wiring example when the clock is supplied from PG-FP4.
Be sure to set and connect as shown below when the clock is supplied from PG-FP4.

- Set the J1 of the flash adapter (FA) to the VDD side.
- Connect CLKOUT of FA to CLKIN of FA.
- Connect X1 of FA to X1 of the device.
- Connect X2 of FA to X2 of the device.

In the case where an oscillator is created on the flash adapter and clock is supplied from it, the above setting and connections are not necessary. The following shows a circuit example.

3. The corresponding pins when UART0 is used.
4. Pins used in the two-power flash memory differ from the pins used in the single-power flash memory.

Remarks 1. Handle the pins not described above in accordance with the specified handling of unused pins (refer to 2.3 Pin I/O Circuits and Recommended Connection of Unused Pins).

When connecting to V_{DD} via a resistor, use of a resistor of 1 kΩ to 10 kΩ is recommended.

2. This adapter is for a 144-pin plastic LQFP (fine pitch) package.
3. This diagram shows the wiring when using a handshake-supporting CSI.

27.3 Programming Environment

The environment required for writing a program to the flash memory of the V850ES/KJ1 is illustrated below.

Figure 27-2. Environment for Writing Program to Flash Memory

A host machine that controls the dedicated flash programmer is necessary.

To interface between the flash programmer and the V850ES/KJ1, UART0 or CSI00 is used for manipulation such as writing and erasing. To write the flash memory off-board, a dedicated program adapter (FA series) is necessary.

27.4 Communication Mode

Communication between the dedicated flash programmer and the V850ES/KJ1 is established by serial communication via UART0 or CSI00 of the V850ES/KJ1.

(1) UART0

Transfer rate: 9600 to 153600 bps (LSB first)

Figure 27-3. Communication with Dedicated Flash Programmer (UART0)

(2) CSI00

Transfer rate: 2.4 kHz to 2.5 MHz (MSB first)

Figure 27-4. Communication with Dedicated Flash Programmer (CSI00)

(3) CSI communication mode supporting handshake

Transfer rate: 2.4 kHz to 2.5 MHz (MSB first)

Figure 27-5. Communication with Flash Programmer (CSI00 + H/S)

If the PG-FP4 is used as the flash programmer, the PG-FP4 generates the following signals for the V850ES/KJ1. For details, refer to the **PG-FP4 User's Manual (U15260E)**.

Table 27-2. Signals Generated by Dedicated Flash Programmer (PG-FP4)

PG-FP4			V850ES/KJ1	Connection	
Signal Name	I/O	Pin Function	Pin Name	CSI00	UART0
VPP	Output	Write voltage	V _{PP}	○	○
VDD	I/O	V _{DD} voltage generation/voltage monitoring	V _{DD}	○	○
GND	—	Ground	V _{SS}	○	○
CLK	Output	Clock output to V850ES/KJ1	X1, X2 ^{Note}	○	○
$\overline{\text{RESET}}$	Output	Reset signal	$\overline{\text{RESET}}$	○	○
SI/RxD	Input	Receive signal	SO00/TXD0	○	○
SO/TxD	Output	Transmit signal	SI00/RXD0	○	○
SCK	Output	Transfer clock	$\overline{\text{SCK00}}$	○	×
H/S	Input	Handshake signal of CSI00 + HS communication	PCS1	△	×

Note For off-board writing only: connect the clock output of the flash programmer to X1 and its inverse signal to X2.

Remark ○: Be sure to connect the pin.

○: The pin does not have to be connected if the signal is generated on the target board.

×: The pin does not have to be connected.

△: In handshake mode

27.5 Pin Processing

To write the flash memory on-board, connectors that connect the flash programmer must be provided on the target system. First provide a function that selects the normal operation mode or flash memory programming mode on the board.

When the flash memory programming mode is set, all the pins not used for programming the flash memory are in the same status as immediately after reset. Therefore, if the external device does not recognize the state immediately after reset, the pins must be processed as described below.

27.5.1 V_{PP} pin

In the normal operation mode, connect the V_{PP} pin to V_{SS} . In the flash memory programming mode, a write voltage of 10 V is supplied to the V_{PP} pin. An example of connection of the V_{PP} pin is illustrated below.

Figure 27-6. Example of Connection of V_{PP} Pin

27.5.2 Serial interface pins

The pins used by each serial interface are listed below.

Table 27-3. Pins Used by Each Serial Interface

Serial Interface	Pins Used
CSI00	SO00, SI00, $\overline{\text{SCK00}}$
CSI00 + HS	SO00, SI00, $\overline{\text{SCK00}}$, PCS1
UART0	TXD0, RXD0

To connect the dedicated flash programmer to the pins of a serial interface that is connected to another device on the board, care must be exercised so that signals do not collide or that the other device does not malfunction.

(1) Signal collision

If the flash programmer (output) is connected to a pin (input) of a serial interface connected to another device (output), signal collision takes place. To avoid this collision, either isolate the connection with the other device, or make the other device go into an output high-impedance state.

Figure 27-7. Signal Collision (Input Pin of Serial Interface)

(2) Malfunction of other device

If the dedicated flash programmer (output or input) is connected to a pin (input or output) of a serial interface connected to another device (input), a signal may be output to the other device, causing the device to malfunction. To avoid this malfunction, isolate the connection with the other device.

Figure 27-8. Malfunction of Other Device

27.5.3 $\overline{\text{RESET}}$ pin

If the reset signal of the flash programmer is connected to the $\overline{\text{RESET}}$ pin that is connected to the reset signal generator on the board, signal collision takes place. To prevent this collision, isolate the connection with the reset signal generator.

If the reset signal is input from the user system while the flash memory programming mode is set, the flash memory will not be correctly programmed. Do not input any signal other than the reset signal of the flash programmer.

Figure 27-9. Signal Collision ($\overline{\text{RESET}}$ Pin)

27.5.4 Port pins

When the system shifts to the flash memory programming mode, all the pins that are not used for flash memory programming are in the same status as that immediately after reset. If the external device connected to each port does not recognize the status of the port immediately after reset, pins require appropriate processing, such as connecting to V_{DD} via a resistor or connecting to V_{SS} via a resistor.

27.5.5 Other signal pins

Connect the X1, X2, XT1, XT2, and REGC pins in the same status as in the normal operation mode.

To input the operating clock from the programmer, however, connect the clock out of the programmer to X1, and its inverse signal to X2.

27.5.6 Power supply

Supply the same power as in the normal operation mode for the power supply (V_{DD} , V_{SS} , AV_{REF0} , AV_{REF1} , AV_{SS} , BV_{DD} , BV_{SS} , EV_{DD} , and EV_{SS}).

27.6 Programming Method

27.6.1 Controlling flash memory

The following figure illustrates the procedure to manipulate the flash memory.

Figure 27-10. Flash Memory Manipulation Procedure

27.6.2 Flash memory programming mode

To rewrite the contents of the flash memory by using the dedicated flash programmer, set the V850ES/KJ1 in the flash memory programming mode. To set the mode, set the V_{PP} pin and clear the reset signal.

Change the mode by using a jumper when writing the flash memory on-board.

Figure 27-11. Flash Memory Programming Mode

27.6.3 Selecting communication mode

In the V850ES/KJ1 a communication mode is selected by inputting pulses (up to 8 pulses) to the V_{PP} pin after the flash memory programming mode is entered. These V_{PP} pulses are generated by the flash programmer.

The following table shows the relationship between the number of pulses and communication modes.

Table 27-4. Communication Modes

V_{PP} Pulse	Communication Mode	Remark
0	CSI00	V850ES/KJ1 operates as slave with MSB first.
3	CSI00 + HS	V850ES/KJ1 operates as slave with MSB first.
8	UART0	Communication rate: 9600 bps (after reset), LSB first
Other	RFU	Setting prohibited

Caution When UART0 is selected, the receive clock is calculated based on the reset command sent from the dedicated flash programmer after the V_{PP} pulse has been received.

27.6.4 Communication commands

The V850ES/KJ1 communicates with the flash programmer by using commands. The signals sent from the flash programmer to the V850ES/KJ1 are called “commands”, and the commands sent from the V850ES/KJ1 to the flash programmer are called “response commands”.

Figure 27-12. Communication Commands

The flash memory control commands of the V850ES/KJ1 are listed in the table below. All these commands are issued from the programmer and the V850ES/KJ1 performs processing corresponding to the respective commands.

Table 27-5. Flash Memory Control Commands

Classification	Command Name	Function
Verify	Batch verify command	Compares the contents of the entire memory with the input data.
Erase	Batch erase command	Erases the contents of the entire memory.
Blank check	Batch blank check command	Checks the erasure status of the entire memory.
Data write	High-speed write command	Writes data by specifying the write address and number of bytes to be written, and executes a verify check.
	Successive write command	Writes data from the address following that of the high-speed write command executed immediately before, and executes a verify check.
System setting, control	Status read command	Obtains the operation status
	Oscillation frequency setting command	Sets the oscillation frequency
	Erase time setting command	Sets the erase time for batch erase
	Write time setting command	Sets the write time for writing data
	Baud rate setting command	Sets the baud rate when UART is used
	Silicon signature command	Reads the silicon signature information
	Reset command	Escapes from each status

The V850ES/KJ1 returns a response command for the command issued by the dedicated flash programmer. The response commands sent from the V850ES/KJ1 are listed below.

Table 27-6. Response Commands

Command Name	Function
ACK	Acknowledges command/data.
NAK	Acknowledges illegal command/data.

The V850ES/KJ1 has an on-chip debug function that uses the JTAG (Joint Test Action Group) interface ($\overline{\text{DRST}}$, DCK, DMS, DDI, and DDO pins) and that can be used via an on-chip debug emulator (MINICUBE[®]).

Caution The on-chip debug function is provided only in the $\mu\text{PD70F3218H}$ and 70F3218HY . It is not provided in the $\mu\text{PD70F3217}$, 70F3217Y , 70F3217H , 70F3217HY , and mask ROM versions.

28.1 Features

- Hardware break function: 2 points
- Software break function: 4 points
- Real-time RAM monitor function: Memory contents can be read during program execution.
- Dynamic memory modification function (DMM function): RAM contents can be rewritten during program execution.
- Mask function: $\overline{\text{RESET}}$, $\overline{\text{NMI}}$, $\overline{\text{HLDRQ}}$, $\overline{\text{WAIT}}$
- ROM security function: 10-byte ID code authentication

Caution The following functions are not supported.

- Trace function
- Event function
- Debug interrupt interface function (DBINT)

28.2 Connection Circuit Example

28.3 Interface Signals

The interface signals are described below.

(1) $\overline{\text{DRST}}$

This is a reset input signal for the on-chip debug unit. It is a negative-logic signal that asynchronously initializes the debug control unit.

MINICUBE raises the $\overline{\text{DRST}}$ signal when it detects V_{DD} of the target system after the integrated debugger is started, and starts the on-chip debug unit of the device.

When the $\overline{\text{DRST}}$ signal goes high, a reset signal is also generated in the CPU.

When starting debugging by starting the integrated debugger, a CPU reset is always generated.

(2) DCK

This is a clock input signal. It supplies a 20 MHz clock from MINICUBE. In the on-chip debug unit, the DMS and DDI signals are sampled at the rising edge of the DCK signal, and the data DDO is output at its falling edge.

(3) **DMS**

This is a transfer mode select signal. The transfer status in the debug unit changes depending on the level of the DMS signal.

(4) **DDI**

This is a data input signal. It is sampled in the on-chip debug unit at the rising edge of DCK.

(5) **DDO**

This is a data output signal. It is output from the on-chip debug unit at the falling edge of the DCK signal.

(6) **EVDD**

This signal is used to detect VDD of the target system. If VDD from the target system is not detected, the signals output from MINICUBE ($\overline{\text{DRST}}$, DCK, DMS, DDI, FLMD0, and $\overline{\text{RESET}}$) go into a high-impedance state.

(7) **FLMD0**

The flash self programming function is used for the function to download data to the flash memory via the integrated debugger. During flash self programming, the FLMD0 pin must be kept high. In addition, connect a pull-down resistor to the FLMD0 pin.

The FLMD0 pin can be controlled in either of the following two ways.

<1> To control from MINICUBE

Connect the FLMD0 signal of MINICUBE to the FLMD0 pin.

In the normal mode, nothing is driven by MINICUBE (high impedance).

During a break, MINICUBE raises the FLMD0 pin to the high level when the download function of the integrated debugger is executed.

<2> To control from port

Connect any port of the device to the FLMD0 pin.

The same port as the one used by the user program to realize the flash self programming function may be used.

On the console of the integrated debugger, make a setting to raise the port pin to high level before executing the download function, or lower the port pin after executing the download function.

For details, refer to the **ID850QB Ver. 3.10 Integrated Debugger Operation User's Manual (U17435E)**.

(8) **$\overline{\text{RESET}}$**

This is a system reset input pin. If the $\overline{\text{DRST}}$ pin is made invalid by the value of the OCDM.OCDM0 bit set by the user program, on-chip debugging cannot be executed. Therefore, reset is effected by MINICUBE, using the $\overline{\text{RESET}}$ pin, to make the $\overline{\text{DRST}}$ pin valid (initialization).

28.4 Register

(1) On-chip debug mode register (OCDM)

The OCDM register is used to select the normal operation mode or on-chip debug mode. This register is a special register and can be written only in a combination of specific sequences (see **3.4.7 Special registers**).

This register is also used to specify whether a pin provided with an on-chip debug function is used as an on-chip debug pin or as an ordinary port/peripheral function pin. It also is used to disconnect the internal pull-down resistor of the P05/INTP2/ $\overline{\text{DRST}}$ pin.

The OCDM register can be written only while a low level is input to the $\overline{\text{DRST}}$ pin.

This register can be read or written in 8-bit or 1-bit units.

After reset: 01H^{Note} R/W Address: FFFFF9FCH

	7	6	5	4	3	2	1	<0>
OCDM	0	0	0	0	0	0	0	OCDM0

OCDM0	Operation mode
0	Selects normal operation mode (in which a pin that functions alternately as on-chip debug function pin is used as a port/peripheral function pin) and disconnects the on-chip pull-down resistor of the P05/INTP2/ $\overline{\text{DRST}}$ pin.
1	When $\overline{\text{DRST}}$ pin is low: Normal operation mode (in which a pin that functions alternately as an on-chip debug function pin is used as a port/peripheral function pin) When $\overline{\text{DRST}}$ pin is high: On-chip debug mode (in which a pin that functions alternately as an on-chip debug function pin is used as an on-chip debug mode pin)

Note $\overline{\text{RESET}}$ input sets this register to 01H. After reset by the WDTRES1 or WDTRES2 signal, however, the value of the OCDM register is retained.

Cautions 1. When using the DDI, DDO, DCK, and DMS pins not as on-chip debug pins but as port pins after external reset, any of the following actions must be taken.

- Input a low level to the P05/INTP2/ $\overline{\text{DRST}}$ pin.
- Set the OCDM0 bit. In this case, take the following actions.
 - <1> Clear the OCDM0 bit to 0.
 - <2> Fix the P05/INTP2/ $\overline{\text{DRST}}$ pin to the low level until <1> is completed.

2. The $\overline{\text{DRST}}$ pin has an on-chip pull-down resistor. This resistor is disconnected when the OCDM0 flag is cleared to 0. In V850ES/KJ1 products other than the $\mu\text{PD70F3218H}$ and 70F3218HY, a pull-down resistor is not connected to P05.

28.5 Operation

The on-chip debug function is made invalid under the conditions shown in the table below.

When this function is not used, keep the $\overline{\text{DRST}}$ pin low until the OCDM.OCDM0 flag is cleared to 0.

OCDM0 Flag $\overline{\text{DRST}}$ Pin	0	1
L	Invalid	Invalid
H	Invalid	Valid

Remark L: Low-level input
H: High-level input

Figure 28-1. Timing When On-Chip Debug Function Is Not Used

28.6 ROM Security Function

28.6.1 Security ID

The flash memory versions of the V850ES/KJ1 perform authentication using a 10-byte ID code to prevent the contents of the flash memory from being read by an unauthorized person during on-chip debugging by the on-chip debug emulator.

Set the ID code in the 10-byte on-chip flash memory area from 0000070H to 0000079H to allow the debugger perform ID authentication.

If the IDs match, the security is released and reading flash memory and using the on-chip debug emulator are enabled.

- Set the 10-byte ID code to 0000070H to 0000079H.
- Bit 7 of 0000079H is the on-chip debug emulator enable flag.
(0: Disable, 1: Enable)
- When the on-chip debug emulator is started, the debugger requests ID input. When the ID code input on the debugger and the ID code set in 0000070H to 0000079H match, the debugger starts.
- Debugging cannot be performed if the on-chip debug emulator enable flag is 0, even if the ID codes match.

Caution When the data in the flash memory has been deleted, all the bits are set to 1.

28.6.2 Setting

The following shows how to set the ID code as shown in Table 28-1.

When the ID code is set as shown in Table 28-1, the ID code input in the configuration dialog box of the ID850QB is "123456789ABCDEF123D4".

Table 28-1. ID Code

Address	Value
0x70	0x12
0x71	0x34
0x72	0x56
0x73	0x78
0x74	0x9A
0x75	0xBC
0x76	0xDE
0x77	0XF1
0x78	0x23
0x79	0xD4

The ID code can be specified for the device file that supports the CA850 Ver. 2.60 or later and the security ID by the PM+ linker option setting.

[Program example (when using CA850 Ver. 2.60 or later)]

```
#-----
#      SECURITYID (continue ILGOP handler)
#-----
      .section      "SECURITY_ID"      --Interrupt handler address 0x70
      .word         0x78563412         --0-3 byte code
      .word         0xF1DEBC9A         --4-7 byte code
      .hword        0xD423             --8-9 byte code
```

Remark Add the above program example to the startup files.

28.7 Cautions

- (1) If a reset signal is input (from the target system or a reset signal from an internal reset source) during RUN (program execution), the break function may malfunction.
- (2) Even if the reset signal is masked by the mask function, the I/O buffer (port pin) may be reset if a reset signal is input from a pin.
- (3) Because a software breakpoint set in the internal flash memory is realized by the ROM correction function, it is made temporarily invalid by target reset or internal reset generated by watchdog timer 2. The breakpoint becomes valid again when a hardware break or forced break occurs, but a software break does not occur until then.
- (4) Pin reset during a break is masked and the CPU and peripheral I/O are not reset. If pin reset or internal reset is generated as soon as the flash memory is rewritten by DMA or read by the RAM monitor function while the user program is being executed, the CPU and peripheral I/O may not be correctly reset.
- (5) Emulation of ROM correction cannot be executed.
- (6) In the on-chip debug mode, the DDO pin is forcibly set to the high-level output.

CHAPTER 29 ELECTRICAL SPECIFICATIONS (SINGLE-POWER FLASH MEMORY VERSION)

Single-power flash memory versions are as follows.

μ PD70F3217H, 70F3217HY, 70F3218H, 70F3218HY

Absolute Maximum Ratings (T_A = 25°C) (1/2)

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	V _{DD}	V _{DD} = EV _{DD} = AV _{REF0}	−0.3 to +6.5	V
	BV _{DD}	BV _{DD} ≤ V _{DD}	−0.3 to V _{DD} + 0.3 ^{Note}	V
	EV _{DD}	V _{DD} = EV _{DD} = AV _{REF0}	−0.3 to +6.5	V
	AV _{REF0}	V _{DD} = EV _{DD} = AV _{REF0}	−0.3 to +6.5	V
	AV _{REF1}	AV _{REF1} ≤ V _{DD} (D/A output mode) AV _{REF1} = AV _{REF0} = V _{DD} (port mode)	−0.3 to V _{DD} + 0.3 ^{Note}	V

Analog input voltage	V _{IAN}	P70 to P715	−0.3 to AV _{REF0} + 0.3 ^{Note}	V

Note Be sure not to exceed the absolute maximum ratings (MAX. value) of each supply voltage.

- Cautions**
1. Do not directly connect the output (or I/O) pins of IC products to each other, or to V_{DD}, V_{CC}, and GND. Open-drain pins or open-collector pins, however, can be directly connected to each other. Direct connection of the output pins between an IC product and an external circuit is possible, if the output pins can be set to the high-impedance state and the output timing of the external circuit is designed to avoid output conflict.
 2. Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded. The ratings and conditions indicated for DC characteristics and AC characteristics represent the quality assurance range during normal operation.

Absolute Maximum Ratings (T_A = 25°C) (2/2)

Parameter	Symbol	Conditions		Ratings	Unit
Output current, low	I _{OL}	Note	Per pin	20	mA
		P36 to P39, P614, P615		30	mA
		P00 to P06, P30 to P39, P40 to P42	Total of all pins:	35	mA
		P50 to P55, P60 to P615, P80, P81, P90 to P915	70 mA	35	mA
		PCD0 to PCD3, PCM0 to PCM5, PCS0 to PCS7, PCT0 to PCT7	Total of all pins:	35	mA
		PDL0 to PDL15, PDH0 to PDH7	70 mA	35	mA
Output current, high	I _{OH}	Note	Per pin	−10	mA
		P00 to P06, P30 to P35, P40 to P42	Total of all pins:	−30	mA
		P50 to P55, P60 to P613, P80, P81, P90 to P915	−60 mA	−30	mA
		PCD0 to PCD3, PCM0 to PCM5, PCS0 to PCS7, PCT0 to PCT7	Total of all pins:	−30	mA
		PDL0 to PDL15, PDH0 to PDH7	−60 mA	−30	mA
Operating ambient temperature	T _A	Normal operation mode		−40 to +85	°C
		Flash programming mode		−40 to +85	°C
Storage temperature	T _{stg}			−40 to +125	°C

Note P00 to P06, P10, P11, P30 to P35, P40 to P42, P50 to P55, P60 to P613, P80, P81, P90 to P915, PCD0 to PCD3, PCM0 to PCM5, PCS0 to PCS7, PCT0 to PCT7, PDL0 to PDL15, PDH0 to PDH7

- Cautions**
1. Do not directly connect the output (or I/O) pins of IC products to each other, or to V_{DD}, V_{CC}, and GND. Open-drain pins or open-collector pins, however, can be directly connected to each other. Direct connection of the output pins between an IC product and an external circuit is possible, if the output pins can be set to the high-impedance state and the output timing of the external circuit is designed to avoid output conflict.
 2. Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded. The ratings and conditions indicated for DC characteristics and AC characteristics represent the quality assurance range during normal operation.

Capacitance (T_A = 25°C, V_{DD} = EV_{DD} = AV_{REF0} = BV_{DD} = AV_{REF1} = V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0 V)

			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V	2	4	MHz
			REGC = $V_{DD} = 2.7$ to 5.5 V	2	2.5	MHz
	Oscillation stabilization time ^{Note 2}	In clock through mode	REGC = $V_{DD} = 2.7$ to 5.5 V	2	10	MHz
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V	2	10	MHz
	Oscillation stabilization time ^{Note 2}	After reset is released	OSTS0 = 1		$2^{15}/f_x$	s
		After STOP mode is released		Note 3		s

Notes 1. Indicates only oscillator characteristics.

2. Time required to stabilize the resonator after reset or STOP mode is released.

3. The value differs depending on the OSTS register settings.

(2) External clock ($T_A = -40$ to $+85^\circ\text{C}$, REGC = $V_{DD} = 2.7$ to 5.5 V, $V_{SS} = 0$ V)

Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
	Input frequency (f_x) ^{Note}	In PLL mode	REGC = $V_{DD} = 4.5$ to 5.5 V	2	5	MHz
			REGC = $V_{DD} = 4.0$ to 5.5 V	2	4	MHz
			REGC = $V_{DD} = 2.7$ to 5.5 V	2	2.5	MHz
		In clock through mode	REGC = $V_{DD} = 2.7$ to 5.5 V	2	10	MHz

Note The duty ratio of the input waveform must be within $50\% \pm 5\%$.

Cautions 1. When using the main clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
 - Do not cross the wiring with the other signal lines.
 - Do not route the wiring near a signal line through which a high fluctuating current flows.
 - Always make the ground point of the oscillator capacitor the same potential as V_{SS} .
 - Do not ground the capacitor to a ground pattern through which a high current flows.
 - Do not fetch signals from the oscillator.
2. When the main clock is stopped and the device is operating on the subclock, wait until the oscillation stabilization time has been secured by the program before switching back to the main clock.
3. When REGC = $10\ \mu\text{F}$, the supply voltage to the oscillator is the on-chip regulator output (3.6 V (TYP.)). However, the supply voltage to the oscillator is V_{DD} in the following modes.
- After reset (except during WDTRES1 and oscillation stabilization time)
 - In STOP mode
 - In Sub-IDLE mode

Subclock Oscillator Characteristics

(1) Crystal resonator ($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = 2.7$ to 5.5 V, $V_{SS} = 0$ V)

Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
	Oscillation frequency (f_{XT}) ^{Note 1}		32	32.768	35	kHz
	Oscillation stabilization time ^{Note 2}			10		s

Notes 1. Indicates only oscillator characteristics.

2. Time required from when V_{DD} reaches oscillation voltage range (2.7 V (MIN.)) to when the crystal resonator stabilizes.

(2) External clock ($T_A = -40$ to $+85^\circ\text{C}$, $REGC = V_{DD} = 2.7$ to 5.5 V, $V_{SS} = 0$ V)

Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
	Input frequency (f_{XT}) ^{Note}	$REGC = V_{DD} = 2.7$ to 5.5 V	32		35	kHz

Note The duty ratio of the input waveform must be within 50% $\pm$ 5%.

Cautions 1. When using the subclock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
 - Do not cross the wiring with the other signal lines.
 - Do not route the wiring near a signal line through which a high fluctuating current flows.
 - Always make the ground point of the oscillator capacitor the same potential as V_{SS} .
 - Do not ground the capacitor to a ground pattern through which a high current flows.
 - Do not fetch signals from the oscillator.
2. The subclock oscillator is designed as a low-amplitude circuit for reducing power consumption, and is more prone to malfunction due to noise than the main clock oscillator. Particular care is therefore required with the wiring method when the subclock is used.
3. When $REGC = 10 \mu\text{F}$, the supply voltage to the oscillator is the on-chip regulator output (3.6 V (TYP.)). However, the supply voltage to the oscillator is V_{DD} in the following modes.
- After reset (except during WDTRES1 and oscillation stabilization time)
 - In STOP mode
 - In Sub-IDLE mode

Address setup time (to $ASTB\downarrow$)	t_{SAST}	<6>	$(0.5 + t_{ASW})T - 23$		ns
Address hold time (from $ASTB\downarrow$)	t_{HSTA}	<7>	$(0.5 + t_{AHW})T - 15$		ns
Delay time from $RD\downarrow$ to address float	t_{FRDA}	<8>		16	ns
Data input setup time from address	t_{SAID}	<9>		$(2 + n + t_{ASW} + t_{AHW})T - 40$	ns
Data input setup time from $RD\downarrow$	t_{SRID}	<10>		$(1 + n)T - 25$	ns
Delay time from $ASTB\downarrow$ to RD , $WRm\downarrow$	$t_{DSTRDWR}$	<11>	$(0.5 + t_{AHW})T - 20$		ns
Data input hold time (from $RD\uparrow$)	t_{HRDID}	<12>	0		ns
Address output time from $RD\uparrow$	t_{DRDA}	<13>	$(1 + i)T - 16$		ns
Delay time from RD , $WRm\uparrow$ to $ASTB\uparrow$	$t_{DRDWRST}$	<14>	$0.5T - 10$		ns
Delay time from $RD\uparrow$ to $ASTB\downarrow$	t_{DRDST}	<15>	$(1.5 + i + t_{ASW})T - 10$		ns
RD , WRm low-level width	t_{WRDWRL}	<16>	$(1 + n)T - 10$		ns
$ASTB$ high-level width	t_{WSTH}	<17>	$(1 + i + t_{ASW})T - 25$		ns
Data output time from $WRm\downarrow$	t_{DWROD}	<18>		20	ns
Data output setup time (to $WRm\uparrow$)	t_{SODWR}	<19>	$(1 + n)T - 25$		ns
Data output hold time (from $WRm\uparrow$)	t_{HWROD}	<20>	$T - 15$		ns
$WAIT$ setup time (to address)	t_{SAWT1}	<21>	$n \geq 1$	$(1.5 + t_{ASW} + t_{AHW})T - 45$	ns
	t_{SAWT2}	<22>		$(1.5 + n + t_{ASW} + t_{AHW})T - 45$	ns
$WAIT$ hold time (from address)	t_{HAWT1}	<23>	$n \geq 1$	$(0.5 + n + t_{ASW} + t_{AHW})T$	ns
	t_{HAWT2}	<24>		$(1.5 + n + t_{ASW} + t_{AHW})T$	ns
$WAIT$ setup time (to $ASTB\downarrow$)	t_{SSTWT1}	<25>	$n \geq 1$	$(1 + t_{AHW})T - 32$	ns
	t_{SSTWT2}	<26>		$(1 + n + t_{AHW})T - 32$	ns
$WAIT$ hold time (from $ASTB\downarrow$)	t_{HSTWT1}	<27>	$n \geq 1$	$(n + t_{AHW})T$	ns
	t_{HSTWT2}	<28>		$(1 + n + t_{AHW})T$	ns

Remarks 1. t_{ASW} : Number of address setup wait clocks (0 or 1)

t_{AHW} : Number of address hold wait clocks (0 or 1)

2. $T = 1/f_{CPU}$ (f_{CPU} : CPU operating clock frequency)

3. n : Number of wait clocks inserted in the bus cycle

The sampling timing changes when a programmable wait is inserted.

4. $m = 0, 1$

5. i : Number of idle states inserted after a read cycle (0 or 1)

6. The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (2/2)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
Address setup time (to $ASTB\downarrow$)	t_{SAST}	<6>	$(0.5 + t_{ASW})T - 42$		ns

RD , WRm low-level width	t_{WRDWRL}	<16>	$(1 + n)T - 20$		ns
$ASTB$ high-level width	t_{WSTH}	<17>	$(1 + i + t_{ASW})T - 50$		ns
Data output time from $WRm\downarrow$	t_{DWRD}	<18>		35	ns
Data output setup time (to $WRm\uparrow$)	t_{SODWR}	<19>	$(1 + n)T - 40$		ns
Data output hold time (from $WRm\uparrow$)	t_{HWRD}	<20>	$T - 30$		ns
$\overline{WAIT}$ setup time (to address)	t_{SAWT1}	<21>	$n \geq 1$		$(1.5 + t_{ASW} + t_{AHW})T - 80$ ns
	t_{SAWT2}	<22>			$(1.5 + n + t_{ASW} + t_{AHW})T - 80$ ns
$\overline{WAIT}$ hold time (from address)	t_{HAWT1}	<23>	$n \geq 1$	$(0.5 + n + t_{ASW} + t_{AHW})T$	ns
	t_{HAWT2}	<24>		$(1.5 + n + t_{ASW} + t_{AHW})T$	ns
$\overline{WAIT}$ setup time (to $ASTB\downarrow$)	t_{SSTWT1}	<25>	$n \geq 1$		$(1 + t_{AHW})T - 60$ ns
	t_{SSTWT2}	<26>			$(1 + n + t_{AHW})T - 60$ ns
$\overline{WAIT}$ hold time (from $ASTB\downarrow$)	t_{HSTWT1}	<27>	$n \geq 1$	$(n + t_{AHW})T$	ns
	t_{HSTWT2}	<28>		$(1 + n + t_{AHW})T$	ns

Caution Set the following in accordance with the usage conditions of the CPU operating clock frequency ($k = 0$ to 3).

- **70 ns < $1/f_{CPU}$ < 84 ns**
Set an address setup wait (AWC.ASWk bit = 1).
- **62.5 ns < $1/f_{CPU}$ < 70 ns**
Set an address setup wait (ASWk bit = 1) and address hold wait (AWC.AHWk bit = 1).

- Remarks 1.** t_{ASW} : Number of address setup wait clocks (0 or 1)
 t_{AHW} : Number of address hold wait clocks (0 or 1)
- 2.** $T = 1/f_{CPU}$ (f_{CPU} : CPU operating clock frequency)
- 3.** n : Number of wait clocks inserted in the bus cycle
 The sampling timing changes when a programmable wait is inserted.
- 4.** $m = 0, 1$
- 5.** i : Number of idle states inserted after a read cycle (0 or 1)
- 6.** The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

Read Cycle (CLKOUT Asynchronous): In Multiplex Bus Mode

Write Cycle (CLKOUT Asynchronous): In Multiplex Bus Mode

(b) Read/write cycle (CLKOUT synchronous): In multiplex bus mode

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 4.0$ to 5.5 V, 4.0 V $\leq BV_{DD} \leq V_{DD}$, 4.0 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (1/2)

Parameter	Symbol		Conditions	MIN.	MAX.	Unit
Delay time from CLKOUT $\uparrow$ to address	t_{DKA}	<29>		0	19	ns

Read Cycle (CLKOUT Synchronous, 1 Wait): In Separate Bus Mode

(d) Write cycle (CLKOUT synchronous): In separate bus mode

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 4.0$ to 5.5 V, 4.0 V $\leq BV_{DD} \leq V_{DD}$, 4.0 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (1/2)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
Delay time from CLKOUT $\uparrow$ to address, CS	t_{DKSA}	<73>	0	35	ns
Data output delay time from CLKOUT $\uparrow$	t_{DKSD}	<74>	0	10	ns
Delay time from CLKOUT $\uparrow\downarrow$ to $\overline{WRm}$	t_{DKSW}	<75>	0	10	ns
$\overline{WAIT}$ setup time (to CLKOUT $\uparrow$)	t_{SWTK}	<76>	20		ns
$\overline{WAIT}$ hold time (from CLKOUT $\uparrow$)	t_{HKWT}	<77>	0		ns

Remarks 1. $m = 0, 1$

2. The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (2/2)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
Delay time from CLKOUT $\uparrow$ to address, CS	t_{DKSA}	<73>	0	65	ns
Data output delay time from CLKOUT $\uparrow$	t_{DKSD}	<74>	0	15	ns
Delay time from CLKOUT $\uparrow\downarrow$ to $\overline{WRm}$	t_{DKSW}	<75>	0	15	ns
$\overline{WAIT}$ setup time (to CLKOUT $\uparrow$)	t_{SWTK}	<76>	40		ns
$\overline{WAIT}$ hold time (from CLKOUT $\uparrow$)	t_{HKWT}	<77>	0		ns

Remarks 1. $m = 0, 1$

2. The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

Write Cycle (CLKOUT Synchronous): In Separate Bus Mode

(3) Bus hold**(a) CLKOUT asynchronous**

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 4.0$ to 5.5 V, 4.0 V $\leq BV_{DD} \leq V_{DD}$, 4.0 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (1/2)

Parameter	Symbol		Conditions	MIN.	MAX.	Unit
$\overline{HLDRQ}$ high-level width	t_{WHQH}	<78>		$T + 10$		ns
$\overline{HLDAK}$ low-level width	t_{WHAL}	<79>		$T - 15$		ns
Delay time from $\overline{HLDAK}\uparrow$ to bus output	t_{DHAC}	<80>		-40		ns
Delay time from $\overline{HLDRQ}\downarrow$ to $\overline{HLDAK}\downarrow$	t_{DHQHA1}	<81>			$(2n + 7.5)T + 40$	ns
Delay time from $\overline{HLDRQ}\uparrow$ to $\overline{HLDAK}\uparrow$	t_{DHQHA2}	<82>		0.5T	$1.5T + 40$	ns

Remarks 1. $T = 1/f_{CPU}$ (f_{CPU} : CPU operating clock frequency)

2. n: Number of wait clocks inserted in the bus cycle

The sampling timing changes when a programmable wait is inserted.

3. The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (2/2)

Parameter	Symbol		Conditions	MIN.	MAX.	Unit
$\overline{HLDRQ}$ high-level width	t_{WHQH}	<78>		$T + 10$		ns
$\overline{HLDAK}$ low-level width	t_{WHAL}	<79>		$T - 15$		ns
Delay time from $\overline{HLDAK}\uparrow$ to bus output	t_{DHAC}	<80>		-80		ns
Delay time from $\overline{HLDRQ}\downarrow$ to $\overline{HLDAK}\downarrow$	t_{DHQHA1}	<81>			$(2n + 7.5)T + 70$	ns
Delay time from $\overline{HLDRQ}\uparrow$ to $\overline{HLDAK}\uparrow$	t_{DHQHA2}	<82>		0.5T	$1.5T + 70$	ns

Remarks 1. $T = 1/f_{CPU}$ (f_{CPU} : CPU operating clock frequency)

2. n: Number of wait clocks inserted in the bus cycle

The sampling timing changes when a programmable wait is inserted.

3. The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

Bus Hold (CLKOUT Asynchronous)

(b) CLKOUT synchronous

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 4.0$ to 5.5 V, 4.0 V $\leq BV_{DD} \leq V_{DD}$, 4.0 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (1/2)

Parameter	Symbol		Conditions	MIN.	MAX.	Unit
HLD $\overline{RQ}$ setup time (to CLKOUT $\downarrow$)	t_{SHQK}	<83>		15		ns
HLD $\overline{RQ}$ hold time (from CLKOUT $\downarrow$)	t_{HKHQ}	<84>		0		ns
Delay time from CLKOUT $\uparrow$ to bus float	t_{DKF}	<85>			20	ns
Delay time from CLKOUT $\uparrow$ to HLD $\overline{AK}$	t_{DKHA}	<86>			20	ns

Remark The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (2/2)

Parameter	Symbol		Conditions	MIN.	MAX.	Unit
HLD $\overline{RQ}$ setup time (to CLKOUT $\downarrow$)	t_{SHQK}	<83>		25		ns
HLD $\overline{RQ}$ hold time (from CLKOUT $\downarrow$)	t_{HKHQ}	<84>		0		ns
Delay time from CLKOUT $\uparrow$ to bus float	t_{DKF}	<85>			40	ns
Delay time from CLKOUT $\uparrow$ to HLD $\overline{AK}$	t_{DKHA}	<86>			40	ns

Remark The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

Bus Hold (CLKOUT Synchronous)

Basic Operation

(1) Reset/external interrupt timing

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
RESET low-level width	t_{WRSL1}	<87> Reset in power-on status	2		μs
	t_{WRSL2}	<88> Power-on reset when REGC = V_{DD}	2		μs
	Note	$t_{VR} > 150 \mu\text{s}$	10		μs
		$t_{VR} \leq 150 \mu\text{s}$	40		μs
NMI high-level width	t_{WNIH}	<89> Analog noise elimination	1		μs
NMI low-level width	t_{WNIL}	<90> Analog noise elimination	1		μs
INTPn high-level width	t_{WITH}	<91> n = 0 to 6 (analog noise elimination)	600		ns
INTPn low-level width	t_{WITL}	<92> n = 0 to 6 (analog noise elimination)	600		ns

Note Power-on reset when REGC = $10 \mu\text{F}$

- Remarks**
1. t_{VR} : Time required for V_{DD} to rise from 0 V to 4.0 V (= operation lower-limit voltage)
 2. The above specification shows the pulse width that is accurately detected as a valid edge. If a pulse narrower than the above specification is input, therefore, it may also be detected as a valid edge.

Reset/Interrupt

Timer Timing

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
TI0n high-level width	t_{TIOH}	<93> REGC = $V_{DD} = 4.5$ to 5.5 V	$2T_{smp0} + 100$ ^{Note 1}		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	$2T_{smp0} + 200$ ^{Note 1}	ns
TI0n low-level width	t_{TIOL}	<94> REGC = $V_{DD} = 4.5$ to 5.5 V	$2T_{smp0} + 100$ ^{Note 1}		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	$2T_{smp0} + 200$ ^{Note 1}	ns
TI5m high-level width	t_{TI5H}	<95> REGC = $V_{DD} = 4.5$ to 5.5 V	50		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	100	ns
TI5m low-level width	t_{TI5L}	<96> REGC = $V_{DD} = 4.5$ to 5.5 V	50		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	100	ns
TIP0m high-level width	t_{TI0PH}	<97> REGC = $V_{DD} = 4.5$ to 5.5 V	$np \times T_{smpp} + 100$ ^{Note 2}		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	$np \times T_{smpp} + 200$ ^{Note 2}	ns
TIP0m low-level width	t_{TI0PL}	<98> REGC = $V_{DD} = 4.5$ to 5.5 V	$np \times T_{smpp} + 100$ ^{Note 2}		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	$np \times T_{smpp} + 200$ ^{Note 2}	ns

Notes 1. T_{smp0} : Timer 0 count clock cycle

However, $T_{smp0} = 4/f_{xx}$ when TI0n is used as an external event count input.

2. np: Number of sampling clocks set by the PmNFC.PmNFSTS bit

T_{smpp} : Digital noise elimination sampling clock cycle of TIP0m pin

If TIP00 is used as an external event count input or an external trigger input, however, $T_{smpp} = 0$ (digital noise is not eliminated).

Remarks 1. n = 00, 01, 10, 11, 20, 21, 30, 31, 40, 41, 50, 51

m = 0, 1

2. The above specification shows the pulse width that is accurately detected as a valid edge. If a pulse narrower than the above specification is input, therefore, it may also be detected as a valid edge.

Stop condition setup time		t _{SU:STO}	<118>	4.0	—	0.6	—	μs
Pulse width of spike suppressed by input filter		t _{SP}	<119>	—	—	0	50	ns
Capacitance load of each bus line		Cb		—	400	—	400	pF

Notes 1. At the start condition, the first clock pulse is generated after the hold time.

2. The system requires a minimum of 300 ns hold time internally for the SDAn signal (at V_{IHmin.} of SCLn signal) in order to occupy the undefined area at the falling edge of SCLn.

3. If the system does not extend the SCLn signal low hold time (t_{LOW}), only the maximum data hold time (t_{HD:DAT}) needs to be satisfied.

4. The high-speed mode I²C bus can be used in the normal-mode I²C bus system. In this case, set the high-speed mode I²C bus so that it meets the following conditions.

- If the system does not extend the SCLn signal's low state hold time:

$$t_{SU:DAT} \geq 250 \text{ ns}$$

- If the system extends the SCLn signal's low state hold time:

Transmit the following data bit to the SDAn line prior to the SCLn line release (t_{Rmax.} + t_{SU:DAT} = 1000 + 250 = 1250 ns: Normal mode I²C bus specification).

5. C_b: Total capacitance of one bus line (unit: pF)

Remark n = 0, 1

Notes 1. Excluding quantization error (± 0.2 %FSR).

2. R is the D/A converter output pin load resistance, and C is the D/A converter output pin load capacitance.

3. Value of 1 channel of D/A converter

4. Value of 2 channels of D/A converter

Remark n = 0, 1

Flash Memory Programming Characteristics

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF)

(1) Basic characteristics

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Programming operation frequency		REGC = $V_{DD} = 4.5$ to 5.5 V	2		20	MHz
		REGC = $V_{DD} = 4.0$ to 5.5 V	2		16	MHz
		REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V	2		16	MHz
		REGC = $V_{DD} = 2.7$ to 5.5 V	2		10	MHz
Supply voltage	V_{DD}		2.7		5.5	V
Number of rewrites	C_{ERWR}	Note	100			Times
Programming temperature	t_{PRG}		-40		+85	$^\circ\text{C}$

Note When writing initially to shipped products, it is counted as one rewrite for both “erase to write” and “write only”.

Example (P: Write, E: Erase)

Shipped product $\longrightarrow$ P $\rightarrow$ E $\rightarrow$ P $\rightarrow$ E $\rightarrow$ P: 3 rewrites

Shipped product $\rightarrow$ E $\rightarrow$ P $\rightarrow$ E $\rightarrow$ P $\rightarrow$ E $\rightarrow$ P: 3 rewrites

(2) Serial write operation characteristics

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Setup time from $V_{DD}\uparrow$ to FLMD0 $\uparrow$	t_{DP}	<120>	10 ms		3 s	
Time from $\overline{\text{RESET}}\uparrow$ to FLMD0 pulse input start	t_{RP}	<121>	$66611.2/f_X$			s
FLMD0 pulse high-/low-level width	t_{PW}	<122>	10		100	μs
FLMD0 pulse rise time	t_R	<123>			50	ns
FLMD0 pulse fall time	t_F	<124>			50	ns

Serial Write Operation Timing

CHAPTER 30 ELECTRICAL SPECIFICATIONS
(STANDARD PRODUCTS (MASK ROM VERSION AND TWO-POWER FLASH
MEMORY VERSION), (A) GRADE PRODUCTS)

Standard products are as follows.

μ PD703216, 703216Y, 703217, 703217Y, 70F3217, 70F3217Y

(A) grade products are as follows.

μ PD703216(A), 703216Y(A), 703217(A), 703217Y(A), 70F3217(A) , 70F3217Y(A)

Absolute Maximum Ratings (T_A = 25°C) (1/2)

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	V _{DD}	V _{DD} = EV _{DD} = AV _{REF0}	−0.3 to +6.5	V
	V _{PP}	Flash memory version, Note 1	−0.3 to +10.5	V
	BV _{DD}	BV _{DD} ≤ V _{DD}	−0.3 to V _{DD} + 0.3 ^{Note 2}	V
	EV _{DD}	V _{DD} = EV _{DD} = AV _{REF0}	−0.3 to +6.5	V
	AV _{REF0}	V _{DD} = EV _{DD} = AV _{REF0}	−0.3 to +6.5	V
	AV _{REF1}	AV _{REF1} ≤ V _{DD} (D/A output mode) AV _{REF1} = AV _{REF0} = V _{DD} (port mode)	−0.3 to V _{DD} + 0.3 ^{Note 2}	V
	V _{SS}	V _{SS} = EV _{SS} = BV _{SS} = AV _{SS}	−0.3 to +0.3	V
	AV _{SS}	V _{SS} = EV _{SS} = BV _{SS} = AV _{SS}	−0.3 to +0.3	V
	BV _{SS}	V _{SS} = EV _{SS} = BV _{SS} = AV _{SS}	−0.3 to +0.3	V
	EV _{SS}	V _{SS} = EV _{SS} = BV _{SS} = AV _{SS}	−0.3 to +0.3	V
Input voltage	V _{I1}	P00 to P06, P30 to P35, P38, P39, P40 to P42, P50 to P55, P60 to P613, P80, P81, P90 to P915, RESET	−0.3 to EV _{DD} + 0.3 ^{Note 2}	V
	V _{I2}	PCD0 to PCD3, PCM0 to PCM5, PCS0 to PCS7, PCT0 to PCT7, PDL0 to PDL15, PDH0 to PDH7	−0.3 to BV _{DD} + 0.3 ^{Note 2}	V
	V _{I3}	P10, P11	−0.3 to AV _{REF1} + 0.3 ^{Note 2}	V
	V _{I4}	P36, P37, P614, P615	−0.3 to +13 ^{Note 3}	V
	V _{I5}	X1, X2, XT1, XT2	−0.3 to V _{DD} + 0.3 ^{Note 2}	V
Analog input voltage	V _{IAN}	P70 to P715	−0.3 to AV _{REF0} + 0.3 ^{Note 2}	V

Notes 1. Make sure that the following conditions of the V_{PP} voltage application timing are satisfied when the flash memory is written.

- **When supply voltage rises**

V_{PP} must exceed V_{DD} 15 μs or more after V_{DD} has reached the lower-limit value (2.7 V) of the operating voltage range (see a in the figure below).

- **When supply voltage drops**

V_{DD} must be lowered 10 μs or more after V_{PP} falls below the lower-limit value (2.7 V) of the operating voltage range of V_{DD} (see b in the figure below).

2. Be sure not to exceed the absolute maximum ratings (MAX. value) of each supply voltage.
3. When an on-chip pull-up resistor is not specified by a mask option. The same as V_{I1} when a pull-up resistor is specified.

Absolute Maximum Ratings ($T_A = 25^\circ\text{C}$) (2/2)

Parameter	Symbol	Conditions		Ratings	Unit
Output current, low	I _{OL}	Note	Per pin	20	mA
		P36 to P39, P614, P615		30	mA
		P00 to P06, P30 to P39, P40 to P42	Total of all	35	mA
		P50 to P55, P60 to P615, P80, P81, P90 to P915	pins: 70 mA	35	mA
		PCD0 to PCD3, PCM0 to PCM5, PCS0 to PCS7, PCT0 to PCT7	Total of all pins: 70 mA	35	mA
		PDL0 to PDL15, PDH0 to PDH7	70 mA	35	mA
Output current, high	I _{OH}	Note	Per pin	−10	mA
		P00 to P06, P30 to P35, P40 to P42	Total of all	−30	mA

		PDL0 to PDL15, PDH0 to PDH7	−60 mA	−30	mA
Operating ambient temperature	T _A			−40 to +85	°C
Storage temperature	T _{stg}	Mask ROM version		−65 to +150	°C
		Flash memory version		−40 to +125	°C

Note P00 to P06, P10, P11, P30 to P35, P40 to P42, P50 to P55, P60 to P613, P80, P81, P90 to P915, PCD0 to PCD3, PCM0 to PCM5, PCS0 to PCS7, PCT0 to PCT7, PDL0 to PDL15, PDH0 to PDH7

- Cautions**
1. Do not directly connect the output (or I/O) pins of IC products to each other, or to V_{DD} , V_{CC} , and GND. Open-drain pins or open-collector pins, however, can be directly connected to each other. Direct connection of the output pins between an IC product and an external circuit is possible, if the output pins can be set to the high-impedance state and the output timing of the external circuit is designed to avoid output conflict.
 2. Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded. The ratings and conditions indicated for DC characteristics and AC characteristics represent the quality assurance range during normal operation.

Capacitance ($T_A = 25^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = BV_{DD} = AV_{REF1} = V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0\text{ V}$)

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit
Input capacitance	C_i	$f_x = 1\text{ MHz}$	P70 to P715			15	pF
I/O capacitance	C_{IO}	Unmeasured pins returned to 0 V	Note			15	pF
			P36 to P39, P614, P615			20	pF

Note P00 to P06, P10, P11, P30 to P35, P40 to P42, P50 to P55, P60 to P613, P80, P81, P90 to P915, PCD0 to PCD3, PCM0 to PCM5, PCS0 to PCS7, PCT0 to PCT7, PDL0 to PDL15, PDH0 to PDH7

Remark f_x : Main clock oscillation frequency

PLL Characteristics ($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = 2.7$ to 5.5 V, $V_{SS} = 0$ V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Input frequency	f_x		2		5	MHz
Output frequency	f_{xx}		8		20	MHz
Lock time	t_{PLL}	After V_{DD} reaches 2.7 V (MIN.)			200	μs

Operating Conditions

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF)

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit
Internal system clock frequency	f _{CLK}	In PLL mode	REGC = V _{DD} = 4.5 to 5.5 V	0.25		20	MHz
			REGC = V _{DD} = 4.0 to 5.5 V	0.25		16	MHz
			REGC = 10 μF, V _{DD} = 4.0 to 5.5 V	0.25		16	MHz
			REGC = V _{DD} = 2.7 to 5.5 V	0.25		10	MHz
		In clock-through mode	REGC = 10 μF, V _{DD} = 4.0 to 5.5 V	0.0625		10	MHz
			REGC = V _{DD} = 2.7 to 5.5 V	0.0625		10	MHz
		Operating with subclock	Note		32.768		kHz

Note REGC = $V_{DD} = 2.7$ to 5.5 V or REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V

Internal System Clock Frequency vs. Supply Voltage

Main Clock Oscillator Characteristics

(1) Crystal resonator, ceramic resonator ($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = 2.7$ to 5.5 V, $V_{SS} = 0$ V)

Recommended Circuit	Parameter	Conditions		MIN.	TYP.	MAX.	Unit
	Oscillation frequency (f_x) ^{Note 1}	PLL mode	REGC = $V_{DD} = 4.5$ to 5.5 V	2		5	MHz
			REGC = $V_{DD} = 4.0$ to 5.5 V	2		4	MHz
			REGC = $10\ \mu\text{F}$ $V_{DD} = 4.0$ to 5.5 V	2		4	MHz
			REGC = $V_{DD} = 2.7$ to 5.5 V	2		2.5	MHz
		Clock-through mode	REGC = $V_{DD} = 2.7$ to 5.5 V	2		10	MHz
			REGC = $10\ \mu\text{F}$ $V_{DD} = 4.0$ to 5.5 V	2		10	MHz
	Oscillation stabilization time ^{Note 2}	After reset is released	When OSTS0 = 1		$2^{15}/f_x$		s
		After STOP mode is released			Note 3		s

Notes 1. Indicates only oscillator characteristics.

2. Time required to stabilize the resonator after reset or STOP mode is released.

3. The value differs depending on the OSTS register settings.

(2) External clock ($T_A = -40$ to $+85^\circ\text{C}$, REGC = $V_{DD} = 2.7$ to 5.5 V, $V_{SS} = 0$ V)

Recommended Circuit	Parameter	Conditions		MIN.	TYP.	MAX.	Unit
	Input frequency (f_x) ^{Note}	PLL mode	REGC = $V_{DD} = 4.5$ to 5.5 V	2		5	MHz
			REGC = $V_{DD} = 4.0$ to 5.5 V	2		4	MHz
			REGC = $V_{DD} = 2.7$ to 5.5 V	2		2.5	MHz
		Clock-through mode	REGC = $V_{DD} = 2.7$ to 5.5 V	2		10	MHz

Note Make sure that the duty ratio of the input waveform is within 50% $\pm$ 5%.

Cautions 1. When using the main clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as V_{SS} .
- Do not ground the capacitor to a ground pattern through which a high current flows.
- Do not fetch signals from the oscillator.

2. When the main clock is stopped and the device is operating on the subclock, wait until the oscillation stabilization time has been secured by the program before switching back to the main clock.

3. When REGC = $10\ \mu\text{F}$, the supply voltage to the oscillator is the on-chip regulator output (3.6 V (TYP.)). However, the supply voltage to the oscillator is V_{DD} in the following modes.

- After reset (except during WDTRES1 and oscillation stabilization time)
- In STOP mode
- In Sub-IDLE mode

(i) Murata Manufacturing Co., Ltd.: Ceramic resonator ($T_A = -40$ to $+85^\circ\text{C}$)

Manufacturer	Product Name	Type	Oscillation Frequency f_{ox} (MHz)	Recommended Circuit Constant			Oscillation Voltage Range

	CSTCR4M00G55A-R0	SMD	4.000	39	39	0	2.7	5.5
	CSTCR5M00G55A-R0	SMD	5.000	39	39	0	2.7	5.5
	CSTCE10M0G52A-R0	SMD	10.000	10	10	0	2.7	5.5

Caution This oscillator constant is a reference value based on evaluation under a specific environment by the resonator manufacturer. If optimization of oscillator characteristics is necessary in the actual application, apply to the resonator manufacturer for evaluation on the implementation circuit.

The oscillation voltage and oscillation frequency indicate only oscillator characteristics. Use the V850ES/KJ1 so that the internal operating conditions are within the specifications of the DC and AC characteristics.

Subclock Oscillator Characteristics

(1) Crystal resonator ($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = 2.7$ to 5.5 V, $V_{SS} = 0$ V)

Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
	Oscillation frequency (f_{XT}) ^{Note 1}		32	32.768	35	kHz
	Oscillation stabilization time ^{Note 2}			10		s

Notes 1. Indicates only oscillator characteristics.

2. Time required from when V_{DD} reaches oscillation voltage range (2.7 V (MIN.)) to when the crystal resonator stabilizes.

(2) External clock ($T_A = -40$ to $+85^\circ\text{C}$, $REGC = V_{DD} = 2.7$ to 5.5 V, $V_{SS} = 0$ V)

Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
	Input frequency (f_{XT}) ^{Note}	$REGC = V_{DD} = 2.7$ to 5.5 V	32		35	kHz

Note The duty ratio of the input waveform must be within 50% $\pm$ 5%.

Cautions 1. When using the subclock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
 - Do not cross the wiring with the other signal lines.
 - Do not route the wiring near a signal line through which a high fluctuating current flows.
 - Always make the ground point of the oscillator capacitor the same potential as V_{SS} .
 - Do not ground the capacitor to a ground pattern through which a high current flows.
 - Do not fetch signals from the oscillator.
2. The subclock oscillator is designed as a low-amplitude circuit for reducing power consumption, and is more prone to malfunction due to noise than the main clock oscillator. Particular care is therefore required with the wiring method when the subclock is used.
3. When $REGC = 10\ \mu\text{F}$, the supply voltage to the oscillator is the on-chip regulator output (3.6 V (TYP.)). However, the supply voltage to the oscillator is V_{DD} in the following modes.
- After reset (except during WDTRES1 and oscillation stabilization time)
 - In STOP mode
 - In Sub-IDLE mode

DC Characteristics

Remarks 1. $T = 1/f_{CPU}$ (f_{CPU} : CPU operating clock frequency)

2. n: Number of wait clocks inserted in the bus cycle

The sampling timing changes when a programmable wait is inserted.

3. The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

Bus Hold (CLKOUT Asynchronous)

(b) CLKOUT synchronous

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 4.0$ to 5.5 V, 4.0 V $\leq BV_{DD} \leq V_{DD}$, 4.0 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (1/2)

Parameter	Symbol		Conditions	MIN.	MAX.	Unit
$\overline{HLDRQ}$ setup time (to CLKOUT $\downarrow$)	t_{SHQK}	<83>		15		ns
$\overline{HLDRQ}$ hold time (from CLKOUT $\downarrow$)	t_{HKHQ}	<84>		0		ns
Delay time from CLKOUT $\uparrow$ to bus float	t_{DKF}	<85>			20	ns
Delay time from CLKOUT $\uparrow$ to $\overline{HLDAK}$	t_{DKHA}	<86>			20	ns

Remark The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF) (2/2)

Parameter	Symbol		Conditions	MIN.	MAX.	Unit
$\overline{HLDRQ}$ setup time (to CLKOUT $\downarrow$)	t_{SHQK}	<83>		25		ns
$\overline{HLDRQ}$ hold time (from CLKOUT $\downarrow$)	t_{HKHQ}	<84>		0		ns
Delay time from CLKOUT $\uparrow$ to bus float	t_{DKF}	<85>			40	ns
Delay time from CLKOUT $\uparrow$ to $\overline{HLDAK}$	t_{DKHA}	<86>			40	ns

Remark The values in the above specifications are values for when clocks with a 1:1 duty ratio are input from X1.

Bus Hold (CLKOUT Synchronous)

Basic Operation

(1) Reset/external interrupt timing

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
RESET low-level width	t_{WRSL1}	<87> Reset in power-on status	2		μs
	t_{WRSL2}	<88> Power-on-reset when REGC = V_{DD}	2		μs
	Note	$t_{VR} > 150 \mu\text{s}$	10		μs
		$t_{VR} \leq 150 \mu\text{s}$	40		μs
NMI high-level width	t_{WNIH}	<89> Analog noise elimination	1		μs
NMI low-level width	t_{WNIL}	<90> Analog noise elimination	1		μs
INTPn high-level width	t_{WITH}	<91> n = 0 to 6 (analog noise elimination)	600		ns
INTPn low-level width	t_{WITL}	<92> n = 0 to 6 (analog noise elimination)	600		ns

Note Power-on-reset when REGC = $10 \mu\text{F}$

Remarks 1. t_{VR} : Time required for V_{DD} to reach 0 V to 4.0 V (= operation lower-limit voltage)

2. The above specification shows the pulse width that is accurately detected as a valid edge. If a pulse narrower than the above specification is input, therefore, it may also be detected as a valid edge.

Reset/Interrupt

Timer Timing

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
Tl0n high-level width	t_{Tl0H}	<93> REGC = $V_{DD} = 4.5$ to 5.5 V	$2T_{\text{smp}0} + 100^{\text{Note}}$		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	$2T_{\text{smp}0} + 200^{\text{Note}}$	ns
Tl0n low-level width	t_{Tl0L}	<94> REGC = $V_{DD} = 4.5$ to 5.5 V	$2T_{\text{smp}0} + 100^{\text{Note}}$		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	$2T_{\text{smp}0} + 200^{\text{Note}}$	ns
Tl5m high-level width	t_{Tl5H}	<95> REGC = $V_{DD} = 4.5$ to 5.5 V	50		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	100	ns
Tl5m low-level width	t_{Tl5L}	<96> REGC = $V_{DD} = 4.5$ to 5.5 V	50		ns
			REGC = $10\ \mu\text{F}$, $V_{DD} = 4.0$ to 5.5 V, REGC = $V_{DD} = 2.7$ to 5.5 V	100	ns

Note $T_{\text{smp}0}$: Timer 0 count clock cycle

However, $T_{\text{smp}0} = 4/f_{\text{xx}}$ when Tl0n is used as an external event count input.

Remarks 1. n = 00, 01, 10, 11, 20, 21, 30, 31, 40, 41, 50, 51

m = 0, 1

2. The above specification shows the pulse width that is accurately detected as a valid edge. If a pulse narrower than the above specification is input, therefore, it may also be detected as a valid edge.

Note t_{CY} : fSCKA cycle

Remark n = 0, 1

I²C Bus Mode (Y Products (Products with On-Chip I²C) Only)

($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V, $C_L = 50$ pF)

Parameter		Symbol		Normal Mode		High-Speed Mode		Unit
				MIN.	MAX.	MIN.	MAX.	
SCLn clock frequency		f _{CLK}		0	100	0	400	kHz
Bus free time (Between start and stop conditions)		t _{BUF}	<109>	4.7	–	1.3	–	μs
Hold time ^{Note 1}		t _{HD:STA}	<110>	4.0	–	0.6	–	μs
SCLn clock low-level width		t _{LOW}	<111>	4.7	–	1.3	–	μs
SCLn clock high-level width		t _{HIGH}	<112>	4.0	–	0.6	–	μs
Setup time for start/restart conditions		t _{SU:STA}	<113>	4.7	–	0.6	–	μs
Data hold time	CBUS compatible master	t _{HD:DAT}	<114>	5.0	–	–	–	μs
	I ² C mode			0 ^{Note 2}	–	0 ^{Note 2}	0.9 ^{Note 3}	μs
Data setup time		t _{SU:DAT}	<115>	250	–	100 ^{Note 4}	–	ns
SDAn and SCLn signal rise time		t _R	<116>	–	1000	20 + 0.1Cb ^{Note 5}	300	ns
SDAn and SCLn signal fall time		t _F	<117>	–	300	20 + 0.1Cb ^{Note 5}	300	ns
Stop condition setup time		t _{SU:STO}	<118>	4.0	–	0.6	–	μs
Pulse width of spike suppressed by input filter		t _{SP}	<119>	–	–	0	50	ns
Capacitance load of each bus line		C _b		–	400	–	400	pF

Notes 1. At the start condition, the first clock pulse is generated after the hold time.

2. The system requires a minimum of 300 ns hold time internally for the SDAn signal (at V_{IHmin.} of SCLn signal) in order to occupy the undefined area at the falling edge of SCLn.
3. If the system does not extend the SCLn signal low hold time (t_{LOW}), only the maximum data hold time (t_{HD:DAT}) needs to be satisfied.
4. The high-speed mode I²C bus can be used in the normal-mode I²C bus system. In this case, set the high-speed mode I²C bus so that it meets the following conditions.
 - If the system does not extend the SCLn signal's low state hold time:
t_{SU:DAT} ≥ 250 ns
 - If the system extends the SCLn signal's low state hold time:
Transmit the following data bit to the SDAn line prior to the SCLn line release (t_{Rmax.} + t_{SU:DAT} = 1000 + 250 = 1250 ns: Normal mode I²C bus specification).
5. C_b: Total capacitance of one bus line (unit: pF)

Remark n = 0, 1

Notes 1. Excluding quantization error (± 0.2 %FSR).

2. R is the D/A converter output pin load resistance, and C is the D/A converter output pin load capacitance.

3. Value of 1 channel of D/A converter

4. Value of 2 channels of D/A converter

Remark n = 0, 1

Flash Memory Programming Characteristics

($T_A = 10$ to 40°C , $V_{DD} = EV_{DD} = AV_{REF0} = 2.7$ to 5.5 V, 2.7 V $\leq BV_{DD} \leq V_{DD}$, 2.7 V $\leq AV_{REF1} \leq V_{DD}$, $V_{SS} = EV_{SS} = BV_{SS} = AV_{SS} = 0$ V)

(1) Basic characteristics

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Programming operation frequency			2		10	MHz
V_{PP} supply voltage	V_{PP2}	During flash memory programming	9.7	10.0	10.3	V
V_{DD} supply current	I_{DD}	When $V_{PP} = V_{PP2}$, $f_{XX} = 10$ MHz, $V_{DD} = 5.5$ V			60	mA
V_{PP} supply current	I_{PP}	When $V_{PP} = V_{PP2}$			100	mA
Step erase time	t_{ER}	Note 1	0.196	0.2	0.204	s
Overall erase time	t_{ERA}	When step erase time = 0.2 s, Note 2			20	s/area
Writeback time	t_{WB}	Note 3	4.9	5.0	5.1	ms
Number of writebacks	C_{WB}	When writeback time = 1 ms, Note 4			100	Times
Number of erases/writebacks	C_{ERWB}				16	Times
Step write time	t_{WR}	Note 5	49	50	51	μs
Overall write time per word	t_{WRW}	When step write time = 50 μs (1 word = 4 bytes), Note 6	49		510	$\mu\text{s}/\text{word}$
Number of rewrites per area	C_{ERWR}	1 erase + 1 write after erase = 1 rewrite, Note 7	20			Count/area

- Notes**
1. The recommended setting value of the step erase time is 0.2 s.
 2. The prewrite time prior to erasure and the erase verify time (writeback time) are not included.
 3. The recommended setting value of the writeback time is 5.0 ms.
 4. Writeback is executed once by the issuance of the writeback command. Therefore, the retry count must be the maximum value minus the number of commands issued.
 5. The recommended setting value of the step writing time is 50 μs .
 6. 100 μs is added to the actual writing time per word. The internal verify time during and after the writing is not included.
 7. When writing initially to shipped products, it is counted as one rewrite for both “erase to write” and “write only”.

Example (P: Write, E: Erase)

Shipped product $\longrightarrow$ P $\rightarrow$ E $\rightarrow$ P $\rightarrow$ E $\rightarrow$ P: 3 rewrites

Shipped product $\rightarrow$ E $\rightarrow$ P $\rightarrow$ E $\rightarrow$ P $\rightarrow$ E $\rightarrow$ P: 3 rewrites

(2) Serial write operation characteristics

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Setup time from $V_{DD}\uparrow$ to $V_{PP}\uparrow$	t_{DPRSR}		15			μs
Setup time from $V_{PP}\uparrow$ to $\overline{RESET}\uparrow$	t_{PSRRF}		10			μs
Count start time from $\overline{RESET}\uparrow$ to V_{PPH}	t_{RFOF}		2			μs
Count complete time	t_{COUNT}				20	ms
V_{PP} counter high-/low-level width	t_{CH}/t_{CL}		8			μs
V_{PP} pulse low-level input voltage	V_{PPL}		$0.8V_{DD}$		$1.2V_{DD}$	V
V_{PP} pulse high-level input voltage	V_{PPH}		9.7	10.0	10.3	V

CHAPTER 32 RECOMMENDED SOLDERING CONDITIONS

The V850ES/KJ1 should be soldered and mounted under the following recommended conditions.

For soldering methods and conditions other than those recommended below, contact an NEC Electronics sales representative.

For technical information, see the following website.

Semiconductor Device Mount Manual (<http://www.necel.com/pkg/en/mount/index.html>)

Table 32-1. Surface Mounting Type Soldering Conditions (1/3)

(1) μ PD703216GJ-xxx-UEN: 144-pin plastic LQFP (fine pitch) (20 × 20)

μ PD703216YGJ-xxx-UEN: 144-pin plastic LQFP (fine pitch) (20 × 20)

μ PD703217GJ-xxx-UEN: 144-pin plastic LQFP (fine pitch) (20 × 20)

μ PD703217YGJ-xxx-UEN: 144-pin plastic LQFP (fine pitch) (20 × 20)

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 230°C, Time: 30 seconds max. (at 210°C or higher), Count: Two times or less, Exposure limit: 3 days ^{Note} (after that, prebake at 125°C for 10 to 72 hours)	IR30-103-2
VPS	Package peak temperature: 215°C, Time: 25 to 40 seconds (at 200°C or higher), Count: Two times or less, Exposure limit: 3 days ^{Note} (after that, prebake at 125°C for 10 to 72 hours)	VP15-103-2
Partial heating	Pin temperature: 350°C max., Time: 3 seconds max. (per pin row)	—

Note After opening the dry pack, store it at 25°C or less and 65% RH or less for the allowable storage period.

Caution Do not use different soldering methods together (except for partial heating).

Remark Soldering conditions for the (A) grade products are the same as for the standard products.

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 260°C, Time: 60 seconds max. (at 220°C or higher), Count: Three times or less, Exposure limit: 7 days ^{Note} (after that, prebake at 125°C for 20 to 72 hours)	IR60-207-3
Partial heating	Pin temperature: 350°C max., Time: 3 seconds max. (per pin row)	—

Note After opening the dry pack, store it at 25°C or less and 65% RH or less for the allowable storage period.

Caution Do not use different soldering methods together (except for partial heating).

- Remarks**
- Products with -A at the end of the part number are lead-free products.
 - For soldering methods and conditions other than those recommended above, contact an NEC Electronics sales representative.

APPENDIX A DEVELOPMENT TOOLS

The following development tools are available for the development of systems that employ the V850ES/KJ1. Figure A-1 shows the development tool configuration.

- **Support for PC98-NX series**

Unless otherwise specified, products supported by IBM PC/AT™ compatibles are compatible with PC98-NX series computers. When using PC98-NX series computers, refer to the explanation for IBM PC/AT compatibles.

- **Windows™**

Unless otherwise specified, "Windows" means the following OSs.

- Windows 98, 2000
- Windows Me
- Windows XP
- Windows NT™ Ver. 4.0

Figure A-1. Development Tool Configuration (1/2)

Notes 1. The project manager PM+ is included in the assembler package.

The PM+ is only used for Windows.

2. QB-V850ESKX1H supports USB only.

3. Products other than in-circuit emulator IE-V850ES-G1 are all sold separately.

4. In-circuit emulator IE-V850ESK1-ET is supplied with integrated debugger ID850, a device file, power supply unit, PCI bus interface adapter IE-70000-PCI-IF-A, and emulation probe. Any other products are sold separately.

5. In-circuit emulator QB-V850ESKX1H is supplied with integrated debugger ID850QB, a flash memory programmer (PG-FPL), power supply unit, and USB interface adapter. Any other products are sold separately.

<R>

Figure A-1. Development Tool Configuration (2/2)

A.1 Software Package

SP850 V850 Series software package	Development tools (software) common to the V850 Series are combined in this package.
	Part number: μ SxxxxSP850

Remark xxxx in the part number differs depending on the host machine and OS used.

μ SxxxxSP850

xxxx	Host Machine	OS	Supply Medium
AB17	PC-9800 series, IBM PC/AT compatibles	Windows (Japanese version)	CD-ROM
BB17		Windows (English version)	

A.2 Language Processing Software

CA850 C compiler package	This compiler converts programs written in C language into object codes executable with a microcontroller. This compiler is started from project manager PM+.
	Part number: μ SxxxxCA703000
DF703218 Device file	This file contains information peculiar to the device. This device file should be used in combination with a tool (CA850, SM850, ID850, and ID850QB). The corresponding OS and host machine differ depending on the tool to be used.

Remark xxxx in the part number differs depending on the host machine and OS used.

μ SxxxxCA703000

xxxx	Host Machine	OS	Supply Medium
AB17	PC-9800 series, IBM PC/AT compatibles	Windows (Japanese version)	CD-ROM
BB17		Windows (English version)	
3K17	SPARCstation™	SunOS™ (Rel. 4.1.4), Solaris™ (Rel. 2.5.1)	

A.3 Control Software

PM+ Project manager	This is control software designed to enable efficient user program development in the Windows environment. All operations used in development of a user program, such as starting the editor, building, and starting the debugger, can be performed from the PM+. <Caution> The PM+ is included in the C compiler package CA850. It can only be used in Windows.

A.4 Debugging Tools (Hardware)

A.4.1 When using in-circuit emulator IE-V850ES-G1

IE-V850ES-G1 In-circuit emulator	The in-circuit emulator serves to debug hardware and software when developing application systems using a V850 Series product. It corresponds to the integrated debugger ID850. This emulator should be used in combination with a power supply unit, emulation probe, and the interface adapter required to connect this emulator to the host machine.
IE-70000-CD-IF-A PC card interface	This is PC card and interface cable required when using a notebook-type computer as the host machine (PCMCIA socket compatible).
IE-70000-PCI-IF-A Interface adapter	This adapter is required when using a computer with a PCI bus as the host machine.
IE-703217-G1-EM1 Emulation board	This board emulates the operations of the peripheral hardware peculiar to a device. It should be used in combination with an in-circuit emulator.
GXP-CABLE Emulation probe	This probe is used to connect the in-circuit emulator and target system. This is supplied with emulation board IE-703217-G1-EM1.
EV-703217GJ Conversion adapter	This conversion adapter is used to connect the emulation probe and target system board on which a 144-pin plastic LQFP (GJ-UEN type) can be mounted.

Remark EV-703217GJ is a product of Application Corporation.

TEL: +81-42-732-1377 Application Corporation

A.4.2 When using in-circuit emulator IE-V850ESK1-ET

IE-V850ESK1-ET ^{Note} In-circuit emulator	The in-circuit emulator serves to debug hardware and software when developing application systems using a V850ES/KJ1 product. It corresponds to the integrated debugger ID850. This emulator should be used in combination with a power supply unit, emulation probe, and the interface adapter required to connect this emulator to the host machine.
IE-70000-PCI-IF-A Interface adapter	This adapter is required when using a computer with a PCI bus as the host machine. This is supplied with IE-V850ESK1-ET.
Emulation probe	This probe is used to connect the in-circuit emulator and target system. This is supplied with IE-V850ESK1-ET.
EV-703217GJ Conversion adapter	This conversion adapter is used to connect the emulation probe and target system board on which a 144-pin plastic LQFP (GJ-UEN type) can be mounted.

Note IE-V850ESK1-ET is supplied with a power supply unit and PCI bus interface adapter IE-70000-PCI-IF-A. It is also supplied with integrated debugger ID850 and a device file as control software.

Remark EV-703217GJ is a product of Application Corporation.

TEL: +81-42-732-1377 Application Corporation

<R>

A.4.3 When using IECUBE® QB-V850ESKX1H

The system configuration when connecting the QB-V850ESKX1H to the host machine (PC-9821 series, PC/AT compatible) is shown below. If no option products are prepared, connection is possible.

Figure A-2. System Configuration (QB-V850ESKX1H Used) (1/2)

Figure A-2. System Configuration (QB-V850ESKX1H Used) (2/2)

- Notes**
1. Obtain the device file from the NEC Electronics website.
<http://www.necel.com/micro/ods/eng/index.html>
 2. Under development
 3. Depending on the ordering number, supplied with the device.
 - When QB-V850ESKX1H-ZZZ is ordered
 The exchange adapter and the target connector are not supplied.
 - When QB-V850ESKX1H-S144GJ is ordered
 The QB-144GJ-EA-02S and QB-144GJ-TC-01S are supplied.
 4. When using both <9> and <10>, the order between <9> and <10> is not cared.

<5> QB-V850ESKX1H ^{Note} In-circuit emulator	The in-circuit emulator serves to debug hardware and software when developing application systems using a V850ES/KJ1 product. It corresponds to the integrated debugger ID850QB. This emulator should be used in combination with a power supply unit and emulation probe. Use USB to connect this emulator to the host machine.
<3> USB interface cable	Cable to connect the host machine and the QB-V850ESKX1H.
<4> AC adapter	100 to 240 V can be supported by replacing the AC plug.
<8> QB-144GJ-EA-02S Exchange adapter	Adapter to perform pin conversion.
<9> QB-144-CA-01S Check pin adapter	Adapter used in waveform monitoring using the oscilloscope, etc.
<10> QB-144-SA-01S Space adapter	Adapter to adjust the height.
<11> QB-144GJ-MA-01S Mount adapter	Adapter to mount the V850ES/KJ1 with socket.
<12> QB-144GJ-TC-01S Target connector	Connector to solder on the target system.

Note QB-V850ESKX1H is supplied with a power supply unit, USB interface cable, and flash memory programmer (PG-FPL). It is also supplied with integrated debugger ID850QB as control software.

Remark The numbers in the square brackets correspond to the numbers in Figure A-2.

<R>

A.4.4 When using MINICUBE QB-V850MINI**(1) On-chip emulation using MINICUBE**

The system configuration when connecting MINICUBE to the host machine (PC-9821 series, PC/AT compatible) is shown below.

Figure A-3. Example of On-Chip Emulation System Configuration

<1> Host machine	PC with USB ports
<2> CD-ROM ^{Note 1}	This CD-ROM is provided with MINICUBE and includes an ID850QB integrated debugger, an N-Wire checker, a device driver, and documents.
<3> USB interface cable	This cable, supporting USB, is provided with MINICUBE and used to connect the host machine to MINICUBE. The length of this cable is approximately 2 m.
<4> MINICUBE On-chip debug emulator	This on-chip emulator is used to debug hardware and software when developing application systems using the V850ES/KJ1. This supports the ID850QB integrated debugger.
<5> OCD cable	This cable is used to connect MINICUBE to the target system. This is provided with MINICUBE. The length of this cable is approximately 20 cm.
<6> Connector conversion board KEL adaptor	This board is provided with MINICUBE.
<7> MINICUBE connector KEL connector ^{Note 2}	8830E-026-170S (provided with MINICUBE) 8830E-026-170L (sold separately)

Notes 1. Obtain device files from the NEC Electronics website.

http://www.necel.com/micro/ods/eng/index_e.html

2. Product of KEL Corporation

Remark The numbers shown in the above table correspond to the numbers in Figure A-3.

(2) Debug emulation using MINICUBE and QB-V850ESKX1-DA

The following shows the system configuration when using MINICUBE, debug adapter QB-V850ESKX1-DA, and the host machine (PC-9821 series, PC/AT compatibles) connected together. They can still be connected without the optional products.

Figure A-4. Example of System Configuration Using QB-V850ESKX1-DA (Using Optional Products)

Figure A-5. Example of System Configuration Using QB-V850ESKX1-DA (Not Using Optional Products)

<1> Host machine	PC with USB ports
<2> CD-ROM ^{Note}	This CD-ROM is provided with MINICUBE and includes an ID850QB integrated debugger, N-Wire checker, a device driver, and documents.
<3> USB interface cable	This cable, supporting USB, is provided with MINICUBE and used to connect the host machine to MINICUBE. The length of this cable is approximately 2 m.
<4> MINICUBE On-chip debug emulator	This on-chip emulator is used to debug hardware and software when developing the application systems using the V850ES/KJ1. This supports the ID850QB integrated debugger.
<5> OCD cable	This cable is used to connect MINICUBE to the target system. This is provided with MINICUBE. The length of this cable is approximately 20 cm.
<6> QB-V850ESKX1-DA Debug adapter	This operates as an in-circuit emulator by using in combination with MINICUBE. This is provided with MINICUBE.
<7> QB-144-CA-01S (optional) Check pin adapter	Adapter used when monitoring waveforms on an oscilloscope.
<8> QB-144-EP-01S (optional) Extension probe coaxial type	This probe is used to connect the QB-V850ESKX1-DA to the exchange adapter. The length of this cable is approximately 40 cm.
<9> QB-144GJ-EA-02S Exchange adapter	Adapter that performs pin conversion
<10> QB-144-SA-01S (optional) Space adapter	Adapter for height regulation
<11> QB-144GJ-TC-01S Target connector	Connector soldered to target system
<12> QB-144GJ-MA-01S (optional) Mount adapter	Adapter for socket mounting of the V850ES/KJ1

Note Obtain device files from the NEC Electronics website.

http://www.necel.com/micro/ods/eng/index_e.html

Remark The numbers shown in the above table correspond to the numbers in Figures A-4 and A-5.

<R> A.5 Debugging Tools (Software)

SM850 System simulator	This is a system simulator for the V850 Series. The SM850 is Windows-based software. It is used to perform debugging at the C source level or assembler level while simulating the operation of the target system on a host machine. Use of the SM850 allows the execution of application logical testing and performance testing on an independent basis from hardware development, thereby providing higher development efficiency and software quality. The SM850 should be used in combination with the device file.
	Part number: μ SxxxxSM703000 (SM850)
ID850 integrated debugger (supporting in-circuit emulators IE-V850ES-G1 and IE-V850ESK1-ET)	This debugger supports the in-circuit emulators for the V850 Series. The ID850 and ID850QB are Windows-based software. It has improved C-compatible debugging functions and can display the results of tracing with the source program using an integrating window function that associates the source program, disassemble display, and memory display with the trace result. It should be used in combination with the device file.
ID850QB Integrated debugger (supporting in-circuit emulator QB-V850ESKX1H)	Part number: μSxxxxID703000 (ID850) μSxxxxID703000-QB (ID850QB)

Remark xxxx in the part number differs depending on the host machine and OS used.

μ SxxxxSM703000
 μ SxxxxID703000
 μ SxxxxID703000-QB

xxxx	Host Machine	OS	Supply Medium
AB17	PC-9800 series, IBM PC/AT compatibles	Windows (Japanese version)	CD-ROM
BB17		Windows (English version)	

A.6 Embedded Software

RX850, RX850 Pro Real-time OS	The RX850 and RX850 Pro are real-time OSs conforming to μ ITRON 3.0 specifications. A tool (configurator) for generating multiple information tables is supplied. RX850 Pro has more functions than RX850.
	Part number: μ SxxxxRX703000- $\Delta\Delta\Delta\Delta$ (RX850) μ SxxxxRX703100- $\Delta\Delta\Delta\Delta$ (RX850 Pro)
V850mini-NET (provisional name) (Network library)	This is a network library conforming to RFC. It is a lightweight TCP/IP of compact design, requiring only a small memory. In addition to the TCP/IP standard set, an HTTP server, SMTP client, and POP client are also supported.
RX-FS850 (File system)	This is a FAT file system function. It is a file system that supports the CD-ROM file system function. This file system is used with the real-time OS RX850 Pro.

Caution To purchase the RX850 or RX850 Pro, first fill in the purchase application form and sign the user agreement.

Remark xxxx and $\Delta\Delta\Delta\Delta$ in the part number differ depending on the host machine and OS used.

μ SxxxxRX703000- $\Delta\Delta\Delta\Delta$

μ SxxxxRX703100- $\Delta\Delta\Delta\Delta$

$\Delta\Delta\Delta\Delta$	Product Outline	Maximum Number for Use in Mass Production
001	Evaluation object	Do not use for mass-produced product.
100K	Mass-production object	0.1 million units
001M		1 million units
010M		10 million units
S01	Source program	Object source program for mass production

xxxx	Host Machine	OS	Supply Medium
AB17	PC-9800 series,	Windows (Japanese version)	CD-ROM
BB17	IBM PC/AT compatibles	Windows (English version)	
3K17	SPARCstation	Solaris (Rel. 2.5.1)	

A.7 Flash Memory Writing Tools

Flashpro IV (part number: PG-FP4) Flash programmer	Flash programmer dedicated to microcontrollers with on-chip flash memory.
FA-144GJ-UEN Flash memory writing adapter	Flash memory writing adapter used connected to the Flashpro IV. • FA-144GJ-UEN: For 144-pin plastic LQFP (GJ-UEN type)

Remark FA-144GJ-UEN is a product of Naito Densei Machida Mfg. Co., Ltd.
TEL: +81-45-475-4191 Naito Densei Machida Mfg. Co., Ltd.

APPENDIX B INSTRUCTION SET LIST

B.1 Conventions

(1) Register symbols used to describe operands

Register Symbol	Explanation
reg1	General-purpose registers: Used as source registers.
reg2	General-purpose registers: Used mainly as destination registers. Also used as source register in some instructions.
reg3	General-purpose registers: Used mainly to store the remainders of division results and the higher 32 bits of multiplication results.
bit#3	3-bit data for specifying the bit number
immX	X bit immediate data
dispX	X bit displacement data
regID	System register number
vector	5-bit data that specifies the trap vector (00H to 1FH)
cccc	4-bit data that shows the condition codes
sp	Stack pointer (r3)
ep	Element pointer (r30)
listX	X item register list

(2) Register symbols used to describe opcodes

Register Symbol	Explanation
R	1-bit data of a code that specifies reg1 or regID
r	1-bit data of the code that specifies reg2
w	1-bit data of the code that specifies reg3
d	1-bit displacement data
l	1-bit immediate data (indicates the higher bits of immediate data)
i	1-bit immediate data
cccc	4-bit data that shows the condition codes
CCCC	4-bit data that shows the condition codes of Bcond instruction
bbb	3-bit data for specifying the bit number
L	1-bit data that specifies a program register in the register list

(3) Register symbols used in operations

Register Symbol	Explanation
←	Input for
GR []	General-purpose register
SR []	System register
zero-extend (n)	Expand n with zeros until word length.
sign-extend (n)	Expand n with signs until word length.
load-memory (a, b)	Read size b data from address a.
store-memory (a, b, c)	Write data b into address a in size c.
load-memory-bit (a, b)	Read bit b of address a.
store-memory-bit (a, b, c)	Write c to bit b of address a.
saturated (n)	Execute saturated processing of n (n is a 2's complement). If, as a result of calculations, n ≥ 7FFFFFFFH, let it be 7FFFFFFFH. n ≤ 80000000H, let it be 80000000H.
result	Reflects the results in a flag.
Byte	Byte (8 bits)
Halfword	Halfword (16 bits)
Word	Word (32 bits)
+	Addition
−	Subtraction
	Bit concatenation
×	Multiplication
÷	Division
%	Remainder from division results
AND	Logical product
OR	Logical sum
XOR	Exclusive OR
NOT	Logical negation
logically shift left by	Logical shift left
logically shift right by	Logical shift right
arithmetically shift right by	Arithmetic shift right

(4) Register symbols used in execution clock

Register Symbol	Explanation
i	If executing another instruction immediately after executing the first instruction (issue).
r	If repeating execution of the same instruction immediately after executing the first instruction (repeat).
l	If using the results of instruction execution in the instruction immediately after the execution (latency).

(5) Register symbols used in flag operations

Identifier	Explanation
(Blank)	No change
0	Clear to 0
X	Set or cleared in accordance with the results.
R	Previously saved values are restored.

(6) Condition codes

Condition Code (cccc)	Condition Formula	Explanation
0 0 0 0	$OV = 1$	Overflow
1 0 0 0	$OV = 0$	No overflow
0 0 0 1	$CY = 1$	Carry Lower (Less than)
1 0 0 1	$CY = 0$	No carry Not lower (Greater than or equal)
0 0 1 0	$Z = 1$	Zero
1 0 1 0	$Z = 0$	Not zero
0 0 1 1	$(CY \text{ or } Z) = 1$	Not higher (Less than or equal)
1 0 1 1	$(CY \text{ or } Z) = 0$	Higher (Greater than)
0 1 0 0	$S = 1$	Negative
1 1 0 0	$S = 0$	Positive
0 1 0 1	–	Always (Unconditional)
1 1 0 1	$SAT = 1$	Saturated
0 1 1 0	$(S \text{ xor } OV) = 1$	Less than signed
1 1 1 0	$(S \text{ xor } OV) = 0$	Greater than or equal signed
0 1 1 1	$((S \text{ xor } OV) \text{ or } Z) = 1$	Less than or equal signed
1 1 1 1	$((S \text{ xor } OV) \text{ or } Z) = 0$	Greater than signed

Notes 1. dddddddd: Higher 8 bits of disp9.

2. 3 if there is an instruction that rewrites the contents of the PSW immediately before.

3. If there is no wait state (3 + the number of read access wait states).

4. n is the total number of list12 load registers. (According to the number of wait states. Also, if there are no wait states, n is the total number of list12 registers. If n = 0, same operation as when n = 1)

5. RRRRR: other than 00000.

6. The lower halfword data only are valid.

7. ddddddddddddddddddd: The higher 21 bits of disp22.

8. ddddddddddddddd: The higher 15 bits of disp16.

9. According to the number of wait states (1 if there are no wait states).

10. b: bit 0 of disp16.

11. According to the number of wait states (2 if there are no wait states).

Notes 12. In this instruction, for convenience of mnemonic description, the source register is made reg2, but the reg1 field is used in the opcode. Therefore, the meaning of register specification in the mnemonic description and in the opcode differs from other instructions.

rrrrr = regID specification

RRRRR = reg2 specification

13. iiii: Lower 5 bits of imm9.

IIII: Higher 4 bits of imm9.

14. Do not specify the same register for general-purpose registers reg1 and reg3.

15. sp/imm: specified by bits 19 and 20 of the sub-opcode.

16. ff = 00: Load sp in ep.

01: Load sign expanded 16-bit immediate data (bits 47 to 32) in ep.

10: Load 16-bit logically left shifted 16-bit immediate data (bits 47 to 32) in ep.

11: Load 32-bit immediate data (bits 63 to 32) in ep.

17. If imm = imm32, n + 3 clocks.

18. rrrrr: Other than 00000.

19. ddddddd: Higher 7 bits of disp8.

20. dddd: Higher 4 bits of disp5.

21. ddddddd: Higher 6 bits of disp8.

APPENDIX D REVISION HISTORY

D.1 Major Revisions in This Edition

(1/3)

Page	Description
Throughout	Addition of on-chip debug function to the μ PD70F3218H and 70F3218HY
Throughout	Modification of oscillation frequency
Throughout	Deletion of special-grade products: μ PD703216(A1), 703216Y(A1), 703217(A1), 703217Y(A1), 703216(A2), 703216Y(A2), 703217(A1), 703217Y(A2)
p. 27	Modification of 1.4 Ordering Information
pp. 45, 46	Modification of 2.3 Pin I/O Circuits and Recommended Connection of Unused Pins
pp. 48, 49	Modification of 2.4 Pin I/O Circuits
p. 53	Modification of Table 3-2 System Register Numbers
p. 87	Modification of 3.4.8 (1) (a) System wait control register (VSWC)
p. 88	Modification of 3.4.8 (1) (b) Access to special on-chip peripheral I/O register
p. 90	Addition of 3.4.8 (2) Restriction on conflict between sld instruction and interrupt request
p. 93	Modification of Table 4-3 Reading to/Writing from Pn Register
p. 184	Addition of 4.6.3 Cautions on on-chip debug pins
p. 184	Addition of 4.6.4 Cautions on P05/INTP2/DRST pin
p. 230	Addition of Caution 3 to 7.4 (5) TMP0 I/O control register 2 (TP0IOC2)
p. 239	Modification of Figure 7-4 Register Setting for Interval Timer Mode Operation
p. 248	Modification of Figure 7-10 Basic Timing in External Event Count Mode
p. 252	Addition of Caution to 7.5.2 (2) Operation timing in external event count mode
p. 257	Modification of Figure 7-17 Basic Timing in External Trigger Pulse Output Mode
p. 257	Addition of description to 7.5.3 External trigger pulse output mode
p. 264	Modification of figure in 7.5.3 (2) (b) 0%/100% output of PWM waveform
p. 272	Modification of Figure 7-23 Software Processing Flow in One-Shot Pulse Output Mode
p. 282	Modification of figure in 7.5.5 (2) (b) 0%/100% output of PWM waveform
p. 302	Modification of 7.5.7 Pulse width measurement mode
p. 310	Addition of 7.7 Cautions
pp. 311 to 383	Modification of description in CHAPTER 8 16-BIT TIMER/COUNTER 0
p. 405	Modification of 10.2 (1) 8-bit timer H compare register n0 (CMPn0)
p. 406	Modification of 10.2 (2) 8-bit timer H compare register n1 (CMPn1)
p. 413	Modification of Figure 10-3 Timing of Interval Timer/Square Wave Output Operation
p. 421	Modification of Figure 10-6 Transfer Timing
p. 422	Modification of 10.4.3 (2) Setting
p. 429	Modification of 11.1.3 (1) Interval timer BRG mode register (PRSM)
p. 431	Modification of 11.1.4 (1) Operation of interval timer BRG
p. 445	Modification of Caution 4 in 12.2.3 (1) Watchdog timer mode register 2 (WDTM2)
p. 446	Addition of Caution 4 to 12.2.3 (2) Watchdog timer enable register (WDTE)
p. 460	Modification of 14.3 (1) A/D converter mode register (ADM)

Page	Description
p. 462	Addition of Caution 3 to 14.3 (2) Analog input channel specification register (ADS)
p. 465	Addition to Caution 2 to 14.3 (4) Power fail compare mode register (PFM)
p. 465	Addition to Caution 2 to 14.3 (5) Power fail compare threshold register (PFT)
p. 467	Modification of 14.4.2 A/D conversion operation
p. 469	Modification of Figure 14-5 Example of How to Reduce Power Consumption in Standby Mode
p. 473	Addition of 14.6 (12) Variation of A/D conversion results
p. 473	Addition of 14.6 (13) A/D conversion result hysteresis characteristics
p. 474	Addition of 14.6 (14) Writing to register during A/D conversion
p. 576	Modification of Figure 19-2 Block Diagram of I²Cn
pp. 580, 581	Modification of 19.4 (1) IIC control registers 0, 1 (IICC0, IICC1)
pp. 585, 586	Modification of 19.4 (2) IIC status registers 0, 1 (IICS0, IICS1)
p. 589	Modification of 19.4 (3) IIC flag registers 0, 1 (IICF0, IICF1)
p. 590	Modification of 19.4 (4) IIC clock selection registers 0, 1 (IICCL0, IICCL1)
p. 591	Modification of 19.4 (5) IIC function expansion registers 0, 1 (IICX0, IICX1)
p. 593	Modification of 19.4 (7) IIC shift registers 0, 1 (IIC0, IIC1)
p. 593	Modification of 19.4 (8) Slave address registers 0, 1 (SVA0, SVA1)
p. 598	Modification of 19.6.4 $\overline{\text{ACK}}$
p. 602	Addition of 19.6.7 Wait state cancellation method
pp. 604, 605, 622 to 624	Modification of 19.7 I ² C Interrupt Request Signals (INTIICn)
p. 627	Modification of 19.11 Extension Code
p. 630	Modification of 19.14.1 When communication reservation function is enabled (IICFn.IICRSVn bit = 0)
p. 630	Modification of Table 19-6 Wait Periods
p. 633	Modification of Table 19-7 Wait Periods
p. 634	Addition of 19.15 Cautions
pp. 635 to 639	Modification of 19.16 Communication Operations
p. 641	Modification of Figure 19-19 Slave Operation Flowchart
pp. 644 to 646	Modification of Figure 19-21 Example of Master to Slave Communication
pp. 647 to 649	Modification of Figure 19-22 Example of Slave to Master Communication
p. 688	Modification of 20.9 Periods in Which Interrupts Are Not Acknowledged by CPU
p. 698	Modification of Table 22-3 Operation Status in HALT Mode
p. 701	Modification of Table 22-5 Operation Status in IDLE Mode
p. 704	Modification of Table 22-7 Operation Status in STOP Mode
p. 707	Modification of Table 22-8 Operation Status in Subclock Operation Mode
p. 708	Addition of Caution to 22.7.1 Setting and operation status
p. 710	Modification of Table 22-10 Operation Status in Sub-IDLE Mode
p. 713	Modification of Table 23-1 Hardware Status on $\overline{\text{RESET}}$ Pin Input or Occurrence of WDTRES2 Signal
p. 713	Modification of Table 23-2 Hardware Status on Occurrence of WDTRES1 Signal
p. 715	Addition of Figure 23-4 Timing of Reset Operation by Watchdog Timer 1
p. 715	Addition of Figure 23-5 Timing of Reset Operation by Watchdog Timer 2
p. 716	Addition of Caution to 24.1 Overview

Page	Description
p. 725	Modification of Table 26-2 Basic Functions
p. 725	Modification of Table 26-3 Security Functions
p. 726	Addition of Table 26-4 Security Setting
p. 727	Addition of 26.3 (1) Security setting by PG-FP4 (Security flag settings)
p. 730	Modification of Table 26-5 Signal Connections of Dedicated Flash Programmer (PG-FP4)
pp. 732, 733	Modification of Figure 26-6 Wiring Example of V850ES/KJ1 Flash Writing Adapter (FA-144GJ-UEN-A)
p. 736	Modification of Table 26-7 Flash Memory Control Commands
p. 743	Modification of 26.5.2 (2) Interrupt support
p. 744	Modification of Figure 26-17 Standard Self Programming Flow
p. 746	Modification of 26.5.6 Internal resources used
pp. 750, 751	Modification of Figure 27-1 Wiring Example of V850ES/KJ1 Flash Writing Adapter (FA-144GJ-UEN-A)
pp. 762 to 770	Addition of CHAPTER 28 ON-CHIP DEBUG FUNCTION
pp. 771 to 816	Modification of CHAPTER 29 ELECTRICAL SPECIFICATIONS (SINGLE-POWER FLASH MEMORY VERSION)
pp. 839, 840	Modification of CHAPTER 30 ELECTRICAL SPECIFICATIONS (STANDARD PRODUCTS (MASK ROM VERSION AND TWO-POWER FLASH MEMORY VERSION), (A) GRADE PRODUCTS)
pp. 866, 867	Modification of CHAPTER 32 RECOMMENDED SOLDERING CONDITIONS
p. 870	Modification of Figure A-1 Development Tool Configuration
p. 873	Modification of A.4.3 When using IECUBE QB-V850ESKX1H
pp. 875 to 877	Addition of A.4.4 When using IECUBE QB-V850MINI
p. 878	Modification of A.5 Debugging Tools (Software)

D.2 Modifications from Document Number U15862EJ4V1UD00

Edition	Description	Applied to:
1st	- Extraction of only descriptions concerning V850ES/KJ1 - Addition of following products μPD70F3217H, 70F3217HY, 70F3218H, 70F3218HY - Addition of pins supporting added products - Addition of internal ROM, RAM, and flash memory capacities of added products	Throughout
	Modification of description in 1.7 Overview of Functions	CHAPTER 1 INTRODUCTION
	Modification of I/O circuit type 13-B to 13-AH in 2.4 Pin I/O Circuits	CHAPTER 2 PIN FUNCTIONS
	Modification of description in 3.3 (2) Flash memory programming mode	CHAPTER 3 CPU FUNCTIONS
	Addition of 3.4.4 (1) (a) Internal ROM (256 KB)	
	Addition of 3.4.4 (2) (a) Internal RAM (16 KB)	
	Modification of description in 3.4.6 Peripheral I/O registers	
	Modification of description in 3.4.8 (1) System wait control register and (2) Access to special on-chip peripheral I/O register	
	Addition of 4.3 (5) Port n function control expansion register (PFCE_n)	CHAPTER 4 PORT FUNCTIONS
	Modification of description in Figure 4-1 Register Settings and Pin Functions	
	Addition of 4.3.1 (5) Cautions	
	Modification of description in 4.3.3 (5) Port 3 function control register (PFC3)	
	Addition of 4.3.3 (6) Port 3 function control expansion register (PFCE3)	
	Addition of 4.3.3 (8) Specifying alternate-function pins of port 3	
	Modification of Figures 4-3 to 4-31 (partial addition)	
	Modification of description in Table 4-19 Settings When Port Pins Are Used for Alternate Functions	
	Addition of CHAPTER 7 16-BIT TIMER/EVENT COUNTER P (TMP)	CHAPTER 7 16-BIT TIMER/EVENT COUNTER P (TMP)
	Addition of Caution 1 in 18.3 (7) CSIA_n buffer RAM (CSIA_nB_m)	CHAPTER 18 CLOCKED SERIAL INTERFACE A (CSIA) WITH AUTOMATIC TRANSMIT/RECEIVE FUNCTION
	Modification of bit 7 in 22.2 (2) Power save mode register (PSMR)	CHAPTER 22 STANDBY FUNCTION
	Addition of CHAPTER 26 FLASH MEMORY (SINGLE POWER)	CHAPTER 26 FLASH MEMORY (SINGLE POWER)
	Addition of CHAPTER 28 ELECTRICAL SPECIFICATIONS (SINGLE-POWER FLASH MEMORY VERSION) (TARGET)	CHAPTER 28 ELECTRICAL SPECIFICATIONS (SINGLE-POWER FLASH MEMORY VERSION) (TARGET)
	Modification of bus timing, basic operation, and timer timing in CHAPTER 29 ELECTRICAL SPECIFICATIONS (STANDARD PRODUCTS (MASK ROM VERSION AND TWO-POWER FLASH MEMORY VERSION), (A) GRADE PRODUCTS)	CHAPTER 29 ELECTRICAL SPECIFICATIONS (STANDARD PRODUCTS (MASK ROM VERSION AND TWO-POWER FLASH MEMORY VERSION), (A) GRADE PRODUCTS)
