

## High-Speed CMOS Logic

FUNCTIONAL DIAGRAM

### Quad D Flip-Flop with Reset

**Type Features:**

- Common Clock and Asynchronous Reset on four D-Type Flip-Flops
- Positive-edge pulse triggering
- Complementary Outputs
- Buffered Inputs
- Typical  $f_{MAX} = 50 \text{ MHz}$  @  $V_{CC} = 5 \text{ V}$ ,  $C_L = 15 \text{ pF}$ ,  $T_A = 25^\circ \text{ C}$

The RCA CD54/74HC175 and the CD54/74HCT175 are high speed Quad D-Type Flip-Flops with individual D-inputs and Q,  $\bar{Q}$  complementary outputs. The devices are fabricated using silicon gate CMOS technology. They have the low power consumption advantage of standard CMOS ICs and the ability to drive 10 LSTTL devices.

Information at the D input is transferred to the Q and  $\bar{Q}$  outputs on the positive-going edge of the clock pulse. All four Flip-Flops are controlled by a common clock (CP) and a common reset ( $\bar{MR}$ ). Resetting is accomplished by a low voltage level independent of the clock. All four Q outputs are reset to a logic 0 and all four  $\bar{Q}$  outputs to a logic 1.

The CD54HC175 and CD54HCT175 are supplied in 16-lead dual-in-line ceramic packages (F suffix) and the CD74HC175 and CD74HCT175 are supplied in 16-lead dual-in-line plastic packages (E suffix) and in 16-lead dual-in-line surface mount plastic packages (M suffix). Both types are also available in chip form (H suffix).
