

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

CY91460Q series is a line of general-purpose 32-bit RISC microcontrollers designed for embedded control applications which require high-speed real-time processing, such as consumer devices and on-board vehicle systems. This series uses the FR60 CPU, which is compatible with the FR family of CPUs.

This series contains the LIN-USART and CAN controllers.

Note: Differences versus CY91F469GB are marked in red color.

Features

FR60 CPU Core

- 32-bit RISC, load/store architecture, five-stage pipeline
- 16-bit fixed-length instructions (basic instructions)
- Instruction execution speed: 1 instruction per cycle
- Instructions including memory-to-memory transfer, bit manipulation, and barrel shift instructions: Instructions suitable for embedded applications
- Function entry/exit instructions and register data multi-load store instructions : Instructions supporting C language
- Register interlock function: Facilitating assembly-language coding
- Built-in multiplier with instruction-level support
 - Signed 32-bit multiplication: 5 cycles
 - Signed 16-bit multiplication: 3 cycles
- Interrupts (save PC/PS) : 6 cycles (16 priority levels)
- Harvard architecture enabling program access and data access to be performed simultaneously
- Instructions compatible with the FR family

Internal Peripheral Resources

- General-purpose ports : Maximum 205 ports
- DMAC (DMA Controller)
 - Maximum of 5 channels able to operate simultaneously (including 2 external channels).
 - 3 transfer sources (external pin/internal peripheral/software)
 - Activation source can be selected using software
 - Addressing mode specifies full 32-bit addresses (increment/decrement/fixed)
 - Transfer mode (demand transfer/burst transfer/step transfer/block transfer)
 - Fly-by transfer support (between external I/O and memory)
 - Transfer data size selectable from 8/16/32-bit
 - Multi-byte transfer enabled (by software)
 - DMAC descriptor in I/O areas (200_H to 240_H, 1000_H to 1024_H)
- A/D converter (successive approximation type): **2 modules**
 - ADC 0: 10-bit resolution: 32 channels
 - **ADC 1: 10-bit resolution: 8 channels**
 - Conversion time: minimum 1 μs

- External interrupt inputs : **32 channels**
 - 12 channels shared with CAN RX, **LIN-USART SIN**, I²C SDA or I²C SCL pins
 - **16 channels shared with ADC input pins**
- Bit search module (for REALOS)
 - Function to search from the MSB (most significant bit) for the position of the first "0", "1", or changed bit in a word
- LIN-USART (full duplex double buffer): **12 channels**, **8 channels with FIFO**
 - Clock synchronous/asynchronous selectable
 - Sync-break detection
 - Internal dedicated baud rate generator
 - **LIN-USART 8-11 with asynchronous operation only**
- I²C bus interface (supports 400 kbps): **3 channel**
 - Master/slave transmission and reception
 - Arbitration function, clock synchronization function
- CAN controller (C-CAN): **3 channels**
 - Maximum transfer speed: 1 Mbps
 - **32 transmission/reception message buffers**
- Sound generator : 1 channelTone frequency : PWM frequency divide-by-two (reload value + 1)
- Alarm comparator : 2 channelsMonitor external voltage
Generate an interrupt in case of voltage lower/higher than the defined thresholds (reference voltage)
- 16-bit PPG timer : 16 channels
- 16-bit PFM timer : 1 channel
- 16-bit reload timer: 8 channels
- 16-bit free-run timer: **9 channels** (1 channel each for ICU and OCU)
- Input capture: **10 channels** (operates in conjunction with the free-run timer)
- Output compare: 8 channels (operates in conjunction with the free-run timer)
- Up/Down counter: 4 channels (4*8-bit or 2*16-bit)
- Watchdog timer
- Real-time clock
- Low-power consumption modes : Sleep/stop mode function
- Supply Supervisor: Low voltage detection circuit for external V_{DD5} and internal 1.8V core voltage

- Clock supervisor
 - Monitors the sub-clock (32 kHz) and the main clock (4 MHz) , and switches to a recovery clock (CR oscillator, etc.) when the oscillations stop.
- Clock modulator
- Clock monitor
- Sub-clock calibration
 - Corrects the real-time clock timer when operating with the 32 kHz or CR oscillator
- Main oscillator stabilization timer
 - Generates an interrupt in sub-clock mode after the stabilization wait time has elapsed on the 23-bit stabilization wait time counter
- Sub-oscillator stabilization timer
 - Generates an interrupt in main clock mode after the stabilization wait time has elapsed on the 15-bit stabilization wait time counter

Package and Technology

- Package : 320-pin plastic BGA (BYA320)
- CMOS 0.18 μm technology
- Power supply range 3 V to 5 V (1.8 V internal logic provided by a step-down voltage converter)
- Operating temperature range: between -40°C and $+105^{\circ}\text{C}/+125^{\circ}\text{C}^{\text{a}}$

a. For maximum ambient temperature $T_{\text{A(max)}}$, See “[Ordering Information](#)” on page 145.

5. Special Port / Resource Assignments

In general, the port / resource assignments and the necessary register settings (PFR, EPFR) are described in the CY91460 series hardware manual. The assignments of CY91460Q series are different on some ports. This chapter explains the differences and the settings needed to enable the resources.

5.1 Overview of Special Port / Resource Assignments

- CY91460Q series has a second A/D converter (ADC1), serving the channels AN34-39, AN42 and AN46. These analog channels are added to P17[7:2], P18[6] and P18[2].
- CY91460Q series has 16 more external interrupts (INT16-31), added to ports 27 and 26.
- The following external interrupts are re-located to other ports then described in the hardware manual: INT4, INT5, INT10, INT11, INT12, INT14.
- CY91460Q series has 2 more Input Capture Units (ICU8, ICU9) and one more Free Run Timer (FRT8).
- CY91460Q series has different initial function of the external bus IOs

5.2 The Second A/D Converter (ADC1)

The second ADC is of the same macro type then ADC0 (10 bit, 1 μ s), and it has the same register set.

For the addresses, please refer to the IO MAP at address 0x5E0 to 0x5EB.

The external trigger signal (ATGX) for ADC1 comes from port P16[7] and is the same as for ADC0.

The internal trigger signal for ADC1 comes from Reload Timer 7 and is the same as for ADC0.

The analog input channels are assigned to the following bits of Ports 17 and 18:

Port 17								Func.	Enabled by
P17[7]	P17[6]	P17[5]	P17[4]	P17[3]	P17[2]	P17[1]	P17[0]	GPIO	PFR17=0
PPG7	PPG6	PPG5	PPG4	PPG3	PPG2	PPG1	PPG0	PPG	PFR17=1
AN39	AN38	AN37	AN36	AN35	AN34	-	-	ADC1	AD1ER [m-32]=1

Port 18								Func.	Enabled by
-	P18[6]	P18[5]	P18[4]	-	P18[2]	P18[1]	P18[0]	GPIO	PFR18=0
-	SCK7	SOT7	SIN7	-	SCK6	SOT6	SIN6	LIN	PFR18=1, EPFR18=0
	ZIN3, CK7	BIN3	AIN3	-	ZIN2, CK6	BIN2	AIN2	UDC, FRT	PFR18=1, EPFR18=1
-	AN46	-	-	-	AN42	-	-	ADC1	AD1ER [m-32]=1

m = 32 to 46 (ADC channel)

The analog channel IO is enabled independently of PFR/EPFR. It only depends on the appropriate **AD1ER**[n] bit (ADC channel enable). If an analog channel is enabled, the digital input stages are disabled by hardware. **Analog overwrites digital input.**

5.3 The Additional External Interrupts (INT16-31)

The additional external interrupts are controlled by a second external interrupt controller having similar register set.

For the addresses, please refer to the IO MAP at address 0xC04 to 0xC0B.

The new interrupt functions are assigned to the ports 26 and 27:

Port 26								Func.	Enabled by
P26[7]	P26[6]	P26[5]	P26[4]	P26[3]	P26[2]	P26[1]	P26[0]	GPIO	PFR26=0
-	-	-	-	-	-	-	-	[SMC]	PFR26=1, EPFR26=0
AN31	AN30	AN29	AN28	AN27	AN26	AN25	AN24	ADC0	PFR26=1, EPFR26=1
INT31	INT30	INT29	INT28	INT27	INT26	INT25	INT24	INT	PFR27=1, EPFR27=1, ENIR3[m-24]=1 and ADERH[an-16]=0

Port 27								Func.	Enabled by
P27[7]	P27[6]	P27[5]	P27[4]	P27[3]	P27[2]	P27[1]	P27[0]	GPIO	PFR27=0
-	-	-	-	-	-	-	-	[SMC]	PFR27=1, EPFR27=0
AN23	AN22	AN21	AN20	AN19	AN18	AN17	AN16	ADC0	PFR27=1, EPFR27=1
INT23	INT22	INT21	INT20	INT19	INT218	INT17	INT16	INT	PFR27=1, EPFR27=1, ENIR2[m-16]=1 and ADERH[an-16]=0

m = 16 to 31 (INT channel)

an = 16 to 31 (ADC channel)

Note: CY91460Q series does not have Stepper Motor Controllers (SMC). On other devices of CY91460 series, the SMC lines are located on ports 25 to 27 and enabled by setting PFR=1, EPFR=0.

The new interrupts are assigned to ports having analog functions (SMC, ADC).

If an analog function is enabled on a pin, then all digital input functionality of this pin is disabled by hardware, and it is not possible to use the interrupt function. Analog overwrites digital input!

The ADC functions are enabled by setting PFR=1, EPFR=1 and ADREH=1 (ADERH is ADC channel enable register of ADC0. If the ADC functions are enabled, the digital input lines are disabled. CMOS-Schmitt, Automotive and CMOS-2 level input lines keep their value (bus holder behaviour) while the TTL input line is tied to low level. In this state, external interrupts cannot be used.

If the analog functions are disabled (ADERH=0), the interrupt can be used after setting the appropriate interrupt channel enable bit in ENIR2/EINR3 register as well as PFR and EPFR. Setting these registers enables the digital input stages for wakeup in STOP mode.

5.4 Re-located External Interrupts (INT4, INT5, INT10, INT11, INT12, INT14)

The re-located interrupts are assigned to ports different to other devices of CY91460 series:

Port 24		Port 35			Port 34			Func.	Enabled by
P24[4]		P35[4]	P35[0]		P34[5]	P34[4]	P34[0]	GPIO	PFR=0
SDA2		-	-		-	-	-	[LCD]	PFR=1, EPFR=0
-		SIN9	SIN8		SOT11	SIN11	SIN10	I2C/ LIN	PFR=1, EPFR=1
INT14		INT12	INT11		INT5	INT4	INT10	ADC1	ENIR1/0[m]=1

Note: CY91460Q series does not have the LCD Controller.

On other devices of CY91460 series, the LCD lines are located on ports 30 to 36 and enabled by setting PFR=1, EPFR=0. This setting would disable the digital input lines on other devices. To keep the software compatible to the new evaluation device, avoid setting PFR=1 & EPFR=0.

Note: Take care about INT5 because it is attached to SOT11 (LIN-USART output direction if PFR=EPFR=1!)

If the LCD function is disabled, the interrupt can be used after setting the appropriate interrupt channel enable bit in ENIR0/ENIR1 register. Setting ENIR0/ENIR1 enables the digital input stages for wakeup in STOP mode. But setting ENIR does **not** switch the port direction to input mode. The user should take care that the port is operating in input direction before expecting external interrupts.

5.5 Input Capture Units (ICU8,9) and Free Run Timer (FRT8)

CY91460Q series has 2 more ICUs and one more FRT. The assignments are the following:

Port 22		Port 21		Func.	Enabled by	Comments
P22[7]	P22[6]	P21[2]		GPIO	PFR=0	
SCL1	SDA1	SCK0		I2C / LIN	PFR=1	Port 22 does not have EPFR.
-	INT15	-		INT	PFR=1	Port 22 does not have EPFR.
-	-	CK0/8		FRT	PFR=1, EPFR=1	PFR=1 & EPFR=1 just switches the port 21[2] to input direction. FRT8 uses the same input signal as FRT0.
ICU9	ICU8	-		ICU	PFR=1 or PFR=0	PFR switches the ICU input signal between LIN-US-ART.LSYNC and the pin.

PFR22[7:6] switch the input signals of the ICU modules 9 and 8:

PFR	Value	ICU input connection
PFR22[7]	0	ICU9 input is connected to port 22[7] input line (default)
	1	ICU9 input is connected to the LSYNC output of LIN-USART9
PFR22[6]	0	ICU8 input is connected to port 22[6] input line (default)
	1	ICU8 input is connected to the LSYNC output of LIN-USART8

Note: For ICU0-7, this multiplexing is controlled by EPFR14 register.

5.6 External Bus Function After Reset

Older devices of CY91460 series switch on the external bus after reset by setting the PFR registers of the ports 00 to 10. This behaviour appears in external vector fetch mode (MD[2:0]=001) as well as in internal vector fetch mode (MD[2:0]=000). New devices of CY91460 series (including CY91460Q) do **not** switch on the external bus in internal vector fetch mode (MD[2:0]=000).

6. Handling Devices

6.1 Preventing Latch-up

Latch-up may occur in a CMOS IC if a voltage higher than (V_{DD5} , V_{DD35}) or less than (V_{SS5}) is applied to an input or output pin or if a voltage exceeding the rating is applied between the power supply pins and ground pins. If latch-up occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Therefore, be very careful not to apply voltages in excess of the absolute maximum ratings.

6.2 Handling of Unused Input Pins

If unused input pins are left open, abnormal operation may result. Any unused input pins should be connected to pull-up or pull-down resistor (2K Ω to 10K Ω) or enable internal pullup or pulldown resistors (PPER/PPCR) before the input enable (PORTEN) is activated by software. The mode pins MD_x can be connected to V_{SS5} or V_{DD5} directly. Unused ALARM input pins can be connected to AV_{SS5} directly.

6.3 Power Supply Pins

In CY91460Q series, devices including multiple power supply pins and ground pins are designed as follows; pins necessary to be at the same potential are interconnected internally to prevent malfunctions such as latch-up. All of the power supply pins and ground pins must be externally connected to the power supply and ground respectively in order to reduce unnecessary radiation, to prevent strobe signal malfunctions due to the ground level rising and to follow the total output current ratings. Furthermore, the power supply pins and ground pins of the CY91460Q series must be connected to the current supply source via a low impedance.

It is also recommended to connect a ceramic capacitor of approximately 0.1 μ F as a bypass capacitor between power supply pin and ground pin near this device.

This series has a built-in step-down regulator. Connect a bypass capacitor of 4.7 μ F (use a X7R ceramic capacitor) to VCC18C pin for the regulator.

6.4 Crystal Oscillator Circuit

Noise in proximity to the X0 (X0A) and X1 (X1A) pins can cause the device to operate abnormally. Printed circuit boards should be designed so that the X0 (X0A) and X1 (X1A) pins, and crystal oscillator, as well as bypass capacitors connected to ground, are located near the device and ground.

It is recommended that the printed circuit board layout be designed such that the X0 and X1 pins or X0A and X1A pins are surrounded by ground plane for the stable operation.

Please request the oscillator manufacturer to evaluate the oscillational characteristics of the crystal and this device.

6.5 Notes on Using External Clock

When using the external clock, it is necessary to simultaneously supply the X0 (X0A) and the X1 (X1A) pins. In the described combination, X1 (X1A) should be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins. At X0 and X1, a frequency up to 16 MHz is possible.

Example of Using Opposite Phase Supply

6.6 Mode Pins (MD_x)

These pins should be connected directly to the power supply or ground pins. To prevent the device from entering test mode accidentally due to noise, minimize the lengths of the patterns between each mode pin and power supply pin or ground pin on the printed circuit board as possible and connect them with low impedance.

6.7 Notes on Operating in PLL Clock Mode

If the oscillator is disconnected or the clock input stops when the PLL clock is selected, the microcontroller may continue to operate at the free-running frequency of the self-oscillating circuit of the PLL. However, this self-running operation cannot be guaranteed.

6.8 Pull-up Control

The AC standard is not guaranteed in case a pull-up resistor is connected to the pin serving as an external bus pin.

6.9 Notes on PS Register

As the PS register is processed in advance by some instructions, when the debugger is being used, the exception handling may result in execution breaking in an interrupt handling routine or the displayed values of the flags in the PS register being updated.

As the microcontroller is designed to carry out reprocessing correctly upon returning from such an EIT event, the operation before and after the EIT always proceeds according to specification.

The following behavior may occur if any of the following occurs in the instruction immediately after a DIV0U/DIV0S instruction:

- (a) a user interrupt or NMI is accepted;
- (b) single-step execution is performed;
- (c) execution breaks due to a data event or from the emulator menu.
 - 1. D0 and D1 flags are updated in advance.
 - 2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
 - 3. Upon returning from the EIT, the DIV0U/DIV0S instruction is executed and the D0 and D1 flags are updated to the same values as those in 1.

The following behavior occurs when an ORCCR, STILM, MOV Ri,PS instruction is executed to enable a user interrupt or NMI source while that interrupt is in the active state.

- 1. The PS register is updated in advance.
- 2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
- 3. Upon returning from the EIT, the above instructions are executed and the PS register is updated to the same value as in 1.

7. Notes on Debugger

7.1 Execution of the RETI Command

If single-step execution is used in an environment where an interrupt occurs frequently, the corresponding interrupt handling routine will be executed repeatedly to the exclusion of other processing. This will prevent the main routine and the handlers for low priority level interrupts from being executed (For example, if the time-base timer interrupt is enabled, stepping over the RETI instruction will always break on the first line of the time-base timer interrupt handler).

Disable the corresponding interrupts when the corresponding interrupt handling routine no longer needs debugging.

7.2 Break Function

If the range of addresses that cause a hardware break (including event breaks) is set to the address of the current system stack pointer or to an area that contains the stack pointer, execution will break after each instruction regardless of whether the user program actually contains data access instructions.

To prevent this, do not set (word) access to the area containing the address of the system stack pointer as the target of the hardware break (including an event breaks).

7.3 Operand Break

It may cause malfunctions if a stack pointer exists in the area which is set as the DSU operand break. Do not set the access to the areas containing the address of system stack pointer as a target of data event break.

9. CPU and Control Unit

The FR family CPU is a high performance core that is designed based on the RISC architecture with advanced instructions for embedded applications.

9.1 Features

- Adoption of RISC architecture
Basic instruction: 1 instruction per cycle
- General-purpose registers: 32-bit × 16 registers
- 4 Gbytes linear memory space
- Multiplier installed
32-bit × 32-bit multiplication: 5 cycles
16-bit × 16-bit multiplication: 3 cycles
- Enhanced interrupt processing function
Quick response speed (6 cycles)
Multiple-interrupt support
Level mask function (16 levels)
- Enhanced instructions for I/O operation
Memory-to-memory transfer instruction
Bit processing instruction
Basic instruction word length: 16 bits
- Low-power consumption
Sleep mode/stop mode

9.2 Internal Architecture

- The FR family CPU uses the Harvard architecture in which the instruction bus and data bus are independent of each other.
- A 32-bit ↔ 16-bit buffer is connected to the 32-bit bus (D-bus) to provide an interface between the CPU and peripheral resources.
- A Harvard ↔ Princeton bus converter is connected to both the I-bus and D-bus to provide an interface between the CPU and the bus controller.

9.3 Programming Model

9.3.1 Basic Programming Model

9.4 Registers

9.4.1 General-purpose Register

Registers R0 to R15 are general-purpose registers. These registers can be used as accumulators for computation operations and as pointers for memory access.

Of the 16 registers, enhanced commands are provided for the following registers to enable their use for particular applications.

R13 : Virtual accumulator

R14 : Frame pointer

R15 : Stack pointer

Initial values at reset are undefined for R0 to R14. The value for R15 is 00000000_H (SSP value).

9.4.2 PS (Program Status)

This register holds the program status, and is divided into three parts, ILM, SCR, and CCR.

All undefined bits (-) in the diagram are reserved bits. The read values are always "0". Write access to these bits is invalid.

9.4.3 CCR (Condition Code Register)

SV : Supervisor flag

S : Stack flag

I : Interrupt enable flag

N : Negative enable flag

Z : Zero flag

V : Overflow flag

C : Carry flag

9.4.4 SCR (System Condition Register)

Flag for step division (D1, D0)

This flag stores interim data during execution of step division.

Step trace trap flag (T)

This flag indicates whether the step trace trap is enabled or disabled.

The step trace trap function is used by emulators. When an emulator is in use, it cannot be used in execution of user programs.

9.4.5 ILM (Interrupt Level Mask Register)

This register stores interrupt level mask values, and the values stored in ILM4 to ILM0 are used for level masking.

The register is initialized to value "01111_B" at reset.

9.4.6 PC (Program Counter)

The program counter indicates the address of the instruction that is being executed.

The initial value at reset is undefined.

9.4.7 TBR (Table Base Register)

The table base register stores the starting address of the vector table used in EIT processing.

The initial value at reset is 000FFC00_H.

9.4.8 RP (Return Pointer)

The return pointer stores the address for return from subroutines.

During execution of a CALL instruction, the PC value is transferred to this RP register.

During execution of a RET instruction, the contents of the RP register are transferred to PC.

The initial value at reset is undefined.

9.4.9 USP (User Stack Pointer)

The user stack pointer, when the S flag is “1”, this register functions as the R15 register.

- The USP register can also be explicitly specified.
The initial value at reset is undefined.
- This register cannot be used with RETI instructions.

9.4.10 Multiply & Divide Registers

These registers are for multiplication and division, and are each 32 bits in length.

The initial value at reset is undefined.

10. Embedded Program/Data Memory (Flash)

10.1 Flash Features

- CY91F469QA: 2112 Kbytes ($32 \times 64 \text{ Kbytes} + 8 \times 8 \text{ Kbytes} = 16.5 \text{ Mbits}$)
- Programmable wait state for read/write access
- Flash and Boot security with security vector at 0x0024:8000 - 0x0024:800F
- Boot security
- Basic specification: Same as MBM29LV400TC (except size and part of sector configuration)

10.2 Operation Modes

1. 64-bit CPU mode:
 - CPU reads and executes programs in word (32-bit) length units.
 - Flash writing is not possible.
 - Actual Flash Memory access is performed in d-word (64-bit) length units.
2. 32-bit CPU mode :
 - CPU reads and executes programs in word (32-bit) length units.
 - Actual Flash Memory access is performed in word (32-bit) length units.
3. 16-bit CPU mode :
 - CPU reads and writes in half-word (16-bit) length units.
 - Program execution from the Flash is not possible.
 - Actual Flash Memory access is performed in half-word (16-bit) length units.

Note: The operation mode of the flash memory can be selected using a Boot-ROM function. The function start address is 0xBF60. The parameter description is given in the Hardware Manual in chapter 54.6 "Flash Access Mode Switching".

Note: FA result is without 40:0000h offset for parallel Flash programming.

Set offset by keeping FA[22] = 1 as described in section "Parallel Flash programming mode".

10.4.2 Pin Connections in Parallel Programming Mode

Resetting after setting the MD[2:0] pins to [111] will halt CPU functioning. At this time, the Flash memory's interface circuit enables direct control of the Flash memory unit from external pins by directly linking some of the signals to General Purpose Ports. Please see table below for signal mapping.

In this mode, the Flash memory appears to the external pins as a stand-alone unit. This mode is generally set when writing/erasing using the parallel Flash programmer. In this mode, all operations of the 16.5 Mbits Flash memory's Auto Algorithms are available.

10.5 Poweron Sequence in Parallel Programming Mode

The flash memory can be accessed in programming mode after a certain wait time, which is needed for Security Vector fetch:

- Minimum wait time after VDD5/VDD5R power on : 2.76 ms
- Minimum wait time after INITX rising : 1.0 ms

10.6 Flash Security

10.6.1 Vector Addresses

Two Flash Security Vectors (FSV1, FSV2) are located parallel to the Boot Security Vectors (BSV1, BSV2) controlling the protection functions of the Flash Security Module:

FSV1: 0x24:8000 BSV1: 0x24:8004
 FSV2: 0x24:8008 BSV2: 0x24:800C

10.6.2 Security Vector FSV1

The setting of the Flash Security Vector FSV1 is responsible for the read and write protection modes and the individual write protection of the 8 Kbytes sectors.

FSV1 (bit31 to bit16)

The setting of the Flash Security Vector FSV1 bits [31:16] is responsible for the read and write protection modes.

Explanation of the bits in the Flash Security Vector FSV1 [31:16]

FSV1[31:19]	FSV1[18] Write Protection Level	FSV1[17] Write Protection	FSV1[16] Read Protection	Flash Security Mode

set all to "0"	set to "1"	set to "0"	set to "1"	Read Protection (all device modes, except INTVEC mode MD[2:0] = "000")
set all to "0"	set to "1"	set to "1"	set to "0"	Write Protection (all device modes, except INTVEC mode MD[2:0] = "000")
set all to "0"	set to "1"	set to "1"	set to "1"	Read Protection (all device modes, except INTVEC mode MD[2:0] = "000") and Write Protection (all device modes except INTVEC mode MD[2:0] = "000")

FSV1 (bit15 to bit0)

The setting of the Flash Security Vector FSV1 bits [15:0] is responsible for the individual write protection of the 8 Kbytes sectors. It is only evaluated if write protection bit FSV1[17] is set.

Explanation of the bits in the Flash Security Vector FSV1 [15:0]

FSV1 bit	Sector	Enable Write Protection	Disable Write Protection	Comment
FSV1[0]	SA0	set to "0"	set to "1"	
FSV1[1]	SA1	set to "0"	set to "1"	
FSV1[2]	SA2	set to "0"	set to "1"	
FSV1[3]	SA3	set to "0"	set to "1"	
FSV1[4]	SA4	set to "0"	—	write protection is mandatory!

FSV1[14]	—	set to "0"	set to "1"	not available
FSV1[15]	—	set to "0"	set to "1"	not available

Note : It is mandatory to always set the sector where the Flash Security Vectors FSV1 and FSV2 are located to write protected (here sector SA4). Otherwise it is possible to overwrite the Security Vector to a setting where it is possible to either read out the Flash content or manipulate data by writing.

See section "Flash access in CPU mode" for an overview about the sector organization of the Flash Memory.

10.6.3 Security Vector FSV2

The setting of the Flash Security Vector FSV2 bits [31:0] is responsible for the individual write protection of the 64 Kbytes sectors. It is only evaluated if write protection bit FSV1 [17] is set.

Explanation of the bits in the Flash Security Vector FSV2[31:0]

Note : See section "Flash access in CPU mode" for an overview about the sector organization of the Flash Memory.

10.7 Notes About Flash Memory CRC Calculation

The Flash Security macro contains a feature to calculate the 32-bit checksum over addresses located in the Flash Memory address space. This feature is described in the CY91460 Series Hardware Manual, chapter 55.4.1 "Flash Security Control Register".

Additional notes are given here:

The CRC calculation runs on the internal RC clock. It is recommended to switch the RC clock frequency to 2 MHz for shortening the calculation time. However, the CPU clock (CLKB) must be faster than RC clock, otherwise the CRC calculation may not start correctly.

11. Memory Space

The FR family has 4 Gbytes of logical address space (2^{32} addresses) available to the CPU by linear access.

Direct Addressing Area

The following address space area is used for I/O.

This area is called direct addressing area, and the address of an operand can be specified directly in an instruction.

The size of directly addressable area depends on the length of the data being accessed as shown below.

Byte data access : 000_H to 0FF_H

Half word access : 000_H to 1FF_H

Word data access : 000_H to 3FF_H

1. depends on the number of available CAN channels
2. ACR0[11:10] depends on bus width setting in Mode vector fetch information
3. TCR[3:0] INIT value = 0000, keeps value after RST
4. Always write 1 to IOS[1] !
5. External Bus PFR registers are initial 0x00 in internal vector fetch mode (MD=000) and 0xff otherwise.

*1 : The Interrupt Control Registers (ICRs) are located in the interrupt controller and set the interrupt level for each interrupt request. An ICR is provided for each interrupt request.

*2 : The vector address for each EIT (exception, interrupt or trap) is calculated by adding the listed offset to the table base register value (TBR) . The TBR specifies the top of the EIT vector table. The addresses listed in the table are for the default TBR value (000FFC00_H) . The TBR is initialized to this value by a reset. The TBR is set to 000FFC00_H after the internal boot ROM is executed.

*3 : ICR23 and ICR47 can be exchanged by setting the REALOS compatibility bit (addr 0C03_H : IOS[0])

*4 : Used by REALOS

*5 : Memory Protection Unit (MPU) support

15. Recommended Settings

15.1 PLL and Clockgear Settings

Please note that for CY91F469QA core base clock frequencies above 88MHz can only be achieved with 1.9V core supply voltage ^{*1}.

Please see “[Absolute Maximum Ratings](#)” on page 96 to find the maximum allowed frequency of Core Base Clock (fCLKB) at high temperature.

15.2 Clock Modulator Settings

The following table shows all possible settings for the Clock Modulator in a base clock frequency range from 32MHz up to 88MHz.

If Fmax exceeds 88MHz the core supply voltage needs to be set to 1.9V. Please refer to flash access time settings (section 2.3.2.2) to setup the correct voltage according to Fmax in the table below.

The Flash access time settings need to be adjusted according to Fmax while the PLL and clockgear settings should be set according to base clock frequency.

Please see “Absolute Maximum Ratings” on page 96 to find the maximum allowed frequency of Fmax (fCLKB) at high temperature.

*1 : The parameter is based on $V_{SS5} = AV_{SS5} = 0.0 \text{ V}$.

*2 : AV_{CC5} and $AVRH5$ must not exceed $V_{DD5} + 0.3 \text{ V}$.

*3 : • Use within recommended operating conditions.

- Use with DC voltage (current).
- +B signals are input signals that exceed the V_{DD5} voltage. +B signals should always be applied by connecting a limiting resistor between the +B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed the rated value at any time, either instantaneously or for an extended period, when the +B signal is input.
- Note that when the microcontroller drive current is low, such as in the low power consumption modes, the +B input potential can increase the potential at the power supply pin via a protective diode, possibly affecting other devices.
- Note that if the +B signal is input when the microcontroller is off (not fixed at 0 V), power is supplied through the +B input pin; therefore, the microcontroller may partially operate.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.

- Do not leave +B input pins open.
- Example of recommended circuit :

Input/output Equivalent Circuit

- *4 : Maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.
- *5 : Average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 100 ms period.
- *6 : Total average output current is defined as the value of the average current flowing through all of the corresponding pins for a 100 ms period.
- *7 : The maximum permitted power dissipation depends on the ambient temperature, the air flow velocity and the thermal conductance of the package on the PCB.
 The actual power dissipation depends on the customer application and can be calculated as follows:
 $P_D = P_{IO} + P_{INT}$
 $P_{IO} = \sum (|V_{SS} - V_{OL}| * I_{OL} + |V_{DD} - V_{OH}| * I_{OH})$ (IO load power dissipation, sum is performed on all IO ports)
 $P_{INT} = V_{DD}5R * I_{CC} + AV_{CC}5 * I_A + AVRH5 * I_R$ (internal power dissipation)
- *8 : Worst case value for the BGA package mounted on a 4-layer PCB at specified T_A without air flow.
- *9 : Please contact Fujitsu's representative for reliability limitations when using under these conditions.
- *10: Applicable only for devices with $T_{A(max)} \geq T_A$.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges.

Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

Definition of A/D Converter Terms

- Resolution
Analog variation that is recognizable by the A/D converter.
- Nonlinearity error
Deviation between actual conversion characteristics and a straight line connecting the zero transition point (00 0000 0000_B ↔ 00 0000 0001_B) and the full scale transition point (11 1111 1110_B ↔ 11 1111 1111_B).
- Differential nonlinearity error
Deviation of the input voltage from the ideal value that is required to change the output code by 1 LSB.
- Total error
This error indicates the difference between actual and theoretical values, including the zero transition error, full scale transition error, and nonlinearity error.

$$1\text{LSB}' (\text{ideal value}) = \frac{\text{AVRH} - \text{AV}_{\text{SS5}}}{1024} [\text{V}]$$

$$\text{Total error of digital output } N = \frac{V_{\text{NT}} - \{1\text{LSB}' \times (N - 1) + 0.5\text{LSB}'\}}{1\text{LSB}'}$$

N : A/D converter digital output value

$$V_{\text{OT}}' (\text{ideal value}) = \text{AV}_{\text{SS5}} + 0.5\text{LSB}' [\text{V}]$$

$$V_{\text{FST}}' (\text{ideal value}) = \text{AVRH} - 1.5\text{LSB}' [\text{V}]$$

V_{NT} : Voltage at which the digital output changes from (N + 1)_H to N_H

$$\text{Nonlinearity error of digital output } N = \frac{V_{NT} - \{1\text{LSB} \times (N - 1) + V_{OT}\}}{1\text{LSB}} \text{ [LSB]}$$

$$\text{Differential nonlinearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1\text{LSB}} - 1 \text{ [LSB]}$$

$$1\text{LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

N : A/D converter digital output value

V_{OT} : Voltage at which the digital output changes from 000_H to 001_H.

V_{FST} : Voltage at which the digital output changes from 3FE_H to 3FF_H.

* : Parameter m depends on t_{SCYCI} and can be calculated as :

- if $t_{SCYCI} = 2 \times k \times t_{CLKP}$, then $m = k$, where k is an integer > 2
- if $t_{SCYCI} = (2 \times k + 1) \times t_{CLKP}$, then $m = k + 1$, where k is an integer > 1

Notes : • The above values are AC characteristics for CLK synchronous mode.
 • t_{CLKP} is the cycle time of the peripheral clock.

NOTES

- ALL DIMENSIONS ARE IN MILLIMETERS.
- DIMENSIONS AND TOLERANCES METHODS PER ASME Y14.5-2009. THIS OUTLINE CONFORMS TO JEP95, SECTION 4.5.
- BALL POSITION DESIGNATION PER JEP95, SECTION 3, SPP-010.
- "e" REPRESENTS THE SOLDER BALL GRID PITCH.
- SYMBOL "MD" IS THE BALL MATRIX SIZE IN THE "D" DIRECTION. SYMBOL "ME" IS THE BALL MATRIX SIZE IN THE "E" DIRECTION. n IS THE NUMBER OF POPULATED SOLDER BALL POSITIONS FOR MATRIX SIZE MD X ME.
- DIMENSION "b" IS MEASURED AT THE MAXIMUM BALL DIAMETER IN A PLANE PARALLEL TO DATUM C.
- "SD" AND "SE" ARE MEASURED WITH RESPECT TO DATUMS A AND B AND DEFINE THE POSITION OF THE CENTER SOLDER BALL IN THE OUTER ROW. WHEN THERE IS AN ODD NUMBER OF SOLDER BALLS IN THE OUTER ROW, "SD" OR "SE" = 0. WHEN THERE IS AN EVEN NUMBER OF SOLDER BALLS IN THE OUTER ROW, "SD" = eD/2 AND "SE" = eE/2.
- A1 CORNER TO BE IDENTIFIED BY CHAMFER, LASER OR INK MARK. METALLIZED MARK INDENTATION OR OTHER MEANS.
- "+" INDICATES THE THEORETICAL CENTER OF DEPOPULATED BALLS.
- JEDEC SPECIFICATION NO. REF: N/A.

19. Revision History

Version	Date	Remark
2.0	2008-01-28	Initial version
2.1	2008-02-05	Pins 257 to 320 are GND.
2.2	2008-02-11	The CANs have only 32-message buffers
2.3	2008-02-15	Corrected product lineup: No NMI function, updated disclaimer at the end
2.4	2008-02-21	ICU8,9: PFR must be 0, DDR recommended 0
2.5	2008-02-22	Corrected naming and size of Flash-cache (F-cache)
2.6	2008-04-30	- IO MAP: initial values for LVSEL + REGSEL corrected - Pin 110: CK0 --> CK0/8 (added Free Run Timer 8) - Flash memory operation modes: Added note about the "flash access mode switching" incl. Boot ROM start address - Flash parallel programming: wait times after power-on / INIT added - External Bus AC spec: T_{AXBGL} values corrected - IO Map: removed INT Relocation control registers (was reservation only) - INT Vector Table: Added resource numbers for INT16-23 - added chapter SPECIAL PORT / RESOURCE ASSIGNMENTS
2.7	2008-05-05	INT Vector Table: Added resource numbers for FRT8 and ICU8,9
2.8	2008-05-08	Updated the section about re-located interrupts (Ports 34+35)
2.9	2008-08-18	- Corrected I/O circuit type of P24_4 from A to C. - SPECIAL PORT / RESOURCE ASSIGNMENTS: corrected the notes that only digital inputs (no outputs) are disabled if an analog function (ADC) is enabled on this port. - FLASH: Corrected a typo in the note about the "flash access mode switching" incl. address in Boot ROM; added section "Poweron Sequence in parallel programming mode" - IO CIRCUIT TYPE: fixed typos in Remarks - "Notes on PS register" updated - IO Map: Initial values of PFR00 - PFR10 corrected (depend on MD=000) - INT Vector Table: Added Resource number for ADC1 (RN=113); corrected the footnotes - Electrical Characteristics: removed the note that analog input/output pins cannot accept +B signal input. - DC Characteristics: Updated I_{IL} and I_{AIN}, updated I_{LVE} and I_{LVI}, corrected values of Pull up/down resistances, updated and re-ordered the table footnotes - ADC Characteristics: fixed the typos regarding "nonlinearity error" - fixed offset between input channels
2.10	2008-08-19	DC characteristics: updated the current consumption values I _{CC} , I _{CCH} (target values based on MB91F469G)
2.11	2008-09-23	I/O MAP: Removed the notes about new INT disable feature, added bookmarks inside IO MAP Added note to IOS register (addr. 0xC03) "always write 1 to IOS[1]"

Version	Date	Remark
2.12	2008-11-07	PIN Definitions: Corrected pin 145 into P34_5 Flash Security Vector FSV2: Corrected typo in table header Embedded Program/Data Memory (Flash): Added section 7 "Notes About Flash Memory CRC Calculation" (CLKB must be faster then the RC clock) Block Diagram: Added External Bus Instruction Cache Special Port/Resource Assignments: Corrected section "The Additional External Interrupts" (PFR/EPFR/ADERH settings)
2.13	2009-01-09	Special Port/Resource Assignments: Re-located External Interrupts: Corrected that SDA2 is enabled by PFR24 (not by EPFR24) IO Map: Added EPFR34, EPFR35 at address 0x00DE2, 0x00DE3 IO Map: Corrected the table header (address +0,+1,+2,+3) DC characteristics: corrected the current consumption values I_{CC} , I_{CCH}

20. Major Changes

Spanson Publication Number: DS07-16614-1E

Page	Section	Change Results
26	I/O Circuit Types	Changed the table of Type I. Pull-down resistor value: 50 kW approx. → Pull-down resistor value: 50 kΩ approx.
107	Electrical Characteristics 4. A/D converter characteristics	Changed the table of “Zero reading voltage”. AVRL – 1.5 → AVRL – 1.5 LSB AVRL + 0.5 → AVRL + 0.5 LSB AVRL + 2.5 → AVRL + 2.5 LSB LSB → V Changed the table of Full scale reading voltage. AVRH – 3.5 → AVRH – 3.5 LSB AVRH – 1.5 → AVRH – 1.5 LSB AVRH + 0.5 → AVRH + 0.5 LSB LSB → V
115	7.3. LIN-USART Timings at V _{DD5} = 3.0 to 5.5 V	Changed the sentences. - Ta = -40 °C to +105 × °C → - Ta = -40 °C to +105 °C

NOTE: Please see “Document History” about later revised information.

Rev. *C		
1	Features Internal peripheral resources	Renamed the Low Voltage detection → Supply Supervisor
2	Features Package and technology	Changed Operating temperature range upper limit from + 105°C → + 105°C / + 125°C and added footnote about T _{A(max)}
4	Product Lineup Software-Watchdog	Renamed "Watchdog timer" → "Software watchdog" Renamed "Watchdog timer (RC osc. based)" → "Hardware-Watchdog (RC osc. based)"
5	Product Lineup Temperature Range (TA)	Changed the symbol of ambient temperature from "Ta" into "T _A ", changed CY91F469Q upper limit from 105°C → "T _{A(max)} "
5	Product Lineup Power Consumption	Changed the value from < 1W → < 2W

Page	Section	Change Results
38	CPU and Control Unit 9.3 Programming model 9.3.1 Basic programming model	Corrected the name of program status register from "RS" → "PS"
59, 61, 65	I/O Map TCDT0 [R/W] to TCDT8 [R/W]	Free Run Timer 0-8: Changed the TCDT register initialization value from 0xFFFF → 0x0000 (by RST)
60	I/O Map LIN-USART (FIFO) 11	Corrected RDR00/TDR00 → RDR11/TDR11
68	I/O Map PFR01 to PFR10	Corrected the foot note number from 4 → 5
89, 90	Recommended Settings 15.1 PLL and Clockgear settings, 15.2 Clock Modulator settings	Added "Please refer to Absolute maximum ratings..."
97	Electrical Characteristics 16.1 Absolute maximum ratings Permitted operating frequency CY91F469QA, CY91F469QAH	Added these parameters, depending on device, T_A and regulator setting
98	Electrical Characteristics 16.1 Absolute maximum ratings Permitted power consumption *7	Added these parameters, depending on device and T_A , added the attached footnotes on next page.
99	Electrical Characteristics 16.2 Recommended operating conditions Operating temperature	Changed maximum from +105°C → $T_{A(max)}$ and added remark
99	Electrical Characteristics 16.2 Recommended operating conditions Lock-up time PLL (4 MHz → 16 ... 100MHz)	Corrected "Look-up time PLL" → "Lock-up time PLL"
100, 103, 107, 109,	Electrical Characteristics 16.3 DC characteristics, 16.4 A/D converter characteristics, 16.5 Alarm comparator characteristics, 16.7 AC characteristics	Changed the condition on top of the tables from $T_A = -40^{\circ}\text{C}$ to +105°C → $T_A = -40^{\circ}\text{C}$ to $T_{A(max)}$ Changed the symbol of ambient temperature from "Ta" → " T_A "
101, 102	Electrical Characteristics 16.3 DC characteristics Input leakage current, Analog input leakage current	Changed the condition from $T_A = 105^{\circ}\text{C}$ → $T_A = T_{A(max)}$
102	Electrical Characteristics 16.3 DC characteristics Power supply current CY91 F469QA, CY91 F469QAH	Added CY91F469QAH, added the I_{ccH} parameters for $T_A = 125^{\circ}\text{C}$
103	Electrical Characteristics 16.4 A/D converter characteristics Compare time	Changed T_{comp} max from 16,500 μs → "t.b.d." because this parameter is under re-evaluation.
109	Electrical Characteristics 16.7 AC characteristics 16.7.2 Reset input ratings	INITX input time (at power-on): Changed t_{INTL} minimum from 8 ms → 10 ms (same as the main oscillator stabilization time).
145	Ordering Information	Added table column defining the maximum ambient temperature $T_{A(max)}$
