

0.5MHz, Low Supply Voltage, Low Input Current BiMOS Operational Amplifiers

November 1996

Features

- CA5420A, CA5420 at 5V Supply Voltage with Full Military Temperature Range Guaranteed Specifications
- CA5420A, CA5420 Guaranteed to Operate from $\pm 1V$ to $\pm 10V$ Supplies
- 2V Supply at 300 μA Supply Current
- 1pA (Typ) Input Current (Essentially Constant to 85°C)
- Rail-to-Rail Output Swing (Drive $\pm 2mA$ Into 1k Ω Load)
- Pin Compatible with 741 Op Amp

Applications

- pH Probe Amplifiers
- Picoammeters
- Electrometer (High Z) Instruments
- Portable Equipment
- Inaccessible Field Equipment
- Battery Dependent Equipment (Medical and Military)
- 5V Logic Systems
- Microprocessor Interface

Ordering Information

PART NUMBER (BRAND)	TEMP. RANGE (°C)	PACKAGE	PKG. NO.
CA5420AM (5420A)	-55 to 125	8 Ld SOIC	MB.15
CA5420AT	-55 to 125	8 Pin Metal Can	T8.C
CA5420E	-55 to 125	8 Ld PDIP	E8.3
CA5420M (5420)	-55 to 125	8 Ld SOIC	MB.15
CA5420T	-55 to 125	8 Pin Metal Can	T8.C

Description

The CA5420A and CA5420 (see Note) are integrated circuit operational amplifiers that combine PMOS transistors and bipolar transistors on a single monolithic chip. They are designed and guaranteed to operate in microprocessor logic systems that use $V_+ = 5V$, $V_- = GND$, since they can operate down to $\pm 1V$ supplies. They will also be suitable for 3.3V logic systems.

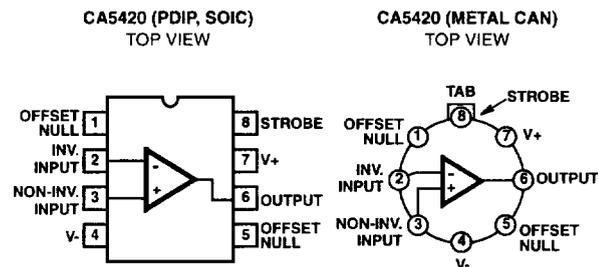

The CA5420A and CA5420 BiMOS operational amplifiers feature gate-protected PMOS transistors in the input circuit to provide very high input impedance, very low input currents (less than 1pA). The internal bootstrapping network features a unique guardbanding technique for reducing the doubling of leakage current for every 10°C increase in temperature. The CA5420 series operates at total supply voltages from 2V to 20V either single or dual supply. These operational amplifiers are internally phase compensated to achieve stable operation in the unity gain follower configuration. Additionally, they have access terminals for a supplementary external capacitor if additional frequency roll-off is desired. Terminals are also provided for use in applications requiring input offset voltage nulling. The use of PMOS in the input stage results in common-mode input voltage capability down to 0.45V below the negative supply terminal, an important attribute for single supply application. The output stage uses a feedback OTA type amplifier that can swing essentially from rail-to-rail. The output driving current of 1.0mA (Min) is provided by using nonlinear current mirrors.

These devices have guaranteed specifications for 5V operation over the full military temperature range of -55°C to 125°C.

The CA5420 series has the same 8 lead pinout used for the industry standard 741.

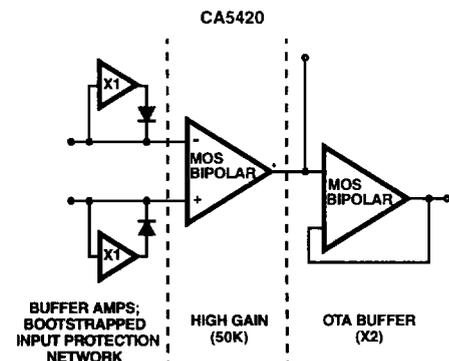

NOTE: Formerly Development Type No. TA10841.

Pinouts

NOTE: Pin is connected to Case.

Functional Diagram

CA5420, CA5420A

Absolute Maximum Ratings

Supply Voltage (Between V+ and V- Terminals)	22V
Differential Input Voltage	15V
Input Voltage	(V+ + 8V) to (V- - 0.5V)
Input Current	1mA
Output Short Circuit Duration (Note 1)	Indefinite

Thermal Information

Thermal Resistance (Typical, Note 2)	θ_{JA} (°C/W)	θ_{JC} (°C/W)
PDIP Package	96	N/A
SOIC Package	157	N/A
Metal Can Package	165	80
Maximum Junction Temperature (Metal Can)	175°C	
Maximum Junction Temperature (Plastic Package)	150°C	
Maximum Storage Temperature Range (All Types)	-65°C to 150°C	
Maximum Lead Temperature (Soldering 10s)	300°C (SOIC - Lead Tips Only)	

Operating Conditions

Temperature Range	-55°C to 125°C
-------------------	----------------

CAUTION: Stresses above those listed in 'Absolute Maximum Ratings' may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

- Short circuit may be applied to ground or to either supply.
- θ_{JA} is measured with the component mounted on an evaluation PC board in free air.

Electrical Specifications Typical Values Intended Only for Design Guidance. V+ = +5V; V- = GND, T_A = 25°C

PARAMETER		SYMBOL	TEST CONDITIONS	CA5420	CA5420A	UNITS

OPERATIONAL AMPLIFIERS

Typical Applications

Picoammeter Circuit

The exceptionally low input current (typically 0.2pA) makes the CA5420 highly suited for use in a picoammeter circuit. With only a single 10GΩ resistor, this circuit covers the range from ±1.5pA. Higher current ranges are possible with suitable switching techniques and current scaling resistors. Input transient protection is provided by the 1MΩ resistor in series with the input. Higher current ranges require that this resistor be reduced. The 10MΩ resistor connected to pin 2 of the CA5420 decouples the potentially high input capacitance often associated with lower current circuits and reduces the tendency for the circuit to oscillate under these conditions.

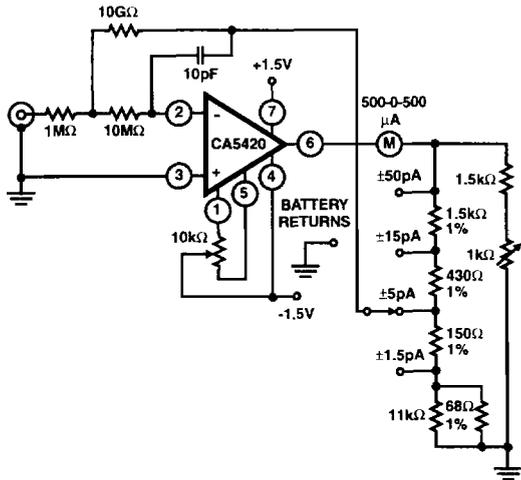

FIGURE 1. PICOAMMETER CIRCUIT

High Input Resistance Voltmeter

Advantage is taken of the high input impedance of the CA5420 in a high input resistance DC voltmeter. Only two 1.5V "AA" type penlite batteries power this exceedingly high-input resistance (>1,000,000MΩ) DC voltmeter. Full-scale deflection is ±500mV, ±150mV, and ±15mV. Higher voltage ranges are easily added with external input voltage attenuator networks.

The meter is placed in series with the gain network, thus eliminating the meter temperature coefficient error term.

Supply current in the standby position with the meter undeflected is 300μA. At full-scale deflection this current rises to 800μA. Carbon-zinc battery life should be in excess of 1,000 hours.
