

## High Voltage, Low Noise, Inductorless EL Lamp Driver

### Features

- ▶ No external components required when using an external EL clock frequency
- ▶ Audible noise reduction with improved EMI
- ▶ EL frequency can be set by an external resistor
- ▶ DC to AC converter
- ▶ Drives up to 5.3nF (approx. 1.5in<sup>2</sup> lamp) load
- ▶ Output voltage regulation
- ▶ Enable function
- ▶ EL Lamp dimming
- ▶ Available in 10-Lead DFN and 8-Lead MSOP packages

### Applications

- ▶ Cellular phone keypad
- ▶ Watches
- ▶ Small handheld wireless devices
- ▶ MP3 Players

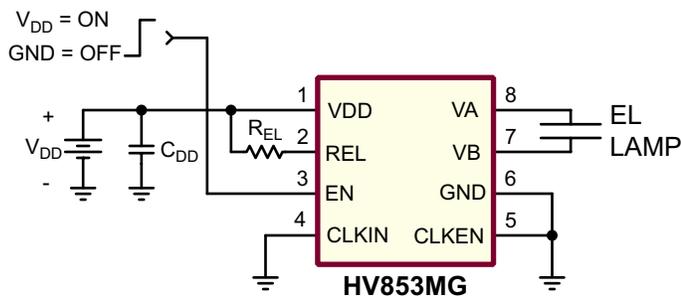

### General Description

The Supertex HV853 is a high voltage, low noise EL (electroluminescent) lamp driver. It is the low noise version of the HV852 with improved EMI performance, operating over an input voltage range of 3.2V to 5.0V. It is designed to drive EL lamps of up to 1.5in<sup>2</sup>, with capacitive values up to 5.3nF. The HV853 converts a low voltage DC input to a high voltage AC output across an EL lamp. A nominal regulated output voltage of  $\pm 80V$  is applied to the EL lamp. It uses a charge pump scheme to boost the input voltage eliminating the need for an external inductor, diode, and high voltage capacitor commonly found in conventional topologies.

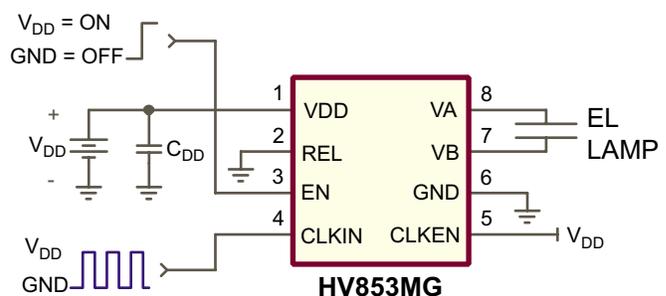

The charge pump circuit discharges its energy into an EL lamp through a high voltage H-bridge. Once the voltage reaches its regulated limit, it is turned off to conserve power. The EL lamp is then discharged to ground and the H-bridge changes state to allow the charge pump to charge the EL lamp in the opposite direction.

The EL lamp frequency can be set either by an external resistor  $R_{EL}$  or by applying an external clock where the clock frequency is divided by 128 to set the EL lamp frequency.

HV853	HV853K7-G	HV853MG-G

-G indicates package is RoHS compliant ("Green")

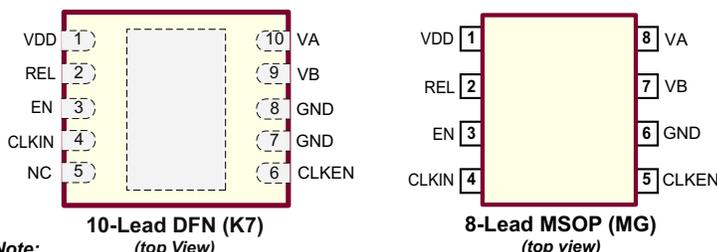

## Absolute Maximum Ratings

Parameter	Value
V <sub>DD</sub> , supply voltage	-0.5V to 6.5V
Storage temperature	-65°C to +150°C
Power dissipation (10-Lead DFN)	1.6W
Power dissipation (8-Lead MSOP)	300mW

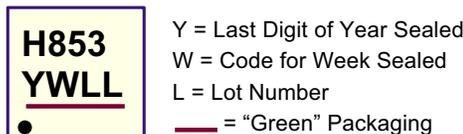

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## Pin Configurations

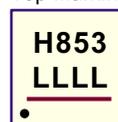

Note:  
Pads are at the bottom of the package.  
Center heat slug should be connected to GND or left floating.

## EL Lamp Dimming Using PWM

EL lamp dimming can be achieved by applying a PWM signal to the ENABLE pin. This is done by pulse skipping the output pulses. The PWM frequency should be kept below the EL frequency but above 50Hz to avoid flickering.

## Pin Descriptions: 10-Lead DFN (K7) / 8-Lead MSOP (MG)

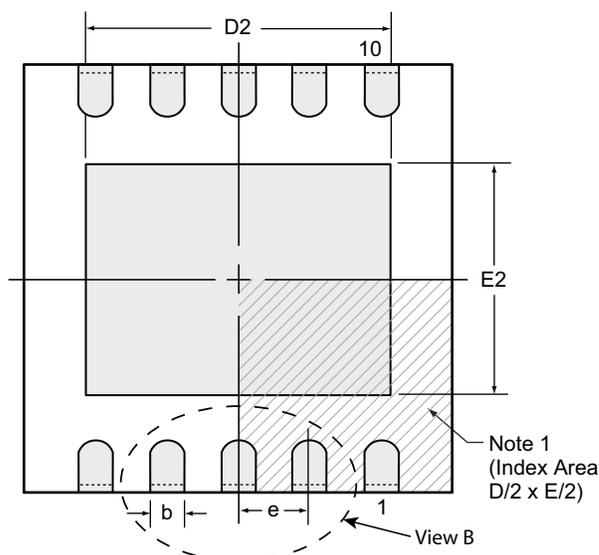

K7	MG	Pin Name	Description
Pin #			
1	1	VDD	Input supply voltage pin.
2	2	REL	An external resistor to VDD will set the EL lamp frequency. The EL frequency is inversely proportional to the $R_{EL}$ resistor value. A 1.5M $\Omega$ resistor would provide a nominal lamp frequency of 280Hz $f_{EL} = (1.5M\Omega)(280Hz) / (R_{EL})$ When using an external clock to set the EL lamp frequency, the REL pin should be connected to ground.
3	3	EN	Enable input pin. Logic high will turn the device on. An external R-C circuit can be added for a delayed turn off.
4	4	CLKIN	Logic input pin. An external logic clock applied to this pin can be used to set the EL lamp frequency (see Figure 3). The EL lamp frequency is the external clock frequency divided by 128. This is useful for applications requiring the EL lamp to be synchronized to a system clock. Connect to ground when not in use.
5	-	NC	No connect.
6	5	CLKEN	Logic input pin. Logic high will cause the EL lamp frequency to be set by the CLKIN input. Logic low will cause the EL lamp frequency to be set by the external $R_{EL}$ resistor.
7,8	6	GND	IC ground pin.
9	7	VB	EL lamp driver output pin. The EL lamp is connected across VA and VB terminals.
10	8	VA	EL lamp driver output pin. The EL lamp is connected across VA and VB terminals.
