MAX77642 Evaluation Kit

Evaluates: MAX77642

General Description

The MAX77642 evaluation kit (EV kit) allows for easy experimentation with various MAX77642 features including the resistor programmability of the SIMO and on-board electronic loads.

The Windows®-based software provides a user-friendly graphical interface to manage the on-board electronic loads.

Ordering Information appears at end of data sheet.

Benefits and Features

- Easy to Use
- GUI-Driven I²C Interface
- Assembled and Fully Tested
- On-Board Electronic Loads
 - Steady-State, Transient, and Random Modes
- Demonstration of End-to-End Analog Multiplexer Implementation
- On-Board ADC

Quick Start

Follow this procedure to become familiar with the EV kit.

Note: In the following sections, software-related items are identified by **bolding**. Text in **bold and underlined** refers to items directly from the EV kit software. Text in **italics and underlined** refers to items from the Windows operating system.

Required Equipment

- MAX77642 EV Kit
- MAX77642 EV Kit GUI
- Windows-Based PC
- Power Supply
- Ammeter
- DVM
- Micro-USB Cable

Procedure

- 1) Install the GUI software. Visit the product webpage at <http://www.maximintegrated.com/MAX77642evkit> and navigate to Design Resources to download the latest version of the EV kit software. Save the EV kit software to a temporary folder and extract the files from the ZIP file.

- 2) Install EV kit shunts according to [Table 1](#).
- 3) Connect a Micro-B USB cable between the EV kit USB port labelled "GUI" and the Windows-based PC.
- 4) Apply a 3.7V supply (set for 100mA current limit) through an ammeter (set for 10mA range) across the V_{BATT} and GND2 terminals of the EV kit. Turn the supply on.
- 5) Open the GUI and select **Device→Connect** in the upper-left corner. Wait for a **CONNECTED DEVICE LIST** window to pop up, and then press the **Connect** button.
- 6) Measure the voltages on SBB0, SBB1, SBB2, and LDO with a DMM.

This concludes the Quick Start procedure. During general device evaluation, set the ammeter range to greater than or equal to 1A to minimize the impact of its series resistance.

For more information on the GUI, see the [Software](#) section.

Table 1. Default Shunt Positions and Jumper Descriptions

REFERENCE DESIGNATOR	DEFAULT POSITION	FUNCTION
J2	3-4	1-2: Connects RSEL_SBB2 to 0kΩ which programs SBB2 to 0.5V. 3-4: Connects RSEL_SBB2 to 14kΩ which programs SBB2 to 1.2V. 5-6: Connects RSEL_SBB2 to the on-board potentiometer to program SBB2's output voltage. Refer to the "SIMO Output Voltage Configuration" section of the <i>MAX77642/MAX77643 data sheet</i> for more information.
J3	3-4	1-2: Connects RSEL_LDO to 7.15kΩ which programs the LDO to 0.8V. 3-4: Connects RSEL_LDO to 80.6kΩ which programs the LDO to 1.8V. 5-6: Connects RSEL_LDO to the on-board potentiometer to program the LDO's output voltage. Refer to the "LDO Output Voltage Configuration" section of the <i>MAX77642/MAX77643 data sheet</i> for more information.
J4	1-2	1-2: Connects INLDO to SBB0.
J5	3-4	1-2: Connects RSEL_SBB1 to 14kΩ which programs SBB1 to 1.2V. 3-4: Connects RSEL_SBB1 to 28kΩ which programs SBB1 to 1.8V. 5-6: Connects RSEL_SBB1 to the on-board potentiometer to program SBB1's output voltage. Refer to the "SIMO Output Voltage Configuration" section of the <i>MAX77642/MAX77643 data sheet</i> for more information.

Table 1. Default Shunt Positions and Jumper Descriptions (continued)

REFERENCE DESIGNATOR	DEFAULT POSITION	FUNCTION
J6	1-2	1-2: Connects RSET_IPK to 7.15kΩ. 3-4: Connects RSET_IPK to 8.45kΩ. 5-6: Connects RSET_IPK to an open-through-hole radial lead for through-hole resistors. Refer to the “Peak Current Configuration” section in the <i>MAX77642/MAX77643 data sheet</i> for more information on how to set the peak current limit of the SIMO.
J7	1-2	1-2: Connects EN0 to SYSA, enabling SBB0. 2-3: Connects EN0 to GND, disabling SBB0.
J8	1-2	1-2: Connects RSEL_SBB0 to 113kΩ which programs SBB1 to 3.0V. 3-4: Connects RSEL_SBB0 to 536kΩ which programs SBB1 to 4.4V. 5-6: Connects RSEL_SBB0 to the on-board potentiometer to program SBB0’s output voltage. Refer to the “SIMO Output Voltage Configuration” section of the <i>MAX77642/MAX77643 data sheet</i> for more information.
J9	1-2	1-2: Connects EN1 to SYSA, enabling SBB1. 2-3: Connects EN1 to GND, disabling SBB1.
J10	1-2	1-2: Connects SYSA to the VL side of the on-board level shifter
J11	1-2	1-2: Connects EN2 to SYSA, enabling SBB2. 2-3: Connects EN2 to GND, disabling SBB2.
J12	1-2	1-2: Connects ENLDO to SYSA, enabling the LDO. 2-3: Connects ENLDO to GND, disabling the LDO.
J201	1-2	1-2: Connects SBB0 to the onboard electronic load and ADC.
J203	1-2	1-2: Connects SBB1 to the onboard electronic load and ADC.
J205	1-2	1-2: Connects SBB2 to the onboard electronic load and ADC.
J207	1-2	1-2: Connects LDO0 to the onboard electronic load and ADC.
J200	1-2	1-2: Connects the gate of the Q200 load FET to the U200 amplifier.
J202	1-2	1-2: Connects the gate of the Q201 load FET to the U201 amplifier.
J204	1-2	1-2: Connects the gate of the Q202 load FET to the U202 amplifier.
J206	1-2	1-2: Connects the gate of the Q203 load FET to the U203 amplifier.

Detailed Description of Hardware (or Software)

Enable Key Options

The MAX77642 features individual hardware enable pins for each of the SIMO outputs and the LDO. These enable pins can be connected to SYSA (to enable the corresponding resource) or GND (to disable the corresponding resource) through jumpers in J7, J9, J11, and J12.

Programming the Output Voltages

The SIMO's and LDO's output voltages are programmed by connecting resistors from their corresponding RSEL pins to ground. The EV kit features pre-selected resistors which can be tied to RSEL pins through jumpers J2, J3, J5, and J8. Additionally, on-board potentiometers can be used to program the entire output voltage range. Refer to the *SIMO Output Voltage Configuration* and *LDO Output Voltage Configuration* sections of the MAX77642/MAX77643 data sheet for more information.

Programming the Inductor Peak Current

The SIMO's inductor peak current is programmed by connecting resistors from RSEL_IPK to ground. Several preselected resistors are placed on the EV kit and can be tied to the RSEL_IPK pin through the jumper J6. A through-hole resistor can be placed in R30 for additional options. See the *Inductor Peak Current Setting* section of the MAX77642/MAX77643 data sheet for more information.

Electronic Load

The EV kit comes with an electronic load allowing the user to evaluate the SIMO and LDO load current capabilities. On-board circuits set the load current through the I²C interface. J201, J203, J205, J207 are used to connect the load to the output of the SBB0, SBB1, SBB2, and LDO respectively. To exercise the load transient response, remove J200 (for SBB0), J202 (for SBB1), J204 (for SBB2), and J206 (for LDO), and connect a signal generator to the gate of the load MOSFET (pin 2 of the respective header). Drive the gate with a signal between 1V (off) and 3V (fully on) to apply transients to the output of the SIMO or LDO. Note that there are 0.1Ω sense resistors with test points (called VIL_SBB0, VIL_SBB1, and VIL_SBB2) and a 1Ω sense resistor with a test point (called VIL_LDO) for a 10:1 and 1:1 conversion of load current to voltage. See the *Software* section to learn how to set the load current from the GUI.

Software

The graphical user interface (GUI) software allows for convenient, quick, and thorough evaluation of the MAX77642. When the EV kit software detects that a MAX77642 EV kit is connected, only the "Load Control" portion of the GUI can be accessed.

Installation

Visit the product webpage at www.maximintegrated.com/MAX77642evkit and navigate to Design Resources to download the latest version of the EVKit software. Save the EVKit software to a temporary folder and decompress the ZIP file.

Windows Drivers

Upon connection of a Micro-USB cable between your PC and the EV kit for the first time, wait a few minutes for Windows to automatically install drivers.

Graphical User Interface Details (GUI)

The GUI drives I²C communication with the EV kit. Every control in the GUI (excluding the Load Control and ADC/AMUX tabs) corresponds directly to a register within the MAX77642. Hover your cursor over control names for a description of that register. Refer to the *IC data sheet* for the complete register map.

Load Control Tab

The Load Control tab contains controls for load currents on the regulator outputs. The GUI is capable of setting steady-state, transient, and random load currents. To set a load current, use the slider bar or text field to input a value (mA) and check the Enable box. Shuffle through the modes to exercise different load conditions.

The offset and gain values are set by Maxim and do not need to be altered.

MAX77642 EV Schematic Diagrams

Part Number	Configuration	7-bit	8-bit Write	8-bit Read
MAX11614 (ADC)	N/A	0x33 0b011 0011	0x66 0b0110 0110	0x67 0b0110 0111
MAX5825 (DAC)	ADDR1=ADDR0=VDDIO	0x1F 0b001 1111	0x3E 0b0011 1110 0x10 * 0b0010 1000	0x3F 0b0011 1111
AT24CS02 (EEPROM)	A0=A1=A2=GND	0x50 ** 0b101 0000	0b1010 0000	0b1010 0001

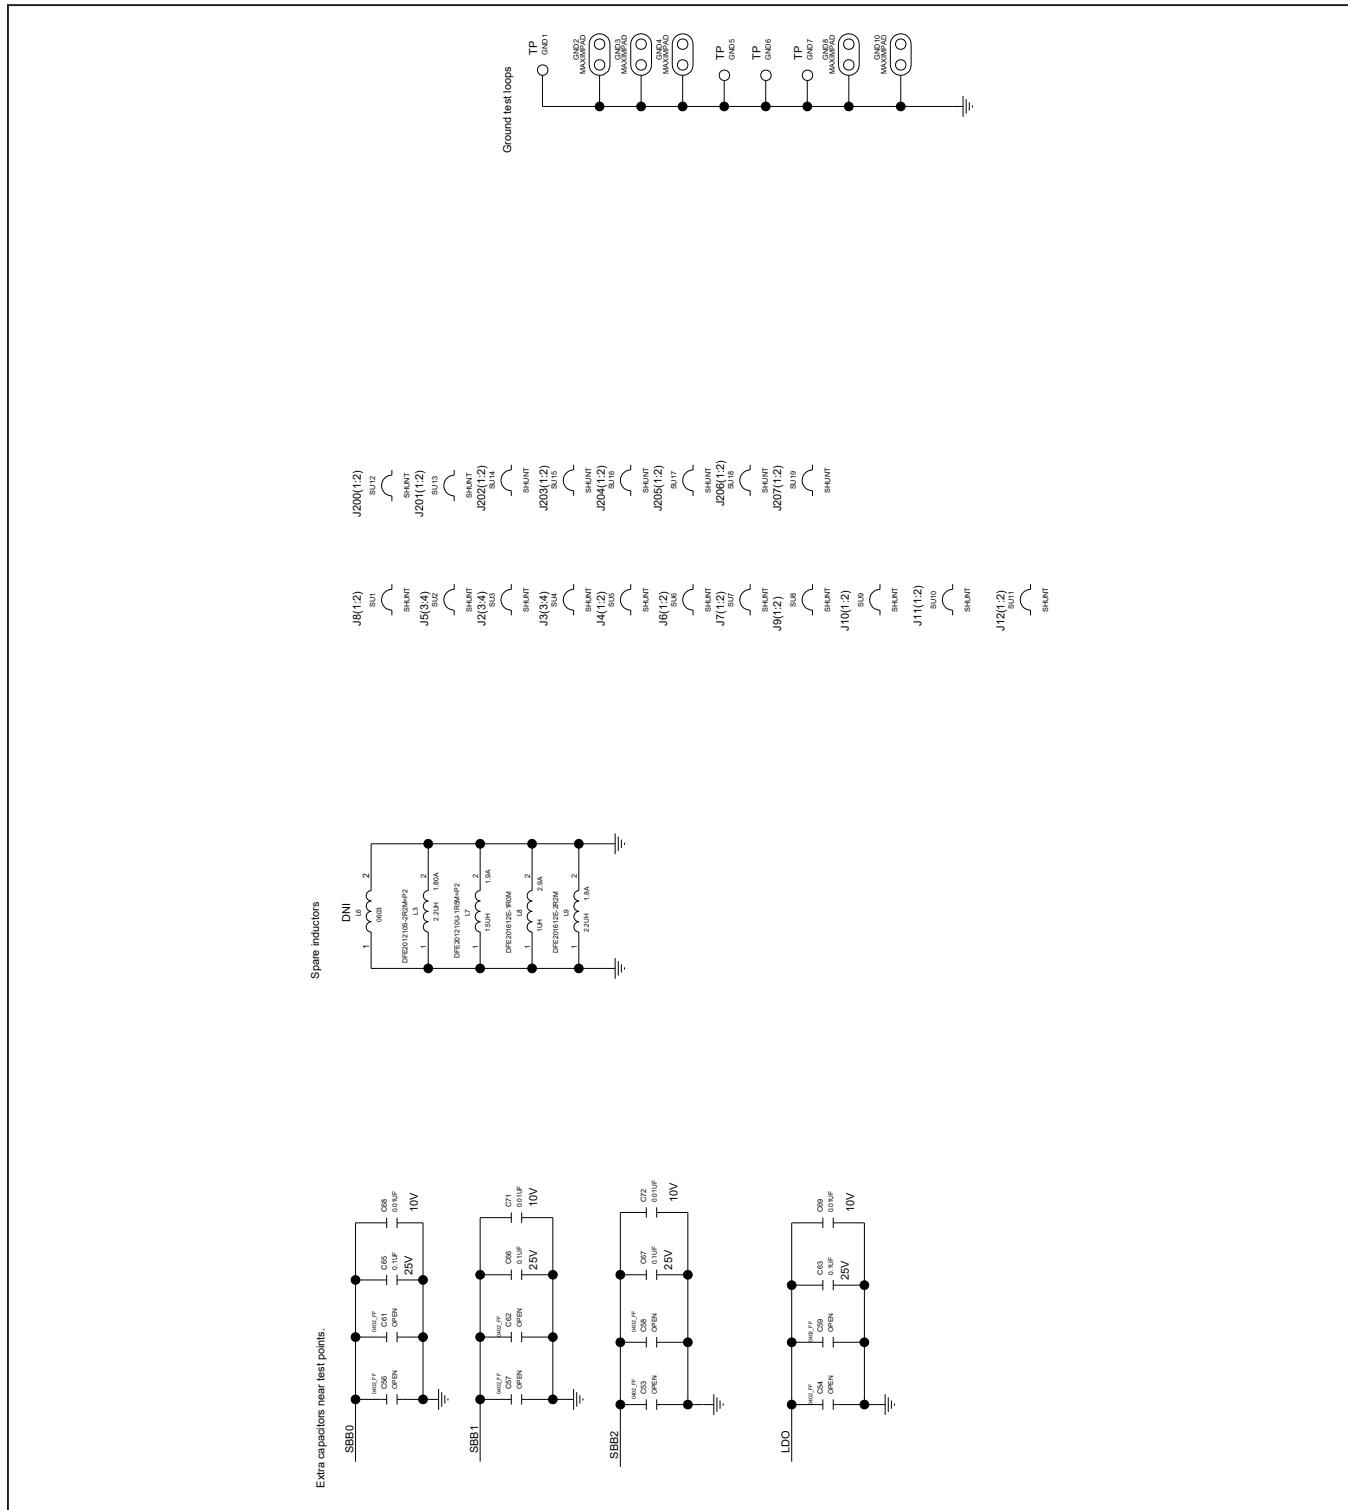

*MAX5825 ALSO RESPONDS TO AN I2C BROADCAST ADDRESS 0b0010 1000

**AT24CS02 ALSO RESPONDS TO 0b1011 0001 FOR READING THE SERIAL NUMBER
