

INAx290 2.7-V to 120-V, 1.1-MHz, Ultra-Precise, Current-Sense Amplifier

1 Features

- Wide common-mode voltage:
 - Operational voltage: 2.7 V to 120 V
 - Survival voltage: –20 V to +122 V
- Excellent CMRR:
 - 160-dB DC
 - 85-dB AC at 50 kHz
- Accuracy
 - Gain:
 - Gain error: $\pm 0.1\%$ (maximum)
 - Gain drift: ± 5 ppm/ $^{\circ}\text{C}$ (maximum)
 - Offset:
 - Offset voltage: ± 12 μV (maximum)
 - Offset drift: ± 0.2 $\mu\text{V}/^{\circ}\text{C}$ (maximum)
- Available gains:
 - A1 devices: 20 V/V
 - A2 devices: 50 V/V
 - A3 devices: 100 V/V
 - A4 devices: 200 V/V
 - A5 devices: 500 V/V
- High bandwidth: 1.1 MHz
- Slew rate: 2 V/ μs
- Quiescent current: 370 μA (per channel)

2 Applications

- Active antenna system mMIMO (AAS)
- Macro remote radio unit (RRU)
- 48-V rack server
- 48-V merchant network & server power supply
- Test and measurement

Typical Application

3 Description

The INAx290 is an ultra-precise, current-sense amplifier that can measure voltage drops across shunt resistors over a wide common-mode range from 2.7 V to 120 V. The ultra-precise current measurement accuracy is achieved thanks to the combination of an ultra-low offset voltage of ± 12 μV (maximum), a small gain error of $\pm 0.1\%$ (maximum), and a high DC CMRR of 160 dB (typical). The INAx290 is not only designed for DC current measurement, but also for high-speed applications (such as fast overcurrent protection, for example) with a high bandwidth of 1.1 MHz (at gain of 20 V/V) and an 85-dB AC CMRR (at 50 kHz).

The INAx290 provides the capability to make ultra-precise current measurements by sensing the voltage drop across a shunt resistor over a wide common-mode range from 2.7 V to 120 V. The INAx290 devices come in highly space-efficient packages. The single-channel INA290 device is featured in the SC-70 package, the dual-channel INA2290 device is available in the MSOP-8 package, and the quad-channel INA4290 device is available in the 4 mm x 4 mm QFN package.

The INAx290 operates from a single 2.7-V to 20-V supply with the single channel device only drawing 370- μA supply current per channel (typical). The devices are available with five gain options: 20 V/V, 50 V/V, 100 V/V, 200 V/V, and 500 V/V. The low offset of the zero-drift architecture enables current sensing with low ohmic shunts as specified over the extended operating temperature range (-40°C to $+125^{\circ}\text{C}$).

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
INA290	SC-70 (5)	2.00 mm × 1.25 mm
INA2290	VSSOP (8)	3.00 mm × 3.00 mm
INA4290	QFN (16)	4.00 mm × 4.00 mm

- (1) For all available packages, see the package option addendum at the end of the data sheet.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _S	Supply voltage	−0.3	22	V
V _{IN+} , V _{IN−} ⁽²⁾	Analog inputs, differential (V _{IN+}) − (V _{IN−})	−30	30	V
	Analog inputs, common mode (V _{IN+} or V _{IN−})	−20	122	
V _{OUTX}	Analog outputs, output voltage	GND − 0.3	V _S + 0.3	V
T _A	Operating temperature	−55	150	°C
T _J	Junction temperature		150	°C
T _{stg}	Storage temperature	−65	150	°C

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) V_{IN+} and V_{IN−} are the voltages at the V_{IN+} and V_{IN−} pins, respectively.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{CM}	Common-mode input range ⁽¹⁾	V _S	48	120	V
V _S	Operating supply range	2.7	5	20	V
T _A	Ambient temperature	−40		125	°C

- (1) Common-mode voltage can go below V_S under certain conditions. See [Figure 7-1](#) for additional information on operating range.

6.4 Thermal Information

7 Detailed Description

7.1 Overview

The INAx290 is a high-side only current-sense amplifier that offers a wide common-mode range, precision zero-drift topology, excellent common-mode rejection ratio (CMRR), high bandwidth, and fast slew rate. Different gain versions are available to optimize the output dynamic range based on the application. The INAx290 is designed using a transconductance architecture with a current-feedback amplifier that enables low bias currents of 20 μA and a common-mode voltage of 120 V.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Amplifier Input Common-Mode Range

The INAx290 supports large input common-mode voltages from 2.7 V to 120 V and features a high DC CMRR of 160 dB (typical) and a 85-dB AC CMRR at 50 kHz. The minimum common-mode voltage as shown in [Figure 7-1](#) is restricted by the supply voltage. The topology of the internal amplifiers INAx290 restricts operation to high-side, current-sensing applications.

Figure 7-1. Minimum Common-Mode Voltage vs Supply

7.3.2 Input-Signal Bandwidth

[Gain vs. Frequency](#) shows the INAx290 –3-dB bandwidth is gain-dependent with gain options of 20 V/V, 50 V/V, 100 V/V, 200 V/V, and 500 V/V. The unique multistage design enables the amplifier to achieve high bandwidth at all gains. This high bandwidth provides the throughput and fast response required for rapid detection and processing of overcurrent events.

The device bandwidth also depends on the applied V_{SENSE} voltage. [Figure 7-2](#) shows the bandwidth performance profile of the device over frequency as output voltage increases for each gain variation. As shown in [Figure 7-2](#), the device exhibits the highest bandwidth with higher V_{SENSE} voltages, and the bandwidth is higher with lower device gain options. Individual requirements determine the acceptable limits of error for high-frequency, current-sensing applications. Testing and evaluation in the end application or circuit is required to determine the acceptance criteria and validate whether or not the performance levels meet the system specifications.

Figure 7-2. Bandwidth vs Output Voltage

7.3.3 Low Input Bias Current

The INAx290 input bias current draws 20 μ A (typical) even with common-mode voltages as high as 120 V. This current enables precision current sensing in applications where the sensed current is small or in applications that require lower input leakage current.

7.3.4 Low V_{SENSE} Operation

The INAx290 enables accurate current measurement across the entire valid V_{SENSE} range. The zero-drift input architecture of the INAx290 provides the low offset voltage and low offset drift required to measure low V_{SENSE} levels accurately across the wide operating temperature of -40°C to $+125^{\circ}\text{C}$. The capability to measure low sense voltages enables accurate measurements at lower load currents, and also allows reduction of the sense resistor value for a given operating current, which minimizes the power loss in the current-sensing element. For multichannel devices, the offset voltage and offset drift characteristics can vary from channel to channel; however, all channels meet the maximum values specified in [Electrical Characteristics](#).

7.3.5 Wide Fixed-Gain Output

The INAx290 gain error is $< 0.1\%$ at room temperature for most gain options, with a maximum drift of 5 ppm/ $^{\circ}\text{C}$ over the full temperature range of -40°C to $+125^{\circ}\text{C}$. The INAx290 is available in multiple gain options of 20 V/V, 50 V/V, 100 V/V, 200 V/V, and 500 V/V, which is selected based on the desired signal-to-noise ratio and other system requirements of the design.

The INAx290 closed-loop gain is set by a precision, low-drift internal resistor network. The ratio of these resistors are excellently matched, although the absolute values can vary significantly. TI does not recommend adding additional resistance around the INAx290 to change the effective gain because of this variation. [Table 7-1](#) describes the typical values of the internal gain resistors seen in the functional diagram above.

Table 7-1. Fixed Gain Resistor

GAIN	R1	RL
20 (V/V)	25 k Ω	500 k Ω
50 (V/V)	10 k Ω	500 k Ω
100 (V/V)	10 k Ω	1000 k Ω
200 (V/V)	5 k Ω	1000 k Ω
500 (V/V)	2 k Ω	1000 k Ω

7.3.6 Wide Supply Range

The INAx290 operates with a wide supply range from a 2.7 V to 20 V. The output stage supports a full-scale output voltage range of up to V_S . A wide output range can enable very-wide dynamic range current measurements. For a gain of 20 V/V, the maximum acceptable differential input is 1 V.

The INAx290A1 gain offset is ± 25 μ V and this device is capable of measuring a wide dynamic range of current up to 92 dB.

7.4 Device Functional Modes

7.4.1 Unidirectional Operation

The INAx290 measures the differential voltage developed by current flowing through a resistor that is commonly referred to as a *current-sensing resistor* or a *current-shunt resistor*. Figure 7-3 shows that the INAx290 operates in unidirectional mode only, meaning the device only senses current sourced from a power supply to a system load.

Figure 7-3. Unidirectional Application (Single-Channel Device)

The linear range of the output stage is limited to how close the output voltage can approach ground under zero-input conditions. The zero current output voltage of the INAx290 is very small, with a maximum of GND + 25 mV. Apply a sense voltage of (25 mV / Gain) or greater to keep the INAx290 output in the linear region of operation.

7.4.2 High Signal Throughput

With a bandwidth of 1.1 MHz at a gain of 20 V/V and a slew rate of 2 V/μs, the INAx290 is specifically designed for detecting and protecting applications from fast inrush currents. As shown in Table 7-2, the INAx290 responds in less than 2 μs for a system measuring a 75-A threshold on a 2-mΩ shunt.

Table 7-2. Response Time

PARAMETER		EQUATION	INAx290 AT V _S = 5 V
G	Gain		20 V/V
I _{MAX}	Maximum current		100 A
I _{Threshold}	Threshold current		75 A
R _{SENSE}	Current sense resistor value		2 mΩ
V _{OUT_MAX}	Output voltage at maximum current	$V_{OUT} = I_{MAX} \times R_{SENSE} \times G$	4 V
V _{OUT_THR}	Output voltage at threshold current	$V_{OUT_THR} = I_{THR} \times R_{SENSE} \times G$	3 V
SR	Slew rate		2 V/μs
	Output response time	$T_{response} = V_{OUT_THR} / SR$	< 2 μs

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The INAx290 amplifies the voltage developed across a current-sensing resistor as current flows through the resistor to the load. The wide input common-mode voltage range and high common-mode rejection of the INAx290 allows use over a wide range of voltage rails while still maintaining an accurate current measurement.

8.1.1 R_{SENSE} and Device Gain Selection

The accuracy of any current-sense amplifier is maximized by choosing the current-sense resistor to be as large as possible. A large sense resistor maximizes the differential input signal for a given amount of current flow and reduces the error contribution of the offset voltage. However, there are practical limits as to how large the current-sense resistor can be in a given application because of the resistor size and maximum allowable power dissipation. Equation 1 gives the maximum value for the current-sense resistor for a given power dissipation budget:

$$R_{SENSE} < \frac{PD_{MAX}}{I_{MAX}^2} \quad (1)$$

where:

- PD_{MAX} is the maximum allowable power dissipation in R_{SENSE}.
- I_{MAX} is the maximum current that flows through R_{SENSE}.

An additional limitation on the size of the current-sense resistor and device gain results from the power-supply voltage, V_S, and device swing-to-rail limitations. To ensure that the current-sense signal is properly passed to the output, both positive and negative output swing limitations must be examined. Equation 2 provides the maximum values of R_{SENSE} and GAIN to keep the device from exceeding the positive swing limitation.

$$I_{MAX} \times R_{SENSE} \times GAIN < V_{SP} \quad (2)$$

where:

- I_{MAX} is the maximum current that flows through R_{SENSE}.
- GAIN is the gain of the current-sense amplifier.
- V_{SP} is the positive output swing as specified in this data sheet.

To avoid positive output swing limitations when selecting the value of R_{SENSE}, there is always a trade-off between the value of the sense resistor and the gain of the device under consideration. If the sense resistor selected for the maximum power dissipation is too large, then selecting a lower gain device is possible to avoid positive swing limitations.

The negative swing limitation places a limit on how small the sense resistor value can be for a given application. Equation 3 provides the limit on the minimum value of the sense resistor.

$$I_{MIN} \times R_{SENSE} \times GAIN > V_{SN} \quad (3)$$

where:

- I_{MIN} is the minimum current that flows through R_{SENSE}.
- GAIN is the gain of the current-sense amplifier.

- V_{SN} is the negative output swing of the device.

Table 8-1 shows an example of the different results obtained from using five different gain versions of the INAx290. From the table data, the highest gain device allows a smaller current-shunt resistor and decreased power dissipation in the element.

Table 8-1. R_{SENSE} Selection and Power Dissipation

PARAMETER ⁽¹⁾		EQUATION	RESULTS AT $V_S = 5\text{ V}$				
			INAx290A1	INAx290A2	INAx290A3	INAx290A4	INAx290A5
G	Gain		20 V/V	50 V/V	100 V/V	200 V/V	500 V/V
V_{SENSE}	Ideal differential input voltage (Ignores swing limitation and power-supply variation.)	$V_{SENSE} = V_{OUT} / G$	250 mV	100 mV	50 mV	25 mV	10 mV
R_{SENSE}	Current-sense resistor value	$R_{SENSE} = V_{SENSE} / I_{MAX}$	25 mΩ	10 mΩ	5 mΩ	2.5 mΩ	1 mΩ
P_{SENSE}	Current-sense resistor power dissipation	$R_{SENSE} \times I_{MAX}^2$	2.5 W	1 W	0.5W	0.25 W	0.1 W

(1) Design example with 10-A, full-scale current with maximum output voltage set to 5 V.

8.1.2 Input Filtering

Note

Input filters are not required for accurate measurements using the INAx290, and use of filters in this location is not recommended. If filter components are used on the input of the amplifier, follow the guidelines in this section to minimize the effects on performance.

Based strictly on user design requirements, external filtering of the current signal may be desired. The initial location that can be considered for the filter is at the output of the current-sense amplifier. Although placing the filter at the output satisfies the filtering requirements, this location changes the low output impedance measured by any circuitry connected to the output voltage pin. The other location for filter placement is at the current-sense amplifier input pins. This location also satisfies the filtering requirement, but the components must be carefully selected to minimally impact device performance. Figure 8-1 shows a filter placed at the input pins.

Figure 8-1. Filter at Input Pins (Single Channel Shown for Simplicity)

External series resistance provides a source of additional measurement error, so keep the value of these series resistors to 10 Ω or less to reduce loss of accuracy. The internal bias network shown in Figure 8-1 creates a mismatch in input bias currents (see Figure 6-16, Figure 6-17, and Figure 6-18) when a differential voltage is applied between the input pins. If additional external series filter resistors are added to the circuit, a mismatch is created in the voltage drop across the filter resistors. This voltage is a differential error voltage in the shunt resistor voltage. In addition to the absolute resistor value, mismatch resulting from resistor tolerance can significantly impact the error because this value is calculated based on the actual measured resistance.

Use [Equation 4](#) to calculate the measurement error expected from the additional external filter resistors, and use [Equation 5](#) to calculate the gain error factor.

$$\text{Gain Error (\%)} = 100 \times (\text{Gain Error Factor} - 1) \quad (4)$$

$$\text{Gain Error Factor} = \frac{R_B \times R_1}{(R_B \times R_1) + (R_B \times R_{IN}) + (2 \times R_{IN} \times R_1)} \quad (5)$$

Where:

- R_{IN} is the external filter resistance value.
- R_1 is the INAx290 input resistance value specified in [Table 7-1](#).
- R_B is the internal bias resistance, which is $6600 \, \Omega \pm 20\%$.

The gain error factor, shown in [Equation 4](#), can be calculated to determine the gain error introduced by the additional external series resistance. [Equation 4](#) calculates the deviation of the shunt voltage, resulting from the attenuation and imbalance created by the added external filter resistance. [Table 8-2](#) provides the gain error factor and gain error for several resistor values.

Table 8-2. Example Gain Error Factor and Gain Error for 10- Ω External Filter Input Resistors

DEVICE (GAIN)	GAIN ERROR FACTOR	GAIN ERROR (%)
A1 devices (20)	0.99658	–0.34185
A2 devices (50)	0.99598	–0.40141
A3 devices (100)	0.99598	–0.40141
A4 devices (200)	0.99499	–0.50051
A5 devices (500)	0.99203	–0.79663

8.2 Typical Application

The INAx290 is a unidirectional, current-sense amplifier capable of measuring currents through a resistive shunt with shunt common-mode voltages from 2.7 V to 120 V. [Figure 8-2](#) shows the circuit configuration for monitoring current in a high-side radio frequency (RF) power amplifier (PA) application.

Figure 8-2. Current Sensing in a PA Application (Single-Channel Device)

8.2.1 Design Requirements

V_{SUPPLY} is set to 5 V and the common-mode voltage set to 54 V. Table 8-3 lists the design setup for this application.

Table 8-3. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
INAx290 supply voltage	5 V
High-side supply voltage	5 V
Maximum sense current (I_{MAX})	5 A
Gain option	50 V/V

8.2.2 Detailed Design Procedure

The maximum value of the current-sense resistor is calculated based on the choice of gain, value of the maximum current to be sensed (I_{MAX}), and the power-supply voltage (V_{S}). When operating at the maximum current, the output voltage must not exceed the positive output swing specification, V_{SP} . Under the given design parameters, Equation 6 calculates the maximum value for R_{SENSE} as 19.2 m Ω .

$$R_{\text{SENSE}} < \frac{V_{\text{SP}}}{I_{\text{MAX}} \times \text{GAIN}} \quad (6)$$

Although 15 m Ω is less than the maximum value calculated, 15 m Ω is selected for this design example because this value is still large enough to provide an adequate signal at the current-sense amplifier output.

8.2.2.1 Overload Recovery With Negative V_{SENSE}

The INAx290 is a unidirectional current-sense amplifier that is meant to operate with a positive differential input voltage (V_{SENSE}). If negative V_{SENSE} is applied, the device is placed in an overload condition and requires time to recover when V_{SENSE} returns positive. The required overload recovery time increases with more negative V_{SENSE} .

8.2.3 Application Curve

Figure 8-3 shows the output response of the device to a high-frequency sinusoidal current.

Figure 8-3. INAx290 Output Response

9 Power Supply Recommendations

The input circuitry of the INAx290 can accurately measure beyond the power-supply voltage. The power supply can be 20 V, whereas the load power-supply voltage at IN+ and IN– can go up to 120 V. The output voltage range of the OUT pin is limited by the voltage on the VS pin and the device swing to the supply specification.

10 Layout

10.1 Layout Guidelines

TI always recommends to follow good layout practices:

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique makes sure that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- Place the power-supply bypass capacitor as close to the device power supply and ground pins as possible. The recommended value of this bypass capacitor is 0.1 μF . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.
- When routing the connections from the current-sense resistor to the device, keep the trace lengths as short as possible.

10.2 Layout Examples

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

DGK (S-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

4073329/E 05/06

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
- D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
- E. Falls within JEDEC MO-187 variation AA, except interlead flash.

DGK (S-PDSO-G8)

PLASTIC SMALL OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

DCK (R-PDSO-G5)

PLASTIC SMALL-OUTLINE PACKAGE

4093553-3/G 01/2007

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
 - Falls within JEDEC MO-203 variation AA.

DCK (R-PDSO-G5)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - D. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

GENERIC PACKAGE VIEW

VQFN - 1 mm max height

4 x 4, 0.65 mm pitch

PLASTIC QUAD FLATPACK - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4224748/A

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

RGV0016A

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 20X

4219037/A 06/2019

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RGV0016A

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 MM THICK STENCIL
SCALE: 20X

EXPOSED PAD 17
79% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE

4219037/A 06/2019

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
