

# ADC1413D series

Dual 14-bit ADC; 65 Msps, 80 Msps, 105 Msps or 125 Msps;  
serial JESD204A interface

Rev. 6 — 8 June 2011

Product data sheet

## 1. General description

The ADC1413D is a dual-channel 14-bit Analog-to-Digital Converter (ADC) optimized for high dynamic performance and low power at sample rates up to 125 Msps. Pipelined architecture and output error correction ensure the ADC1413D is accurate enough to guarantee zero missing codes over the entire operating range. Supplied from a 3 V source for analog and a 1.8 V source for the output driver, it embeds two serial outputs. Each lane is differential and complies with the JESD204A standard. An integrated Serial Peripheral Interface (SPI) allows the user to easily configure the ADCs. A set of IC configurations is also available via the binary level control pins taken, which are used at power-up. The device also includes a programmable full-scale SPI to allow a flexible input voltage range of 1 V to 2 V (peak-to-peak).

Excellent dynamic performance is maintained from the baseband to input frequencies of 170 MHz or more, making the ADC1413D ideal for use in communications, imaging, and medical applications.

## 2. Features and benefits

- SNR, 72 dBFS; SFDR, 86 dBc
- Sample rate up to 125 Msps
- Clock input divided by 2 for less jitter contribution
- 3 V, 1.8 V power supplies
- Flexible input voltage range: 1 V (p-p) to 2 V (p-p)
- Two configurable serial outputs
- Compliant with JESD204A serial transmission standard
- Pin compatible with the ADC1613D series, ADC1213D series, and ADC1113D125
- Input bandwidth, 600 MHz
- Power dissipation, 995 mW at 80 Msps
- SPI register programming
- Duty cycle stabilizer (DCS)
- High IF capability
- Offset binary, two's complement, gray code
- Power-down mode and Sleep mode
- HVQFN56 package

### 3. Applications

- Wireless and wired broadband communications
- Spectral analysis
- Ultrasound equipment
- Portable instrumentation
- Imaging systems
- Software defined radio

### 4. Ordering information

Table 1. Ordering information

| Type number      | Sampling frequency (MSPs) | Package |                                                                                                    |          |
|------------------|---------------------------|---------|----------------------------------------------------------------------------------------------------|----------|
|                  |                           | Name    | Description                                                                                        | Version  |
| ADC1413D125HN/C1 | 125                       | HVQFN56 | plastic thermal enhanced very thin quad flat package; no leads; 56 terminals; body 8 × 8 × 0.85 mm | SOT684-7 |
| ADC1413D105HN/C1 | 105                       | HVQFN56 | plastic thermal enhanced very thin quad flat package; no leads; 56 terminals; body 8 × 8 × 0.85 mm | SOT684-7 |
| ADC1413D080HN/C1 | 80                        | HVQFN56 | plastic thermal enhanced very thin quad flat package; no leads; 56 terminals; body 8 × 8 × 0.85 mm | SOT684-7 |
| ADC1413D065HN/C1 | 65                        | HVQFN56 | plastic thermal enhanced very thin quad flat package; no leads; 56 terminals; body 8 × 8 × 0.85 mm | SOT684-7 |

| AGND      | 52  | G                   | analog ground                                                        |

Table 2. Pin description ...continued

| Symbol | Pin | Type <sup>[1]</sup> | Description                    |
|--------|-----|---------------------|--------------------------------|
| VDDA   | 53  | P                   | analog power supply 3 V        |
| SENSE  | 54  | I                   | reference programming pin      |
| VREF   | 55  | I/O                 | voltage reference input/output |
| VDDA   | 56  | P                   | analog power supply 3 V        |

[1] P: power supply; G: ground; I: input; O: output; I/O: input/output.

[2] OTRA stands for "OuT of Range A". OTRB stands for "OuT of Range B"

## 7. Limiting values

Table 3. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

| Symbol           | Parameter              | Conditions | Min  | Max  | Unit |
|------------------|------------------------|------------|------|------|------|
| V <sub>DDA</sub> | analog supply voltage  |            | -0.4 | +4.6 | V    |
| V <sub>DDD</sub> | digital supply voltage |            | -0.4 | +2.5 | V    |
| T <sub>stg</sub> | storage temperature    |            | -55  | +125 | °C   |
| T <sub>amb</sub> | ambient temperature    |            | -40  | +85  | °C   |
| T <sub>j</sub>   | junction temperature   |            | -    | 125  | °C   |

## 8. Thermal characteristics

Table 4. Thermal characteristics

| Symbol               | Parameter                                   | Conditions     | Typ  | Unit |
|----------------------|---------------------------------------------|----------------|------|------|
| R <sub>th(j-a)</sub> | thermal resistance from junction to ambient | <sup>[1]</sup> | 17.8 | K/W  |
| R <sub>th(j-c)</sub> | thermal resistance from junction to case    | <sup>[1]</sup> | 6.8  | K/W  |

[1] Value for six layers board in still air with a minimum of 25 thermal vias.

## 9. Static characteristics

Table 5. Static characteristics<sup>[1]</sup>

[1] Typical values measured at  $V_{\text{DDA}} = 3 \text{ V}$ ,  $V_{\text{DDD}} = 1.8 \text{ V}$ ,  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ . Minimum and maximum values are across the full temperature range  $T_{\text{amb}} = -40 \text{ }^\circ\text{C}$  to  $+85 \text{ }^\circ\text{C}$  at  $V_{\text{DDA}} = 3 \text{ V}$ ,  $V_{\text{DDD}} = 1.8 \text{ V}$ ;  $V_i$  (INAP, INBP) –  $V_i$  (INAM, INBM) =  $-1 \text{ dBFS}$ ; internal reference mode;  $100 \text{ } \Omega$  differential applied to serial outputs; unless otherwise specified.

### 10.3 Serial output timing

The eye diagram of the serial output is shown in [Figure 3](#) and [Figure 4](#). Test conditions are:

- 3.125 Gbps data rate
- $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$
- DC coupling with two different receiver common-mode voltages

Fig 3. Eye diagram at 1 V receiver common-mode

Fig 4. Eye diagram at 2 V receiver common-mode

## 10.4 SPI timing

Table 8. SPI timing characteristics<sup>[1]</sup>

| Symbol         | Parameter               | Conditions               | Min | Typ | Max | Unit |
|----------------|-------------------------|--------------------------|-----|-----|-----|------|
| $t_{w(SCLK)}$  | SCLK pulse width        |                          | -   | 40  | -   | ns   |
| $t_{w(SCLKH)}$ | SCLK HIGH pulse width   |                          | -   | 16  | -   | ns   |
| $t_{w(SCLKL)}$ | SCLK LOW pulse width    |                          | -   | 16  | -   | ns   |
| $t_{su}$       | set-up time             | data to SCLKH            | -   | 5   | -   | ns   |
|                |                         | $\overline{CS}$ to SCLKH | -   | 5   | -   | ns   |
| $t_h$          | hold time               | data to SCLKH            | -   | 2   | -   | ns   |
|                |                         | $\overline{CS}$ to SCLKH | -   | 2   | -   | ns   |
| $f_{clk(max)}$ | maximum clock frequency |                          | -   | 25  | -   | MHz  |

[1] Typical values measured at  $V_{DDA} = 3\text{ V}$ ,  $V_{DDD} = 1.8\text{ V}$ ,  $T_{amb} = 25\text{ }^{\circ}\text{C}$ . Minimum and maximum values are across the full temperature range  $T_{amb} = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$  at  $V_{DDA} = 3\text{ V}$ ,  $V_{DDD} = 1.8\text{ V}$ ;  $V_I$  (INAP, INBP) –  $V_I$  (INAM, INBM) =  $-1\text{ dBFS}$ ; internal reference mode;  $100\text{ }\Omega$  differential applied to serial outputs; unless otherwise specified.

Fig 5. SPI timing

## 11. Application information

### 11.1 Analog inputs

#### 11.1.1 Input stage description

The analog input of the ADC1413D supports a differential or a single-ended input drive. Optimal performance is achieved using differential inputs with the common-mode input voltage ( $V_{I(cm)}$ ) on pins INxP and INxM set to  $0.5V_{DDA}$ .

The full-scale analog input voltage range is configurable between 1 V (p-p) and 2 V (p-p) via a programmable internal reference (see [Section 11.2](#) and [Table 21](#)).

[Figure 6](#) shows the equivalent circuit of the sample-and-hold input stage, including ElectroStatic Discharge (ESD) protection and circuit and package parasitics.

**Fig 6. Input sampling circuit**

The sample phase occurs when the internal clock (derived from the clock signal on pin CLKP/CLKM) is HIGH. The voltage is then held on the sampling capacitors. When the clock signal goes LOW, the stage enters the hold phase and the voltage information is transmitted to the ADC core.

11.1.2 Anti-kickback circuitry

Anti-kickback circuitry (RC filter in [Figure 7](#)) is needed to counteract the effects of a charge injection generated by the sampling capacitance.

The RC filter is also used to filter noise from the signal before it reaches the sampling stage. The value of the capacitor should be chosen to maximize noise attenuation without degrading the settling time excessively.

The component values are determined by the input frequency and should be selected so as not to affect the input bandwidth.

Table 9. RC coupling versus input frequency, typical values

| Input frequency (MHz) | Resistance ( $\Omega$ ) | Capacitance (pF) |
|-----------------------|-------------------------|------------------|
| 3                     | 25                      | 12               |
| 70                    | 12                      | 8                |
| 170                   | 12                      | 8                |

11.1.3 Transformer

The configuration of the transformer circuit is determined by the input frequency. The configuration shown in [Figure 8](#) would be suitable for a baseband application.

**Fig 9. Dual transformer configuration**

The configuration shown in [Figure 9](#) is recommended for high frequency applications. In both cases, the choice of transformer is a compromise between cost and performance.

## 11.2 System reference and power management

### 11.2.1 Internal/external reference

The ADC1413D has a stable and accurate built-in internal reference voltage to adjust the ADC full-scale. This reference voltage can be set internally via SPI or with pins VREF and SENSE (see [Figure 11](#) to [Figure 14](#)), in 1 dB steps between 0 dB and -6 dB, via SPI control bits INTREF[2:0] (when bit INTREF\_EN = logic 1; see [Table 21](#)). The equivalent reference circuit is shown in [Figure 10](#). An external reference is also possible by providing a voltage on pin VREF as described in [Figure 13](#).

Fig 10. Reference equivalent schematic

If bit INTREF\_EN is set to logic 0, the reference voltage is determined either internally or externally as detailed in [Table 10](#).

Table 10. Reference modes

| Mode                                             | SPI bit, "Internal reference" | SENSE pin                                        | VREF pin                           | Full-scale (V (p-p)) |
|--------------------------------------------------|-------------------------------|--------------------------------------------------|------------------------------------|----------------------|
| Internal ( <a href="#">Figure 11</a> )           | 0                             | GND                                              | 330 pF capacitor to GND            | 2                    |
| Internal ( <a href="#">Figure 12</a> )           | 0                             | VREF pin = SENSE pin and 330 pF capacitor to GND |                                    | 1                    |
| External ( <a href="#">Figure 13</a> )           | 0                             | V <sub>DDA</sub>                                 | external voltage from 0.5 V to 1 V | 1 to 2               |
| Internal, SPI mode ( <a href="#">Figure 14</a> ) | 1                             | VREF pin = SENSE pin and 330 pF capacitor to GND |                                    | 1 to 2               |

[Figure 11](#) to [Figure 14](#) illustrate how to connect the SENSE and VREF pins to select the required reference voltage source.

Fig 11. Internal reference, 2 V (p-p) full-scale

Fig 12. Internal reference, 1 V (p-p) full-scale

Fig 13. External reference, 1 V (p-p) to 2 V (p-p) full-scale

Fig 14. Internal reference via SPI, 1 V (p-p) to 2 V (p-p) full-scale

### 11.2.2 Programmable full-scale

The full-scale is programmable between 1 V (p-p) to 2 V (p-p) (see [Table 11](#)).

**Table 11. Programmable full-scale**

| INTREF[2:0] | Level (dB) | Full-scale (V (p-p)) |
|-------------|------------|----------------------|
| 000         | 0          | 2                    |
| 001         | −1         | 1.78                 |
| 010         | −2         | 1.59                 |
| 011         | −3         | 1.42                 |
| 100         | −4         | 1.26                 |
| 101         | −5         | 1.12                 |
| 110         | −6         | 1                    |
| 111         | not used   | x                    |

### 11.2.3 Common-mode output voltage ( $V_{O(cm)}$ )

An 0.1  $\mu\text{F}$  filter capacitor should be connected between pins VCMA and VCMB and ground to ensure a low-noise common-mode output voltage. When AC-coupled, these pins can be used to set the common-mode reference for the analog inputs, for instance via a transformer middle point.

### 11.2.4 Biasing

The common-mode input voltage,  $V_{I(cm)}$ , at the inputs to the sample-and-hold stage (pins INAM, INBM, INAP, and INBP) must be between 0.9 V and 2 V for optimal performance.

## 11.3 Clock input

### 11.3.1 Drive modes

The ADC1413D can be driven differentially (LVPECL). It can also be driven by a single-ended Low Voltage Complementary Metal Oxide Semiconductor (LVCMOS) signal connected to pin CLKP (pin CLKM should be connected to ground via a capacitor) or pin CLKM (pin CLKP should be connected to ground via a capacitor).

11.3.2 Equivalent input circuit

The equivalent circuit of the input clock buffer is shown in [Figure 18](#). The common-mode voltage of the differential input stage is set via 5 kΩ internal resistors.

Single-ended or differential clock inputs can be selected via the SPI (see [Table 20](#)). If single-ended is selected, the input pin (CLKM or CLKP) is selected via control bit SE\_SEL.

If single-ended is implemented without setting bit SE\_SEL accordingly, the unused pin should be connected to ground via a capacitor.

### 11.3.3 Duty cycle stabilizer

The duty cycle stabilizer can improve the overall performance of the ADC by compensating the input clock signal duty cycle. When the duty cycle stabilizer is active (bit DCS\_EN = logic 1; see [Table 20](#)), the circuit can handle signals with duty cycles of between 30 % and 70 % (typical). When the duty cycle stabilizer is disabled (DCS\_EN = logic 0), the input clock signal should have a duty cycle of between 45 % and 55 %.

Table 12. Duty cycle stabilizer

| Bit DCS_EN | Description                   |
|------------|-------------------------------|
| 0          | duty cycle stabilizer disable |
| 1          | duty cycle stabilizer enable  |

### 11.3.4 Clock input divider

The ADC1413D contains an input clock divider that divides the incoming clock by a factor of 2 (when bit CLKDIV2\_SEL = logic 1; see [Table 20](#)). This feature allows the user to deliver a higher clock frequency with better jitter performance, leading to a better SNR result once acquisition has been performed.

## 11.4 Digital outputs

### 11.4.1 Serial output equivalent circuit

The JESD204A standard specifies that if the receiver and the transmitter are DC-coupled, both must be fed from the same supply.

The output should be terminated when 100 Ω (typical) is reached at the receiver side.

Fig 20. CML output connection to the receiver (AC-coupled)

11.5 JESD204A serializer

For more information about the JESD204A standard refer to the JEDEC web site.

11.5.1 Digital JESD204A formatter

The block placed after the ADC cores is used to implement all functionalities of the JESD204A standard. This ensures signal integrity and guarantees the clock and the data recovery at the receiver side.

The block is highly parameterized and can be configured in various ways depending on the sampling frequency and the number of lanes used.

Fig 21. General overview of the JESD204A serializer

005aaa085

Fig 22. Detailed view of the JESD204A serializer with debug functionality

### 11.5.2 ADC core output codes versus input voltage

Table 13 shows the data output codes for a given analog input voltage.

Table 13. Output codes versus input voltage

| INP – INM (V) | Offset binary     | Two's complement  | OTR |
|---------------|-------------------|-------------------|-----|
| < -1          | 00 0000 0000 0000 | 10 0000 0000 0000 | 1   |
| -1            | 00 0000 0000 0000 | 10 0000 0000 0000 | 0   |

## 11.6 Serial Peripheral Interface (SPI)

### 11.6.1 Register description

The ADC1413D serial interface is a synchronous serial communications port allowing easy interfacing with many industry microprocessors. It provides access to the registers that control the operation of the chip in both read and write modes.

This interface is configured as a 3-wire type (SDIO as bidirectional pin).

SCLK acts as the serial clock, and pin  $\overline{\text{CS}}$  acts as the serial chip select.

Each read/write operation is sequenced by the  $\overline{\text{CS}}$  signal and enabled by a LOW level to drive the chip with 2 bytes to 5 bytes, depending on the content of the instruction byte (see [Table 14](#)).

Table 14. SPI instruction bytes

|             | MSB                |    |    |     |     |     |    | LSB |
|-------------|--------------------|----|----|-----|-----|-----|----|-----|
| Bit         | 7                  | 6  | 5  | 4   | 3   | 2   | 1  | 0   |
| Description | R/W <sup>[1]</sup> | W1 | W0 | A12 | A11 | A10 | A9 | A8  |
|             | A7                 | A6 | A5 | A4  | A3  | A2  | A1 | A0  |

[1] R/W indicates whether a read (logic 1) or write (logic 0) transfer occurs after the instruction byte.

Table 15. Read or Write mode access description

| R/W <sup>[1]</sup> | Description          |
|--------------------|----------------------|
| 0                  | Write mode operation |
| 1                  | Read mode operation  |

[1] Bits W1 and W0 indicate the number of bytes transferred after the instruction byte.

Table 16. Number of bytes to be transferred

| W1 | W0 | Number of bytes transferred |
|----|----|-----------------------------|
| 0  | 0  | 1 byte                      |
| 0  | 1  | 2 bytes                     |
| 1  | 0  | 3 bytes                     |
| 1  | 1  | 4 or more bytes             |

Bits A12 to A0 indicate the address of the register being accessed. In the case of a multiple byte transfer, this address is the first register to be accessed. An address counter is incremented to access subsequent addresses.

The steps for a data transfer:

1. The falling edge on pin  $\overline{\text{CS}}$  in combination with a rising edge on pin SCLK determine the start of communications.
2. The first phase is the transfer of the 2-byte instruction.
3. The second phase is the transfer of the data which can vary in length but is always a multiple of 8 bits. The Most Significant Bit (MSB) is always sent first (for instruction and data bytes).
4. A rising edge on pin  $\overline{\text{CS}}$  indicates the end of data transmission.

Fig 23. Transfer diagram for two data bytes (3-wire type)

### 11.6.2 Channel control

The two ADC channels can be configured at the same time or separately. By using the register "Channel index", the user can choose which ADC channel receives the next SPI-instruction. By default the channel A and B receives the same instructions in write mode. In read mode only A is active.

Table 17. Register allocation map

| Address<br>(hex)     | Register name              | Access <sup>[1]</sup> | Bit definition  |                   |                 |                   |                |                |                |              | Default<br>(bin) |

[1] an "\*" in the Access column means that this register is subject to control access conditions in Write mode.

### 11.6.3 Register description

#### 11.6.3.1 ADC control registers

**Table 18. Register Channel index (address 0003h)**

Default values are highlighted.

| Bit    | Symbol | Access | Value  | Description                      |
|--------|--------|--------|--------|----------------------------------|
| 7 to 2 | -      | -      | 111111 | not used                         |
| 1      | ADCB   | R/W    |        | ADC B gets the next SPI command: |
|        |        |        | 0      | ADC B not selected               |
|        |        |        | 1      | <b>ADC B selected</b>            |
| 0      | ADCA   | R/W    |        | ADC A gets the next SPI command: |
|        |        |        | 0      | ADC A not selected               |
|        |        |        | 1      | <b>ADC A selected</b>            |

**Table 19. Register Reset and Power-down mode (address 0005h)**

Default values are highlighted.

| Bit    | Symbol  | Access | Value | Description                          |
|--------|---------|--------|-------|--------------------------------------|
| 7      | SW_RST  | R/W    |       | reset digital part:                  |
|        |         |        | 0     | <b>no reset</b>                      |
|        |         |        | 1     | performs a reset of the digital part |
| 6 to 2 | -       | -      | 00000 | not used                             |
| 1 to 0 | PD[1:0] | R/W    |       | Power-down mode:                     |
|        |         |        | 00    | <b>normal (power-up)</b>             |
|        |         |        | 01    | full power-down                      |
|        |         |        | 10    | sleep                                |
|        |         |        | 11    | normal (power-up)                    |

**Table 20. Register Clock (address 0006h)**

Default values are highlighted.

| Bit    | Symbol      | Access | Value | Description                                   |
|--------|-------------|--------|-------|-----------------------------------------------|
| 7 to 5 | -           | -      | 000   | not used                                      |
| 4      | SE_SEL      | R/W    |       | select SE clock input pin:                    |
|        |             |        | 0     | <b>select CLKM input</b>                      |
|        |             |        | 1     | select CLKP input                             |
| 3      | DIFF_SE     | R/W    |       | differential/single-ended clock input select: |
|        |             |        | 0     | <b>fully differential</b>                     |
|        |             |        | 1     | single-ended                                  |
| 2      | -           | -      | 0     | not used                                      |
| 1      | CLKDIV2_SEL | R/W    |       | select clock input divider by 2:              |
|        |             |        | 0     | <b>disable</b>                                |
|        |             |        | 1     | active                                        |
| 0      | DCS_EN      | R/W    |       | duty cycle stabilizer enable:                 |
|        |             |        | 0     | disable                                       |
|        |             |        | 1     | <b>active</b>                                 |

**Table 21. Register Vref (address 0008h)**

Default values are highlighted.

| Bit    | Symbol      | Access | Value      | Description                             |
|--------|-------------|--------|------------|-----------------------------------------|
| 7 to 4 | -           | -      | 0000       | not used                                |
| 3      | INTREF_EN   | R/W    |            | enable internal programmable VREF mode: |
|        |             |        | <b>0</b>   | <b>disable</b>                          |
|        |             |        | 1          | active                                  |
| 2 to 0 | INTREF[2:0] | R/W    |            | programmable internal reference:        |
|        |             |        | <b>000</b> | <b>0 dB (FS=2 V)</b>                    |
|        |             |        | 001        | -1 dB (FS=1.78 V)                       |
|        |             |        | 010        | -2 dB (FS=1.59 V)                       |
|        |             |        | 011        | -3 dB (FS=1.42 V)                       |
|        |             |        | 100        | -4 dB (FS=1.26 V)                       |
|        |             |        | 101        | -5 dB (FS=1.12 V)                       |
|        |             |        | 110        | -6 dB (FS=1 V)                          |
|        |             |        | 111        | not used                                |

**Table 22. Digital Offset adjustment (address 0013h)**

Default values are highlighted.

| Register Offset |                 |         |
|-----------------|-----------------|---------|
| Decimal         | DIG_OFFSET[5:0] |         |
| +31             | 011111          | +31 LSB |
| ...             | ...             | ...     |

[1] F: Octets per frame clock cycle

HD: High-density mode

K: Frame per multi-frame

M: Converters per device

L: Lane per converter device

CS: Number of control bits per conversion sample

CF: Control words per frame clock cycle and link

S: Number of samples transmitted per single converter per frame cycle

**Table 30. Ser\_Control1 (address 0805h)**

Default values are highlighted.

| Bit | Symbol            | Access | Value    | Description                                                                                            |
|-----|-------------------|--------|----------|--------------------------------------------------------------------------------------------------------|
| 7   | -                 | -      | 0        | not used                                                                                               |
| 6   | TRISTATE_CFG_PINS | R/W    | <b>1</b> | <b>pins CFG3 to CFG0 are set to high-impedance. Switch to 0 automatically after start-up or reset.</b> |
| 5   | SYNC_POL          | R/W    |          | defines the sync signal polarity:                                                                      |
|     |                   |        | <b>0</b> | <b>synchronization signal is active LOW</b>                                                            |

Default values are highlighted.

| Bit    | Symbol         | Access | Value             | Description                                                                    |
|--------|----------------|--------|-------------------|--------------------------------------------------------------------------------|
| 7 to 2 | -              | -      | 000000            | not used                                                                       |
| 1 to 0 | PRBS_TYPE[1:0] | R/W    |                   | defines the type of Pseudo-Random Binary Sequence (PRBS) generator to be used: |
|        |                |        | <b>00</b> (reset) | <b>PRBS-7</b>                                                                  |
|        |                |        | 01                | PRBS-7                                                                         |
|        |                |        | 10                | PRBS-23                                                                        |
|        |                |        | 11                | PRBS-31                                                                        |

**Table 36. Cfg\_0\_DID (address 0820h)**

Default values are highlighted.

| Bit    | Symbol   | Access | Value           | Description                                              |
|--------|----------|--------|-----------------|----------------------------------------------------------|
| 7 to 0 | DID[7:0] | R      | <b>11101101</b> | <b>defines the device (= link) identification number</b> |

**Table 37. Cfg\_1\_BID (address 0821h)**

Default values are highlighted.

| Bit    | Symbol   | Access | Value       | Description                                   |
|--------|----------|--------|-------------|-----------------------------------------------|
| 7 to 4 | -        | -      | 0000        | not used                                      |
| 3 to 0 | BID[3:0] | R/W    | <b>1010</b> | <b>defines the bank ID – extension to DID</b> |

**Table 38. Cfg\_3\_SCR\_L (address 0822h)**

Default values are highlighted.

| Bit    | Symbol | Access | Value  | Description                                               |
|--------|--------|--------|--------|-----------------------------------------------------------|
| 7      | SCR    | R/W    | 0      | scrambling enabled                                        |
| 6 to 1 | -      | -      | 000000 | not used                                                  |
| 0      | L      | R/W    | 0      | defines the number of lanes per converter device, minus 1 |

**Table 39. Cfg\_4\_F (address 0823h)**

Default values are highlighted.

| Bit    | Symbol | Access | Value | Description                                     |
|--------|--------|--------|-------|-------------------------------------------------|
| 7 to 3 | -      | -      | 00000 | not used                                        |
| 2 to 0 | F[2:0] | R/W    | 001   | defines the number of octets per frame, minus 1 |

**Table 40. Cfg\_5\_K (address 0824h)**

Default values are highlighted.

| Bit    | Symbol | Access | Value | Description                                          |
|--------|--------|--------|-------|------------------------------------------------------|
| 7 to 5 | -      | -      | 000   | not used                                             |
| 4 to 0 | K[4:0] | R/W    | 01000 | defines the number of frames per multiframe, minus 1 |

**Table 41. Cfg\_6\_M (address 0825h)**

Default values are highlighted.

| Bit    | Symbol | Access | Value   | Description                                          |
|--------|--------|--------|---------|------------------------------------------------------|
| 7 to 1 | -      | -      | 0000000 | not used                                             |
| 0      | M      | R/W    | 0       | defines the number of converters per device, minus 1 |

**Table 42. Cfg\_7\_CS\_N (address 0826h)**

Default values are highlighted.

| Bit    | Symbol | Access | Value | Description                                            |
|--------|--------|--------|-------|--------------------------------------------------------|
| 7      | -      | -      | 0     | not used                                               |
| 6      | CS[0]  | R/W    | 1     | defines the number of control bits per sample, minus 1 |
| 5 to 4 | -      | R      | 00    | not used                                               |
| 3 to 0 | N[3:0] | R/W    | 0100  | defines the converter resolution                       |

**Table 43. Cfg\_8\_Np (address 0827h)**

Default values are highlighted.

| Bit    | Symbol  | Access | Value | Description                                          |
|--------|---------|--------|-------|------------------------------------------------------|
| 7 to 5 | -       | -      | 000   | not used                                             |
| 4 to 0 | NP[4:0] | R/W    | 01111 | defines the total number of bits per sample, minus 1 |

**Table 44. Cfg\_9\_S (address 0828h)**

Default values are highlighted.

| Bit    | Symbol | Access | Value   | Description                                             |
|--------|--------|--------|---------|---------------------------------------------------------|
| 7 to 1 | -      | -      | 0000000 | not used                                                |
| 0      | S      | R/W    | 0       | defines number of samples per converter per frame cycle |

**Table 45. Cfg\_10\_HD\_CF (address 0829h)**

Default values are highlighted.

| Bit    | Symbol  | Access | Value | Description                                                     |
|--------|---------|--------|-------|-----------------------------------------------------------------|
| 7      | HD      | R/W    | 0     | defines high density format                                     |
| 6 to 2 | -       | -      | 00000 | not used                                                        |
| 1 to 0 | CF[1:0] | R/W    | 00    | defines number of control words per frame clock cycle per link. |

**Table 46. Cfg\_01\_2\_LID (address 082Ch)**

Default values are highlighted.

| Bit    | Symbol   | Access | Value | Description                          |
|--------|----------|--------|-------|--------------------------------------|
| 7 to 5 | -        | -      | 000   | not used                             |
| 4 to 0 | LID[4:0] | R/W    | 11011 | defines lane 0 identification number |

**Table 47. Cfg\_02\_2\_LID (address 082Dh)**

Default values are highlighted.

| Bit    | Symbol   | Access | Value        | Description                                 |
|--------|----------|--------|--------------|---------------------------------------------|
| 7 to 5 | -        | -      | 000          | not used                                    |
| 4 to 0 | LID[4:0] | R/W    | <b>11100</b> | <b>defines lane 1 identification number</b> |

**Table 48. Cfg01\_13\_FCHK (address 084Ch)**

Default values are highlighted.

| Bit    | Symbol    | Access | Value    | Description                                                                                                                                                         |
|--------|-----------|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 to 0 | FCHK[7:0] | R      | 00000000 | defines the checksum value for lane 0<br>checksum corresponds to the sum of all the link configuration parameters modulo 256 (as defined in JEDEC Standard No.204A) |

**Table 49. Cfg02\_13\_FCHK (address 084Dh)**

Default values are highlighted.

| Bit    | Symbol    | Access | Value    | Description                                                                                                                                                         |
|--------|-----------|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 to 0 | FCHK[7:0] | R      | 00000000 | defines the checksum value for lane 1<br>checksum corresponds to the sum of all the link configuration parameters modulo 256 (as defined in JEDEC Standard No.204A) |

**Table 50. Lane0\_0\_Ctrl (address 0870h)**

Default values are highlighted.

| Bit    | Symbol            | Access | Value      | Description                                                                                                                                                                    |

## 13. Abbreviations

Table 54. Abbreviations

| Acronym | Description                                         |
|---------|-----------------------------------------------------|
| ADC     | Analog-to-Digital Converter                         |
| DCS     | Duty Cycle Stabilizer                               |
| ESD     | ElectroStatic Discharge                             |
| IF      | Intermediate Frequency                              |
| IMD     | InterModulation Distortion                          |
| LSB     | Least Significant Bit                               |
| LVCMOS  | Low Voltage Complementary Metal Oxide Semiconductor |
| LVPECL  | Low-Voltage Positive Emitter-Coupled Logic          |
| MSB     | Most Significant Bit                                |
| OTR     | Out-of-Range                                        |
| PRBS    | Pseudo-Random Binary Sequence                       |
| SFDR    | Spurious-Free Dynamic Range                         |
| SNR     | Signal-to-Noise Ratio                               |
| SPI     | Serial Peripheral Interface                         |
| TX      | Transmitter                                         |

## 15. Legal information

### 15.1 Data sheet status

| Document status <sup>[1][2]</sup> | Product status <sup>[3]</sup> | Definition                                                                            |
|-----------------------------------|-------------------------------|---------------------------------------------------------------------------------------|
| Objective [short] data sheet      | Development                   | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet    | Qualification                 | This document contains data from the preliminary specification.                       |
| Product [short] data sheet        | Production                    | This document contains the product specification.                                     |

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 15.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 15.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use** — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or

malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from national authorities.

**Non-automotive qualified products** — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond

NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
