H = high level, L = low level

- NOTES: 1. $A = \bar{A}_C + \bar{A}^* + A_1 \cdot A_2$, $B = \bar{B}_C + \bar{B}^* + B_1 \cdot B_2$.
 2. When A^* is used as an input, A_1 or A_2 must be low. When B^* is used as an input, B_1 or B_2 must be low.
 3. When A_1 and A_2 or B_1 and B_2 are used as inputs, A^* or B^* , respectively, must be open or used to perform dot-AND logic.

description

These single-bit, high-speed, binary full adders with gated complementary inputs, complementary sum (Σ and $\bar{\Sigma}$) outputs and inverted carry output are designed for medium-and high-speed, multiple-bit, parallel-add/serial-carry application. These circuits (see schematic) utilize diode-transistor logic (DTL) for the gated inputs, and high-speed, high-fan-out transistor-transistor logic (TTL) for the sum and carry outputs and are entirely compatible with the TTL logic families. The implementation of a single-inversion, high-speed, Darlington-connected serial-carry circuit minimizes the necessity for extensive "look-ahead" and carry-cascading circuits.
