

DUAL TYPE D FLIP-FLOP

MTTL III MC3100/3000 series

MC3160F • MC3060F
MC3160L • MC3060L,P

See General Information section for packaging

This dual flip-flop triggers on the positive edge of the clock and performs the Type D flip-flop logic function. This device consists of two completely independent Type D flip-flops, both having direct SET and RESET inputs for asynchronous operations such as parallel data entry in shift register applications.

Information may be applied to, or changed at, the D inputs any time during the clock cycle except during the time interval between the Setup and Hold times. The clocked inputs are inhibited when the clock is high and data may be applied to the input steering section of the flip-flop when the clock goes low. The input steering section continually reflects the input state being applied when the clock is low. The information present at the inputs during the time interval between the Setup and Hold times is transferred to the bistable section on the positive edge of the clock, and the outputs Q and Q-bar respond accordingly.

The flip-flop can also be set or reset directly at any time, regardless of the state of the clock, by applying a low state to the direct SET or RESET inputs.

TRUTH TABLE

D	Q ⁿ	Q ⁿ⁺¹
0	0	0
0	1	0
1	0	1
1	1	1

$$Q^{n+1} = D^n$$

Input Loading Factors:

SET = 1.15
RESET = 1.7
CLOCK = 1.5
D = 0.75

Output Loading Factor = 10

Typical Characteristics: ($V_{CC} = 5.0$ V, $T_A = 25^\circ\text{C}$)

Total Power Dissipation = 120 mW/pkg
Toggle Frequency = 30 MHz
Logical "1" Setup Time = 10 ns
Logical "0" Setup Time = 5.0 ns
Logical "1" and "0" Hold Times = 5.0 ns
 $t_{pd} = 17$ ns
 $t_{pd+} = 15$ ns

CLOCK 3
RESET 10
SET 1
D 12
CLOCK 11
RESET 13

Pin 14 is used to set trip point in desired state. If pin is idle, it is used to set trip point in desired state. If pin is idle, it is used to set trip point in desired state.

Pin 14 is used to set trip point in desired state. If pin is idle, it is used to set trip point in desired state. If pin is idle, it is used to set trip point in desired state.

* Pulse is used to set flip-flop in desired state. P_1 is in μ W. If this is also in another column, the pulse must be returned to that column in vertical or measurement.

* Letters shown in these columns refer to waveforms at left.

AC ELECTRICAL CHARACTERISTICS

The timing waveforms in the AC Electrical Characteristics are tested with a V_{IL} maximum of 0.5 V and a V_{IH} minimum of 2.4 V for all pins, except EXTAL, RESET, MODA, MODB, and MODC. These pins are tested using the input levels set forth in the DC Electrical Characteristics. AC timing specifications that are referenced to a device input signal are measured in production with respect to the 50% point of the respective input signal's transition. DSP56002 output levels are measured with the production test machine V_{OL} and V_{OH} reference levels set at 0.8 V and 2.0 V, respectively.

Note: The midpoint is $V_{IL} + (V_{IH} - V_{IL})/2$.
