

**Rochester Electronics
Manufactured Components**

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All recreations are done with the approval of the OCM.

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceed the OCM data sheet.

Quality Overview

- ISO-9001
 - AS9120 certification
 - Qualified Manufacturers List (QML) MIL-PRF-35835
 - Class Q Military
 - Class V Space Level
 - Qualified Suppliers List of Distributors (QSLD)
 - Rochester is a critical supplier to DLA and meets all industry and DLA standards.
- Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OEM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

SN54178, SN74178 4-BIT PARALLEL-ACCESS SHIFT REGISTERS

DECEMBER 1972 — REVISED MARCH 1988

- Typical Maximum Clock Frequency . . . 39 MHz
- Three Operating Modes:
Synchronous Parallel Load
Right Shift
Hold (Do Nothing)
- Negative-Edge-Triggered Clocking
- D-C Coupling Simplifies System Designs

description

These shift registers utilize fully d-c coupled storage elements and feature synchronous parallel inputs and parallel outputs.

Parallel loading is accomplished by taking the shift input low, applying the four bits of data, and taking the load input high. The data is loaded into the associated flip-flop synchronously and appears at the outputs after a high-to-low transition of the clock. During loading, serial data flow is inhibited.

Shift right is also accomplished on the falling edge of the clock pulse when the shift input is high regardless of the level of the load input. Serial data for this mode is entered at the serial data input.

When both the shift and load inputs are low, clocking of the register can continue; however, data appearing at each output is fed back to the flip-flop input creating a mode in which the data is held unchanged. Thus, the system clock may be left free-running without changing the contents of the register.

				a	b	c	d
				H	QA _n	QB _n	QC _n
				L	QA _n	QB _n	QC _n

H = high level (steady state), L = low level (steady state)

X = irrelevant (any input, including transitions)

↓ = transition from high to low level

a, b, c, d = the level of steady state input at inputs A, B, C, or D, respectively.

QA0, QB0, QC0, QD0 = the level of QA, QB, QC, or QD, respectively, before the indicated steady state input conditions were established.

QA_n, QB_n, QC_n = the level of QA, QB, or QC, respectively, before the most-recent ↓ transition of the clock.

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

† For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable device type.

‡ All typical values are at $V_{CC} = 5 \text{ V}$, $T_A = 25^\circ\text{C}$.

§ Not more than one output should be shorted at a time.

NOTE 2 I_{CC} is measured as follows:

- 4.5 V is applied to serial inputs, load, shift, and clear.
- Parallel inputs A through D are grounded.
- 4.5 V is momentarily applied to clock which is then grounded.

PARAMETER MEASUREMENT INFORMATION

NOTES: A. Input pulses are supplied by generators having the following characteristics: $t_{PLH} \leq 10\text{ ns}$, $t_{PHL} \leq 10\text{ ns}$, $PRR \leq 1\text{ MHz}$, $Z_{out} \approx 50\ \Omega$.
B. Data input and Q output are any related pair. Serial and other data inputs are at GND. Serial data input is tested in conjunction with Q_A output in the shift mode.
C. C_L includes probe and jig capacitance.
D. All diodes are 1N3064 or equivalent.
