

Am25LS2538

One-of-Eight Decoder
with Three-State Outputs and Polarity Control

DISTINCTIVE CHARACTERISTICS

- Three-state decoder outputs
- Buffered common output polarity control
- Inverting and non-inverting enable inputs
- A. C. parameters specified over operating temperature and power supply ranges

GENERAL DESCRIPTION

The Am25LS2538 is a three-line to eight-line decoder/demultiplexer fabricated using advanced Low-Power Schottky technology. The decoder has three buffered select inputs—A, B, and C—that are decoded to one-of-eight Y outputs. Two active-HIGH and two active-LOW enables can be used for gating the decoder or can be used with incoming data for demultiplexing applications.

A separate polarity (POL) input can be used to force the function active-HIGH or active-LOW at the output. Two separate active-LOW output enables ($\overline{OE}$) inputs are provided.

If either $\overline{OE}$ input is HIGH, the output is in the high-impedance (off) state. When the POL input is LOW, the Y outputs are active-HIGH and when the POL input is HIGH, the Y outputs are active-LOW.

The device is packaged in a space saving (0.3-inch row spacing) 20-pin package. It also features Am25LS family improved switching specifications, higher noise margin, and twice the fan-out over the military temperature range when compared with Am54LS/74LS devices.

PIN DESCRIPTION

Pin No.	Name	I/O	Description
6, 7, 17	A, B, C	I	The three select inputs to the decoder/demultiplexer.
16, 15	$\bar{E}_1, \bar{E}_2$	I	The active LOW enable inputs. A HIGH on either the $\bar{E}_1$ or $\bar{E}_2$ input forces all decoded functions to be disabled.
14, 13	E_3, E_4	I	The active HIGH enable inputs. A LOW on either the E_3 or E_4 input forces all the decoded functions to be inhibited.
12	POL	I	Polarity Control. A LOW on the polarity control input forces the output to the active-HIGH state while a HIGH on the polarity control input forces the Y outputs to the active-LOW state.
4, 5	$\bar{OE}_1, \bar{OE}_2$	I	Output Enable. When both the $\bar{OE}_1$ and $\bar{OE}_2$ inputs are LOW, the Y outputs are enabled. If either $\bar{OE}_1$ or $\bar{OE}_2$ input is HIGH, the Y outputs are in the high-impedance state.
	Y_i	O	The eight outputs for the decoder/demultiplexer.
