information and details on our current products and services.

Stereo Audio Subsystem with Class G Headphone Amplifier and Class D Speaker Amplifier with Speaker Protection

General Description

The LM49251 is a fully integrated audio subsystem designed for portable handheld applications such as cellular phones. Part of National's PowerWise family of products, the LM49251 utilizes a high efficiency class G headphone amplifier topology as well as a high efficiency class D loudspeaker. The headphone amplifiers feature National's class G ground referenced architecture that creates a ground-referenced output with dynamic supply rails for optimum efficiency. The stereo class D speaker amplifier provides both a no-clip feature and speaker protection. The Enhanced Emission Suppression (E²S) outputs feature a patented, ultra low EMI PWM architecture that significantly reduces RF emissions.

The LM49251 features separate volume controls for the mono and stereo inputs. Mode selection, shutdown control, and volume are controlled through an I²C compatible interface.

Click and pop suppression eliminates audible transients on power-up/down and during shutdown. The LM49251 is available in an ultra-small 30-bump micro SMD package (2.55mmx3.02mm)

Key Specifications

- Class G Headphone Amplifier, $HPV_{DD} = 1.8V$, $R_L = 32\Omega$
 $IDDQ_{HP} = 1.15mA$ (typ)
Output Power, $THD+N \leq 1\%$ 20mW (typ)
- Stereo Class D Speaker Amplifier $R_L = 8\Omega$
Output Power, $THD+N \leq 1\%$, $LSV_{DD} = 5.0V$ 1.37W (typ)
Output Power, $THD+N \leq 1\%$, $LSV_{DD} = 3.6V$ 680mW (typ)
Efficiency 90% (typ)

Features

- Class G Ground Referenced Headphone Outputs
- E²S Class D Amplifier
- No Clip Function
- Power Limiter Speaker Protection
- I²C Volume and Mode Control
- Advanced Click-and-Pop Suppression
- Micro-power shutdown

Applications

- Feature Phones
- Smart phones

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified.

Note 2: The Electrical Characteristics tables list guaranteed specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not guaranteed.

Note 3: The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX} , θ_{JA} , and the ambient temperature, T_A . The maximum allowable power dissipation is $P_{DMAX} = (T_{JMAX} - T_A) / \theta_{JA}$ or the number given in Absolute Maximum Ratings, whichever is lower.

Note 4: Human body model, applicable std. JESD22-A114C.

Note 5: Machine model, applicable std. JESD22-A115-A.

Note 6: Typical values represent most likely parametric norms at $T_A = +25^\circ C$, and at the Recommended Operation Conditions at the time of product characterization and are not guaranteed.

Note 7: Datasheet min/max specification limits are guaranteed by test or statistical analysis.

Note 8: Loudspeaker R_L is a resistive load in series with two inductors to simulate an actual speaker load. For $R_L = 8\Omega$, the load is $15\mu H + 8\Omega + 15\mu H$. For $R_L = 4\Omega$, the load is $15\mu H + 4\Omega + 15\mu H$.

Note 9: The LM49251 ALC limits the output power to which ever is lower, the supply voltage or output power limit.

Note 10: Charge device model, applicable std. JESD22-C101D.

System Control

I²C SIGNALS

In I²C mode the LM49251 pin SCL is used for the I²C clock SCL and the pin SDA is used for the I²C data signal SDA. Both of these signals need a pull-up resistor according to I²C specification. The 7-bits I²C slave address for LM49251 is 1111100.

I²C DATA VALIDITY

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, state of the data line can only be changed when SCL is LOW.

301218b5

FIGURE 3. I²C Signals: Data Validity

I²C START AND STOP CONDITIONS

START and STOP bits classify the beginning and the end of the I²C session. START condition is defined as SDA signal transitioning from HIGH to LOW while SCL line is HIGH. STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The I²C master always generates

START and STOP bits. The I²C bus is considered to be busy after START condition and free after STOP condition. During data transmission, I²C master can generate repeated START conditions. First START and repeated START conditions are equivalent, function-wise.

301218b6

FIGURE 4. I²C Start and Stop Conditions

TRANSFERRING DATA

Every byte put on the SDA line must be eight bits long, with the most significant bit (MSB) being transferred first. Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the master. The transmitter releases the SDA line (HIGH) during the acknowledge clock pulse. The receiver must pull down the SDA line during the 9th clock pulse, signifying an acknowledge. A receiver which has been addressed must generate an ac-

knowledge after each byte has been received. After the START condition, the I²C master sends a chip address. This address is seven bits long followed by an eight bit which is a data direction bit (R/W). The LM49251 address is 11111000. For the eighth bit, a "0" indicates a WRITE and a "1" indicates a READ. The second byte selects the register to which the data will be written. The third byte contains data to write to the selected register.

301218b7

FIGURE 5. I²C Chip Address

FIGURE 6. Example I²C Write Cycle

When a READ function is to be accomplished, a WRITE function must precede the READ function, as shown in the Read Cycle waveform.

w = write (SDA = "0")
 r = read (SDA = "1")
 ack = acknowledge (SDA pulled down by slave)
 rs = repeated start

FIGURE 7. Example I²C Read Cycle

Application Information

DIFFERENTIAL AMPLIFIER EXPLANATION

The LM49251 features a differential input stage, which offers improved noise rejection compared to a single-ended input amplifier. Because a differential input amplifier amplifies the difference between the two input signals, any component common to both signals is cancelled. An additional benefit of the differential input structure is the possible elimination of the DC input blocking capacitors. Since the DC component is common to both inputs, and thus cancelled by the amplifier, the LM49251 can be used without input coupling capacitors when configured with a differential input signal.

INPUT MIXER/MULTIPLEXER

The LM49251 includes a comprehensive mixer multiplexer controlled through the I²C interface. The mixer/multiplexer allows any input combination to appear on any output of LM49251. [Table 5](#) (MODE CONTROL) shows how the input signals are routed together for each possible input selection.

SHUTDOWN FUNCTION

The LM49251 features the following shutdown controls: Bit B4 (GAMP_SD) of the SHUTDOWN CONTROL register controls the gain amplifiers. When GAMP_SD = 1, it disables the gain amplifiers that are not in use. For example, in Modes 1, 4 and 5, the Mono inputs are in use, so the Left and Right input gain amplifiers are disabled, causing the I_{DD} to be minimized. Bit B0 (PWR_ON) of the SHUTDOWN CONTROL register is the global shutdown control for the entire device. Set PWR_ON = 0 for normal operation. PWR_ON = 1 overrides any other shutdown control bit.

CLASS D AMPLIFIER

The LM49251 features a mono class D audio power amplifier with a filterless modulation scheme that reduces external component count, conserving board space and reducing system cost. With no signal applied, the outputs (LSOUT+ and LSOUT-) switch between VDD and GND with 50% duty cycle, in phase, causing the two outputs to cancel. This cancellation results in no net voltage across the speaker, thus there is no current to the load in the idle state.

With an input signal applied, the duty cycle (pulse width) of the class D output changes. For increasing output voltage, the duty cycle of LSOUT+ increases, while the duty cycle of LSOUT- decreases. For decreasing output voltages, the converse occurs. The difference between the two pulse widths yields the differential output voltage.

ENHANCED EMISSIONS SUPPRESSION (E²S)

The LM49251 class D amplifier features National's patent-pending E²S system that reduces EMI, while maintaining high quality audio reproduction and efficiency. The E²S system features selectable spread spectrum and advanced edge rate control (ERC). The LM49251 class D ERC greatly reduces the high frequency components of the output square waves by controlling the output rise and fall times, slowing the transitions to reduce RF emissions, while maximizing THD+N and efficiency performance.

FIXED FREQUENCY

The LM49251 class D amplifier features two modulation schemes, a fixed frequency mode and a spread spectrum mode. Select the fixed frequency mode by setting bit B0

(SS_EN) of the SS Control register to 0. In fixed frequency mode, the loudspeaker outputs switch at a constant 300kHz. The output spectrum consists of the 300kHz fundamental and its associated harmonics.

SPREAD SPECTRUM

The selectable spread spectrum mode minimizes the need for output filters, ferrite beads or chokes. In spread spectrum mode, the switching frequency varies randomly by 30% about a 300kHz center frequency, reducing the wideband spectral content, improving EMI emission radiated by the speaker and associated cables and traces. Where a fixed frequency class D exhibits large amounts of spectral energy at multiples of the switching frequency, the spread spectrum architecture spreads that energy over a larger bandwidth. The cycle-to-cycle variation of the switching period does not affect the audio reproduction, efficiency, or PSRR. Set bit B0 (SS_EN) of the SS Control register to 1 to enable spread spectrum mode.

GROUND REFERENCED HEADPHONE AMPLIFIER

The LM49251 features a low noise inverting charge pump that generates an internal negative supply voltage. This allows the headphone outputs to be biased about GND instead of a nominal DC voltage, like traditional headphone amplifiers. Because there is no DC component, the large DC blocking capacitors (typically 220μF) at the headphone outputs are not necessary. The coupling capacitors are replaced by two small ceramic charge pump capacitors, saving board space and cost. Eliminating the output coupling capacitors also improves low frequency response. In traditional headphone amplifiers, the headphone impedance and the output capacitor form a high-pass filter that not only blocks the DC component of the output, but also attenuates low frequencies, impacting the bass response. Because the LM49251 does not require the output coupling capacitors, the low frequency response of the device is not degraded by external components. In addition to eliminating the output coupling capacitors, the ground referenced output nearly doubles the available dynamic range of the LM49251 headphone amplifiers when compared to a traditional headphone amplifier operating from the same supply voltage.

CLASS G OPERATION

The LM49251 features a ground referenced class G headphone amplifier for increased efficiency and decreased power dissipation. This particular architecture creates a ground-referenced output with dynamic supply rails for optimum efficiency. Music and voice signals have a high peak-to-mean ratio with the majority of the signal content at low levels, class G amplifiers take advantage of this behavior. Class G amplifiers have multiple voltage supplies to decrease power dissipation. The LM49251 has two discrete supply rails: ±0.9V and ±1.8V. The device switches from ±0.9V to ±1.8V when the output signal reaches the selectable threshold level to switch to the higher voltage rails. When the output falls below the required voltage for a set period of time, it will switch back to the lower rail until the next time the threshold is reached. The threshold level has 4 selectable levels that can be set through the Class G Control I²C control register <B1:B2>. With this topology power dissipation is reduced for typical music or voice sources. [Figure 8](#) below shows how a music output may look.

301218c1

FIGURE 8. Class G Operation

Disabling the Class G

The Class G feature can be disabled via I²C Shutdown Control Register B1. When the Class G is disabled the headphone supply rails are selectable. In the Other Control register B1 =

0 sets the headphone supply rails at $\pm 1.8\text{V}$ (high) and B1 = 1 sets the supply to $\pm 0.9\text{V}$ (low). [Figure 9](#) below shows a curve of THD+N vs Output Power for the two supply rails.

30121824

FIGURE 9. Class G Disabled (Low/High Supply Rails)

AUTOMATIC LIMITER CONTROL (ALC)

When enabled, the ALC continuously monitors and adjusts the gain of the loudspeaker amplifier signal path if necessary. The ALC serves two functions: voltage limiter/speaker protection and output clip prevention (No-Clip) with three clip controls levels. The voltage limiter/speaker protection prevents an output overload condition by maintaining the loud-

speaker output signal below a preset amplitude (See voltage Limiter section). The No Clip feature monitors the output signal and maintains audio quality by preventing the loudspeaker output from exceeding the amplifier's headroom (see No Clip/Output Clip Control section). The voltage limiter thresholds, clip control levels, attack and release times are configured through the I²C interface.

VOLTAGE LIMITER

The voltage limiter function of the ALC monitors and prevents the audio signal from exceeding the voltage limit threshold. The voltage limit threshold ($V_{TH(VLIM)}$) is set by bits B2:B0 in the "Voltage Limit Threshold Register" (see [Table 6](#)). Although the ALC reduces the gain of the speaker path to

maintain the audio signal below the voltage limit threshold, it is still possible to overdrive the speaker output in which case loudspeaker output will exceed the voltage limit threshold and cause clipping on the output, and speaker damage is possible. Please see the ALC headroom section for further details.

FIGURE 10. Voltage Limit Output Level

NO CLIP/OUTPUT CLIP CONTROL

The LM49251 No Clip circuitry detects when the loudspeaker output is near clipping and reduces the signal gain to prevent output clipping and preserve audio quality (Figure 6). Al-

though the ALC reduces the gain of the speaker path to prevent output clipping, it is still possible to overdrive the speaker output. Please see the ALC headroom section for further details.

No Clip Disabled

No Clip Enabled

301218b0

FIGURE 11. No Clip Function

The LM49251 also features an output clip control that allows a certain amount of clipping at the output in order to increase the loudspeaker output power. The clip level is set by B2:B0 in the No Clip Control Register (see [Table 7](#)). The clip control works by allowing the output to enter clipping before the ALC turns on and maintains the output level. The clip control has

three levels: low, medium, and high. The low and max clip level control settings give the lowest distortion and highest distortion respectively on the output (see [Figure 12](#)). The actual output level of the device will depend upon the supply voltage, and the output power will depend upon the load impedance.

301218b1

FIGURE 12. Clip Control Levels
 $V_{DD} = 3.3V$, $V_{IN} = 8V_{PP}$ Shaped Burst, 1kHz
 Blue = No Clip Disabled, Gray = Low, Light Green = Medium
 Green = High, Yellow = Max

ALC HEADROOM

When either voltage limiter or no clip is enabled, it is still possible to drive LM49251 into clipping by over driving the input volume stage of the signal path beyond its output dynamic range. In this case, clipping occurs at the input volume stage, and although ALC is active, the gain reduction will have no effect on the output clipping. The maximum input that can safely pass through the input volume stage can be calculated by following formula:

$$V_{IN} \leq \frac{V_{DD}}{A_v \text{ (volume gain)}} \quad (1)$$

So in the case of 0 dB volume gain, audio input has to be less than V_{DD} for both voltage limiter or No clip settings.

When voltage limiter is enabled, ALC can reach its max attenuation for lower voltage limit levels as shown in Figure 13. Typically, after the ALC started working, with 6 dB of audio input change ALC is well within its regulation. Voltage limiter Input headroom can be increased by switching to the LS_GAIN to 18dB in the Gain Control Register (see Table 8).

301218b2

FIGURE 13. Voltage Limiter Function
 $V_{DD} = 3.3V$, $R_L = 15\mu H + 8\Omega + 15\mu H$
 $f_{IN} = 1kHz$, LS_GAIN = 0

301218b3

FIGURE 14. No Clip Function
 $V_{DD} = 3.3V$, $R_L = 15\mu H + 8\Omega + 15\mu H$
 $f_{IN} = 1kHz$, $LS_GAIN = 0$
 Blue, Green = Output Power vs Input Voltage
 Gray, Yellow = THD+N vs Input Voltage

When No Clip is enabled, class D speaker output reduces when it's about to enter clipping region and power stay constant as long as V_{IN} is less than V_{DD} for 0 dB volume gain (see figure 9). For example, in the case of $V_{DD} = 3.3V$, there is a 6 dB of headroom for the change in input. Please see the ALC typical performance curves for additional plots relating to different supply voltages and LS_GAIN settings for specific application parameters.

ATTACK TIME

Attack time (t_{ATK}) is the time it takes for the gain to be reduced by 6dB ($LS_GAIN=0$) once the audio signal exceeds the ALC threshold. Fast attack times allow the ALC to react quickly and prevent transients such as symbol crashes from being distorted. However, fast attack times can lead to volume pumping, where the gain reduction and release becomes noticeable, as the ALC cycles quickly. Slower attack times cause the ALC to ignore the fast transients, and instead act upon longer, louder passages. Selecting an attack time that is too slow can lead to increased distortion in the case of the No Clip function, and possible output overload conditions in the case of the Voltage limiter. The attack time is set by a combination of the value of C_{SET} and the attack time coefficient as given by equation (2):

$$t_{ATK} = 20k\Omega C_{SET} / \alpha_{ATK} \quad (s) \quad (2)$$

Where α_{ATK} is the attack time coefficient (Table 14) set by bits B4:B3 in the Voltage Limit Control Register (see Table 6). The attack time coefficient allows the user to set a nominal attack time. The internal $20k\Omega$ resistor is subject to temperature change, and it has tolerance between -11% to +20%.

TABLE 14. Attack Time Coefficient

B4	B3	α_{ATK}
0	0	2.667
0	1	2
1	0	1.333
1	1	1

RELEASE TIME

Release time (t_{RL}) is the time it takes for the gain to return from 6dB ($LS_GAIN=0$) to its normal level once the audio signal returns below the ALC threshold. A fast release time allows the ALC to react quickly to transients, preserving the original dynamics of the audio source. However, similar to a fast attack time, a fast release time contributes to volume pumping. A slow release time reduces the effect of volume pumping. The release time is set by a combination of the value of C_{SET} and release time coefficient as given by equation (3):

$$t_{RL} = 20M\Omega C_{SET} / \alpha_{RL} \quad (s) \quad (3)$$

where α_{RL} is the release time coefficient (Table 15) set by bits B4:B3 in the No Clip Control Register. The release time coefficient allows the user to set a nominal release time. The internal $20M\Omega$ is subject to temperature change, and it has tolerance between -11% to +20%.

A-WEIGHTED FILTER

The human ear is sensitive for acoustic signals within a frequency range from about 20Hz to 20kHz. Within this range the sensitivity of the human ear is not equal for each frequency. To approach the hearing response, weighting filters are introduced. One of those filters is the A-weighted filter.

The A-weighted filter is used in signal to noise measurements, where the wanted audio signal is compared to device noise and distortion.

The use of this filter improves the correlation of the measured values to the way these ratios are perceived by the human ear.

301218b4

FIGURE 15. A-Weighted Filter

PROPER SELECTION OF EXTERNAL COMPONENTS

ALC Timing (C_{SET}) Capacitor Selection

The recommended range value of C_{SET} is between .01 μ F to 1 μ F. Lowering the value below .01 μ F can increase the attack time but LM49251 ALC ability to regulate its output can be disrupted and approaches the hard limiter circuit. This in turn increases the THD+N and audio quality will be severely affected.

Charge Pump Capacitor Selection

Use low ESR ceramic capacitors (less than 100m Ω) for optimum performance.

Charge Pump Flying Capacitor (C_1)

The flying capacitor (C_1), see [Figure 2](#), affects the load regulation and output impedance of the charge pump. A C_1 value that is too low results in a loss of current drive, leading to a loss of amplifier headroom. A higher valued C_1 improves load regulation and lowers charge pump output impedance to an extent. Above 2.2 μ F, the $RDS_{(ON)}$ of the charge pump switches and the ESR of C_1 and CPV_{SS} dominate the output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

Charge Pump Hold Capacitor (CPV_{SS})

The value and ESR of the hold capacitor (CPV_{SS}) directly affects the ripple on CPV_{SS} (see [Figure 2](#)). Increasing the value

of CPV_{SS} reduces output ripple. Decreasing the ESR of CPV_{SS} reduces both output ripple and charge pump output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

Input Capacitor Selection

Input capacitors may be required for some applications, or when the audio source is single-ended. Input capacitors block the DC component of the audio signal, eliminating any conflict between the DC component of the audio source and the bias voltage of the LM49251. The input capacitors create a high-pass filter with the input resistors R_{IN} . The -3dB point of the high-pass filter is found using Equation (4) below.

$$f = 1 / 2\pi R_{IN} C_{IN} \quad (\text{Hz}) \quad (4)$$

Where the value of R_{IN} is given in the Electrical Characteristics Table.

High-pass filtering the audio signal helps protect the speakers. When the LM49251 is using a single-ended source, power supply noise on the ground is seen as an input signal. Setting the high-pass filter point above the power supply noise frequencies, 217Hz in a GSM phone, for example, filters out the noise such that it is not amplified and heard on the output. Capacitors with a tolerance of 10% or better are recommended for impedance matching and improved CMRR and PSRR.

Demo Board User Guide

Quick Start Guide:

1. Connect a shunt across pin 1 and pin 2 of JUI to provide 3.3V to I²CV_{DD}.
2. Connect a shunt across JU3 to provide 1.8V to V_{DD}HP from on board regulator.
3. Connect a 4Ω or 8Ω speaker across LSOUTL (left loudspeaker output) and LSOUTR (right loudspeaker output).
4. Connect stereo headphones to the headphone jack J1.
5. Connect a 3.6V power supply to the V_{DD} pin of J3 and the ground source to the GND pin.
6. Apply audio input signal to any of the stereo (IN1/IN2) or mono (MONO_IN) inputs.

7. Turn on power supply.
8. Connect the mini USB cable to J29 and the other end of the cable to a PC.
9. Open the LM49251 I²C control software.
10. Verify that the device has been acknowledged by looking at bottom left corner of GUI (see [Figure 16](#) and [Figure 17](#)).
11. On GUI:
 - a. Set POWER: on
 - b. Set MODE SELECT to desired position (see [Table 16](#)).
 - c. Set all VOLUME CONTROL to 0dB by clicking on Set 0 dB button.

30121822

THE CONTENTS OF THIS DOCUMENT ARE PROVIDED IN CONNECTION WITH NATIONAL SEMICONDUCTOR CORPORATION ("NATIONAL") PRODUCTS. NATIONAL MAKES NO REPRESENTATIONS OR WARRANTIES WITH RESPECT TO THE ACCURACY OR COMPLETENESS OF THE CONTENTS OF THIS PUBLICATION AND RESERVES THE RIGHT TO MAKE CHANGES TO SPECIFICATIONS AND PRODUCT DESCRIPTIONS AT ANY TIME WITHOUT NOTICE. NO LICENSE, WHETHER EXPRESS, IMPLIED, ARISING BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT.

TESTING AND OTHER QUALITY CONTROLS ARE USED TO THE EXTENT NATIONAL DEEMS NECESSARY TO SUPPORT NATIONAL'S PRODUCT WARRANTY. EXCEPT WHERE MANDATED BY GOVERNMENT REQUIREMENTS, TESTING OF ALL PARAMETERS OF EACH PRODUCT IS NOT NECESSARILY PERFORMED. NATIONAL ASSUMES NO LIABILITY FOR APPLICATIONS ASSISTANCE OR BUYER PRODUCT DESIGN. BUYERS ARE RESPONSIBLE FOR THEIR PRODUCTS AND APPLICATIONS USING NATIONAL COMPONENTS. PRIOR TO USING OR DISTRIBUTING ANY PRODUCTS THAT INCLUDE NATIONAL COMPONENTS, BUYERS SHOULD PROVIDE ADEQUATE DESIGN, TESTING AND OPERATING SAFEGUARDS.

EXCEPT AS PROVIDED IN NATIONAL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, NATIONAL ASSUMES NO LIABILITY WHATSOEVER, AND NATIONAL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY RELATING TO THE SALE AND/OR USE OF NATIONAL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
