

Stereo 3.1W Class D Amplifier

MAX98303

General Description

The MAX98303 stereo 3.1W Class D amplifier provides Class AB audio performance with Class D efficiency. This device offers five selectable gain settings (6dB, 9dB, 12dB, 15dB, and 18dB) set by a single gain-select input (GAIN).

Active emissions limiting, edge-rate, and overshoot control circuitry greatly reduces EMI. A filterless spread-spectrum modulation scheme eliminates the need for output filtering found in traditional Class D devices. These features reduce application component count.

The IC's 2.0mA at 3.7V, 2.7mA at 5V, quiescent current extends battery life in portable applications.

The IC is available in a 16-bump WLP (1.68mm x 1.68mm x 0.64mm) package specified over the extended -40°C to +85°C temperature range.

Applications

Notebook and Netbook
Computers
Tablets
Cellular Phones

MP3 Players
Portable Audio Players
VoIP Phones

Features

- ◆ **Low Quiescent Current:** 2.0mA at 3.7V, 2.7mA at 5V
- ◆ **Spread Spectrum and Active Emissions Limiting**
- ◆ **Five Pin-Selectable Gains**
- ◆ **Click-and-Pop Suppression**
- ◆ **Thermal and Overcurrent Protection**
- ◆ **Low-Current Shutdown Mode**
- ◆ **Space-Saving, 1.68mm x 1.68mm x 0.64mm, 16-Bump WLP (0.4mm Pitch)**

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	TOP MARK

+ Denotes a lead(Pb)-free/RoHS-compliant package.

Typical Application Circuit

Stereo 3.1W Class D Amplifier

ABSOLUTE MAXIMUM RATINGS

PVDD to PGND -0.3V to +6V
 OUT₊, OUT₋ to PGND -0.3V to (V_{PVDD} + 0.3V)
 All Other Pins to PGND -0.3V to +6V
 Continuous Current for PVDD, PGND,
 OUTL₋, OUTR₋ ±1600mA
 Continuous Input Current (all other pins) ±20mA
 Duration of Short Circuit Between
 OUTL₋, OUTR₋ to PVDD or PGND Continuous
 OUTL₊ to OUTL₋, OUTR₊ to OUTR₋ Continuous

Continuous Power Dissipation for Multilayer Board (T_A = +70°C)
 16-Bump WLP (derate 17.2mW/°C above +70°C) 1.38W
 θ_{JA} (Note 1) 58°C/W
 θ_{JC} (Note 1) 15°C/W
 Junction Temperature +150°C
 Operating Temperature Range -40°C to +85°C
 Storage Temperature Range -65°C to +150°C
 Soldering Temperature (reflow) +260°C

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{PVDD} = V_{SHDN} = 3.7V, V_{PGND} = 0V, A_V = 12dB (GAIN = PVDD), R_L = ∞, R_L connected between OUT₊ to OUT₋, 20Hz to 22kHz AC measurement bandwidth, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at T_A = +25°C.) (Notes 2, 3)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

Bump Configuration

Bump Description

BUMP	NAME	FUNCTION
A1	OUTL+	Positive Left Speaker Output
A2	OUTL-	Negative Left Speaker Output
A3	GAIN	Gain Select. See Table 1 for Gain Settings.
A4	INL+	Noninverting Audio Left Input
B1, B2, B3	PGND	Ground
B4	INL-	Inverting Audio Left Input
C1, C2, C3	PVDD	Power Supply. Bypass PVDD to PGND with 0.1μF and 10μF capacitors.
C4	INR-	Inverting Audio Right Input
D1	OUTR+	Positive Right Speaker Output
D2	OUTR-	Negative Right Speaker Output
D3	$\overline{\text{SHDN}}$	Active-Low Shutdown Input. Drive $\overline{\text{SHDN}}$ low to place the device in shutdown.
D4	INR+	Noninverting Audio Right Input

Stereo 3.1W Class D Amplifier

Detailed Description

The MAX98303 features low quiescent current, a low-power shutdown mode, comprehensive click-and-pop suppression, and excellent RF immunity.

The IC offers Class AB audio performance with Class D efficiency in a minimal board-space solution.

The Class D amplifier features spread-spectrum modulation, edge-rate, and overshoot control circuitry that offers significant improvements to switch-mode amplifier radiated emissions.

The amplifier features click-and-pop suppression that reduces audible transients on startup and shutdown. The amplifier includes thermal-overload and short-circuit protection.

Class D Speaker Amplifier

The filterless Class D amplifier offers much higher efficiency than Class AB amplifiers. The high efficiency of a Class D amplifier is due to the switching operation of the output stage transistors. Any power loss associated with the Class D output stage is mostly due to the I^2R loss of the MOSFET on-resistance and quiescent current overhead.

Ultra-Low-EMI Filterless Output Stage

Traditional Class D amplifiers require the use of external LC filters, or shielding, to meet EN55022B electromagnetic-interference (EMI) regulation standards. Maxim's active emissions limiting edge-rate control circuitry and spread-spectrum modulation reduce EMI emissions, while maintaining up to 93% efficiency.

Maxim's spread-spectrum modulation mode flattens wideband spectral components, while proprietary techniques ensure that the cycle-to-cycle variation of the switching period does not degrade audio reproduction or efficiency. The IC's spread-spectrum modulator randomly varies the switching frequency by $\pm 15\text{kHz}$ around the center frequency (300kHz). Above 10MHz, the wideband spectrum looks like noise for EMI purposes (Figure 1).

Speaker Current Limit

If the output current of the speaker amplifier exceeds the current limit (2A typ), the IC disables the outputs for approximately 100 μs . At the end of 100 μs , the outputs are reenabled. If the fault condition still exists, the IC continues to disable and reenables the outputs until the fault condition is removed.

Selectable Gain

The IC offers five programmable gains selected using the GAIN input.

Table 1. Gain Control Configuration

GAIN PIN	MAXIMUM GAIN (dB)
Connect to PGND	18
Connect to PGND through 100k Ω $\pm 5\%$ resistor	15
Connect to PVDD	12
Connect to PVDD through 100k Ω $\pm 5\%$ resistor	9
Unconnected	6

Figure 1. EMI with 30cm of Speaker Cable and No Output Filter

Shutdown

The IC features a low-power shutdown mode, drawing $\leq 0.1\mu\text{A}$ (typ) of supply current. Drive $\overline{\text{SHDN}}$ low to place the MAX98303 into shutdown.

Click-and-Pop Suppression

The IC speaker amplifier features Maxim's comprehensive click-and-pop suppression. During startup, the click-and-pop suppression circuitry reduces any audible transient sources internal to the device. When entering shutdown, the differential speaker outputs ramp down to PGND quickly and simultaneously.

Stereo 3.1W Class D Amplifier

Applications Information

Filterless Class D Operation

Traditional Class D amplifiers require an output filter. The filter adds cost and size and decreases THD performance. The IC's filterless modulation scheme does not require an output filter.

Because the switching frequency of the IC is well beyond the bandwidth of most speakers, voice coil movement due to the switching frequency is very small. Use a speaker with a series inductance > 10μH. Typical 8Ω speakers exhibit series inductances in the 20μH to 100μH range.

Component Selection

Power-Supply Input (PVDD)

PVDD powers the speaker amplifier. PVDD ranges from 2.6V to 5.5V. Bypass PVDD with 0.1μF and 10μF capacitors to PGND. Apply additional bulk capacitance at the device if long input traces between PVDD and the power source are used.

Input Filtering

The input-coupling capacitor (C_{IN}), in conjunction with the amplifier's internal input resistance (R_{IN}), forms a highpass filter that removes the DC bias from the incoming signal. These capacitors allow the amplifier to bias the signal to an optimum DC level.

Assuming zero source impedance with a gain setting of 12dB, 15dB, or 18dB, C_{IN} is:

$$C_{IN} = \frac{8}{f_{-3dB}} [\mu F]$$

with a gain setting of 9dB, C_{IN} is:

$$C_{IN} = \frac{5.7}{f_{-3dB}} [\mu F]$$

with a gain setting of 6dB, C_{IN} is:

$$C_{IN} = \frac{4}{f_{-3dB}} [\mu F]$$

where f_{-3dB} is the -3dB corner frequency. Use capacitors with adequately low-voltage coefficients for best low-frequency THD performance.

Layout and Grounding

Proper layout and grounding are essential for optimum performance. Good grounding improves audio performance and prevents switching noise from coupling into the audio signal.

Use wide, low-resistance output traces. As the load impedance decreases, the current drawn from the device increases. At higher current, the resistance of the output traces decrease the power delivered to the load. For example, if 2W is delivered from the device output to a 4Ω load through 100mΩ of total speaker trace, 1.904W is delivered to the speaker. If power is delivered through 10mΩ of total speaker trace, 1.99W is delivered to the speaker. Wide output, supply, and ground traces also improve the power dissipation of the device.

The IC is inherently designed for excellent RF immunity. For best performance, add ground fills around all signal traces on top or bottom PCB planes.

WLP Applications Information

For the latest application details on WLP construction, dimensions, tape carrier information, PCB techniques, bump-pad layout, and recommended reflow temperature profile, as well as the latest information on reliability testing results, refer to Application Note 1891: *Wafer level packaging (WLP) and its applications*.
