### 36.3.5 TAPAnACWE — TAPA Asynchronous Hi-Z Control Write Enable Register

This register is used to enable writing for asynchronous Hi-Z control.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAPAn\_base> + 04<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

### 36.3.10 TAPAnEMU — TAPA Emulation Register

This register controls SVSTOP for emulation.

**Access:** This register can be read or written in 8-bit units. (when EPC.SVSTOP = 0, rewritten only)

**Address:** <TAPAn\_base> + 28<sub>H</sub>

**Value after reset:** Reading this register returns always 00<sub>H</sub>.

## 36.4 Asynchronous Hi-Z Control Function

If the operation of the timer motor control function controlled by the MCU becomes abnormal, the rotation of the external motor also becomes abnormal. This function can forcibly set the motor control output to the Hi-Z state upon detection of abnormal motor operation, independent of MCU control.

### 36.4.1 Overview

This function forcibly stops TAPAn output through asynchronous Hi-Z control.

- When the TAPATHASIN signal becomes active, the levels of the motor control output pins are set to Hi-Z, and motor control output is forcibly stopped.
- Motor control output in a Hi-Z state can be resumed by writing the Hi-Z stop trigger register (TAPAnOPHT0).
- The Hi-Z state of motor control output can also be specified by writing the Hi-Z control start trigger register (TAPAnOPHS).
- Setting PIC can enable or disable Hi-Z control input when an error occurs.

### 36.4.2 System Configuration Example

A system configuration example is shown below, where an external error detection signal (the TAPA0ESO signal) is used for Hi-Z control of the motor control outputs (TAPA0UP / TAPA0UN / TAPA0VP / TAPA0VN / TAPA0WP / TAPA0WN).

When valid edges of the external error detection signal are detected, the level of the motor control outputs is set to Hi-Z.

Because the microcontroller might freeze when an error occurs, external error detection signals are continuously processed so that the motor control timer outputs can be set to Hi-Z even if no clock is supplied.

Note that an error is detected only when the valid edge of the error detection signal is detected. Therefore, no error is detected if the output level is fixed and the signal level does not change.

Figure 36.4 System Configuration Example of Asynchronous Hi-Z Control for Pin Input

### 36.4.3 Basic Operation

Hi-Z control for motor control output pins can be started as follows:

- Detecting the valid edge of asynchronous Hi-Z control signal (TAPATHASIN)
- Setting the start trigger bit TAPAnOPHS.TAPAnOPHS0 of the Hi-Z control signal

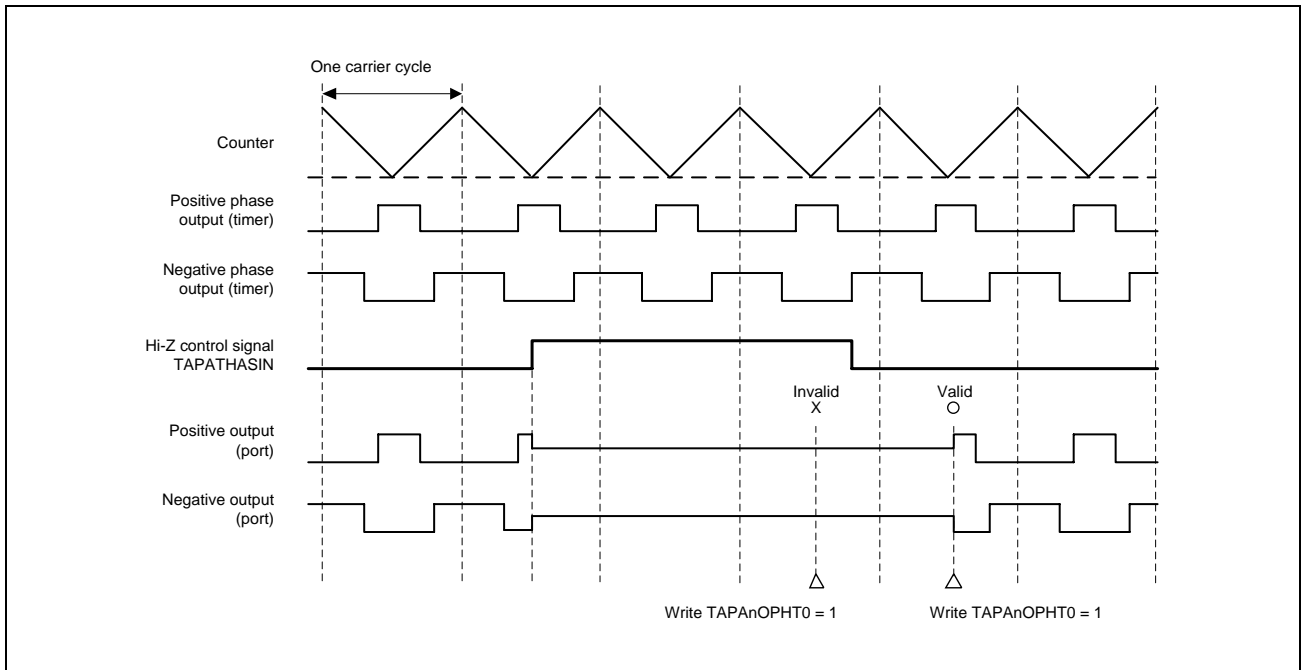

The levels of the motor control output pins are set to Hi-Z until the stop trigger bit of the Hi-Z control signal (TAPAnOPHT.TAPAnOPHT0) is set. Note that whether the setting of TAPAnOPHT0 is valid or invalid depends on the setting of TAPAnCTL0.TAPAnDCM.

#### (1) Operation when TAPAnCTL0.TAPAnDCM = 0, TAPAnDCP = 1, and TAPAnDCN = 0

The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.

The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0, regardless of the level of TAPATHASIN.

**(2) Operation when TAPAnCTL0.TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0**

The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.

Writing 1 to the stop trigger bit (TAPAnOPHT.TAPAnOPHT0) of the Hi-Z control signal is ignored while TAPATHASIN is active (high level because TAPAnCTL0.TAPAnDCP is 1).

The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0 after TAPATHASIN becomes inactive (low level because TAPAnCTL0.TAPAnDCP is 1).

### 36.4.4 Asynchronous Hi-Z Control Using Software Trigger

Hi-Z control for motor control output is possible by using the Hi-Z control start trigger bit TAPAnOPHS.TAPAnOPHS0 and Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHT0.

#### (1) Function of Hi-Z control start trigger bit TAPAnOPHS.TAPAnOPHS0

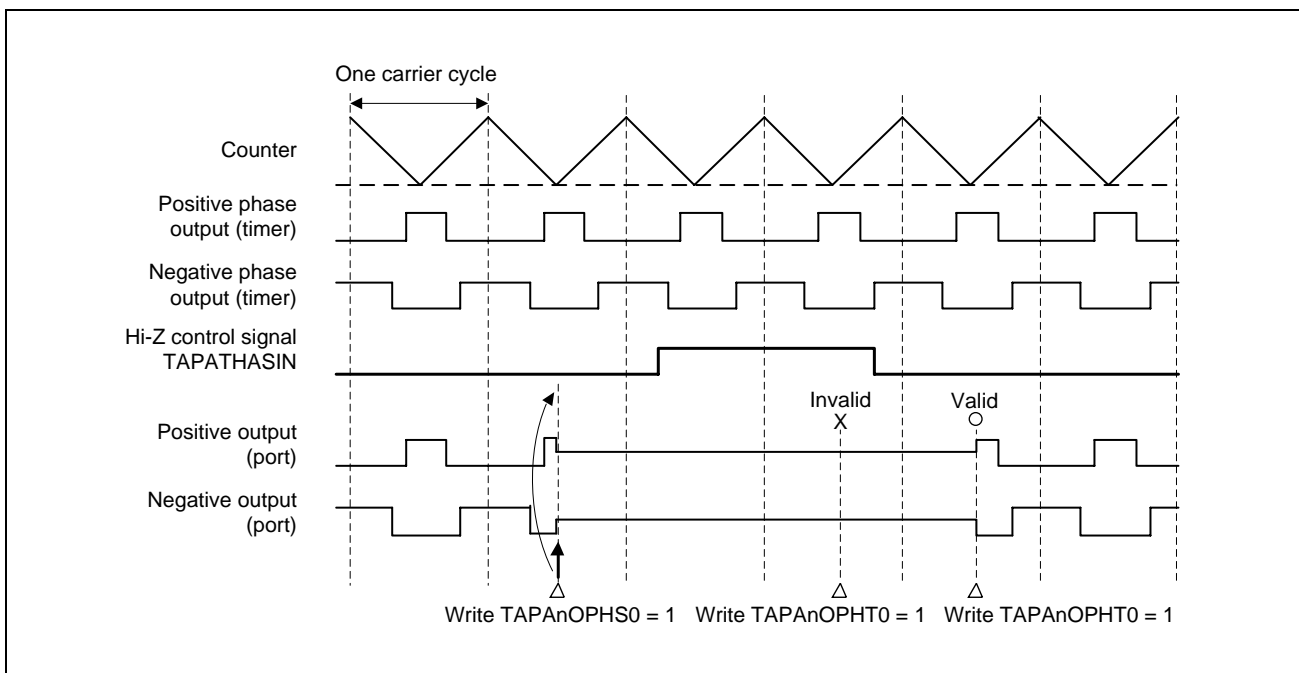

TAPAnDCM	Function
0/1	Writing 1 to TAPAnOPHS0 starts Hi-Z control and forcibly stops the motor control output (Hi-Z output).

#### (2) Function of Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHT0

Whether the Hi-Z control stop trigger is valid or invalid depends on the conditions below:

TAPAnDCM	Function
0	Writing 1 to TAPAnOPHT0 stops Hi-Z control and restarts motor control output.
1	If TAPATHASIN is inactive, writing 1 to TAPAnOPHT0 stops Hi-Z control and restarts motor control output. If TAPATHASIN is active, writing 1 to TAPAnOPHT0 is ignored.

#### (3) Operation when TAPAnCTL0.TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0

The motor control output (Hi-Z output) is forcibly stopped when 1 is written to TAPAnOPHS0.

After that, the level of the motor control output remains Hi-Z even if the rising edge of TAPATHASIN is detected.

Writing to TAPAnOPHT0 is ignored while TAPATHASIN is active (high level because TAPAnDCN is 0 and TAPAnDCP is 1).

After detection of the falling edge of TAPATHASIN, the motor control output restarts when 1 is written to TAPAnOPHT0 while TAPATHASIN is inactive (low level because TAPAnDCN is 0 and TAPAnDCP is 1).

### 36.4.5 Operating Procedure

The operating procedure for the asynchronous input Hi-Z control function is shown below:

	Operation	Status of TAPA
Restart ↑	Initial setup Set up the TAPAnCTL0 register. Specify TAPAnDCP and TAPAnDCN to select the input edge. Specify TAPAnDCM to select the clear mode.	Asynchronous Hi-Z control stopped (TAPAnFLG.TAPAnACE = 0)
	Start operation Set up the TAPAnACWE register. Set TAPAnACWE to 1.  Set up the TAPAnACTS register. Set TAPAnACTS to 1.	Writing to TAPAnACTS is enabled.  Asynchronous Hi-Z control enabled (TAPAnFLG.TAPAnACE = 1)
	During operation Hi-Z control for the timer function outputs can be started by controlling the following: <ul style="list-style-type: none"> <li>• TAPAnOPHS register</li> <li>• Asynchronous Hi-Z control signal (TAPATHASIN)</li> </ul> Hi-Z control for the timer function outputs can be stopped by controlling the following: <ul style="list-style-type: none"> <li>• TAPAnOPHT register (If TAPAnDCM is 1, control by the TAPAnOPHT register is enabled only while TAPATHASIN is inactive.)</li> </ul> The TAPA operating status can always be read using the TAPAnFLG register.	Hi-Z control for the motor control output pins is started by detecting the valid edge of the asynchronous Hi-Z control signal (TAPATHASIN) or by setting the Hi-Z control start trigger bit TAPAnOPHS0 to 1.  Hi-Z control for the motor control output pins is stopped by setting the Hi-Z control stop trigger bit TAPAnOPHT0 to 1 according to the operation mode specified by the TAPAnDCM bit.
	Stop operation Set up the TAPAnACWE register. Set TAPAnACWE to 1.  Set up the TAPAnACTT register. Set TAPAnACTT to 1.	Writing to TAPAnACTT is enabled.  Asynchronous Hi-Z control stopped (TAPAnFLG.TAPAnACE = 0)

### 36.4.6 TAPA0 Hi-Z Control Input Selection

In order to stop the motor control output in case of errors, error events are selected in PIC and the level of the motor control output is set to Hi-Z in TAPA0, as shown in the diagram below.

The TAPA function can be stopped by setting  $TAPA0ACTT = 01_H$  after setting  $PIC0HIZCEN0 = 00_H$  or  $TAPA0ACWE = 01_H$ .

## 36.5 INT Signal Output Selection Function

### 36.5.1 Configuration of the INT Signal Output Selection Function

This function generates the peak interrupt `INTTAPA0IPEK0` and valley interrupt `INTTAPA0IVLY0` by using the `TAPATSIM0` signal, which is connected to the INT signal on the `TAUD`'s triangular carrier cycle generation channel (master) and `TAPATUDCM0` signal, which is connected to the counter up/down signal.

For the connection destination of `TAPATSIM0`, see **Section 36.1.7, Internal Output Signal**.

Figure 36.6 Basic Timing of Signals for the INT Signal Output Selection Function

Triangular carrier cycles are generated on the master channel.

The INT signal generated on the master channel in each half triangular carrier cycle is input to `TAPAn` as the `TAPATSIM0` signal. `TAPAn` generates the `INTTAPA0IPEK0` signal (peak interrupt) during high level of the `TAPATUDCM0` signal and the `INTTAPA0IVLY0` signal (valley interrupt) during low level of the `TAPATUDCM0` signal by using the `TAPATSIM0` and `TAPATUDCM0` input signals.

#### CAUTION

The peak interrupt `INTTAPA0IPEK0` and valley interrupt `INTTAPA0IVLY0` are generated regardless of the function of the master channel of `TAUD`.

When not using these peak and valley interrupts, mask them by using the `ICTAPAnIPEK0` and `ICTAPAnIVLY0` registers, respectively.

### 36.6.4 Operating Procedure for A/D Converter Conversion Trigger Selection Function

The operating procedure for the A/D converter conversion trigger selection function is shown below.

	Operation	Status of TAUD and TAPA
Restart	Initial setup Initialize TAUD. Specify the timer operation mode.  Set up the TAPAnCTL1 register. Specify TAPAnATS[1:0] (TAPATADOUT0 setting). Specify TAPAnATS[3:2] (TAPATADOUT1 setting).  Set up the PIC0ADTEN4nj and PIC0REG2n0 registers according to the signal to be used. Specify PIC0ADTEN4nj (TAPATCDENS0 or TAPATCDENS1 setting). Specify PIC0REG2n0 (INTTAPA0IVLY0 setting).	TAUD and TAPA stop the operation.
	Start operation Start the TAUD operation.	TAUD starts the count operation.
	During operation TAUD operates according to the setting of each function.	The A/D conversion trigger selection function outputs either TAPATADOUT0 according to the setting of TAPAnATS[1:0] or TAPATADOUT1 according to the setting of TAPAnATS[3:2], based on the interrupt TAPATCDENS1 or TAPATCDENS0, which is input from TAUD, and the valley interrupt INTTAPA0IVLY0, which is generated by TAPA.
	Stop operation Stop the TAUD operation.	TAUD stops the count operation.

## 36.7 ADCA Trigger Selection Function

### 36.7.4 Example of Operation

- (1) Initial setting: Set the function of each channel of the TAUD0 to be used.
- (2) Setting of the A/D conversion trigger output control register 4nj (PIC0ADTEN4nj):  
Setting the bits of A/D conversion trigger output control register 4nj ((PIC0ADTEN4nj) to 1 enables selection of an interrupt request signal from each channel of the TAUD0 as the trigger of the A/D conversion scan group.  
– Register setting should be performed when A/D conversion is stopped.
- (3) Setting of the A/D conversion trigger selection control register (ADCA0SGTSELx):  
Setting the bits corresponding to each trigger to 1 enables to use the signal generated by executing the logical OR of each trigger as the start trigger of the A/D conversion scan group.  
– Register setting should be performed when the A/D conversion is stopped.
- (4) Enabling of TAUD0 timer operation  
Each channel of the TAUD0 timer set in (1) starts.

0	SYNCTRG	Generates a start trigger for the timer whose simultaneous start is enabled. When read, this bit is always read as 0. 0: Disabled. 1: Simultaneous start trigger is generated (the pulse in the width of 1PCLK is output).

### 36.8.4 Example of Operation

- (1) Operation example of timer configuration:  
The timers that operates in operation mode to be selected can be simultaneously started in any combinations.
- (2) Simultaneous start enable:  
Setting the relevant bits in the PICOSSER0 and PICOSSER2 registers of the target timers to be simultaneously started to 1 enables these timers to simultaneously start.
- (3) Start trigger output:  
Writing 1 to the SYNCTRG bit in the PICOSST register enables the target timers set in (2) to simultaneously start.
- (4) Repeating (2) and (3) for the channels that have not started yet enables the different target timers to simultaneously start in multiple batches.

### 36.9.4 Example of Operation

The trigger and pulse width measurement function is achieved by combining the ENCA0 trigger signals (ENCAT0IEC, ENCAT0EQ0, ENCAT0EQ1) and the following functions of TAUD0 and TAUJ1.

- TAUDTTINm input pulse interval measurement function (TAUD0)
- TAUJTTINm input pulse interval measurement function (TAUJ1)

Also, the following function of PIC is used to convert the trigger signal input to TINm into a level-sensitive toggle signal.

- DT circuit

The trigger and pulse width measurement function implements measurement of the ENCA0 output trigger signal interval using the TAUDTTINm input pulse interval measurement function of TAUD0 and the TAUJTTINm input pulse interval measurement function of TAUJ1.

#### (1) TAUDTTINm Input Pulse Interval Measurement Function, TAUJTTINm Input Pulse Interval Measurement Function

When the valid TINm edge of TAUD0 or TAUJ1 is detected, the CNTm value is captured into CDRm and CNTm is cleared.

#### CAUTION

Set both edges (rising and falling edges) of TINm to be detected as valid (TAUD0CMURm.TAUD0TIS[1:0] = 10<sub>B</sub>, TAUJ1CMURm.TAUJ1TIS[1:0] = 10<sub>B</sub>) for this function.

For details of the TAUD and TAUJ functions, see the corresponding sections.

#### (2) DT Circuit

The DT circuit is used to convert the trigger signal output from ENCA0 into a level-sensitive toggle signal.

As shown in **Figure 36.17, Operation of DT Circuit**, the output signal is toggled upon each input trigger signal generation.

Figure 36.17 Operation of DT Circuit

PIC provides input signal conversion and signal connection to TAUD0 and TAUJ1 to measure the generation interval of trigger signals from ENCA0.

The timing chart of the trigger and pulse width measurement function is shown below.

Figure 36.18 Operation Example of the Function of Trigger and Pulse Width Measurement (m = 0 to 2, k = 0, 1)

- (1) The following signals are output from ENCA0 as triggers:
  - ENCAT0IEC (interrupt trigger signal output when timer counter value is cleared by ENCA0EC input)
  - ENCAT0EQ0 (trigger signal output according to timing of a match of timer counter value and value of compare register 0)
  - ENCAT0EQ1 (trigger signal output according to timing of a match of timer counter value and value of compare register 1)
- (2) The trigger signal output from ENCA0 is converted to a level-sensitive toggle signal by the DT circuit and is output to TINm of TAUD0 and TAUJ1.
- (3) By setting both TINm edges (rising and falling edges) of TAUD0 and TAUJ1 as valid, the CNTm value is captured into CDRm at the TINm toggle timing and cleared to 0000H. This operation is repeated. The first captured value (shown as “a” in the figure) from the start of operation indicates the interval from the start of TAUJ operation until trigger input.
- (4) When an overflow occurs, the count value FFFF<sub>H</sub> (FFFF FFFF<sub>H</sub> for TAUJ) is captured but the count value is not captured at the first trigger after the overflow.

With the above operation, the trigger generation interval can be measured.

The following table shows the combinations of the trigger signals and measurement timers, and the bit settings of the pertinent PIC registers for setting the signal paths and the I/O selection registers. Appropriately set these bits according to the trigger signal to be measured and the measurement timer to be used.

Table 36.36 Combinations of Trigger Signals and Measurement Timers

Interrupt Trigger Signal	Measurement Timer	PIC Register Bit Setting	
ENCAT0IEC	TAUJ1 CH0	PIC0REG3100 = 1	
	TAUJ1 CH1	PIC0REG3101 = 1	
ENCAT0EQ0	TAUD0 CH0	PIC0REG3109 = 0 PIC0REG3110 = 1	
	TAUD0 CH2	PIC0REG3112 = 1 PIC0REG3113 = 0	
ENCAT0EQ1	TAUD0 CH0	PIC0REG3106 = 1	PIC0REG3109 = 0
		PIC0REG3107 = 0	PIC0REG3110 = 0
	TAUD0 CH1	PIC0REG3108 = 0	PIC0REG3111 = 1

### 36.9.5 Setup Flow

The setup flow in this section shows the general setup flow to measure the pulse interval, which applies to all the following combinations. For the combinations of the trigger signals and measurement timers, see **Table 36.36, Combinations of Trigger Signals and Measurement Timers**.

#### NOTE

When TAUJ1CMORk is used for the TAUDTTINm input pulse interval measurement function, the TAUJ1CKS[1:0] (operating clock selection) and TAUJ1MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUJ1COS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 33, Timer Array Unit J (TAUJ)**.

For TAUJ common registers (TAUJ1TOE, TAUJ1TO, TAUJ1TOM, TAUJ1TOC, TAUJ1TOL, TAUJ1RDE, and TAUJ1RDM), only set the bits corresponding to the used channels to 0.

#### NOTE

When TAUD0CMORm is used for the TAUDTTINm input pulse interval measurement function, the TAUD0CKS[1:0] (operating clock selection) and TAUD0MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUD0COS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 32, Timer Array Unit D (TAUD)**.

For TAUD common registers (TAUD0TOE, TAUD0TO, TAUD0TOM, TAUD0TOC, TAUD0TOL, TAUD0TDE, TAUD0TDM, TAUD0TDL, TAUD0TRE, TAUD0TRO, TAUD0TRC, TAUD0TME, TAUD0RDE, TAUD0RDS, TAUD0RDM, and TAUD0RDC), only set the bits corresponding to the used channels to 0.

## 36.10 A/D Trigger Encoder Capture Function

### 36.10.1 Functional Overview

The value of the encoder counter synchronized with A/D conversion can be obtained by using an A/D conversion trigger signal as a capture signal of ENCA0.

### 36.10.2 Configuration

#### (1) Configuration

Table 36.41 Configuration of A/D Trigger Encoder Capture Function

A/D Converter	Encoder Timer
ADCA0	ENCA0

#### (2) Block Diagram

Figure 36.21 Block Diagram of A/D Trigger Encoder Capture Function

#### CAUTION

- It takes ENCA0 one additional clock cycle to capture the input signal of the ADCA0TRG0, ADCA0TRG1, and ADCA0TRG2 pins compared with the number of clock cycles it takes to capture the input signal of the ENCA0TIN1 pin when using CKSCLK\_IPER11, and three additional clock cycles when using CKSCLK\_AADCA. Be sure to take this into account when configuring your system.
- Configure the edge detection function by using the edge detection function registers of the digital noise filter, which are FCLA0CTL0\_ADC0, FCLA0CTL1\_ADC0, and FCLA0CTL2\_ADC0 (see **Section 2A.12.1.4, Input Pins that Incorporate Digital Filter Type D**, **Section 2B.12.1.4, Input Pins that Incorporate Digital Filter Type D** and **Section 2C.12.1.4, Input Pins that Incorporate Digital Filter Type D** for details), and specify “rising edge” for edge detection of the ENCA0TIN1 capture trigger input of ENCA0 (ENCA0IOC0.ENCA0TIS [3:2] = 01<sub>B</sub>). Do not set ENCA0IOC0.ENCA0TIS [3:2] to 10<sub>B</sub> (falling edge) or 11<sub>B</sub> (both edges).
- ADCA0TRG0-2 are selected by ADCA0SGTSEL1-3 signal shown in **Figure 36.8, Block Diagram of A/D Conversion Trigger Selection Function**.

### 36.10.4 Example of Operation

The A/D trigger encoder capture function is implemented by connecting A/D conversion trigger signal ADCAnTRGi ( $n = 0, i = 0$  to 2) to ENCA0.

#### CAUTION

When using this function, the ENCA0 interrupt signal ENCATINT1 should not be selected as the A/D converter trigger. If selected, the correct operation cannot be performed because the following loop occurs: ADCAnTRG1 generation → ENCA0 capture operation → ENCATINT1 generation by capture operation → ADCAnTRG1 generation.

The following shows a timing chart of the A/D trigger encoder capture function using the ADCA0TRG1 as a trigger.

Figure 36.22 Operation Example of Trigger Encoder Capture Function

- (1) When ADCA0TRG1 is selected as ENCA0 capture trigger 1 signal ENCATTIN1, the valid ADCA0TRG1 is input to ENCA0 as the ENCATTIN1 signal and ENCA0 is captured.
- (2) When a hardware trigger signal (ADCA0TRG0, ADCA0TRG2) other than ADCA0TRG1 is generated, the ENCATTIN1 signal is not generated and ENCA0 is not captured.

### 36.10.5 Setup Flow

The setup flow in this section shows the general setup flow to perform the capture operation of encoder timer ENCA0 based on the ADCA0TRG1 signal.

## 36.11 Three-Phase PWM Output with Dead Time

### 36.11.1 Functional Overview

This feature generates each of the set signals (active level timing signals) and clear signals (inactive level timing signals) once or less per cycle and then uses the results to output a three-phase PWM waveform with dead time.

For the PWM output feature of TAUD, only the clear timing used during each cycle is specified by specifying the duty value, but for the feature described here, the set timing can also be specified, which makes more flexible PWM output with dead time possible.

### 36.11.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0)

Table 36.44 Configuration of Three-Phase PWM Output with Dead Time

Timer	Timer Motor Control Function
TAUD0 CH2, CH4 to CH15 (used channels fixed)	TAPA0

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INT<sub>m</sub> → INTTAUD<sub>n</sub>Im (TAUD<sub>n</sub> channel m interrupt)
- TIN<sub>m</sub> → TAUDTTIN<sub>m</sub> (TAUD<sub>n</sub> channel m input)
- TOUT<sub>m</sub> → TAUDTTOUT<sub>m</sub> (TAUD<sub>n</sub> channel m output)
- CDR<sub>m</sub> → TAUDnCDR<sub>m</sub> (TAUD<sub>n</sub> channel m data register)
- CNT<sub>m</sub> → TAUDnCNT<sub>m</sub> (TAUD<sub>n</sub> channel m counter register)

#### (1) TAUD<sub>n</sub> Configuration

Because CH10, CH12, and CH14 are only used for TOUT<sub>m</sub>, these channels can be used for features that do not use TOUT<sub>m</sub> (m = 10, 12, 14).

### 36.11.4 Operation Example

This example shows how to generate each of the set signals and clear signals once or less per cycle and then use the results to output a three-phase PWM waveform with dead time.

This is achieved by combining the following TAUD features:

- PWM output
- One-phase PWM output

In addition, the following peripheral interconnections are used to create the PWM waveform supplied from the set and clear signals generated during PWM output to the input TIN<sub>m</sub> signal (m = 11, 13, or 15) of one-phase PWM output:

- SR flip-flop circuit

Three-phase PWM output is achieved by assigning the one-phase PWM output with dead time achieved using the above features to the U, V, and W phases. Therefore, the set and clear signals of PWM output can be freely specified for each PWM phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

#### 36.11.4.1 Pwm Output

PWM output uses a combination of CH2, CH4, and CH5.

By specifying the cycle for CDR02, the U phase set value for CDR04, and the U phase clear value for CDR05, a set/clear signal is generated for the SR flip-flop circuit that generates the input TIN11 signal of one-phase PWM output from INT04 and INT05.

Instead of CH4 and CH5, which are used for the above described U phase set/clear signal generation, the V phase uses CH6 and CH7, and the W phase uses CH8 and CH9.

#### 36.11.4.2 One-Phase PWM Output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.

By specifying the dead time value for CDR11, a one-phase PWM signal with dead time is output for the TIN11 input.

Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM signal with dead time, while the W phase uses CH14 and CH15.

#### CAUTION

---

Specify the same clock for each TAUD<sub>n</sub> channel that uses the PWM output and one-phase PWM output features.

---

For details about the TAUD functions, see **Section 32, Timer Array Unit D (TAUD)**.

### 36.11.4.3 SR Flip-Flop Circuit

The PWM waveform supplied to input TIN11 of one-phase PWM output is generated by using the U phase set signal generated by CH4 of TAUD and the U phase clear signal generated by CH5.

Figure 36.26 SR Flip-Flop Circuit Operation Timing Chart (U phase example)

- (1) When a signal is input to input S, output Q goes to the high level at the rising edge of S.
- (2) When a signal is input to input R, output Q goes to the low level at the rising edge of R.
- (3) If a signal is input to input S while output Q is at the high level, output Q is not affected.
- (4) If a signal is input to input R while output Q is at the low level, output Q is not affected.
- (5) If a signal is input to input S and input R at the same time, input R is prioritized and output Q goes to the low level at the rising edge of R.

The V phase uses INT06 and INT07 as input to supply a PWM waveform to TIN13, and the W phase uses INT08 and INT09 as input to supply a PWM waveform to TIN15.

The output change timing of the PWM waveform generated during one-phase PWM output is based on PWM output.

The active level output timing set signal and inactive level output timing clear signal of PWM are generated during PWM output. By inputting these signals to the SR flip-flop circuit, a PWM signal that can be changed at any time is generated.

A one-phase PWM signal is output by generating a positive or negative PWM waveform and then adding dead time to it according to changes in the generated PWM signal.

PIC is used to set/clear signal generated during PWM output as the TIN input for one-phase PWM output through the SR flip-flop circuit.

Figure 36.27 Example of Three-Phase PWM (U/UB, V/VB, W/WB) Output with Dead Time

**Figure 36.27, Example of Three-Phase PWM (U/UB, V/VB, W/WB) Output with Dead Time** shows a typical example of three-phase PWM output with dead time.

By appropriately setting up the set/clear signal output timing, PWM output that extends across carrier cycles (point (1)) and other types of output are also possible.

In this example, ADCA0TRG0 and ADCA0TRG1 (which are at the bottom) use the CNT and INT signals of CH10 and CH12, which are not used for one-phase PWM output, and the A/D trigger signal is output by performing type-1 A/D trigger output.

In this way, because only the TOUT<sub>m</sub> signal that performs signal output for the channel performing positive phase output is used during one-phase PWM output, any feature that uses CNT<sub>m</sub>, CDR<sub>m</sub>, or INT<sub>m</sub> can be specified. For details, see **Section 32, Timer Array Unit D (TAUD)** (m = 10, 12, or 14).

The following figures show timing charts for outputting a three-phase PWM signal with dead time.

Figure 36.28 Example of One-Phase PWM (U phase, UB phase) Output with Dead Time

An operation example of the timer configuration for performing the U phase PWM output in **Figure 36.28, Example of One-Phase PWM (U phase, UB phase) Output with Dead Time** is provided below.

- (1) By simultaneously starting timers, CH2 (the carrier cycle timer), CH4 (the U phase set signal output timing timer), and CH5 (the U phase clear signal output timing timer) are started simultaneously.  
The CH11 timer is also enabled, but until a TIN11 edge is detected, which is the count start timing, counting is not performed.
- (2) For CH4 and CH5, when there is a CH2 underflow, the settings from CDR04 and CDR05 are reloaded to CNT04 and CNT05.
- (3) When there is a CH4 underflow, the U phase set timing signal (INT04) is generated.
- (4) When there is a CH5 underflow, the U phase clear timing signal (INT05) is generated.
- (5) The peripheral interconnections supply the output of the SR flip-flop circuit that uses INT04 (the set timing signal) and INT05 (the clear timing signal) as input to the input TIN11 signal of one-phase PWM output.
- (6) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.

Figure 36.29 Example of One-Phase PWM (V phase, VB phase) Output with Dead Time

An operation example of the timer configuration for performing the V phase PWM output in **Figure 36.29, Example of One-Phase PWM (V phase, VB phase) Output with Dead Time** is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.

- (1) If the setting of CH7 (the V phase clear signal output timing timer), which generates the V phase clear timing signal (INT07), is greater than the CH2 (the carrier cycle timer) setting.
- (2) Before a V phase clear timing signal (INT07) is generated by a CH7 underflow, a CH2 (carrier cycle timer) underflow occurs, and the CH7 setting is reloaded.
- (3) It causes the V phase clear timing signal (INT07) not to be generated, resulting in consecutive generation of the V phase set timing signal (INT06).
- (4) In this case, because the V phase set timing signal (INT06) is ignored by the SR flip-flop circuit, there is no effect on the PWM output waveform. Therefore, a PWM waveform that extends across carrier cycles is output.
- (5) The PWM output is changed at the timing of the next V phase clear timing signal (INT07).

Figure 36.30 Example of One-Phase PWM (W phase, WB phase) Output with Dead Time

An operation example of the timer configuration for performing the W phase PWM output in **Figure 36.30, Example of One-Phase PWM (W phase, WB phase) Output with Dead Time** is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.

- (1) If the setting of CH9 (the W phase clear signal output timing timer), which generates the W phase clear timing signal (INT09), is less than the CH8 (the W phase set signal output timing timer) setting.
- (2) Before a W phase set timing signal (INT08) is generated by a CH8 underflow, a CH9 (W phase clear signal output timing timer) underflow occurs, and the W phase clear timing signal (INT09) is generated.
- (3) This results in consecutive W phase clear timing signals (INT09) being generated.
- (4) In this case, because the consecutively generated W phase clear timing signals (INT09) are ignored by the SR flip-flop circuit, there is no effect on the PWM output waveform.
- (5) The PWM output is changed at the timing of the next W phase set timing signal (INT08).

### 36.11.5 Setup Flow

Figure 36.31 Setup Flow (Active High Example)

Note 1. Specify the selection register and output port to use after specifying the initial settings for the peripheral interconnections and timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

Note 3. If initialization processing is not performed, the SR flip-flop circuit enters the timer-stopped state, and the timer restart output pulse might be output at an unintended level.

## 36.12 High-accuracy Triangle PWM Output with Dead Time

### 36.12.1 Functional Overview

Compared to the triangle PWM output with dead time of TAUD, this makes it possible to control the variable dead time areas near duties of 100% and 0%. This makes more accurate triangle PWM output possible.

For the triangle PWM output with dead time feature of TAUD, it is not possible to output a UB phase dead time pulse, such as when transitioning to U phase 0% triangular wave output. (See **Figure 36.33, Timing of Dead Time Output by the TAUD Feature for Outputting a Triangle PWM Signal with Dead Time**)

For this feature, a pulse is generated in combination with the TAUD timer output, and a pseudo dead time pulse is added.

Figure 36.33 Timing of Dead Time Output by the TAUD Feature for Outputting a Triangle PWM Signal with Dead Time

### 36.12.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0)

Table 36.53 Configuration of Delay Pulse Output with Dead Time

Timer	Timer Motor Control Function
TAUD0 CH2, CH4 to CH15 (used channels fixed)	TAPA0

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)

### 36.12.4 Operation Example

This is achieved by combining the following TAUD features:

- Triangle PWM output with dead time
- One-shot pulse output

In addition, the following PIC is also used because the pulse to be inserted into the variable dead time area is generated for the positive or negative phase:

- Combination circuit (PFN001, PFN023, and PFN045)

In addition, the following peripheral interconnections are also used because the pulse to be inserted into the variable dead time area is combined with the triangle PWM output waveform:

- Logical operation circuit (FN0i) (i = 0 to 5)

A high-accuracy triangle PWM signal with dead time is output by assigning the PWM output achieved using the above features to the U, V, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

#### 36.12.4.1 Triangle PWM Output with Dead Time

A triangle PWM signal with dead time is output from TOUT04 and TOUT05 by using CH2, CH4, and CH5 in combination.

#### 36.12.4.2 One-shot Pulse Output

A CDR11 pulse for which the width is delayed by the delay time (CDR10) from the valid edge of the TIN10 (TOUT02) signal of CH10 is output as TOUT11 by using CH10 and CH11 in combination.

This pulse is used as the variable dead time area pulse used near duties of 100% and 0%.

#### CAUTION

---

Specify each CDR setting for one-shot pulse output such that the following condition is satisfied:  $CDR05 \geq (CDR10 + CDR11)$

If a value that does not satisfy the above condition is specified, the output waveform might be affected. To minimize this effect, in addition to satisfying the above setting condition, leave CDR11 set to 0000<sub>H</sub> until the variable dead time area pulse is required.

Detect both rising and falling edges as the valid TIN10 (TOUT02) edge, and set TAUDnTOL11 to 1 (active low).

Specify the same operation clock for each TAUDn channel used for outputting a triangle PWM signal with dead time or a one-shot pulse.

---

For details about the TAUD functions, see **Section 32, Timer Array Unit D (TAUD)**.

### 36.12.4.3 U phase Combination Circuit (PFN001)

This circuit generates a variable dead time area pulse (FN00 A, FN01 A) for adding a generated one-shot pulse to a generated triangle PWM signal with dead time.

Figure 36.35 Block Diagram Excerpt (PFN001, FN00, and FN01)

The table below shows the relationships between combination circuit input (UIN, U2) and output (UO1, UO2).

#### NOTE

The PIC0REG2n116, PIC0REG2n117, PIC0REG2n118, and PIC0REG2n119 settings change depending on the active U phase and UB phase levels of the generated triangle PWM signal with dead time.

### 36.12.4.4 Logical Operation Circuit (FN0i) (i = 0 or 1)

This circuit combines an output triangle PWM signal with dead time (TOUT04, TOUT05) with combination circuit output (UO1 and UO2 of PFN001) and generates a PWM signal to which a variable dead time area pulse has been added.

The combination logic for the logical operation circuit is switched according to the PIC0REG2n3 register setting. (Bits 0 to 2 are specified for U phase output, and bits 4 to 6 are specified for UB phase output.)

Set up the logical operation circuit as shown in the table below. The combined signal is output from the TAPAnUP and TAPAnUM pins according to the specified combination logic.

Table 36.61 Logical Operation Circuit (FN0i) (i = 0 or 1) Settings and TAPAnUP and TAPAnUM Pin Output

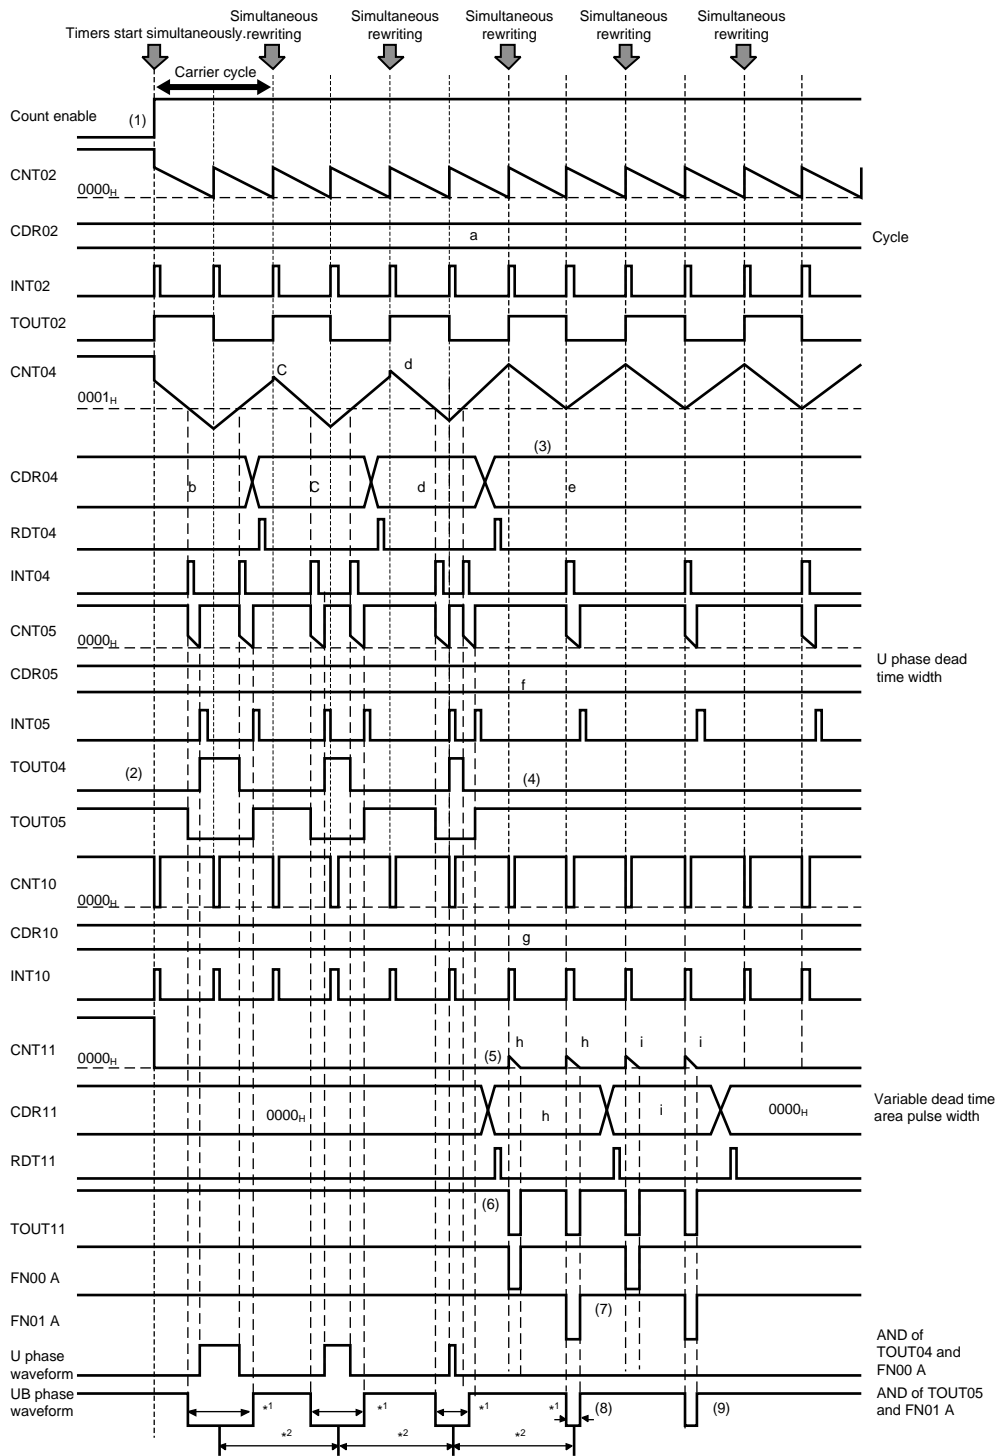

• U phase output (TOUT04)		
Active Level	PIC0REG2n302 to 00	TAPAnUP Pin Output Waveform
Active high (TAUDnTOL04 = 0)	100 <sub>B</sub>	AND of FN00 B (TOUT04) and FN00 A (UO1)
Active low (TAUDnTOL04 = 1)	101 <sub>B</sub>	OR of FN00 B (TOUT04) and FN00 A (UO1)
• UB phase output (TOUT05)		
Active Level	PIC0REG2n306 to 04	TAPAnUM Pin Output
Active high (TAUDnTOL05 = 0)	100 <sub>B</sub>	AND of FN01 B (TOUT05) and FN01 A (UO2)
Active low (TAUDnTOL05 = 1)	101 <sub>B</sub>	OR of FN01 B (TOUT05) and FN01 A (UO2)

Because the above makes variable dead time control possible to ensure output accuracy near duties of 0% and 100% even for TAUD, a more accurate triangle PWM signal can be output than that output using the TAUD feature for outputting a triangle PWM signal with dead time.

For the V/VB phase and W/WB phase, the used channels and register bits differ, but the settings are the same, as shown in **Figure 36.34, Block Diagram: High-Accuracy Triangle PWM Output with Dead Time**.

The peripheral interconnections provide a connection for adding the pulse generated during one-shot pulse output to the PWM signal generated during output of a triangle PWM signal with dead time by using the combination circuit and logical operation circuit of the peripheral interconnections.

The following figures show timing charts for outputting a high-accuracy triangle PWM signal with dead time.

- Note 1. The variable dead time area pulse uses a sawtooth wave and is therefore expanded on one side, unlike a pulse that uses a triangle wave, which is expanded on both sides.
- Note 2. Because the variable dead time area pulse is expanded on one side, the length of the one-phase PWM output cycle for the variable dead time area increases by 1/2 the added variable dead time area pulse width.

Figure 36.36 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%)  
(when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))

An operation example in which the system transitions to a U phase of 0% and UB phase of 100% in the timer configuration for performing the U phase PWM output shown in **Figure 36.36, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))** is provided below. Output of a triangle PWM signal with dead time is active high.

- (1) When timer operation is started, output of a triangle PWM with dead time is started by the CH2, CH4, and CH5 channels of TAUDn.
- (2) A triangle PWM waveform with dead time is generated from TOUT04 and TOUT05.
- (3) A U phase duty output value of 0% is specified for CDR04.
- (4) Due to the setting in (3), TOUT04 output is the inactive level, and TOUT05 output is the active level. However, no variable dead time area pulse is output during this operation.
- (5) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 when specifying the 0% U phase duty in (3).  
For this example, the CDR11 setting is fixed to 0000<sub>H</sub> until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.
- (6) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.
- (7) The pulse output in (6) is converted to a variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).
- (8) The pulse generated in (7) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).
- (9) By later changing the CDR11 setting, which specifies the width of the variable dead time area pulse, the desired variable dead time area pulse can be added.

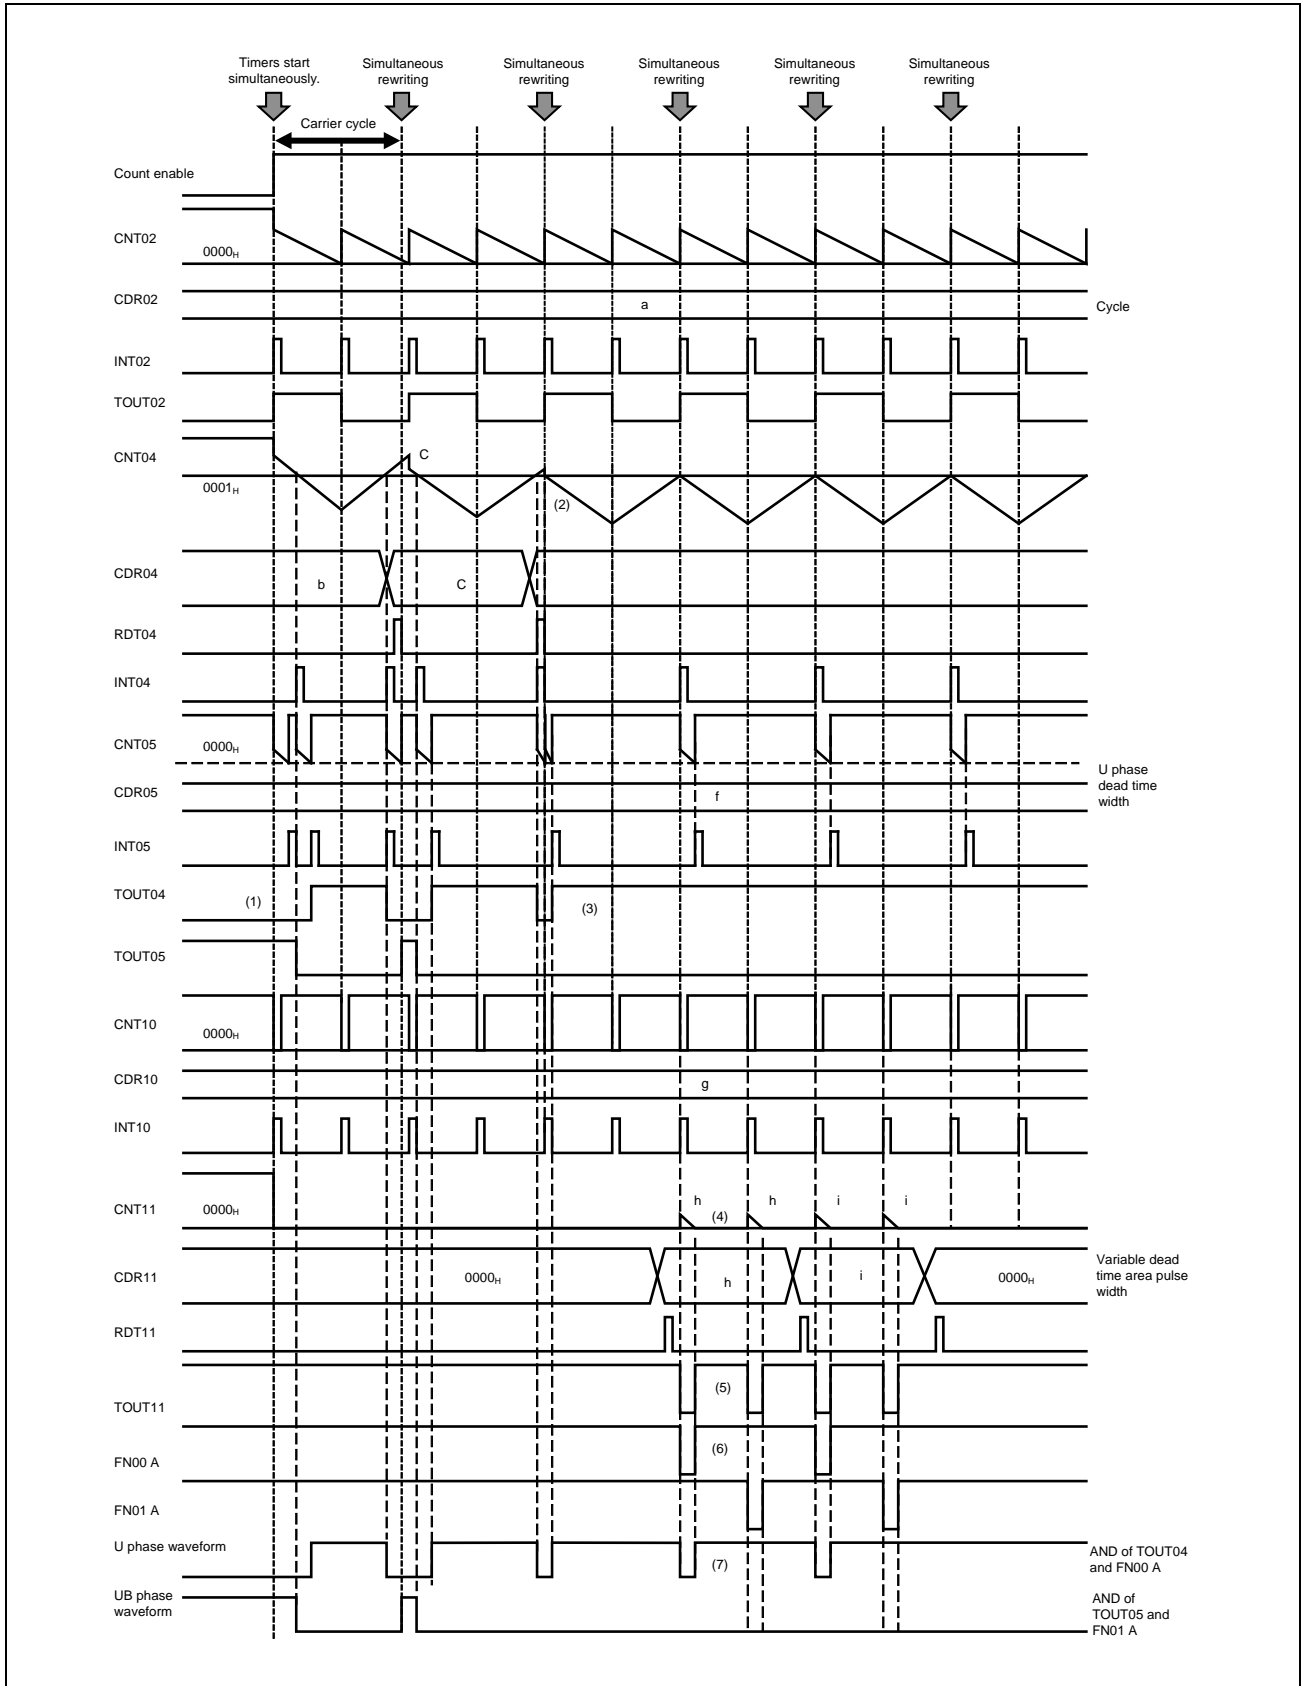

Figure 36.37 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))

An operation example in which the system transitions to a U phase of 100% and UB phase of 0% in the timer configuration for performing the U phase PWM output shown in **Figure 36.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))** is provided below. Output of a triangle PWM signal with dead time is active high.

- (1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same.
- (2) A U phase duty output value of 100% ( $CDR04 = 0000_H$ ) is specified for CDR04.
- (3) Due to the setting in (2), TOUT04 output is the active level, and TOUT05 output is the inactive level. However, no variable dead time area pulse is output during this operation.
- (4) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 one cycle after specifying the 100% U phase duty setting in (2).  
For this example, the CDR11 setting is fixed to  $0000_H$  until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.
- (5) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.
- (6) The pulse output in (5) is converted to a variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).
- (7) The pulse generated in (6) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).

#### CAUTION

If the 100% U phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the variable dead time area pulse is affected by the amount shown by (2) for the last PWM signal output from TOUT04 and shown by feature specification (1), as shown in **Figure 36.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**.

To cancel this effect, the CDR11 setting is delayed one cycle.

Figure 36.38 Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse

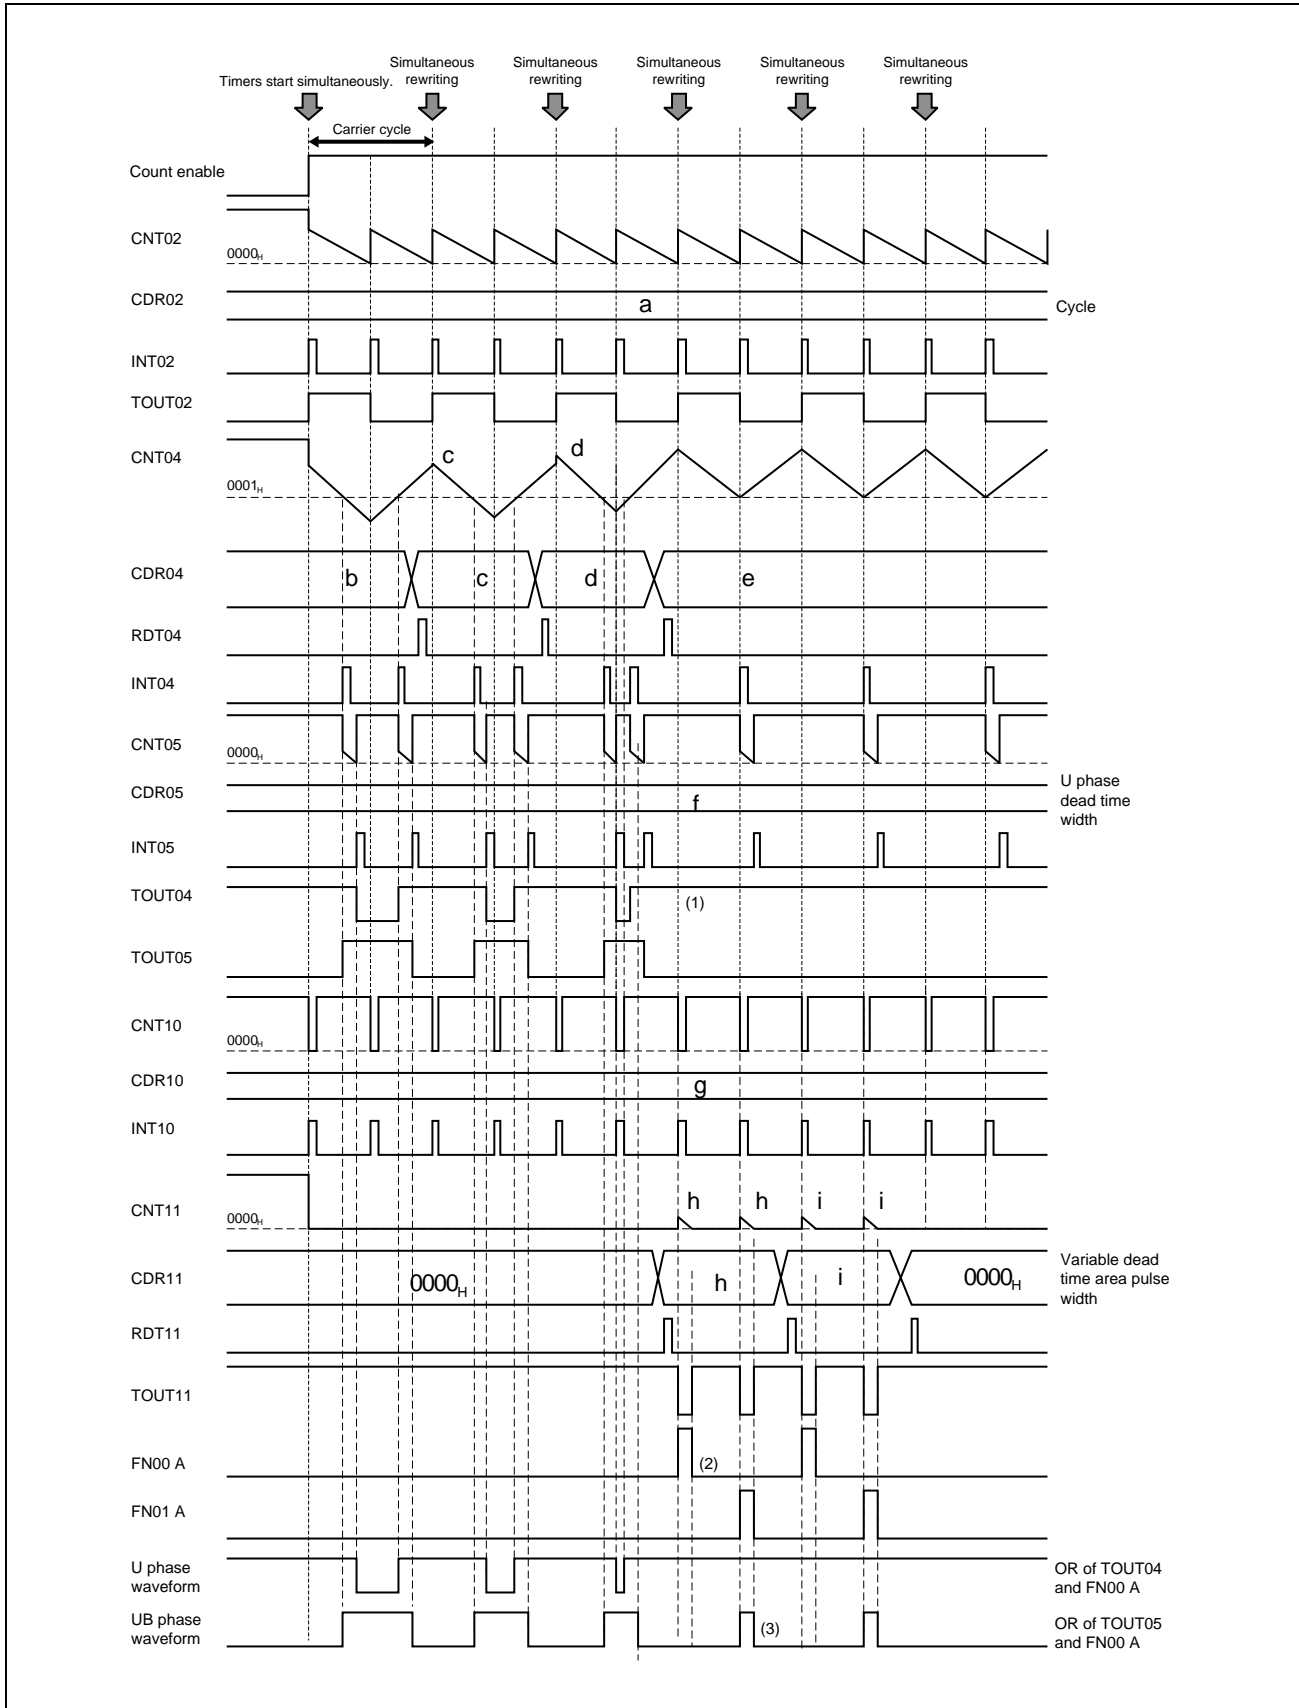

Figure 36.39 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%)  
 (TAUDnTOL04 = 1 (Active Low), TAUDnTOL05 = 1 (Active Low))

An operation example in which the system transitions to a U phase of 100% and UB phase of 0% in the timer configuration for performing the U phase PWM output shown in **Figure 36.39, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (TAUDnTOL04 = 1 (Active Low), TAUDnTOL05 = 1 (Active Low))** is provided below. Output of a triangle PWM signal with dead time is active low.

- (1) The timer operation from the start of timer operation until the output of a triangle PWM with dead time is the same as in **Figure 36.36, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**. However, an active low PWM signal is output from TOUT04 and TOUT05.
- (2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PICOREG2n116 and PICOREG2n117, and PICOREG2n118 and PICOREG2n119). This results in the output of an active low variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A).
- (3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PICOREG2n302 to PICOREG2n300 and PICOREG2n306 to PICOREG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

Figure 36.40 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%)  
 (when TAUDnTOL04 = 0 (Active Low) and TAUDnTOL05 = 0 (Active Low))

An operation example in which the system transitions to a U phase of 0% and UB phase of 100% in the timer configuration for performing the U phase PWM output shown in **Figure 36.40, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active Low) and TAUDnTOL05 = 0 (Active Low))** is provided below. Output of a triangle PWM signal with dead time is active low.

- (1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same as in **Figure 36.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**. However, an active low PWM signal is output.
- (2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PICOREG2n116 and PICOREG2n117, and PICOREG2n118 and PICOREG2n119). This results in the output of an active low variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A).
- (3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PICOREG2n302 to PICOREG2n300 and PICOREG2n306 to PICOREG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

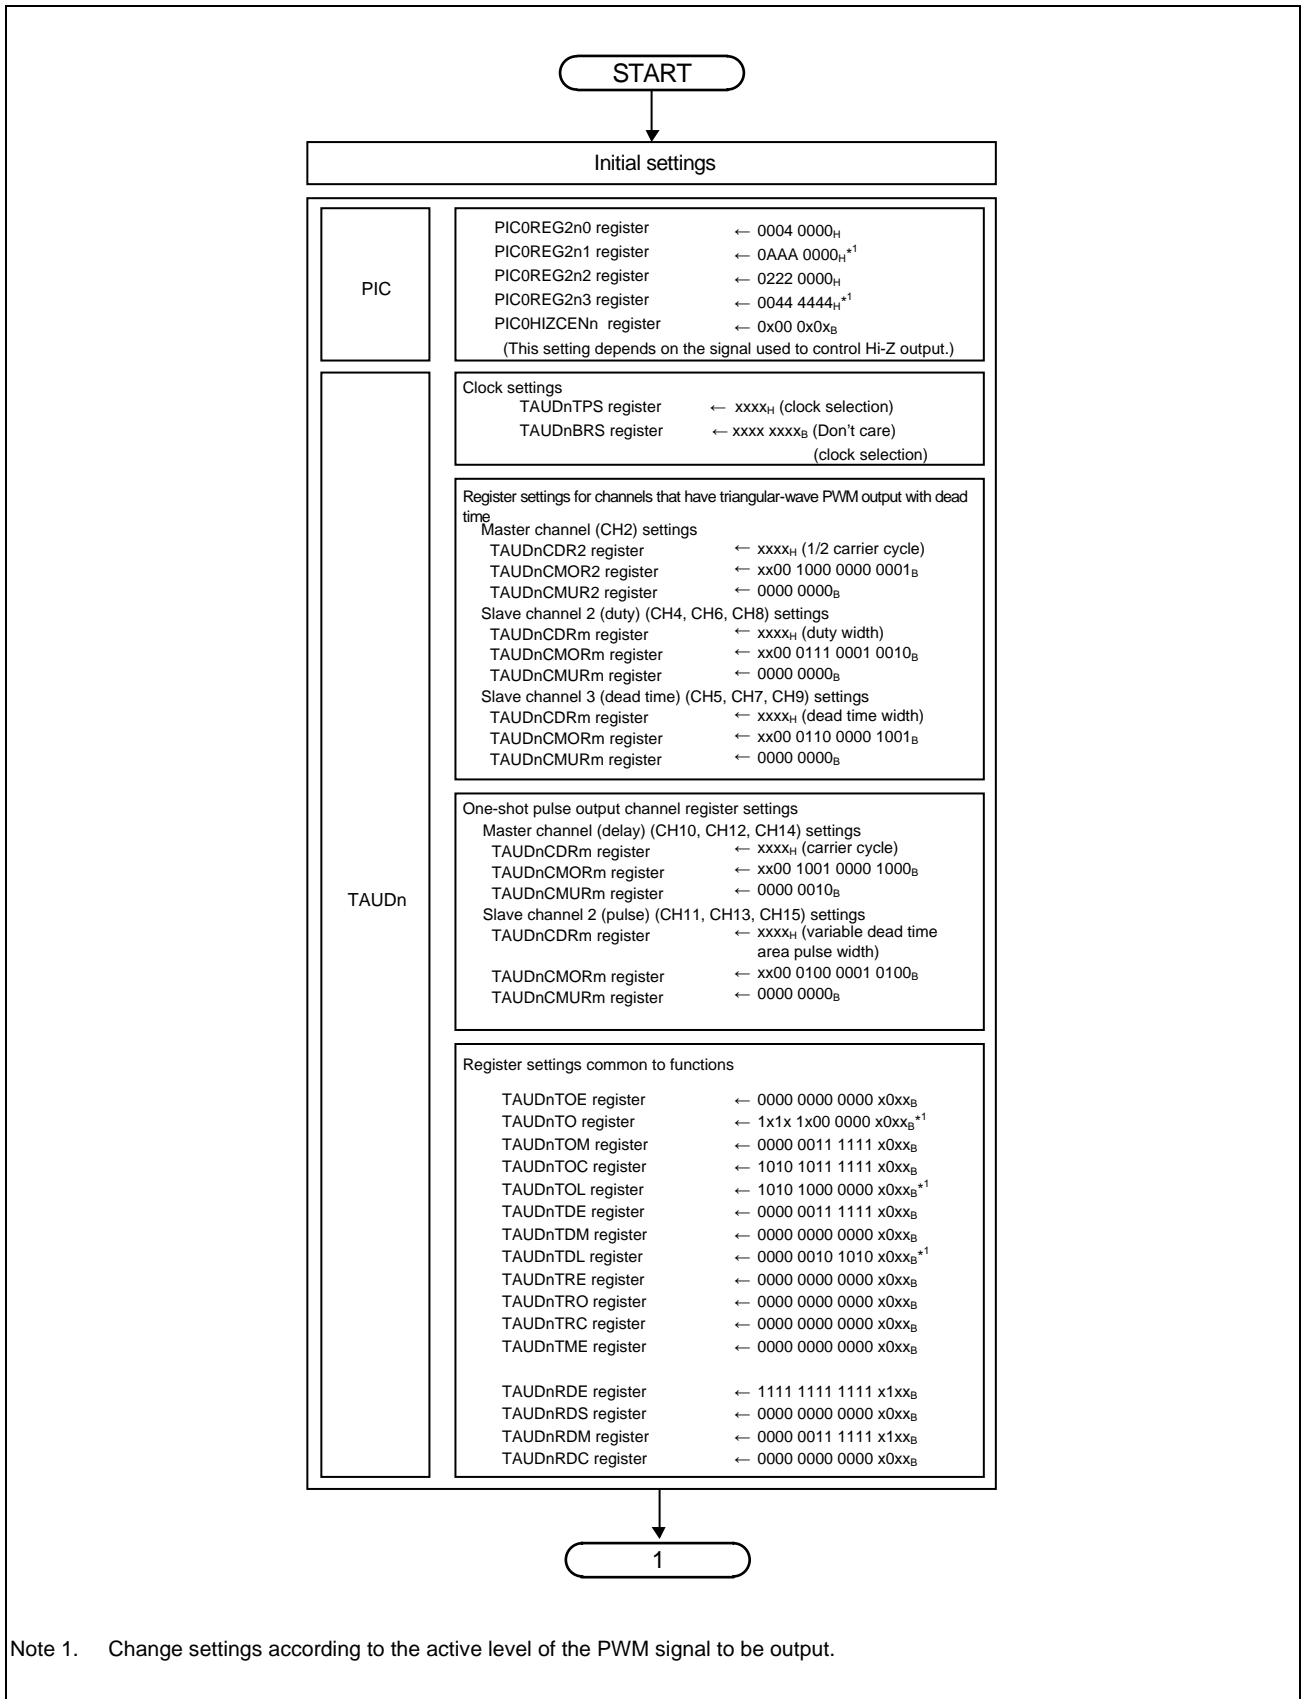

#### CAUTION

If the 100% U phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the last PWM signal output from TOUT04 is adversely affected due to the feature specifications.

To cancel this effect, the CDR11 setting is delayed one cycle.

For details, see **Figure 36.38, Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse**.

### 36.12.5 Setup Flow

Note 1. Change settings according to the active level of the PWM signal to be output.

Note 1. The master channel and slave channel names are defined for TAUD triangle PWM output with dead time. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

#### NOTE

For the TAUDnCMORm register of the master channel used when outputting a triangle PWM signal with dead time, TAUDnCKs[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

For this feature, set TAUDnMD0 to 1.

Table 36.63 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Triangle PWM Signal with Dead Time\*1) (m = 4, 6, or 8)

TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The same operation clock must be specified for the master channel and slave channel.  
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKs[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel. Specify the same clock setting as for the master channel (CH2) used to output a triangle PWM signal with dead time.

#### NOTE

For the TAUDnCMORM register used during one-shot pulse output, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

For this feature clear TAUDnMD0 to 0.

## 36.13 Delay Pulse Output with Dead Time

### 36.13.1 Functional Overview

This feature outputs a three-phase PWM with dead time that is later than the cycle timing by an amount equal to the delay amount.

Unlike the function of three-phase PWM output with dead time, a PWM signal that has a reset in the next cycle can be output.

### 36.13.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0, m = 0 to 15)

Table 36.69 Configuration of Delay Pulse Output with Dead Time

Timer	Timer Motor Control Function
TAUD0 CH2 to CH15 (used channels fixed)	TAPA0

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INT<sub>m</sub> → INTTAUD<sub>nIm</sub> (TAUD<sub>n</sub> channel m interrupt)
- TIN<sub>m</sub> → TAUDTTIN<sub>m</sub> (TAUD<sub>n</sub> channel m input)
- TOUT<sub>m</sub> → TAUDTTOUT<sub>m</sub> (TAUD<sub>n</sub> channel m output)
- CDR<sub>m</sub> → TAUDnCDR<sub>m</sub> (TAUD<sub>n</sub> channel m data register)
- CNT<sub>m</sub> → TAUDnCNT<sub>m</sub> (TAUD<sub>n</sub> channel m counter register)

### 36.13.2.1 TAUDn Configuration

Because the CDR<sub>m</sub> value of CH3 does not affect TOUT0 to TOUT15, the INT<sub>m</sub> signal of CH3 can also be used for other purposes such as A/D conversion trigger generation.

### 36.13.3 Registers

#### 36.13.3.1 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0)

This register selects CHm input signals of the TAUDn timer. This section describes the bits to be used in the delay pulse output with dead time.

**Access:** This register can be read or written in 32-bit units.

**Address:** PIC0REG202: FFDD 00C8<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

### 36.13.4 Operation Example

This is achieved by combining the following TAUD features:

- Delay pulse output function
- One-phase PWM output

The delay pulse output feature generates a PWM signal that is later than the cycle timing by an amount equal to the delay amount. Next, a one-phase PWM signal to which dead time has been added is output for the delayed PWM signal by one-phase PWM output feature.

A delay pulse with dead time is output by assigning the PWM output achieved using the above features to the U, V, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference between phases is the assigned channel, only one phase (the U phase) is described below.

#### 36.13.4.1 Delay Pulse Output Function

By using a combination of CH2, CH4, and CH5, a basic PWM signal for one-phase PWM is output from TOUT05 delayed by the amount specified by CH4 with respect to the cycle specified by CH2.

Note that CH3 is a reserved timer for achieving this feature, so do not use it for other features.

#### CAUTION

---

Do not specify a delay amount that exceeds the cycle.

---

#### 36.13.4.2 One-phase PWM Output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.

By specifying the dead time value for CDR11, a one-phase PWM with dead time is output for the TIN11 input.

Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM with dead time, while the W phase uses CH14 and CH15.

#### CAUTION

---

Specify the same clock for each TAUDn channel that uses the delay pulse output and one-phase PWM output features.

---

For details about the TAUD functions, see **Section 32, Timer Array Unit D (TAUD)**.

The differences between the delay pulse output with dead time and the three-phase PWM output with dead time are described below.

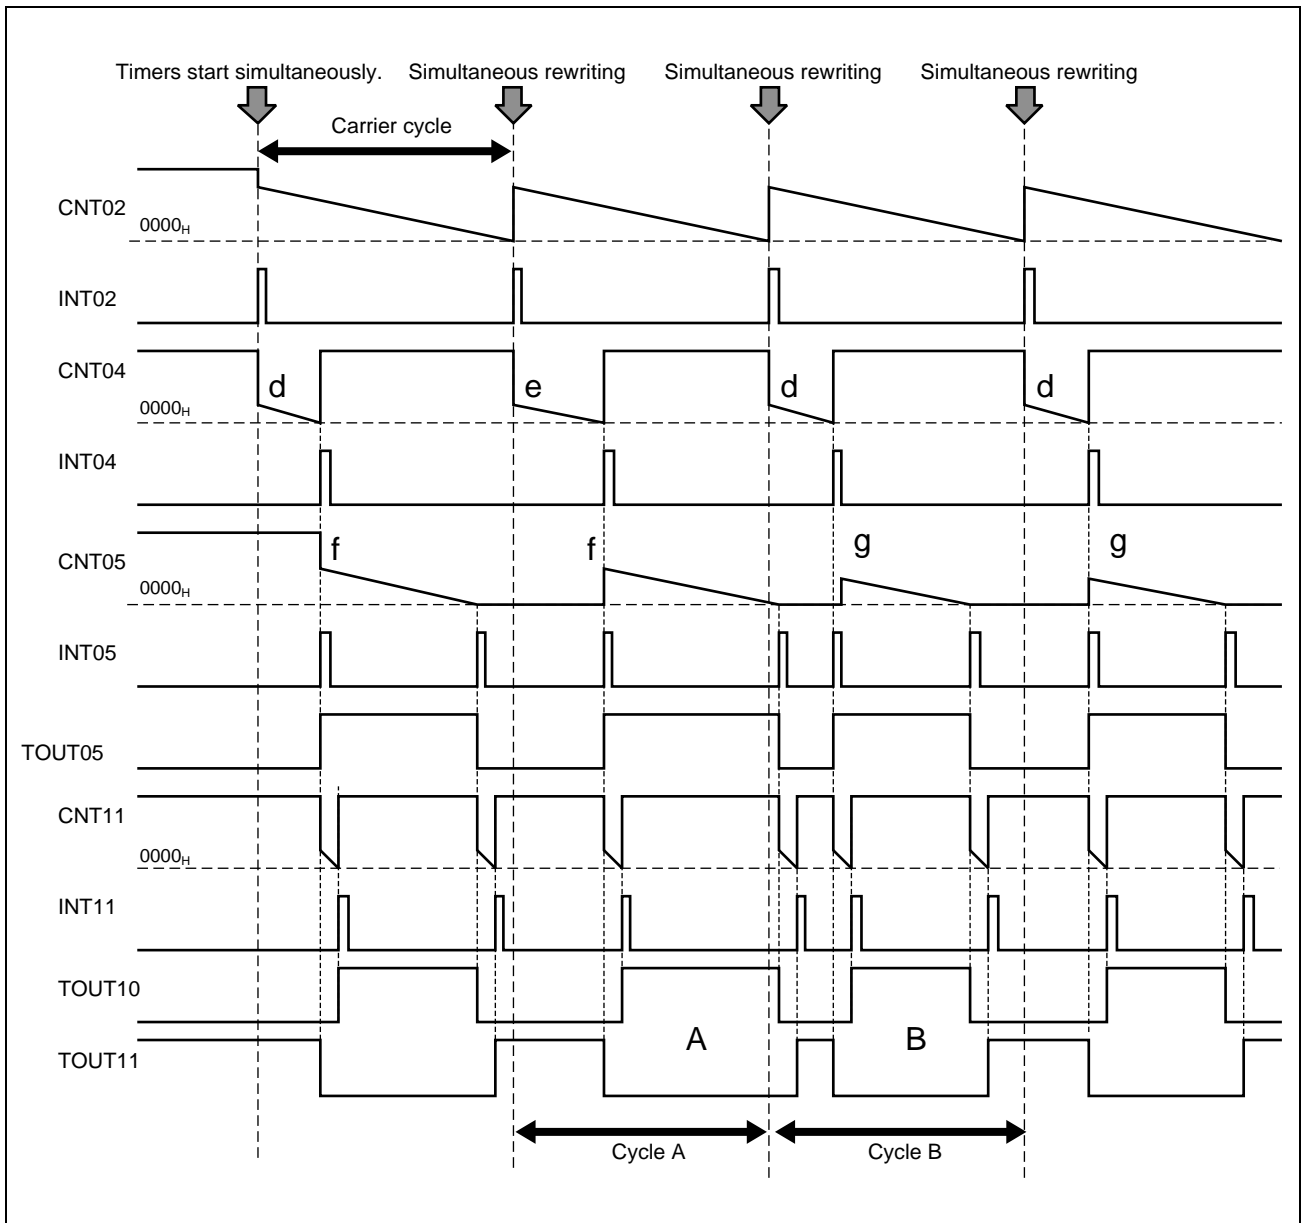

Figure 36.44 PWM Output by Outputting a Delay Pulse with Dead Time

In **Figure 36.44, PWM Output by Outputting a Delay Pulse with Dead Time**, PWM waveform A is supposed to be output before cycle A ends, but because the delay timing is too long, the PWM clear position is after the end of cycle A. Next, PWM waveform B, which is for cycle B, is output.

The operations shown below occur when an attempt is made to achieve the operations shown in **Figure 36.44, PWM Output by Outputting a Delay Pulse with Dead Time** by the three-phase PWM output with dead time.

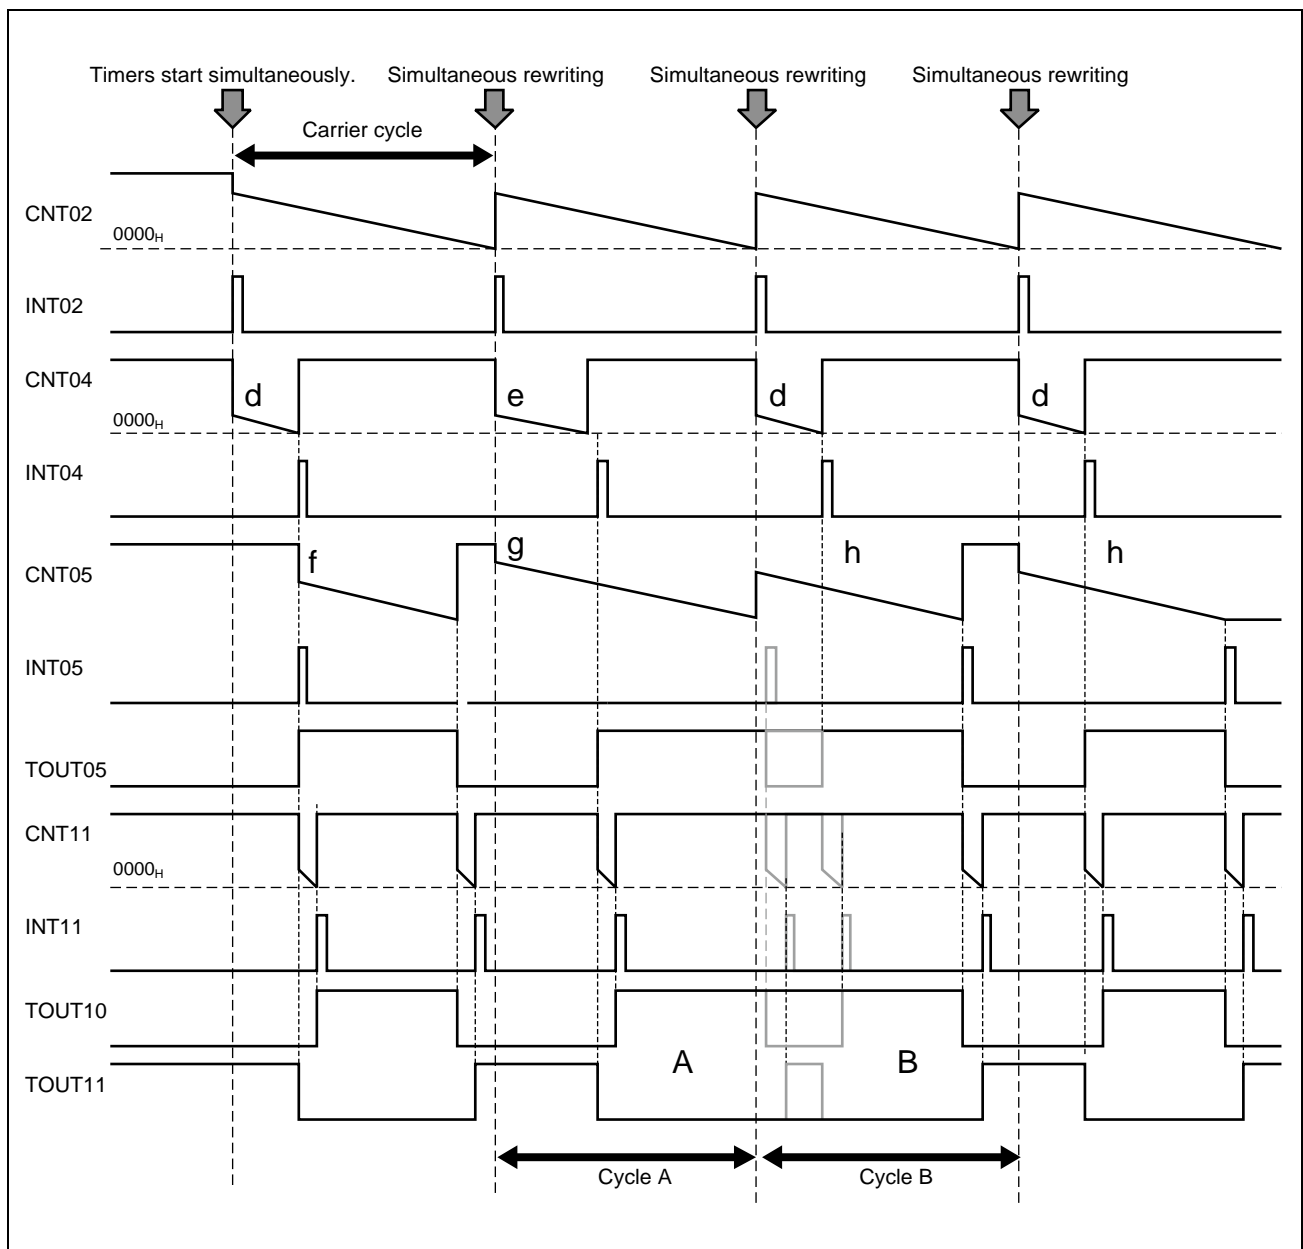

Figure 36.45 Output of a Three-Phase PWM Signal with Dead Time (1)

**Figure 36.45, Output of a Three-Phase PWM Signal with Dead Time (1)** shows an example in which the output PWM signal does not end before carrier cycle A because the set timing for outputting a three-phase PWM signal with dead time is delayed and the clear timing is after the end of the carrier cycle.

For cycle A, the set timing of PWM waveform A is the same as that in the figure on the previous page, but because the clear timing is after the end of cycle A, a reload operation occurs in cycle A before PWM waveform A is cleared, and the clear timing for PWM waveform A does not occur.

In addition, the set timing of PWM waveform B for cycle B is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle B, and a waveform that combines PWM waveform A and PWM waveform B is output.

Figure 36.46 Output of a Three-Phase PWM Signal with Dead Time (2)

**Figure 36.46, Output of a Three-Phase PWM Signal with Dead Time (2)** shows an example of outputting a three-phase PWM signal with dead time in which counter operation for which the clear timing is longer than cycle A is continued in cycle B, and PWM output A is cleared at the beginning of cycle B.

The output of PWM waveform A for cycle A is the same as the output of a delay pulse with dead time, but because the clear timing is used at the beginning of cycle B, the clear timing of PWM output B, which is supposed to be output during cycle B, does not occur.

In addition, the set timing of PWM waveform C for cycle C is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle C, and a waveform that combines PWM waveform B and PWM waveform C is output.

In this way, it is possible to achieve freer PWM output timing when outputting a delay pulse with dead time than when outputting a three-phase PWM signal with dead time.

The peripheral interconnections provide a connection for using the PWM output timing of delay pulse output as input for one-phase PWM output.

**Figure 36.47, Output of a Delay Pulse with Dead Time** shows a timing chart for outputting a delay pulse with dead time.

Figure 36.47 Output of a Delay Pulse with Dead Time

The output of a delay pulse with dead time shown in **Figure 36.47, Output of a Delay Pulse with Dead Time** is described below.

- (1) CH2 (the carrier cycle timer) and CH4 (the delay timing timer) are started simultaneously by starting timers simultaneously.  
CH5 (the PWM duty timer) and CH11 (the dead time timer) are also enabled, but no counting operations are performed until the edges of INT04, which indicates the count start timing for CH5, and TIN11, which indicates the count start timing for CH11, are detected.  
Because CH3 does not affect PWM output for this function, the channel is not described.
- (2) For CH4, when there is a CH2 underflow, the settings from CDR04 are reloaded to CNT04.
- (3) The CH4 underflow generates the delay timing signal (INT04).
- (4) When INT04 is generated, the settings from CDR05 are reloaded to CNT05, and then the CH5 (the PWM duty timer) operation starts.
- (5) At this time, INT05 is generated and the TOUT05 output level changes to the active level.
- (6) Due to the CH5 underflow, INT05 is generated again, and TOUT05 changes to the inactive level. TOUT05, which is changed by the CH4 and CH5 underflow, is supplied to the TIN11 input of one-phase PWM output.
- (7) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.

## Section 37 PWM Output/Diagnostic (PWM-Diag)

This section contains a generic description of the PWM output/diagnostic function (PWM-Diag).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of PWM-Diag.

### 37.1 Features of RH850/F1KH, RH850/F1KM PWM-Diag

#### 37.1.1 Number of Units

The PWM-Diag unit consists of a PWBA block for generating clock signals, PWGA blocks that generate PWM signals, and a PWSA block for generating triggers for A/D conversion. The numbers of individual units are listed below.

Each PWGA unit has single PWM channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 37.1 Number of Units (RH850/F1KH-D8)

Table 37.5 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, individual units constituting the PWM-Diag function are identified by the index "n"; for example, PWBA <sub>n</sub> TE indicates the PWBA <sub>n</sub> status register.
m	The PWBA generation clock is identified by the index "m"; for example, PWBA <sub>n</sub> BRS <sub>m</sub> (m = 0 to 3) indicates the PWMCLK <sub>m</sub> clock cycle configuration register.
x, y	An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index "x, y"; for example, PWSAnPVCR <sub>x_y</sub> (x_y = 00_01, 02_03, ..., 94_95).
j	Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index "j"; for example, the PWSAnQUE <sub>j</sub> (j = 0 to 7) register.
k	Sets of registers where each has the same function are identified by the index "k"; for example, the SLPWGAK (k = 0 to 2) register.
z	An A/D conversion result correspond to PWSAnPVCR <sub>x_y</sub> register is identified by the index "z"; for example, PWSAnPWDDIR <sub>z</sub> (z = 00, 01, ..., 95).
h	Sets of registers where each has the same function are identified by the index "h"; for example, the PWGAINTF <sub>h</sub> k (h = 0, 1) register.

### 37.1.8 Functional Overview

This function is comprised of four types of units: clock divider (PWBA), PWM generator (PWGA), A/D conversion trigger select function (PWSA), and A/D converter (ADCA).

#### PWBA

- Clock divider

PWBA generates a PWMCLK<sub>m</sub> count clock signal by frequency division of PCLK and supplies it to the PWM generator PWGA.

The cycle of the PWMCLK<sub>m</sub> count clock signal can be calculated from the setting of the PWBA<sub>n</sub>BR<sub>Sm</sub> register by the equation below.

(When the PWBA<sub>n</sub>BR<sub>Sm</sub> = 1 to 2047)

$$\text{PWMCLK}_m \text{ count clock cycle} = (\text{PWBA}_n\text{BR}_{Sm} \text{ value} \times 2) \times \text{PCLK cycle}$$

(When the PWBA<sub>n</sub>BR<sub>Sm</sub> = 0)

$$\text{PWMCLK}_m \text{ count clock cycle} = \text{PCLK cycle}$$

In addition, PWBA can control operation when the on-chip debugger is in use by using the PWBA<sub>n</sub>EMU register.

#### PWGA

PWGA outputs PWM waveforms and A/D conversion trigger to PWSA by using the clock PWMCLK<sub>m</sub> input from PWBA.

- PWM waveform output PWGA\_TOUT<sub>n</sub>

This generator outputs PWM waveforms from the PWGA\_TOUT<sub>n</sub> pin. The PWM cycle is controlled by the match timing of PWGA<sub>n</sub>CNT register value and the PWGA\_PERIOD input value. PWGA\_PERIOD input value can be set by PWGAPRD and PWGAPRDSLk register setting. Set the high-level period of PWM output in the PWGA<sub>n</sub>CSDR and PWGA<sub>n</sub>CRDR registers.

The PWM waveform cycle and duty can be calculated by the equations below.

$$\text{PWM waveform cycle} = (\text{PWGA\_PERIOD} + 1) \times \text{PWMCLK}_m \text{ count clock cycle}$$

When PWGA<sub>n</sub>CRDR[11:0] > PWGA<sub>n</sub>CSDR[11:0],

High-level period of PWM waveform =

$$(\text{PWGA}_n\text{CRDR register value} - \text{PWGA}_n\text{CSDR register value}) \times \text{PWMCLK}_m \text{ count clock cycle}$$

$$\text{PWM waveform duty (\%)} = \text{High-level period of PWM waveform} / \text{PWM waveform cycle} \times 100 = (\text{PWGA}_n\text{CRDR register value} - \text{PWGA}_n\text{CSDR register value}) / (\text{PWGA\_PERIOD} + 1) \times 100$$

Note that the PWM output is fixed to the low level when the PWGA<sub>n</sub>CRDR register value is equal to the PWGA<sub>n</sub>CSDR register value.

When 1<sub>XXXXH</sub> or the value higher than PWGA\_PERIOD is set in the PWGA<sub>n</sub>CRDR register (i.e. bit 12 is set to 1), the PWM output is fixed to the high level.

- A/D conversion trigger output PWGA\_TRGOUT<sub>n</sub>

The A/D conversion trigger signal PWGA\_TRGOUT<sub>n</sub> for PWSA is generated when the PWGA<sub>n</sub>CTDR register value and the PWGA<sub>n</sub>CNT register value match and its timing can be set by PWGA<sub>n</sub>OCL.

The output enable/disable of PWGA\_TRGOUT<sub>n</sub> is controlled by PWGA<sub>n</sub>TCR register. The timing can be calculated by the equation below.

$$\text{A/D conversion trigger signal generation timing} = \text{PWGA}_n\text{CTDR register value} \times \text{PWMCLK}_m \text{ count clock cycle}$$

- PWGA interrupt request signal PWGA\_INTn

PWGA generates the interrupt request signal PWGA\_INTn at the falling edge of the PWM output PWGA\_TOUTn. When the PWM output is fixed to the low level, PWGA\_INTn is generated when the PWGAnCRDR register value and the PWGAnCNT register value match; when the PWM output is fixed to the high level, it is generated when the PWGAnCNT register value and the PWGA\_PERIOD input value match.

## PWSA

PWSA transmits the required setting information to the A/D converter and outputs the A/D conversion start trigger, based on the A/D conversion trigger signal PWGA\_TRGOUTn from the PWM generator (PWGA).

- A/D conversion control by PWSA

PWSA outputs the information required for the A/D conversion, which is set in the corresponding PWSAnPVCrx\_y register for the channel number of the trigger input from PWGAn, (i.e., information on ADC physical channel, external MPX control, and error detection level selection) to the A/D converter.

At the same timing, A/D conversion trigger (PWSA\_ADTRG) is output to ADCA0 or ADCA1. (A maximum of eight input trigger signal PWGA\_TRGOUTn data received during A/D conversion are stored and kept in PWSAnQUE.)

The setting information to be output to the A/D converter is kept until the next trigger is generated.

When the A/D conversion triggered by the PWM-Diag function is completed in the A/D converter, PWSA triggers the next A/D conversion based on the data stored in the PWSAnQUE register.

- Queuing of A/D conversion triggers from PWGA

The A/D conversion trigger signal (PWGA\_TRGOUTn) input from PWGAn is stored in the PWSAnQUEj register as a channel number. The PWSAnQUEj register stores a maximum of eight channel numbers of the A/D conversion trigger signal PWGA\_TRGOUTn received during A/D conversion in a queue structure.

A PWSA queue full interrupt occurs in the following states, when the queue of the PWSAnQUEj register becomes full

- A trigger number is written to PWSAnQUE7
- A trigger number has already been written to PWSAnQUE7 and cannot be written when PWGA\_TRGOUTn is input.

- Storing A/D conversion result

The A/D conversion result is stored in PWSAnPWDDIRz register.

## ADCA

A/D conversion is executed upon receipt of information required for A/D conversion and A/D conversion trigger from PWSA.

A/D conversion is executed using the PWM-Diag-dedicated scan group; on completion of the A/D conversion, it is reported to the PWSA.

For the basic operation of the A/D converter, see **Section 38, A/D Converter (ADCA)**.

For the A/D converter operation with the PWM-Diag function, see **Section 38.4.7.1, A/D Conversion with PWM-Diag Enabled**.

0	PWBA <sub>n</sub> TS0	Start Trigger for PWMCLK0 0: Writing 0 has no effect. 1: Starts the output of PWMCLK0.

### 37.2.1.4 PWBAnTT — PWMCLKm Stop Trigger Register

This register is a stop trigger register for PWMCLKm (m = 0 to 3).

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <PWBA<sub>n</sub>\_base> + 0018<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

0	PWBAnTT0	Stop Trigger for PWMCLK0 0: Writing 0 has no effect. 1: Stops the output of PWMCLK0.

### 37.2.1.5 PWBA<sub>n</sub>EMU — PWBA Emulation Register

This register sets the operation during emulation.

**Access:** This register can be read or written in 8-bit units.

**Address:** <PWBA<sub>n</sub>\_base> + 001C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 37.2.1.6 PWGAnCTL — PWGA Control Register

PWGAnCTL is used to select the count clock from PWBA and setting output condition of PWGA\_TRGOUTn.

**Access:** This register can be read or written in 8-bit units.

**Address:** <PWGAn\_base> + 0020<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

### 37.2.1.7 PWGAnCNT — PWM Cycle Count Register

This is a count register.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <PWGAn\_base> + 0014<sub>H</sub>

**Value after reset:** 0FFF<sub>H</sub>

### 37.2.1.8 PWGAnCSDR — PWM Output Set Condition Register

This register sets the setting condition for PWGA\_TOUT<sub>n</sub> output.

**Access:** This register can be read or written in 16-bit units.

**Address:** <PWGAn\_base> + 0000<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	PWGAnCSDR[11:0]	These bits set the setting condition for PWM output. The set value is reflected to the PWGAnCSBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

#### NOTE

In case of changing PWM period by PWGAPRD and PWGAPRDSLk registers, the setting of PWGAnCSDR > PWGA\_PERIOD is prohibited.

### 37.2.1.9 PWGAnCRDR — PWM Output Reset Condition Register

This register sets the reset condition for PWGA\_TOUTn output.

**Access:** This register can be read or written in 16-bit units.

**Address:** <PWGAn\_base> + 0004H

**Value after reset:** 0000H

15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 0	PWGAnCRDR[12:0]	These bits set the reset condition for PWM output. The set value is reflected to the PWGAnCRBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

### 37.2.1.10 PWGAnCTDR — PWGA\_TRGOUTn Generation Condition Register

This register sets the generation condition for PWGA\_TRGOUTn.

**Access:** This register can be read or written in 16-bit units.

**Address:** <PWGAn\_base> + 0008H

**Value after reset:** 0000H

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	PWGAnCTDR[11:0]	These bits set the A/D conversion trigger generation condition for PWSAn. The set value is reflected to the PWGAnCTBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

### 37.2.1.11 PWGAnTCR — PWGA\_TRGOUTn Control Register

This register controls enable/disable of PWGA\_TRGOUTn.

**Access:** This register can be read or written in 8-bit units.

**Address:** <PWGAn\_base> + 0018<sub>H</sub>

**Value after reset:** 01<sub>H</sub>

0	PWGAnTOE	This bit set the output enable/disable of PWGA_TRGOUTn 0: Output disable of PWGA_TRGOUTn. 1: Output enable of PWGA_TRGOUTn. This register value is reflected to the PWGAnTCBR at the update timing selected by PWGAnTCUT[1:0].

#### NOTE

PWGAnTOE bit has to be set before count operation. In addition, in case of PWGAnTCUT=01B or 10B, PWGAnTOE bit has to be set before PWGAnTCBR rewrite request.

### 37.2.1.12 PWGAnCSBR — PWGAnCSDR Buffer Register

This is a buffer register for the PWGAnCSDR register.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <PWGAn\_base> + 0024<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

11 to 0	PWGAnCSBR[11:0]	The PWGAnCSDR register value is reflected to this register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, the pin output is driven high.

### 37.2.1.13 PWGAnCRBR — PWGAnCRDR Buffer Register

This is a buffer register for the PWGA\_TOUTn reset condition.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <PWGAn\_base> + 0028<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

When the value matches the PWGAnCNT register value, the pin output is driven low.

### 37.2.1.14 PWGAnCTBR — PWGAnCTDR Buffer Register

This is a buffer register for the PWGA\_TRGOUTn generation condition.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <PWGAn\_base> + 002C<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

When the value matches the PWGAnCNT register value, a trigger is transmitted to PWSAn.

### 37.2.1.15 PWGAnTCBR — PWGAnTCR Buffer Register

This is a buffer register for the PWGAnTCR register.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <PWGAn\_base> + 001C<sub>H</sub>

**Value after reset:** 01<sub>H</sub>

### 37.2.1.16 PWGAnRSF — Buffer Register Reload Status Register

This register is a status register for simultaneous rewrite control.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <PWGAn\_base> + 0010<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	PWGAnRSFT	PWGAnTCBR Rewrite Control Status 0: PWGAnTCBR rewrite is enabled. This value indicates the completion of PWGAnTCBR rewrite after the generation of a PWGAnTCBR rewrite trigger signal. In case of PWGAnTCUT = 00 <sub>B</sub> or 11 <sub>B</sub> , this bit shows always "0". 1: PWGAnTCBR rewrite is in progress. This value indicates the waiting state for completion.
0	PWGAnRSF	Compare Buffer Register Simultaneous Rewrite Control Status 0: Compare buffer register simultaneous rewrite is enabled. This value indicates the completion of compare buffer register simultaneous rewrite after the generation of a compare buffer register simultaneous rewrite trigger signal. 1: Compare buffer register simultaneous rewrite is in progress. This value indicates the waiting state for completion.

### 37.2.1.17 PWGAnRDT — Buffer Register Reload Trigger Register

This is a simultaneous rewrite request trigger register.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <PWGAn\_base> + 000C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

1	PWGAnRDTT	PWGAnTCBR Rewrite Request Trigger 0: Writing 0 does not work as a function. 1: Triggers the rewrite request for PWGAnTCBR, and sets PWGA0RSF.PWGA0RSFT to 1. In case of PWGAnTCUT = 00 <sub>B</sub> or 11 <sub>B</sub> , write to this bit “1” is invalid.
0	PWGAnRDT	Compare Buffer Register Simultaneous Rewrite Request Trigger 0: Writing 0 does not work as a function. 1: Triggers the simultaneous rewrite request for the compare registers (PWGAnCSDR, PWGAnCRDR, and PWGAnCTDR), and sets PWGAnRSF.PWGAnRSF to 1.

### 37.2.1.18 SLPWGAk — PWGA Synchronous Trigger Register (k = 0 to 2)

This register triggers start and stop for multiple channels simultaneously.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SLPW\_base> + k × 4H

**Value after reset:** 0000 0000H

### 37.2.1.19 PWGAPRD — PWGA Period Setting Register

This register is used to set the PWGA counter period.

**Access:** This register can be read or written in 16-bit units.

**Address:** <SLPW\_base> + 000CH

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

11 to 0	PWGAPRD[11:0]	These bits set the PWGA counter period. (= PWGA_PERIOD) The period of PWGA_TOUTn can be flexible changed by setting this register when PWGAPRDSLk is set to 1. If PWGAPRDSLk is set to 0, PWGA_PERIOD value is FFFH.

#### NOTE

PWGAPRD register setting change is prohibited during count operation.

### 37.2.1.20 PWGAPRDSLk — PWGA Period Selection Register (k = 0 to 2)

This register is used to select the PWGA counter period either 12bit free-running or PWGAPRD register setting.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SLPW\_base> + 0010<sub>H</sub> + k × 4<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

### 37.2.1.21 PWSAnCTL — PWSA Control Register

This register is used to control operations of PWSA.

**Access:** This register can be read or written in 8-bit units.

**Address:** <PWSAn\_base> + 0000H

**Value after reset:** 00H

Bit	7	6	5	4	3	2	1	0

0	PWSAnENBL	Operation Permission Control 0: Operation is prohibited (initial state). Writing 0 initializes PWSAnSTR, PWSAnQUEj, PWSAnOWE and PWSAnWFLG. 1: Operation is enabled.

#### NOTE

PWSAnARSE setting has to be changed during the state of trigger has not been input (PWSAnQUE0 = 7FH) and condition of not input the trigger from PWGA.

### 37.2.1.22 PWSAnSTR — Trigger Queue Status Register

This is a status register that indicates whether the number of a channel for which an A/D conversion trigger has been generated is stored in a PWSAnQUEj register.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <PWSAn\_base> + 0004<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

1	PWSAnQFL	Indicates the queuing state of the A/D conversion trigger. 0: Some PWSAnQUEj registers do not store a channel number. 1: All of the PWSAnQUEj registers store a channel number.
0	PWSAnQNE	Bit indicating that there is a trigger in the trigger queue 0: A channel number is not stored in a PWSAnQUEj register, or A/D conversion is in progress while only PWSAnQUE0 stores a channel number. 1: The number of the channel waiting for conversion is stored in j = 1 and subsequent PWSAnQUEj registers.

### 37.2.1.23 PWSAnSTC — Trigger Queue Status Clear Register

This register clears the status of the PWSAnSTR register.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <PWSAn\_base> + 0008<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

### 37.2.1.24 PWSAnQUEj — Trigger Queue Register (j = 0 to 7)

This register stores the channel number that received the trigger from PWGAn.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <PWSAn\_base> + 0020<sub>H</sub> + j × 4<sub>H</sub>

**Value after reset:** 7F<sub>H</sub>

6 to 0	PWSAnQUEj[6:0]	These bits hold the channel number (0 to 95) of the PWGA for which a trigger was generated in order from PWSAnQUE0 to PWSAnQUE7. After the A/D conversion of PWSAnQUE0 is completed, the values in PWSAnQUE1 to PWSAnQUE7 shift to PWSAnQUE0 to PWSAnQUE6.

#### NOTE

If a trigger occurs simultaneously for multiple channels, the trigger with the smaller channel number has priority.

### 37.2.1.25 PWSAnPVCRx\_y — PWM-Diag Mode A/D Setting Register

This register is used to set the corresponding A/D converter for each channel.

Two consecutive channels are set such as PWSA0PVCR02\_03, and the 16 higher-order bits of each register correspond to an odd-numbered channel while the 16 lower-order bits correspond to an even-numbered channel.

At the generation of a trigger, the set value is transmitted to the ADCAnPWDVCR register of the A/D converter.

For the ADCAnPWDVCR register, see **Section 38, A/D Converter (ADCA)**.

**Access:** PWSAnPVCRx\_y register can be read or written in 32-bit units.

PWSAnPVCRx\_yL, PWSAnPVCRx\_yH registers can be read or written in 16-bit units.

**Address:** PWSAnPVCRx\_y: <PWSAn\_base> + 0040<sub>H</sub> + x × 2<sub>H</sub>

PWSAnPVCRx\_yL: <PWSAn\_base> + 0040<sub>H</sub> + x × 2<sub>H</sub>

### 37.3 Operating Procedure

Procedures for setting when starting and stopping operation of PWM-Diag are illustrated below.

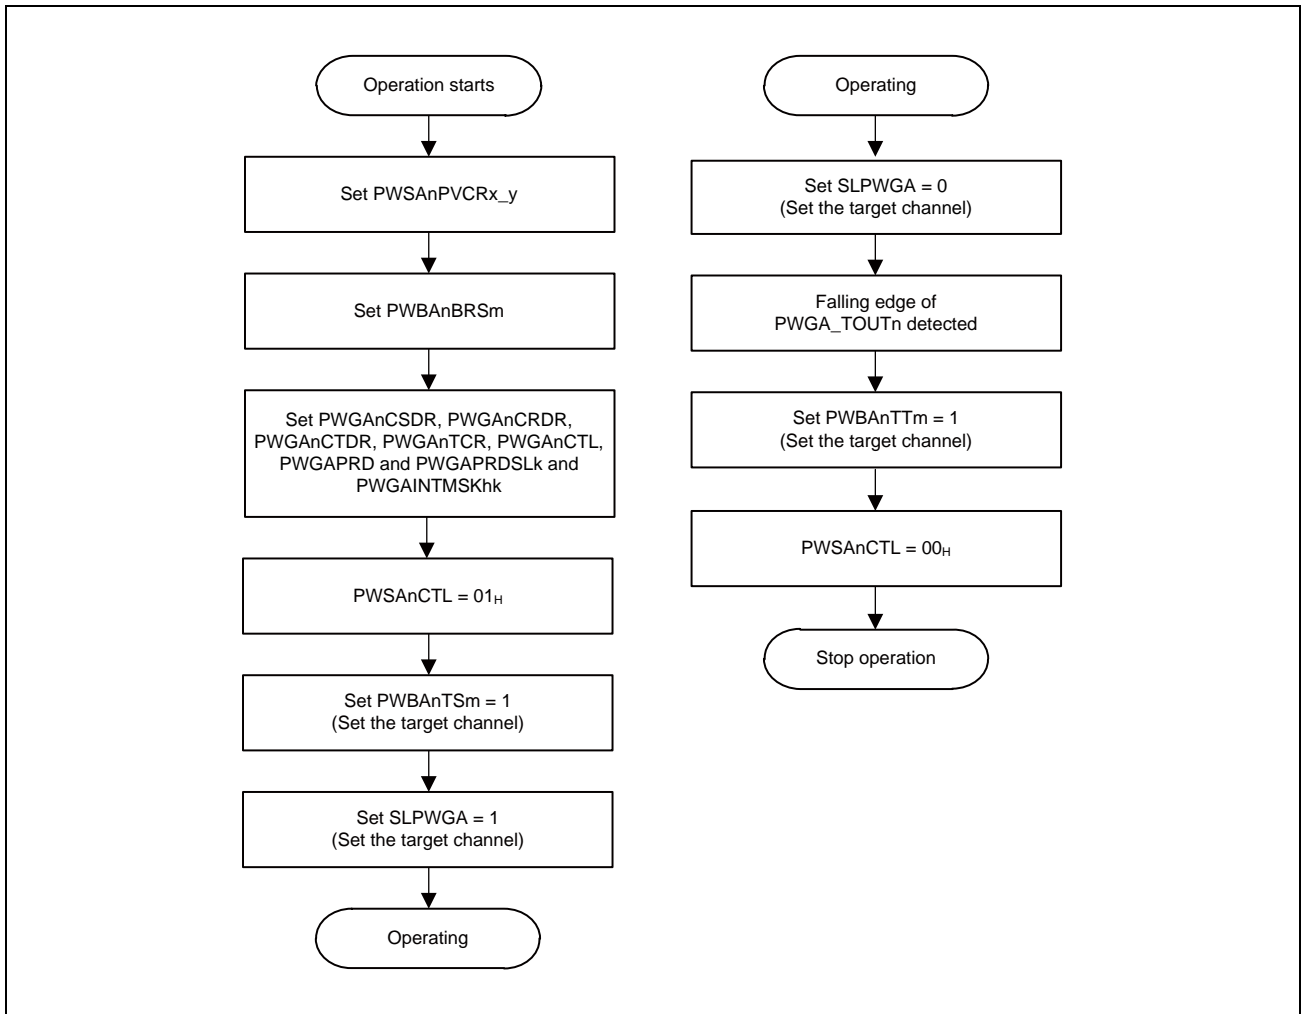

Figure 37.3 PWM-Diag Operating Procedure

Procedures for compare buffer register simultaneous rewrite of PWGA are illustrated below.

The described term “compare register” indicates PWGAnCSDR, PWGAnCRDR, or PWGAnCTDR.

In addition, the described term “buffer register” indicates PWGAnCSBR, PWGAnCRBR, or PWGAnCTBR.

Figure 37.4 Compare Buffer Register Simultaneous Rewrite Procedure

Procedures for PWGAnTCBR register rewrite of PWGA are illustrated below.

### 37.4 Operation Waveform of PWM-Diag

#### 37.4.1 PWM Waveform Output by PWGA and Operation Waveform for A/D Conversion Trigger Output

##### 37.4.1.1 Basic Operation Waveform of PWGA

The basic operation waveforms of PWGA are illustrated below.

Figure 37.6 Basic Waveform

### 37.4.1.2 Operation Waveform when Compare Buffer Register Simultaneous Rewrite for PWGA is Executed

The following figure illustrates the operation waveforms when compare buffer register simultaneous rewrite for PWGA is executed.

Figure 37.7 Waveform when Compare Buffer Register Simultaneous Rewrite is Executed (PWGAnOCL = 0)

Compare buffer register simultaneous rewrite is executed by re-setting the PWGAnCSDR and PWGAnCRDR registers, then setting either the PWGAnRDT or SLPWGAk register.

Moreover, if the relationship between set values in one interval is  $PWGAnCSDR > PWGAnCRDR$ , a falling edge in that interval is meaningless, and the falling edge in the next interval is valid.

In case of  $PWGAnOCL = 1$ , PWGAn\_TRGOUTn is also occurred at the timing of “TRGOUT does not occur” in **Figure 37.7, Waveform when Compare Buffer Register Simultaneous Rewrite is Executed (PWGAnOCL = 0)**.

### 37.4.1.3 Operation Waveform when PWGAnTCBR Register Rewrite for PWGA is Executed

The following figure illustrates the operation waveforms when PWGAnTCBR register rewrite for PWGA is executed.

PWGAnTCBR register rewrite is executed by re-setting the PWGAnTCR register after setting of PWGAnRDTT.

The update timing of PWGAnTCBR register requested by PWGAnRDTT is depended on PWGAnTCUT setting.

Figure 37.8 Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 01B)

PWGAn\_TRGOUTn is not occurred at the timing of “TRGOUT does not occur” in **Figure 37.8, Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 01B)** because PWGAnTOBE = 0 even if PWGAnOCL = 1.

Figure 37.9 Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 10<sub>B</sub>)

PWGAn\_TRGOUTn is not occurred at the timing of “TRGOUT does not occur” in **Figure 37.9, Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 10<sub>B</sub>)** because PWGAnTOBE = 0 even if PWGAnOCL = 1.

Figure 37.10 Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 11B)

PWGAn\_TRGOUTn is not occurred at the timing of "TRGOUT does not occur" in **Figure 37.10, Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 11B)** because PWGAnTOBE = 0 even if PWGAnOCL = 1.

### 37.4.1.4 Operation Waveform when Stopping and Restarting PWGA Operation

The following figure illustrates the operation waveforms when stopping and restarting PWGA operation.

Figure 37.11 Stopping and Resuming Operation (1)

After the setting of SLPWGA has been changed from 1 to 0, PWGAnCNT stops operation because PWGA\_INTn is generated.

After PWGA\_INTn has been generated, by changing the setting of SLPWGA from 0 to 1, PWGAnCNT resumes counting from 000H.

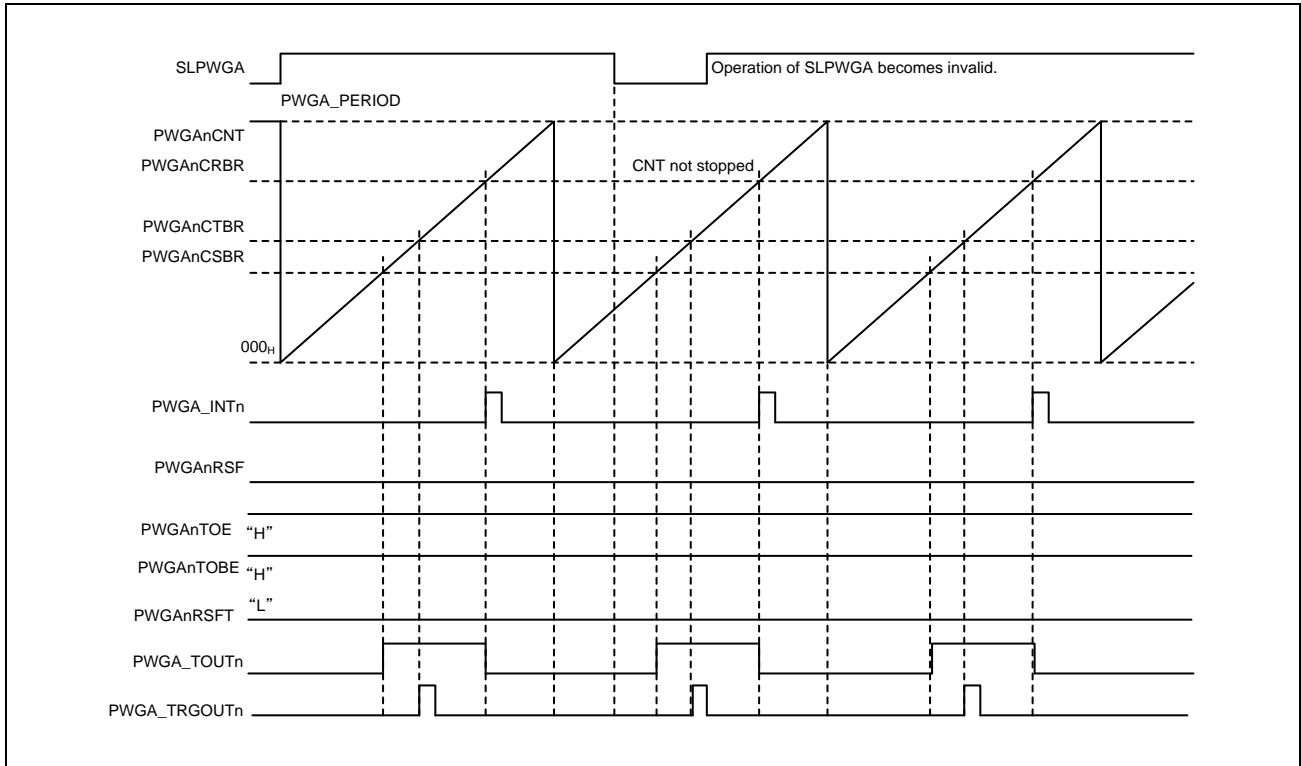

Figure 37.12 Stopping and Resuming Operation (2)

After the setting of SLPWGA has been changed from 1 to 0, if the setting of SLPWGA is changed from 0 to 1 before PWGA\_INTn is generated, operations of SLPWGA become invalid, and PWGAnCNT continues counting.

### 37.4.1.5 Waveforms of PWGA Operation with Specific Settings

The following figures illustrate the waveforms of PWGA operation with specific settings.

When PWGAnOCL is set to 0 and PWGAnCSBR is equal to PWGAnCRBR, PWGA\_TOUTn is fixed to the low level and PWGA\_TRGOUTn does not become valid as illustrated.

When PWGAnOCL is set to 1, PWGA\_TRGOUTn occurs at the timing PWGAnCNT matches PWGAnCTBR regardless of PWGA\_TOUTn level.

Figure 37.13 PWGA\_TOUTn = 0% Output Waveform

Figure 37.14 PWGA\_TOUTn = 100% Output Waveform

### 37.4.2 Operation Waveform when A/D Conversion Trigger Occurs in PWSA

An example of the PWSA operation is shown below.

Figure 37.15 Example of PWSA Operation

- (1) Triggers occur simultaneously in channels 0 and 1 of PWGA. Channel 0 with the smaller channel number is stored in PWSAnQUE0, and channel 1 with the larger channel number is stored in PWSAnQUE1. The lower 16 bits data of PWSAnPVCr00\_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter.  
The A/D converter whether ADCA0 or ADCA1 is selected by PWSAnSLAD00 bit of PWSAnPVCr00\_01. This example shows that ADCA0 is selected when PWSAnSLAD00 is 0.  
At this time, as the A/D conversion for channel 1 is in the waiting state, the PWSAnSTR.PWSAnQNE bit is set.
- (2) On completion of A/D conversion executed in step (1), the result of A/D conversion is stored in the lower 16 bits of PWSAnPWDDIR00. The higher 16 bits of PWSAnPWDDIR00 mirrors the information of PWSAnPVCr00\_01[15:0]. The channel number of PWSAnQUE1 shifts to PWSAnQUE0 and PWSAnQUE1 enters the empty state.  
After that, as similar to step (1), the upper 16-bit data of PWSAnPVCr00\_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter. This example shows that ADCA1 is selected when PWSAnSLAD01 is 1.
- (3) On completion of A/D conversion executed in step (2), the result of A/D conversion is stored in the lower 16 bits of PWSAnPWDDIR01. The higher 16 bits of PWSAnPWDDIR01 mirrors the information of PWSAnPVCr00\_01[31:16]. PWSAnQUE0 enters the empty state.

## 37.5 PWM-Diag Related Function in A/D Converter (ADCA)

This section describes the A/D converter used in the PWM-Diag function.

## 37.6 ADCA Registers when the PWM-Diag Function is Used

- Before starting PWSA operation, the A/D converter must be set using the following register.
  - PWM-Diag scan group control register (ADCA<sub>n</sub>PWDSGCR)
- When the PWM-Diag is running, the PWSA<sub>n</sub>PVCR<sub>x\_y</sub> value corresponding to the channel under conversion is set in the following register of the A/D converter.
  - PWM-Diag virtual channel register (ADCA<sub>n</sub>PWDVCR)
- After completion of A/D conversion, the conversion result can be checked by reading the following registers.
  - PWM-Diag data register (ADCA<sub>n</sub>PWDTSNDR)
  - PWM-Diag data supplementary information register (ADCA<sub>n</sub>PWDDIR, PWSA<sub>n</sub>PWDDIR<sub>z</sub>\*<sup>1</sup>)
- When A/D conversion result is outside the expected range, it can be confirmed using the upper/lower limit error detection function. The upper/lower limit error detection function is set by the following register.
  - Upper limit/lower limit error register (ADCA<sub>n</sub>ULER)
- The scan end flag of the PWM-Diag scan group can be cleared using the following register.
  - PWM-Diag scan end flag clear register (ADCA<sub>n</sub>PWDSGSEFCR)

## Section 38 A/D Converter (ADCA)

This section contains a generic description of the A/D Converter (ADCA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of ADCA.

### 38.1 Features of RH850/F1KH, RH850/F1KM ADCA

#### 38.1.1 Number of Units and Channels

This microcontroller has the following number of ADCA units.

Table 38.13 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual ADCA units are identified by the index "n"; for example, ADCAnPVDVCR (n = 0, 1) indicates the PWM-Diag virtual channel register.
m	Throughout this section, the individual physical channels (channels in the unit) of ADCAn are identified by the index "m"; for example, ANInm.
j	Throughout this section, the individual virtual channels of ADCAn are identified by the index "j"; for example, ADCAnVCRj indicates the virtual channel register.
x	Throughout this section, the individual scan groups (SG) of ADCAn are identified by the index "x"; for example, ADCAnSGSTCRx indicates the scan group x start control register (x = 1 to 3).
k	Throughout this section, the individual physical channel numbers for T&H are identified by the index "k"; for example, THkE (k = 0 to 5) is T&H enable bit of the T&H enable register (ADCAnTHER).

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector** and **Section 2C.12, Noise Filter & Edge/Level Detector**.

### CAUTION

- When port P8\_6 is used as ADCA0I8S, port P8\_6 pin outputs a low-level  $\overline{\text{RESETOUT}}$  signal while a reset is asserted and continues to output a low level after the reset is deasserted.  
For details, see **Section 2A.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$** , **Section 2B.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  and **Section 2C.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$** .
- The RH850/F1KH-D8, RH850/F1KM-S4 and RH850/F1KM-S2 do not have ANI028 (ADCA0I12S) and ANI029 (ADCA0I13S) pins, so do not attempt writing to the corresponding bits or controlling the signals.  
For descriptions in this section that mention ANI028 (ADCA0I12S) and ANI029 (ADCA0I13S), read them as stating that ANI028 (ADCA0I12S) and ANI029 (ADCA0I13S) are not supported.

## 38.2 Overview

### 38.2.1 Functional Overview

ADCA has the following features.

- 10-bit/12-bit resolution
- Successive approximation conversion method
- Number of A/D input channels
 

A/D conversion is available for a maximum of 34 ADCA0 channels and 36 ADCA1 channels. Additionally, ADCA0 supports the connection of an external analog multiplexer (MPX) to extend the number of analog input channels.
- Internal track and hold (T&H) circuit
 

ANI000 to ANI005 (ADCA0I0 to ADCA0I5) of ADCA0 include the track and hold circuit. The track and hold circuit can sample up to 6 channels of analog input simultaneously.
- A/D conversion control by scan groups
 

The A/D conversion channel or conversion mode (scan mode) can be set for each scan group.
- Two scan modes
 

Multi-cycle scan mode: Specified number of scans are executed.  
Continuous scan mode: Scans are executed repeatedly and continuously.
- Asynchronous/synchronous suspend and resume function
 

A processing for a scan group can be interrupted to run the processing for another scan group.
- Start/Stop trigger for each scan group
 

Software, hardware, and external trigger can start processing of each scan group.  
Software can stop processing of each scan group.
- Scan end interrupt and DMA transfer are supported.
 

For each scan group, an interrupt request to INTC can be issued or DMA transfer can be started, each time a processing for the virtual channel indicated by the end virtual channel pointer ends, or a virtual channel ends.
- A/D conversion channel repeat function
 

A/D conversion is performed for the same channel two or four times sequentially, and the result is stored in the data register.
- Abundant safety functions
 

Abundant safety functions are provided, such as A/D converter diagnosis, diagnosis of the channel multiplexer, diagnosis of open pins, diagnosis of the T&H circuit, 8 pairs of upper limit/lower limit check for the A/D converter and have error flag register for each virtual channel, overwrite check for data registers, and read and clear function for data registers.
- Shortest A/D conversion time per channel
 

1.15  $\mu$ s (when MPX is not used)  
2.30  $\mu$ s (when MPX is used)
- Configurable stabilization time for MPX analog input
 

Stabilization time can be selected by 8 patterns of counter setting for each physical channel.  
Min. 1 $\mu$ s  
Max. 250 $\mu$ s

---

**NOTE**

---

- Physical channel (ANInm)

Each A/D input channel of ADCA0 and ADCA1 units is called a physical channel. The physical channel of each unit is represented as ANI0m (m = 0 to 27, 30 to 35) for ADCA0 and ANI1m (m = 0 to 35) for ADCA1.

In RH850/F1KH, RH850/F1KM, the alternative port pins for 12-bit resolution A/D input channel and 10-bit resolution A/D input channel are represented as ADCAnIm and ADCAnImS, respectively. In this section, the physical channels and the corresponding alternative port pins are listed together.

- Virtual channel (ADCAnVCRj)

ADCA0 has a maximum of 50 virtual channels, and ADCA1 has a maximum of 36 virtual channels. The virtual channel specifies the physical channel to be scanned.

Scans are executed in sequence from the smallest virtual channel number. The scan order can be arbitrarily-specified by using virtual channels. In addition, the scanned result is stored in the data register (ADCAnDRj) corresponding to the virtual channel.

- Scan group (SGx)

ADCA has three scan groups (SG1, SG2, SG3) and one PWM-Diag group (SG4). A/D conversion is executed in scan group unit. The channel to be scanned can be selected for each group by specifying the scan range, that is, the conversion start virtual channel and the conversion end virtual channel.

### (3) Configuration of External Trigger Input Pins

An external trigger input pin is a hardware trigger source to activate ADCAn.

The configuration of external trigger input pins is shown below.

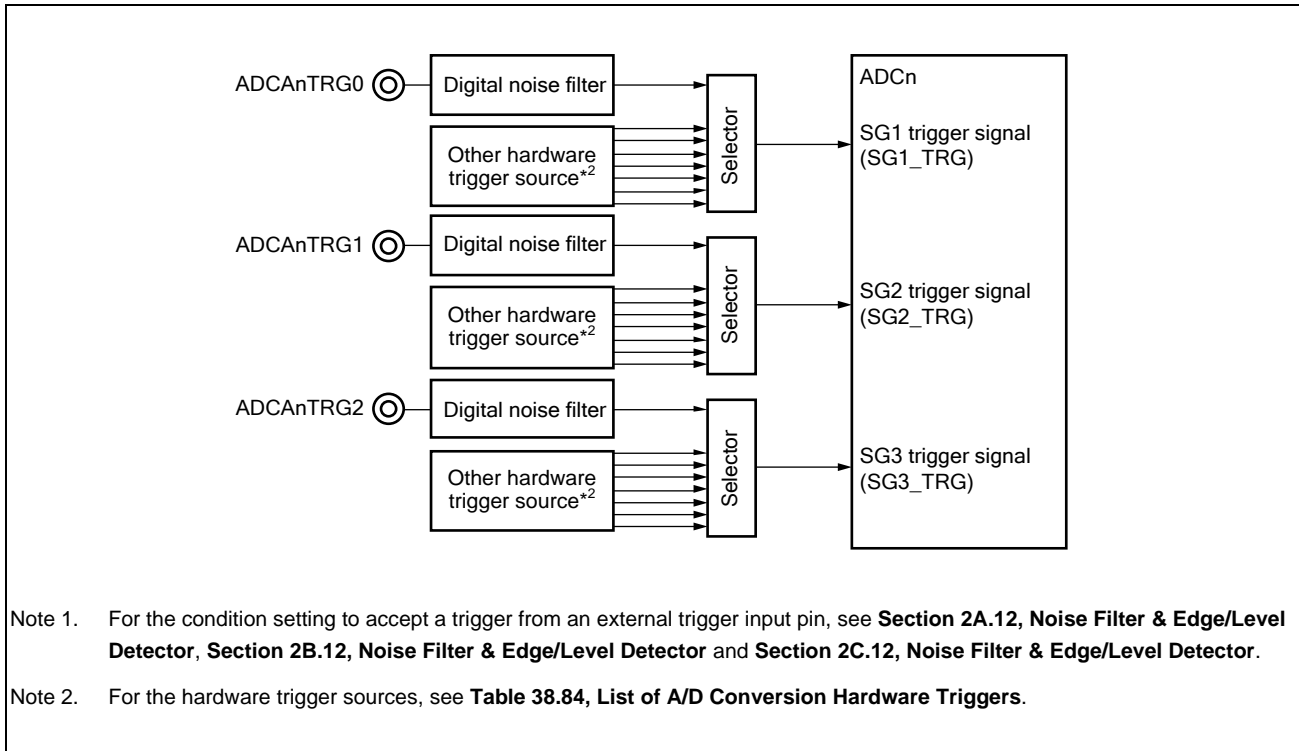

Figure 38.3 Internal Connection Diagram of External Trigger Input Pins

#### (4) Configuration of External Analog Multiplexer (MPX)

The external analog multiplexer (MPX) can be connected to any input signal pins ADCA0I0 to ADCA0I19S. An example of the external analog multiplexer connection is shown below.

Figure 38.4 Example of External Analog Multiplexer Connection

**(5) Virtual Channel**

The virtual channel specifies the physical address to be scanned.

The virtual channel is controlled by the ADCAnVCRj register.

A usage example of the virtual channel is shown below.

### 38.3.2 ADCA Specific Registers

This section describes the registers that are equipped in each of ADCA0 and ADCA1.

#### 38.3.2.1 ADCAnVCRj — Virtual Channel Register j

This register is used to control the virtual channel.

**Access:** ADCAnVCRj register can be read or written in 32-bit units.  
 ADCAnVCRjL register can be read or written in 16-bit units.  
 ADCAnVCRjLL and ADCAnVCRjLH registers can be read or written in 8-bit units.

**Address:** ADCAnVCRj: <ADCAn\_base> + j × 4H  
 ADCAnVCRjL: <ADCAn\_base> + j × 4H  
 ADCAnVCRjLL: <ADCAn\_base> + j × 4H  
 ADCAnVCRjLH: <ADCAn\_base> + j × 4H + 1H

**Value after reset:** 0000 0000H

Table 38.43 ADCAnVCRj Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	MPXE <sup>*1,*2</sup>	MPX Enable 0: The use of MPX is prohibited. No wait is inserted before A/D conversion is performed. 1: The use of MPX is permitted. The MPXV[2:0] bits are output from ADCAnSEL0 to ADCAnSEL2 when the virtual channel starts, and a wait of one A/D-conversion time is inserted before A/D conversion is performed.
14 to 12	MPXV[2:0] <sup>*1</sup>	These bits are used to set the MPX value to be transferred to an external analog multiplexer.
11, 10	ULS[3:2]	Upper Limit/Lower Limit Table Select <sup>*4</sup>
9	CNVCLS <sup>*1,*3</sup>	A/D Conversion Type Select for Self-Diagnosis 0: A/D conversion of the hold value is performed during a self-diagnosis. 1: Normal A/D conversion is performed during a self-diagnosis. When normal A/D conversion is performed during a self-diagnosis and MPX is in use (MPXE is set), however, a wait of one A/D conversion time is inserted before A/D conversion is performed. On the other hand, MPX cannot be used when A/D conversion of the hold value is performed during a self-diagnosis.
8	ADIE	A/D Conversion End Interrupt Enable 0: A scan group x end interrupt (INT_SGx) is not generated when A/D conversion for virtual channel j ends in SGx. 1: A scan group x end interrupt (INT_SGx) is generated when A/D conversion for virtual channel j ends in SGx.

**NOTE:** These bits shall set the physical channel which is supported. See **Table 38.16, Indices of Products (RH850/F1KH-D8)**, **Table 38.17, Indices of Products (RH850/F1KM-S4)**, **Table 38.18, Indices of Products (RH850/F1KM-S2)**, **Table 38.19, Indices of Products (RH850/F1KM-S1)**, **Table 38.32, ADCA0 Analog Input Signals (RH850/F1KH-D8)**, **Table 38.33, ADCA0 Analog Input Signals (RH850/F1KM-S4)**, **Table 38.34, ADCA0 Analog Input Signals (RH850/F1KM-S2)**, **Table 38.35, ADCA0 Analog Input Signals (RH850/F1KM-S1)**, **Table 38.37, ADCA1 Analog Input Signals (RH850/F1KH-D8)**, **Table 38.38, ADCA1 Analog Input Signals (RH850/F1KM-S4)** and **Table 38.39, ADCA1 Analog Input Signals (RH850/F1KM-S2)**.

Note 1. These bits are only supported for ADCA0. For ADCA1, when writing, write the value after reset.

Note 2. When GCTRL[5:0] is set to 24<sub>H</sub> (Self-Diagnosis channel), set MPXE to 0.

Note 3. This bit is only supported when j = 33 to 35. Otherwise, when writing, write the value after reset.

### 38.3.2.2 ADCAnPWDVCR — PWM-Diag Virtual Channel Register

This register is used to indicate virtual channel setting (PWSAnPVCRx\_y register setting) of the PWM-Diag (SG4).

**Access:** ADCAnPWDVCR register is a read-only register that can be read in 32-bit units.  
 ADCAnPWDVCRL register is a read-only register that can be read in 16-bit units.  
 ADCAnPWDVCRLH register is a read-only register that can be read in 8-bit units.  
 ADCAnPWDVCRLH register is a read-only register that can be read in 8-bit units.

**Address:** ADCAnPWDVCR: <ADCAn\_base> + 0F4H  
 ADCAnPWDVCRL: <ADCAn\_base> + 0F4H  
 ADCAnPWDVCRLH: <ADCAn\_base> + 0F4H

### 38.3.2.3 ADCAnDRj — Data Register j

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to ADCAnVCRj and ADCAnVCR(j+1). As the A/D conversion results, the conversion result for ADCAnVCR(j+1) is stored in the upper bits (ADCAnDR(j+1)), and the conversion result for ADCAnVCRj is stored in the lower bits (ADCAnDRj).

**Access:** ADCAnDRj register is a read-only register that can be read in 32-bit units.  
ADCAnDRjL and ADCAnDRjH registers are read-only registers that can be read in 16-bit units.

**Address:** ADCAnDRj: <ADCAn\_base> + 100<sub>H</sub> + j × 2<sub>H</sub>  
ADCAnDRjL: <ADCAn\_base> + 100<sub>H</sub> + j × 2<sub>H</sub>

15 to 0	DRj[15:0]	These bits are used to store the A/D conversion result data. (The A/D conversion result for the channel set in ADCAnVCRj are transferred.)

#### CAUTION

ADCAnDIRj.WFLG and ADCAnDIR(j+1).WFLG are cleared by reading ADCAnDRjL or ADCAnDRjH in 16-bit units at this time. If virtual channels 33, 34, and 35 are used exclusively for self-diagnosis, the lower-order bits (DRj[15:0]) for channel 32 cannot be used.

#### NOTES

- j = 00, 02, ..., 46, 48 (for ADCA0)  
j = 00, 02, ..., 32, 34 (for ADCA1)
- By controlling ADCAnADCR.CRAC and ADCAnADCR.CTYP, the data format of this register becomes as follows:

  - ADCAnADCR.CTYP = 0 and ADCAnADCR.CRAC = 0 → Right alignment is used.  
→ The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 27 to 16, and the A/D conversion result for ADCAnVCRj is transferred to bits 11 to 0.
  - ADCAnADCR.CTYP = 0 and ADCAnADCR.CRAC = 1 → Left alignment is used.  
→ The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 31 to 20, and the A/D conversion result for ADCAnVCRj is transferred to bits 15 to 4.

- $ADCA_nADCR.CTYP = 1$  and  $ADCA_nADCR.CRAC = 0$  → Right alignment is used.  
→The A/D conversion result for  $ADCA_nVCR(j+1)$  is transferred to bits 25 to 16, and the A/D conversion result for  $ADCA_nVCRj$  is transferred to bits 9 to 0.
  - $ADCA_nADCR.CTYP = 1$  and  $ADCA_nADCR.CRAC = 1$  → Left alignment is used.  
→The A/D conversion result for  $ADCA_nVCR(j+1)$  is transferred to bits 31 to 22, and the A/D conversion result for  $ADCA_nVCRj$  is transferred to bits 15 to 6.

### 38.3.2.4 ADCAnDIRj — Data Supplementary Information Register j

This register is a 32-bit read-only register that stores the A/D conversion result for ADCAnDRj and information incidental to the A/D converted value.

As the A/D conversion result, the ADCAnDRj value is transferred. As information incidental to the A/D converted value, information about the write flag (WFLG), the MPX value (MPXV[2:0]), and the physical channel (ID[5:0]) is transferred. The data format of the A/D conversion result stored in ADCAnDIRj is the same as that for the ADCAnDRj register.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ADCAn\_base> + 200H + j × 4H

**Value after reset:** 0000 0000H

27, 26	Reserved	When read, the value after reset is returned.
25	WFLG	Write Flag 0: ADCAnDRj or ADCAnDIRj is read (cleared when read). 1: A/D converted value is stored in ADCAnDRj (set when the value is stored).
24 to 22	Reserved	When read, the value after reset is returned.
21 to 16	ID[5:0]	These bits store the physical channel number (GCTRL) corresponding to the conversion result. The physical channel number to be stored is the number corresponding to the most recent conversion result.
15 to 0	DR[15:0]	These bits are used to store the A/D conversion result.

Note 1. These bits are only supported by ADCA0.  
For ADCA1, when read, the value after reset is returned.

### 38.3.2.5 ADCAnPWDTSNDR — PWM-Diag Data Register

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to the PWM-Diag. As the A/D conversion results, the conversion result for the PWM-Diag (PWDDR) is stored in the upper bits.

**Access:** ADCAnPWDTSNDR register is a read-only register that can be read in 32-bit units.  
ADCAnPWDTSNDRH register is a read-only register that can be read in 16-bit units.

**Address:** ADCAnPWDTSNDR: <ADCAn\_base> + 178<sub>H</sub>

#### NOTE

The data format of this register is controlled by ADCAnADCR.CRAC and ADCAnADCR.CTYP, as shown below.

- ADCAnADCR.CTYP = 0, ADCAnADCR.CRAC = 0 → Right alignment is used.  
→ The A/D conversion result for ADCAnPWDVCR is transferred to bits 27 to 16.
- ADCAnADCR.CTYP = 0, ADCAnADCR.CRAC = 1 → Left alignment is used.  
→ The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 20.
- ADCAnADCR.CTYP = 1, ADCAnADCR.CRAC = 0 → Right alignment is used.  
→ The A/D conversion result for ADCAnPWDVCR is transferred to bits 25 to 16.
- ADCAnADCR.CTYP = 1, ADCAnADCR.CRAC = 1 → Left alignment is used.  
→ The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 22.

### 38.3.2.6 ADCAnPWDDIR — PWM-Diag Data Supplementary Information Register

This register is a 32-bit read-only register that stores the A/D conversion result when PWM-Diag is used, and information incidental to the A/D converted value.

As the A/D conversion result, the ADCAnPWDSNDR.PWDDR[15:0] value is transferred. As supplementary information to the A/D converted value, the write flag (WFLG), MPX value (MPXV[2:0]), and physical channel (ID[5:0]) are transferred. The data format of the A/D conversion result stored in ADCAnPWDDIR is the same as that for the ADCAnPWDTSNDR register. In addition, PWDDR[15:0] can be read with corresponded PWGA channel by PWSAnPWDDIRz register. For details, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ADCAn\_base> + 2F4<sub>H</sub>

Note 1. These bits are only supported for ADCA0.  
For ADCA1, when read, the value after reset is returned.

### 38.3.2.7 ADCAnADHALTR — A/D Force Halt Register

This register is used to halt conversion for all SGs of ADCAn. The read value is always 0.

**Access:** ADCAnADHALTR register is a write-only register that can be written in 32-bit units.  
 ADCAnADHALTRL register is a write-only register that can be written in 16-bit units.  
 ADCAnADHALTRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnADHALTR:<ADCAn\_base> + 300<sub>H</sub>

### 38.3.2.8 ADCAnADCR — A/D Control Register

This register is used for ADCAn common control.

**Access:** ADCAnADCR register can be read or written in 32-bit units.  
 ADCAnADCRL register can be read or written in 16-bit units.  
 ADCAnADCRLl register can be read or written in 8-bit units.

#### CAUTION

To prevent malfunction, ADCAnADCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

**NOTE**

---

- Synchronous suspend:

If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the A/D conversion for the higher-priority SG is performed after the on-going A/D conversion of a channel is completed. After processing for the higher-priority SG is completed, the suspended A/D channel processing for the lower-priority SG is resumed.

- Asynchronous suspend:

If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the on-going channel processing is suspended, and then the A/D conversion for the higher-priority SG is performed. After processing for the higher-priority SG is completed, the suspended A/D channel conversion for the lower-priority SG is resumed.

For details, see **Figure 38.25, Example of Synchronous Suspend and Resume Operation** and **Figure 38.26, Example of Asynchronous Suspend and Resume Operation**.

### 38.3.2.9 ADCAnMPXCURR — MPX Current Register

This register is used to store the MPX value for an external analog multiplexer.

**Access:** ADCAnMPXCURR register is a read-only register that can be read in 32-bit units.  
 ADCAnMPXCURRL register is a read-only register that can be read in 16-bit units.  
 ADCAnMPXCURRLL register is a read-only register that can be read in 8-bit units.

If conversion of a virtual channel starts after setting ADCAnPWDVCR.MPX <sub>E</sub> to 1, the setting of ADCAnPWDVCR.MPXV[2:0] is stored.

#### NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.10 ADCAnTHSMPSTCR — T&H Sampling Start Control Register

This register is used to control the start of sampling for all T&Hk (k = 0 to 5). The bits are always read as 0.

**Access:** ADCAnTHSMPSTCR register is a write-only register that can be written in 32-bit units.  
 ADCAnTHSMPSTCRL register is a write-only register that can be written in 16-bit units.  
 ADCAnTHSMPSTCRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnTHSMPSTCR: <ADCAn\_base> + 314<sub>H</sub>

The conditions to place the T&H circuit in the sampling state are as follows:

- Condition to start sampling while T&H is stopped:  
 1 being written to ADCAnTHSMPSTCR.SMPST while ADCAnTHER.THkE = 1 (k = 0 to 5).
- Condition to start continuous sampling in automatic sampling:  
 A/D conversion of the hold value for T&Hk being completed while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHCR.ASMPMSK = 1.

#### NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.11 ADCAnTHCR — T&H Control Register

This register controls the sampling transition after A/D conversion of the hold value for T&H is completed.

Automatic start of sampling on the T&H circuit after A/D conversion of the hold value for T&H is completed shortens the time required for the generation of succeeding hold completion triggers.

**Access:** ADCAnTHCR register can be read or written in 32-bit units.  
 ADCAnTHCRL register can be read or written in 16-bit units.  
 ADCAnTHCRL register can be read or written in 8-bit units.

To prevent malfunction, ADCAnTHCR should be set when SGACTION of all scan groups is 0 (before scan groups are started) and TRGMDC of all scan groups is 0.

#### NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.12 ADCAnTHAHLSTCR — T&H Group A Hold Start Control Register

This register is used to control the start of the hold for T&H group A. The bits are always read as 0.

**Access:** ADCAnTHAHLSTCR register is a write-only register that can be written in 32-bit units.  
 ADCAnTHAHLSTCRL register is a write-only register that can be written in 16-bit units.  
 ADCAnTHAHLSTCRLRLL register is a write-only register that can be written in 8-bit units.

### 38.3.2.13 ADCAnTHBHLDDSTCR — T&H Group B Hold Start Control Register

This register is used to control the start of the hold for T&H group B. The bits are always read as 0.

**Access:** ADCAnTHBHLDDSTCR register is a write-only register that can be written in 32-bit units.  
 ADCAnTHBHLDDSTCRL register is a write-only register that can be written in 16-bit units.  
 ADCAnTHBHLDDSTCRLL register is a write-only register that can be written in 8-bit units.

### 38.3.2.14 ADCAnTHACR — T&H Group A Control Register

This register is used to control T&H group A.

**Access:** ADCAnTHACR register can be read or written in 32-bit units.  
ADCAnTHACRL register can be read or written in 16-bit units.  
ADCAnTHACRLL register can be read or written in 8-bit units.

### 38.3.2.16 ADCAnTHER — T&H Enable Register

This register controls enabling and disabling of each T&H.

**Access:** ADCAnTHER register can be read or written in 32-bit units.  
ADCAnTHERL register can be read or written in 16-bit units.  
ADCAnTHERLL register can be read or written in 8-bit units.

### 38.3.2.17 ADCAnTHGSR — T&H Group Select Register

This register is used to select a T&H group for each T&H.

**Access:** ADCAnTHGSR register can be read or written in 32-bit units.  
ADCAnTHGSRL register can be read or written in 16-bit units.  
ADCAnTHGSRLL register can be read or written in 8-bit units.

**Address:** ADCAnTHGSR: <ADCAn\_base> + 330<sub>H</sub>

0	TH0GS	T&H0 Group Select 0: T&H0 is selected to group A. 1: T&H0 is selected to group B.

**CAUTION**

---

- Do not set T&H0 to T&H2 to the same group as T&H3 to T&H5.

Example

– Group A: 0ch, 1ch, 2ch

Group B: 3ch, 4ch, 5ch → Setting allowed

– Group A: 0ch

Group B: 1ch, 2ch → Setting allowed

– Group A: 0ch, 1ch, 3ch

Group B: 2ch, 4ch → Setting prohibited

- To prevent malfunction, ADCAnTHGSR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
- 

**NOTE**

---

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.18 ADCAnSMPCR — Sampling Control Register

This register controls sampling.

ADCAnSMPCR controls the sampling time for SG4 (PWM-Diag) and SG1 to SG3.

**Access:** ADCAnSMPCR register can be read or written in 32-bit units.  
ADCAnSMPCRL register can be read or written in 16-bit units.  
ADCAnSMPCRLL register can be read or written in 8-bit units.

**Address:** ADCAnSMPCR: <ADCAn\_base> + 380<sub>H</sub>  
ADCAnSMPCRL: <ADCAn\_base> + 380<sub>H</sub>  
ADCAnSMPCRLL: <ADCAn\_base> + 380<sub>H</sub>

31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	SMPT[7:0]	These bits are used to set the sampling time (the number of cycles). 12 <sub>H</sub> : 18 cycles (ADCLK = 8 MHz to 32 MHz) 18 <sub>H</sub> : 24 cycles (ADCLK = 8 MHz to 40 MHz) Settings other than above are prohibited.

#### CAUTION

- To prevent malfunction, ADCAnSMPCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
- When SMPT is changed, the A/D conversion wait time is also changed when MPX is used by virtual channel register j (ADCAnVCRj) or PWM-Diag virtual channel register (ADCAnPWDVCR).

### 38.3.2.19 ADCAnMPXSTBTSELR0 to 4 — MPX Stabilization Time Selection Register 0 to 4

This register is used to select the stabilization time for respective physical channels when external multiplexer is used. ADCAnMPXSTBTSELR0 corresponds to physical channels ANIn00 to ANIn07, ADCAnMPXSTBTSELR1 corresponds to physical channels of ANIn08 to ANIn15, ADCAnMPXSTBTSELR2 corresponds to physical channels of ANIn16 to ANIn23, and ADCAnMPXSTBTSELR3 corresponds to physical channels of ANIn24 to ANIn31, and ADCAnMPXSTBTSELR4 corresponds to physical channels of ANIn32 to ANIn35.

**Access:** ADCAnMPXSTBTSELR0 to 4 registers can be read or written in 32-bit units.  
 ADCAnMPXSTBTSELR0L to 4L registers can be read or written in 16-bit units.  
 ADCAnMPXSTBTSELR0H to 3H registers can be read or written in 16-bit units.

**Address:** ADCAnMPXSTBTSELR0: <ADCAn\_base> + 5F0<sub>H</sub>  
 ADCAnMPXSTBTSELR1: <ADCAn\_base> + 5F4<sub>H</sub>

**NOTE**

- STBTCH00[2:0] to STBTCH35[2:0] are enabled when the MPXE bit of the ADCAnVCRj or ADCAnPWDVCR register is set to 1.
- In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

**CAUTION**

To prevent malfunction, ADCAnMPXSTBTSELR0 to ADCAnMPXSTBTSELR4 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

### 38.3.2.20 ADCAnMPXSTBTR0 to 7 — MPX Stabilization Time Setting Register 0 to 7

This register is used to set the stabilization time when external multiplexer is used.

Stabilization time of corresponded physical channels which is selected by ADCAnMPXSTBTSEL0 to 4 register is set by setting this register.

**Access:** ADCAnMPXSTBTR0 to 7 registers can be read or written in 32-bit units.  
ADCAnMPXSTBTROL to 7L registers can be read or written in 16-bit units.

**Address:** ADCAnMPXSTBTR0: <ADCAn\_base> + 610<sub>H</sub>

31 to 14	Reserved	When read, the value after reset is returned. When writing, write value after reset.
13 to 0	STBTIME[13:0]	Specify the analog input stabilization time when an external analog multiplexer is used only. When these bits are all "0" (reset value), wait time of one A/D conversion is inserted. Other than all "0", wait time is inserted before A/D conversion according to the calculation below.

Calculation formula: STBTIME[13:0] / ADCLK

Refer to **Table 38.64, Setting Example of ADCAnMPXSTBR0 to 7 Register** below for as example. Stabilization time has to be set within from 1μs to 250μs.

Note 1. This setting should be changed in accordance with A/D conversion clock selection.

### CAUTION

To prevent malfunction, ADCAnMPXSTBR0 to ADCAnMPXSTBR7 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

### NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.21 ADCAnSFTCR — Safety Control Register

This is a register for safety control.

**Access:** ADCAnSFTCR register can be read or written in 32-bit units.  
ADCAnSFTCRL register can be read or written in 16-bit units.  
ADCAnSFTCRLL register can be read or written in 8-bit units.

**Address:** ADCAnSFTCR: <ADCAn\_base> + 334<sub>H</sub>  
ADCAnSFTCRL: <ADCAn\_base> + 334<sub>H</sub>  
ADCAnSFTCRLL: <ADCAn\_base> + 334<sub>H</sub>

#### CAUTION

To prevent malfunction, ADCAnSFTCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

### 38.3.2.22 ADCAnULLMTBR0 to 7 — Upper Limit/Lower Limit Table Register 0 to 7

These registers are used to set the threshold for detection of an upper limit or lower limit error in the A/D converted value. Any of ADCAnULLMTBR0 to ADCAnULLMTBR7 is specified by setting ADCAnPWDVCR.ULS[3:0] and ADCAnVCRj.ULS[3:0] and compared with ADCAnPWDTSNDR and ADCAnDRj.

**Access:** ADCAnULLMTBR0 to 7 registers can be read or written in 32-bit units.  
ADCAnULLMTBR0L to 7L and ADCAnULLMTBR0H to 7H registers can be read or written in 16-bit units.

19 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 4	LLMTB[11:0]	Lower Limit Table Specify the threshold for detection of a lower limit error in the A/D converted value. The lower limit error (ADCAnULER.LE) is set when the following condition is met: LLMTB[11:0] > A/D converted value
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

**CAUTION**

- When A/D conversion is executed in 10-bit mode (ADCAnADCR.CTYP = 1), ULMTB[1:0] and LLMTB[1:0] should be set to 11B and 00B, respectively.
- To prevent malfunction, ADCAnULLMTBR0 to ADCAnULLMTBR7 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
- The upper-limit table (ULMTB[11:0]) must be greater than the lower-limit table (LLMTB[11:0]).

### 38.3.2.23 ADCAnECR — Error Clear Register

This register is used to control clearing of an error. The read value is always 0.

**Access:** ADCAnECR register is a write-only register that can be written in 32-bit units.  
 ADCAnECRL register is a write-only register that can be written in 16-bit units.  
 ADCAnECRLL register is a write-only register that can be written in 8-bit units.

### 38.3.2.24 ADCAnULER — Upper Limit/Lower Limit Error Register

This register is a read-only register that indicates information regarding the upper limit/lower limit errors.

**Access:** ADCAnULER register is a read-only register that can be read in 32-bit units.  
 ADCAnULERL register is a read-only register that can be read in 16-bit units.  
 ADCAnULERLH register is a read-only register that can be read in 8-bit units.  
 ADCAnULERLL register is a read-only register that can be read in 8-bit units.

**Address:** ADCAnULER: <ADCAn\_base> + 348<sub>H</sub>

31 to 16	Reserved	When read, the value after reset is returned.
15	UE	Upper Limit Error Flag 0: An upper limit error is not detected. 1: An upper limit error is detected. Setting condition: The A/D converted value exceeds the upper limit threshold specified by the upper limit/lower limit table registers 0 to 7 (ADCAnULLMTBR0 to 7). If a subsequent upper limit error is detected in A/D conversion while this bit is set to 1, the ADCAnULER register is not updated. Clearing condition: 1 is written to ADCAnECR.ULEC.
14	LE	Lower Limit Error Flag 0: A lower limit error is not detected. 1: A lower limit error is detected. Setting condition: The A/D converted value is lower than the lower limit threshold specified by the upper limit/lower limit table registers 0 to 7 (ADCAnULLMTBR0 to 7). If a subsequent lower limit error is detected in A/D conversion while this bit is set to 1, the ADCAnULER register is not updated. Clearing condition: 1 is written to ADCAnECR.ULEC.

Note 1. These bits are only supported for ADCA0.  
For ADCA1, when read, the value after reset is returned.

#### NOTE

ADCAnULER is updated when the A/D converted value is set in ADCAnDRj or ADCAnPWDTSNDR.

### 38.3.2.25 ADCAnOWER — Overwrite Error Register

This register is a 32/16/8-bit read-only register that indicates an overwrite error. The target for overwrite errors is SG1 to SG3, and not PWM-Diag.

**Access:** ADCAnOWER register is a read-only register that can be read in 32-bit units.  
ADCAnOWERL register is a read-only register that can be read in 16-bit units.  
ADCAnOWERLL register is a read-only register that can be read in 8-bit units.

**Address:** ADCAnOWER: <ADCAn\_base> + 34C<sub>H</sub>

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	OWE	Overwrite Error Flag 0: An overwrite error is not detected. 1: An overwrite error is detected. Setting condition: ADCAnDIRj.WFLG = 1, and the A/D converted value is written to ADCAnDRj. If a subsequent overwrite error is detected in A/D conversion while this bit is set to 1, the ADCAnOWER register is not updated. Clearing condition: 1 is written to ADCAnECR.OWEC.
6	Reserved	When read, the value after reset is returned.
5 to 0	OWECAP[5:0]	Overwrite Error Capture The virtual channel number is captured when an overwrite error occurs. Capturing condition: OWE = 0 and ADCAnDIRj.WFLG = 1, and the A/D converted value is written to ADCAnDRj Clearing condition: 1 is written to ADCAnECR.OWEC.

#### NOTE

ADCAnOWER is updated when the A/D converted value is set in ADCAnDRj.

### 38.3.2.26 ADCAnULEVCFR0 — Upper Limit/Lower Limit Error VC Flag Register 0

This is a flag register for each virtual channel indicating an upper or lower limit error. ADCAnULEVCFR0 corresponds to ADCAnVCRj (j = 0 to 31).

**Access:** ADCAnULEVCFR0 register is a read-only register that can be read in 32-bit units.

**Address:** ADCAnULEVCFR0: <ADCAn\_base> + 540<sub>H</sub>

### 38.3.3 Scan Group (SG) Specific Registers

This section describes the registers provided for each scan group.

#### 38.3.3.1 ADCAnSGSTCRx — Scan Group x Start Control Register

This register is used to control the start of scan group x. The read value is always 0.

**Access:** ADCAnSGSTCRx is a write-only register that can be written in 32-bit units.  
 ADCAnSGSTCRxL is a write-only register that can be written in 16-bit units.  
 ADCAnSGSTCRxLL is a write-only register that can be written in 8-bit units.

**Address:** ADCAnSGSTCRx: <ADCAn\_base> + x × 40<sub>H</sub> + 400<sub>H</sub>  
 ADCAnSGSTCRxL: <ADCAn\_base> + x × 40<sub>H</sub> + 400<sub>H</sub>  
 ADCAnSGSTCRxLL: <ADCAn\_base> + x × 40<sub>H</sub> + 400<sub>H</sub>

### 38.3.3.2 ADCAnPWDSGSTPCR — PWM-Diag Scan Stop Control Register

This is a control register to stop scan group for PWM-Diag. The read value is always 0.

**Access:** ADCAnPWDSGSTPCR register is a write-only register that can be written in 32-bit units.  
 ADCAnPWDSGSTPCRL register is a write-only register that can be written in 16-bit units.  
 ADCAnPWDSGSTPCRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnPWDSGSTPCR: <ADCAn\_base> + 504<sub>H</sub>  
 ADCAnPWDSGSTPCRL: <ADCAn\_base> + 504<sub>H</sub>

### 38.3.3.3 ADCAnPWDSGCR — PWM-Diag Scan Group Control Register

This register is used to control PWM-Diag.

**Access:** ADCAnPWDSGCR register can be read or written in 32-bit units.  
 ADCAnPWDSGCRLL register can be read or written in 16-bit units.  
 ADCAnPWDSGCRLL register can be read or written in 8-bit units.

**Address:** ADCAnPWDSGCR: <ADCAn\_base> + 508<sub>H</sub>  
 ADCAnPWDSGCRLL: <ADCAn\_base> + 508<sub>H</sub>

0	PWDTRGMD	PWM-Diag Trigger Mode Select 0: PWSA_ADTRG trigger input is disabled. 1: PWSA_ADTRG is selected for the trigger input to the PWM-Diag scan group.

#### CAUTION

To prevent malfunction, ADCAnPWDSGCR should be set (except clearing PWDTRGMD upon completion of A/D conversion) when SGACT of the PWM-Diag scan group (SG4) is 0 (before the scan group is started).

### 38.3.3.4 ADCAnSGCRx — Scan Group x Control Register

This register controls scan group x.

**Access:** ADCAnSGCRx register can be read or written in 32-bit units.  
ADCAnSGCRxL register can be read or written in 16-bit units.  
ADCAnSGCRxLL register can be read or written in 8-bit units.

**Address:** ADCAnSGCRx: <ADCAn\_base> + x × 40<sub>H</sub> + 408<sub>H</sub>  
ADCAnSGCRxL: <ADCAn\_base> + x × 40<sub>H</sub> + 408<sub>H</sub>

4	ADIE	Scan End Interrupt Enable 0: INT_SGx is not output when the scan for SGx ends. 1: INT_SGx is output when the scan for SGx ends.
3, 2	SCT[1:0]	Channel Repeat Times Select 00: The selected number of channel repeat times is one. 01: The selected number of channel repeat times is two. 10: The selected number of channel repeat times is four. 11: Setting prohibited
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TRGMD	Trigger Mode 0: Trigger input to SGx_TRG is disabled (Hardware trigger disabled). 1: SGx_TRG start trigger or hold complete trigger A/B is selected for the trigger input to SGx. The software trigger is valid regardless of the TRGMD bit setting.

#### CAUTION

To prevent malfunction, ADCAnSGCRx should be set (except clearing TRGMD upon completion of A/D conversion and ADIE = 0 setting when stop procedure of scan group) when SGACT of all scan groups is 0 (before the scan group is started) and TRGMD of all scan groups is 0.

### 38.3.3.5 ADCAnSGVCSPx — Scan Group x Start Virtual Channel Pointer

This register specifies the start pointer of a virtual channel.

**Access:** ADCAnSGVCSPx register can be read or written in 32-bit units.  
 ADCAnSGVCSPxL register can be read or written in 16-bit units.  
 ADCAnSGVCSPxLL register can be read or written in 8-bit units.

**Address:** ADCAnSGVCSPx: <ADCAn\_base> + x × 40<sub>H</sub> + 40C<sub>H</sub>  
 ADCAnSGVCSPxL: <ADCAn\_base> + x × 40<sub>H</sub> + 40C<sub>H</sub>

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	VCSP[5:0]	Start Virtual Channel Pointer These bits are used to specify the virtual channel from which the SGx scan is to be started.

#### CAUTION

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When writing to the channel pointers, be sure to write in the following order: ADCAnSGVCSPx → ADCAnSGVCEPx. When SGx is started, the A/D conversion for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.
- Though ADCAnSGVCSPx can be written during the A/D conversion, the register is updated at the time when ADCAnSGVCEPx is written. The new setting is applied when SGx is started next time.
- When the hardware trigger is used, writing to this register during operation is prohibited.

### 38.3.3.6 ADCAnSGVCEPx — Scan Group x End Virtual Channel Pointer

This register specifies the end pointer of a virtual channel.

**Access:** ADCAnSGVCEPx register can be read or written in 32-bit units.  
 ADCAnSGVCEPxL register can be read or written in 16-bit units.  
 ADCAnSGVCEPxLL register can be read or written in 8-bit units.

**Address:** ADCAnSGVCEPx: <ADCAn\_base> + x × 40<sub>H</sub> + 410<sub>H</sub>  
 ADCAnSGVCEPxL: <ADCAn\_base> + x × 40<sub>H</sub> + 410<sub>H</sub>

5 to 0	VCEP[5:0]	End Virtual Channel Pointer These bits are used to specify the virtual channel at which the SGx scan is to be ended.

#### CAUTION

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When SGx is started, processing for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.  
 ADCAnSGVCEPx can be rewritten even when SGx is being processed. The new setting is applied when SGx is started next time.

### 38.3.3.7 ADCAnSGMCCRx — Scan Group x Multicycle Register

This register is a 32/16/8-bit read/write register that indicates the number of scan times in multicycle scan mode.

**Access:** ADCAnSGMCCRx register can be read or written in 32-bit units.  
 ADCAnSGMCCRxL register can be read or written in 16-bit units.  
 ADCAnSGMCCRxLL register can be read or written in 8-bit units.

**Address:** ADCAnSGMCCRx: <ADCAn\_base> + x × 40<sub>H</sub> + 414<sub>H</sub>  
 ADCAnSGMCCRxL: <ADCAn\_base> + x × 40<sub>H</sub> + 414<sub>H</sub>

1, 0	MCCY[1:0]	Multicycle Number Specification These bits are used to specify the number of scan times in multicycle scan mode. 00 <sub>B</sub> : Number of scans = 1 01 <sub>B</sub> : Number of scans = 2 10 <sub>B</sub> : Setting prohibited 11 <sub>B</sub> : Number of scans = 4

#### CAUTION

- To prevent malfunction, ADCAnSGMCCRx should be set when SGACTION of scan group x is 0 (before the scan group is started) and TRGMDC is 0.
- When SGx is started, the scan for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is repeatedly executed as many times as specified in ADCAnSGMCCRx.

### 38.3.3.8 ADCAnPWDSGSEFCR — PWM-Diag Scan End Flag Clear Register

This register is used to control the clearing of PWM-Diag scan end flag (SEF). The bits are always read as 0.

**Access:** ADCAnPWDSGSEFCR register is a write-only register that can be written in 32-bit units.  
 ADCAnPWDSGSEFCRL register is a write-only register that can be written in 16-bit units.  
 ADCAnPWDSGSEFCRLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnPWDSGSEFCR: <ADCAn\_base> + 518<sub>H</sub>

### 38.3.3.9 ADCAnSGSEFCRx — Scan Group x Scan End Flag Clear Register

This register is a write-only register that clears the scan end flag (ADCAnSGSTR.SEFx). The read value is always 0.

**Access:** ADCAnSGSEFCRx register is a write-only register that can be written in 32-bit units.  
 ADCAnSGSEFCRxL register is a write-only register that can be written in 16-bit units.  
 ADCAnSGSEFCRxLL register is a write-only register that can be written in 8-bit units.

**Address:** ADCAnSGSEFCRx: <ADCAn\_base> + x × 40<sub>H</sub> + 418<sub>H</sub>  
 ADCAnSGSEFCRxL: <ADCAn\_base> + x × 40<sub>H</sub> + 418<sub>H</sub>

### 38.3.3.10 ADCAnSGSTR — Scan Group Status Register

This register indicates the state of T&H, SVSTOP, scan group x, and PWM-Diag scan group. The SHACT and SGACT bits are cleared when HALT is executed.

**Access:** ADCAnSGSTR register is a read-only register that can be read in 32-bit units.  
ADCAnSGSTRL register is a read-only register that can be read in 16-bit units.

**Address:** ADCAnSGSTR: <ADCAn\_base> + 308<sub>H</sub>  
ADCAnSGSTRL: <ADCAn\_base> + 308<sub>H</sub>

### 38.3.3.11 ADCAnSGSTPCR<sub>x</sub> — Scan Group x Stop Control Register

This is a control register to stop scan group x. The read value is always 0.

**Access:** ADCAnSGSTPCR<sub>x</sub> register is a write-only register that can be written in 32-bit units.  
 ADCAnSGSTPCR<sub>xL</sub> register is a write-only register that can be written in 16-bit units.  
 ADCAnSGSTPCR<sub>xLL</sub> register is a write-only register that can be written in 8-bit units.

### 38.3.4 Hardware Trigger Specific Register

#### 38.3.4.1 ADCAnSGTSELx — Scan Group x Start Trigger Control Register

This register is used to select the A/D conversion trigger (hardware trigger) for SGx.

**Access:** ADCAnSGTSELx register can be read or written in 32-bit units.  
ADCAnSGTSELxL register can be read or written in 16-bit units.

**CAUTIONS**

---

1. When enabling the LPS trigger factor (SEQADTRG), select and enable only one of ADCA0SGTSEL1.T1SEL4, ADCA0SGTSEL2.T2SEL4, and ADCA0SGTSEL3.T3SEL4.
  2. To prevent malfunction, ADCAnSGTSELx should be set when SGACTION of all scan groups is 0 (before scan groups are started) and TRGMDC of all scan groups is 0.

To prevent malfunction, ADCAnDGCTL1 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

### 38.3.5.3 ADCAnPDCTL1 — Pull Down Control Register 1

This register specifies the channel to which the pull down resistor is connected.

For details, see **Section 38.5.3, Diagnosis of Open Pins**.

**Access:** ADCAnPDCTL1 register can be read or written in 32-bit units.

ADCAnPDCTL1L register can be read or written in 16-bit units.

**Address:** ADCAnPDCTL1: <ADCAn\_base> + 358<sub>H</sub>

### 38.3.5.4 ADCAnPDCTL2 — Pull Down Control Register 2

This register specifies the channel to which the pull down resistor is connected.

For details, see **Section 38.5.3, Diagnosis of Open Pins**.

**Access:** ADCAnPDCTL2 register can be read or written in 32-bit units.

ADCAnPDCTL2H and ADCAnPDCTL2L registers can be read or written in 16-bit units.

ADCAnPDCTL2HL, ADCAnPDCTL2LH, and ADCAnPDCTL2LL registers can be read or written in 8-bit units.

#### CAUTION

To prevent malfunction, SVSDIS should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

## 38.4 Operation

### 38.4.1 Initial Setting

Figure 38.6, Flowchart for Initial Setting shows an initial setting example of the A/D conversion. For trigger input, see Figure 38.7, Flowchart for Trigger Input in the next section. For interrupt request signals, see Section 38.4.12, Scan End Interrupt Request.

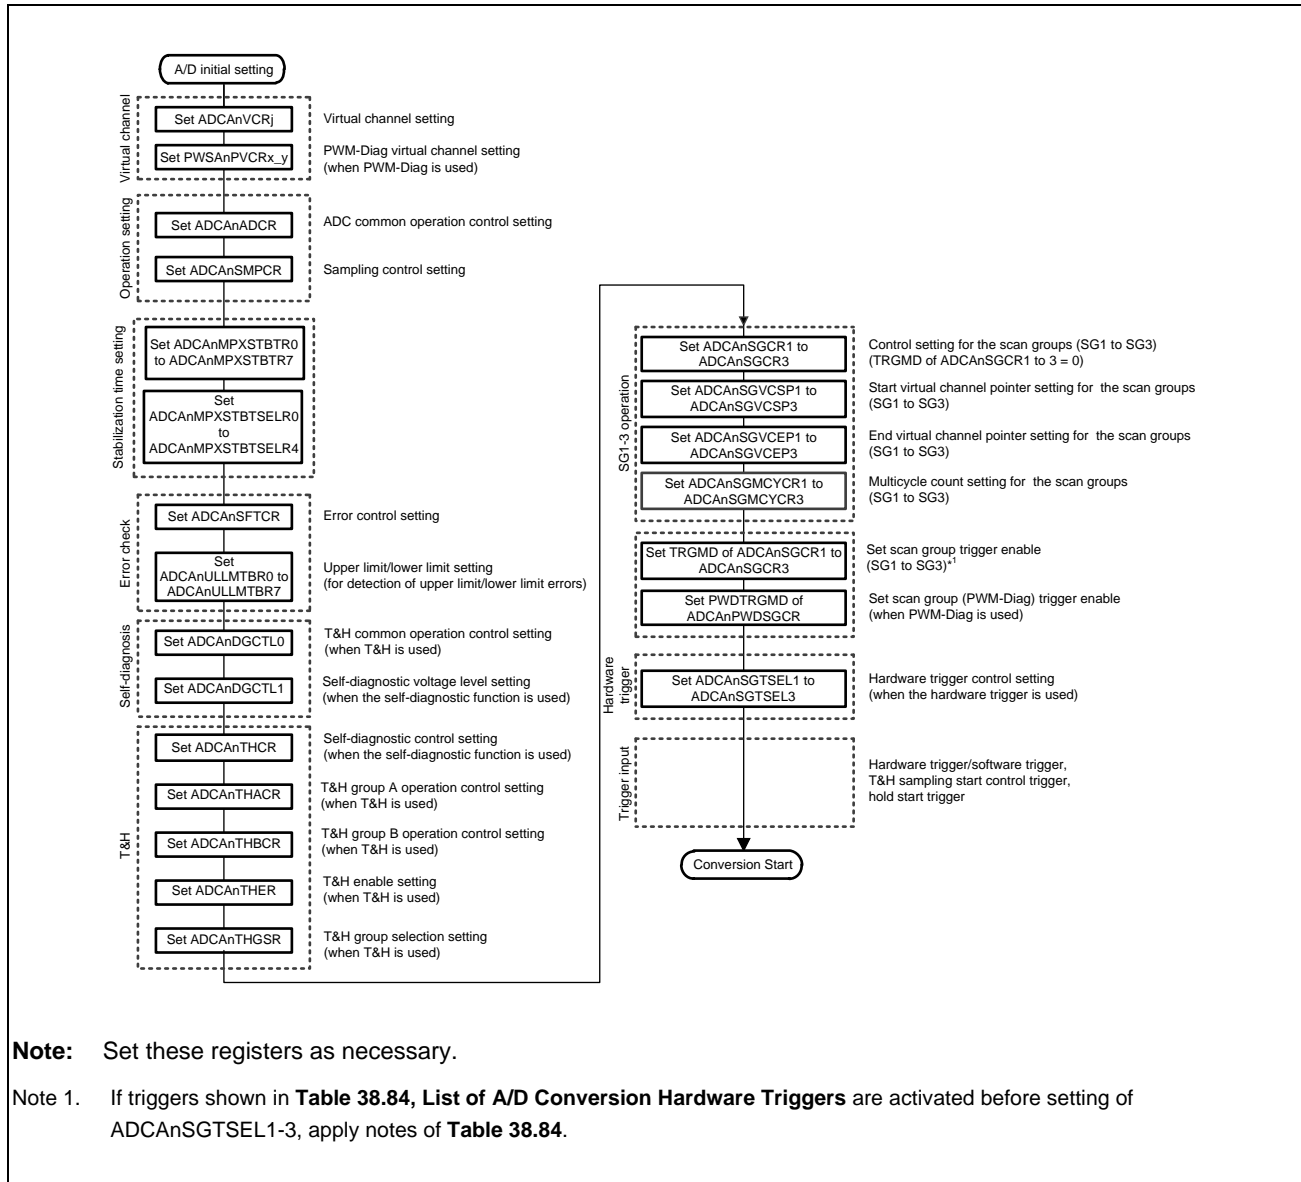

Figure 38.6 Flowchart for Initial Setting

### 38.4.2 Trigger Input

The following figure shows the flowchart for trigger input.

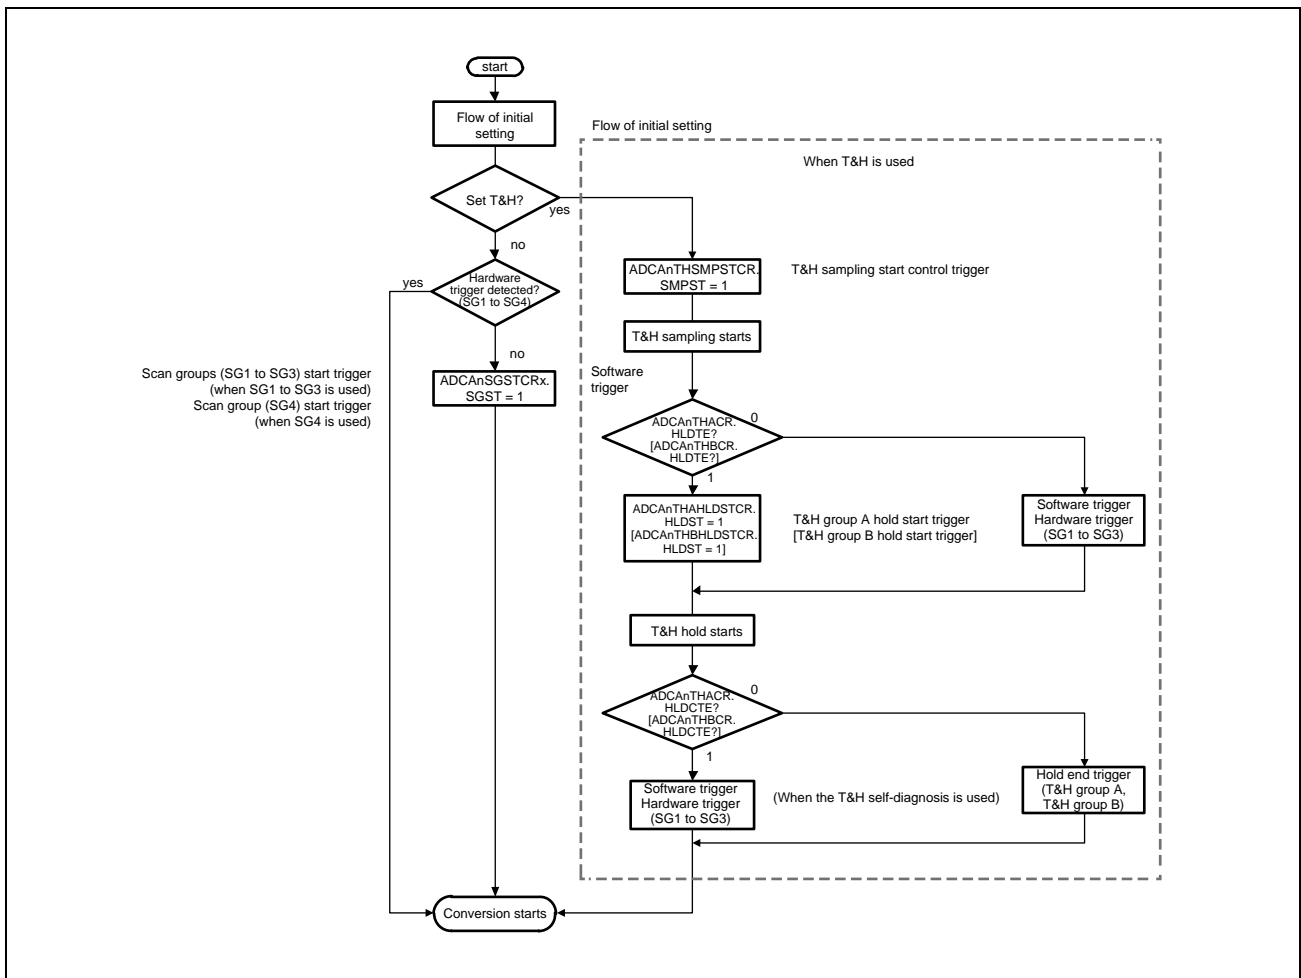

Figure 38.7 Flowchart for Trigger Input

**NOTE**

When an SG start trigger is generated during scanning, the SG start trigger is ignored.

### 38.4.3 Ending/Stopping A/D Conversion

#### 38.4.3.1 Ending by ADHALT

The flow for ending A/D conversion is shown below.

Figure 38.8 Flowchart for Ending A/D Conversion by ADHALT

### 38.4.3.2 Stopping by SGSTP (for Each Scan Group)

The flow for stopping A/D conversion for each scan group is shown below with SG1 as an example. Scan group which is selected in T&H group (Group A or Group B) has to be stopped after stopping of T&H (Group A or Group B).

Other scan group can be also controlled by its corresponding bit (ADCA<sub>n</sub>SGSTPCR2.SGSTP, ADCA<sub>n</sub>SGSTPCR3.SGSTP and ADCA<sub>n</sub>PWDSGSTPCR.PWDSGSTP). In case of SGSTP = 1 is set, it is necessary to confirm the clearing of corresponded scan group of SGACT.

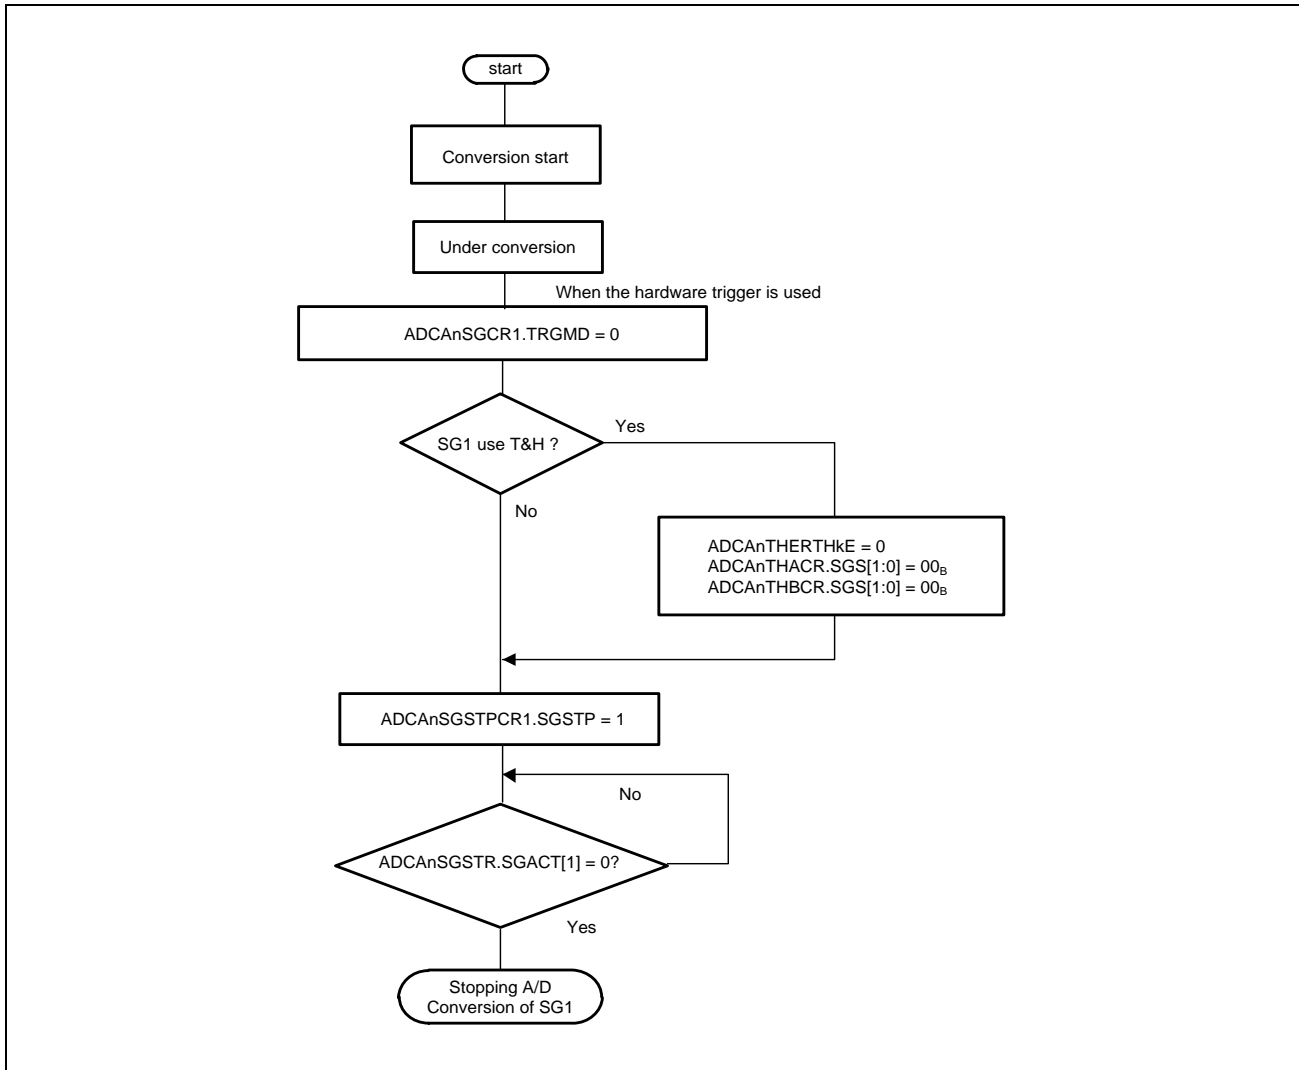

Figure 38.9 Flowchart for Stopping A/D Conversion for Each Scan Group (SG1)

#### CAUTION

In order to treat the A/D conversion results and re-set registers correctly after scan group stop setting, more than 14-bus clock (7-times of dummy read) has to be waited. In case of using the interrupt, this procedure is not necessary.

#### NOTE

When the scan group stop bit is set right before A/D conversion is completed, the corresponding scan group makes a transition to the IDLE state, but an A/D conversion end interrupt or scan end interrupt may be output. If it has any system inconvenience, disable the interrupt and then set the stop bit.

When the scan group stop bit (ADCA<sub>n</sub>SGSTPCR<sub>x</sub>.SGSTP, ADCA<sub>n</sub>PWDSGSTPCR.PWDSGST) is set, the corresponding scan group enters the IDLE state and SGA<sub>CT</sub> is cleared to 0 after finishing of the virtual channel in progress. An example of the operation is shown below.

Figure 38.10 Example of Scan Group Stop Operation (SG1)

Figure 38.11 Example of Scan Group Stop Operation (SG1 channel repeat)

When the stop bit of the scan group that has been suspended due to synchronous/asynchronous suspend is set, the corresponding scan group enters the IDLE state and SGACT is cleared to 0 without resuming the processing.

When the scan group stop bit is set and asynchronous suspend occurs due to interruption by a scan group with a higher priority during processing by a virtual channel, the processing of the virtual channel is stopped as shown in **Figure 38.12, Example of Scan Group Stop Operation (Asynchronous suspend of SG1)**, the virtual channel enters the IDLE state and SGACT is cleared to 0.

Figure 38.12 Example of Scan Group Stop Operation (Asynchronous suspend of SG1)

### 38.4.4 Example of Scan Group Operation

#### (1) Multicycle Scan Mode

The following figure illustrates an operation example where four virtual channels of scan group 1 are converted using the two-cycle scan in multicycle scan mode.

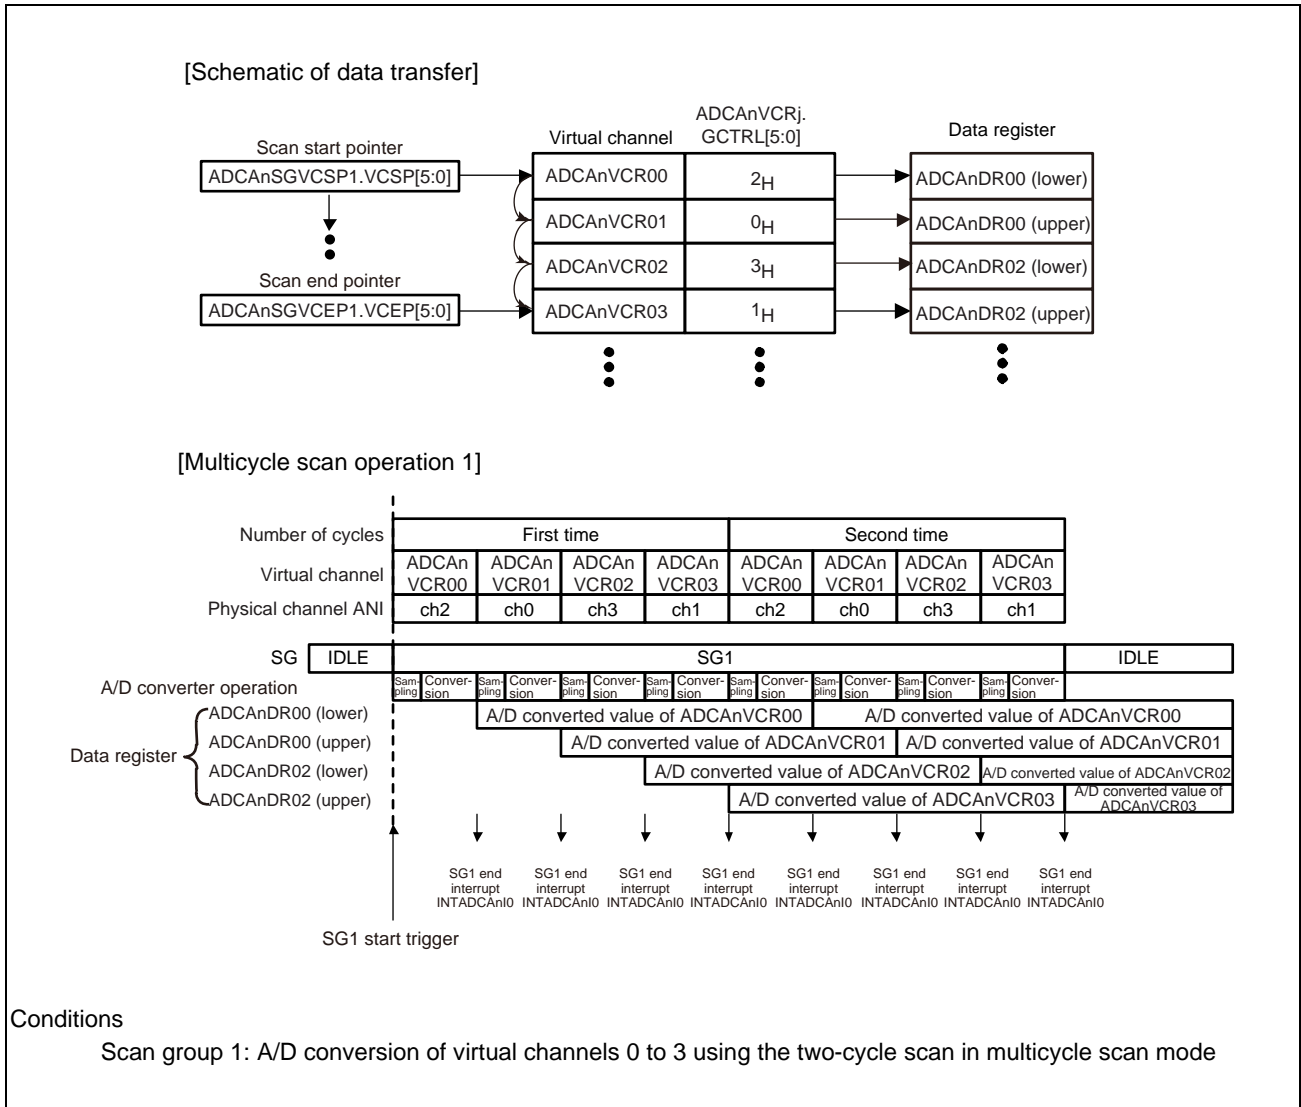

Figure 38.13 Example of Multicycle Scan Operation 1

The following figure illustrates an operation example where a pin is scanned once in multicycle scan mode.

Figure 38.14 Example of Multicycle Scan Operation 2

**(2) Continuous Scan Mode**

Continuous scan mode allows A/D conversion of the SG channels indicated by the pointers specified by ADCAnSGVCSPx.VCSP[5:0] to ADCAnSGVCEPx.VCEP[5:0] to continue until ADCAnADHALTR.HALT or ADCAnSGSTPCRx.SGSTP is asserted. This mode can be used only with SG1.

The following figure shows an example of operation in continuous scan mode.

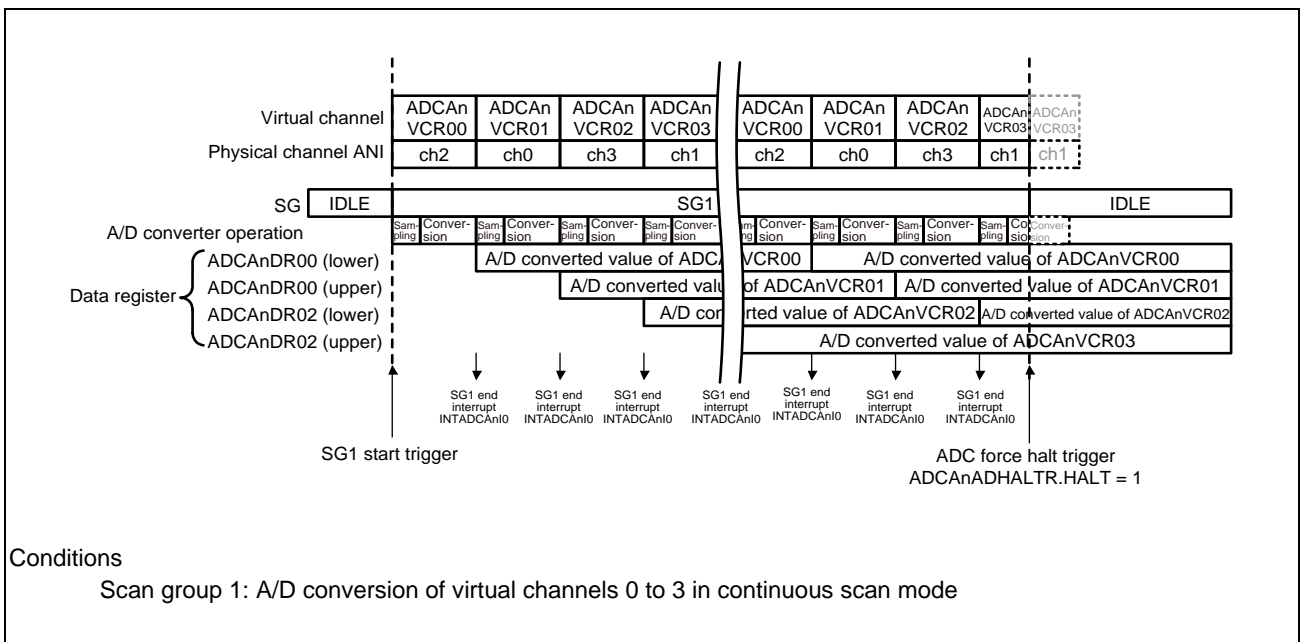

Figure 38.15 Example of Continuous Scan Operation

### 38.4.5 Channel Repeat Mode

Channel repeat mode allows A/D conversion of the SG channel indicated by the pointer specified by  $ADCA_nSGVCSPx.VCSP[5:0]$  to  $ADCA_nSGVCEPx.VCEP[5:0]$  to repeat number of channel repeat times specified by  $ADCA_nSGCRx.SCT[1:0]$ . This mode operates exclusively in each SG. The number of channel repeat times is selectable from 1, 2, and 4.

The following figures show examples of operation under respective conditions.

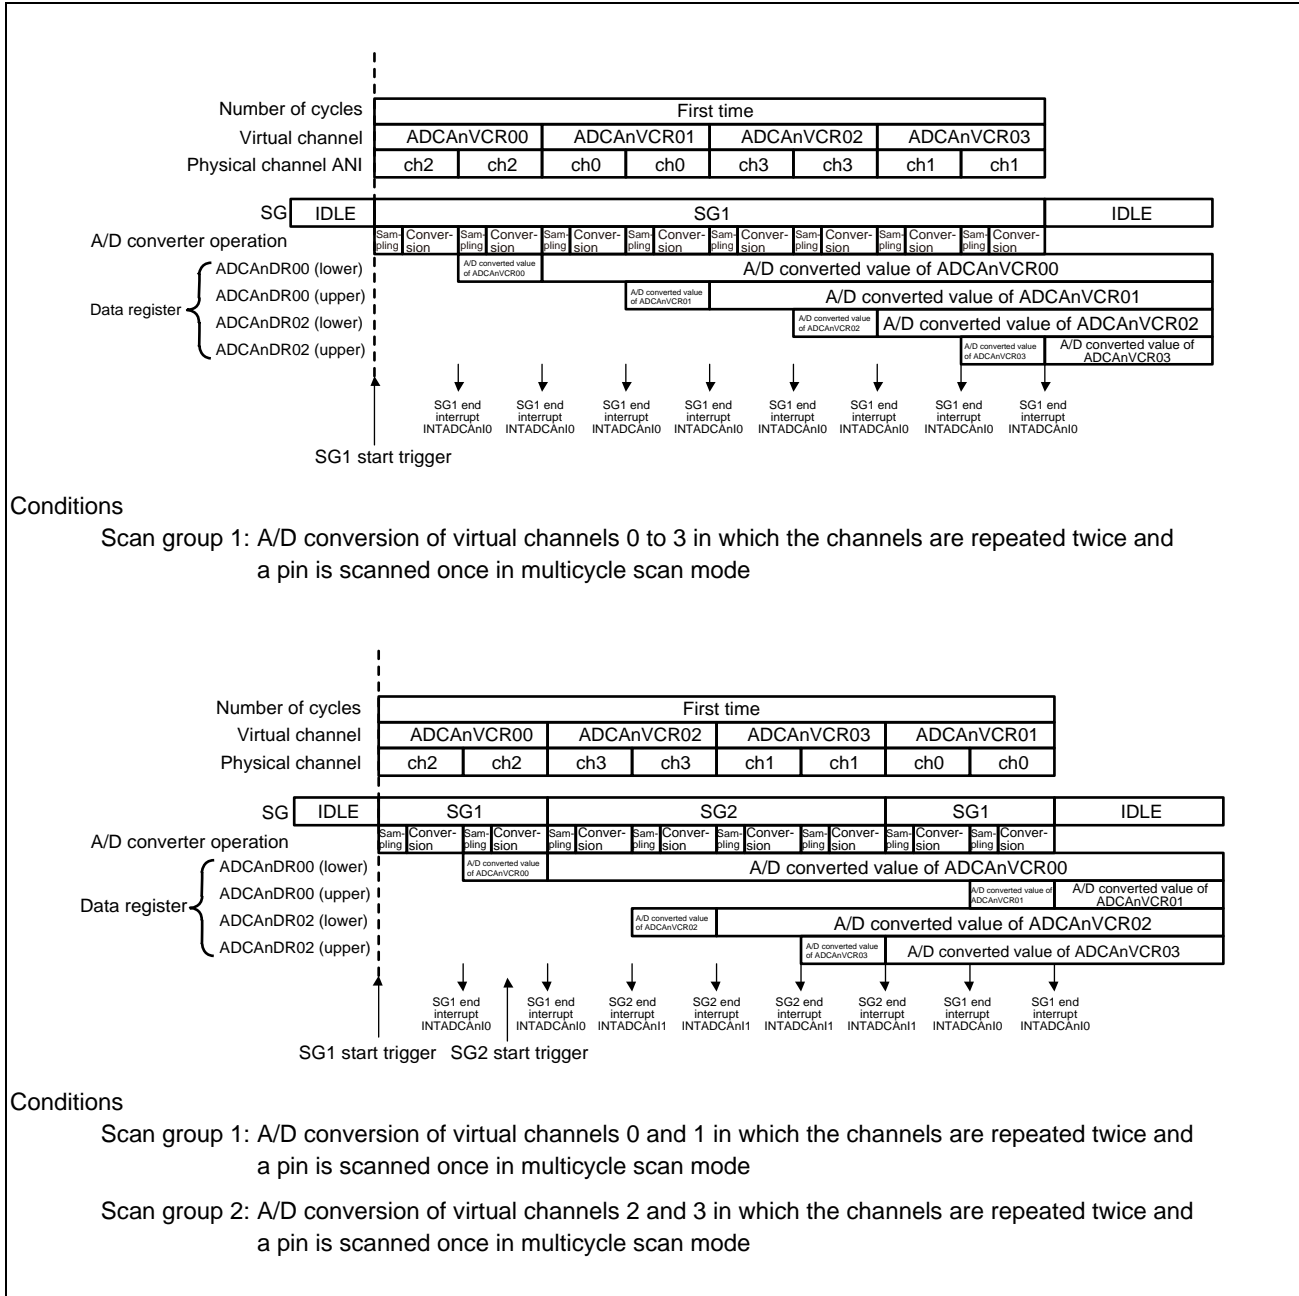

Figure 38.16 Example of Channel Repeat Operation 1

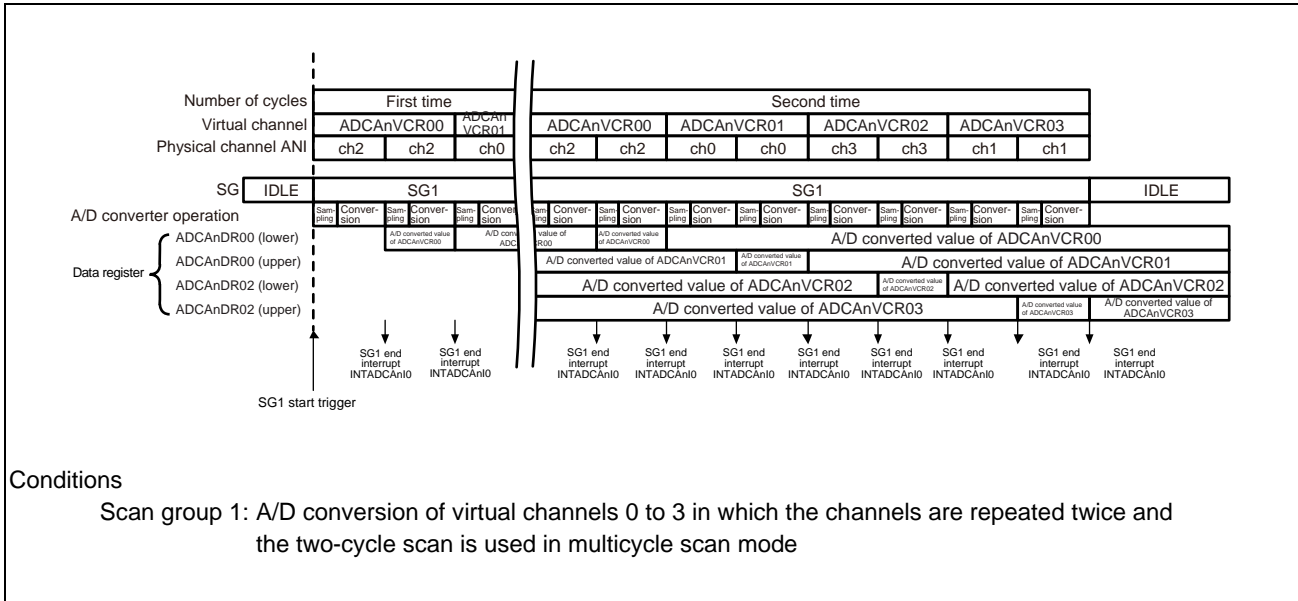

Figure 38.17 Example of Channel Repeat Operation 2

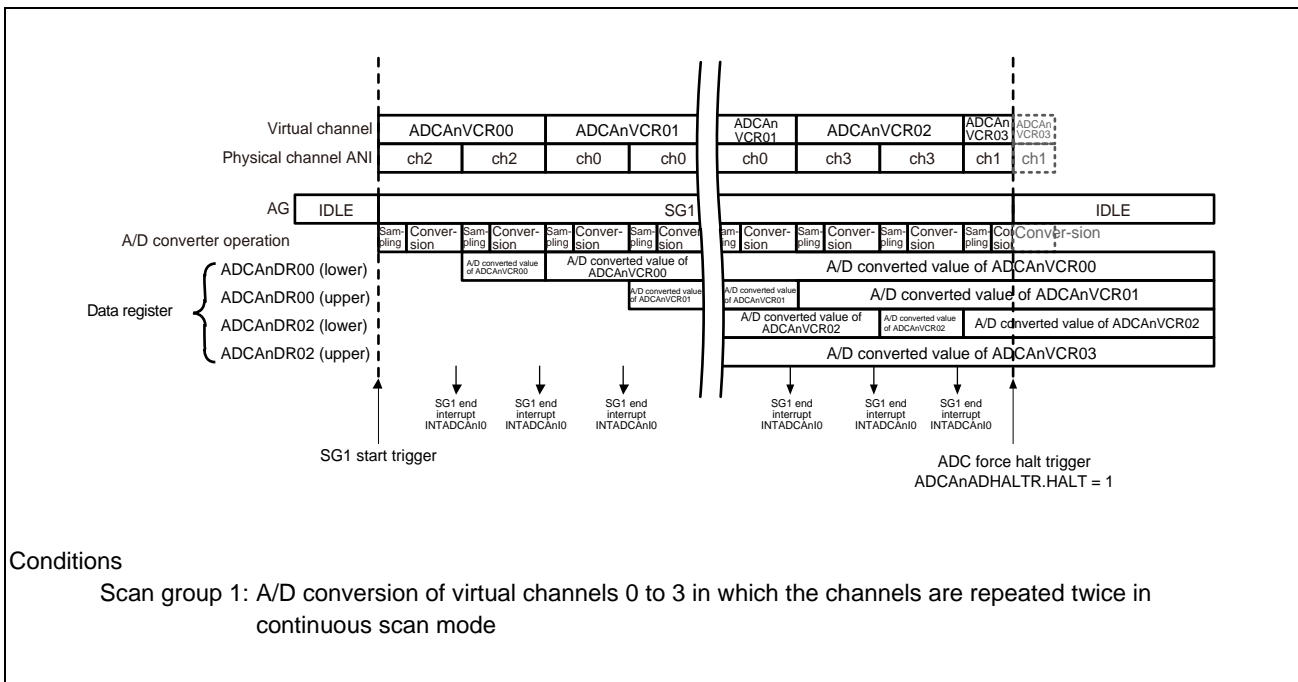

Figure 38.18 Example of Channel Repeat Operation 3

### 38.4.6 Example of Simultaneous Track and Hold Operation

Figure 38.19, Example of Simultaneous Track & Hold Operation 1 shows an operation example of simultaneous track and hold.

Figure 38.19 Example of Simultaneous Track & Hold Operation 1

**CAUTION**

---

- Do not specify the same physical channel in different groups.
  - Two-cycle (or more) scan in multicycle scan mode and track & hold operation using continuous scan mode are prohibited.
  - Because ADCAnTHSMPSTCR.SMPST is common to group A and group B, set SMPST after T&H operation for both group A and group B has been completed.
  - If the hardware trigger is asserted before HLDCTE = 1 and HLDTE = 1 of ADCAnTHACR register or ADCAnTHBCR register are set and HLDST of ADCAnTHAHLDDSTCR register or ADCAnTHBHLDDSTCR register is written to hold T&H, scan operation starts. In that case, the channel switch opens with T&H staying in the sampling state. Therefore, all scan results are undefined. Do not assert the hardware trigger by setting HLDCTE = 1 and HLDTE = 1 before writing HLDST.
  - Setting any channel from among 0 to 2 and any channel from among 3 to 5 in the same scan group is prohibited.
  - Set the interval between T&H sampling start control trigger and hold start trigger to be 450 ns or more.
  - Set the interval between hold start trigger and completion of the group A/D conversion to be 10  $\mu$ s or less.  
In suspend mode, do not use T&H for the channel of a scan group with low priority setting, if suspend time exceeds 10  $\mu$ s.
-

### 38.4.7 A/D Conversion with External Analog Multiplexer

The following figures show examples of A/D conversion in each case.

Figure 38.20 Schematic of Data Transfer and Register Settings

**Conditions**

### 38.4.7.1 A/D Conversion with PWM-Diag Enabled

With the PWM-Diag function enabled, A/D conversion is performed by the signal from the PWM-Diag.

For details on the PWM-Diag function, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

To control the A/D conversion, the A/D converter receives the setting information on the MPX by the A/D conversion trigger select (PWSA) signal. The flow of A/D conversion with PWM-Diag is as follows.

- (1) Set the channel MPX value of the MPX to ADCAnPWDVCR.MPXV[2:0]. Up to 8 channels can be specified to the MPX.
- (2) The A/D conversion is started by the trigger signal PWSA\_ADTRG from the PWM-Diag. In addition, when the MPX enable bit (ADCAnPWDVCR.MPXE) is 1, a wait of one A/D-conversion time or configured wait time which is set by ADCAnMPXSTBTR0 to ADCAnMPXSTBTR7 and ADCAnMPXSTBTSELR0 to ADCAnMPXSTBTSELR4 is inserted before A/D conversion is performed.
- (3) At the end of A/D conversion, the scan end is notified to the PWM-Diag.

#### CAUTION

As the trigger signal PWSA\_ADTRG of PWM-Diag function has a higher-priority than SGx\_TRG (x = 1 to 3), the operation of other scan groups may be kept waiting until the PWM-Diag function is ended.

Figure 38.24, PWM-Diag Operation shows an example of PWM-Diag operation using an MPX.

Figure 38.24 PWM-Diag Operation

### 38.4.8 Example of Synchronous Suspend and Resume Operation

Figure 38.25, Example of Synchronous Suspend and Resume Operation shows an example of synchronous suspend and resume operation. In this example, a higher-priority SG interrupts a lower-priority SG.

Priority of scan groups is as follows.

## 38.4.10 Error Detecting Functions

ADCA<sub>n</sub> covers upper-limit error, lower-limit error, and overwrite error.

### 38.4.10.1 Upper-Limit/Lower-Limit Error Detecting Function

The upper-limit/lower-limit error detecting function determines whether the A/D converted data is larger than the upper-limit table ADCA<sub>n</sub>ULLMTBR0.ULMTB[11:0] to ADCA<sub>n</sub>ULLMTBR7.ULMTB[11:0] or smaller than the lower-limit table ADCA<sub>n</sub>ULLMTBR0.LLMTB[11:0] to ADCA<sub>n</sub>ULLMTBR7.LLMTB[11:0] at the end of A/D conversion.

### 38.4.10.2 Overwrite Error Detecting Function

If the ADCA<sub>n</sub>DIR<sub>j</sub> register or ADCA<sub>n</sub>DR<sub>j</sub> register of a virtual channel is not read while ADCA<sub>n</sub>DIR<sub>j</sub>.WFLG = 1 (A/D converted value is stored) and the next A/D converted value is written in the ADCA<sub>n</sub>DR<sub>j</sub> register, an overwrite error is detected.

### 38.4.10.3 SVSTOP Operation

The SVSTOP function is supported by the SVSTOP signal sent from the on-chip debugger control unit. The SVSTOP function stops conversion of the A/D converter when the SVSTOP signal is input during an emulation break. While the SVSTOP signal is high, reading registers ADCA<sub>n</sub>DR<sub>j</sub>, ADCA<sub>n</sub>DIR<sub>j</sub>, ADCA<sub>n</sub>SGSTR, ADCA<sub>n</sub>ULER, ADCA<sub>n</sub>OWER, ADCA<sub>n</sub>PWDTSNDR, ADCA<sub>n</sub>PWDDIR, ADCA<sub>n</sub>ULEVCFR0, and ADCA<sub>n</sub>ULEVCFR1 by the external access does not affect these registers.

When the high level is input to SVSTOP while ADCA<sub>n</sub>EMU.SVSDIS = 0, ADCA<sub>n</sub>SGSTR.SGACT[5] is set to 1 to make a transition to the SVSTOP state. Hardware triggers and software triggers are valid in the SVSTOP state. When the high level is input to SVSTOP while ADCA<sub>n</sub>EMU.SVSDIS = 1, the ADCA does not make a transition to the SVSTOP state. ADHALT (forced termination of A/D conversion) and scan group stop by ADCA<sub>n</sub>SGSTPCR<sub>x</sub> should not be performed in the SVSTOP state.

In operations for synchronous suspension, a new start trigger cannot be accepted over the time from when the high level is input to SVSTOP to the completion of conversion on the channel where conversion is currently proceeding. This time can be up to the time taken for one A/D conversion.

The following example illustrates a SVSTOP operation example.

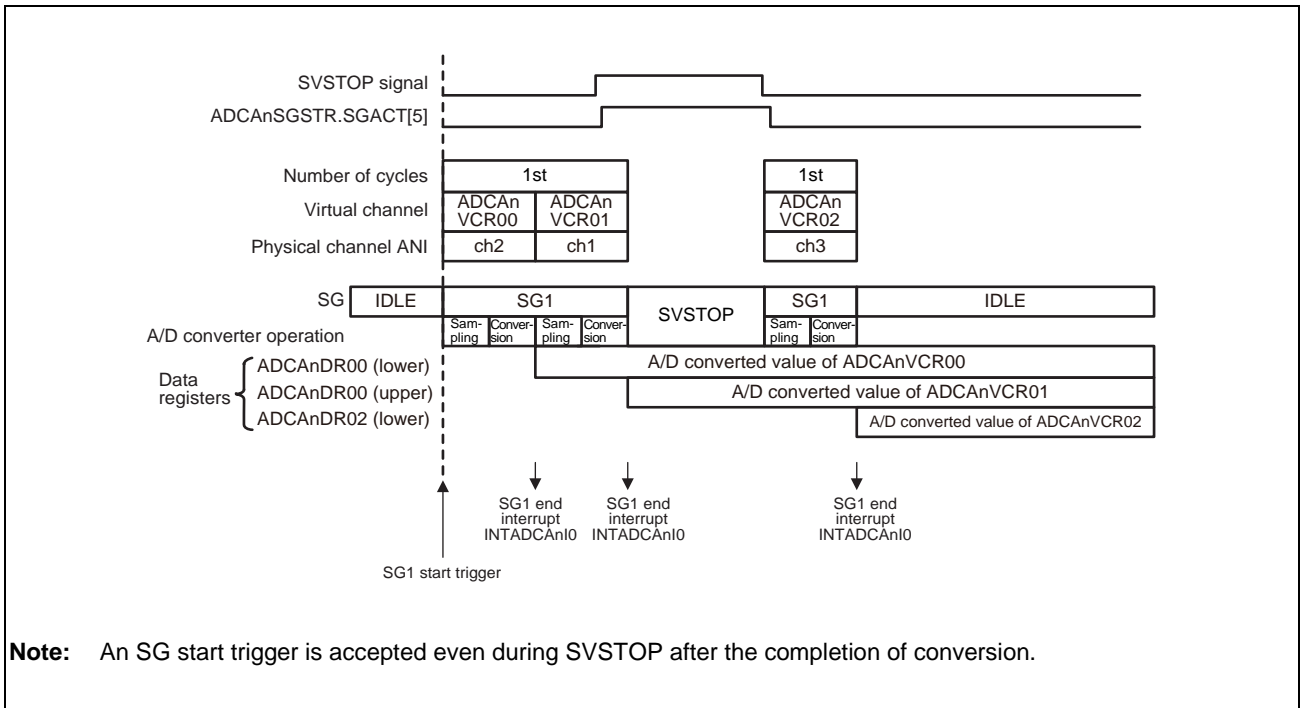

Figure 38.27 Example of SVSTOP Operation (ADCA n ADCR.SUSMTD = 00 and ADCA n EMU.SVSDIS = 0)

### 38.4.11 Activating Scan Group by a Hardware Trigger

Scan group x can be activated by the hardware trigger input to SGx\_TRG. As for the hardware trigger sources to be used, see **Table 38.84, List of A/D Conversion Hardware Triggers**. When activating SGx\_TRG by the hardware trigger, set the peripheral function to be used by the trigger and set the start trigger in the A/D conversion trigger select control register (ADCA<sub>n</sub>SGTSEL<sub>x</sub>).

A hardware trigger from external trigger input pin requires digital filter setting. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector** and **Section 2C.12, Noise Filter & Edge/Level Detector**. More than one start trigger can be specified.

#### 38.4.11.1 Stopping Scan Group by ADHALT

Setting ADCA<sub>n</sub>ADHALTR.HALT (A/D force halt trigger) to 1 forcibly halts the A/D conversion and clears the scan group status register (ADCA<sub>n</sub>SGSTR). The error flag of ADCA<sub>n</sub>ULER, ADCA<sub>n</sub>ULEVCFR0, and ADCA<sub>n</sub>ULEVCFR1 (upper limit/lower limit error register) is not cleared. When ADCA<sub>n</sub>ADHALTR.HALT is set, make sure that ADCA<sub>n</sub>SGSTR.SGACT has been cleared.

### 38.4.12 Scan End Interrupt Request

Scan group x can issue a scan end interrupt request (INT\_SGx) to INTC. If ADIE of ADCAnSGCRx is set to 1, INT\_SGx can be output after the SGx scan ends. If ADIE of ADCAnSGCRx is set to 0, the INT\_SGx output when the SGx scan ends can be disabled. If ADIE of ADCAnVCRj is set to 1, INT\_SGx can be output when A/D conversion for virtual channel j in SGx ends. If ADIE of ADCAnVCRj is set to 0, the INT\_SGx output when A/D conversion for virtual channel j in SGx ends can be disabled. Since SGx scan ending is simultaneous with A/D conversion ending for virtual channel j in SGx when ADIEs of both ADCAnSGCRx and ADCAnVCRj are set to 1, INT\_SGx occurs only once.

- Example 1: A scan is executed for virtual channel 0 or 1 in SG1 when ADIE of ADCAnSGCR1 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 0.  
INT\_SG1 is output when A/D conversion ends for virtual channel 0.
- Example 2: A scan is executed for virtual channel 0 or 1 in SG2 when ADIE of ADCAnSGCR2 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 1.  
INT\_SG2 is output when A/D conversion ends for virtual channel 0 and virtual channel 1.
- Example 3: A scan is executed for virtual channel 0 or 1 in SG3 when ADIE of ADCAnSGCR3 is 1, ADIE of VCR0 is 0, and ADIE of VCR1 is 0.  
INT\_SG3 is output when a scan ends (when A/D conversion for virtual channel 1 ends).

Furthermore, the DMA can be started when scan ends.

For the setting of DMA, see **Section 8, DMA Controller**.

Figure 38.33 Example of a Scan Conversion End Interrupt Occurrence

### 38.4.13 A/D Error Interrupt Request

ADCA can issue an A/D error interrupt request (INT\_ADE) to INTC. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 1, the OR condition of the error source is issued as INT\_ADE. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 0, INT\_ADE does not output an interrupt.

Figure 38.34 A/D Error Interrupt (Example: Overwrite Error)

### 38.5 Self-Diagnostic Function

To check the ADCAn function, the following self-diagnostic functions are available.

#### Section 38.5.1, Diagnosis of A/D Conversion Circuit

#### Section 38.5.2, Diagnosis of Channel Multiplexer

#### Section 38.5.3, Diagnosis of Open Pins

#### Section 38.5.4, Diagnosis of T&H Circuit

The overview of the self-diagnostic functions is shown in the figure below. A detailed description is given in the following sections.

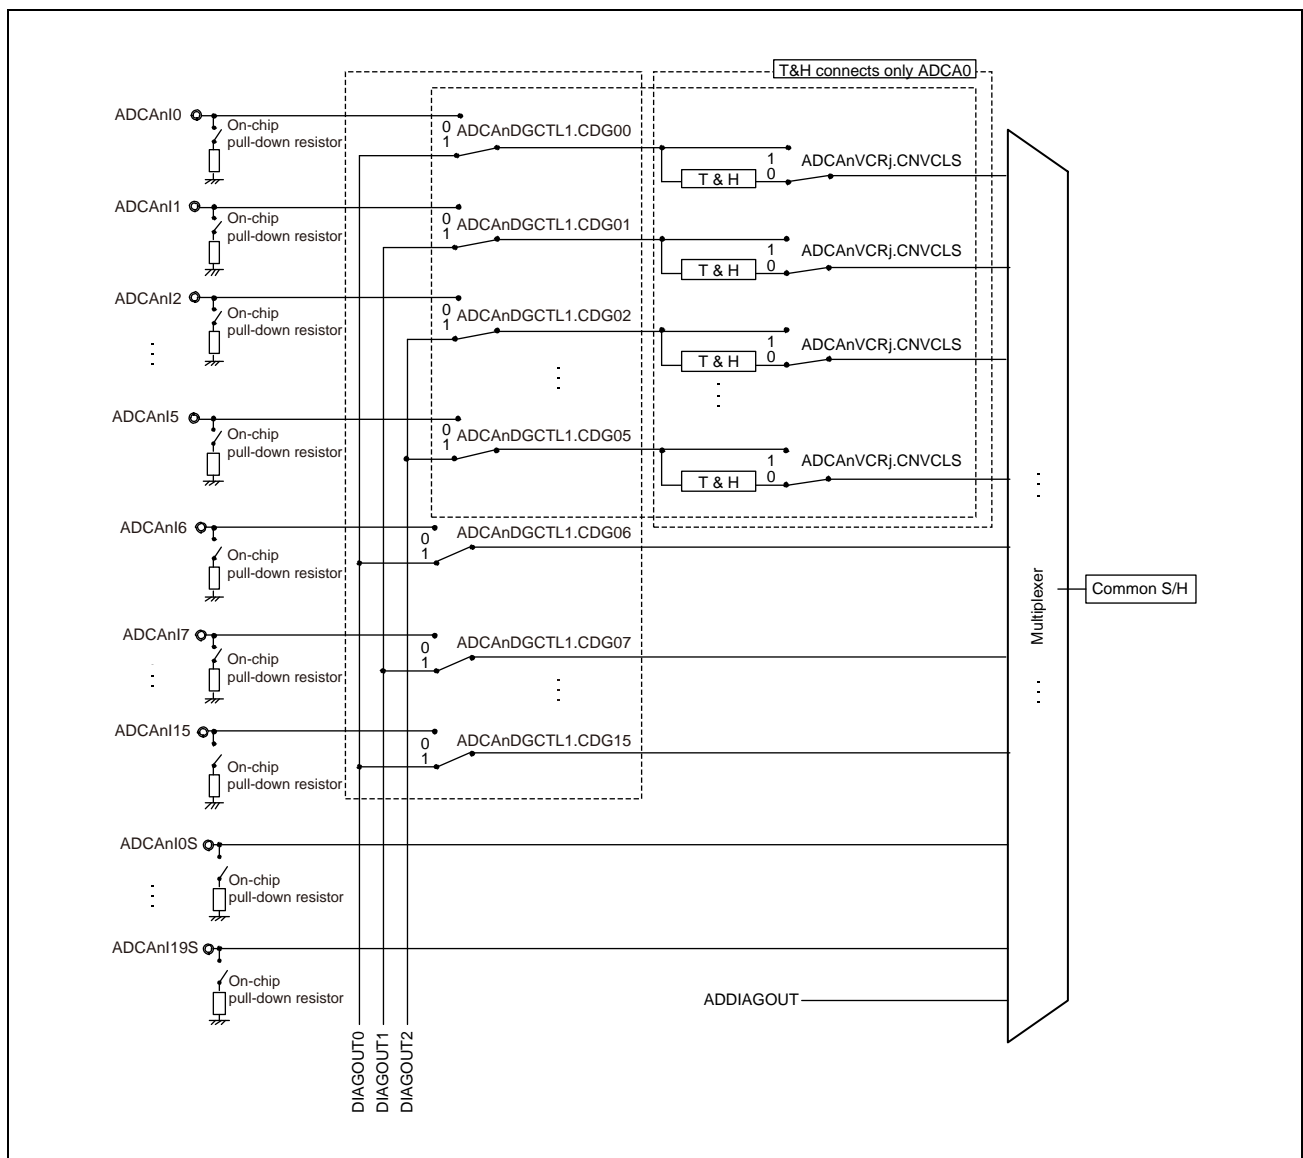

Figure 38.35 Overview of Self-Diagnostic Functions

**NOTE**

The functions in the dashed-line frames depend on the product.

### 38.5.1 Diagnosis of A/D Conversion Circuit

This function checks whether the A/D converter is operating normally by verifying the A/D conversion for self-diagnostic voltage (ADDIAGOUT) and the result of conversion. If the result of A/D conversion differs from the expected value, an internal circuit may be broken. The features of self-diagnosis of the A/D converter are as follows:

- As the self-diagnostic voltage (ADDIAGOUT) level,  $AnV_{REF}$ ,  $2/3AnV_{REF}$ ,  $1/3AnV_{REF}$ ,  $1/2AnV_{REF}$ , and  $AnV_{SS}$  are selectable by the PSEL[2:0] bits in the ADCAnDGCTL0 register.
- Self-diagnosis of the A/D converter is enabled by performing A/D conversion on one of SG1 to SG3.

#### 38.5.1.1 Diagnostic Procedure

The diagnostic procedures are shown below.

Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set ADCAnADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCAnDGCTL0.PSEL[2:0] to select a self-diagnostic voltage level.
4. Set ADCAnADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Set an arbitrary bit of ADCAnVCRj.GCTRL[5:0] to 100100<sub>B</sub> to select the diagnosis channel.
7. Set ADCAnVCRj.ADIE = 1 to enable the A/D conversion end interrupt.
8. Set ADCAnSGVCSPx to specify the start pointer of virtual channel.
9. Set ADCAnSGVCEPx to specify the end pointer of virtual channel.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

#### NOTE

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCAnDGCTL0.PSEL[2:0]. However, the value of ADCAnDGCTL0.PSEL[2:0] becomes effective from the next A/D conversion.
- To clear ADCAnADCR.DGON, follow the procedure below:
  1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
  2. Clear ADCAnDGCTL0.PSEL[2:0].
  3. Clear ADCAnADCR.DGON.

### 38.5.2 Diagnosis of Channel Multiplexer

This function checks whether the path from the analog input to the A/D converter is normal.

Set the A/D conversion reference voltage (DIAGOUT0, DIAGOUT1, DIAGOUT2) by ADCAnDGCTL0.PSEL[2:0] and the channels to be connected by the ADCAnDGCTL1 register to perform A/D conversion using multiple analog channels.

If the result of A/D conversion differs from the expected value, an internal circuit may be broken. The features of self-diagnosis of the channel multiplexer are as follows:

- Channels for diagnosis can be arbitrarily selected from among ADCA0I0 to ADCA0I15 and ADCA1I0 to ADCA1I15.
- As the self-diagnostic voltage level,  $2/3AnV_{REF}$ ,  $1/3AnV_{REF}$ , and  $1/2AnV_{REF}$  are selectable and one of the three reference voltage levels can be allocated to each channel.

Table 38.90 Selection of Channel to be Diagnosed

Connection	Select Channel
DIAGOUT0	Channels 0, 3, 6, 9, 12, and 15
DIAGOUT1	Channels 1, 4, 7, 10, and 13
DIAGOUT2	Channels 2, 5, 8, 11, and 14

- Self-diagnosis of the channel multiplexer is enabled by performing A/D conversion on one of SG1 to SG3 by using multiple channels.

### 38.5.2.1 Diagnostic Procedure

The diagnostic procedure is shown below.

Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set `ADCAnADCR.DGON = 1` to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set `ADCAnDGCTL0.PSEL[2:0]` to select a self-diagnostic voltage level.
4. Set `ADCAnADCR.DGON = 1` to update the voltage level.
5. Wait for 500 ns.
6. Use two or more `ADCAnVCRj` registers.  
Set `ADCAnVCRj.GCTRL[5:0]` bits to select physical channels.  
Set `ADCAnVCRj.ADIE` bit to enable the A/D conversion end interrupt.
7. Set `ADCAnSGVCSPx` register to specify the start pointer of virtual channel.
8. Set `ADCAnSGVCEPx` register to specify the end pointer of virtual channel.
9. Set `ADCAnDGCTL1` register to specify the physical channel to the self-diagnostic channel.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

#### NOTE

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to `ADCAnDGCTL0.PSEL[2:0]`. However, the value of `ADCAnDGCTL0.PSEL[2:0]` becomes effective from the next A/D conversion.
- To clear `ADCAnADCR.DGON`, follow the procedure below:
  1. Confirm that `SGACT` of all scan groups is 0 (before scan groups are started) and `TRGMD` of all scan groups is 0.
  2. Clear `ADCAnDGCTL0.PSEL[2:0]`.
  3. Clear `ADCAnADCR.DGON`.

### 38.5.3 Diagnosis of Open Pins

This function detects whether the analog input pin (ADCAnIm, ADCAnImS) is open due to disconnection, etc. An internal pull-down resistor can be connected to diagnose the analog input pin.

Connect the analog input pin (ADCAnIm, ADCAnImS) with the pull-down resistor for self-diagnosis for A/D conversion of the target channels.

Figure 38.36 Setting of On-chip Pull Down Resistor

When there is a disconnection, the conversion result is almost 0 V and it indicates an open detection.

Figure 38.37 Analog Input Signal Disconnection Detection

#### CAUTIONS

1. The pull-down resistors must not be connected during normal A/D conversion operation. Connected pull-down resistors may lead to a drop in the input voltage and result in erroneous A/D conversion results.
2. When the analog input voltage is nearly equal to the voltage level which is pulled down, a disconnection cannot be detected by this function.

### 38.5.3.1 Diagnostic Procedure

1. Set the ADCAnPDCTL1.PDNA or ADCAnPDCTL2.PDNB bit which correspond to analog input pins (ADCAnIm, ADCAnImS) to be diagnosed to enable the pull down resistor.
2. Generate the start trigger of scan group to perform the A/D conversion.
3. Perform the A/D conversion multiple times on the same analog input.
4. Monitor the channel's A/D conversion results and check if any result declines to almost 0 V.

### 38.5.4 Diagnosis of T&H Circuit

This function is used to diagnose proper operation of the T&H0 to T&H5 circuits for ADCA0I0 to ADCA0I5.

Virtual channel registers 33 to 35 (ADCA0VCR33 to ADCA0VCR35) are used exclusively for comparison of the potential conversion result using the T&H circuit and that obtained without using the T&H circuit to detect a failure of the T&H circuit.

For this diagnosis, the ADCA0THACR.HLDCTE is set to 1 (ADCA0THBCR.HLDCTE = 1) and ADCA0THACR.HLDTE to 0 (ADCA0THBCR.HLDTE = 0) and the A/D conversion trigger is used as the hold start/end trigger. Connect the reference voltage signal (DIAGOUT0, DIAGOUT1, or DIAGOUT2) selected by ADCAnDGCTL0.PSEL[2:0] to the target channels for diagnosis by using the ADCAnDGCTL1 register.

#### 38.5.4.1 Diagnostic Procedure (in case of T&H circuit ch0 diagnosis)

1. Set ADCA0ADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCA0DGCTL0.PSEL[2:0] = 001<sub>B</sub> to select 1/3AnV<sub>REF</sub> voltage level.
4. Set ADCA0ADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Set ADCA0DGCTL1.CDG0 = 1 to enable DIAGOUT0.
7. Set ADCA0VCR33.GCTRL[5:0] to ADCAVCR35.GCTRL[5:0] to 000000<sub>B</sub> to select physical ch0.
8. Set ADCA0VCR33.CNVCLS and ADCA0VCR34.CNVCLS to 1 to select normal conversion.
9. Set ADCA0VCR35.CNVCLS = 0 to select hold value conversion.
10. Set ADCA0THACR.SGS[1:0] = 01<sub>B</sub> to select SG1 to “T&H group A”.
11. Set ADCA0THER.TH0E = 1 to enable T&H circuit ch0.
12. Set ADCA0THGSR.TH0GS = 0 to select T&H circuit ch0 to “T&H group A”.
13. Set ADCA0SGVCSP1.VCSP[5:0] = 100001<sub>B</sub> to select SG1 start pointer to VCR33.
14. Set ADCA0SGVCEP1.VCEP[5:0] = 100011<sub>B</sub> to select SG1 end pointer to VCR35.
15. Set ADCA0DGCTL0.PSEL[2:0] = 011<sub>B</sub> to select 2/3AnV<sub>REF</sub> voltage level.
16. Set ADCA0THSMPSTCR.SMPST = 1 to execute T&H sampling.
17. Wait for 500 ns.
18. Set ADCA0SGSTCR1.SGST = 1 to execute SG1 A/D conversion.
19. Read ADCA0DIR33 to ADCA0DIR35, and check A/D conversion result to see if SG1 A/D conversion has finished.

#### NOTES

To clear ADCAnADCR.DGON, follow the procedure below:

1. Confirm that SGACTION of all scan groups is 0 (before scan groups are started) and TRGMDCON of all scan groups is 0.
2. Use the ADCAnTHER register to disable the diagnosed T&Hk.
3. Clear ADCAnDGCTL0.PSEL[2:0].
4. Clear ADCAnADCR.DGON.

### 38.5.4.2 Diagnosis Mechanism

- (1) A reference voltage “A” is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T&H circuit holds the voltage “A” and an A/D conversion is performed without using the T&H circuit.

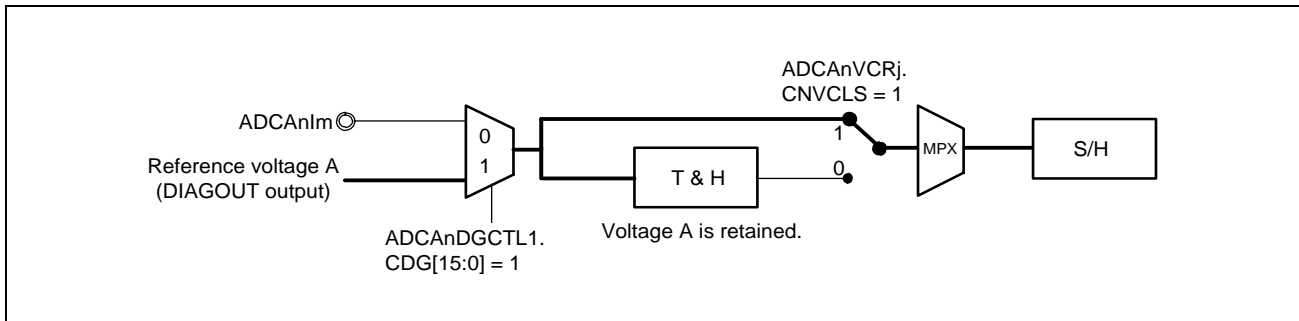

Figure 38.38 T&H Circuit Diagnostic Mechanisms (1)

- (2) A reference voltage “B” is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T&H circuit still holds the voltage “A” and an A/D conversion is performed without using the T&H circuit. Note that since reference voltage “A” is being held, reference voltage “B” is not held.

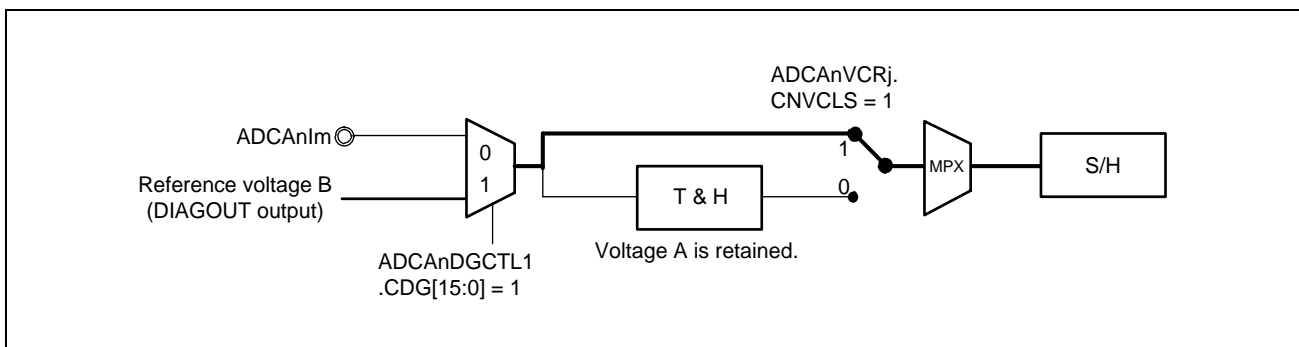

Figure 38.39 T&H Circuit Diagnostic Mechanisms (2)

- (3) An A/D conversion is performed using the T&H circuit. The T&H circuit continues to hold the voltage A.

Figure 38.40 T&H Circuit Diagnostic Mechanisms (3)

- (4) The diagnosis of T&H circuit is successful if the following results are obtained:
1. The first result (step 1) is voltage "A".
  2. The second result (step 2) is voltage "B".
  3. The last result (step 3) is voltage "A" again.

## 38.6 Definition of A/D Conversion Accuracy

A/D conversion accuracy is defined as follows:

- Resolution  
Digital output code value from the A/D converter
- Quantization error  
An error essentially contained in the A/D converter, which is assumed as 1/2 LSB (**Figure 38.41, Definition of A/D Conversion Accuracy**).
- Offset error  
Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from the minimum voltage value 000<sub>H</sub> to 001<sub>H</sub>. However, the quantization error is not included.
- Full scale error  
Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from FFE<sub>H</sub> to FFF<sub>H</sub>. However, the quantization error is not included.
- DNL (Differential nonlinear error)  
Deviation between the ideal digital output code width ( $V_q$ ) and the actual digital output code width ( $V_a$ ), which is assumed as  $(V_a - V_q)/V_q$ . However, the offset error, the full scale error, and the quantization error are not included.
- INL (Integral nonlinear error)  
Deviation of the actual value from the ideal A/D conversion characteristics between the zero voltage and the full scale voltage, which is assumed as an integral of DNL from 000<sub>H</sub> to a digital output code. However, the offset error, the full scale error, and the quantization error are not included.
- Absolute accuracy  
Deviation between the digital value and the analog input value. The offset error, the full scale error, the quantization error, DNL, and INL are included.
- Overall error  
Deviation between the digital value and the analog input value. The offset error, the full scale error, DNL, and INL are included, but the quantization error isn't included.

## 38.7 Usage Notes

### 38.7.1 Range of Channel Input Voltage

#### CAUTION

ADCA<sub>nIm</sub> and ADCA<sub>nImS</sub> input voltages should be used within the specification range. When the channel input voltage exceeds AnVREF or falls below AnVSS, an over-voltage/injected current condition applies.

1. When an over-voltage is applied to ADCA<sub>nIm</sub> pins (within the specified injected current range) and at the same pins the ADC self-diagnosis (diagnosis of channel multiplexer) is executed an offset voltage to the diagnosis voltage will be measured.
2. When an over-voltage is applied to ADCA<sub>nIm</sub> pins (within the specified injected current range) and at adjacent pins the ADC self-diagnosis (diagnosis of channel multiplexer) is executed an AD conversion result within the range of TESH0SN will be measured.

**Case:** Injected current is applied at only two pins (ADCA0I0 and ADCA0I1 in the example below) where the ADC self-diagnosis is executed.

- ADCA0I0 and ADCA0I1 with applied injected current, but ADC self-diagnosis executed (CDG0-15 = 1 set to DIAGOUT<sub>n</sub> selected).  
→ Conversion result of TESH0SN with offset voltage
- ADCA0I2-15 without applied injected current, but ADC self-diagnosis executed (CDG0-15 = 1 set to DIAGOUT<sub>n</sub> selected).  
→ Conversion result of TESH0SN without offset voltage

### 38.7.2 Notes on Application Design

#### (1) Analog Input Pins (ADCA<sub>nIm</sub>, ADCA<sub>nImS</sub>)

- Ensure that the input voltages on the ADCA<sub>nIm</sub> and ADCA<sub>nImS</sub> pins are within the specified ranges. We recommend using diodes with VF of 0.3V or below to form a clamp to avoid the input of voltages at or above AnVREF and at or below AnVSS. The results of conversion for input voltages at or above AnVREF and at or below AnVSS are undefined and so are not guaranteed. Input of such voltages can also affect the results of conversion on other channels.
- Reduce noise on the analog input pins (ADCA<sub>nIm</sub> and ADCA<sub>nImS</sub>) by connecting a resistor Re between the pins and the external sources of analog input signals for conversion and capacitor Ce to the AnVSS pins.
- Avoid analog signal lines crossing digital signal lines and vice versa, since this can introduce noise and reduce performance in A/D conversion.
- We recommend avoiding the driving of large currents through input and output pins near the ADCA<sub>nIm</sub> and ADCA<sub>nImS</sub> pins and toggled signals in particular should be kept away from these pins.
- If you are using the standby functions, confirm the Force halt or the Normal end with the flow for **Section 38.4.3, Ending/Stopping A/D Conversion**. Then, set the ADCA<sub>nTHER</sub>.THkE bits, which are to be effective on standby, to 0.
- If you are using the LPS on ADCA0 (also when standby function is used), set the ADCA0SGCRx.TRGMMD bit to 1 and the ADCA0SGTSELx.TxSEL bits to SEQTRG (LPS). For details, see **Section 15, Low-Power Sampler (LPS)**.
- Do not connect a channel to be used with the T&H function to an external analog multiplexer.

- Changes to physical and virtual channels during operation while the T&H function is in use is prohibited.
- Writing to PWM-Diag-related registers while PWM-Diag is not in use is prohibited.

## (2) Power Wiring

The following methods are recommended to minimize the influence of switching noise from digital circuits on A/D converter accuracy.

- Connect markedly thick wiring patterns to the mesh pattern or connect solid patterns to the power-supply lines.
- Insert bypass capacitors between power-supply pins (EVCC, BVCC, and AnVREF) and ground pins (EVSS, BVCC, and AnVSS).
- We recommend separating the analog power supply (AnVREF) from the digital power supplies (EVCC, BVCC) and providing the voltages from a series regulator. If the analog power supply is to come from the same source as that of the digital power supplies, wire the analog and digital power supplies to an electrolytic capacitor, and provide separate wiring patterns on the board.

We also recommend inserting a chip inductor in the input for the analog power supply. Furthermore, earth the analog and digital grounds to the same point on an electrolytic capacitor, and provide separate wiring patterns for the grounds on the board.

The analog power supply also serves as the analog reference voltage for this product.

## (3) Variation in A/D Converted Data

The effects of noise and variations in the power supply voltages lead to dispersal of the results of A/D conversion. Furthermore, noise on the analog input pins (ADCAnIm and ADCAnImS) or on the reference voltage input pins (AnVREF and AnVSS) can lead to the results of A/D conversion being incorrect.

Apply software processing to avoid ill effects on the system of fluctuations in or incorrectness of the results of A/D conversion.

Examples of software handling are described below.

- Use averaged values from several rounds of A/D conversion
- Execute A/D conversion for several time and omit extreme results
- Repeat the processing for abnormalities to check for repeated abnormalities in the case of results of A/D conversion which will cause malfunctions of the system.

There is a possibility that A/D conversion accuracy of high priority SG become worse when following both conditions are applicable.

- (1) During the A/D conversion of low priority SG (e.g. SG1), conversion trigger of the high priority SG (e.g. SG3) occur.
- (2) The channel T&H function of high priority SG (e.g. SG3) is enabled.

The above case is one of an example of SG combination. The SG priority is  $SG4 > SG3 > SG2 > SG1$ . The fluctuation of conversion error depends on the external circuit and devices mounted on the customer board.

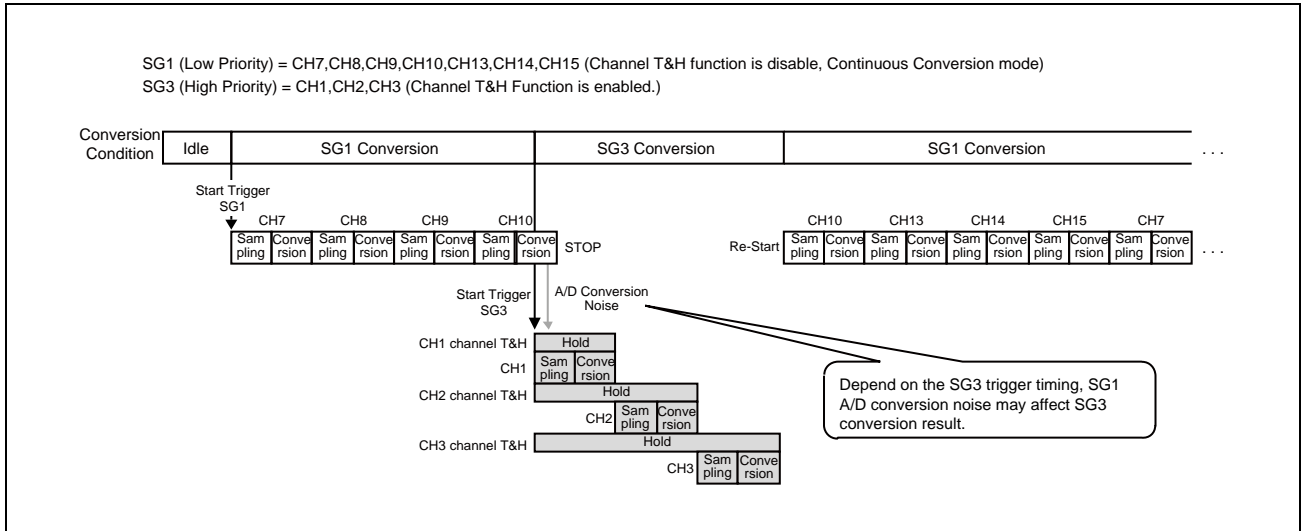

Figure 38.42 SG priority

Examples of software handling are described below.

- Low priority SG (e.g. SG1) A/D conversion have to be finished 3 ADCLK before the conversion trigger of high priority SG (e.g. SG3), if the SG3 contains the channels which channel T&H is available.
- If there is a case that high priority SG (e.g. SG3) conversion trigger occur during the conversion of low priority SG (e.g. SG1), disable the high priority SG channel T&H function.
- If the both conditions mentioned in previous page need to be used, adjust high priority SG (e.g. SG3) conversion trigger timing to synchronize with the following timing (the period shown by arrowed line in the following figure) during A/D conversion of low priority SG (e.g. SG1).

Even if trigger timing is adjusted above recommendation time, conversion error specified in **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4**, **RH850/F1KM-S2** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1** cannot be removed.

Figure 38.43 SG conversion trigger timing

When it is not possible to use the above 3 software handlings, following process is recommended.

- Doing A/D conversion several times and using average of several A/D conversion results.
- Doing continuous A/D conversion several times, remove abnormal conversion result and use only the other results.
- When abnormal A/D conversion result is detected, not to proceed abnormal operation immediately, doing one more A/D conversion before proceeding abnormal operation.

The effect of above process is depend on the external circuit and devices mounted on the customer board. Sufficient evaluation of the system is recommended.

#### (4) Alternative Input/Output

Analog input (ADCA<sub>nIm</sub>, ADCA<sub>nImS</sub>) pins can be used as port pins.

Do not read from input port pins or write to output port pins while an ADCA<sub>nIm</sub> or ADCA<sub>nImS</sub> pin function is selected and handling A/D conversion. Doing so may reduce the accuracy of conversion.

Fluctuations in output current from output port pins due to the effects of an external circuit connected to a port pin while A/D conversion is in progress may also reduce the accuracy of conversion. If digital pulses are applied to or digital pulses are output through a pin adjacent to a pin for which A/D conversion is in progress, the A/D converted value may not be as expected due to coupling noise. Accordingly, do not apply pulses to or output pulses from a pin adjacent to a pin for which A/D conversion is in progress.

Figure 38.44 Example of Noise Protection for Analog Input Circuit

Capacitor C1 is effective for low-frequency noise, and capacitors C2 and Ce are effective for high-frequency noise.

The voltage on an AnVREF pin is undefined immediately after switching from the stopped state to the start of conversion operations, and this may have the effect of reducing the accuracy of conversion. As a countermeasure for this situation, connect capacitors C1 and C2 to the AnVREF pins.

## Section 39 Key Return (KR)

This section contains a generic description of the Key Return (KR).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of KR.

## 39.2 Overview

### 39.2.1 Functional Overview

The Key Return function has the following features:

A key interrupt request signal (INTKR<sub>n</sub>) can be generated by inputting a falling signal, that goes from high to low, to any of the eight key input pins (KR<sub>n</sub>TPKR7 to KR<sub>n</sub>TPKR0).

### 39.2.2 Block Diagram

Bit Position	Bit Name	Function
7 to 0	KRnKRMm	Enables/disables the key input signal detection. 0: Disabled 1: Enabled

## 39.4 Operation

### 39.4.1 Interrupt Request INTKRn

The interrupt request INTKRn is generated when the level of the corresponding key input pin (KRnTPKRm) is changed from high to low while input to the key input pin (KRnTPKRm) is enabled (KRnKRM.KRnKRMm = 1).

**Figure 39.2, Interrupt Request Generation** shows how the interrupt request is generated:

Figure 39.2 Interrupt Request Generation

#### CAUTIONS

1. The change of a key input pin (KRnTPKRm) level from high to low does not trigger another INTKRn if any of the key return input pins are already low. The next INTKRn is only triggered by a key input pin level changing from high to low if all other key input pins are high.
2. If the key input value changes at the same time the setting of KRnKRM.KRnKRMm is changed, an unintended key interrupt request INTKRn might be generated.  
Therefore, mask (disable) INTKRn of the interrupt controller before changing KRnKRM.KRnKRMm from 0 to 1, or from 1 to 0.

## Section 40A Functional Safety of RH850/F1KH-D8

This section provides an overview of the safety mechanisms included in the RH850/F1KH Series.

This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.

For more information about the development process and safety mechanisms, please contact our sales office.

The following are the failure detection functions provided by this microcontroller.

### 40A.1 Overview

#### **ECC**

Detects failures of memories and data transfer paths and corrects some types of failures.

#### **Memory Protection**

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

#### **Clock Monitor**

Monitors the clock operation to detect abnormal operations.

For details, see **Section 13, Clock Monitor (CLMA)**.

#### **Data CRC**

Generates CRC to detect data errors.

For details, see **Section 41, Data CRC (DCRA)**.

#### **Write-Protected Registers**

The write-protected registers are protected from inadvertent write access due to erroneous program execution.

For details, see **Section 5, Write-Protected Registers**.

## 40A.2 ECC

### 40A.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 40A.1 ECC Overview

Applicable Memory	Applicable Data Width [bits]	Operation upon Error Detection					Failure Insertion	
		Detection/Correction	SYSERR	Interrupt Notice	Error Status	Address Capture

Note 1. For details of ECC for each peripheral IP, see **Section 40A.2.6, ECC for Peripheral RAM**.

Note 2. For details, see **Section 40A.2.2.2, Interrupt Requests**, **Section 40A.2.4.2, Interrupt Requests**, and **Section 40A.2.5.2, Interrupt Requests**.

#### Applicable Data Width

This is the data width to be ECC encoded.

To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).

- (1) Reading data to be ECC-encoded including data to be rewritten
- (2) Replacing data to be rewritten
- (3) Writing back data generated in (2)

#### Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected.

SED-DED: 1-bit errors and 2-bit errors can only be detected.

#### SYSERR

SYSERR can be generated upon error detection.

#### Interrupt Notice

An interrupt can be generated upon error detection.

#### Error Status

The status of a detected error is retained.

**Address Capture**

The address of a detected error is retained.

**Failure Insertion**

Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

## 40A.2.2 Code Flash ECC

### 40A.2.2.1 Overview

RH850/F1KH has three code flash ECC decoder circuits implemented, two inside the Processor Element (PE1/PE2) and one on the VCI (system interconnect).

**Figure 40A.1, Block Diagram of Code Flash ECC** shows the location of three ECC decoders for the code flash.

Figure 40A.1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.

Table 40A.2 Summary of Code Flash ECC

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction.</li> <li>• 2-bit error detection and 1-bit error detection.</li> </ul> <p>When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. (This is not supported in CFERRINT_PE1/PE2 register.) Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch.</li> <li>• Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see <b>Section 3A, CPU System of RH850/F1KH-D8</b>.</li> </ul> <p>In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.</p>

Table 40A.2 Summary of Code Flash ECC

Item	Description
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The ECC 1-bit error status is set only when no error status has been set. The ECC 2-bit error status is set even when the ECC 1-bit error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured.
Self-diagnosis	The ECC bit can be read directly.
Inhibiting instruction execution	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching avoids the execution of incorrect instructions.

### 40A.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.

Table 40A.3 Code Flash ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0*1 (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR	—

Note 1. ECCFLI0FEIF flag set can be read (not jump to handler address of FEINT) in SYSERR processing because return from SYSERR is not possible.

Table 40A.4 Code Flash ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0 (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR, INTECCFLI0	—

Note 1. The registers suffixed with symbols “\_VCI”, “\_PE1” and “\_PE2” are provided to ECC controllers corresponding to each access port: registers with “\_VCI” are provided to the ECC controller for data access from the system interconnect to the code flash, registers with “\_PE1” are provided to the ECC controller for fetch access from the CPU1 and registers with “\_PE2” are provided to the ECC controller for fetch access from the CPU2.

#### 40A.2.2.4 Details of Registers

##### (1) CFEECCTL\_VCI/PE1/PE2 — Code Flash ECC Control Register

CFEECCTL\_VCI/PE1/PE2 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFEECCTL\_VCI/PE1/PE2, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** CFEECCTL\_VCI, CFEECCTL\_PE1 and CFEECCTL\_PE2 can be read or written in 32-bit units.  
CFEECCTL\_VCIL, CFEECCTL\_PE1L and CFEECCTL\_PE2L can be read or written in 16-bit units.

**Address:** CFEECCTL\_VCI: FFC6 2200<sub>H</sub>  
CFEECCTL\_VCIL: FFC6 2200<sub>H</sub>  
CFEECCTL\_PE1: FFC6 2400<sub>H</sub>  
CFEECCTL\_PE1L: FFC6 2400<sub>H</sub>  
CFEECCTL\_PE2: FFC6 2600<sub>H</sub>  
CFEECCTL\_PE2L: FFC6 2600<sub>H</sub>

Table 40A.7 CFEECCTL\_VCI/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFEECCTL_VCI/PE1/PE2.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

**(2) CFERRINT\_VCI/PE1/PE2 — Code Flash Error Information Control Register**

CFERRINT\_VCI/PE1/PE2 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** CFERRINT\_VCI, CFERRINT\_PE1 and CFERRINT\_PE2 can be read or written in 32-bit units.  
CFERRINT\_VCIL, CFERRINT\_PE1L and CFERRINT\_PE2L can be read or written in 16-bit units.  
CFERRINT\_VCILL, CFERRINT\_PE1LL and CFERRINT\_PE2LL can be read or written in 8-bit units.

**Address:** CFERRINT\_VCI: FFC6 2204<sub>H</sub>  
CFERRINT\_VCIL: FFC6 2204<sub>H</sub>  
CFERRINT\_VCILL: FFC6 2204<sub>H</sub>

0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

Note 1. This bit is not supported in CFERRINT\_PE1/PE2. When writing to this bit in CFERRINT\_PE1/PE2, always write 1.

Note 2. Regarding the interrupt request, see **Section 40A.2.2.2, Interrupt Requests**.

**(3) CFSTCLR\_VCI/PE1/PE2 — Code Flash Status Clear Register**

CFSTCLR\_VCI/PE1/PE2 clears the error flags in the error status register (CF1STERSTR\_VCI/PE1/PE2), the overflow flag in the error overflow status register (CFOVFSTR\_VCI/PE1/PE2), and the error address register (CF1STEADR0\_VCI/PE1/PE2).

**Access:** CFSTCLR\_VCI, CFSTCLR\_PE1 and CFSTCLR\_PE2 are write-only registers that can be written in 32-bit units.  
CFSTCLR\_VCIL, CFSTCLR\_PE1L and CFSTCLR\_PE2L are write-only registers that can be written in 16-bit units.  
CFSTCLR\_VCILL, CFSTCLR\_PE1LL and CFSTCLR\_PE2LL are write-only registers that can be written in 8-bit units.

#### (4) CFOVFSTR\_VCI/PE1/PE2 — Code Flash Error Count Overflow Status Register

CFOVFSTR\_VCI/PE1/PE2 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

**Access:** CFOVFSTR\_VCI, CFOVFSTR\_PE1 and CFOVFSTR\_PE2 are read-only registers that can be read in 32-bit units. CFOVFSTR\_VCIL, CFOVFSTR\_PE1L and CFOVFSTR\_PE2L are read-only registers that can be read in 16-bit units. CFOVFSTR\_VCILL, CFOVFSTR\_PE1LL and CFOVFSTR\_PE2LL are read-only registers that can be read in 8-bit units.

**(5) CF1STERSTR\_VCI/PE1/PE2 — Code Flash 1st Error Status Register**

CF1STERSTR\_VCI/PE1/PE2 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

**Access:** CF1STERSTR\_VCI, CF1STERSTR\_PE1 and CF1STERSTR\_PE2 are read-only registers that can be read in 32-bit units.

CF1STERSTR\_VCIL, CF1STERSTR\_PE1L and CF1STERSTR\_PE2L are read-only registers that can be read in 16-bit units.

CF1STERSTR\_VCILL, CF1STERSTR\_PE1LL and CF1STERSTR\_PE2LL are read-only registers that can be read in 8-bit units.

0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected when DEDF0 flag is 0. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1/PE2 to 1. [Setting condition] ECC 1-bit error is detected when DEDF0, SEDF0 are 0.

**(6) CF1STEADR0\_VCI/PE1/PE2 — Code Flash 1st Error Address Register**

CF1STEADR0\_VCI/PE1/PE2 holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR\_VCI/PE1/PE2. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STEADR0\_VCI/PE1/PE2 register is cleared by an internal reset, the external reset, or by setting the STCLR bit in the CFSTCLR\_VCI/PE1/PE2 register to 1.

**Access:** CF1STEADR0\_VCI, CF1STEADR0\_PE1 and CF1STEADR0\_PE2 are read-only registers that can be read in 32-bit units.

CF1STEADR0\_VCIL, CF1STEADR0\_VCIH, CF1STEADR0\_PE1L, CF1STEADR0\_PE1H, CF1STEADR0\_PE2L and CF1STEADR0\_PE2H are read-only registers that can be read in 16-bit units.

CF1STEADR0\_VCILL, CF1STEADR0\_VCILH, CF1STEADR0\_VCIHL, CF1STEADR0\_VCIHH, CF1STEADR0\_PE1LL, CF1STEADR0\_PE1LH, CF1STEADR0\_PE1HL, CF1STEADR0\_PE1HH, CF1STEADR0\_PE2LL, CF1STEADR0\_PE2LH, CF1STEADR0\_PE2HL and CF1STEADR0\_PE2HH are read-only registers that can be read in 8-bit units.

### (7) CFSTSTCTL\_VCI — Code Flash Sub-Test Control Register

CFSTSTCTL\_VCI is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly.

When writing to CFSTSTCTL\_VCI, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** CFSTSTCTL\_VCI can be read or written in 32-bit units.  
CFSTSTCTL\_VCIL can be read or written in 16-bit units.

**Address:** CFSTSTCTL\_VCI: FFC6 2350<sub>H</sub>  
CFSTSTCTL\_VCIL: FFC6 2350<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 40A.13 CFSTSTCTL\_VCI Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST bit.
14	PROT0	The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFSTSTCTL_VCI.
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see **Section 3A, CPU System of RH850/F1KH-D8**.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of reading code flash are as follows:

Bit Number	Meaning	Bit Position	Description
bit[31:10]	all-0	31 to 10	These bits are always 0.
bit[9]	reserved	9	Unknown

### 40A.2.3.4 Details of Registers

#### (1) DFECCTL — Data Flash ECC Control Register

DFECCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCTL, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** DFECCTL can be read or written in 16-bit units.

**Address:** DFECCTL: FFC6 2A00<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 40A.18 DFECCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

**(2) DFERSTR — Data Flash Error Status Register**

DFERSTR monitors occurrence of errors.

The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

**Access:** DFERSTR is a read-only register that can be read in 8-bit units.

**Address:** DFERSTR: FFC6 2A04<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	DEDF	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 2-bit error is detected when both SEDF and DEDF are 0.
0	SEDF	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 1-bit error is detected when both SEDF and DEDF are 0.

**(3) DFERSTC — Data Flash Error Status Clear Register**

DFERSTC clears the error flags in the data flash error status register.

**Access:** DFERSTC is a write-only register that can be written in 8-bit units.

**Address:** DFERSTC: FFC6 2A08<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

0	ERRCLR	SEDF/DEDF Flag Clear 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in DFERSTR.) 1: The SEDF/DEDF flag in DFERSTR is cleared.

**(4) DFOVFSTR — Data Flash Error Overflow Status Register**

DFOVFSTR monitors occurrence of data flash error overflow.

**Access:** DFOVFSTR is a read-only register that can be read in 8-bit units.

**Address:** DFOVFSTR: FFC6 2A0C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

**(5) DFOVFSTC — Data Flash Error Overflow Status Clear Register**

DFOVFSTC clears the data flash error overflow flag.

**Access:** DFOVFSTC is a write-only register that can be written in 8-bit units.

**Address:** DFOVFSTC: FFC6 2A10<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

**(6) DFERRINT — Data Flash Error Notification Control Register**

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** DFERRINT can be read or written in 8-bit units.

**Address:** DFERRINT: FFC6 2A14<sub>H</sub>

**Value after reset:** 02<sub>H</sub>

1	DEDIE	ECC 2-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

**(7) DFEADR — Data Flash 1st Error Address Register**

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0.

**Access:** DFEADR is a read-only register that can be read in 32-bit units.

**Address:** DFEADR: FFC6 2A18<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

1, 0	Reserved	When read, the value after reset is returned.

**(8) DFTSTCTL — Data Flash Test Control Register**

DFTSTCTL is used for the ECC test.

After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read.

When writing to DFTSTCTL, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** DFTSTCTL can be read or written in 16-bit units.

**Address:** DFTSTCTL: FFC6 2A1C<sub>H</sub>

13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test Sets ECC test mode. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

## 40A.2.4 Local RAM ECC

### 40A.2.4.1 Overview

The local RAM ECC of CPU1/CPU2 is summarized in the table below.

Table 40A.26 Summary of Local RAM ECC (CPU1/CPU2)

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled.</p> <p>When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction.</li> <li>• 2-bit error detection and 1-bit error detection.</li> </ul> <p>When disabled, neither error detection nor correction is carried out.</p> <p>In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected.</p>

Self-diagnosis	<p>Arbitrary data can be written to RAM data and the ECC bit.</p> <p>RAM data and the ECC bit can be read directly.</p>
Others	<p>Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.</p>

### CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

#### 40A.2.4.4 Details of Registers

##### (1) LRTSTCTL\_PE1/PE2 — Local RAM Test Control Register

LRTSTCTL\_PE1/PE2 is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits.

When writing to LRTSTCTL\_PE1/PE2, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** LRTSTCTL\_PE1 and LRTSTCTL\_PE2 registers can be read or written in 32-bit units.  
LRTSTCTL\_PE1L and LRTSTCTL\_PE2L registers can be read or written in 16-bit units.

**Address:** LRTSTCTL\_PE1: FFC6 5004<sub>H</sub>

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST and DATSEL bits.
14	PROT0	The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRTSTCTL_PE1/PE2.
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read by reading LRTDATBF0_PE1/PE2 register or written directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: RAM data is selected. 1: The ECC bits are selected.

#### CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

**(2) LRTDATBF0\_PE1/PE2 — Local RAM Test Data Read Buffer 0**

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL\_PE1/PE2, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

**Access:** LRTDATBF0\_PE1 and LRTDATBF0\_PE2 registers are read-only registers that can be read in 32-bit units.

**(3) LRECCCTL\_PE1/PE2 — Local RAM ECC Control Register**

LRECCCTL\_PE1/PE2 enables or disables ECC error detection and correction and 1-bit error correction.

When writing to LRECCCTL\_PE1/PE2, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** LRECCCTL\_PE1 and LRECCCTL\_PE2 registers can be read or written in 32-bit units.  
LRECCCTL\_PE1L and LRECCCTL\_PE2L registers can be read or written in 16-bit units.

**(4) LRERRINT\_PE1/PE2 — Local RAM Error Information Control Register**

LRERRINT\_PE1/PE2 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** LRERRINT\_PE1 and LRERRINT\_PE2 registers can be read or written in 32-bit units.  
LRERRINT\_PE1L and LRERRINT\_PE2L registers can be read or written in 16-bit units.  
LRERRINT\_PE1LL and LRERRINT\_PE2LL registers can be read or written in 8-bit units.

**(5) LRSTCLR\_PE1/PE2 — Local RAM Status Clear Register**

LRSTCLR\_PE1/PE2 clears the error flags in the error status register (LR1STERSTR\_PE1/PE2), the overflow flag in the error overflow status register (LROVFSTR\_PE1/PE2), and the error address register (LR1STEADR0\_PE1/PE2). LRSTCLR\_PE1/PE2 is a write-only register and is always read as 0.

**Access:** LRSTCLR\_PE1 and LRSTCLR\_PE2 registers are write-only registers that can be written in 32-bit units.  
LRSTCLR\_PE1L and LRSTCLR\_PE2L registers are write-only registers that can be written in 16-bit units.  
LRSTCLR\_PE1LL and LRSTCLR\_PE2LL registers are write-only registers that can be written in 8-bit units.

31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Error Status Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in LR1STERSTR_PE1/PE2; ERROVF0 flag in LROVFSTR_PE1/PE2; and LR1STEADR0_PE1/PE2.

**(6) LROVFSTR\_PE1/PE2 — Local RAM Error Count Overflow Status Register**

LROVFSTR\_PE1/PE2 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR\_PE1/PE2.

**Access:** LROVFSTR\_PE1 and LROVFSTR\_PE2 registers are read-only registers that can be read in 32-bit units.  
LROVFSTR\_PE1L and LROVFSTR\_PE2L registers are read-only registers that can be read in 16-bit units.

**(7) LR1STERSTR\_PE1/PE2 — Local RAM 1st Error Status Register**

LR1STERSTR\_PE1/PE2 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0.

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR\_PE1/PE2 is cleared by an internal reset, the external reset, or setting 1 to the STCLR0 bit in LRSTCLR\_PE1/PE2.

**Access:** LR1STERSTR\_PE1 and LR1STERSTR\_PE2 registers are read-only registers that can be read in 32-bit units.  
LR1STERSTR\_PE1L and LR1STERSTR\_PE2L registers are read-only registers that can be read in 16-bit units.

0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1/PE2 to 1. [Setting condition] ECC 1-bit error is detected with both SEDFO and DEDFO being 0.

**(8) LR1STEADR0\_PE1/PE2 — Local RAM 1st Error Address Register 0**

LR1STEADR0\_PE1/PE2 holds the address at which an error has occurred.

The error address is set if an error occurs while error flags are 0 in LR1STERSTR\_PE1/PE2. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set in LR1STERSTR\_PE1/PE2. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address[31:19] bits of the associated memory to transform the internal address to the real address. LR1STEADR0\_PE1/PE2 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR\_PE1/PE2.

**Access:** LR1STEADR0\_PE1 and LR1STEADR0\_PE2 registers are read-only registers that can be read in 32-bit units.  
LR1STEADR0\_PE1L, LR1STEADR0\_PE1H, LR1STEADR0\_PE2L and LR1STEADR0\_PE2H registers are read-only registers that can be read in 16-bit units.  
LR1STEADR0\_PE1LL, LR1STEADR0\_PE1LH, LR1STEADR0\_PE1HL, LR1STEADR0\_PE2LL,  
LR1STEADR0\_PE2LH and LR1STEADR0\_PE2HL registers are read-only registers that can be read in 8-bit units.

## 40A.2.5 Global RAM (Including the Retention RAM) ECC

### 40A.2.5.1 Overview

#### CAUTION

The retention RAM is a part of the global RAM. The ECC for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

In RH850/F1KH, an ECC encoder and an ECC decoder are provided for each bank (bank A and bank B).

**Figure 40A.2, Block Diagram of Global RAM ECC** shows the location of two ECC decoders and two ECC encoders for the global RAM.

Figure 40A.2 Block Diagram of Global RAM ECC

The global RAM ECC is summarized in the table below.

Table 40A.39 Summary of Global RAM ECC

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled.</p> <p>When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction</li> <li>• 2-bit error detection and 1-bit error detection</li> </ul> <p>When disabled, neither error detection nor correction is carried out.</p> <p>In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable.</li> </ul> <p>Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch.</p> <p>For details of the SYSERR, see <b>Section 3A, CPU System of RH850/F1KH-D8</b>.</p> <p>In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error.</p> <p>However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.</p>
Error status	<p>A status register is provided to indicate the statuses of 2-bit ECC error detection and 1-bit ECC error detection. If an error occurs while no error status is set, the corresponding status is set.</p> <p>The error status can be cleared using the clear register.</p>
Address capture	<p>If an ECC error occurs while no error status is set, the address at which the associated error has occurred is captured. In addition, if the address source retained is 1-bit ECC error, it is captured when a 2-bit ECC error is detected</p>
Self-diagnosis	<p>Arbitrary data can be written to RAM data and the ECC bit.</p> <p>RAM data can be read directly</p>
Others	<p>Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.</p>

### 40A.2.5.2 Interrupt Requests

Global RAM ECC interrupt requests are listed below.

#### 40A.2.5.4 Details of Registers

##### (1) GRECCCTL\_BKA/BKB — Global RAM ECC Control Register

GRECCCTL\_BKA/BKB enables or disables ECC error detection and correction and 1-bit error correction. Set the PROT1 and PROT0 bits to 01<sub>B</sub> when writing to GRECCCTL\_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

**Access:** GRECCCTL\_BKA and GRECCCTL\_BKB can be read or written in 32-bit units  
GRECCCTL\_BKAL and GRECCCTL\_BKBL can be read or written in 16-bit units

**Address:** GRECCCTL\_BKA: FFC6 4000<sub>H</sub>  
GRECCCTL\_BKAL: FFC6 4000<sub>H</sub>  
GRECCCTL\_BKB: FFC6 4200<sub>H</sub>  
GRECCCTL\_BKBL: FFC6 4200<sub>H</sub>

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set PROT1 to 0 and PROT0 to 1 when writing to this register.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. When writing, write 01 to PROT1 and PROT0 at the same time. 0: 1-bit error correction is performed when a 1-bit error is detected. 1: 1-bit error correction is not performed when a 1-bit error is detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. When writing, write 01 to PROT1 and PROT0 at the same time. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

## (2) GRERRINT\_BKA/BKB— Global RAM Error Information Control Register

GRERRINT\_BKA/BKB enables or disables generation of the error notification signal upon detection of an ECC 1-bit error.

The setting of this register is used for accesses through the respective access port.

**Access:** GRERRINT\_BKA and GRERRINT\_BKB can be read or written in 32-bit units  
 GRERRINT\_BKAL and GRERRINT\_BKBL can be read or written in 16-bit units  
 GRERRINT\_BKALL and GRERRINT\_BKBLL can be read or written in 8-bit units

### (3) GRSTCLR\_BKA/BKB — Global RAM Status Clear Register

GRSTCLR\_BKA/BKB clears the error flags in the error status register (GR1STERSTR\_BKA/BKB), the overflow flag in the error count overflow status register (GROVFSTR\_BKA/BKB), and the error address register (GR1STEADR\_BKA/BKB). GRSTCLR\_BKA/BKB is a write-only register and is always read as 0.

The setting of this register is used for accesses through the respective access port.

**Access:** GRSTCLR\_BKA and GRSTCLR\_BKB are write-only registers that can be written in 32-bit units.  
GRSTCLR\_BKAL and GRSTCLR\_BKBL are write-only registers that can be written in 16-bit units.  
GRSTCLR\_BKALL and GRSTCLR\_BKBLL are write-only registers that can be written in 8-bit units

**Address:** GRSTCLR\_BKA: FFC6 4010<sub>H</sub>

#### (4) GROVFSTR\_BKA/BKB— Global RAM Error Count Overflow Status Register

GROVFSTR\_BKA/BKB monitors occurrence of error overflow. If a second error occurs after the first error (while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

The setting of this register is used for accesses through the respective access port.

**Access:** GROVFSTR\_BKA and GROVFSTR\_BKB are read-only registers that can be read in 32-bit units  
 GROVFSTR\_BKAL and GROVFSTR\_BKBL are read-only registers that can be read in 16-bit units  
 GROVFSTR\_BKALL and GROVFSTR\_BKBLL are read-only registers that can be read in 8-bit units

**Address:** GROVFSTR\_BKA: FFC6 4014<sub>H</sub>  
 GROVFSTR\_BKAL: FFC6 4014<sub>H</sub>  
 GROVFSTR\_BKALL: FFC6 4014<sub>H</sub>

0	ERROVF0	Error Overflow Flag ERROVF0 is set if a second error occurs while any of the error flags (DEDF and SEDF) in the error status register is set. ERROVF0 is not set when the second error occurs at the same address or source like the first error.

### (5) GR1STERSTR\_BKA/BKB— Global RAM 1st Error Status Register

GR1STERSTR\_BKA/BKB monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. However, the corresponding error flag is set if an ECC 2-bit error occurs only when SEDF bit is set. GR1STERSTR\_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR\_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

**Access:** GR1STERSTR\_BKA and GR1STERSTR\_BKB are read-only registers that can be read in 32-bit units.  
GR1STERSTR\_BKAL and GR1STERSTR\_BKBL are read-only registers that can be read in 16-bit units.  
GR1STERSTR\_BKALL and GR1STERSTR\_BKBLL are read-only registers that can be read in 8-bit units.

**Address:** GR1STERSTR\_BKA: FFC6 4018<sub>H</sub>

0	SEDF	ECC 1-bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in GRSTCLR_BKA/BKB to 1. [Setting condition] ECC 1-bit error is detected when DEDF and SEDF are 0.

### (6) GR1STEADR\_BKA/BKB— Global RAM 1st Error Address Register

GR1STEADR\_BKA/BKB holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR\_BKA/BKB. The address

is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated.

GR1STEADR\_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR\_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

**Access:** GR1STEADR\_BKA and GR1STEADR\_BKB are read-only registers that can be read in 32-bit units.  
GR1STEADR\_BKAL, GR1STEADR\_BKBL, GR1STEADR\_BKAH and GR1STEADR\_BKBH are read-only registers that can be read in 16-bit units.  
GR1STEADR\_BKALL, GR1STEADR\_BKALH, GR1STEADR\_BKAHL, GR1STEADR\_BKBLL,  
GR1STEADR\_BKBLH and GR1STEADR\_BKBHL are read-only registers that can be read in 8-bit unit.

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	EADR[19:0]	1st Error Address Monitors the address of the first error. The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR_BKA/BKB. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Note 1. The value after reset differs depending on bank A or bank B.

**(7) GRTSTCTL\_BKA/BKB — Global RAM Test Control Register**

This register is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST to 1, any data can be written to the ECC bits.

Also, input and output by the ECC decoder in the global RAM controller can be controlled for testing (self-diagnosis).

Set PROT1 to 0 and PROT0 to 1 when writing to this register.

**Access:** GRTSTCTL\_BKA and GRTSTCTL\_BKB can be read or written in 32-bit units  
GRTSTCTL\_BKAL and GRTSTCTL\_BKBL can be read or written in 16-bit units

13 to 1	Reserved	When read, these bits are always read as 0. When writing, always write 0.
0	ECCTST	ECC test bit. This bit permits to switch the ECC data for writing into RAM. Assert (PROT1, PROT0) = (0, 1) to write to this register. 0: Output of ECC encoder is used for ECC data to RAM 1: Register output is used for ECC data to RAM.

**(8) GRDECINBF1\_BKA/BKB— Global RAM ECC Decoder Input Data Buffer 1**

7-bit ECC of global RAM is replaced to this register value by write access to global RAM during GRTSTCTL\_BKA/BKB.ECCTST = 1 (test mode).

**Access:** GRDECINBF1\_BKA and GRDECINBF1\_BKB can be read or written in 32-bit units.  
GRDECINBF1\_BKAL and GRDECINBF1\_BKBL can be read or written in 16-bit units.

ECC error detection/correction	<p>ECC error detection and correction can be enabled or disabled.</p> <p>Either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction</li> <li>• 2-bit error detection and 1-bit error detection</li> </ul> <p>The ECC error detection/correction can be disabled by using through mode.</p> <p>In the initial state, 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Error notification can be enabled or disabled when an ECC 2-bit error is detected.</li> <li>• Error notification can be enabled or disabled when an ECC 1-bit error is detected.</li> </ul> <p>In the initial state of ECC controller, 2-bit error notification is enabled and 1-bit error notification is disabled.</p> <p>However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed.</p>
Error status	<p>Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available.</p> <p>A bit for clearing the error status is provided.</p>
Address capture	<p>Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).</p>

#### CAUTION

When ECC error detection/correction is performed about RS-CANFD or FlexRay, initialize the RAM area before it is used.

#### 40A.2.6.4 Details of Registers

##### (1) <Module\_Name>CTL — ECC Control Register

The <Module\_Name>CTL register controls the mode of the ECC and the status for target peripheral modules.

Bits 7, 5, 4 and 3 should be set (written) while the target peripheral module's operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01<sub>B</sub>.

Access: This register can be read or written in 16-bit units.

Address: See Table 40A.58, List of ECC Modules and Table 40A.59, List of Registers.

Value after reset: 001X<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	ECCOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	—
	R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R

Note 1. These bits are always read as 0.

Table 40A.60 <Module\_Name>CTL Register Contents

Bit Position	Bit Name	Function
15	EMCA1	Access Control Bits 1 and 0 to ECC Mode Selection These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.
14	EMCA0	When these bits are 01 <sub>B</sub> , writing to bit 7 is enabled.
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECCOVFF	By detecting an error while the error status is set and the new error has another address than the already latched (not cleared or reset is not issued), this bit is set.  0: Overflow is not occurred after reset of clearing ECER2F and ECER1F. 1: Error address register overflowed  <b>NOTE:</b> This bit clear condition is as follows. (1) Reset (2) Writing ECER2C = 1 when ECER2F = 1 or ECER1C = 1 when ECER1F = 1 (3) Selecting through mode enable (ECTHM = 1)
10	ECER2C	2-Bit ECC Error Detection Flag Clear This bit clears 2-bit error detection flags of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. ECER2C = 1 also clears the ECCOVFF bit while ECER2F bit is set.
9	ECER1C	1-Bit ECC Error Detection Correction Accumulation Flag Clear This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. ECER1C = 1 also clears the ECCOVFF bit while ECER1F bit is set.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40A.60 &lt;Module\_Name&gt;CTL Register Contents

Bit Position	Bit Name	Function
7	ECTHM	<p>ECC Function through Mode Selection</p> <p>Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function.</p> <p>When writing to this bit, write 01<sub>B</sub> to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function.</p> <p>0: Passing through mode is disabled (normal operation mode). 1: Passing through mode is enabled. (ECC function disable)</p>
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	<p>1-Bit Error Correction Enable</p> <p>This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled.</p> <p>0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.</p>
4	EC2EDIC	<p>2-Bit Error Detection Interrupt Control</p> <p>This bit controls whether to generate an interrupt when 2-bit error is detected.</p> <p>0: When 2-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 2-bit error is detected, a target peripheral module's interrupt will be generated.</p>
3	EC1EDIC	<p>1-Bit Error Detection Interrupt Control</p> <p>This bit controls whether to generate an interrupt when 1-bit error is detected.</p> <p>0: When 1-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 1-bit error is detected, a target peripheral module's interrupt will be generated.</p>
2	ECER2F	<p>2-Bit Error Detection Flag</p> <p>This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (a target peripheral module's interrupt) is output.</p> <p>Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM = 1), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated.</p> <p>0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred.</p> <p>This bit is read-only. Writing 0 or 1 does not change internal state.</p>
1	ECER1F	<p>1-Bit Error Detection/Correction Flag</p> <p>This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. When through mode is enabled (ECTHM = 1), this bit is cleared.</p> <p>0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred.</p> <p>This bit is read-only. Writing 0 or 1 does not change internal state.</p>
0	ECEMF	<p>ECC Error Message Flag</p> <p>This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled (ECTHM = 1) and there is no 1-bit error in decode circuit input data.</p> <p>0: The current RAM output data does not have bit errors. 1: The current RAM output data have bit errors.</p>

**CAUTION**

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

**(2) <Module\_Name>TMC — ECC Test Mode Control Register**

The <Module\_Name>TMC register is used to switch to the test mode, and this register is for test mode control.

This register can be used when a target peripheral module is not accessed to RAM.

When writing to bit 7, ETMA1 and ETMA0 need to be 10<sub>B</sub>.

Access: This register can be read or written in 16-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

Value after reset: 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 40A.61 <Module\_Name>TMC Register Contents

Bit Position	Bit Name	Function
15	ETMA1	Access Control Bits 1 and 0 to ECC Test Mode
14	ETMA0	These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC Test Mode Enable This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write 10 <sub>B</sub> to the ETMA1 and ETMA0 bits at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled.  Test registers: <Module_Name>TED, <Module_Name>TRC, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, <Module_Name>ERDB Register test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM Read Test Mode Selection This bit selects the targets for reading when the <Module_Name>TED and <Module_Name>ERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Read value of the <Module_Name>TED register will be the write value of the <Module_Name>TED register. Read value of the <Module_Name>ERDB register will be the write value of the <Module_Name>ERDB register. 1: Read value of the <Module_Name>TED register can read RAM data. Read value of the <Module_Name>ERDB register will be the ECC Data to be written to RAM.
3	ECREOS	ECC Redundant Bit Output Data Selection This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the <Module_Name>ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated for write data is stored in RAM. 1: The value of <Module_Name>ERDB Register is stored in RAM.

**(3) <Module\_Name>TED — ECC Encode/Decode Input/Output Replacement Test Register**

In ECC test mode, this register handles test data.

This register value is used to generate ECC data or syndrome code.

This register can be accessed when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When <Module\_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000<sub>H</sub> is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

**(4) <Module\_Name>TRC — ECC Redundant Bit Data Control Test Register**

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers, <Module\_Name>SYND, <Module\_Name>HORD, <Module\_Name>ECRD, and <Module\_Name>ERDB.

This register can be accessed when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When <Module\_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000<sub>H</sub> is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

**(5) <Module\_Name>AD0 — Target ECC Error Address Register 0**

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored.</p> <p>Only one address can be held in ECEAD0</p>

**(6) <Module\_Name>SYND — ECC Decode Syndrome Data Register**

This register is a read-only register for storing generated syndrome data in ECC test mode.

Writing to this register is ignored.

This register is read-only when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module\_Name>TMC.ECTMCE = 0), 00<sub>H</sub> is read.

Access: This register is a read-only register that can be read in 8-bit units.

**(7) <Module\_Name>HORD — ECC 7-Bit Redundant Bit Data Hold Test Register**

This register is for storing ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module\_Name>TMC.ECTMCE = 0), 00<sub>H</sub> is read.

Access: This register is a read-only register that can be read in 8-bit units.

Table 40A.65 <Module\_Name>HORD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	These bits store ECC code for read RAM data as needed. When <Module_Name>TMC.ECTRRS =1 and if <Module_Name>TED register is read, ECC code is stored.

**(8) <Module\_Name>ECRD — ECC Encode Test Register**

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module\_Name>TMC.ECTMCE = 0), 00<sub>H</sub> is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing and can read ECC data for data written in the <Module_Name>TED register when <Module_Name>MC.ECENS = 1.

**(9) <Module\_Name>ERDB — ECC Redundant Bit Input/Output Replacement Register**

In ECC test mode, this register handles test data.

This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When <Module\_Name>TMC.ECTMCE = 0, writing to this register is ignored and 00<sub>H</sub> is read.

Access: This register can be read or written in 8-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

6 to 0	ERDB[6:0]	These bits can store this register value as ECC data when <Module_Name>TMC.ECREOS = 1. When the register is read while <Module_Name>TMC.ECREIS = 1, the value read from these bits is ECC data read from the RAM. When <Module_Name>TMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instead of written data.

**(10) SELB\_READTEST — ECCREAD Test Select Register**

SELB\_READTEST is used to check read/write access to the target peripheral module's RAM ECC registers.

Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

Access: SELB\_READTESTW can be read or written in 32-bit units.

SELB\_READTEST and SELB\_READTESTH can be read or written in 16-bit units.

Address: SELB\_READTESTW: FFC7 8000<sub>H</sub>

## 40A.3 Memory Protection

### 40A.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU

The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see *the RH850 Family User's Manual: Software*.

- Slave Guard

A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

- PEG

The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see **Section 3A, CPU System of RH850/F1KH-D8**.

- IPG

The CPU Peripheral is protected against illegal accesses.

For details, see **Section 3A, CPU System of RH850/F1KH-D8**.

- GRG

The global RAM is protected against illegal accesses.

- PBG/HBG

The control registers in the peripheral circuits are protected against illegal accesses. For details, see **Section 40A.3.3, PBG/HBG**.

- PBGC

The CPU system has its dedicated PBG function which is called PBG for CPU system. For details, see **Section 40A.3.4, PBG for CPU System**.

### 40A.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

Table 40A.69 Identifiers for Slave Guard

Identifier	Function
UM	<p>When the CPU makes an access, this indicates the operating mode of the CPU.</p> <p>0: Supervisor mode 1: User mode</p> <p>When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 0.</p>
SPID	<p>When the CPU makes an access, this indicates the system protection identifier SPID that is set by MCFG0.SPID in the CPU.</p> <p>When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.</p> <p>When another master (peripheral device connected to H-BUS) makes an access, the value of this identifier is always 00<sub>B</sub>.</p>
PEID	<p>This indicates the access source bus master.</p> <p>001<sub>B</sub>: CPU1 010<sub>B</sub>: CPU2 100<sub>B</sub>: Other bus master (H-Bus bus master)</p> <p>When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.</p>

### 40A.3.2 GRG (Global RAM Guard)

This product is provided with 4-channel GRG, which is described in detail in the following sections.

**CAUTION**

---

The retention RAM is a part of the global RAM. The Guard for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

Bit Position	Bit Name	Function
19	PEID2	Access with PEID = 2 (CPU2)*1 0: Disables access with PEID2. 1: Enables access with PEID2.
18	PEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	SPID3	Access with SPID = 3*2,*3 0: Disables access with SPID3. 1: Enables access with SPID3.
7	SPID2	Access with SPID = 2 (CPU2)*2,*3 0: Disables access with SPID2. 1: Enables access with SPID2.
6	SPID1	Access with SPID = 1 (CPU1)*2,*3 0: Disables access with SPID1. 1: Enables access with SPID1.
5	SPID0	Access with SPID = 0*2,*3 0: Disables access with SPID0. 1: Enables access with SPID0.
4 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. Access with PEID  
PEID is a bit list with each bit corresponding to a PEID value.  
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID  
SPID is a bit list with each bit corresponding to a SPID value.  
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. For SPID, refer to **Table 40A.69, Identifiers for Slave Guard**.

### CAUTION

Global RAM Guard (GRG) only supports write accesses. The guard setting is not enabled for read accesses.

**(2) MGDGRBADn\_BKA/BKB — GRG Compare Base Address Register n (n = 0 to 3)**

**Access:** MGDGRBADn\_BKA and MGDGRBADn\_BKB can be read or written in 32-bit units.

MGDGRBADn\_BKAL, MGDGRBADn\_BKAH, MGDGRBADn\_BKBL and MGDGRBADn\_BKBH can be read or written in 16-bit units.

MGDGRBADn\_BKALH, MGDGRBADn\_BKAHL, MGDGRBADn\_BKBLH and MGDGRBADn\_BKBHL can be read or written in 8-bit units.

Table 40A.73 MGDGRADVn\_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 11	ADV[19:11]	Valid Compare Address Setting MGDGRADVn_BKA/BKB[19:11] to 1 executes address compare. If all the bits of MGDGRADVn_BKA/BKB[19:11] are 1, 2 Kbytes, which is the minimum unit based on the address specified by MGDGRBADn_BKA/BKB, are protected. However, if all the bits of MGDGRADVn_BKA/BKB[19:11] are 0, all the areas of global RAM are protected.
10 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

**Setting example**

If MGDGRBAD<sub>n</sub>\_BKA.AD[19:11] is 170<sub>H</sub> and MGDGRADV<sub>n</sub>\_BKA.ADV[19:11] is 1FD<sub>H</sub>, global RAM guard protection area n is from FEEB 8000<sub>H</sub> to FEEB 87FF<sub>H</sub> and FEEB 9000<sub>H</sub> to FEEB 97FF<sub>H</sub>.

If MGDGRBAD<sub>n</sub>\_BKB.AD[19:11] is 170<sub>H</sub> and MGDGRADV<sub>n</sub>\_BKB.ADV[19:11] is 1FD<sub>H</sub>, global RAM guard protection area n is from FEFB 8000<sub>H</sub> to FEFB 87FF<sub>H</sub> and FEFB 9000<sub>H</sub> to FEFB 97FF<sub>H</sub>.

**Concept (e.g. bank A)**

When MGDGRBAD<sub>n</sub>\_BKA.AD[19:11] is 170<sub>H</sub>, the base address is FEEB 8000<sub>H</sub>.

The settable range is shown by an underline as follows:

1	1	1	1	1	1	1	0	1	1	1	0	1	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	B
F					E			E				<u>B</u>	<u>8</u>	<u>0</u>				0			0				0			0				H		

The settable range is as follows when MGDGRADV<sub>n</sub>\_BKA.ADV[19:11] is 1FD<sub>H</sub>:

0	0	0	0	0	0	0	0	0	0	0	0	<u>1</u>	<u>1</u>	<u>1</u>	<u>1</u>	<u>1</u>	<u>0</u>	<u>1</u>	0	0	0	0	0	0	0	0	0	0	0	0	0	0	B
---	---	---	---	---	---	---	---	---	---	---	---	----------	----------	----------	----------	----------	----------	----------	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

The area to which protection applies is as shown below because the bits set to 0 and the lower eleven bits are not applicable:

0	0	0	0	0	0	0	0	0	0	0	0	<u>1</u>	<u>0</u>	<u>1</u>	<u>1</u>	<u>1</u>	<u>0</u>	<u>0</u>	<u>x</u>	<u>x</u>	<u>x</u>	<u>x</u>	0	x	x	x	x	x	x	x	x	B
---	---	---	---	---	---	---	---	---	---	---	---	----------	----------	----------	----------	----------	----------	----------	----------	----------	----------	----------	---	---	---	---	---	---	---	---	---	---

Therefore the protection range is as follows:

1	1	1	1	1	1	1	0	1	1	1	0	1	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	B
F					E			E				<u>B</u>	<u>8</u>	<u>0</u>									0			0			0			H

to

1	1	1	1	1	1	1	0	1	1	1	0	1	0	1	1	1	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	B
F					E			E				<u>B</u>	<u>8</u>	<u>7</u>								F			F			F			H	

and

1	1	1	1	1	1	1	0	1	1	1	0	1	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	B
F					E			E				<u>B</u>	<u>9</u>	<u>0</u>								0			0			0			H	

to

1	1	1	1	1	1	1	0	1	1	1	0	1	0	1	1	1	0	0	0	0	0	1	1	1	1	1	1	1	1	1	B
F					E			E				<u>B</u>	<u>9</u>	<u>7</u>								F			F			F			H

The following 2 Kbytes each (a total of 4 Kbytes) are protected (in hexadecimal):

- FEEB 8000<sub>H</sub> to FEEB 87FF<sub>H</sub>
- FEEB 9000<sub>H</sub> to FEEB 97FF<sub>H</sub>

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred.  If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of GRG error entry stages is 1.  Note that this overflow is notified to INTGUARD.  In addition, it is not possible to determine whether overflow has occurred in INTGUARD. Check the value of this bit. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	GRG protection violation Error Flag 0: No GRG protection violation has occurred. 1: A GRG protection violation has occurred.

### 40A.3.3 PBG/HBG

The PBG/HBG module is divided into several PBG/HBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG/HBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG/HBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG/HBG group names, and the PBG/HBG channel numbers.

#### NOTE

Be sure to enable PBG/HBG before disabling register access clock of each clock domain.

### 40A.3.3.1 List of Registers

The following table lists the registers provided for each PBG/HBG group. And PBG/HBG group is equal to module name.

Note 1. The Group indicates the module name.

Note 2. Register name index.

The following table lists the registers provided for each PBG/HBG group.

Table 40A.81 List of PBG/HBG Error Registers

Module Name	Symbol	Register Name	R/W	Value after Reset	Address	Access Size

	HERRSLVxxTYPE	HBGxx error type register	R	0000 0000 <sub>H</sub>	<base_addr1> + C <sub>H</sub>	16/32

In the above table, “xx” in the register names and symbols represents the PBG group numbers. The table below shows the base address values <base\_addr0>, which correspond to each of the PBG group numbers and channel numbers as well as base address values <base\_addr1>, which correspond to each of the HBG group numbers and channel numbers.

### 40A.3.3.2 Details of Registers

#### (1) FSGDxxPROTn — PBGxx Protection Register n HFSGDxxPROTn — HBGxx Protection Register n

FSGDxxPROTn and HFSGDxxPROTn specify the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. "n" in the register names and symbols represents the PBG/HBG channel number.

**Access:** FSGDxxPROTn and HFSGDxxPROTn can be read or written in 32-bit units.  
FSGDxxPROTnL, FSGDxxPROTnH, HFSGDxxPROTnL, and HFSGDxxPROTnH can be read or written in 16-bit units.  
FSGDxxPROTnLL, FSGDxxPROTnHL, FSGDxxPROTnHH, HFSGDxxPROTnLL, HFSGDxxPROTnHL, and HFSGDxxPROTnHH can be read or written in 8-bit units.

**Address:** See Table 40A.80, List of PBG/HBG Protection Registers.

**Value after reset:** See Table 40A.80, List of PBG/HBG Protection Registers.

Table 40A.84 FSGDxxPROTn/HFSGxxPROTn Register Contents

Bit Position	Bit Name	Function
31	PROTLOCK	Register Lock 0: Enables FSGDxxPROTn/HFSGDxxPROTn rewrite. 1: Disables FSGDxxPROTn/HFSGDxxPROTn rewrite. When PROTLOCK is set to 1, the value is held until reset is asserted.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	PROTPEID4	Access with PEID = 4 (peripheral device connected to H-BUS)*1 0: Disables access with PEID4. 1: Enables access with PEID4.
20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19	PROTPEID2	Access with PEID = 2 (CPU2)*1 0: Disables access with PEID2. 1: Enables access with PEID2.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40A.84 FSGDxxPROTn/HFSGxxPROTn Register Contents

Bit Position	Bit Name	Function
8	PROTSPID3	Access with SPID = 3 <sup>*2,*3</sup> 0: Disables access with SPID3. 1: Enables access with SPID3.
7	PROTSPID2	Access with SPID = 2 (CPU2) <sup>*2,*3</sup> 0: Disables access with SPID2. 1: Enables access with SPID2.
6	PROTSPID1	Access with SPID = 1 (CPU1) <sup>*2,*3</sup> 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0 <sup>*2,*3</sup> 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID  
PROTPEID is a bit list with each bit corresponding to a PEID value.  
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID  
PROTSPID is a bit list with each bit representing an SPID value.  
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. For SPID, refer to **Table 40A.69, Identifiers for Slave Guard**.

## (2) ERRSLVxxCTL — PBGxx Error Control Register HERRSLVxxCTL — HBGxx Error Control Register

ERRSLVxxCTL and HERRSLVxxCTL clear the status in the error status register with the PBGxx/HBGxx.

**Access:** ERRSLVxxCTL and HERRSLVxxCTL are write-only registers that can be written in 32-bit units.  
ERRSLVxxCTLL and HERRSLVxxCTLL are write-only registers that can be written in 16-bit units.  
ERRSLVxxCTLLL and HERRSLVxxCTLLL are write-only registers that can be written in 8-bit units.

**Address:** ERRSLVxxCTL: <base\_addr0> + 0<sub>H</sub>  
ERRSLVxxCTLL: <base\_addr0> + 0<sub>H</sub>  
ERRSLVxxCTLLL: <base\_addr0> + 0<sub>H</sub>

### (3) ERRSLVxxSTAT — PBGxx Error Status Register HERRSLVxxSTAT — HBGxx Error Status Register

ERRSLVxxSTAT and HERRSLVxxSTAT hold the status of the illegal access rejected with the PBGxx/HBGxx.

**Access:** ERRSLVxxSTAT and HERRSLVxxSTAT are read-only registers that can be read in 32-bit units.  
ERRSLVxxSTATL and HERRSLVxxSTATL are read-only registers that can be read in 16-bit units.  
ERRSLVxxSTATLL and HERRSLVxxSTATLL are read-only registers that can be read in 8-bit units.

**Address:** ERRSLVxxSTAT: <base\_addr0> + 4<sub>H</sub>  
ERRSLVxxSTATL: <base\_addr0> + 4<sub>H</sub>

For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.</p>
0	ERR	<p>Error Status Flag</p> <p>0: No PBG/HBG protection violation 1: PBG/HBG protection violation occurred.</p>

#### CAUTION

After writing HERRSLVxxCTL, the value of HERRSLVxxSTAT takes the following procedure for a reflection:

- Execute SYNCM
- Wait for 24 × CPU clock\*1 cycles

**Note 1.** CPU clock: Clock selected by CKSC\_CPUCLKS\_CTRL and CKSC\_CPUCLKD\_CTL

#### (4) ERRSLVxxADDR — PBGxx Error Address Register HERRSLVxxADDR — HBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

HERRSLVxxADDR holds the address of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.

**Access:** ERRSLVxxADDR and HERRSLVxxADDR are read-only registers that can be read in 32-bit units.

**Address:** ERRSLVxxADDR: <base\_addr0> + 8<sub>H</sub>  
HERRSLVxxADDR: <base\_addr1> + 8<sub>H</sub>

### (5) ERRSLVxxTYPE — PBGxx Error Type Register HERRSLVxxTYPE — HBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

HERRSLVxxTYPE holds the type of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.

**Access:** ERRSLVxxTYPE and HERRSLVxxTYPE are read-only registers that can be read in 32-bit units.  
ERRSLVxxTYPEEL and HERRSLVxxTYPEEL are read-only registers that can be read in 16-bit units.

**Address:** ERRSLVxxTYPE: <base\_addr0> + C<sub>H</sub>

0	WRITE	This bit is set to 1 when the access that has generated the PBG/HBG protection violation is a write access.

### 40A.3.4 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.

Table 40A.90 Target Registers of PBG for CPU Subsystem

PBGC Group	Group No.	Channel Number	Protection Target Module	Target Register
PBGC0	C0 (PBC group 0 for CPU system)	0	INTC2	ICxxx, IBDxxx (xxx =32 to 381) IMRm (m = 1 to 11) (described in <b>Section 7A, Exception/Interrupts of RH850/F1KH-D8</b> )

### 40A.3.4.2 Details of Registers

#### (1) FSGDCxPROTn — PBGCx Protection Register n (x = 0, 1)

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.

"n" in the register names and symbols represents the PBGC channel number.

**Access:** FSGDCxPROTn register can be read or written in 32-bit units.  
FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units.  
FSGDCxPROTnLL, FSGDCxPROTnHL, and FSGDCxPROTnHH registers can be read or written in 8-bit units.

**Address:** See Table 40A.91, List of PBGC Protection Registers.

**Value after reset:** See Table 40A.91, List of PBGC Protection Registers.

Bit Position	Bit Name	Function
31	PROTLOCK	Lock of write to this register 0: Register can be re-written. 1: Any further write to this register is ignored. This bit can be cleared by RESET.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	PROTPEID4	Access with PEID = 4 (peripheral device connected to H-BUS)*1 0: Disables access with PEID4. 1: Enables access with PEID4.
20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19	PROTPEID2	Access with PEID = 2 (CPU2)*1 0: Disables access with PEID2. 1: Enables access with PEID2.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3*2,*3 0: Disables access with SPID3. 1: Enables access with SPID3.

Table 40A.93 FSGDCxPROTn Register Contents

Bit Position	Bit Name	Function
7	PROTSPID2	Access with SPID = 2 (CPU2) <sup>*2,*3</sup> 0: Disables access with SPID2. 1: Enables access with SPID2.
6	PROTSPID1	Access with SPID = 1 (CPU1) <sup>*2,*3</sup> 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0 <sup>*2,*3</sup> 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID  
PROTPEID is a bit list with each bit corresponding to a PEID value.  
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID  
PROTSPID is a bit list with each bit representing an SPID value.  
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. For SPID, refer to **Table 40A.69, Identifiers for Slave Guard**.

**(2) ERRSLVCxCTL — PBGCx Error Control Register (x = 0, 1)**

ERRSLVCxCTL clears the status in error status register PBGCx.

**Access:** ERRSLVCxCTL register is a write-only register that can be written in 32-bit units.  
ERRSLVCxCTLL register is a write-only register that can be written in 16-bit units.  
ERRSLVCxCTLLL register is a write-only register that can be written in 8-bit units.

**Address:** ERRSLVCxCTL: FFC4 C800<sub>H</sub> + (100<sub>H</sub> × x)

**(3) ERRSLVCxSTAT — PBGCx Error Status Register (x = 0, 1)**

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

**Access:** ERRSLVCxSTAT register is a read-only register that can be read in 32-bit units.  
ERRSLVCxSTATL register is a read-only register that can be read in 16-bit units.  
ERRSLVCxSTATLL register is a read-only register that can be read in 8-bit units.

**Address:** ERRSLVCxSTAT: FFC4 C804<sub>H</sub> + (100<sub>H</sub> × x)  
ERRSLVCxSTATL: FFC4 C804<sub>H</sub> + (100<sub>H</sub> × x)

**(4) ERRSLVCxADDR — PBGCx Error Address Register (x = 0, 1)**

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

**Access:** ERRSLVCxADDR register is a read-only register that can be read in 32-bit units.

**Address:** FFC4 C808<sub>H</sub> + (100<sub>H</sub> × x)

**(5) ERRSLVCxTYPE — PBGCx Error Type Register (x = 0, 1)**

ERRSLVCxTYPE holds the type of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

**Access:** ERRSLVCxTYPE register is a read-only register that can be read in 32-bit units.  
ERRSLVCxTYPEPEL register is a read-only register that can be read in 16-bit units.

**Address:** ERRSLVCxTYPE: FFC4 C80C<sub>H</sub> + (100<sub>H</sub> × x)

## Section 40B Functional Safety of RH850/F1KM-S4, RH850/F1KM-S2

This section provides an overview of the safety mechanisms included in the RH850/F1KM Series.

This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.

For more information about the development process and safety mechanisms, please contact our sales office.

The following are the failure detection functions provided by this microcontroller.

### 40B.1 Overview

#### **ECC**

Detects failures of memories and data transfer paths and corrects some types of failures.

#### **Memory Protection**

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

#### **Clock Monitor**

Monitors the clock operation to detect abnormal operations.

For details, see **Section 13, Clock Monitor (CLMA)**.

#### **Data CRC**

Generates CRC to detect data errors.

For details, see **Section 41, Data CRC (DCRA)**.

#### **Write-Protected Registers**

The write-protected registers are protected from inadvertent write access due to erroneous program execution.

For details, see **Section 5, Write-Protected Registers**.

## 40B.2 ECC

### 40B.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 40B.1 ECC Overview

Applicable Memory	Applicable Data Width [bits]	Operation upon Error Detection					Failure Insertion	
		Detection/Correction	SYSERR	Interrupt Notice	Error Status	Address Capture		
Code flash	128	SEC-DED	SED/DED*2	SEC-DED	Possible	Possible	Possible	
Data flash	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible	
Local RAM (CPU1/Self)	32	SEC-DED	SED/DED*2	SEC-DED	Possible	Possible	Possible	
Global RAM Retention RAM	32	SEC-DED	SED/DED*2	SEC-DED	Possible	Possible	Possible	
Peripheral RAM*1	CSIH	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	RS-CANFD	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	FlexRay*3	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	Ethernet*3	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible

Note 1. For details of ECC for each peripheral IP, see **Section 40B.2.6, ECC for Peripheral RAM**.

Note 2. For details, see **Section 40B.2.2.2, Interrupt Requests**, **Section 40B.2.4.2, Interrupt Requests**, and **Section 40B.2.5.2, Interrupt Requests**.

Note 3. This is not supported in RH850/F1KM-S2 product.

### Applicable Data Width

This is the data width to be ECC encoded.

To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).

- (1) Reading data to be ECC-encoded including data to be rewritten
- (2) Replacing data to be rewritten
- (3) Writing back data generated in (2)

### Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected.

SED-DED: 1-bit errors and 2-bit errors can only be detected.

### SYSERR

SYSERR can be generated upon error detection.

### Interrupt Notice

An interrupt can be generated upon error detection.

### Error Status

The status of a detected error is retained.

**Address Capture**

The address of a detected error is retained.

**Failure Insertion**

Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

## 40B.2.2 Code Flash ECC

### 40B.2.2.1 Overview

RH850/F1KM has two code flash ECC decoder circuits implemented, one inside the Processor Element (PE1) and one on the VCI (system interconnect).

**Figure 40B.1, Block Diagram of Code Flash ECC** shows the location of two ECC decoders for the code flash.

Figure 40B.1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.

Table 40B.2 Summary of Code Flash ECC

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction.</li> <li>• 2-bit error detection and 1-bit error detection.</li> </ul> <p>When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. (This is not supported in CFERRINT_PE1 register.)</li> <li>• Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch.</li> <li>• Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see <b>Section 3BC, CPU System of RH850/F1KM</b>.</li> </ul> <p>In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.</p>

Table 40B.2 Summary of Code Flash ECC

Item	Description
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The ECC 1-bit error status is set only when no error status has been set. The ECC 2-bit error status is set even when the ECC 1-bit error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured.
Self-diagnosis	The ECC bit can be read directly.
Inhibiting instruction execution	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching avoids the execution of incorrect instructions.

### 40B.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.

Table 40B.3 Code Flash ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0*1 (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR	—

Note 1. ECCFLI0FEIF flag set can be read (not jump to handler address of FEINT) in SYSERR processing because return from SYSERR is not possible.

Table 40B.4 Code Flash ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0 (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR, INTECCFLI0	—

Table 40B.5 Code Flash ECC Interrupt Requests (During Bus Master Data Access except CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number

	Code flash error count overflow status register (VCI)	CFOVFSTR_VCI	FFC6 220C <sub>H</sub>
	Code flash 1st error status register (VCI)	CF1STERSTR_VCI	FFC6 2210 <sub>H</sub>
	Code flash 1st error address register (VCI)	CF1STEADR0_VCI	FFC6 2250 <sub>H</sub>
CFECC_CPU1	Code flash ECC control register (PE1)	CFECCCTL_PE1	FFC6 2400 <sub>H</sub>
	Code flash error information control register (PE1)	CFERRINT_PE1	FFC6 2404 <sub>H</sub>
	Code flash status clear register (PE1)	CFSTCLR_PE1	FFC6 2408 <sub>H</sub>
	Code flash error count overflow status register (PE1)	CFOVFSTR_PE1	FFC6 240C <sub>H</sub>
	Code flash 1st error status register (PE1)	CF1STERSTR_PE1	FFC6 2410 <sub>H</sub>
	Code flash 1st error address register (PE1)	CF1STEADR0_PE1	FFC6 2450 <sub>H</sub>
CFECC_VCI	Code flash sub-test control register (VCI)	CFSTSTCTL_VCI	FFC6 2350 <sub>H</sub>

Note 1. The registers suffixed with symbols “\_VCI” and “\_PE1” are provided to ECC controllers corresponding to each access port: registers with “\_VCI” are provided to the ECC controller for data access from the system interconnect to the code flash and registers with “\_PE1” are provided to the ECC controller for fetch access from the CPU1.

## 40B.2.2.4 Details of Registers

## (1) CFEECCTL\_VCI/PE1 — Code Flash ECC Control Register

CFEECCTL\_VCI/PE1 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFEECCTL\_VCI/PE1, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** CFEECCTL\_VCI and CFEECCTL\_PE1 can be read or written in 32-bit units.  
CFEECCTL\_VCIL and CFEECCTL\_PE1L can be read or written in 16-bit units.

**Address:** CFEECCTL\_VCI: FFC6 2200<sub>H</sub>  
CFEECCTL\_VCIL: FFC6 2200<sub>H</sub>  
CFEECCTL\_PE1: FFC6 2400<sub>H</sub>  
CFEECCTL\_PE1L: FFC6 2400<sub>H</sub>

Table 40B.7 CFEECCTL\_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFEECCTL_VCI/PE1.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

## (2) CFERRINT\_VCI/PE1 — Code Flash Error Information Control Register

CFERRINT\_VCI/PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** CFERRINT\_VCI and CFERRINT\_PE1 can be read or written in 32-bit units.  
CFERRINT\_VCIL and CFERRINT\_PE1L can be read or written in 16-bit units.  
CFERRINT\_VCILL and CFERRINT\_PE1LL can be read or written in 8-bit units.

**Address:** CFERRINT\_VCI: FFC6 2204<sub>H</sub>

1	DEDIE <sup>*1</sup>	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

Note 1. This bit is not supported in CFERRINT\_PE1. When writing to this bit in CFERRINT\_PE1, always write 1.

Note 2. Regarding the interrupt request, see **Section 40B.2.2.2, Interrupt Requests**.

**(3) CFSTCLR\_VCI/PE1 — Code Flash Status Clear Register**

CFSTCLR\_VCI/PE1 clears the error flags in the error status register (CF1STERSTR\_VCI/PE1), the overflow flag in the error overflow status register (CFOVFSTR\_VCI/PE1), and the error address register (CF1STEADR0\_VCI/PE1).

**Access:** CFSTCLR\_VCI and CFSTCLR\_PE1 are write-only registers that can be written in 32-bit units.  
CFSTCLR\_VCIL and CFSTCLR\_PE1L are write-only registers that can be written in 16-bit units.  
CFSTCLR\_VCILL and CFSTCLR\_PE1LL are write-only registers that can be written in 8-bit units.

**Address:** CFSTCLR\_VCI: FFC6 2208<sub>H</sub>

#### (4) CFOVFSTR\_VCI/PE1 — Code Flash Error Count Overflow Status Register

CFOVFSTR\_VCI/PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

**Access:** CFOVFSTR\_VCI and CFOVFSTR\_PE1 are read-only registers that can be read in 32-bit units.  
CFOVFSTR\_VCIL and CFOVFSTR\_PE1L are read-only registers that can be read in 16-bit units.  
CFOVFSTR\_VCILL and CFOVFSTR\_PE1LL are read-only registers that can be read in 8-bit units.

**(5) CF1STERSTR\_VCI/PE1 — Code Flash 1st Error Status Register**

CF1STERSTR\_VCI/PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

**Access:** CF1STERSTR\_VCI and CF1STERSTR\_PE1 are read-only registers that can be read in 32-bit units.  
CF1STERSTR\_VCIL and CF1STERSTR\_PE1L are read-only registers that can be read in 16-bit units.

**(6) CF1STEADR0\_VCI/PE1 — Code Flash 1st Error Address Register**

CF1STEADR0\_VCI/PE1 holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR\_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STEADR0\_VCI/PE1 register is cleared by an internal reset, the external reset, or by setting the STCLR bit in the CFSTCLR\_VCI/PE1 register to 1.

**Access:** CF1STEADR0\_VCI and CF1STEADR0\_PE1 are read-only registers that can be read in 32-bit units.  
CF1STEADR0\_VCIL, CF1STEADR0\_VCIH, CF1STEADR0\_PE1L and CF1STEADR0\_PE1H are read-only registers that can be read in 16-bit units.

### (7) CFSTSTCTL\_VCI — Code Flash Sub-Test Control Register

CFSTSTCTL\_VCI is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly.

When writing to CFSTSTCTL\_VCI, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** CFSTSTCTL\_VCI can be read or written in 32-bit units.  
CFSTSTCTL\_VCIL can be read or written in 16-bit units.

**Address:** CFSTSTCTL\_VCI: FFC6 2350<sub>H</sub>

Table 40B.13 CFSTSTCTL\_VCI Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST bit.
14	PROT0	The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFSTSTCTL_VCI.
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see **Section 3BC, CPU System of RH850/F1KM**.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of reading code flash are as follows:

Table 40B.14 Results of Reading Code Flash

Bit Number	Meaning	Bit Position	Description
bit[31:10]	all-0	31 to 10	These bits are always 0.
bit[9]	reserved	9	Unknown
bit[8:0]	ECC bits	8 to 0	ECC bits

## 40B.2.3 Data Flash ECC

### 40B.2.3.1 Overview

The data flash ECC is summarized in the table below.

Table 40B.15 Summary of Data Flash ECC

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled.</p> <p>When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection / correction.</li> <li>• 2-bit error detection and 1-bit error detection.</li> </ul> <p>When disabled, neither error detection nor correction is carried out.</p> <p>In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Enabling or disabling of error notification in the case of detection of ECC 2-bit errors is selectable.</li> <li>• Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable.</li> </ul> <p>In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is disabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the Interrupt Controller, an interrupt processing is not executed.</p>
Error status	<p>The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored.</p> <p>The function is set only while no error status is set.</p> <p>A register for clearing the error status is provided.</p>
Address capture	<p>When no ECC error status has been set, the address at which the first ECC error occurred is captured. ECC error address is captured when both SEDF and DEDF of DFERSTR are 0.</p>
Self-diagnosis	<p>ROM data and the ECC bit can be read directly.</p> <p>Arbitrary data can be written to ROM data and the ECC bit.</p>

### 40B.2.3.2 Interrupt Requests

The interrupt requests for data flash ECC are shown below.

#### 40B.2.3.4 Details of Registers

##### (1) DFECCTL — Data Flash ECC Control Register

DFECCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCTL, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** DFECCTL can be read or written in 16-bit units.

**Address:** DFECCTL: FFC6 2A00<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 40B.18 DFECCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

## (2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.

The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

**Access:** DFERSTR is a read-only register that can be read in 8-bit units.

**Address:** DFERSTR: FFC6 2A04<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

7 to 2	Reserved	When read, the value after reset is returned.
1	DEDF	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 2-bit error is detected when both SEDF and DEDF are 0.
0	SEDF	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 1-bit error is detected when both SEDF and DEDF are 0.

### (3) DFERSTC — Data Flash Error Status Clear Register

DFERSTC clears the error flags in the data flash error status register.

**Access:** DFERSTC is a write-only register that can be written in 8-bit units.

**Address:** DFERSTC: FFC6 2A08<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

0	ERRCLR	SEDF/DEDF Flag Clear 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in DFERSTR.) 1: The SEDF/DEDF flag in DFERSTR is cleared.

### (4) DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of data flash error overflow.

**Access:** DFOVFSTR is a read-only register that can be read in 8-bit units.

**Address:** DFOVFSTR: FFC6 2A0C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVF

**(5) DFOVFSTC — Data Flash Error Overflow Status Clear Register**

DFOVFSTC clears the data flash error overflow flag.

**Access:** DFOVFSTC is a write-only register that can be written in 8-bit units.

**Address:** DFOVFSTC: FFC6 2A10<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

0	ERROVFCLR	Error Overflow Flag Clear 0: No effect (Setting the ERROVFCLR bit to 0 does not affect the ERROVF flag in DFOVFSTR.) 1: The ERROVF flag in DFOVFSTR is cleared.

**(6) DFERRINT — Data Flash Error Notification Control Register**

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** DFERRINT can be read or written in 8-bit units.

**Address:** DFERRINT: FFC6 2A14<sub>H</sub>

**Value after reset:** 02<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDIE	SEDIE

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	ECC 2-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

**(7) DFEADR — Data Flash 1st Error Address Register**

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0.

**Access:** DFEADR is a read-only register that can be read in 32-bit units.

**Address:** DFEADR: FFC6 2A18<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20 to 2	DFEADR[20:2]	ECC Error Address DFEADR is read-only field to monitor the address at which an ECC error has occurred. This register holds an internal address. Convert it to the actual address by adding the data flash base address FF20 0000 <sub>H</sub> .
1, 0	Reserved	When read, the value after reset is returned.

**(8) DFTSTCTL — Data Flash Test Control Register**

DFTSTCTL is used for the ECC test.

After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read.

When writing to DFTSTCTL, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** DFTSTCTL can be read or written in 16-bit units.

**Address:** DFTSTCTL: FFC6 2A1C<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test Sets ECC test mode. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

## 40B.2.4 Local RAM ECC

### 40B.2.4.1 Overview

The local RAM ECC of CPU1 is summarized in the table below.

Table 40B.26 Summary of Local RAM ECC (CPU1)

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled.</p> <p>When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction.</li> <li>• 2-bit error detection and 1-bit error detection.</li> </ul> <p>When disabled, neither error detection nor correction is carried out.</p> <p>In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch.</li> <li>• Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see <b>Section 3BC, CPU System of RH850/F1KM</b>.</li> </ul> <p>In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error.</p> <p>However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.</p>
Error status	<p>The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored.</p> <p>The function is set only while no error status is set.</p> <p>A register for clearing the error status is provided.</p>
Address capture	<p>When no error status has been set, the address at which the first error occurred is captured. In addition, when the retained address source is an ECC 1-bit error or ECC 2-bit error, the address is also captured.</p>
Self-diagnosis	<p>Arbitrary data can be written to RAM data and the ECC bit.</p> <p>RAM data and the ECC bit can be read directly.</p>
Others	<p>Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.</p>

### CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

### 40B.2.4.2 Interrupt Requests

The local RAM ECC interrupt requests are listed below.

#### 40B.2.4.4 Details of Registers

##### (1) LRTSTCTL\_PE1 — Local RAM Test Control Register

LRTSTCTL\_PE1 is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits.

When writing to LRTSTCTL\_PE1, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** LRTSTCTL\_PE1 register can be read or written in 32-bit units.  
LRTSTCTL\_PE1L register can be read or written in 16-bit units.

**Address:** LRTSTCTL\_PE1: FFC6 5004<sub>H</sub>  
LRTSTCTL\_PE1L: FFC6 5004<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 40B.31 LRTSTCTL\_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST and DATSEL bits.
14	PROT0	The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRTSTCTL_PE1.
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read by reading LRTDATBF0_PE1 register or written directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: RAM data is selected. 1: The ECC bits are selected.

#### CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

**(2) LRTDATBF0\_PE1 — Local RAM Test Data Read Buffer 0**

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL\_PE1, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

**Access:** LRTDATBF0\_PE1 register is a read-only register that can be read in 32-bit units.

**Address:** LRTDATBF0\_PE1: FFC6 5008<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

**(3) LRECCCTL\_PE1 — Local RAM ECC Control Register**

LRECCCTL\_PE1 enables or disables ECC error detection and correction and 1-bit error correction.

When writing to LRECCCTL\_PE1, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** LRECCCTL\_PE1 register can be read or written in 32-bit units.  
LRECCCTL\_PE1L register can be read or written in 16-bit units.

**Address:** LRECCCTL\_PE1: FFC6 5400<sub>H</sub>

14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

**(4) LRERRINT\_PE1 — Local RAM Error Information Control Register**

LRERRINT\_PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** LRERRINT\_PE1 register can be read or written in 32-bit units.  
LRERRINT\_PE1L register can be read or written in 16-bit units.  
LRERRINT\_PE1LL register can be read or written in 8-bit units.

**Address:** LRERRINT\_PE1: FFC6 5404<sub>H</sub>

1	DEDIE	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

**(5) LRSTCLR\_PE1 — Local RAM Status Clear Register**

LRSTCLR\_PE1 clears the error flags in the error status register (LR1STERSTR\_PE1), the overflow flag in the error overflow status register (LROVFSTR\_PE1), and the error address register (LR1STEADR0\_PE1). LRSTCLR\_PE1 is a write-only register and is always read as 0.

**Access:** LRSTCLR\_PE1 register is a write-only register that can be written in 32-bit units.  
LRSTCLR\_PE1L register is a write-only register that can be written in 16-bit units.  
LRSTCLR\_PE1LL register is a write-only register that can be written in 8-bit units.

**Address:** LRSTCLR\_PE1: FFC6 5408<sub>H</sub>

0	STCLR0	Error Status Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in LR1STERSTR_PE1; ERROVF0 flag in LROVFSTR_PE1; and LR1STEADR0_PE1.

**(6) LROVFSTR\_PE1 — Local RAM Error Count Overflow Status Register**

LROVFSTR\_PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR\_PE1.

**Access:** LROVFSTR\_PE1 register is a read-only register that can be read in 32-bit units.  
LROVFSTR\_PE1L register is a read-only register that can be read in 16-bit units.  
LROVFSTR\_PE1LL register is a read-only register that can be read in 8-bit units.

**Address:** LROVFSTR\_PE1: FFC6 540C<sub>H</sub>

**(7) LR1STERSTR\_PE1 — Local RAM 1st Error Status Register**

LR1STERSTR\_PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0.

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR\_PE1 is cleared by an internal reset, the external reset, or setting 1 to the STCLR0 bit in LRSTCLR\_PE1.

**Access:** LR1STERSTR\_PE1 register is a read-only register that can be read in 32-bit units.  
LR1STERSTR\_PE1L register is a read-only register that can be read in 16-bit units.  
LR1STERSTR\_PE1LL register is a read-only register that can be read in 8-bit units.

31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1 to 1. [Setting condition] ECC 2-bit error is detected with DEDF0 being 0.
0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1 to 1. [Setting condition] ECC 1-bit error is detected with both SEDF0 and DEDF0 being 0.

**(8) LR1STEADR0\_PE1 — Local RAM 1st Error Address Register 0**

LR1STEADR0\_PE1 holds the address at which an error has occurred.

The error address is set if an error occurs while error flags are 0 in LR1STERSTR\_PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set in LR1STERSTR\_PE1. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address[31:19] bits of the associated memory to transform the internal address to the real address. LR1STEADR0\_PE1 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR\_PE1.

**Access:** LR1STEADR0\_PE1 register is a read-only register that can be read in 32-bit units.

LR1STEADR0\_PE1L and LR1STEADR0\_PE1H registers are read-only registers that can be read in 16-bit units.

LR1STEADR0\_PE1LL, LR1STEADR0\_PE1LH, and LR1STEADR0\_PE1HL registers are read-only registers that can be read in 8-bit units.

**Address:** LR1STEADR0\_PE1: FFC6 5450<sub>H</sub>

## 40B.2.5 Global RAM (Including the Retention RAM) ECC

### 40B.2.5.1 Overview

#### CAUTION

The retention RAM is a part of the global RAM. The ECC for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

In RH850/F1KM-S4 and RH850/F1KM-S2, an ECC encoder and an ECC decoder are provided for each bank (bank A and bank B).

**Figure 40B.2, Block Diagram of Global RAM ECC** shows the location of two ECC decoders and two ECC encoders for the global RAM.

The global RAM ECC is summarized in the table below.

Table 40B.39 Summary of Global RAM ECC

ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled.</p> <p>When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction</li> <li>• 2-bit error detection and 1-bit error detection</li> </ul> <p>When disabled, neither error detection nor correction is carried out.</p> <p>In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable.</li> </ul> <p>Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch.</p> <p>For details of the SYSERR, see <b>Section 3BC, CPU System of RH850/F1KM</b>.</p> <p>In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error.</p> <p>However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.</p>
Error status	<p>A status register is provided to indicate the statuses of 2-bit ECC error detection and 1-bit ECC error detection. If an error occurs while no error status is set, the corresponding status is set.</p> <p>The error status can be cleared using the clear register.</p>
Address capture	<p>If an ECC error occurs while no error status is set, the address at which the associated error has occurred is captured. In addition, if the address source retained is 1-bit ECC error, it is captured when a 2-bit ECC error is detected</p>
Self-diagnosis	<p>Arbitrary data can be written to RAM data and the ECC bit.</p> <p>RAM data can be read directly</p>
Others	<p>Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.</p>

#### 40B.2.5.4 Details of Registers

##### (1) GRECCCTL\_BKA/BKB — Global RAM ECC Control Register

GRECCCTL\_BKA/BKB enables or disables ECC error detection and correction and 1-bit error correction. Set the PROT1 and PROT0 bits to 01<sub>B</sub> when writing to GRECCCTL\_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

**Access:** GRECCCTL\_BKA and GRECCCTL\_BKB can be read or written in 32-bit units  
GRECCCTL\_BKAL and GRECCCTL\_BKBL can be read or written in 16-bit units

**Address:** GRECCCTL\_BKA: FFC6 4000<sub>H</sub>  
GRECCCTL\_BKAL: FFC6 4000<sub>H</sub>  
GRECCCTL\_BKB: FFC6 4200<sub>H</sub>  
GRECCCTL\_BKBL: FFC6 4200<sub>H</sub>

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set PROT1 to 0 and PROT0 to 1 when writing to this register.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. When writing, write 01 to PROT1 and PROT0 at the same time. 0: 1-bit error correction is performed when a 1-bit error is detected. 1: 1-bit error correction is not performed when a 1-bit error is detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. When writing, write 01 to PROT1 and PROT0 at the same time. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

**(2) GRERRINT\_BKA/BKB— Global RAM Error Information Control Register**

GRERRINT\_BKA/BKB enables or disables generation of the error notification signal upon detection of an ECC 1-bit error.

The setting of this register is used for accesses through the respective access port.

**Access:** GRERRINT\_BKA and GRERRINT\_BKB can be read or written in 32-bit units  
 GRERRINT\_BKAL and GRERRINT\_BKBL can be read or written in 16-bit units  
 GRERRINT\_BKALL and GRERRINT\_BKBLL can be read or written in 8-bit units

### (3) GRSTCLR\_BKA/BKB — Global RAM Status Clear Register

GRSTCLR\_BKA/BKB clears the error flags in the error status register (GR1STERSTR\_BKA/BKB), the overflow flag in the error count overflow status register (GROVFSTR\_BKA/BKB), and the error address register (GR1STEADR\_BKA/BKB). GRSTCLR\_BKA/BKB is a write-only register and is always read as 0.

The setting of this register is used for accesses through the respective access port.

**Access:** GRSTCLR\_BKA and GRSTCLR\_BKB are write-only registers that can be written in 32-bit units.  
GRSTCLR\_BKAL and GRSTCLR\_BKBL are write-only registers that can be written in 16-bit units.  
GRSTCLR\_BKALL and GRSTCLR\_BKBLL are write-only registers that can be written in 8-bit units

**Address:** GRSTCLR\_BKA: FFC6 4010<sub>H</sub>

#### (4) GROVFSTR\_BKA/BKB— Global RAM Error Count Overflow Status Register

GROVFSTR\_BKA/BKB monitors occurrence of error overflow. If a second error occurs after the first error (while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

The setting of this register is used for accesses through the respective access port.

**Access:** GROVFSTR\_BKA and GROVFSTR\_BKB are read-only registers that can be read in 32-bit units  
 GROVFSTR\_BKAL and GROVFSTR\_BKBL are read-only registers that can be read in 16-bit units  
 GROVFSTR\_BKALL and GROVFSTR\_BKBLL are read-only registers that can be read in 8-bit units

**Address:** GROVFSTR\_BKA: FFC6 4014<sub>H</sub>  
 GROVFSTR\_BKAL: FFC6 4014<sub>H</sub>  
 GROVFSTR\_BKALL: FFC6 4014<sub>H</sub>

0	ERROVF0	Error Overflow Flag ERROVF0 is set if a second error occurs while any of the error flags (DEDF and SEDF) in the error status register is set. ERROVF0 is not set when the second error occurs at the same address or source like the first error.

**(5) GR1STERSTR\_BKA/BKB— Global RAM 1st Error Status Register**

GR1STERSTR\_BKA/BKB monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. However, the corresponding error flag is set if an ECC 2-bit error occurs only when SEDF bit is set. GR1STERSTR\_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR\_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

**Access:** GR1STERSTR\_BKA and GR1STERSTR\_BKB are read-only registers that can be read in 32-bit units.  
GR1STERSTR\_BKAL and GR1STERSTR\_BKBL are read-only registers that can be read in 16-bit units.  
GR1STERSTR\_BKALL and GR1STERSTR\_BKBLL are read-only registers that can be read in 8-bit units.

0	SEDF	ECC 1-bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in GRSTCLR_BKA/BKB to 1. [Setting condition] ECC 1-bit error is detected when DEDF and SEDF are 0.

**(6) GR1STEADR\_BKA/BKB— Global RAM 1st Error Address Register**

GR1STEADR\_BKA/BKB holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR\_BKA/BKB. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated.

GR1STEADR\_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR\_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

**Access:** GR1STEADR\_BKA and GR1STEADR\_BKB are read-only registers that can be read in 32-bit units.  
GR1STEADR\_BKAL, GR1STEADR\_BKBL, GR1STEADR\_BKAH and GR1STEADR\_BKBH are read-only registers that can be read in 16-bit units.  
GR1STEADR\_BKALL, GR1STEADR\_BKALH, GR1STEADR\_BKAHL, GR1STEADR\_BKBLL,  
GR1STEADR\_BKBLH and GR1STEADR\_BKBHL are read-only registers that can be read in 8-bit units.

**Address:** GR1STEADR\_BKA: FFC6 401C<sub>H</sub>  
GR1STEADR\_BKAL: FFC6 401C<sub>H</sub>

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	EADR[19:0]	1st Error Address Monitors the address of the first error. The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR_BKA/BKB. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Note 1. The value after reset differs depending on bank A or bank B.

### (7) GRTSTCTL\_BKA/BKB — Global RAM Test Control Register

This register is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST to 1, any data can be written to the ECC bits.

Also, input and output by the ECC decoder in the global RAM controller can be controlled for testing (self-diagnosis).

Set PROT1 to 0 and PROT0 to 1 when writing to this register.

**Access:** GRTSTCTL\_BKA and GRTSTCTL\_BKB can be read or written in 32-bit units  
GRTSTCTL\_BKAL and GRTSTCTL\_BKBL can be read or written in 16-bit units

**Address:** GRTSTCTL\_BKA: FFC6 4020<sub>H</sub>

14	PROT0	The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to GRTSTCTL_BKA/BKB.
13 to 1	Reserved	When read, these bits are always read as 0. When writing, always write 0.
0	ECCTST	ECC test bit. This bit permits to switch the ECC data for writing into RAM. Assert (PROT1, PROT0) = (0, 1) to write to this register. 0: Output of ECC encoder is used for ECC data to RAM 1: Register output is used for ECC data to RAM.

**(8) GRDECINBF1\_BKA/BKB— Global RAM ECC Decoder Input Data Buffer 1**

7-bit ECC of global RAM is replaced to this register value by write access to global RAM during GRTSTCTL\_BKA/BKB.ECCTST = 1 (test mode).

**Access:** GRDECINBF1\_BKA and GRDECINBF1\_BKB can be read or written in 32-bit units.  
GRDECINBF1\_BKAL and GRDECINBF1\_BKBL can be read or written in 16-bit units.  
GRDECINBF1\_BKALL and GRDECINBF1\_BKBLL can be read or written in 8-bit units.

## 40B.2.6 ECC for Peripheral RAM

### 40B.2.6.1 Overview

This is an ECC module for the RAM of the following peripheral modules.

CSIH, RS-CANFD, FlexRay and Ethernet AVB.

Table 40B.52 List of the ECC Functions for the peripheral RAM

Item	Description
ECC error detection/correction	<p>ECC error detection and correction can be enabled or disabled.</p> <p>Either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction</li> <li>• 2-bit error detection and 1-bit error detection</li> </ul> <p>The ECC error detection/correction can be disabled by using through mode.</p> <p>In the initial state, 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Error notification can be enabled or disabled when an ECC 2-bit error is detected.</li> <li>• Error notification can be enabled or disabled when an ECC 1-bit error is detected.</li> </ul> <p>In the initial state of ECC controller, 2-bit error notification is enabled and 1-bit error notification is disabled.</p> <p>However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed.</p>
Error status	<p>Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available.</p> <p>A bit for clearing the error status is provided.</p>
Address capture	<p>Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).</p>

### CAUTION

When ECC error detection/correction is performed about RS-CANFD or FlexRay, initialize the RAM area before it is used.

### 40B.2.6.2 Interrupt Requests

ECC of peripheral interrupt requests are listed below.

#### 40B.2.6.4 Details of Registers

##### (1) <Module\_Name>CTL — ECC Control Register

The <Module\_Name>CTL register controls the mode of the ECC and the status for target peripheral modules.

Bits 7, 5, 4 and 3 should be set (written) while the target peripheral module's operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01<sub>B</sub>.

Access: This register can be read or written in 16-bit units.

Address: See Table 40B.57, List of ECC Modules (RH850/F1KM-S4), Table 40B.58, List of ECC Modules (RH850/F1KM-S2) and Table 40B.59, List of Registers.

Value after reset: 001X<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	ECCOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	—
	R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R

Note 1. These bits are always read as 0.

Table 40B.60 <Module\_Name>CTL Register Contents

Bit Position	Bit Name	Function
15	EMCA1	Access Control Bits 1 and 0 to ECC Mode Selection These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.
14	EMCA0	When these bits are 01 <sub>B</sub> , writing to bit 7 is enabled.
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECCOVFF	By detecting an error while the error status is set and the new error has another address than the already latched (not cleared or reset is not issued), this bit is set.  0: Overflow is not occurred after reset of clearing ECER2F and ECER1F. 1: Error address register overflowed  <b>NOTE:</b> This bit clear condition is as follows. (1) Reset (2) Writing ECER2C = 1 when ECER2F = 1 or ECER1C = 1 when ECER1F = 1 (3) Selecting through mode enable (ECTHM = 1)
10	ECER2C	2-Bit ECC Error Detection Flag Clear This bit clears 2-bit error detection flags of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. ECER2C = 1 also clears the ECCOVFF bit while ECER2F bit is set.
9	ECER1C	1-Bit ECC Error Detection Correction Accumulation Flag Clear This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. ECER1C = 1 also clears the ECCOVFF bit while ECER1F bit is set.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40B.60 &lt;Module\_Name&gt;CTL Register Contents

Bit Position	Bit Name	Function
7	ECTHM	<p>ECC Function through Mode Selection</p> <p>Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function.</p> <p>When writing to this bit, write 01<sub>B</sub> to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function.</p> <p>0: Passing through mode is disabled (normal operation mode). 1: Passing through mode is enabled. (ECC function disable)</p>
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	<p>1-Bit Error Correction Enable</p> <p>This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled.</p> <p>0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.</p>
4	EC2EDIC	<p>2-Bit Error Detection Interrupt Control</p> <p>This bit controls whether to generate an interrupt when 2-bit error is detected.</p> <p>0: When 2-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 2-bit error is detected, a target peripheral module's interrupt will be generated.</p>
3	EC1EDIC	<p>1-Bit Error Detection Interrupt Control</p> <p>This bit controls whether to generate an interrupt when 1-bit error is detected.</p> <p>0: When 1-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 1-bit error is detected, a target peripheral module's interrupt will be generated.</p>
2	ECER2F	<p>2-Bit Error Detection Flag</p> <p>This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (a target peripheral module's interrupt) is output.</p> <p>Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM = 1), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated.</p> <p>0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred.</p> <p>This bit is read-only. Writing 0 or 1 does not change internal state.</p>
1	ECER1F	<p>1-Bit Error Detection/Correction Flag</p> <p>This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. When through mode is enabled (ECTHM = 1), this bit is cleared.</p> <p>0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred.</p> <p>This bit is read-only. Writing 0 or 1 does not change internal state.</p>
0	ECEMF	<p>ECC Error Message Flag</p> <p>This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled (ECTHM = 1) and there is no 1-bit error in decode circuit input data.</p> <p>0: The current RAM output data does not have bit errors. 1: The current RAM output data have bit errors.</p>

**CAUTION**

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

**(2) <Module\_Name>TMC — ECC Test Mode Control Register**

The <Module\_Name>TMC register is used to switch to the test mode, and this register is for test mode control.

This register can be used when a target peripheral module is not accessed to RAM.

When writing to bit 7, ETMA1 and ETMA0 need to be 10<sub>B</sub>.

Access: This register can be read or written in 16-bit units.

Address: See **Table 40B.57, List of ECC Modules (RH850/F1KM-S4)**, **Table 40B.58, List of ECC Modules (RH850/F1KM-S2)** and **Table 40B.59, List of Registers**.

Note 1. These bits are always read as 0.

Table 40B.61 <Module\_Name>TMC Register Contents

Bit Position	Bit Name	Function
15	ETMA1	Access Control Bits 1 and 0 to ECC Test Mode
14	ETMA0	These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC Test Mode Enable This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write 10 <sub>B</sub> to the ETMA1 and ETMA0 bits at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled.  Test registers: <Module_Name>TED, <Module_Name>TRC, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, <Module_Name>ERDB Register test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM Read Test Mode Selection This bit selects the targets for reading when the <Module_Name>TED and <Module_Name>ERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Read value of the <Module_Name>TED register will be the write value of the <Module_Name>TED register. Read value of the <Module_Name>ERDB register will be the write value of the <Module_Name>ERDB register. 1: Read value of the <Module_Name>TED register can read RAM data. Read value of the <Module_Name>ERDB register will be the ECC Data to be written to RAM.
3	ECREOS	ECC Redundant Bit Output Data Selection This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the <Module_Name>ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated for write data is stored in RAM. 1: The value of <Module_Name>ERDB Register is stored in RAM.

**(3) <Module\_Name>TED — ECC Encode/Decode Input/Output Replacement Test Register**

In ECC test mode, this register handles test data.

This register value is used to generate ECC data or syndrome code.

This register can be accessed when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When <Module\_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000<sub>H</sub> is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See Table 40B.57, List of ECC Modules (RH850/F1KM-S4), Table 40B.58, List of ECC Modules (RH850/F1KM-S2) and Table 40B.59, List of Registers.

**(4) <Module\_Name>TRC — ECC Redundant Bit Data Control Test Register**

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers, <Module\_Name>SYND, <Module\_Name>HORD, <Module\_Name>ECRD, and <Module\_Name>ERDB.

This register can be accessed when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When <Module\_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000<sub>H</sub> is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See Table 40B.57, List of ECC Modules (RH850/F1KM-S4), Table 40B.58, List of ECC Modules (RH850/F1KM-S2) and Table 40B.59, List of Registers.

**(5) <Module\_Name>AD0 — Target ECC Error Address Register 0**

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 40B.57, List of ECC Modules (RH850/F1KM-S4)**, **Table 40B.58, List of ECC Modules (RH850/F1KM-S2)** and **Table 40B.59, List of Registers**.

**(6) <Module\_Name>SYND — ECC Decode Syndrome Data Register**

This register is a read-only register for storing generated syndrome data in ECC test mode.

Writing to this register is ignored.

This register is read-only when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module\_Name>TMC.ECTMCE = 0), 00<sub>H</sub> is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See Table 40B.57, List of ECC Modules (RH850/F1KM-S4), Table 40B.58, List of ECC Modules (RH850/F1KM-S2) and Table 40B.59, List of Registers.

**(7) <Module\_Name>HORD — ECC 7-Bit Redundant Bit Data Hold Test Register**

This register is for storing ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module\_Name>TMC.ECTMCE = 0), 00<sub>H</sub> is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See Table 40B.57, List of ECC Modules (RH850/F1KM-S4), Table 40B.58, List of ECC Modules (RH850/F1KM-S2) and Table 40B.59, List of Registers.

**(8) <Module\_Name>ECRD — ECC Encode Test Register**

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module\_Name>TMC.ECTMCE = 0), 00<sub>H</sub> is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See [Table 40B.57, List of ECC Modules \(RH850/F1KM-S4\)](#), [Table 40B.58, List of ECC Modules \(RH850/F1KM-S2\)](#) and [Table 40B.59, List of Registers](#).

**(9) <Module\_Name>ERDB — ECC Redundant Bit Input/Output Replacement Register**

In ECC test mode, this register handles test data.

This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When <Module\_Name>TMC.ECTMCE = 0, writing to this register is ignored and 00<sub>H</sub> is read.

Access: This register can be read or written in 8-bit units.

Address: See Table 40B.57, List of ECC Modules (RH850/F1KM-S4), Table 40B.58, List of ECC Modules (RH850/F1KM-S2) and Table 40B.59, List of Registers.

6 to 0	ERDB[6:0]	These bits can store this register value as ECC data when <Module_Name>TMC.ECREOS = 1. When the register is read while <Module_Name>TMC.ECREIS = 1, the value read from these bits is ECC data read from the RAM. When <Module_Name>TMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instead of written data.

**(10) SELB\_READTEST — ECCREAD Test Select Register**

SELB\_READTEST is used to check read/write access to the target peripheral module's RAM ECC registers.

Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

Access: This register can be read or written in 16-bit units.

Address: See **Table 40B.57, List of ECC Modules (RH850/F1KM-S4)**, **Table 40B.58, List of ECC Modules (RH850/F1KM-S2)** and **Table 40B.59, List of Registers**.

## 40B.3 Memory Protection

### 40B.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU

The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see *the RH850 Family User's Manual: Software*.

- Slave Guard

A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

- PEG

The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see **Section 3BC, CPU System of RH850/F1KM**.

- IPG

The CPU Peripheral is protected against illegal accesses.

For details, see **Section 3BC, CPU System of RH850/F1KM**.

- GRG

The global RAM is protected against illegal accesses.

- PBG/HBG

The control registers in the peripheral circuits are protected against illegal accesses. For details, see **Section 40B.3.3, PBG/HBG**.

- PBGC

The CPU system has its dedicated PBG function which is called PBG for CPU system. For details, see **Section 40B.3.4, PBG for CPU System**.

### 40B.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

Table 40B.69 Identifiers for Slave Guard

Identifier	Function
UM	<p>When the CPU makes an access, this indicates the operating mode of the CPU.</p> <p>0: Supervisor mode 1: User mode</p> <p>When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 0.</p>
SPID	<p>When the CPU makes an access, this indicates the system protection identifier SPID that is set by MCFG0.SPID in the CPU.</p> <p>When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.</p> <p>When another master (peripheral device connected to H-BUS) makes an access, the value of this identifier is always 00<sub>B</sub>.</p>
PEID	<p>This indicates the access source bus master.</p> <p>001<sub>B</sub>: CPU1 100<sub>B</sub>: Other bus master (H-Bus bus master)</p> <p>When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.</p>

### 40B.3.2 GRG (Global RAM Guard)

This product is provided with 4-channel GRG, which is described in detail in the following sections.

**CAUTION**

---

The retention RAM is a part of the global RAM. The Guard for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

4 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. Access with PEID  
PEID is a bit list with each bit corresponding to a PEID value.  
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID  
SPID is a bit list with each bit corresponding to a SPID value.  
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. For SPID, refer to **Table 40B.69, Identifiers for Slave Guard**.

### CAUTION

Global RAM Guard (GRG) only supports write accesses. The guard setting is not enabled for read accesses.

1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred.  If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of GRG error entry stages is 1.  Note that this overflow is notified to INTGUARD.  In addition, it is not possible to determine whether overflow has occurred in INTGUARD. Check the value of this bit. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	GRG protection violation Error Flag 0: No GRG protection violation has occurred. 1: A GRG protection violation has occurred.

### 40B.3.3 PBG/HBG

The PBG/HBG module is divided into several PBG/HBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG/HBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG/HBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG/HBG group names, and the PBG/HBG channel numbers.

## 40B.3.3.2 Details of Registers

(1) FSGDxxPROTn — PBGxx Protection Register n  
HFSGDxxPROTn — HBGxx Protection Register n

FSGDxxPROTn and HFSGDxxPROTn specify the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. "n" in the register names and symbols represents the PBG/HBG channel number.

**Access:** FSGDxxPROTn and HFSGDxxPROTn can be read or written in 32-bit units.  
FSGDxxPROTnL, FSGDxxPROTnH, HFSGDxxPROTnL, and HFSGDxxPROTnH can be read or written in 16-bit units.  
FSGDxxPROTnLL, FSGDxxPROTnHL, FSGDxxPROTnHH, HFSGDxxPROTnLL, HFSGDxxPROTnHL, and HFSGDxxPROTnHH can be read or written in 8-bit units.

**Address:** See Table 40B.81, List of PBG/HBG Protection Registers (RH850/F1KM-S4) and Table 40B.82, List of PBG/HBG Protection Registers (RH850/F1KM-S2).

**Value after reset:** See Table 40B.81, List of PBG/HBG Protection Registers (RH850/F1KM-S4) and Table 40B.82, List of PBG/HBG Protection Registers (RH850/F1KM-S2).

Table 40B.86 FSGDxxPROTn/HFSGxxPROTn Register Contents

Bit Position	Bit Name	Function
31	PROTLOCK	Register Lock 0: Enables FSGDxxPROTn/HFSGDxxPROTn rewrite. 1: Disables FSGDxxPROTn/HFSGDxxPROTn rewrite. When PROTLOCK is set to 1, the value is held until reset is asserted.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	RH850/F1KM-S4: PROTPEID4 RH850/F1KM-S2: Reserved	RH850/F1KM-S4: Access with PEID = 4 (peripheral device connected to H-BUS)*1 0: Disables access with PEID4. 1: Enables access with PEID4. RH850/F1KM-S2: When read, the value after reset is returned. When writing, write the value after reset.
20,19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PROTPEID1	Access with PEID = 1 (CPU)*1 0: Disables access with PEID1. 1: Enables access with PEID1.

Table 40B.86 FSGDxxPROTn/HFSGxxPROTn Register Contents

Bit Position	Bit Name	Function
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3 <sup>*2,*3</sup> 0: Disables access with SPID3. 1: Enables access with SPID3.
7	PROTSPID2	Access with SPID = 2 <sup>*2,*3</sup> 0: Disables access with SPID2. 1: Enables access with SPID2.
6	PROTSPID1	Access with SPID = 1 (CPU1) <sup>*2,*3</sup> 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0 <sup>*2,*3</sup> 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID  
PROTPEID is a bit list with each bit corresponding to a PEID value.  
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID  
PROTSPID is a bit list with each bit representing an SPID value.  
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. For SPID, refer to **Table 40B.69, Identifiers for Slave Guard**.

## (2) ERRSLVxxCTL — PBGxx Error Control Register HERRSLVxxCTL — HBGxx Error Control Register

ERRSLVxxCTL and HERRSLVxxCTL clear the status in the error status register with the PBGxx/HBGxx.

**Access:** ERRSLVxxCTL and HERRSLVxxCTL are write-only registers that can be written in 32-bit units.  
ERRSLVxxCTLL and HERRSLVxxCTLL are write-only registers that can be written in 16-bit units.  
ERRSLVxxCTLLL and HERRSLVxxCTLLL are write-only registers that can be written in 8-bit units.

**Address:** ERRSLVxxCTL: <base\_addr0> + 0<sub>H</sub>  
ERRSLVxxCTLL: <base\_addr0> + 0<sub>H</sub>  
ERRSLVxxCTLLL: <base\_addr0> + 0<sub>H</sub>

0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

### (3) ERRSLVxxSTAT — PBGxx Error Status Register HERRSLVxxSTAT — HBGxx Error Status Register

ERRSLVxxSTAT and HERRSLVxxSTAT hold the status of the illegal access rejected with the PBGxx/HBGxx.

**Access:** ERRSLVxxSTAT and HERRSLVxxSTAT are read-only registers that can be read in 32-bit units.  
ERRSLVxxSTATL and HERRSLVxxSTATL are read-only registers that can be read in 16-bit units.  
ERRSLVxxSTATLL and HERRSLVxxSTATLL are read-only registers that can be read in 8-bit units.

**Address:** ERRSLVxxSTAT: <base\_addr0> + 4<sub>H</sub>  
ERRSLVxxSTATL: <base\_addr0> + 4<sub>H</sub>  
ERRSLVxxSTATLL: <base\_addr0> + 4<sub>H</sub>

31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	<p>Error Entry Overflow Flag</p> <p>0: No overflow 1: An overflow occurred.</p> <p>If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBG/HBG error entry stages is 1.</p> <p>Note that this overflow is notified to INTGUARD.</p> <p>In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.</p>
0	ERR	<p>Error Status Flag</p> <p>0: No PBG/HBG protection violation 1: PBG/HBG protection violation occurred.</p>

#### CAUTION

After writing HERRSLVxxCTL, the value of HERRSLVxxSTAT takes the following procedure for a reflection:

- Execute SYNCM
- Wait for 24 × CPU clock\*1 cycles

**Note 1.** CPU clock: Clock selected by CKSC\_CPUCLKS\_CTRL and CKSC\_CPUCLKD\_CTL

#### (4) ERRSLVxxADDR — PBGxx Error Address Register HERRSLVxxADDR — HBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

HERRSLVxxADDR holds the address of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.

**Access:** ERRSLVxxADDR and HERRSLVxxADDR are read-only registers that can be read in 32-bit units.

**Address:** ERRSLVxxADDR: <base\_addr0> + 8<sub>H</sub>  
HERRSLVxxADDR: <base\_addr1> + 8<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

### (5) ERRSLVxxTYPE — PBGxx Error Type Register HERRSLVxxTYPE — HBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

HERRSLVxxTYPE holds the type of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.

**Access:** ERRSLVxxTYPE and HERRSLVxxTYPE are read-only registers that can be read in 32-bit units.  
ERRSLVxxTYPEEL and HERRSLVxxTYPEEL are read-only registers that can be read in 16-bit units.

**Address:** ERRSLVxxTYPE: <base\_addr0> + C<sub>H</sub>  
ERRSLVxxTYPEEL: <base\_addr0> + C<sub>H</sub>

31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	PEID of the access source from which the PBG/HBG protection violation is generated.
12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBG/HBG protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBG/HBG protection violation is generated.
5	Reserved	When read, the value after reset is returned.
4 to 1	Reserved	These bits are read as an undefined value.
0	WRITE	This bit is set to 1 when the access that has generated the PBG/HBG protection violation is a write access.

### 40B.3.4 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.

Table 40B.92 Target Registers of PBG for CPU Subsystem

PBGC Group	Group No.	Channel Number	Protection Target Module	Target Register
PBGC0	C0 (PBC group 0 for CPU system)	0	INTC2	ICxxx (xxx = 32 to 376) IMRm (m = 1 to 11) (described in <b>Section 7BC, Exception/Interrupt of RH850/F1KM</b> )
		1	PDMA0	All registers inside DMA controller (described in <b>Section 8, DMA Controller</b> )

## 40B.3.4.2 Details of Registers

## (1) FSGDCxPROTn — PBGCx Protection Register n (x = 0, 1)

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.

"n" in the register names and symbols represents the PBGC channel number.

**Access:** FSGDCxPROTn register can be read or written in 32-bit units.  
FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units.  
FSGDCxPROTnLL, FSGDCxPROTnHL, and FSGDCxPROTnHH registers can be read or written in 8-bit units.

**Address:** See Table 40B.93, List of PBGC Protection Registers.

**Value after reset:** See Table 40B.93, List of PBGC Protection Registers.

20, 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3*2,*3 0: Disables access with SPID3. 1: Enables access with SPID3.

Table 40B.95 FSGDCxPROTn Register Contents

Bit Position	Bit Name	Function
7	PROTSPID2	Access with SPID = 2 <sup>*2,*3</sup> 0: Disables access with SPID2. 1: Enables access with SPID2.
6	PROTSPID1	Access with SPID = 1 (CPU1) <sup>*2,*3</sup> 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0 <sup>*2,*3</sup> 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID  
PROTPEID is a bit list with each bit corresponding to a PEID value.  
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID  
PROTSPID is a bit list with each bit representing an SPID value.  
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. For SPID, refer to **Table 40B.69, Identifiers for Slave Guard**.

**(2) ERRSLVCxCTL — PBGCx Error Control Register (x = 0, 1)**

ERRSLVCxCTL clears the status in error status register PBGCx.

**Access:** ERRSLVCxCTL register is a write-only register that can be written in 32-bit units.  
ERRSLVCxCTLL register is a write-only register that can be written in 16-bit units.  
ERRSLVCxCTLLL register is a write-only register that can be written in 8-bit units.

**Address:** ERRSLVCxCTL: FFC4 C800<sub>H</sub> + (100<sub>H</sub> × x)

**(3) ERRSLVCxSTAT — PBGCx Error Status Register (x = 0, 1)**

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

**Access:** ERRSLVCxSTAT register is a read-only register that can be read in 32-bit units.  
ERRSLVCxSTATL register is a read-only register that can be read in 16-bit units.  
ERRSLVCxSTATLL register is a read-only register that can be read in 8-bit units.

**Address:** ERRSLVCxSTAT: FFC4 C804<sub>H</sub> + (100<sub>H</sub> × x)

For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.</p>
0	ERR	<p>Error Status Flag</p> <p>0: No PBGC protection violation 1: A PBGC protection violation occurred.</p>

**(4) ERRSLVCxADDR — PBGCx Error Address Register (x = 0, 1)**

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

**Access:** ERRSLVCxADDR register is a read-only register that can be read in 32-bit units.

**Address:** FFC4 C808<sub>H</sub> + (100<sub>H</sub> × x)

**(5) ERRSLVCxTYPE — PBGCx Error Type Register (x = 0, 1)**

ERRSLVCxTYPE holds the type of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

**Access:** ERRSLVCxTYPE register is a read-only register that can be read in 32-bit units.  
ERRSLVCxTYPEPEL register is a read-only register that can be read in 16-bit units.

**Address:** ERRSLVCxTYPE: FFC4 C80C<sub>H</sub> + (100<sub>H</sub> × x)  
ERRSLVCxTYPEPEL: FFC4 C80C<sub>H</sub> + (100<sub>H</sub> × x)

12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBGC protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBGC protection violation is generated.
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	This bit is set to 1 when an access that has generated the PBGC protection violation is the write.

## Section 40C Functional Safety of RH850/F1KM-S1

This section provides an overview of the safety mechanisms included in the RH850/F1KM Series.

This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.

For more information about the development process and safety mechanisms, please contact our sales office.

The following are the failure detection functions provided by this microcontroller.

### 40C.1 Overview

#### **ECC**

Detects failures of memories and data transfer paths and corrects some types of failures.

#### **Memory Protection**

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

#### **Clock Monitor**

Monitors the clock operation to detect abnormal operations. For details, see **Section 13, Clock Monitor (CLMA)**.

#### **Data CRC**

Generates CRC to detect data errors.

For details, see **Section 41, Data CRC (DCRA)**.

#### **Write-Protected Registers**

The write-protected registers are protected from inadvertent write access due to erroneous program execution.

For details, see **Section 5, Write-Protected Registers**.

## 40C.2 ECC

### 40C.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 40C.1 ECC Overview

Applicable Memory	Applicable Data Width [bits]	Operation upon Error Detection					Failure Insertion	
		Detection/Correction	SYSERR	Interrupt Notice	Error Status	Address Capture		
Code flash	128	SEC-DED	SED/DED*2	SEC-DED	Possible	Possible	Possible	
Data flash	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible	
Local RAM (CPU1/Self) Retention RAM (CPU1/Self)	32	SEC-DED	SED/DED*2	SEC-DED	Possible	Possible	Possible	
Peripheral RAM*1	CSIH	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	RS-CANFD	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible

Note 1. For details of ECC for each peripheral IP, see **Section 40C.2.5, ECC for Peripheral RAM**.

Note 2. For details, see **Section 40C.2.2.2, Interrupt Requests** and **Section 40C.2.4.2, Interrupt Requests**.

### Applicable Data Width

This is the data width to be ECC encoded.

To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).

- (1) Reading data to be ECC-encoded including data to be rewritten
- (2) Replacing data to be rewritten
- (3) Writing back data generated in (2)

### Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected. SED-DED: 1-bit errors and 2-bit errors can only be detected.

### SYSERR

SYSERR can be generated upon error detection.

### Interrupt Notice

An interrupt can be generated upon error detection.

### Error Status

The status of a detected error is retained.

**Address Capture**

The address of a detected error is retained.

**Failure Insertion**

Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

## 40C.2.2 Code Flash ECC

### 40C.2.2.1 Overview

RH850/F1KM has two code flash ECC decoder circuits implemented, one inside the Processor Element (PE1) and one on the VCI (system interconnect).

**Figure 40C.1, Block Diagram of Code Flash ECC** shows the location of two ECC decoders for the code flash.

Figure 40C.1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.

Table 40C.2 Summary of Code Flash ECC

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction.</li> <li>• 2-bit error detection and 1-bit error detection.</li> </ul> <p>When disabled, neither error detection nor correction is carried out.</p> <p>In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. (This is not supported in CFERRINT_PE1 register.) Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch.</li> <li>• Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see <b>Section 3BC, CPU System of RH850/F1KM</b>.</li> </ul> <p>In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error.</p> <p>However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.</p>

Table 40C.2 Summary of Code Flash ECC

Item	Description
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The ECC 1-bit error status is set only when no error status has been set. The ECC 2-bit error status is set even when the ECC 1-bit error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured.
Self-diagnosis	The ECC bit can be read directly.
Inhibiting instruction execution	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching avoids the execution of incorrect instructions.

### 40C.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.

Table 40C.3 Code Flash ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0*1 (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR	—

Note 1. ECCFLI0FEIF flag set can be read (not jump to handler address of FEINT) in SYSERR processing because return from SYSERR is not possible.

Table 40C.4 Code Flash ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number

CFECC_VCI	Code flash sub-test control register (VCI)	CFSTSTCTL_VCI	FFC6 2350 <sub>H</sub>

Note 1. The registers suffixed with symbols “\_VCI” and “\_PE1” are provided to ECC controllers corresponding to each access port: registers with “\_VCI” are provided to the ECC controller for data access from the system interconnect to the code flash and registers with “\_PE1” are provided to the ECC controller for fetch access from the CPU1.

## 40C.2.2.4 Details of Registers

## (1) CFECCTL\_VCI/PE1 — Code Flash ECC Control Register

CFECCTL\_VCI/PE1 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFECCTL\_VCI/PE1, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** CFECCTL\_VCI and CFECCTL\_PE1 can be read or written in 32-bit units.  
CFECCTL\_VCIL and CFECCTL\_PE1L can be read or written in 16-bit units.

**Address:** CFECCTL\_VCI: FFC6 2200<sub>H</sub>  
CFECCTL\_VCIL: FFC6 2200<sub>H</sub>

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFECCTL_VCI/PE1.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

**(2) CFERRINT\_VCI/PE1 — Code Flash Error Information Control Register**

CFERRINT\_VCI/PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** CFERRINT\_VCI and CFERRINT\_PE1 can be read or written in 32-bit units.  
CFERRINT\_VCIL and CFERRINT\_PE1L can be read or written in 16-bit units.  
CFERRINT\_VCILL and CFERRINT\_PE1LL can be read or written in 8-bit units.

**Address:** CFERRINT\_VCI: FFC6 2204<sub>H</sub>

0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

Note 1. This bit is not supported in CFERRINT\_PE1. When writing to this bit in CFERRINT\_PE1, always write 1.

Note 2. Regarding the interrupt request, see **Section 40C.2.2.2, Interrupt Requests**.

**(3) CFSTCLR\_VCI/PE1 — Code Flash Status Clear Register**

CFSTCLR\_VCI/PE1 clears the error flags in the error status register (CF1STERSTR\_VCI/PE1), the overflow flag in the error overflow status register (CFOVFSTR\_VCI/PE1), and the error address register (CF1STEADR0\_VCI/PE1).

**Access:** CFSTCLR\_VCI and CFSTCLR\_PE1 are write-only registers that can be written in 32-bit units.  
CFSTCLR\_VCIL and CFSTCLR\_PE1L are write-only registers that can be written in 16-bit units.

**(4) CFOVFSTR\_VCI/PE1 — Code Flash Error Count Overflow Status Register**

CFOVFSTR\_VCI/PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

**Access:** CFOVFSTR\_VCI and CFOVFSTR\_PE1 are read-only registers that can be read in 32-bit units.  
CFOVFSTR\_VCIL and CFOVFSTR\_PE1L are read-only registers that can be read in 16-bit units.  
CFOVFSTR\_VCILL and CFOVFSTR\_PE1LL are read-only registers that can be read in 8-bit units.

**(5) CF1STERSTR\_VCI/PE1 — Code Flash 1st Error Status Register**

CF1STERSTR\_VCI/PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

**Access:** CF1STERSTR\_VCI and CF1STERSTR\_PE1 are read-only registers that can be read in 32-bit units.  
CF1STERSTR\_VCIL and CF1STERSTR\_PE1L are read-only registers that can be read in 16-bit units.  
CF1STERSTR\_VCILL and CF1STERSTR\_PE1LL are read-only registers that can be read in 8-bit units.

**(6) CF1STEADR0\_VCI/PE1 — Code Flash 1st Error Address Register**

CF1STEADR0\_VCI/PE1 holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR\_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STEADR0\_VCI/PE1 register is cleared by an internal reset, the external reset, or by setting the STCLR bit in the CFSTCLR\_VCI/PE1 register to 1.

**Access:** CF1STEADR0\_VCI and CF1STEADR0\_PE1 are read-only registers that can be read in 32-bit units.  
CF1STEADR0\_VCIL, CF1STEADR0\_VCIH, CF1STEADR0\_PE1L and CF1STEADR0\_PE1H are read-only registers that can be read in 16-bit units.  
CF1STEADR0\_VCILL, CF1STEADR0\_VCILH, CF1STEADR0\_VCIHL, CF1STEADR0\_VCIHH,  
CF1STEADR0\_PE1LL, CF1STEADR0\_PE1LH, CF1STEADR0\_PE1HL and CF1STEADR0\_PE1HH are read-only registers that can be read in 8-bit units.

### (7) CFSTSTCTL\_VCI — Code Flash Sub-Test Control Register

CFSTSTCTL\_VCI is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly.

When writing to CFSTSTCTL\_VCI, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** CFSTSTCTL\_VCI can be read or written in 32-bit units.  
CFSTSTCTL\_VCIL can be read or written in 16-bit units.

**Address:** CFSTSTCTL\_VCI: FFC6 2350<sub>H</sub>

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST bit.
14	PROT0	The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFSTSTCTL_VCI.
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see **Section 3BC, CPU System of RH850/F1KM**.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of reading code flash are as follows:

Table 40C.14 Results of Reading Code Flash

Bit Number	Meaning	Bit Position	Description
bit[31:10]	all-0	31 to 10	These bits are always 0.

bit[8:0]	ECC bits	8 to 0	ECC bits

## 40C.2.3 Data Flash ECC

### 40C.2.3.1 Overview

The data flash ECC is summarized in the table below.

Table 40C.15 Summary of Data Flash ECC

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled.</p> <p>When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection / correction.</li> <li>• 2-bit error detection and 1-bit error detection.</li> </ul> <p>When disabled, neither error detection nor correction is carried out.</p> <p>In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Enabling or disabling of error notification in the case of detection of ECC 2-bit errors is selectable.</li> <li>• Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable.</li> </ul> <p>In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is disabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the Interrupt Controller, an interrupt processing is not executed.</p>
Error status	<p>The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored.</p> <p>The function is set only while no error status is set. A register for clearing the error status is provided.</p>
Address capture	<p>When no ECC error status has been set, the address at which the first ECC error occurred is captured. ECC error address is captured when both SEDF and DEDF of DFERSTR are 0.</p>
Self-diagnosis	<p>ROM data and the ECC bit can be read directly.</p> <p>Arbitrary data can be written to ROM data and the ECC bit.</p>

### 40C.2.3.2 Interrupt Requests

The interrupt requests for data flash ECC are shown below.

### 40C.2.3.4 Details of Registers

#### (1) DFECCTL — Data Flash ECC Control Register

DFECCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCTL, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** DFECCTL can be read or written in 16-bit units.

**Address:** DFECCTL: FFC6 2A00<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 40C.18 DFECCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

## (2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.

The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

**Access:** DFERSTR is a read-only register that can be read in 8-bit units.

**Address:** DFERSTR: FFC6 2A04<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

0	SEDF	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 1-bit error is detected when both SEDF and DEDF are 0.

**(3) DFERSTC — Data Flash Error Status Clear Register**

DFERSTC clears the error flags in the data flash error status register.

**Access:** DFERSTC is a write-only register that can be written in 8-bit units.

**Address:** DFERSTC: FFC6 2A08<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

**(6) DFERRINT — Data Flash Error Notification Control Register**

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** DFERRINT can be read or written in 8-bit units.

**Address:** DFERRINT: FFC6 2A14<sub>H</sub>

0	SEDIE	ECC 1-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

**(7) DFEADR — Data Flash 1st Error Address Register**

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0.

**Access:** DFEADR is a read-only register that can be read in 32-bit units.

**Address:** DFEADR: FFC6 2A18<sub>H</sub>

**(8) DFTSTCTL — Data Flash Test Control Register**

DFTSTCTL is used for the ECC test.

After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read.

When writing to DFTSTCTL, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** DFTSTCTL can be read or written in 16-bit units.

**Address:** DFTSTCTL: FFC6 2A1C<sub>H</sub>

13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test Sets ECC test mode. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

## 40C.2.4 Local RAM (Including the Retention RAM) ECC

### 40C.2.4.1 Overview

#### CAUTION

The retention RAM is a part of the local RAM. The ECC for the retention RAM is shared with the local RAM. Therefore, use for the retention RAM the same register as that for the local RAM.

The local RAM ECC of CPU1 is summarized in the table below.

Table 40C.26 Summary of Local RAM ECC (CPU1)

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction.</li> <li>• 2-bit error detection and 1-bit error detection.</li> </ul> <p>When disabled, neither error detection nor correction is carried out.</p> <p>In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch.</li> <li>• Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see <b>Section 3BC, CPU System of RH850/F1KM</b>.</li> </ul> <p>In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error.</p> <p>However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.</p>
Error status	<p>The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored.</p> <p>The function is set only while no error status is set. A register for clearing the error status is provided.</p>
Address capture	<p>When no error status has been set, the address at which the first error occurred is captured. In addition, when the retained address source is an ECC 1-bit error or ECC 2-bit error, the address is also captured.</p>
Self-diagnosis	<p>Arbitrary data can be written to RAM data and the ECC bit.</p> <p>RAM data and the ECC bit can be read directly.</p>
Others	<p>Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.</p>

#### CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

### 40C.2.4.2 Interrupt Requests

The local RAM ECC interrupt requests are listed below.

## 40C.2.4.4 Details of Registers

## (1) LRTSTCTL\_PE1 — Local RAM Test Control Register

LRTSTCTL\_PE1 is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits. When writing to LRTSTCTL\_PE1, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** LRTSTCTL\_PE1 register can be read or written in 32-bit units.  
LRTSTCTL\_PE1L register can be read or written in 16-bit units.

**Address:** LRTSTCTL\_PE1: FFC6 5004<sub>H</sub>  
LRTSTCTL\_PE1L: FFC6 5004<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 40C.31 LRTSTCTL\_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST and DATSEL bits.
14	PROT0	The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRTSTCTL_PE1.
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read by reading LRTDATBF0_PE1 register or written directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: RAM data is selected. 1: The ECC bits are selected.

**CAUTION**

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

**(2) LRTDATBF0\_PE1 — Local RAM Test Data Read Buffer 0**

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL\_PE1, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

**Access:** LRTDATBF0\_PE1 register is a read-only register that can be read in 32-bit units.

**Address:** LRTDATBF0\_PE1: FFC6 5008<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

**(3) LRECCCTL\_PE1 — Local RAM ECC Control Register**

LRECCCTL\_PE1 enables or disables ECC error detection and correction and 1-bit error correction.

When writing to LRECCCTL\_PE1, PROT1 and PROT0 need to be 01<sub>B</sub>.

**Access:** LRECCCTL\_PE1 register can be read or written in 32-bit units.  
LRECCCTL\_PE1L register can be read or written in 16-bit units.

**(4) LRERRINT\_PE1 — Local RAM Error Information Control Register**

LRERRINT\_PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

**Access:** LRERRINT\_PE1 register can be read or written in 32-bit units.  
LRERRINT\_PE1L register can be read or written in 16-bit units.  
LRERRINT\_PE1LL register can be read or written in 8-bit units.

0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

**(5) LRSTCLR\_PE1 — Local RAM Status Clear Register**

LRSTCLR\_PE1 clears the error flags in the error status register (LR1STERSTR\_PE1), the overflow flag in the error overflow status register (LROVFSTR\_PE1), and the error address register (LR1STEADR0\_PE1). LRSTCLR\_PE1 is a write-only register and is always read as 0.

**Access:** LRSTCLR\_PE1 register is a write-only register that can be written in 32-bit units.  
LRSTCLR\_PE1L register is a write-only register that can be written in 16-bit units.  
LRSTCLR\_PE1LL register is a write-only register that can be written in 8-bit units.

**Address:** LRSTCLR\_PE1: FFC6 5408<sub>H</sub>

**(6) LROVFSTR\_PE1 — Local RAM Error Count Overflow Status Register**

LROVFSTR\_PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR\_PE1.

**Access:** LROVFSTR\_PE1 register is a read-only register that can be read in 32-bit units.  
LROVFSTR\_PE1L register is a read-only register that can be read in 16-bit units.  
LROVFSTR\_PE1LL register is a read-only register that can be read in 8-bit units.

**(7) LR1STERSTR\_PE1 — Local RAM 1st Error Status Register**

LR1STERSTR\_PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0.

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR\_PE1 is cleared by an internal reset, the external reset, or setting 1 to the STCLR0 bit in LRSTCLR\_PE1.

**Access:** LR1STERSTR\_PE1 register is a read-only register that can be read in 32-bit units.  
LR1STERSTR\_PE1L register is a read-only register that can be read in 16-bit units.  
LR1STERSTR\_PE1LL register is a read-only register that can be read in 8-bit units.

0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1 to 1. [Setting condition] ECC 1-bit error is detected with both SEDFO and DEDFO being 0.

**(8) LR1STEADR0\_PE1 — Local RAM 1st Error Address Register 0**

LR1STEADR0\_PE1 holds the address at which an error has occurred.

The error address is set if an error occurs while error flags are 0 in LR1STERSTR\_PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address[31:19] bits of the associated memory to transform the internal address to the real address. LR1STEADR0\_PE1 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR\_PE1.

**Access:** LR1STEADR0\_PE1 register is a read-only register that can be read in 32-bit units.

LR1STEADR0\_PE1L and LR1STEADR0\_PE1H registers are read-only registers that can be read in 16-bit units.

LR1STEADR0\_PE1LL, LR1STEADR0\_PE1LH, and LR1STEADR0\_PE1HL registers are read-only registers that can be read in 8-bit units.

## 40C.2.5 ECC for Peripheral RAM

### 40C.2.5.1 Overview

This is an ECC module for the RAM of the following peripheral modules.

CSIH and RS-CANFD.

Table 40C.39 List of the ECC Functions for the peripheral RAM

Item	Description
ECC error detection/correction	<p>ECC error detection and correction can be enabled or disabled.</p> <p>Either of the following settings can be selected.</p> <ul style="list-style-type: none"> <li>• 2-bit error detection and 1-bit error detection/correction</li> <li>• 2-bit error detection and 1-bit error detection</li> </ul> <p>The ECC error detection/correction can be disabled by using through mode.</p> <p>In the initial state, 1-bit errors are detected and corrected, 2-bit errors are detected.</p>
Error notification	<p>A notification is sent when an ECC error occurs.</p> <ul style="list-style-type: none"> <li>• Error notification can be enabled or disabled when an ECC 2-bit error is detected.</li> <li>• Error notification can be enabled or disabled when an ECC 1-bit error is detected.</li> </ul> <p>In the initial state of ECC controller, 2-bit error notification is enabled and 1-bit error notification is disabled.</p> <p>However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed.</p>
Error status	<p>Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available.</p> <p>A bit for clearing the error status is provided.</p>
Address capture	<p>Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).</p>

### CAUTION

When ECC error detection/correction is performed about RS-CANFD, initialize the RAM area before it is used.

## 40C.2.5.4 Details of Registers

## (1) &lt;Module\_Name&gt;CTL — ECC Control Register

The <Module\_Name>CTL register controls the mode of the ECC and the status for **target peripheral modules**.

Bits 7, 5, 4 and 3 should be set (written) while the **target peripheral module**'s operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01<sub>B</sub>.

Access: This register can be read or written in 16-bit units.

Address: See Table 40C.42, List of ECC Modules and Table 40C.43, List of Registers.

Value after reset: 001X<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	ECCOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	—
	R/W	R/W*	R/W*	R	R	R	R/W*	R/W*	R	R/W	R	R/W	R/W	R/W	R	R

Note 1. These bits are always read as 0.

Table 40C.44 <Module\_Name>CTL Register Contents

Bit Position	Bit Name	Function
15	EMCA1	Access Control Bits 1 and 0 to ECC Mode Selection
14	EMCA0	These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01 <sub>B</sub> , writing to bit 7 is enabled.
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECCOVFF	By detecting an error while the error status is set and the new error has another address than the already latched (not cleared or reset is not issued), this bit is set.  0: Overflow is not occurred after reset of clearing ECER2F and ECER1F. 1: Error address register overflowed  <b>NOTE:</b> This bit clear condition is as follows. (1) Reset (2) Writing ECER2C = 1 when ECER2F = 1 or ECER1C = 1 when ECER1F = 1 (3) Selecting through mode enable (ECTHM = 1)
10	ECER2C	2-Bit ECC Error Detection Flag Clear This bit clears 2-bit error detection flags of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. ECER2C = 1 also clears the ECCOVFF bit while ECER2F bit is set.
9	ECER1C	1-Bit ECC Error Detection Correction Accumulation Flag Clear This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. ECER1C = 1 also clears the ECCOVFF bit while ECER1F bit is set.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40C.44 &lt;Module\_Name&gt;CTL Register Contents

Bit Position	Bit Name	Function
7	ECTHM	<p>ECC Function through Mode Selection</p> <p>Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function.</p> <p>When writing to this bit, write 01<sub>B</sub> to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function.</p> <p>0: Passing through mode is disabled (normal operation mode). 1: Passing through mode is enabled. (ECC function disable)</p>
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	<p>1-Bit Error Correction Enable</p> <p>This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled.</p> <p>0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.</p>
4	EC2EDIC	<p>2-Bit Error Detection Interrupt Control</p> <p>This bit controls whether to generate an interrupt when 2-bit error is detected.</p> <p>0: When 2-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 2-bit error is detected, a target peripheral module's interrupt will be generated.</p>
3	EC1EDIC	<p>1-Bit Error Detection Interrupt Control</p> <p>This bit controls whether to generate an interrupt when 1-bit error is detected.</p> <p>0: When 1-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 1-bit error is detected, a target peripheral module's interrupt will be generated.</p>
2	ECER2F	<p>2-Bit Error Detection Flag</p> <p>This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (a target peripheral module's interrupt) is output.</p> <p>Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM = 1), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated.</p> <p>0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred.</p> <p>This bit is read-only. Writing 0 or 1 does not change internal state.</p>
1	ECER1F	<p>1-Bit Error Detection/Correction Flag</p> <p>This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. When through mode is enabled (ECTHM = 1), this bit is cleared.</p> <p>0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred.</p> <p>This bit is read-only. Writing 0 or 1 does not change internal state.</p>
0	ECEMF	<p>ECC Error Message Flag</p> <p>This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled (ECTHM = 1) and there is no 1-bit error in decode circuit input data.</p> <p>0: The current RAM output data does not have bit errors. 1: The current RAM output data have bit errors.</p>

**CAUTION**

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

**(2) <Module\_Name>TMC — ECC Test Mode Control Register**

The <Module\_Name>TMC register is used to switch to the test mode, and this register is for test mode control.

This register can be used when a **target peripheral module** is not accessed to RAM.

When writing to bit 7, ETMA1 and ETMA0 need to be 10<sub>B</sub>.

Access: This register can be read or written in 16-bit units.

Address: See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.

Value after reset: 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. These bits are always read as 0.

Table 40C.45 <Module\_Name>TMC Register Contents

Bit Position	Bit Name	Function
15	ETMA1	Access Control Bits 1 and 0 to ECC Test Mode
14	ETMA0	These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC Test Mode Enable This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write 10 <sub>B</sub> to the ETMA1 and ETMA0 bits at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled.  Test registers: <Module_Name>TED, <Module_Name>TRC, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECDR, <Module_Name>ERDB Register test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM Read Test Mode Selection This bit selects the targets for reading when the <Module_Name>TED and <Module_Name>ERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Read value of the <Module_Name>TED register will be the write value of the <Module_Name>TED register. Read value of the <Module_Name>ERDB register will be the write value of the <Module_Name>ERDB register. 1: Read value of the <Module_Name>TED register can read RAM data. Read value of the <Module_Name>ERDB register will be the ECC Data to be written to RAM.
3	ECREOS	ECC Redundant Bit Output Data Selection This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the <Module_Name>ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated for write data is stored in RAM. 1: The value of <Module_Name>ERDB Register is stored in RAM.

**(3) <Module\_Name>TED — ECC Encode/Decode Input/Output Replacement Test Register**

In ECC test mode, this register handles test data.

This register value is used to generate ECC data or syndrome code.

This register can be accessed when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When <Module\_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000<sub>H</sub> is read.

This register can be used when a **target peripheral module** is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.

**(4) <Module\_Name>TRC — ECC Redundant Bit Data Control Test Register**

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers, <Module\_Name>SYND, <Module\_Name>HORD, <Module\_Name>ECRD, and <Module\_Name>ERDB.

This register can be accessed when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When <Module\_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000<sub>H</sub> is read.

This register can be used when **a target peripheral module** is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.

**(5) <Module\_Name>AD0 — Target ECC Error Address Register 0**

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.

**(6) <Module\_Name>SYND — ECC Decode Syndrome Data Register**

This register is a read-only register for storing generated syndrome data in ECC test mode.

Writing to this register is ignored.

This register is read-only when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module\_Name>TMC.ECTMCE = 0), 00<sub>H</sub> is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.

**(7) <Module\_Name>HORD — ECC 7-Bit Redundant Bit Data Hold Test Register**

This register is for storing ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module\_Name>TMC.ECTMCE = 0), 00<sub>H</sub> is read.

Access: This register is a read-only register that can be read in 8-bit units.

**(8) <Module\_Name>ECRD — ECC Encode Test Register**

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module\_Name>TMC.ECTMCE = 0), 00<sub>H</sub> is read.

Access: This register is a read-only register that can be read in 8-bit units.

6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing and can read ECC data for data written in the <Module_Name>TED register when <Module_Name>MC.ECENS =1.

**(9) <Module\_Name>ERDB — ECC Redundant Bit Input/Output Replacement Register**

In ECC test mode, this register handles test data.

This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode is enabled (<Module\_Name>TMC.ECTMCE = 1). When <Module\_Name>TMC.ECTMCE = 0, writing to this register is ignored and 00<sub>H</sub> is read.

Access: This register can be read or written in 8-bit units.

6 to 0	ERDB[6:0]	These bits can store this register value as ECC data when <Module_Name>TMC.ECREOS = 1. When the register is read while <Module_Name>TMC.ECREIS = 1, the value read from these bits is ECC data read from the RAM. When <Module_Name>TMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instead of written data.

**(10) SELB\_READTEST — ECCREAD Test Select Register**

SELB\_READTEST is used to check read/write access to the target peripheral module's RAM ECC registers.

Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

Access: This register can be read or written in 16-bit units.

Address: See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.

## 40C.3 Memory Protection

### 40C.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU

The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see the *RH850 Family User's Manual: Software*.

- Slave Guard

A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

- PEG

The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see **Section 3BC, CPU System of RH850/F1KM**.

- IPG

The CPU Peripheral is protected against illegal accesses. For details, see **Section 3BC, CPU System of RH850/F1KM**.

- PBG

The control registers in the peripheral circuits are protected against illegal accesses. For details, see **Section 40C.3.2, PBG**.

- PBGC

The CPU system has its dedicated PBG function which is called a PBG for CPU system. For details, see **Section 40C.3.3, PBG for CPU System**.

### 40C.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

Table 40C.53 Identifiers for Slave Guard

Identifier	Function
UM	<p>When the CPU makes an access, this indicates the operating mode of the CPU.</p> <p>0: Supervisor mode 1: User mode</p> <p>When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.</p> <p>When another master makes an access, the value of this identifier is always 0.</p>
SPID	<p>When the CPU makes an access, this indicates the system protection identifier SPID that is set by MCFG0.SPID in the CPU.</p> <p>When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.</p> <p>When another master makes an access, the value of this identifier is always 00<sub>B</sub>.</p>
PEID	<p>This indicates the access source bus master.</p> <p>001<sub>B</sub>: CPU1</p> <p>When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.</p>

### 40C.3.2 PBG

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers.

### 40C.3.2.2 Details of Registers

#### (1) FSGDxxPROTn — PBGxx Protection Register n

FSGDxxPROTn specifies the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. “n” in the register names and symbols represents the PBG channel number.

**Access:** FSGDxxPROTn register can be read or written in 32-bit units.  
FSGDxxPROTnL and FSGDxxPROTnH registers can be read or written in 16-bit units.  
FSGDxxPROTnLL, FSGDxxPROTnHL and FSGDxxPROTnHH registers can be read or written in 8-bit units.

**Address:** See Table 40C.55, List of PBG Protection Registers.

**Value after reset:** See Table 40C.55, List of PBG Protection Registers.

Note 1. It varies depending on each register. See Section 40C.3.2.1, List of Registers.

Table 40C.58 FSGDxxPROTn Register Contents

Bit Position	Bit Name	Function
31	PROTLOCK	Register Lock 0: Enables FSGDxxPROTn rewrite. 1: Disables FSGDxxPROTn rewrite. When PROTLOCK is set to 1, the value is held until reset is asserted.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3*2,*3 0: Disables access with SPID3. 1: Enables access with SPID3.
7	PROTSPID2	Access with SPID = 2*2,*3 0: Disables access with SPID2. 1: Enables access with SPID2.

Table 40C.58 FSGDxxPROTn Register Contents

Bit Position	Bit Name	Function
6	PROTSPID1	Access with SPID = 1 (CPU1)*2,*3 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0*2,*3 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID  
PROTPEID is a bit list with each bit corresponding to a PEID value.  
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID  
PROTSPID is a bit list with each bit representing an SPID value.  
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. For SPID, refer to **Table 40C.53, Identifiers for Slave Guard**.

**(2) ERRSLVxxCTL — PBGxx Error Control Register**

ERRSLVxxCTL clears the status in the error status register with the PBGxx.

**Access:** ERRSLVxxCTL is write-only register that can be written in 32-bit units.  
ERRSLVxxCTLL is write-only register that can be written in 16-bit units.  
ERRSLVxxCTLLL is write-only register that can be written in 8-bit units.

**Address:** ERRSLVxxCTL: <base\_addr0> + 0<sub>H</sub>  
ERRSLVxxCTLL: <base\_addr0> + 0<sub>H</sub>  
ERRSLVxxCTLLL: <base\_addr0> + 0<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 40C.59 ERRSLVxxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears the overflow flag. 0: Does not clear the overflow flag. 1: Clears the overflow flag.
0	CLRE	Clears the error flag. 0: Does not clear the error flag. 1: Clears the error flag.

Table 40C.60 CLRO and CLRE in ERRSLVxxCTL Register

CLRO	CLRE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

**(3) ERRSLVxxSTAT — PBGxx Error Status Register**

ERRSLVxxSTAT holds the status of the illegal access rejected with the PBGxx.

**Access:** ERRSLVxxSTAT is read-only register that can be read in 32-bit units.  
ERRSLVxxSTATL is read-only register that can be read in 16-bit units.  
ERRSLVxxSTATLL is read-only register that can be read in 8-bit units.

**Address:** ERRSLVxxSTAT: <base\_addr0> + 4<sub>H</sub>  
ERRSLVxxSTATL: <base\_addr0> + 4<sub>H</sub>  
ERRSLVxxSTATLL: <base\_addr0> + 4<sub>H</sub>

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred.  If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBG error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBG protection violation 1: A PBG protection violation occurred.

**(4) ERRSLVxxADDR — PBGxx Error Address Register**

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

**Access:** ERRSLVxxADDR is read-only register that can be read in 32-bit units.

**Address:** ERRSLVxxADDR: <base\_addr0> + 8<sub>H</sub>

**(5) ERRSLVxxTYPE — PBGxx Error Type Register**

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

**Access:** ERRSLVxxTYPE is read-only register that can be read in 32-bit units.

ERRSLVxxTYPEEL is read-only register that can be read in 16-bit units.

9, 8	SPID[1:0]	SPID of the access source from which the PBG protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBG protection violation is generated.
5	Reserved	When read, the value after reset is returned.
4 to 1	Reserved	These bits are read as an undefined value.
0	WRITE	This bit is set to 1 when the access that has generated the PBG protection violation is a write access.

### 40C.3.3 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.

Table 40C.64 Target Registers of PBG for CPU Subsystem

PBGC Group	Group No.	Channel Number	Protection Target Module	Target Register
PBGC0	C0 (PBC group 0 for CPU system)	0	INTC2	ICxxx (xxx=32 to 357) IMRm (m=1 to 11) (described in <b>Section 7BC, Exception/Interrupts of RH850/F1KM</b> )
		1	PDMA0	All registers inside DMA controller (described in <b>Section 8, DMA Controller</b> )
PBGC1	C1 (PBC group 1 for CPU system)	0	Flash memory (Programming function)	BFASELR*1
		1	Code flash ECC control register (VCI)	CFECCCTL_VCI CFERRINT_VCI CFSTCLR_VCI CFOVFSTR_VCI CF1STERSTR_VCI CF1STEADR0_VCI CFSTSTCTL_VCI

## 40C.3.3.2 Details of Registers

## (1) FSGDCxPROTn — PBGCx Protection Register n (x = 0, 1)

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.

"n" in the register names and symbols represents the PBGC channel number.

**Access:** FSGDCxPROTn register can be read or written in 32-bit units.  
FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units.  
FSGDCxPROTnLL, FSGDCxPROTnHL and FSGDCxPROTnHH registers can be read or written in 8-bit units.

**Address:** See Table 40C.65, List of PBGC Protection Registers.

**Value after reset:** See Table 40C.65, List of PBGC Protection Registers.

25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3*2,*3 0: Disables access with SPID3. 1: Enables access with SPID3.
7	PROTSPID2	Access with SPID = 2*2,*3 0: Disables access with SPID2. 1: Enables access with SPID2.
6	PROTSPID1	Access with SPID = 1 (CPU1)*2,*3 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0*2,*3 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40C.67 FSGDCxPROTn Register Contents

Bit Position	Bit Name	Function
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID  
PROTPEID is a bit list with each bit corresponding to a PEID value.  
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID  
PROTSPID is a bit list with each bit representing an SPID value.  
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. For SPID, refer to **Table 40C.53, Identifiers for Slave Guard**.

**(2) ERRSLVCxCTL — PBGCx Error Control Register (x = 0, 1)**

ERRSLVCxCTL clears the status in error status register PBGCx.

**Access:** ERRSLVCxCTL is a write-only register that can be written in 32-bit units.  
ERRSLVCxCTLL is a write-only register that can be written in 16-bit units.  
ERRSLVCxCTLLL is a write-only register that can be written in 8-bit units.

**Address:** ERRSLVCxCTL: FFC4 C800<sub>H</sub> + (100<sub>H</sub> × x)

**(3) ERRSLVCxSTAT — PBGCx Error Status Register (x = 0, 1)**

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

**Access:** ERRSLVCxSTAT is a read-only register that can be read in 32-bit units.  
ERRSLVCxSTATL is a read-only register that can be read in 16-bit units.  
ERRSLVCxSTATLL is a read-only register that can be read in 8-bit units.

If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBGC error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBGC protection violation 1: A PBGC protection violation occurred.

**(4) ERRSLVCxADDR — PBGCx Error Address Register (x = 0, 1)**

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx. The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

**Access:** ERRSLVCxADDR is read-only register that can be read in 32-bit units.

ERRSLVCxTYPE holds the type of the illegal access rejected with the PBGCx. The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

**Access:** ERRSLVCxTYPE is read-only register that can be read in 32-bit units.  
ERRSLVCxTYPEEL is read-only register that can be read in 16-bit units.

**Address:** ERRSLVCxTYPE: FFC4 C80C<sub>H</sub> + (100<sub>H</sub> × x)

## Section 41 Data CRC (DCRA)

This section contains a generic description of the data CRC function A (DCRA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of DCRA.

### 41.1 Features of RH850/F1KH, RH850/F1KM DCRA

#### 41.1.1 Number of Units

This microcontroller has the following number of DCRA units.

Each DCRA unit has single channel interface.

Table 41.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins

Index	Description
n	Throughout this section, the individual data CRC function A units are identified by the index "n"; for example, DCRAnCTL (n = 0 to 3) indicates the DCRAn control register.

### 41.1.2 Register Base Addresses

DCRAn base addresses are listed in the following table.

DCRAn register addresses are given as offsets from the base addresses.

## 41.2 Overview

### 41.2.1 Functional Overview

The data CRC function A can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- 32-bit Ethernet CRC  
( $X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^8+X^7+X^5+X^4+X^2+X+1$ )
- 16-bit CCITT CRC  
( $X^{16}+X^{12}+X^5+1$ )
- CRC of an arbitrary data block length can be generated.
- After initialization of the CRC data register, every write access to the CRC input register generates a new CRC according to the selected polynomial, and the result is stored in the CRC data register.

### 41.2.2 Block Diagram

The following picture shows the block diagram of the data CRC function A.

## 41.3 Registers

### 41.3.1 List of Registers

DCRA registers are listed in the following table.

For details about <DCRAn\_base>, **Section 41.1.2, Register Base Addresses**.

Table 41.9 List of Registers

Module Name	Register Name	Symbol	Address
DCRAn	CRC input register	DCRAnCIN	<DCRAn_base> + 00 <sub>H</sub>
	CRC data register	DCRAnCOUT	<DCRAn_base> + 04 <sub>H</sub>
	CRC control register	DCRAnCTL	<DCRAn_base> + 20 <sub>H</sub>

### 41.3.2 DCRAnCIN — CRC Input Register

This register holds the input data for CRC calculation. The effective bit width used for CRC calculation must be set by DCRAnCTL.DCRAnISZ[1:0].

When data is written to this register, the CRC code is generated.

The CRC calculation is immediately started after the DCRAnCIN register is written. The DCRAnCOUT register must be initialized with the initial starting value, before the first data of the data block is written to DCRAnCIN register.

**Access:** This register can be read or written in 32-bit units

**Address:** <DCRAn\_base>

**Value after reset:** 0000 0000<sub>H</sub>

### 41.3.3 DCRAnCOUT — CRC Data Register

This register stores the result of the CRC code generated by the 32-bit Ethernet polynomial or the 16-bit CCITT polynomial.

**Access:** This register can be read or written in 32-bit units.

**Address:** <DCRAn\_base> + 4<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

#### CAUTION

This register must be initialized by setting the initial start value before the first data of the data block is written to DCRAnCIN register.

### 41.3.4 DCRAnCTL — CRC Control Register

This register controls the CRC generation process.

**Access:** This register can be read or written in 8-bit units.

**Address:** <DCRAn\_base> + 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2, 1	DCRAnSZ[1:0]	Specify the CRC input bit width. 00: 32 bits (DCRAnCIN[31:0]) 01: 16 bits (DCRAnCIN[15:0]) 10: 8 bits (DCRAnCIN[7:0]) 11: Setting prohibited
0	DCRAnPOL	Specifies the CRC generation method. 0: 32-bit Ethernet CRC polynomial generation. The byte order of the DCRAnCIN register is LSB (least significant bit) first. This means that, if the CRC input bit width is 8 bits (DCRAnSZ[1:0] = 10 <sub>B</sub> ), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 0 (LSB) is the start bit of the input data. 1: 16-bit CCITT CRC polynomial generation. The byte order of the DCRAnCIN register is MSB (most significant bit) first. This means that, if the CRC input bit width is 8 bits (DCRAnSZ[1:0] = 10 <sub>B</sub> ), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 7 (MSB) is the start bit of the input data.

#### CAUTION

- If the CRC generation method (DCRAnCTL.DCRAnPOL) is changed, the DCRAnCOUT register must be initialized by setting the initial start value.
- The CRC input bit width (DCRAnCTL.DCRAnSZ[1:0]) must be set according to the data block bit width. Changing the CRC input bit width is not allowed during processing of a data block (a data block consists of N bytes, half-words or one word). After the final CRC result is read from DCRAnCOUT register, the bit width can be changed. In that case, the DCRAnCOUT register must be initialized with the initial start value.

## 41.4 Operation

The data CRC function A generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is forwarded to the data CRC function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet or 16-bit CCITT. The initial starting value must be set at the DCRA<sub>n</sub>CO<sub>U</sub>T register before the first write access to the CRC input register (DCRA<sub>n</sub>CI<sub>N</sub>) is performed.

The flowchart below shows the CRC generating procedure.

Figure 41.2 Flowchart of Data CRC Function A

### NOTES

1. Before writing the first data to DCRA<sub>n</sub>CI<sub>N</sub>, the CRC output register DCRA<sub>n</sub>CO<sub>U</sub>T must be initialized with the initial start value.
2. DCRA<sub>n</sub>CO<sub>U</sub>T must be re-initialized by setting the initial start value when the polynomial is changed by changing DCRA<sub>n</sub>CTL.DCRA<sub>n</sub>POL.
3. Setting example of the initial start values of the respective polynomials  
The following is the example of setting values.

Table 41.13 Setting Example of Initial Start Values (When Read at a Reset)

	Initial Start Value	EXOR Value	DCRA <sub>n</sub> CO <sub>U</sub> T Read Value
16-bit CCITT	XXXX FFFF <sub>H</sub>	XXXX 0000 <sub>H</sub>	XXXX FFFF <sub>H</sub>
32-bit Ethernet	FFFF FFFF <sub>H</sub>	FFFF FFFF <sub>H</sub>	0000 0000 <sub>H</sub>

## Section 43 On-Chip Debug Unit (OCD)

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

The debug functions incorporated in this microcontroller conform to IEEE-ISTO 5001™-2003 Class 3\*1, a Nexus debug interface standard.

**Note 1.** This function is supported only by products with an  $\overline{\text{EVTO}}$  pin.

### CAUTION

The debug functions described in this section are supported by the microcontroller but whether they are usable depends on the debugger. For details on debugging, see the user's manual of the debugger.

## 43.1 Overview of RH850/F1KH, RH850/F1KM OCD

### 43.1.1 Functional Overview

The on-chip debug functions described below are supported by the microcontroller.

#### (1) Debug Interface

This microcontroller supports the following as debug interfaces: Nexus Interface, Low Pin Debug Interface (1 pin) - hereinafter called "LPD (1 pin)", and Low Pin Debug Interface (4 pins) - hereinafter called "LPD (4 pins)".

On-chip debug can be performed using these debug interfaces.

#### NOTE

When LPD (1 pin) is used, LPD is operating by the clock of MainOSC.

#### (2) Debug Monitoring Function

Debug-dedicated monitor program space is mounted and is used during debugging.

The basic debug functions below can be used by running a monitoring program.

- Downloading the user-created program
- Reading and writing the memory and registers
- Running the user-created program starting at any address

#### (3) On-chip Break

A maximum of 12 breakpoints can be specified at any execution address. Of the 12 breakpoints, a maximum of four breakpoints can be specified for any access (access address, access data).

#### (4) Software Break

Software break points can be specified at any execution address.

### (5) Peripheral Break

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for instance upon a breakpoint hit.

### (6) Forced Break

Execution of the user-created program can be interrupted forcibly.

### (7) Forced Reset

This device (microcontroller) can be forcibly reset.

### (8) Real Time RAM Monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.

### (9) Dynamic Memory Modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.

### (10) Timer Function

Using a 32-bit counter, the time for running the user-created program can be measured based on the clock for debug. For the measurement accuracy, see the user's manual of the debugger.

### (11) Mask Function

Masking the following factors is possible.

- All reset sources except for a POC reset and a wakeup reset
- $\overline{\text{MEMC0WAIT}}$  \*1

**Note 1.** This function is supported only by products with MEMC.

### (12) Hot Plug-in Function

Debugging can be started in normal operating mode without the external reset input.

#### NOTE

---

When the hot plug-in function is used in power save mode, the INTDCUTDI interrupt is required to return from power save mode as the wake-up process. About the INTDCUTDI interrupt, see **Table 7A.4, EI Level Maskable Interrupt Sources**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2)** and **Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)** (Channel No.21).

---

### (13) Security Function

To prevent the contents of the flash memory from being read by an unauthorized person, a 128-bit ID code can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code written to the microcontroller, the flash memory cannot be accessed.

For details on how to set the ID code, see the user's manual of the debugger.

### (14) Trace Function

Execution history, data changes, etc. of the user-created program can be obtained.

#### NOTE

The trace function is only available in devices with 8-MB memory in RH850/F1KH-D8.

The trace function is only available in devices with 4-MB memory in RH850/F1KM-S4.

The trace function is not supported in RH850/F1KM-S2. If the trace function is necessary, use RH850/F1KM-S4 device.

The trace function is only available in devices with 1-MB memory in RH850/F1KM-S1.

## 43.2 Peripheral Break Control

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for instance upon a breakpoint hit.

During peripheral break, the peripheral modules operate as follows.

### a. Modules that stop unconditionally regardless of the EPC.SVSTOP setting

Table 43.5 Modules that Stop Unconditionally Regardless of the EPC.SVSTOP Setting (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Module
Window watchdog timer (WDTA)

### CAUTION

RH850/F1KH-D8:

Do not write to the WDTAn when using the individual break function.

In order for the WDTAn of a CPU for which break points have not been configured to receive clear commands, writing to the WDTAn by using SVACCESS is not disabled.

If WDTA0MD or a trigger register is written on the debugger GUI or by some other means, it might cause an unintentional reset.

To prevent this, be sure to configure synchronous breaks for all CPUs. (SVACCESS is enabled by a tool.)

## 43.3 Hot Plug-in in Each Mode

### 43.3.1 RUN Mode

When Hot Plug-in has occurred in RUN mode, it is necessary to maintain the current state.

### 43.3.2 STOP/DeepSTOP Mode

When Hot Plug-in has occurred in STOP/DeepSTOP mode, it is necessary to transfer in RUN mode.

Figure 43.1 Hot Plug-in in STOP/DeepSTOP Mode

### 43.3.3 Cyclic RUN Mode

When Hot Plug-in has occurred in Cyclic RUN mode, it is necessary to transfer in DeepSTOP mode and wakeup to RUN mode.

All regulators in ISO are made operating state in OCD mode.

Then, on the occurrence of interrupt of “DCUTDI Low level Detection interrupt (INTDCUTDI)”, it is necessary for a transfer order to be executed to DeepSTOP mode by user (software) if on-chip debugging is performed.

The sequence of the time when to enter to OCD mode in Cyclic RUN mode is mentioned below.

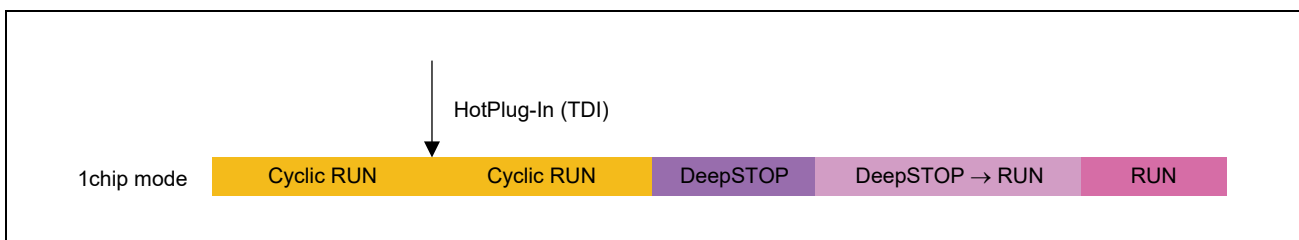

Figure 43.2 Hot Plug-in in Cyclic RUN Mode

### 43.3.4 Cyclic STOP Mode

When Hot Plug-in has occurred in Cyclic STOP mode, it is necessary to transfer in Cyclic RUN mode.

Then, on the occurrence of wakeup factor of DCUTDI, it is necessary for a transfer to be executed as the same case of Cyclic RUN mode.

The sequence of the time when to enter to OCD mode in Cyclic STOP mode is mentioned below.

EPC is set by the debugger. Setting by the user program is prohibited. As for the setting of the debugger, see the user's manual of the debugger.

## 43.5 Cautions on Using On-Chip Debugging

### 43.5.1 Treatment of Devices Used for Debugging

Do not install a device that was used for debugging on a mass-produced product, because the flash memory was rewritten during system debugging and thus the write/erase endurance of the flash memory cannot be guaranteed.

### 43.5.2 Reset Assertion when a Debugger is Connected

If a program in which a reset is asserted at the start of program execution is executed when a debugger is being used, the microcontroller is reset before preparation for communications between the OCD emulator and microcontroller is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. To ensure that the debugger operates properly when debugging a program in which a reset is asserted at the start of program execution, insert a wait between the start of program and reset assertion.

### 43.5.3 Restrictions when HS IntOSC is Used as the Main Clock Source Instead of MainOSC

Need to change the debug interface configuration (OPJTAG) to LPD (4 pins) in advance if E1 Emulator is used for debug.

LPD (1 pin) mode cannot be used.

### 43.5.4 Restrictions when the Writing of `OCD_MODE`\*1 and Reset are Occur at the Same Time, or Restrictions when the Writing of `MTR (DBG_CTRLP)`\*1 and Reset are Occur at the Same Time

When the writing of `OCD_MODE`\*1 and reset are occur at the same time, or the writing of `MTR (DBG_CTRLP)`\*1 and reset are occur at the same time, it is a possibility of terminal hazard.

If the debugger was disconnected, please reconnect the debugger.

**Note 1.** The following registers are accessed from a debugger.  
`OCD_MODE`, `DBG_CTRLP`

### 43.5.5 Transition to DeepSTOP Mode when a Debugger is Connected

When a debugger is in use, when a program to transition to DeepSTOP mode is executed immediately following the start of the program, the microcomputer stops power supply to the Isolated area (ISO area) before preparation for communications between the OCD emulator and microcomputer is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. A wait must be inserted during the period from release from the reset state and transition to DeepSTOP mode by the emulator for correct operation of the debugger when debugging a program to transition to DeepSTOP mode immediately after the program starts.

## Section 44 Flash Memory

This section describes the flash memory mounted on RH850/F1KH, RH850/F1KM.

The first part in this section describes the characteristics of the mounted flash memory and the characteristics specific to RH850/F1KH, RH850/F1KM, such as the memory map, flash memory programming, and ECC.

### 44.1 Features of RH850/F1KH, RH850/F1KM Flash Memory

- Includes code flash memory and data flash memory

The code flash memory can store program codes and data and has the user area and the extended user area.

The data flash memory is used for storing data.

- Method of flash memory programming

Flash memory programming via a serial interface and programming of flash memory by a user program (self-programming) are supported.

- Support for BGO (Back Ground Operation)

RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2:

- The BGO function allows programs to be executed in the code flash memory while the data flash memory is being programmed/erased.
- The BGO function allows programs to be executed in the code flash memory while the code flash memory is being programmed/erased. (There are restrictions of programming/erasing area and reading area combination. See **Table 44.6, Conditions under which Background Operation is Usable (RH850/F1KH-D8)**, **Table 44.7, Conditions under which Background Operation is Usable (RH850/F1KM-S4)** and **Table 44.8, Conditions under which Background Operation is Usable (RH850/F1KM-S2)**).

RH850/F1KM-S1:

- The BGO function allows programs to be executed in the code flash memory while the data flash memory is being programmed/erased.

- Flash memory data security

- Support for security functions to protect against illicit tampering with or reading out of data in the flash memory
- Support for protection functions to protect against erroneous overwriting of the flash memory

- Option byte function

RH850/F1KH-D8, RH850/F1KM-S4:

- Sets the operation after releasing reset for ports, WDTA, CVM, clock divider mode for CPUCLK, FlexRay, Ethernet AVB and  $\overline{\text{RESETOUT}}$  .

RH850/F1KM-S2:

- Sets the operation after releasing reset for ports, WDTA, CVM, clock divider mode for CPUCLK and  $\overline{\text{RESETOUT}}$  .

RH850/F1KM-S1:

- Sets the operation after releasing reset for ports, WDTA, CVM and  $\overline{\text{RESETOUT}}$  .

- Support for the error detection/correction function (ECC) in the code flash memory and data flash memory

Built-in ECC function can detect 2-bit errors and detect/correct 1-bit errors.

- Interrupts can be acknowledged in self-programming mode.

For code flash sizes and data flash sizes of each product, see the following sections.

- **Section 4A.1, Address Space**
- **Section 4B.1, Address Space**
- **Section 4C.1, Address Space**

## 44.2 Structure of Memory

### 44.2.1 Mapping of Code Flash Memory

Figure 44.1, Mapping of the Code Flash Memory (RH850/F1KH-D8), Figure 44.2, Mapping of the Code Flash Memory (RH850/F1KM-S4), Figure 44.3, Mapping of the Code Flash Memory (RH850/F1KM-S2), Figure 44.4, Mapping of the Code Flash Memory (RH850/F1KM-S1), illustrates the mapping of the code flash memory.

The user area of the code flash memory is divided into 8 and 32 KB blocks, which serve as the units of erasure. A single 32 KB block is also incorporated as the extended user area. The user area and extended user area are available as areas for storing the user program.

## 44.4 Functions

### 44.4.1 Functional Overview

The flash memory can be updated via a serial interface by a dedicated flash memory programmer (serial programming), before being mounted on the target system or on a flash adapter system.

Furthermore, security functions to prohibit updating of the user program written in the flash memory are incorporated, and this can prevent tampering by third parties.

Programming by the user program (self-programming) is suited for applications where the target system program may require updating after deployed to the end user. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as external communications, etc., and this allows programming under various conditions. **Table 44.2, Methods of Programming** gives an overview of the methods of programming and the corresponding operating modes.

Table 44.2 Methods of Programming

Method of Programming	Description	Operating Mode
Serial programming	A dedicated flash memory programmer allows on-board programming of the flash memory after the device is mounted on the target system.	Serial programming mode
	A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system.	
Self-programming	The user program that is written to code flash memory in advance by serial programming also allows updating the flash memory. The background operation capability makes it possible to fetch instructions or otherwise read data in code flash memory while the data flash memory is self-programming. For this reason, it is possible to update the data flash memory by executing a program written to the code flash memory. RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2: In addition, when the specific conditions of the code flash memory range for updating and the code flash memory range for reading are satisfied, the background operation can be used. (see <b>Table 44.6, Conditions under which Background Operation is Usable (RH850/F1KH-D8)</b> , <b>Table 44.7, Conditions under which Background Operation is Usable (RH850/F1KM-S4)</b> , <b>Table 44.8, Conditions under which Background Operation is Usable (RH850/F1KM-S2)</b> ). In this case, the code flash memory can be update using the instructions for programming in the code flash memory by self-programming. When background operation cannot be used, instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being updated by self-programming. In such cases, a program for updating must be transferred to the internal RAM in advance and executed.	Normal operating mode User boot mode
	RH850/F1KM-S1: Instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being updated by self-programming. In such cases, a program for updating must be transferred to the local RAM in advance and executed.	

Renesas provides a library for self-programming. For details on this library, see the user's manuals for the code flash library and data flash library of this device.

**Table 44.3, Basic Functions at a Glance** lists the functions of the flash memory. Dedicated flash memory programmer commands enable serial programming, while reading of the flash memory by a library function or the user program enables self-programming.

Table 44.3 Basic Functions at a Glance

Function	Description	Level of Support (✓: Supported, Δ: Conditionally Supported, —: Not Supported)	
		Serial Programming	Self-Programming
Blank checking	This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	✓	Δ (Only data flash is supported)
Block erasure	This is for erasing the contents of a specified block of memory.	✓	✓
Programming	This is for writing to a specified address.	✓	✓
Verification and checksum	Data that are read out from flash memory are compared with data transferred from the flash memory programmer.	✓	— (Reading of data by the user program is possible)
Reading	Data that have been written to the flash memory are read out.	✓	✓
Setting for OTP (one-time programming)	A specified block of code flash memory is set for OTP (OTP can only be set, that is, it is not possible to release a block's OTP setting).	✓	✓
Setting an ID	An ID setting is made for use in controlling the connection of a dedicated flash memory programmer for serial programming, controlling of the on-chip debugger, and programming of the code flash memory by self-programming.  In the initial state of the product at shipment, the ID codes are FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_FF FF <sub>H</sub> .	✓	✓
Security settings	Security settings are for use in serial programming.	✓	Δ (Only when setting is prohibited after being permitted)
Protection settings	Settings for block protection of code flash memory and variable reset vector are provided.	Δ (Setting of the reset vector values for variable reset vector function is not supported.)	✓
Setting of option bytes	Option bytes are set to change them from the initial values.	✓	✓
Clearing the configuration	ID setting, security settings, protection settings, and option byte settings are initialized. Execution of the configuration clear command is prohibited in the following cases: <ul style="list-style-type: none"> <li>• The lock bit is set to one of blocks.</li> <li>• One block of a code flash and a data flash is not blank.</li> <li>• Prohibited by security function (Table 44.4, Summary of Security Functions)</li> </ul>	✓	—

For details on serial programming, see the user's manual of the flash programmer.

For details on self-programming, see the user's manuals for the code flash library and data flash library of this device.

The flash memory supports various security functions.

The OTP setting and authentication of the ID code are security functions for use with serial programming and self-programming.

In serial programming, authentication of the ID code, prohibiting connection of a dedicated flash memory programmer, and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

The security functions supported by the flash memory are listed in **Table 44.4, Summary of Security Functions**.

Table 44.4 Summary of Security Functions

Function	Description
OTP	OTP can be individually set for each block of the user area and the extended user area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self-programming is prohibited. Once set, the OTP setting cannot be released. Furthermore, since execution of the configuration clearing command is prohibited for any area for which OTP has been set, changing a security setting from "prohibited" to "permitted" is not possible.
ID authentication	The result of ID authentication can be used to control the connection of a dedicated flash memory programmer for serial programming. The result of ID authentication can also be used to control enabling of self-programming.
Prohibition of connection of a dedicated flash memory programmer	The connection of a dedicated flash memory programmer for serial programming is prohibited. Since execution of the configuration clearing command is also prohibited when the connection of a dedicated flash memory programmer is prohibited, changing a security setting from "prohibited" to "permitted" is not possible.
Prohibition of block erasure commands	Block erasure commands at the time of serial programming are prohibited. Since execution of the configuration clearing command is also prohibited when block erasure commands are prohibited, changing a security setting from "prohibited" to "permitted" is not possible.
Prohibition of programming commands	Block erasure commands and programming commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.
Prohibition of read commands	Read commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.

The flash memory supports various protection functions. The protection functions supported by the flash memory are listed in **Table 44.5, Summary of Protection Functions**.

Table 44.5 Summary of Protection Functions

Function	Description
Block protection	Lock bit settings can be individually made to enable or disable programming and erasure of each block of the user area and the extended user area of code flash memory. Programming and erasure by self-programming of an area for which the lock bit is set and the lock bit function is enabled are prohibited. Programming or erasure can proceed again when the lock bit function is disabled after having been enabled. When a block of code flash memory is erased, the lock bit for that block is also erased.
Hardware protection	The level on the FLMD0 pin can be set to prohibit programming and erasure of the code flash memory. <ul style="list-style-type: none"> <li>– FLMD0 = 0: Programming prohibited</li> <li>– FLMD0 = 1: Programming permitted</li> </ul>
Variable reset vector	The protection settings include control of the reset vector. As shown in <b>Figure 44.10, Utilizing the Variable Reset Vector Function to Update the Boot Program</b> , after programming of a new boot program while leaving the existing boot program in place, changing the reset vector is a safe way to change to the area holding the new boot program. The areas that can be specified by using the reset vector are the user area and extended user area.

## 44.5 Serial Programming

A dedicated flash memory programmer can be used to handle flash memory in serial programming mode.

### Serial Programming

The microcontroller is mounted on the system board at the time of serial programming. Providing a connector to the board enables handling of the microcontroller by the flash memory programmer to proceed.

#### 44.5.1 Environments for Programming

The recommended environments for handling the flash memory of the microcontroller with data are described below.

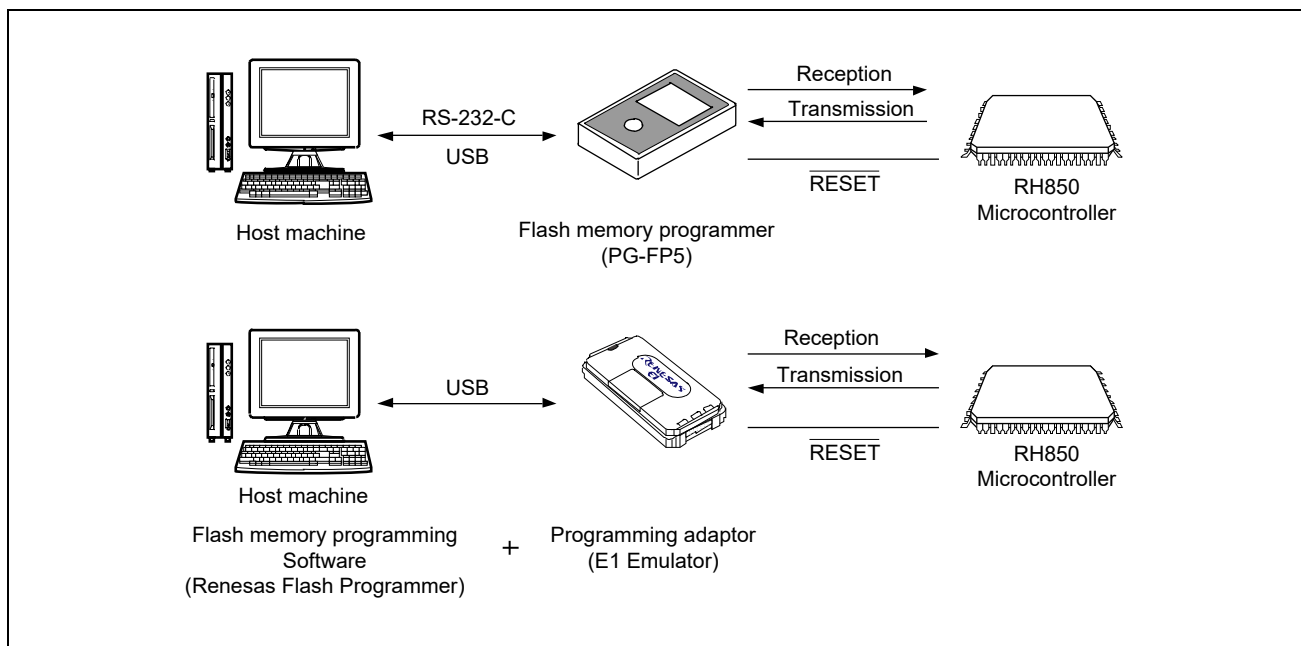

Figure 44.11 Environments for Handling Programs of the Flash Memory

By using the PG-FP5 flash memory programmer or the combination of the Renesas Flash Programmer (software for writing to flash memory) running on the host machine and the E1 emulator as an programming adaptor, the user is easily able to erase, program, and verify the contents of the on-chip memory of flash-memory-equipped microcontrollers from Renesas Electronics.

The PG-FP5 flash memory programmer handles programming from a host machine or programming in stand-alone mode while the Renesas Flash Programmer only handles programming from a host machine.

#### NOTE

For details on the PG-FP5, see *the PG-FP5 Flash Memory Programmer User's Manual*. For details on the Renesas Flash Programmer of flash programming software, see *the Renesas Flash Programmer Flash Programming Software User's Manual*.

## 44.6 Communication Modes

### 44.6.1 Asynchronous Flash Programming Interface — 1-Wire UART

The single-wire asynchronous serial programming interface, 1-wire UART is connected to the flash memory programmer with the following port.

- FPDR (JP0\_0): Receive data input/transmit data output

### 44.6.2 Asynchronous Flash Programming Interface — 2-Wire UART

The double-wire asynchronous serial programming interface, 2-wire UART is connected to the flash memory programmer with the following ports.

- FPDR (JP0\_0): Receive data input
- FPDT (JP0\_1): Transmit data output

### 44.6.3 Synchronous Flash Programming Interface CSI

The synchronous serial programming interface CSI is connected to the flash memory programmer with the following ports.

- FPDR (JP0\_0): Receive data input
- FPDT (JP0\_1): Transmit data output
- FPCK (JP0\_2): Serial clock input

The flash memory programmer outputs the serial data clock SCK, and the microcontroller operates as a slave.

#### NOTE

---

For details on Renesas Flash Programmer, see *the Renesas Flash Programmer Flash Programming Software User's Manual*.

---

#### 44.6.4 Selection of Communication Method

The communication method can be selected by pulse input to the FLMD0 pin (up to 7 pulses) after transition to the flash memory programming mode. The FLMD0 pulse is generated by a dedicated flash memory programmer.

**Figure 44.12, Selection of Communication Method** shows the relation between the number of pulses and communication method.

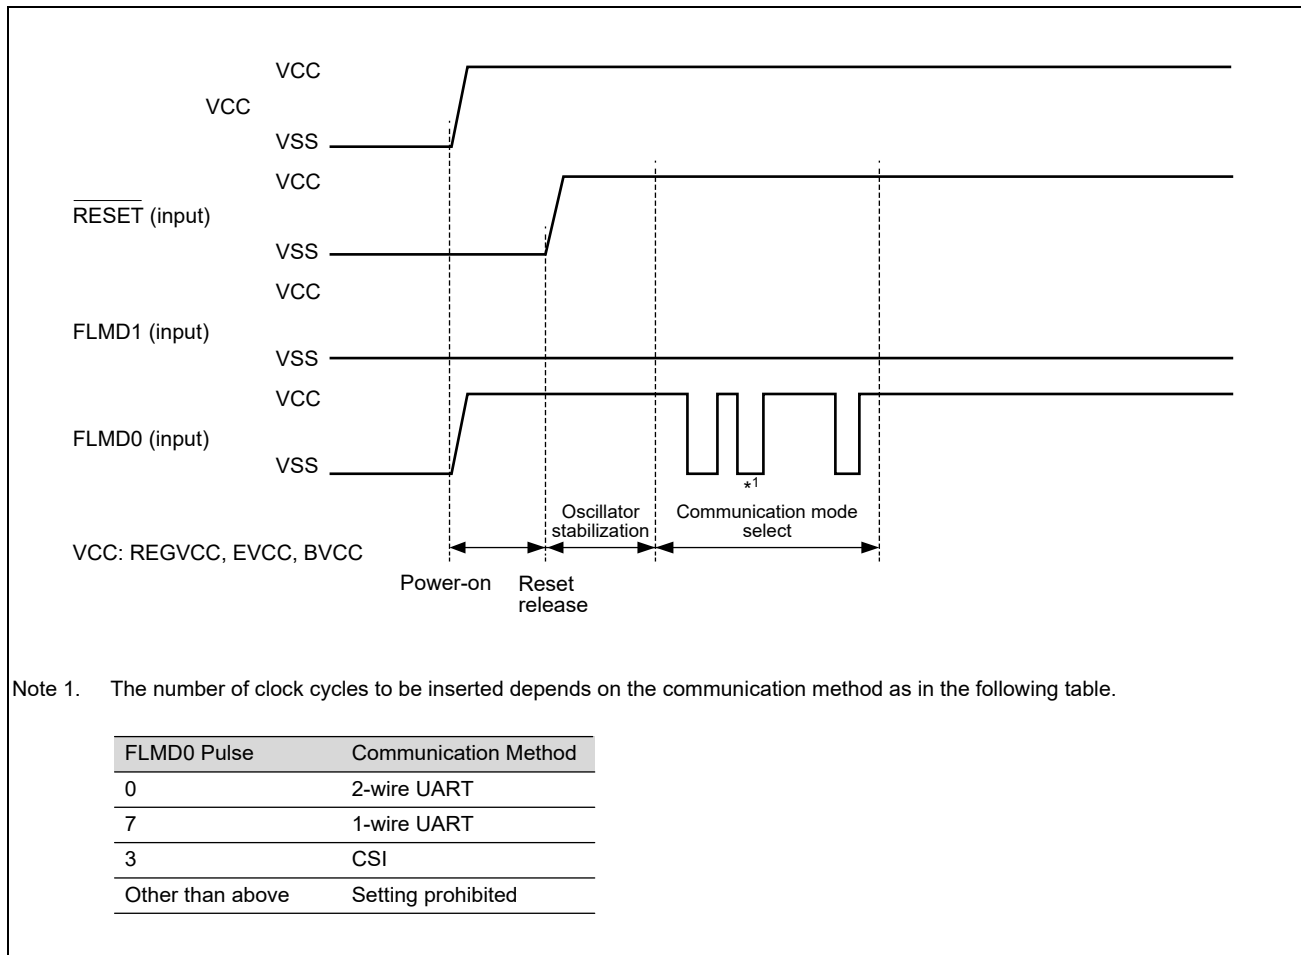

Figure 44.12 Selection of Communication Method

## 44.7 Self-Programming

### 44.7.1 Outline

The RH850/F1KH and RH850/F1KM supports programming of the flash memory by the user program itself. Renesas Electronics provides a code flash library and a data flash library for use with user programs. These libraries can be used for writing to the code flash memory and to the data flash memory.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to internal RAM in advance of the programming operation, and executed from the given destination to perform the programming.

In addition, when the specific conditions of the code flash memory range for updating and the code flash memory range for reading are satisfied, the background operation can be used. (see **Table 44.6, Conditions under which Background Operation is Usable (RH850/F1KH-D8)**, **Table 44.7, Conditions under which Background Operation is Usable (RH850/F1KM-S4)**, **Table 44.8, Conditions under which Background Operation is Usable (RH850/F1KM-S2)**, **Table 44.9, Conditions under which Background Operation is Usable (RH850/F1KM-S1)**). In this case, the code flash memory can be update using the instructions for programming in the code flash memory by self-programming. The programming program can also be copied to the internal RAM in advance and executed to program the code flash memory.

When background operation cannot be used, the programming program can be copied to the internal RAM in advance and executed to program the code flash memory.

Figure 44.13 Schematic View of Self-Programming

For details on the self-programming of flash memory, see the user's manuals for the code flash and data flash libraries for this device.

## 44.7.2 Background Operation

Background operations can be used when the combination of the flash memory for writing and the flash memory for reading is any of those listed below.

### 44.7.3 Enabling Self-Programming

The self-programming function can be activated in normal operating mode and user boot mode.

Erase and programming of the code flash memory by the self-programming function is enabled by making the FLMD0 pin high level.

This prevents unnecessary overwriting of the program if the device operates incorrectly.

The FLMD0 pin is made high level by using one of the following methods.

- The FLMD0 pin is externally pulled up.
- The FLMD0 pin is pulled up by the FLMDCNT register.

The outline of the FLMDCNT register is described in **Section 44.7.3.1, FLMDCNT Register**.

FLMD	FLMDCNT register	FLMDCNT	FFA0 0000 <sub>H</sub>

### 44.7.3.1 FLMDCNT Register

This register specifies the internal pull-up or pull-down of the FLMD0 pin.

The correct write sequence using the FLMDPCMD register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

## 44.8 Reading Flash Memory

### 44.8.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in normal mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception.

### 44.8.2 Reading Data Flash Memory

Configure the number of read cycles in the EEPRDCYCL register prior to reading data from data flash memory in normal mode. Once this register is properly configured, data can be read by simply accessing addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programmed again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

### 44.8.2.1 EEPRDCYCL — Data Flash Wait Cycle Control Register

This register is used to specify the number of wait cycles to be inserted when reading the data in the data flash.

Set the number of wait cycles to be inserted in the clock cycle when reading the data flash according to the operating clock frequency of the CPU ( $f_{CPUCLK}$ ).

**Access:** This register can be read or written in 8-bit units.

**Address:** FFC5 9810<sub>H</sub>

**Value after reset:** 0F<sub>H</sub>

**NOTES**

---

1. The read access time to the data flash is calculated by the number of wait cycles.  
RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2:  
Read access time to the data flash =  $\{20 + (\text{Number of wait cycles} \times 8)\} / \text{CPU operating frequency}$   
(CKDIVMD = 1, including products of CPU frequency 160 MHz max.)  
Read access time to the data flash =  $\{12 + (\text{Number of wait cycles} \times 4)\} / \text{CPU operating frequency}$   
(CKDIVMD = 0)  
RH850/F1KM-S1:  
Read access time to the data flash =  $\{17 + (\text{Number of wait cycles} \times 4)\} / \text{CPU operating frequency}$   
However, the time may be changed depending on the combination of instructions before and after the execution.
  2. ✓ indicates the number of wait cycles that can be set.

### 44.8.2.2 PRDNAME<sub>n</sub> — Product Name Storage Register (n = 1 to 3)

This register stores the product name. The product part name is stored in 16-byte ASCII code, and PRDNAME1, PRDNAME2, and PRDNAME3 correspond to the fourth to first bytes, eighth to fifth bytes, and twelfth to ninth bytes of the product part name respectively.

**Access:** These registers are read-only registers that can be read in 32-bit units.

**Address:** PRDNAME1: FFCD 00D0<sub>H</sub>  
 PRDNAME2: FFCD 00D4<sub>H</sub>  
 PRDNAME3: FFCD 00D8<sub>H</sub>

**Value after reset:** See Table 44.15, List of Registers Related to Product Information (Products of CPU frequency 240 MHz max.) ## 44.9 Option Bytes

The option bytes of the flash memory are an expansion area and hold data specified by the user for a variety of purposes. Initial settings for peripheral modules and so on as specified by the option bytes become effective on release from the reset state. **Table 44.20, Value of Shipping (RH850/F1KH-D8), Table 44.21, Value of Shipping (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)** shows the value of shipping.

### 44.9.1 Option Byte Setting

Be sure to set the option byte area that corresponds to the optional functions listed below, before writing a program to the flash memory.

The optional functions specified by the option bytes are as follows.

- Function of port group JP0
- Activation code method of WDTA2\*<sup>3</sup>
- Start mode of WDTA2\*<sup>3</sup>
- Enabling or disabling WDTA2\*<sup>3</sup>
- Activation code method of WDTA1
- Start mode of WDTA1
- Enabling or disabling WDTA1
- Activation code method of WDTA0
- Start mode of WDTA0
- Enabling or disabling WDTA0
- Initial value of the overflow interval time for WDTA2\*<sup>3</sup>, WDTA1 and WDTA0
- Enabling or disabling of  $\overline{\text{RESETOUT}}$
- Enabling the high voltage monitor
- Enabling the low voltage monitor
- Clock divider mode for CPUCLK\*<sup>1</sup>
- Enabling or disabling FlexRay\*<sup>1.\*2</sup>
- Enabling or disabling Ethernet AVB 0\*<sup>1.\*2</sup>
- Enabling or disabling Ethernet AVB 1\*<sup>3</sup>
- Enabling or disabling PE2\*<sup>3</sup>
- Enabling or disabling PE2 Boot\*<sup>3</sup>

**Note 1.** This function is not supported in RH850/F1KM-S1.

**Note 2.** This function is not supported in RH850/F1KM-S2

**Note 3.** This function is supported in RH850/F1KH-D8.

## 44.10 Usage Notes

### (1) Reading areas where Programming or Erasure was Interrupted

When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid the reading out of undefined data, which might cause a malfunction, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.

### (2) Reading the Code Flash Memory that has been Erased but Not yet been Programmed Again

Note that reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.

### (3) Prohibition of Additional Writing

Writing to a given area two or more times is not possible. When overwriting data in an area of flash memory after writing to the area has been completed, erase the area first.

### (4) Resets During Programming and Erasure

In the case of the external reset during programming and erasure, wait for at least the minimum value of  $\overline{\text{RESET}}$  input low level width once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.

### (5) Allocation of Vectors for Interrupts and Other Exceptions During Programming and Erasure

Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.

### (6) Abnormal Termination of Programming and Erasure

Even if programming/erasure ends abnormally due to the assertion of a reset by the  $\overline{\text{RESET}}$  pin, the programming/erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming/erasure ends abnormally, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to ensure that the corresponding area is completely erased before using.

If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled (locked). In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state (the area is not locked).

**(7) Items Prohibited During Programming, Erasure and Blank check.**

Do not perform the following operations during programming, erasure, and blank check.

- Set the operating voltage from the power supply outside the allowed range.

RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2:

- Change the frequency of the peripheral clock.

RH850/F1KM-S1:

- Change of all clock register described in **Section 12C, Clock Controller**.

The following steps have to be applied during writing and/or erasing:

- (a) Please do not select the HS IntOSC and EMCLK as clock source when writing and/or erasing the code/data flash. This is also applicable when the HS IntOSC is set as PLL1 source clock.
- (b) Please disable CLMA0, and CLMA3. (Set CLMA0CTL0.CLMA0CLME = 0, CLMA3CTL0.CLMA3CLME = 0)
- (c) Please disable the LPS (DPEN = 0, ADEN = 0) when writing and/or erasing the code/data flash.

If (a) to (c) above are difficult to apply, please contact your local sales representative.

**(8) Erasure of all flash memory before clearing the configuration**

Erase the user area of code flash and all of the data area of data flash before clearing the configuration.

**(9) Restriction on Serial Programming when HS IntOSC is Used**

RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2:

- 1-wire/2-wire UART mode cannot be used.
- The E1 emulator cannot be used.

RH850/F1KM-S1:

Please do not select the HS IntOSC and EMCLK as clock source during serial programming mode.

When the HS IntOSC and EMCLK are set, there is a possibility that a failure occurs during flash write or flash erase. In case the flash write and flash erase process are finished successfully, the write and erase can be guaranteed.

## Section 45 RAM

This section describes the RAM mounted on RH850/F1KH, RH850/F1KM.

### 45.1 Features of RH850/F1KH, RH850/F1KM RAM

- RH850/F1KH and RH850/F1KM includes the following RAMs:

- Local RAM (LRAM)

The local RAM is accessible at high speed. Values in the local RAM are not retained in DeepSTOP mode.

- Global RAM (GRAM)

RH850/F1KH-D8:

The global RAM is used for serving as a source or destination for DMA transfer. The global RAM is divided into banks A and B and parallel access to both banks is possible. Values in global RAM are not retained in DeepSTOP mode.

RH850/F1KM-S4, RH850/F1KM-S2:

The global RAM is used for serving as a source or destination for DMA transfer. The global RAM is divided into banks A and B and parallel access to both banks is possible. Values in global RAM are not retained in DeepSTOP mode.

RH850/F1KM-S1:

There is no global RAM in RH850/F1KM-S1

- Retention RAM (RRAM)

RH850/F1KH-D8:

The retention RAM is a part of the global RAM (Bank B). Values in the retention RAM are retained in DeepSTOP mode.

In addition, even if the power-supply voltage (REG0VCC / REG1VCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (VVLVI).

RH850/F1KM-S4, RH850/F1KM-S2:

The retention RAM is a part of the global RAM (Bank B). Values in the retention RAM are retained in DeepSTOP mode.

In addition, even if the power-supply voltage (REGVCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (VVLVI).

RH850/F1KM-S1:

The retention RAM is a part of the local RAM and is also accessible at high speed. Values in the retention RAM are retained in DeepSTOP mode.

In addition, even if the power-supply voltage (REGVCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (VVLVI).

Access time for each RAM is shown in the table below.

#### NOTE

There is possibility that number of access clock of above table is changed depending on the combination before and after instructions.

When RAM access is misaligned, these number is increased.

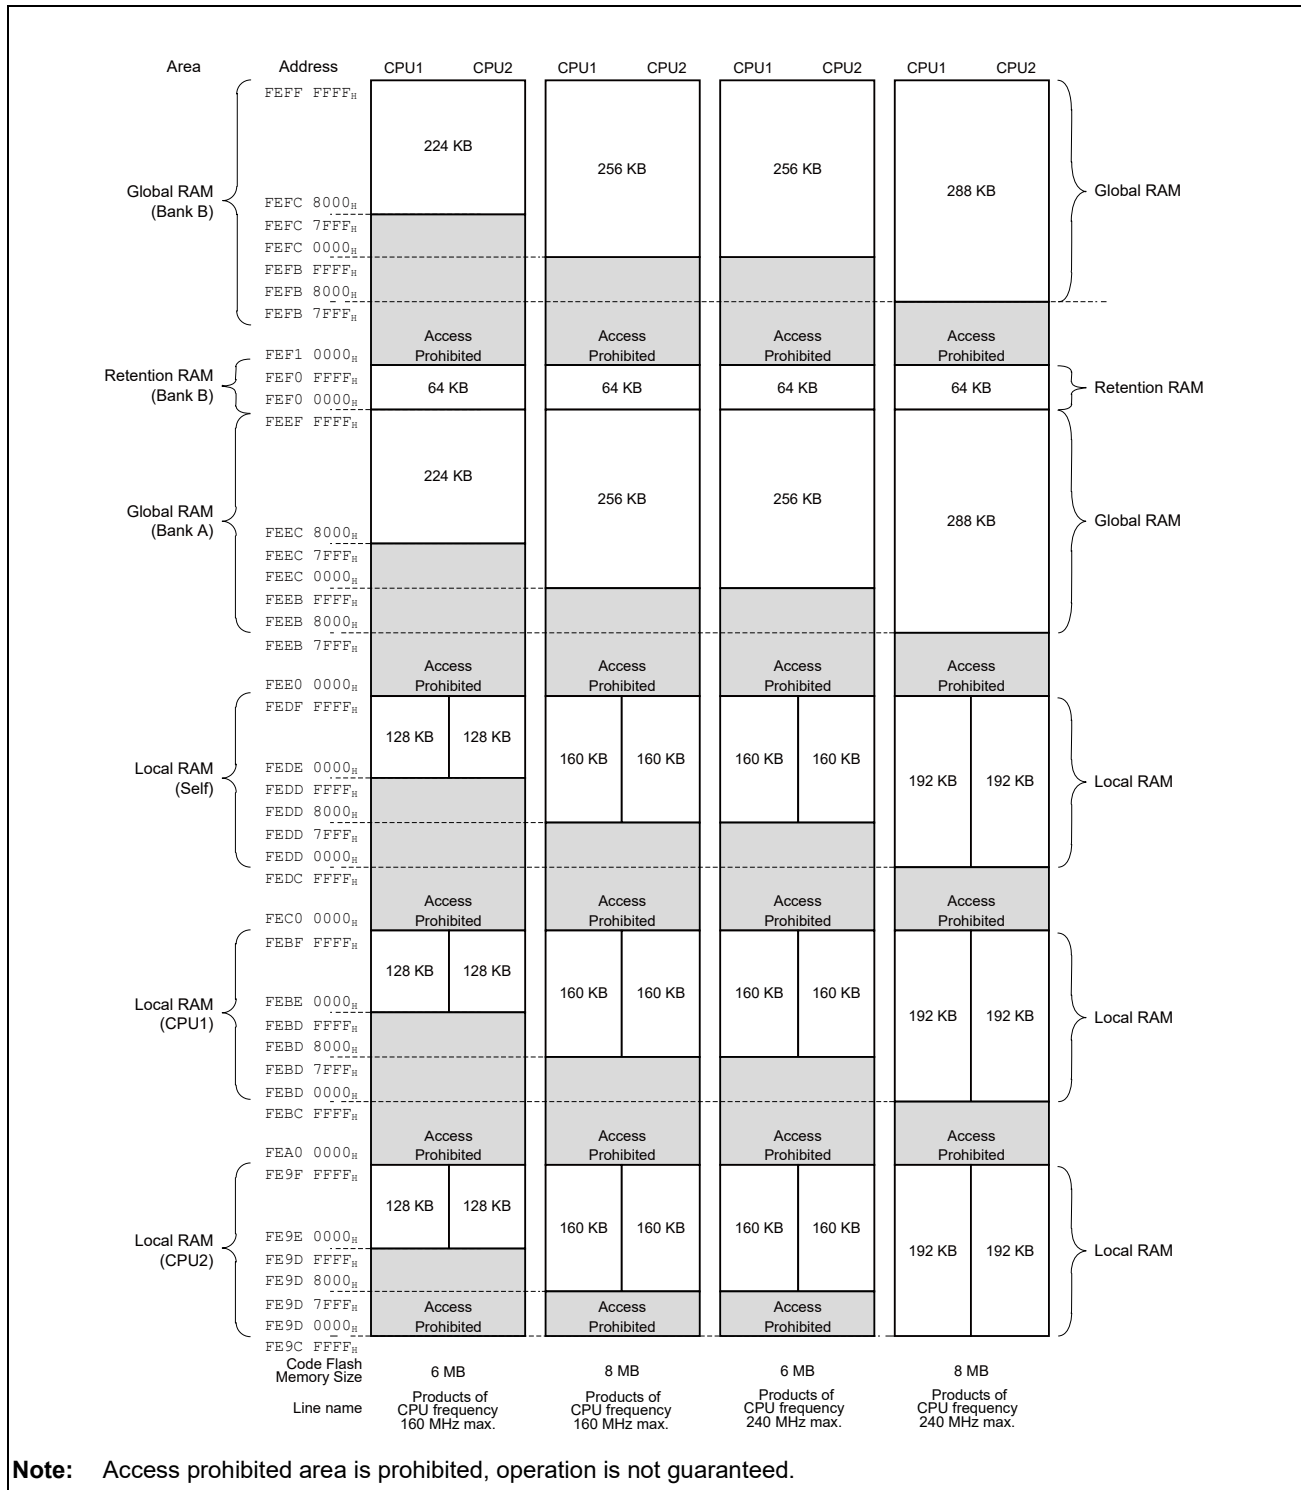

- Error detection/correction function (ECC) in the local RAM, global RAM and retention RAM

The ECC function is included, which can detect 2-bit errors and detect/correct 1-bit errors. For details, see

**Section 40A, Functional Safety of RH850/F1KH-D8, Section 40B, Functional Safety of RH850/F1KM-S4, RH850/F1KM-S2 and Section 40C, Functional Safety of RH850/F1KM-S1.**

### 45.3.6 Functional Overview

This function is memory ZERO fill and verify check for GRAM area (including RRAM)

GRZF cannot arbitrate access from other bus-master. So, when GRZF is in busy status, do not access the same bank on GRAM that GRZF is accessing. If other bus-master accesses to the same bank that GRZF is accessing, the operation of GRZF is terminated and INTGRZF occurs with error status. Also, the access of other bus master will not be fulfilled (Writing is ignored, and read data cannot be guaranteed).

Other bus-master can access to the bank that GRZF is not accessing.

## 45.3.7 Registers

### 45.3.7.1 List of Registers

GRZF registers are listed in the following table.

For details about <GRZF\_base>, see **Section 45.3.2, Register Base Address**.

Table 45.16 List of Registers

Module Name	Register Name	Symbol	Address
GRZF	GRZF control register	GRZFCTL	<GRZF_base> + 00 <sub>H</sub>

	GRZF fill size setting register	GRZFSZ	<GRZF_base> + 0C <sub>H</sub>

### 45.3.7.2 GRZFCTL — GRZF Control Register

This register is used to configure various operation settings of the global RAM Zero Fill.

**Access:** This register is a write-only register that can be written in 32-bit units in RH850/F1KM-S4 and RH850/F1KM-S2.

This register can be read or written in 32-bit units in RH850/F1KH-D8.

### 45.3.7.3 GRZFSTS — GRZF Status Register

This register is the status of the memory ZERO fill performed.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <GRZF\_base> + 04<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

#### NOTE

The value of progress address indicated by the PSTS is not guaranteed, if stopped by the forcibly stop or contention access of other bus master. Please restart without changing value of the start address and size.

#### 45.3.7.4 GRZFSA — GRZF Start Address Setting Register

This register is used to set start address of the memory ZERO fill performed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <GRZF\_base> + 08<sub>H</sub>

**Value after reset:** FEE0 0000<sub>H</sub>

#### NOTE

This register can be rewritten only when the Stop state. Writing in operation will be ignored.

### 45.3.7.5 GRZFSZ — GRZF Fill Size Setting Register

This register is used to set fill size of the memory ZERO fill performed

**Access:** This register can be read or written in 32-bit units.

**Address:** <GRZF\_base> + 0C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

19 to 0	SIZE[19:0]	Memory fill size setting (bits 9 to 0 is fixed to 0). Size the actual initialization will be the SIZE + 1 KB.

#### CAUTIONS

1. This register can be rewritten only when the Stop state. Writing in operation will be ignored.
2. The size setting across BankA and BankB is prohibited.

### 45.3.8 Operation

This module effects only global RAM bank A and global RAM bank B. The RRAM area belong to global RAM bank B. So this module also effects the RRAM area.

Global RAM Zero Fill (GRZF) consists of the following function:

- FILL function
  - Write zero to GRAM
- VERI function
  - Write zero to GRAM and verify the data GRAM have been zero

The transition state from Busy state to Stop state always generate the Interrupt request.

The cause for transition from Busy state to Stop state are shown below:

- Success in FILL function to all the target banks.
- Conflict occur when the other master accesses the target bank while running.
- Verify error occur when the RAM area is not zero at VERI function.
- Forcibly stop by GRZFCTL.OPE[7:0] = 0000 0000<sub>B</sub>.

#### 45.3.8.1 Procedure for FILL and VERI Function

The procedure for FILL and VERI function is shown below.

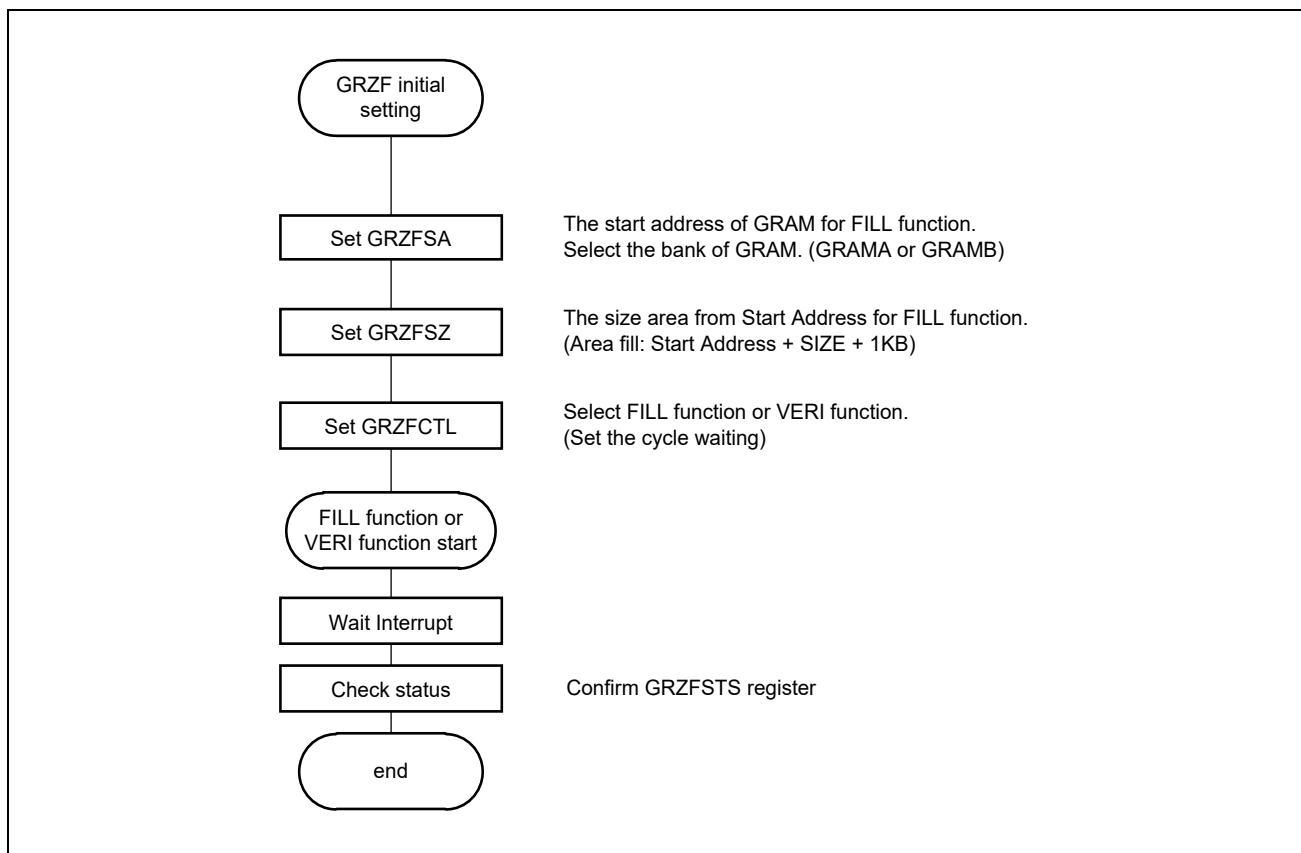

Figure 45.6 FILL and VERI Flow

### 45.3.8.2 Interrupt Sources

GRZF can generate the following interrupt requests:

- The interrupt occurs when transition from Busy to Stop in both FILL function and VERI function.
- When an interrupt occurred, the source of the interrupt is identified by checking GRZFSTS.SSTS. This status flag holds the value until the next startup (accordingly, does not change when the GRZF module transition from Busy to Stop).

## 45.4 Usage Notes

- Before accessing the global, local or retention RAM with ECC error detection and correction enabled, initialize the RAM by setting the access size to the largest bit length.
- Accessing the RAM before initializing it may lead to the detection of ECC errors. ECC errors may be detected if initialization is not handled in the maximum unit of access, for example, when 32-bit word RAM is accessed in 8- or 16-bit units.

The following notes apply to the GRZF. See **Figure 40A.2, Block Diagram of Global RAM ECC** and **Figure 40B.2, Block Diagram of Global RAM ECC**.

- When GRZF accesses to GRAM, GRZF does not use ECC encoder or decoder. When there is any differences between the read value and the write value in 39 bits including GRZF 32 bits (all 0) and ECC code 7 bits, a verify error is occurred in GRZF. The verify error can be checked by the GRZFSTS.SSTS[1:0].
- Global RAM Guard (GRG) cannot guard the access from GRZF to GRAM.

## Section 46 Boundary Scan

This section contains a generic description of boundary scan.

The RH850/F1KH, RH850/F1KM has a JTAG interface and provides a boundary scan function.

### 46.1 Overview

Boundary scan is a test method defined in the IEEE standard 1149.1 that is used to test the connection between the devices mounted on the printed-circuit board. The boundary scan of the RH850/F1KH, RH850/F1KM conforms to IEEE Std 1149.1-2001.

### 46.2 Features of RH850/F1KH, RH850/F1KM Boundary Scan

- Five control signals (DCUTCK, DCUTDI, DCUTDO, DCUTMS, and  $\overline{\text{DCUTRST}}$  )
- TAP controller
- Instruction register
- Bypass register
- Boundary scan register

The JTAG interface has four instructions.

- BYPASS  
Test mode conforming to the IEEE 1149.1
- EXTEST  
Test mode conforming to the IEEE 1149.1
- SAMPLE/PRELOAD  
Test mode conforming to the IEEE 1149.1
- IDCODE  
Test mode conforming to the IEEE 1149.1

**Figure 46.1, Block Diagram of JTAG Interface** shows a block diagram of the JTAG interface.

Figure 46.1 Block Diagram of JTAG Interface

### 46.3 External Input/Output Pins

There are five JTAG control signals: DCUTCK, DCUTDI, DCUTMS, DCUTDO, and  $\overline{\text{DCUTRST}}$ .

**Table 46.1, Pin Configuration** shows the pin configuration.

Table 46.1 Pin Configuration

Pin Name	Description
DCUTCK	Serial data input/output clock pin Data is input to DCUTDI and is output from DCUTDO in synchronization with this clock signal.
DCUTMS	Mode select input pin Changing the level of this signal in synchronization with DCUTCK changes the state of the TAP controller. For the protocol, see <b>Figure 46.2, TAP Controller State Transition Diagram</b> .
$\overline{\text{DCUTRST}}$	Reset input pin A low-level input of this signal resets the JTAG interface. This signal is accepted asynchronously with DCUTCK.
DCUTDI	Serial data input pin Data is input in synchronization with DCUTCK and sent to the JTAG interface.
DCUTDO	Serial data output pin Data to be read from the JTAG interface is output in synchronization with DCUTCK.

## 46.4 Registers

The JTAG interface has the following registers. None of the registers can be accessed by the CPU.

- SDIR: Instruction register
- SDID: ID register
- SDBPR: Bypass register
- SDBSR: Boundary scan register

Table 46.2 Register Configuration

Register Name	Symbol	Access Size	Value After Reset*1
Instruction register	SDIR	8	55 <sub>H</sub>
ID register	SDID	32	See Table 46.5, ID Register Codes (RH850/F1KH-D8), Table 46.6, ID Register Codes (RH850/F1KM-S4), Table 46.7, ID Register Codes (RH850/F1KM-S2), Table 46.8, ID Register Codes (RH850/F1KM-S1).
Bypass register	SDBPR	1	Undefined
Boundary scan register	SDBSR	—	Undefined

Note 1. Registers are initialized when  $\overline{\text{DCUTRST}}$  pin is 0 or when TAP is in the Test-Logic-Reset state.

Instructions can be serially transferred from the serial data input pin (DCUTDI) and input to the instruction register (SDIR). The bypass register (SDBPR) is a 1-bit register, to which DCUTDI and DCUTDO are connected in BYPASS mode. The boundary scan register (SDBSR) is connected to DCUTDI and DCUTDO in SAMPLE/PRELOAD mode and EXTEST mode. The ID register (SDID) is a 32-bit register, from which the fixed code is output via DCUTDO in IDCODE mode.

**Table 46.3, Serial Transfer Types** shows the serial transfer types possible with the JTAG interface registers.

Table 46.3 Serial Transfer Types

Register	Serial Input	Serial Output
SDIR	Possible	Impossible*1
SDBPR	Possible	Possible
SDBSR	Possible	Possible
SDID	Impossible	Possible

### 46.4.1 Instruction Register (SDIR)

The instruction register (SDIR) is an 8-bit register that holds a boundary scan instruction. SDIR is initialized by a low-level input of DCUTRST or in the TAP Test-Logic-Reset state. Operation is not guaranteed if a reserved instruction is set in this register.

Other than above								Reserved

### 46.4.2 ID Register (SDID)

The ID register (SDID) is a 32-bit register with a device specific ID.

SDID can be read from the JTAG interface when the IDCODE instruction is set, but cannot be accessed from the CPU.

For the read values, see **Table 46.5, ID Register Codes (RH850/F1KH-D8)**, **Table 46.6, ID Register Codes (RH850/F1KM-S4)**, **Table 46.7, ID Register Codes (RH850/F1KM-S2)**, **Table 46.8, ID Register Codes (RH850/F1KM-S1)** and **Table 46.2, Register Configuration**.

### 46.4.3 Bypass Register (SDBPR)

The bypass register (SDBPR) is a 1-bit register. When SDIR is set to BYPASS mode, SDBPR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBPR is not initialized by a power-on reset or by a low-level input of  $\overline{\text{DCUTRST}}$ .

### 46.4.4 Boundary Scan Register (SDBSR)

The boundary scan register (SDBSR) is a shift register for controlling the external I/O pins. When SDIR is set to SAMPLE/PRELOAD or EXTEST mode, SDBSR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBSR is not initialized by a power-on reset or a low-level input of  $\overline{\text{DCUTRST}}$ .

## 46.5 Operation

### 46.5.1 TAP Controller

Figure 46.2, TAP Controller State Transition Diagram shows the state transition of the TAP controller. The transition condition is the DCUTMS value at the rising edge of DCUTCK.

Figure 46.2 TAP Controller State Transition Diagram

#### NOTE

The DCUTDI value is sampled at the rising edge of DCUTCK and is shifted at the falling edge. DCUTDO is in the high-impedance state in the states other than Shift-DR and Shift-IR. A low-level input of  $\overline{\text{DCUTRST}}$  causes transition to Test-Logic-Reset state asynchronously with DCUTCK.

## 46.5.2 Supported Instructions

### 46.5.2.1 BYPASS

The BYPASS instruction is a required standard instruction to operate the bypass register. This instruction shortens the shift path to achieve high-speed serial data transfer of other devices on the printed-circuit board. During execution of this instruction, the test circuit has no effect on the system circuit.

### 46.5.2.2 SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input the value to the boundary scan register from the internal circuits of this device; to output the value from the scan path; and to load data onto the scan path. During execution of this instruction, the level of the input pin of this device is sent to the internal circuits as is, and the value of the internal circuits is output to the outside via the output pin as is. Executing this instruction has no effect on the system circuit of this device.

The SAMPLE operation allows taking in the snapshots of the value to be transferred to the internal circuits from the input pin or the value to be transferred to the output pin from the internal circuits to the boundary scan register and allows reading the snapshots from the scan path. Snapshots can be taken in without preventing the normal operation of this device.

The PRELOAD operation allows setting the initial value to the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. If the EXTEST instruction is executed without PRELOAD operation, an undefined value is output from the output pin until the first scan sequence is completed (transfer to the output latch) because the parallel output latch value is always output to the output pin by the EXTEST instruction.

### 46.5.2.3 EXTEST

The EXTEST instruction is used to test the external circuits when this device is mounted on the printed-circuit board. When this instruction is executed, the output pin is used to output the test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed-circuit board; whereas the input pin is used to take in the test result from the printed-circuit board to the boundary scan register. When the EXTEST instruction is executed N times for testing, the test data for the Nth execution is scanned in at the (N - 1)th scan-out.

If the data is loaded onto the boundary scan register of the output pin in the Capture-DR state of this instruction, it is not used for testing the external circuits (replaced through shift operation).

### 46.5.2.4 IDCODE

The IDCODE instruction sets the JTAG interface pins to IDCODE mode, which is defined by the JTAG standard. When the JTAG interface is initialized (by a low-level input of DCUTRST or placing TAP in the Test-Logic-Reset state), IDCODE mode is set.

### 46.5.3 Pins Subject to Boundary Scan

All pins, excluding pins such as external clock input pins or power supply pins, are subject to boundary scan.

The pins which are not subjected to boundary scan are listed in **Table 46.9, Pins not Subject to Boundary Scan (RH850/F1KH-D8)** and **Table 46.10, Pins not Subject to Boundary Scan (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)**.

Note 1. Only available for 272/233/176/144-pin versions.

The following signals are only sampled in boundary scan mode.

Table 46.11 Pins Subject to Boundary Scan (Sampling Only)

Function	Pin Name
Reset	$\overline{\text{RESET}}$
Mode setting	FLMD0

The following pins are shared by the analog buffer. Accordingly, boundary scan only applies to general I/O pins.

Table 46.12 Pins Subject to Boundary Scan (Only General I/O Pins)

Function	Pin Name
ADCA0 input	P8_0-12, P9_0-4, AP0_0-15
ADCA1 input	P18_0-15, P19_0-3, AP1_0-15

#### NOTE

In boundary scan mode, the level of the following pins must be fixed:

P10\_1 = Low, P10\_2 = High, and P10\_8 = High

## 46.6 Usage Notes

1. Once an instruction is set, it is not modified until another instruction is issued. To issue the same instruction twice in a row, insert an instruction that has no effect on chip operation (such as BYPASS) between the instructions.
2. To start the system in boundary scan mode, de-assert  $\overline{\text{DCUTRST}}$  while  $\overline{\text{RESET}}$  is high. Also be sure to set DCUTMS to high before de-asserting  $\overline{\text{DCUTRST}}$  and ensure that DCUTMS remains high for 600 ns + five DCUTCK clock cycles after de-asserting  $\overline{\text{DCUTRST}}$ .
3. For the maximum clock frequency that can be input to DCUTCK, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.
4. If serial transfer is performed exceeding the number of bits of the register connected between DCUTDI and DCUTDO, the data that is input from DCUTDI is output from DCUTDO as is.
5. If the serial transfer sequence is corrupted, be sure to assert  $\overline{\text{DCUTRST}}$ . In this case, transfer starts again from the beginning regardless of the point of transfer corruption.
6. Data is output via DCUTDO at the falling edge of DCUTCK.
7. To facilitate debugging, route  $\overline{\text{DCUTRST}}$  on the board in such a way that patterns can be easily cut.

### 47A.1.2.2 AC Characteristic Measurement Condition

#### (1) AC Test Input Measurement Points

#### (2) AC Test Output Measurement Points

#### (3) Load Conditions

#### CAUTION

If the load capacitance exceeds 30pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30pF.

## 47A.2 Absolute Maximum Ratings

### CAUTIONS

1. Do not directly connect outputs (or input/outputs) to each other, power supply and ground.
2. Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.
3. When designing an external circuit ensure that the connections don't conflict with the port state of this device.

Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.

## 47A.2.3 Port Current

**Definition of the condition:**

- Per pin: Output current of one GPIO
- Per side: Total output current of all GPIO pins on one side of one IOVxx
- Total: Total output current of both sides of one IOVxx

**Note:**

- GPIO: General-purpose I/O pin (JP0, P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, P23, P24, AP0, AP1)
- IOVxx: Power supply pin for I/O pins (EVCC/EVSS, BVCC/BVSS, A0VREF/A0VSS, A1VREF/A1VSS)

Note 1. For clock specification of peripherals, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2.**

Note 2. This frequency depends on the internal oscillator (LS IntOSC).

Note 3. "VPOC" means POC (power-on clear) detection voltage (TYP. 2.85 V). For detail, see **Section 47A.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics.**

In addition, the guaranteed operation in DC characteristic.

And AC characteristic is guaranteed when more than 3.0 V.

When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V.

Note 5. Divided by 2 on MEMC internal.

		$f_{EX} = 24 \text{ MHz}$	16			ns
X1 clock Input period jitter			-0.3		0.3	ns

Note 1. The following four external clock input frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

Note 2. X2 should be open and its parasitic capacitance should be less than 5 pF.

**(3) SubOSC**

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
SubOSC frequency	$f_{SOSC}$	Crystal	30	32.768	38	kHz
SubOSC current consumption	$I_{SOSC}$	After stabilization		1.5*2	4*2	μA

Lock time* <sup>2</sup>	$t_{\text{LCK1}}$		104	112.3	122.1	μs

Note 1. This is reference value.

Note 2. Lock time is time until being set ("1") in PLL1S.PLL1CLKACT bit after PLL1E.PLL1ENTRG bit is written "1".

Note 3. The HS IntOSC has a frequency deviation. When the HSIntOSC is used the frequency deviation should be considered for the customer application as it affects peripheral functions (e.g. TAUx, ADCAn, etc.).

## 47A.4 DC Characteristics

### 47A.4.1 Capacitance

**Condition:** REG0VCC = REG1VCC = EVCC = BVCC = A0VREF = A1VREF = AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, Ta = 25°C

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input capacitance	CI* <sup>1</sup>	f = 1 MHz			10	pF
Input/output capacitance	CIO* <sup>2</sup>	0 V for non measurement pins			10	pF

Note 1. CI: Capacitance between the input pin and ground

Note 2. CIO: Capacitance between the input/output pin and ground

## 47A.4.2 Pin Characteristics

**Condition:** Some of the conditions mentioned in this chapter can be selected by software and described in the hardware user's manual.

Note 1. Pull-down resistor for ADC diagnostic purpose. Control via ADC self-diagnostic register.

Note 2. Supports Cload: 100 pF

Note 3. Supports Cload: 50 pF

Note 4. Pull-down resistors for ADC diagnostic and internal pull-down purposes. For ADC diagnostic, control via ADC self-diagnostic register. For internal pull-down, control via PD register.

Note 5. TTL is selected for Boundary scan mode or Nexus in normal operating mode.

Note 6. Only available for 324-pin devices.

Note 1. The condition of "TYP." shows the specification with the following conditions. Also, the value is just for reference only.

- Tj = 25°C
- REG0VCC = EVCC = BVCC = A0VREF = A1VREF = 5.0 V
- REG1VCC = 3.3 V
- AWOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V

Note 2. Operating condition of each peripheral function is shown in the table of next page.

**Caution:** It must be ensured that the junction temperature in the Ta range remains below  $T_j \leq 150^\circ\text{C}$  and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

## CAUTIONS

- The DC injection current (Total) must satisfy the specifications of the injection current per pin.
- In case of an injected current condition for Pga0 and Pga1, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

Note 1. When MainOSC, HS IntOSC, LS IntOSC or SubOSC is selected as source clock with the condition of N = 1, the characteristics of output signal depends on the selected source clock. It is recommended to use output signal after evaluation on an actual environment.

Note 2. "N" is the value of "Clock divisor N" defined by FOUTDIV register.

Note 3. The selection of N = 3 is prohibited when slow mode is used.

### 47A.5.12 RIIC Timing

**Condition:** REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC, BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = -40 to (depend on the product) °C

Table 47A.17 RIIC Timing (Normal Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIICnSCL clock period	$f_{CLK}$				100	kHz
Bus free time (between stop/start condition)	$t_{BUF}$		4.7			μs
Hold time*1	$t_{HD: STA}$		4.0			μs
RIICnSCL clock low-level width	$t_{LOW}$		4.7			μs
RIICnSCL clock high-level time	$t_{HIGH}$		4.0			μs
Setup time for start/restart condition	$t_{SU: STA}$		4.7			μs
Data hold time	$t_{HD: DAT}$	CBUS compatible master	5.0			μs
		I <sup>2</sup> C mode	0*2			μs
Data setup time	$t_{SU: DAT}$		250			ns
Stop condition setup time	$t_{SU: STO}$		4.0			μs
Capacitance load of each bus line	Cb				400	pF

**Remark:** n = 0, 1

**Note:** If the system does not extend the RIICnSCL signal low hold time ( $t_{LOW}$ ), only the maximum data hold time ( $t_{HD: DAT}$ ) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Table 47A.18 RIIC Timing (Fast Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit

Pulse width with spike suppressed by input filter	$t_{SP}$		0		50	ns
Capacitance load of each bus line	$C_b$				400	pF

**Remark:**  $n = 0, 1$

**Note:** If the system does not extend the RIICnSCL signal low hold time ( $t_{LOW}$ ), only the maximum data hold time ( $t_{HD: DAT}$ ) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

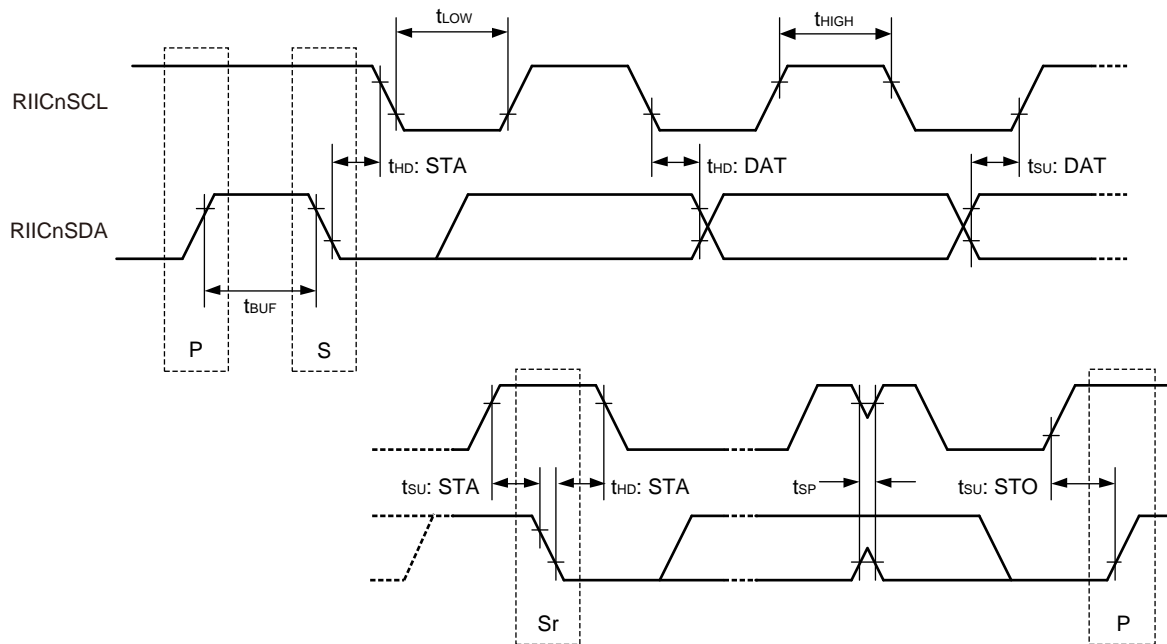

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at  $V_{IH}$  min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Note 3. The fast mode I<sup>2</sup>C bus can be used in normal mode I<sup>2</sup>C bus system. In this case, set the fast mode I<sup>2</sup>C bus so that it meets the following conditions.

- If the system does not extend the RIICnSCL signal's low state hold time:  $t_{SU: DAT} \geq 250$  ns

- If the system extends the RIICnSCL signal's low state hold time:

Transmit the following data bit to the RIICnSDA line prior to releasing the RIICnSCL line (1250 ns: Normal mode I<sup>2</sup>C bus specification).

**Note:** Conversion accuracy when ADCA0ImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.

Note 1. This does not include quantization error.

Note 2.  $3.0 + 1.3 \times$  (the number of used T&H)

Note 3. Include the oscillation accuracy of HS IntOSC.

Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as "sampling time + successive approximation time".

**CAUTION**

When an external digital pulse is applied to AP0, AP1, P8, P9, P18, and P19 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse.

The same behavior may apply when the digital buffer is used as an output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

## 47A.7 Flash Programming Characteristics

### 47A.7.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

**Condition:** REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC,  
 BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,

 CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = -40 to (depend on the product) °C,  
 CL = 30 pF

Table 47A.21 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	$f_{PCLK}^{*3}$		5 <sup>*4</sup>		30	MHz
Number of rewrites <sup>*1</sup>	CWRT	Data retention of 20 years <sup>*2</sup>	1000			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 1000), the device can be erased “n” times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3.  $f_{PCLK} = 1/8 f_{CPUCLK\_H}$ : System operating frequency for internal flash.

Note 4. Only for program/erase operation.

**Note 1.** “VPOC” means POC (power-on clear) detection voltage. For more detail, see **Section 47B.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

**Note 2.** Regarding operation temperature of each product, see **Section 1B.3, RH850/F1KM Product Lineup**.

### 47B.1.2.2 AC Characteristic Measurement Condition

#### (1) AC Test Input Measurement Points

#### (2) AC Test Output Measurement Points

#### (3) Load Conditions

#### CAUTION

If the load capacitance exceeds 30pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30pF.

## 47B.2 Absolute Maximum Ratings

### CAUTIONS

1. Do not directly connect outputs (or input/outputs) to each other, power supply and ground.
2. Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.
3. When designing an external circuit ensure that the connections don't conflict with the port state of this device.

### 47B.2.1 Supply Voltages

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
System supply voltage	REGVCC		-0.5		6.5	V
	AWOVSS		-0.5		0.5	V
	ISOVSS		-0.5		0.5	V
Port supply voltage	EVCC		-0.5		6.5	V
	BVCC		-0.5		6.5	V
	EVSS		-0.5		0.5	V
	BVSS		-0.5		0.5	V
A/D-converter supply voltage	A0VREF		-0.5		6.5	V
	A1VREF		-0.5		6.5	V
	A0VSS		-0.5		0.5	V
	A1VSS		-0.5		0.5	V

### 47B.2.2 Port Voltages

Item	Pin Group*1	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	PgR	VI		-0.5		REGVCC + 0.5 (Do not exceed 6.5 V)	V
	PgE			-0.5		EVCC + 0.5 (Do not exceed 6.5 V)	V
	PgB			-0.5		BVCC + 0.5 (Do not exceed 6.5 V)	V
	PgA0			-0.5		A0VREF + 0.5 (Do not exceed 6.5 V)	V
	PgA1			-0.5		A1VREF + 0.5 (Do not exceed 6.5 V)	V

Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.

## 47B.2.3 Port Current

**Definition of the condition:**

- Per pin: Output current of one GPIO
- Per side: Total output current of all GPIO pins on one side of one IOVxx
- Total: Total output current of both sides of one IOVxx

**Note:**

- GPIO: General-purpose I/O pin (JP0, P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, AP0, AP1)
- IOVxx: Power supply pin for I/O pins (EVCC/EVSS, BVCC/BVSS, A0VREF/A0VSS, A1VREF/A1VSS)

		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 11		4.0*2		mA/V

Note 1. Oscillator stabilization time is time until being set ("1") in MOSCS.MOSCCLKACT bit after MOSCE.MOSCENTRG bit is written "1", and depends on the setting value of MOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

Note 2. This is reference value.

Note 3. The following four crystal/ceramic resonator frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

**(2) MainOSC (In Case of External Clock Input to X1)**

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
X1 clock Input frequency*1	$f_{EX}$		8		24	MHz

		$f_{EX} = 20 MHz$	20			ns
		$f_{EX} = 24 MHz$	16			ns
X1 clock Input period jitter			-0.3		0.3	ns

Note 1. The following four external clock input frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

Note 2. X2 should be open and its parasitic capacitance should be less than 5 pF.

**(3) SubOSC**

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
SubOSC frequency	$f_{SOSC}$	Crystal	30	32.768	38	kHz
SubOSC current consumption	$I_{SOSC}$	After stabilization		$1.5^{*2}$	$4^{*2}$	$\mu A$
SubOSC DC operating point	$V_{SOSCD COP}$			$0.65^{*2}$		V
SubOSC oscillation stabilization time	$t_{SSTB}$			*1		s

Note 1. Oscillator stabilization time is time until being set ("1") in SOSCS.SOSCCLKACT bit after SOSCE.SOSCENTRG bit is written "1", and depends on the setting value of SOSST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

Note 2. This is reference value.

**CAUTION**

The oscillation stabilization time differs according the matching with the external resonator circuit. It is recommended to determine the oscillation stabilization time by an oscillator matching test.

**NOTE**

Recommended oscillator circuit is shown below.

HS IntOSC current consumption	$I_{RH}$	After stabilization			170*1	$\mu$ A
HS IntOSC oscillation stabilization time	$t_{RHSTB}$				54.4	$\mu$ s

Note 1. This is reference value.

Note 2. The HS IntOSC frequency may not meet the specification range (8.00 MHz  $\pm$ 0.08 MHz after user trimming @ trimming temp) in the while writing/erasing the code/data flash.

Note 3. The HS IntOSC frequency may not meet the specification range in the Cyclic STOP/Cyclic RUN mode.

## 47B.3.4 PLL Characteristics

### 47B.3.4.1 PLL0 (for CPU, with SSCG) Characteristics

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product) °C, CL = 30 pF

- Note 1. Pull-down resistor for ADC diagnostic purpose. Control via ADC self-diagnostic register.
- Note 2. Supports Clod: 100 pF
- Note 3. Supports Clod: 50 pF
- Note 4. Pull-down resistors for ADC diagnostic and internal pull-down purposes. For ADC diagnostic, control via ADC self-diagnostic register. For internal pull-down, control via PD register.
- Note 5. TTL is selected for Boundary scan mode or Nexus in normal operating mode.
- Note 6. Only available for 176-pin, 233-pin and 272-pin devices.

Note 1. The condition of "TYP." shows the specification with the following conditions. Also, the value is just for reference only.

- Tj = 25°C
- REGVCC = EVCC = BVCC = A0VREF = A1VREF = 5.0 V
- AWOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V

Note 2. Operating condition of each peripheral function is shown in the table of next page.

**Caution:** It must be ensured that the junction temperature in the Ta range remains below  $T_j \leq 150^\circ\text{C}$  and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

## CAUTIONS

- The DC injection current (Total) must satisfy the specifications of the injection current per pin.
- In case of an injected current condition for PgA0 and PgA1, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

**(2) 100-Pin Version (RH850/F1KM-S4, RH850/F1KM-S2)**

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I <sub>INJPM</sub>	PgE	Per pin		10	mA
			Total		60	mA
		PgE'	Per pin		10	mA
			Total		60	mA
		PgA0	Per pin		10	mA
			Total		60	mA
Negative overload current VIN < VSS	I <sub>INJNM</sub>	PgE	Per pin		-10	mA
			Total		-60	mA
		PgE'	Per pin		-10	mA
			Total		-60	mA
		PgA0	Per pin		-10	mA
			Total		-60	mA

**CAUTIONS**

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgA0, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

## 47B.5 AC Characteristics

### 47B.5.1 RESET Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ input low level width*1	$t_{\text{WRSL}}$	Except power on	600			ns
$\overline{\text{RESET}}$ pulse rejection*2	$t_{\text{WRSRJ}}$		100			ns

Note 1.  $\overline{\text{RESET}}$  input width is needed to ensure that the internal reset signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

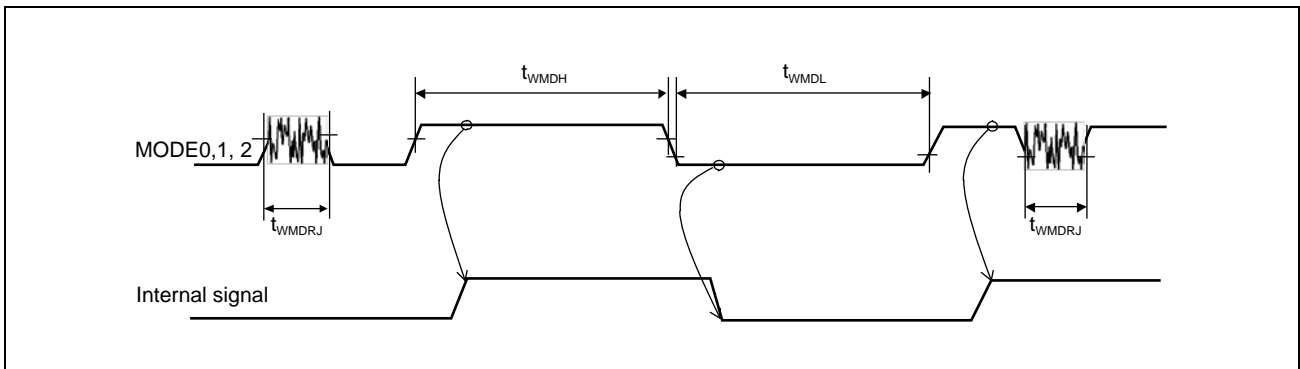

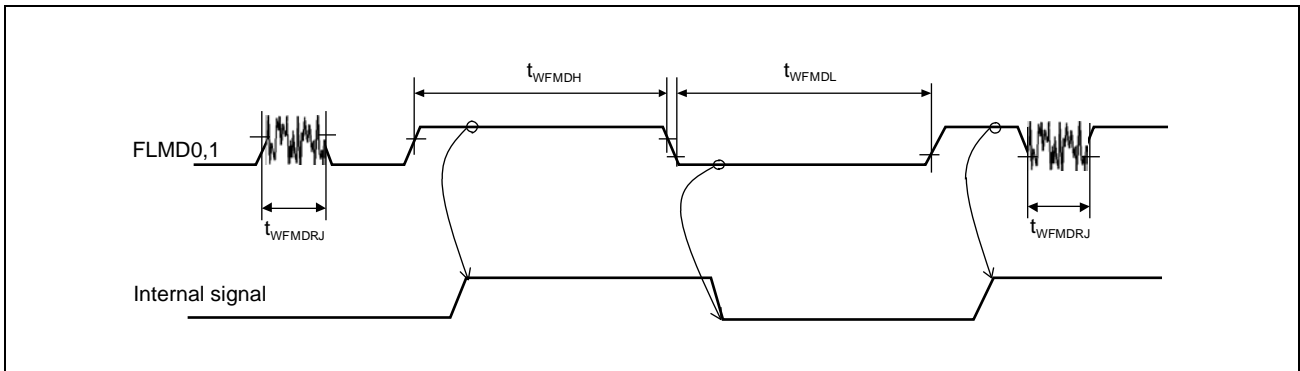

## 47B.5.2 Mode Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0, 1 input high/low level width*1	$t_{WFMDH}/$ $t_{WFMDL}$		600			ns
FLMD0, 1 pulse rejection*2	$t_{WFMDRJ}$		100			ns

		Level detection mode (EMCLK is operated by LS IntOSC)	24			$\mu$ s
INTPn pulse rejection*2	$t_{WITRJ}$		100			ns

Note 1. NMI and INTPn input width is needed to ensure that the internal interrupt signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

#### 47B.5.4 Low Power Sampler (DPIN input) Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
DPINn input delay time (vs SELDP2-0)	$t_{DSDDI}$				150	ns

**Note:** n = 7 to 0

### 47B.5.5 CSCXFOUT Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product) °C, CL = 30 pF

<Output driver strength>

CSCXFOUT: Slow or fast mode (refer to the condition in the following table)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CSCXFOUT output cycle	$t_{FOUT}$	Slow mode	100 (max. 10 MHz)			ns
		Fast mode	41.6 (max. 24 MHz)			ns
CSCXFOUT high level width	$t_{WKHFO}$	Slow mode	N: 1* <sup>1</sup> or even value* <sup>2</sup>	$t_{FOUT} / 2 - 37$		ns
			N: Odd value (N $\geq$ 5)* <sup>2,*3</sup>	$t_{FOUT} \times (N+1) / 2N - 37$		ns
		Fast mode	N: 1* <sup>1</sup> or even value* <sup>2</sup>	$t_{FOUT} / 2 - 10$		ns
			N: Odd value (N $\geq$ 3)* <sup>2</sup>	$t_{FOUT} \times (N+1) / 2N - 10$		ns
CSCXFOUT low level width	$t_{WKLFO}$	Slow mode	N: 1* <sup>1</sup> or even value* <sup>2</sup>	$t_{FOUT} / 2 - 37$		ns
			N: Odd value (N $\geq$ 5)* <sup>2,*3</sup>	$t_{FOUT} \times (N-1) / 2N - 37$		ns
		Fast mode	N: 1* <sup>1</sup> or even value* <sup>2</sup>	$t_{FOUT} / 2 - 10$		ns
			N: Odd value (N $\geq$ 3)* <sup>2</sup>	$t_{FOUT} \times (N-1) / 2N - 10$		ns
CSCXFOUT rise/fall time	$t_{KRFO} / t_{KFFO}$	Slow mode			37	ns
		Fast mode			10	ns

Note 1. When MainOSC, HS IntOSC, LS IntOSC or SubOSC is selected as source clock with the condition of N=1, the characteristics of output signal depends on the selected source clock. It is recommended to use output signal after evaluation on an actual environment.

Note 2. "N" is the value of "Clock divisor N" defined by FOUTDIV register.

Note 3. The selection of N = 3 is prohibited when slow mode is used.

- Note 1. ASW means the number of address setup wait for multiplex bus.
- Note 2. AHW means the number of address hold wait for multiplex bus.
- Note 3. DPW means the number of programmable data wait for multiplex bus.  
DEW means the number of external data wait for multiplex bus.  
"w" means the sum of DPW and DEW.
- Note 4.  $t_{CPUCLK}$ : CPU clock period.
- Note 5. DHW means the number of data hold wait for multiplex bus.
- Note 6. Address means MEMC0AD15-0, MEMC0A23-16, MEMC0CS3-0, and MEMC0BEN1-0 .  
272-pin product supports 24-bit address. 233/176-pin products support 23-bit address.

**Note:** If the system does not extend the RIICnSCL signal low hold time ( $t_{LOW}$ ), only the maximum data hold time ( $t_{HD: DAT}$ ) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Stop condition setup time	$t_{SU: STO}$		0.6			$\mu$ s
Pulse width with spike suppressed by input filter	$t_{SP}$		0		50	ns
Capacitance load of each bus line	$C_b$				400	pF

**Remark:**  $n = 0, 1$

**Note:** If the system does not extend the RIICnSCL signal low hold time ( $t_{LOW}$ ), only the maximum data hold time ( $t_{HD: DAT}$ ) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

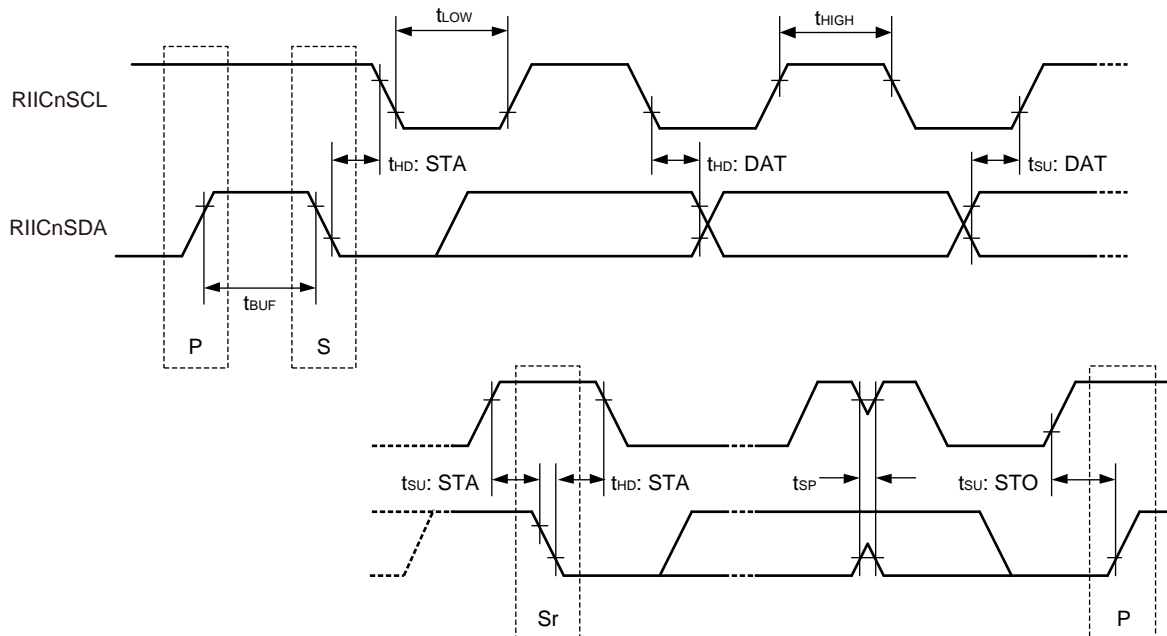

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at  $V_{IH}$  min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Note 3. The fast mode I<sup>2</sup>C bus can be used in normal mode I<sup>2</sup>C bus system. In this case, set the fast mode I<sup>2</sup>C bus so that it meets the following conditions.

- If the system does not extend the RIICnSCL signal's low state hold time:  $t_{SU: DAT} \geq 250$  ns

- If the system extends the RIICnSCL signal's low state hold time:

Transmit the following data bit to the RIICnSDA line prior to releasing the RIICnSCL line (1250 ns: Normal mode I<sup>2</sup>C bus specification).

**Note:** Conversion accuracy when ADCA0ImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.

Note 1. This does not include quantization error.

Note 2.  $3.0 + 1.3 \times$  (the number of used T&H)

Note 3. Include the oscillation accuracy of HS IntOSC.

Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as "sampling time + successive approximation time".

**CAUTION**

When an external digital pulse is applied to AP0, AP1, P8, P9, P18, and P19 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse.

The same behavior may apply when the digital buffer is used as an output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

## 47B.7 Flash Programming Characteristics

### 47B.7.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product) °C, CL = 30 pF

Table 47B.22 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	$f_{PCLK}^{*3}$		5 <sup>*4</sup>		30	MHz
Number of rewrites <sup>*1</sup>	CWRT	Data retention of 20 years <sup>*2</sup>	1000			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 1000), the device can be erased “n” times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3.  $f_{PCLK} = 1/8 f_{CPUCLK\_H}$ : System operating frequency for internal flash.

Note 4. Only for program/erase operation.

## 47C.1.2 General Measurement Conditions

### 47C.1.2.1 Common Conditions

- Power supply
  - REGVCC = EVCC = VPOC\*<sup>1</sup> to 5.5 V
  - A0VREF = 3.0 V to 5.5 V
  - AWOVSS = ISOVSS = EVSS = A0VSS = 0 V
- Capacitance of the internal regulator
  - CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%
  - CISOVCL: 0.1  $\mu$ F  $\pm$ 30%
- Operating temperature
  - T<sub>j</sub> = -40 to +130°C @ R7F7016xx3AFP\*<sup>2</sup>
  - T<sub>j</sub> = -40 to +150°C @ R7F7016xx4AFP\*<sup>2</sup>

xx = 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95
- Load conditions
  - CL = 30 pF

**Note 1.** “VPOC” means POC (power-on clear) detection voltage. For more detail, see **Section 47C.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

**Note 2.** Regarding operation temperature of each product, see **Section 1C.3, RH850/F1KM Product Lineup**.

### 47C.1.2.2 AC Characteristic Measurement Condition

#### (1) AC Test Input Measurement Points

#### (2) AC Test Output Measurement Points

#### (3) Load Conditions

#### CAUTION

If the load capacitance exceeds 30 pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30 pF.

## 47C.2 Absolute Maximum Ratings

### CAUTIONS

1. Do not directly connect outputs (or input/outputs) to each other, power supply and ground.
2. Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.
3. When designing an external circuit ensure that the connections don't conflict with the port state of this device.

### 47C.2.1 Supply Voltages

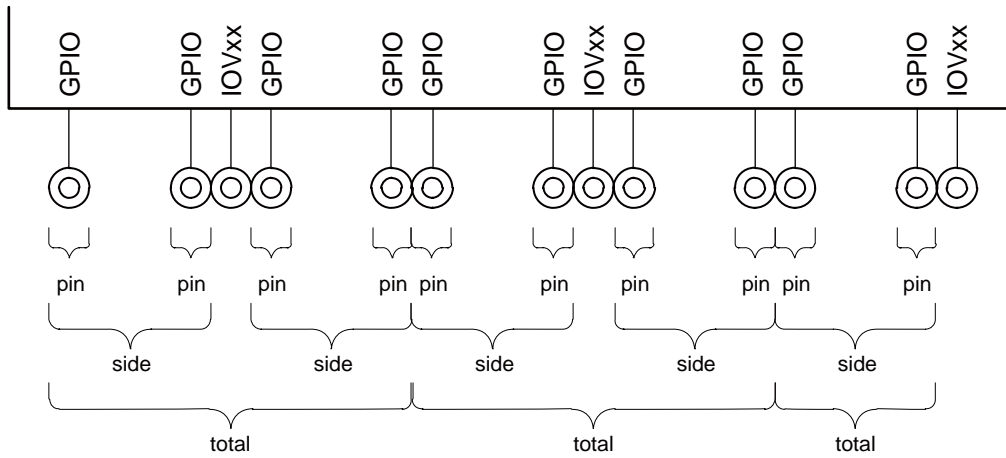

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
System supply voltage	REGVCC		-0.5		6.5	V
	AWOVSS		-0.5		0.5	V
	ISOVSS		-0.5		0.5	V
Port supply voltage	EVCC		-0.5		6.5	V
	EVSS		-0.5		0.5	V
A/D-converter supply voltage	A0VREF		-0.5		6.5	V
	A0VSS		-0.5		0.5	V

### 47C.2.2 Port Voltages

Item	Pin Group*1	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	PgR	VI		-0.5		REGVCC + 0.5 (Do not exceed 6.5 V)	V
	PgE			-0.5		EVCC + 0.5 (Do not exceed 6.5 V)	V
	PgA0			-0.5		A0VREF + 0.5 (Do not exceed 6.5 V)	V

Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.

## 47C.2.3 Port Current

**Definition of the condition:**

- Per pin: Output current of one GPIO
- Per side: Total output current of all GPIO pins on one side of one IOVxx
- Total: Total output current of both sides of one IOVxx

**Note:**

- GPIO: General-purpose I/O pin (JP0, P0, P8, P9, P10, P11, AP0)
- IOVxx: Power supply pin for I/O pins (EVCC/EVSS, A0VREF/A0VSS)

Power supply	REGVCC	REGVCC = EVCC		VPOC*3	5.5	V
	EVCC					
	A0VREF		3.0		5.5	V
Normal operation voltage	AWOVCL		1.1	1.25	1.35	V
	ISOVCL					
Limited operation voltage*4	AWOVCL		1.35		1.43	V
	ISOVCL					

Note 1. For clock specification of peripherals, see **Section 12C, Clock Controller of RH850/F1KM-S1**.

Note 2. This frequency depends on the internal oscillator (LS IntOSC).

Note 3. "VPOC" means POC (power-on clear) detection voltage (TYP. 2.85 V). For detail, see **Section 47C.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

In addition, the guaranteed operation in DC characteristic.

And AC characteristic is guaranteed when more than 3.0 V.

When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V.

### 47C.3.2 Oscillator Characteristics

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS 0 V,  
CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%,  
Tj = -40 to (depend on the product) °C

#### (1) MainOSC (In Case of Using a Crystal/Ceramic)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MainOSC frequency*3	f <sub>MOSC</sub>		8		24	MHz
MainOSC current consumption	I <sub>MOSC</sub>	After stabilization		1.9*2	2.3*2	mA
MainOSC oscillation start point	V <sub>MOSCSP</sub>		VPOC			V
MainOSC oscillation operating point	V <sub>MOSCOF</sub>			0.5 × REGVCC*2		V
MainOSC oscillation amplitude	V <sub>MOSCAAMP</sub>		0.4 × REGVCC - 0.2*2			V
MainOSC oscillation stabilization time	t <sub>MSTB</sub>			2*1, *2		ms
MainOSC transconductance	g <sub>m_MOSC</sub>	MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 00		11.1*2		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 01		10.6*2		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 10		9.3*2		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 11		7.8*2		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 00		8.6*2		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 01		7.8*2		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 10		6.1*2		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 11		4.0*2		mA/V

Note 1. Oscillator stabilization time is time until being set ("1") in MOSCS.MOSCCLKACT bit after MOSCE.MOSCENTRG bit is written "1", and depends on the setting value of MOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

Note 2. This is reference value.

Note 3. The following four crystal/ceramic resonator frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

**(2) MainOSC (In Case of External Clock Input to X1)**

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
X1 clock Input frequency*1	$f_{EX}$		8		24	MHz
X1 clock Input cycle time	$t_{EXCYC}$		41.7		125	ns
X1 High level Input voltage	$V_{IH}$		$0.7 \times REGVCC$		$REGVCC + 0.5$	V
		@Flash Programing Interface*2	$0.8 \times REGVCC$		$REGVCC + 0.5$	V
X1 Low level Input voltage	$V_{IL}$		-0.5		$0.3 \times REGVCC$	V
		@Flash Programing Interface*2	-0.5		$0.2 \times REGVCC$	V
X1 Input leakage current	$I_{LIH}$	$V_I = REGVCC$			0.5	$\mu A$
	$I_{LIL}$	$V_I = 0 V$			-0.5	$\mu A$
X1 clock Input low-level pulse width	$t_{EXL}$	$f_{EX} = 8 MHz$	58			ns
		$f_{EX} = 16 MHz$	26			ns
		$f_{EX} = 20 MHz$	20			ns
		$f_{EX} = 24 MHz$	16			ns
X1 clock Input high-level pulse width	$t_{EXH}$	$f_{EX} = 8 MHz$	58			ns
		$f_{EX} = 16 MHz$	26			ns
		$f_{EX} = 20 MHz$	20			ns
		$f_{EX} = 24 MHz$	16			ns
X1 clock Input period jitter			-0.3		0.3	ns

Note 1. The following four external clock input frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

Note 2. X2 should be open and its parasitic capacitance should be less than 5 pF.

**CAUTION**

The oscillation stabilization time differs according the matching with the external resonator circuit. It is recommended to determine the oscillation stabilization time by an oscillator matching test.

**NOTE**

Recommended oscillator circuit is shown below.

**MainOSC**

**External clock**

### 47C.3.3 Internal Oscillator Characteristics

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LS IntOSC frequency	f <sub>RL</sub>		220.8	240	259.2	kHz
HS IntOSC frequency*2, *3	f <sub>RH</sub>		7.6	8	8.4	MHz
		After user trimming @ trimming temp	7.92	8	8.08	MHz
HS IntOSC current consumption	I <sub>RH</sub>	After stabilization			170*1	$\mu$ A
HS IntOSC oscillation stabilization time	t <sub>RHSTB</sub>				54.4	$\mu$ s

Note 1. This is reference value.

Note 2. The HS IntOSC frequency may not meet the specification range (8.00 MHz  $\pm$ 0.4 MHz, 8.00 MHz  $\pm$ 0.08 MHz after user trimming @ trimming temp) in the while writing/erasing the code/data flash.

Note 3. The HS IntOSC frequency may not meet the specification range in the Cyclic STOP/Cyclic RUN mode.

### 47C.3.4 PLL Characteristics

#### 47C.3.4.1 PLL1 (for CPU/Peripheral) Characteristics

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input frequency	f <sub>PLL1CLKIN</sub>	MainOSC	8		24	MHz
		HS IntOSC After user trimming @ trimming temp*3, *4	7.92	8.0	8.08	MHz
Output frequency	f <sub>CPLL1OUT</sub>	MainOSC	80		120	MHz
		HS IntOSC*3 After user trimming @ trimming temp*3	79.2	80	80.8	MHz
		f <sub>PPLL0UT</sub>	79.2	80	80.8	MHz
Output period jitter*1	t <sub>CPJ1</sub>		-100		100	ps
Long term jitter*1	t <sub>LTJ</sub>	term = 1 $\mu$ s	-500		500	ps
		term = 10 $\mu$ s	-1		1	ns
		term = 20 $\mu$ s	-2		2	ns
Lock time*2	t <sub>LCK1</sub>		104	112.3	122.1	$\mu$ s

Note 1. This is reference value.

Note 2. Lock time is time until being set ("1") in PLL1S.PLL1CLKACT bit after PLL1E.PLL1ENTRG bit is written "1".

Note 3. The HS IntOSC has a frequency deviation. When the HSIntOSC is used the frequency deviation should be considered for the customer application as it affects peripheral functions (e.g. TAUx, ADCAn, etc.).

Note 4. Do not select the PLL1 as clock source during the code/data flash write and/or erase.

## 47C.4 DC Characteristics

### 47C.4.1 Capacitance

**Condition:** REGVCC = EVCC = A0VREF = AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,  
Ta = 25°C

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input capacitance	CI* <sup>1</sup>	f = 1 MHz			10	pF
Input/output capacitance	CIO* <sup>2</sup>	0 V for non measurement pins			10	pF

Note 1. CI: Capacitance between the input pin and ground

Note 2. CIO: Capacitance between the input/output pin and ground

## 47C.4.2 Pin Characteristics

Slow mode	CL = 30 pF				10	MHz
	CL = 100 pF				3	MHz

Note 1. "IOVCC" means the pins are assigned to the power supply (EVCC, and A0VREF).

Note 2. Not select the analog input function of ADCn.

Note 3. When the internal pull-up resistor of FLMD0 pin is applied by FLMDCNT register, please connect 86 kΩ or more as external pull-down resistor.

Note 4. The number of pin indicates simultaneous ON.

Note 5. Measurement point:  $0.1 \times \text{IOVCC}$  to  $0.9 \times \text{IOVCC}$

Note 6. Measurement point:  $0.2 \times \text{IOVCC}$  to  $0.8 \times \text{IOVCC}$

## 47C.4.4.1 Absolute Maximum Ratings

## (1) 100-Pin Version

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I <sub>INJPM</sub>	PgE	Per pin		10	mA
			Total		60	mA
		PgE'	Per pin		10	mA
			Total		60	mA
		PgA0	Per pin		10	mA

			Total		-60	mA
		PgE'	Per pin		-10	mA
			Total		-60	mA
		PgA0	Per pin		-10	mA
			Total		-60	mA

**CAUTIONS**

- The DC injection current (Total) must satisfy the specifications of the injection current per pin.
- In case of an injected current condition for PgA0, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

## 47C.5 AC Characteristics

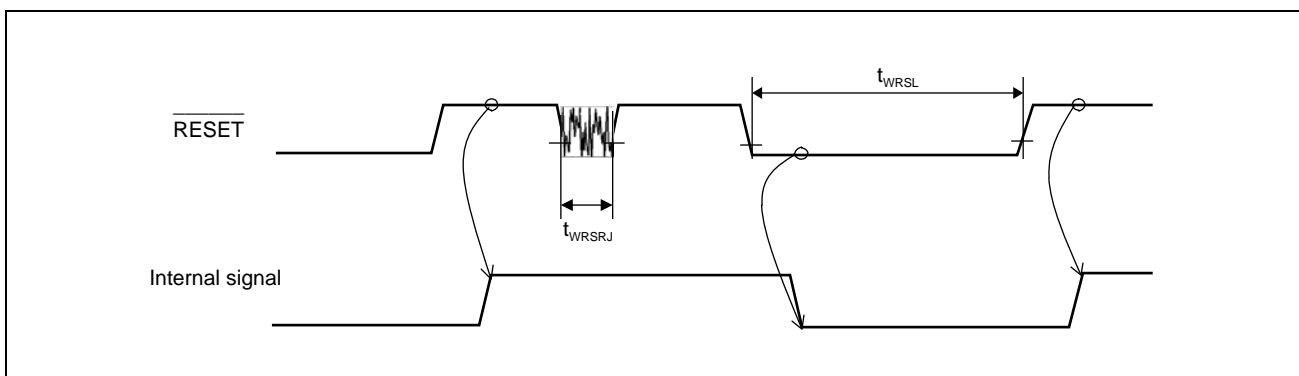

### 47C.5.1 $\overline{\text{RESET}}$ Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,  
CAWOVCL: 0.1  $\mu\text{F}$   $\pm 30\%$ , CISOVCL: 0.1  $\mu\text{F}$   $\pm 30\%$ ,  
 $T_j = -40$  to (depend on the product)  $^{\circ}\text{C}$ , CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ input low level width*1	$t_{\text{WRSL}}$	Except power on	600			ns
$\overline{\text{RESET}}$ pulse rejection*2	$t_{\text{WRSRJ}}$		100			ns

Note 1.  $\overline{\text{RESET}}$  input width is needed to ensure that the internal reset signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

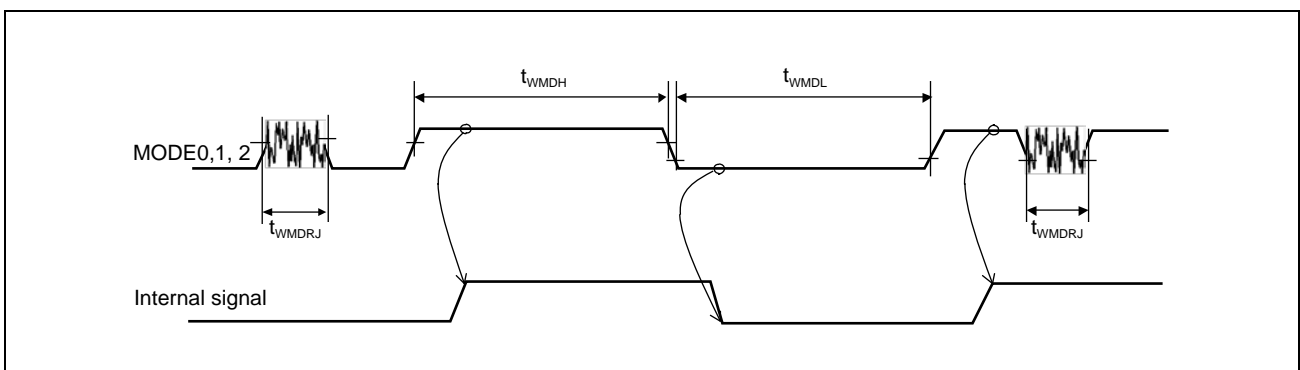

### 47C.5.2 Mode Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,  
CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%,  
Tj = -40 to (depend on the product)  $^{\circ}$ C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0, 1 input high/low level width*1	$t_{WFMDH}/$ $t_{WFMDL}$		600			ns
FLMD0, 1 pulse rejection*2	$t_{WFMDRJ}$		100			ns
MODE0, 1, 2 input high/low level width*1	$t_{WMDH}/$ $t_{WMDL}$		600			ns
MODE0, 1, 2 pulse rejection*2	$t_{WMDRJ}$		100			ns

Note 1. FLMD0,1 and MODE0, 1, 2 input width is needed to ensure that the internal mode signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

### 47C.5.3 Interrupt Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product)  $^{\circ}$ C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
NMI input high/low level width*1	$t_{WNiH}/$ $t_{WNiL}$	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	24			$\mu$ s
NMI pulse rejection*2	$t_{WNiRJ}$		100			ns
INTPn input high/low level width*1	$t_{WiTh}/$ $t_{WiL}$	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	24			$\mu$ s
INTPn pulse rejection*2	$t_{WiTRJ}$		100			ns

Note 1. NMI and INTPn input width is needed to ensure that the internal interrupt signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

#### 47C.5.4 Low Power Sampler (DPIN input) Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,  
CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%,  
Tj = -40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
DPINn input delay time (vs SELDP2-0)	$t_{DSDDI}$				150	ns

**Note:** n = 7 to 0

### 47C.5.5 CSCXFOUT Timing

**Condition:** REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,  
CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%,  
Tj = -40 to (depend on the product) °C, CL = 30 pF

<Output driver strength>

CSCXFOUT: Slow or fast mode (refer to the condition in the following table)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CSCXFOUT output cycle	$t_{FOUT}$	Slow mode	100 (max. 10 MHz)			ns
		Fast mode	41.6 (max. 24 MHz)			ns
CSCXFOUT high level width	$t_{WKHFO}$	Slow mode	N: 1* <sup>1</sup> or even value* <sup>2</sup>	$t_{FOUT} / 2 - 37$		ns
			N: Odd value (N $\geq$ 5)* <sup>2, *3</sup>	$t_{FOUT} \times (N+1) / 2N - 37$		ns
		Fast mode	N: 1* <sup>1</sup> or even value* <sup>2</sup>	$t_{FOUT} / 2 - 10$		ns
			N: Odd value (N $\geq$ 3)* <sup>2</sup>	$t_{FOUT} \times (N+1) / 2N - 10$		ns
CSCXFOUT low level width	$t_{WKLFO}$	Slow mode	N: 1* <sup>1</sup> or even value* <sup>2</sup>	$t_{FOUT} / 2 - 37$		ns
			N: Odd value (N $\geq$ 5)* <sup>2, *3</sup>	$t_{FOUT} \times (N-1) / 2N - 37$		ns
		Fast mode	N: 1* <sup>1</sup> or even value* <sup>2</sup>	$t_{FOUT} / 2 - 10$		ns
			N: Odd value (N $\geq$ 3)* <sup>2</sup>	$t_{FOUT} \times (N-1) / 2N - 10$		ns
CSCXFOUT rise/fall time	$t_{KRFO}$ / $t_{KFFO}$	Slow mode			37	ns
		Fast mode			10	ns

Note 1. When MainOSC, HS IntOSC, or LS IntOSC is selected as source clock with the condition of N = 1, the characteristics of output signal depends on the selected source clock. It is recommended to use output signal after evaluation on an actual environment.

Note 2. "N" is the value of "Clock divisor N" defined by FOUTDIV register.

Note 3. The selection of N = 3 is prohibited when slow mode is used.

Data setup time	$t_{SU: DAT}$		250			ns
Stop condition setup time	$t_{SU: STO}$		4.0			$\mu$ s
Capacitance load of each bus line	Cb				400	pF

**Remark:** n = 0, 1

**Note:** If the system does not extend the RIICnSCL signal low hold time ( $t_{LOW}$ ), only the maximum data hold time ( $t_{HD: DAT}$ ) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

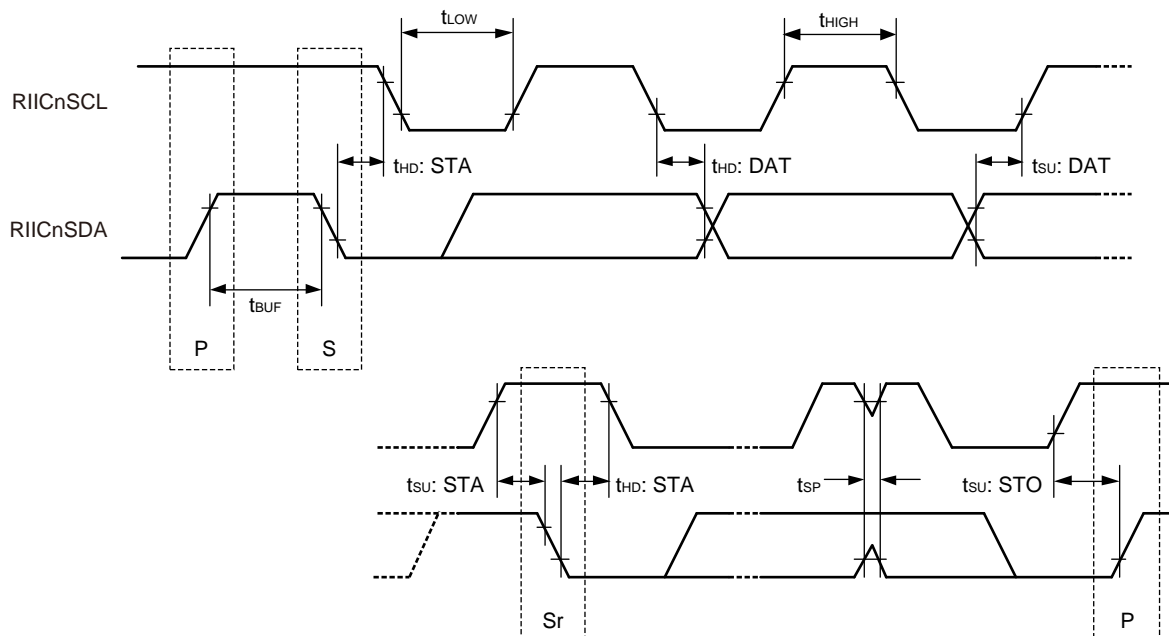

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at  $V_{IH \text{ min.}}$  of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL

Note 3. The fast mode I<sup>2</sup>C bus can be used in normal mode I<sup>2</sup>C bus system. In this case, set the fast mode I<sup>2</sup>C bus so that it meets the following conditions.

- If the system does not extend the RIICnSCL signal's low state hold time:  $t_{SU: DAT} \geq 250 \text{ ns}$

- If the system extends the RIICnSCL signal's low state hold time:

Transmit the following data bit to the RIICnSDA line prior to releasing the RIICnSCL line (1250 ns: Normal mode I<sup>2</sup>C bus specification).

Note 2.  $3.0 + 1.3 \times$  (the number of used T&H)

Note 3. Include the oscillation accuracy of HS IntOSC.

Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as "sampling time + successive approximation time".

## CAUTION

When an external digital pulse is applied to AP0, P8, and P9 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse. The same behavior may apply when the digital buffer is used as an output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

### 47C.6.1 Equivalent Circuit of the Analog Input Block

Terminals	Condition	R <sub>IN</sub> (kΩ)	C <sub>IN</sub> (pF)
ADCA0I0 to 5	When T&H is used	14.2	2.1
	When T&H is not used	4.2	2.1
ADCA0I6 to 15	—	4.2	2.1
ADCA0I0S to 3S, 5S to 16S	—	5.6	9.5
ADCA0I4S, 17S to 19S	—	6.2	9.5

#### CAUTION

This specification is not tested during outgoing inspection. Therefore R<sub>IN</sub> and C<sub>IN</sub> are reference values only and not guaranteed. In addition these values are specified as maximum values.

## 47C.7 Flash Programming Characteristics

### 47C.7.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V, CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%, Tj = -40 to (depend on the product) °C, CL = 30 pF

Table 47C.19 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f <sub>PCLK</sub> *3		4*4		30	MHz
Number of rewrites*1	CWRT	Data retention of 20 years*2	1000			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is "n" (n = 1000), the device can be erased "n" times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3. f<sub>PCLK</sub> = 1/4 f<sub>CPUCLK\_M</sub>: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

### 47C.7.2 Data Flash

The data flash memory is shipped in the erased state. If the data flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

**Condition:** REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,  
CAWOVCL: 0.1  $\mu$ F  $\pm$ 30%, CISOVCL: 0.1  $\mu$ F  $\pm$ 30%,  
Tj = -40 to (depend on the product) °C, CL = 30 pF

Table 47C.21 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	$f_{PCLK}^{*3}$		4 <sup>*4</sup>		30	MHz
Number of rewrites <sup>*1</sup>	CWRT	Data retention 20 years <sup>*2</sup>	125 k			times
		Data retention 3 years <sup>*2</sup>	250 k			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 125000), the device can be erased “n” times for each block. For example, when a block of 64 bytes is erased after 4 bytes of writing have been performed for different addresses 16 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the data flash memory.

Note 3.  $f_{PCLK} = 1/4 f_{CPUCLK\_M}$ : System operating frequency for internal flash.

Note 4. Only for program/erase operation.
