### 9BC.3.3 Details of Software Reset Control Register

#### 9BC.3.3.1 SWRESA — Software Reset Register

This register is used to generate a software reset SWRES. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFF8 0A04<sub>H</sub>

**Value after reset:** Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

0	SWRESA	Software reset trigger 0: No Software reset trigger is generated. 1: Software reset trigger is generated.

### 9BC.3.4 Details of Cyclic RUN Mode Reset Vector Address Register

CYCRBASE Register is supported in RH850/F1KM-S1.

#### 9BC.3.4.1 CYCRBASE — Cyclic RUN Mode RBASE Register

This register is used to specify reset vector address (RBASE) of the CPU, when the CPU returns to Cyclic RUN mode from DeepSTOP mode. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Update of this register is only permitted when the chip is in RUN mode. Do not change the value in Cyclic RUN mode.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can only be read or written in 32-bit units.

**Address:** FFF8 3600<sub>H</sub>

**Value after reset:** FEBF 8000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CYCRBASE[31:16]															
Value after reset	1	1	1	1	1	1	1	0	1	0	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 9BC.12 CYCRBASE Register Contents

Bit Position	Bit Name	Function
31 to 9	CYCRBASE	Reset vector base address (RBASE) in Cyclic RUN mode. Specifies the RBASE value in Cyclic RUN mode. The default value is set to the start address of the retention RAM.
8 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

## 9BC.4 Functional Description

### 9BC.4.1 Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) provide reset flags for each reset source.

If a reset has occurred, the corresponding flag is set. According to this, the source of the reset is evaluated.

RESF and RESFR are initialized by a power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$ ) (though bits RESF9 and RESFR9 are set to 1 after initialization). In addition, flags in RESF and RESFR can be cleared by the reset factor clear register (RESFC) and the redundant reset factor clear register (RESFCR).

Each reset source can set the corresponding flag independently from other reset sources.

### 9BC.4.2 Power-On Clear (POC) Reset

The power-on clear circuit (POC) constantly compares the power supply voltage REGVCC with the internal reference voltage VPOC. It ensures that the microcontroller only operates as long as the power supply exceeds a certain level.

If REGVCC falls below the internal reference voltage ( $\text{REGVCC} < \text{VPOC}$ ), the internal reset signal POCRES and a power-up reset PURES are generated.

For details on the specification of the internal voltage reference level VPOC, see **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.

The reset factor register (RESF) and the redundant reset factor register (RESFR) are cleared by the power-on clear reset. RESF9 and RESFR9 are set to 1 after initialization.

The power-on clear function holds the microcontroller in reset state as long as the power supply voltage does not exceed the threshold level VPOC.

The following figure illustrates the timing of a POCRES.

Figure 9BC.4 POC Reset Timing

(1) Overview of CPU System Startup after Power-On Clear

Figure 9BC.5 When  $\overline{\text{RESET}}$  is Released before the Flash Sequence is Completed

Figure 9BC.6 When  $\overline{\text{RESET}}$  is Released after the Flash Sequence is Completed

### 9BC.4.3 Low-Voltage Indicator (LVI) Reset

The low-voltage indicator (LVI) constantly compares the power supply voltage REGVCC with the LVI internal reference voltage VLVIn.

When setting the LVI detection voltage and releasing the LVIRESMK, if REGVCC falls below the internal reference voltage ( $REGVCC < VLVIn$ ), the internal reset signal  $\overline{LVIRES}$  is generated.

Additionally, the  $\overline{LVIRES}$  flags (bits RESF.RESF6 and RESFR.RESFR6) are set.

After that, even if REGVCC exceeds VLVIn, bits RESF.RESF6 and RESFR.RESFR6 are not cleared automatically. They are cleared as described below.

- Setting the RESFC.RESFC6 bit to 1 clears the RESF.RESF6 bit.  
Setting the RESFCR.RESFCR6 bit to 1 clears the RESFR.RESFR6 bit.
- Power-up reset PURES (POCRES or  $\overline{DBRES}$  )

For details on the LVI functions, see **Section 11BC, Supply Voltage Monitor of RH850/F1KM**.

The following figure illustrates the timing of a  $\overline{LVIRES}$  and bits RESF.RESF6 and RESFR.RESFR6.

Figure 9BC.7 LVI Reset Timing

### 9BC.4.4 Core Voltage Monitor (CVM) Reset

Core voltage monitor is used to monitor the core voltage inside the microcontroller.

The reset  $\overline{\text{CVMRES}}$  is generated if the core voltage is not in the specified voltage range while CVM is enabled. Moreover, the  $\overline{\text{CVMRES}}$  flags (RESF.RESF7 and RESFR.RESFR7) are set.

After that, the RESF.RESF7 and RESFR.RESFR7 bits are not automatically cleared even if the core voltage returns to the specified voltage range. The RESF.RESF7 and RESFR.RESFR7 bits are cleared as described below.

- Setting the RESFC.RESFC7 bit to 1 clears the RESF.RESF7 bit.  
Setting the RESFCR.RESFCR7 bit to 1 clears the RESFR.RESFR7 bit.
- Power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$ )

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off. Once  $\overline{\text{CVMRES}}$  is generated upon high voltage detection, the microcontroller stays in the reset state. To cancel this state, it is mandatory to use the external reset ( $\overline{\text{RESET}}$ ) input. Release the external reset ( $\overline{\text{RESET}}$ ) after the voltage level becomes lower than the high detection voltage.

For details on the CVM function, see **Section 11BC, Supply Voltage Monitor of RH850/F1KM**.

Figure 9BC.8 CVM Reset Timing

### 9BC.4.5 External Reset ( $\overline{\text{RESET}}$ )

When a low level input is applied to the  $\overline{\text{RESET}}$  pin, a reset is asserted and the RESF.RESF8 and RESFR.RESFR8 bits are set.

After that, bits RESF.RESF8 and RESFR.RESFR8 are not cleared automatically, even if the low-level input to the  $\overline{\text{RESET}}$  pin is released. Bits RESF.RESF8 and RESFR.RESFR8 are cleared as described below.

- Setting the RESFC.RESFC8 bit to 1 clears the RESF.RESF8 bit.  
Setting the RESFCR.RESFCR8 bit to 1 clears the RESFR.RESFR8 bit.
- Power-up reset PURES (POCRES or DBRES )

The  $\overline{\text{RESET}}$  pin includes an analog noise filter to prevent erroneous resets due to noise.

The following figure shows the timing when AWORES and ISORES are generated by the external reset. This figure also shows the effect of the noise filter.

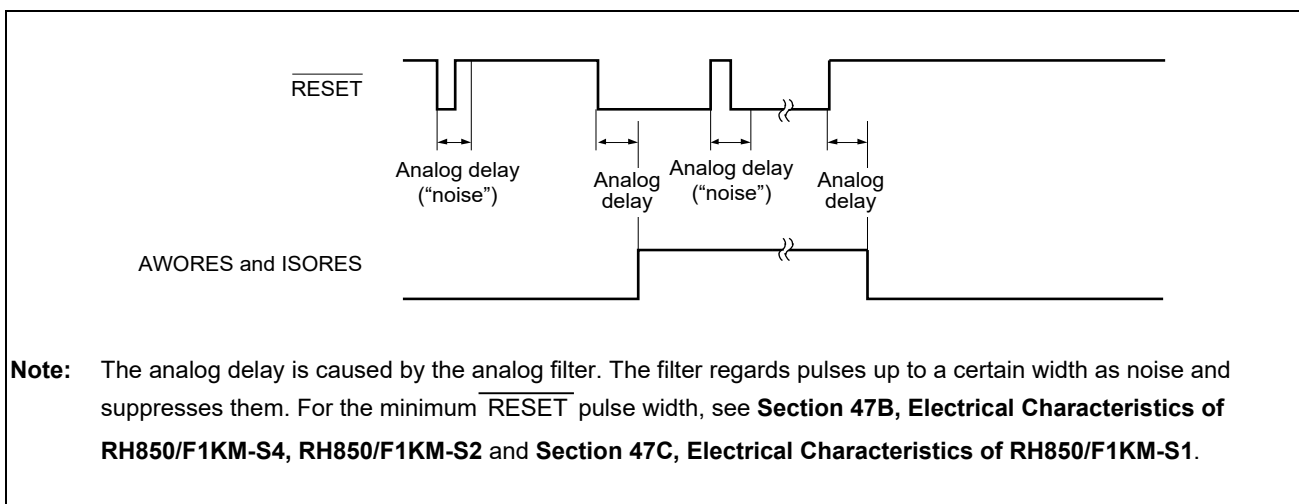

Figure 9BC.9 External Reset (  $\overline{\text{RESET}}$  )

### 9BC.4.6 Watchdog Timer (WDTA) Reset

The watchdog timers can be configured to generate a reset if the overflow time is exceeded. After a watchdog timer reset is asserted, the corresponding watchdog timer reset flags (the RESF.RESF1 and RESFR.RESFR1 bits for WDTA0RES, and the RESF.RESF2 and RESFR.RESFR2 bits for WDTA1RES) are set.

After that, bits RESF.RESF1 and RESFR.RESFR1 (or bits RESF.RESF2 and RESFR.RESFR2) are not cleared automatically, even if WDTA0RES (or WDTA1RES) is released.

Bits RESF.RESF1 and RESFR.RESFR1, and bits RESF.RESF2 and RESFR.RESFR2 are cleared as described below.

- WDTA0RES:  
Setting the RESFC.RESFC1 bit to 1 clears the RESF.RESF1 bit.  
Setting the RESFCR.RESFCR1 bit to 1 clears the RESFR.RESFR1 bit.
- WDTA1RES:  
Setting the RESFC.RESFC2 bit to 1 clears the RESF.RESF2 bit.  
Setting the RESFCR.RESFCR2 bit to 1 clears the RESFR.RESFR2 bit.
- Power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$  )

### 9BC.4.7 Software Reset

The software reset SWRES can be asserted by setting SWRESA.SWRESA to 1.

SWRES sets the reset flag RESF.RESF0 and the RESFR.RESFR0 bit.

RESF.RESF0 and RESFR.RESFR0 are not cleared automatically. RESF.RESF0 and RESFR.RESFR0 are cleared as described below.

- Setting the RESFC.RESFC0 bit to 1 clears the RESF.RESF0 bit.  
Setting the RESFCR.RESFCR0 bit to 1 clears the RESFR.RESFR0 bit.
- Power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$  )

### 9BC.4.8 Clock Monitor (CLMA) Reset

The clock monitors can generate the following resets:

- $\overline{\text{CLMA0RES}}$  , if a frequency abnormality in HS IntOSC is detected
- $\overline{\text{CLMA1RES}}$  , if a frequency abnormality in MainOSC is detected
- $\overline{\text{CLMA2RES}}$  , if a frequency abnormality in PLL0 is detected
- $\overline{\text{CLMA3RES}}$  , if a frequency abnormality in PLL1 is detected

When the Clock Monitor detects frequency abnormality of the respective clocks, resets  $\overline{\text{CLMA0RES}}$  ,  $\overline{\text{CLMA1RES}}$  ,  $\overline{\text{CLMA2RES}}$  , and  $\overline{\text{CLMA3RES}}$  are generated.

In addition, flags  $\overline{\text{CLMA0RES}}$  ,  $\overline{\text{CLMA1RES}}$  ,  $\overline{\text{CLMA2RES}}$  , and  $\overline{\text{CLMA3RES}}$  (RESF.RESF3, RESFR.RESFR3, RESF.RESF4, RESFR.RESFR4, RESF.RESF5, RESFR.RESFR5, RESF.RESF14, and RESFR.RESFR14) are set.

These flags are not cleared automatically. They are cleared as described below.

- $\overline{\text{CLMA0RES}}$  :

Setting the RESFC.RESFC3 bit to 1 clears the RESF.RESF3 bit.

Setting the RESFCR.RESFCR3 bit to 1 clears the RESFR.RESFR3 bit.

- $\overline{\text{CLMA1RES}}$  :

Setting the RESFC.RESFC4 bit to 1 clears the RESF.RESF4 bit.

Setting the RESFCR.RESFCR4 bit to 1 clears the RESFR.RESFR4 bit.

- $\overline{\text{CLMA2RES}}$  :

[RH850/F1KM-S4, RH850/F1KM-S2]

Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.

Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.

[RH850/F1KM-S1]

This is not supported.

- $\overline{\text{CLMA3RES}}$  :

[RH850/F1KM-S4, RH850/F1KM-S2]

Setting the RESFC.RESFC14 bit to 1 clears the RESF.RESF14 bit.

Setting the RESFCR.RESFCR14 bit to 1 clears the RESFR.RESFR14 bit.

[RH850/F1KM-S1]

Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.

Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.

- Power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$  )

### 9BC.4.9 Debugger Reset

Debugger reset (  $\overline{\text{DBRES}}$  ) is generated via a debugger command.  $\overline{\text{DBRES}}$  activates PURES, and therefore operates in the same way as the power-on clear reset POCRES:

- The clock generators are reset and stop operating. The clock generators should be restarted after release from the reset state.
- The reset factor register RESF and the redundant reset factor register RESFR are cleared (Bits RESF9 and RESFR9 are set to 1 after initialization).

### 9BC.4.10 Reset Vector Address of CPU

This function is supported in RH850/F1KM-S1.

The default value of reset vector base address (RBASE) of CPU is set to 0000 0000<sub>H</sub> at shipment. In Cyclic RUN mode, the reset vector base address is automatically switched to the address specified by the CYCRBASE register. After returning to the RUN mode, the reset vector base address automatically switches back to the default address.

For details about the RBASE register, see **Section 3BC, CPU System of RH850/F1KM**.

## Section 10A Power Supply Circuit of RH850/F1KH-D8

This section describes the power supply and power domains of the RH850/F1KH.

### 10A.1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area (AWO area) is always on in all operating modes and stand-by modes.

The power supply of the Isolated area (ISO area) can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.

For operation of the device, the following voltages are required:

- Power supply voltages REG0VCC and REG1VCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltages EVCC and BVCC for the I/O ports.
- Power supply voltages A0VREF and A1VREF for the A/D converters and the separated I/O ports.

### 10A.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.

Table 10A.1 Power Supply Pins

## Section 10B Power Supply Circuit of RH850/F1KM-S4, RH850/F1KM-S2

This section describes the power supply and power domains of the RH850/F1KM.

### 10B.1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area (AWO area) is always on in all operating modes and stand-by modes.

The power supply of the Isolated area (ISO area) can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.

For operation of the device, the following voltages are required:

- Power supply voltage REGVCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltages EVCC and BVCC\*<sup>1</sup> for the I/O ports.
- Power supply voltages A0VREF and A1VREF\*<sup>1</sup> for the A/D converters and the separated I/O ports.

**Note 1.** Not supported for the 100-pin devices.

### 10B.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.

Table 10B.1 Power Supply Pins

Power Supply	Power Supply Pins	Power Supply for
Power supply for internal circuits	REGVCC	<ul style="list-style-type: none"> <li>On-chip voltage regulators for the Always-On area (AWO area) and Isolated area (ISO area)</li> <li>Port group IP0*2</li> <li>MainOSC</li> <li>SubOSC*2</li> <li>POC / LVI</li> </ul>

## Section 10C Power Supply Circuit of RH850/F1KM-S1

This section describes the power supply and power domains of the RH850/F1KM.

### 10C.1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area (AWO area) is always on in all operating modes and stand-by modes.

The power supply of the Isolated area (ISO area) can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.

For operation of the device, the following voltages are required:

- Power supply voltage REGVCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltage EVCC for the I/O ports.
- Power supply voltage A0VREF for the A/D converters and the separated I/O ports.

### 10C.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.

Table 10C.1 Power Supply Pins

Power Supply	Power Supply Pins	Power Supply for
Power supply for internal circuits	REGVCC	<ul style="list-style-type: none"> <li>On-chip voltage regulators for the Always-On area (AWO area) and Isolated area (ISO area)</li> </ul>
	AWOVCL*1	
	AOVVSS	<ul style="list-style-type: none"> <li>MainOSC</li> <li>POC / LVI</li> </ul>
	ISOVCL*1	
	ISOVSS	
Power supply for I/O port	EVCC	<ul style="list-style-type: none"> <li>RESET</li> <li>FLMD0</li> </ul>
	EVSS	(100/80-pin devices) <ul style="list-style-type: none"> <li>Port groups JP0, P0, P8, P9, P10, P11</li> </ul> (64/48-pin devices) <ul style="list-style-type: none"> <li>Port groups JP0, P0, P8, P9, P10</li> </ul>
Power supply for A/D converters	A0VREF	<ul style="list-style-type: none"> <li>Analog circuits of ADCA0, port group AP0</li> </ul>
	A0VSS	

**Note:** See Section 47C, Electrical Characteristics of RH850/F1KM-S1 for the voltage range of each power supply.

Note 1. Pin to connect a stabilization capacitor for on-chip voltage regulator.

### 10C.1.2 Block Diagram of Power Domains

The figure below shows the overview of power supply circuit.

Figure 10C.1 Overview of Power Supply Circuit (100/80 Pins)

Figure 10C.2 Overview of Power Supply Circuit (64/48 Pins)

### 10C.1.3 Power Domains Arrangement

The table below lists the microcontroller functional modules for each power domain.

Table 10C.2 Functional Modules and Power Domain

Power Domain	Functions
Always-On area (AWO area)	<ul style="list-style-type: none"> <li>• STBC, Reset controller</li> <li>• Retention RAM</li> <li>• MainOSC, LS IntOSC, HS IntOSC, CLMA0, CLMA1</li> <li>• WDTA0, RTCA<sub>n</sub>, TAUJ0, TAUJ2, ADCA0, LPS0</li> <li>• Port groups JP0, P0, P8, AP0</li> </ul>
Isolated area (ISO area)	<ul style="list-style-type: none"> <li>• CPU subsystem</li> <li>• Code flash, Data flash, Local RAM</li> <li>• PLL1, CLMA3</li> <li>• WDTA1, DCRAn, TAUD<sub>n</sub>, TAUB<sub>n</sub>, TAUJ1, TAUJ3, OSTM<sub>n</sub>, PWM-Diag, CSIG<sub>n</sub>, CSIH<sub>n</sub>, RCFDC<sub>n</sub>, RLIN24<sub>n</sub>, RLIN3<sub>n</sub>, RIIC<sub>n</sub>, Motor Control, ENCA<sub>n</sub>, KR<sub>n</sub>, RSENT<sub>n</sub></li> <li>• Port groups P9, P10, P11</li> </ul>

## Section 11A Supply Voltage Monitor of RH850/F1KH-D8

This section explains in general about the supply voltage monitor.

The first part in this section describes the supply voltage monitor function, and the ensuing sections describe the registers.

This supply voltage monitor is for detecting and control of a power supply failure. However, the supply voltage monitor does not detect all of the possible failures.

Therefore, a power supply monitoring with an external device is required for the following terminals, in case that the customer's system requires an appropriate failure detection and control for Functional Safety.

- REG0VCC
- REG1VCC
- EVCC
- BVCC
- A0VREF
- A1VREF
- AWOVCL
- ISOVCL

The required power supply specification for power supply monitoring with external device is shown at **Section 47A.4.5, Power Management Characteristics**.

### 11A.1 Overview

#### 11A.1.1 Functional Overview

The supply voltage monitor continuously monitors multiple external and internal supply voltages in order to ensure that the device operates with a supply voltage within the specified range. If the voltage drops below the reference voltage or comparison voltage, an interrupt request signal or internal reset signal is generated. The following table lists the supply voltage monitor functions.

Table 11A.1 Supply Voltage Monitor Functions

Function Name	Monitor Voltage	Signal Generated when Voltage Drops below Certain Level
Power-On Clear (POC)	REG0VCC REG1VCC	Internal reset signal
Low-Voltage Indicator Circuit (LVI)	REG0VCC	Internal reset signal, interrupt request signal
Core Voltage Monitor (CVM)	Isolated area (ISO area) voltage	Internal reset signal
RAM Retention Voltage Indicator (VLVI)	REG0VCC	—

#### NOTES

1. The RAM Retention Voltage Indicator sets the very-low voltage detection flag (VLVF) when the voltage drops below the RAM retention voltage.
2. When the internal core voltage monitor (CVM) is used for customer's system as the functional safety measure, the voltage of the Always-On area (AWO area) shall be monitored by the external voltage monitor.

### 11A.1.2 Power-On Clear (POC)

The POC continuously monitors the external power supply voltage REG0VCC and REG1VCC. This ensures that the microcontroller only operates at or above power-on clear detection voltage (VPOC).

If REG0VCC or REG1VCC falls below the POC detection voltage ( $\text{REG0VCC} < \text{VPOC}$ ,  $\text{REG1VCC} < \text{VPOC}$ ), the internal reset signal (POCRES) is generated.

For details, see **Section 9A.4.2, Power-On Clear (POC) Reset**.

### 11A.1.3 Low Voltage Indicator Circuit (LVI)

The LVI continuously compares the external power supply voltage REG0VCC with the LVI reference voltage VLVIIn.

If REG0VCC falls below the reference voltage ( $\text{REG0VCC} < \text{VLVIIn}$ ), an internal reset signal or interrupt request signal is generated.

#### 11A.1.3.1 LVI Reference Voltage

The LVI reference voltage VLVIIn can be selected from three different levels by LVICNT.LVICNT[1:0].

If LVICNT.LVICNT[1:0] is set to 00<sub>B</sub>, the LVI is disabled.

For the specification of the reference voltage level VLVIIn, see **Section 11A.2.2.1, LVICNT — LVI Control Register**.

#### 11A.1.3.2 LVI Reset ( $\overline{\text{LVIRES}}$ )

When the LVI detection voltage is set and LVIRESMK is cleared, if REG0VCC falls below the reference voltage ( $\text{REG0VCC} < \text{VLVIIn}$ ), the internal reset signal  $\overline{\text{LVIRES}}$  is generated.

For the specification of  $\overline{\text{LVIRES}}$  generation, see **Section 9A.4.3, Low-Voltage Indicator (LVI) Reset**.

### 11A.1.3.3 LVI Interrupt (INTLVIL/INTLVIH)

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REG0VCC falls below the reference voltage ( $REG0VCC (MIN) < VLVIn$ ), the LVI interrupt INTLVIL is generated.

To use the LVI as an interrupt source, the INTLVIL interrupt must be unmasked.

INTLVIL interrupt can be used as wake-up source from all of standby modes. For details, see **Section 14, Stand-By Controller (STBC)**.

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REG0VCC exceeds the reference voltage ( $REG0VCC (MIN) > VLVIn$ ), LVI interrupt INTLVIH is generated.

When LVI is used as an interrupt source, INTLVIH interrupt must be unmasked.

The following figure illustrates the timing of INTLVIL/INTLVIH.

Figure 11A.1 INTLVIL/INTLVIH Generation Timing

### 11A.1.3.4 LVI Setting Procedure

The setting procedures for LVI are shown below.

#### (1) Using LVI as the Reset Source

- a. Mask LVI reset. (LVICNT.LVIRESMK = 1)\*<sup>1</sup>
- b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)
- c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])\*<sup>1</sup>
- d. Insert ample wait time by software (see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**).
- e. Unmask LVI reset. (LVICNT.LVIRESMK = 0)\*<sup>1</sup>

#### (2) Using LVI as the Interrupt Source (FEINT)

- a. Mask LVI reset. (LVICNT.LVIRESMK = 1)\*<sup>1</sup>
- b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)
- c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])\*<sup>1</sup>
- d. Insert ample wait time by software (see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**).
- e. Unmask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 0, FEINTFMSK.LVIHFEIFMSK = 0)

**Note 1.** Follow the register protection sequence to set LVICNT register because it is a write-protected register. For details on the write-protected registers, see **Section 5, Write-Protected Registers**.

#### CAUTION

If REG0VCC is not stable around the LVI detection level (VLVIn), correct judgment of whether INTLVIH or INTLVIL interrupt processing should proceed may not be possible.

For example, if multiple interrupts consisting of both INTLVIH and INTLVIL occur during INTLVIL interrupt processing due to REG0VCC being unstable, the software cannot detect which type of interrupt was generated last.

Consequently, if the last interrupt generated was an INTLVIL interrupt, regardless of REG0VCC (min.) being greater than VLVIn, the software erroneously judges that REG0VCC (min.) < VLVIn.

Accordingly, take measures such as programming the software so that LVI detection interrupt processing is completed before a next LVI interrupt. Also, consider control of REG0VCC.

### 11A.1.3.5 Clock Supply to the LVI

The clock supply to the LVI is shown in the following table.

Table 11A.2 Clock Supply to the LVI

Unit Name	Unit Clock Name	Supply Clock Name
LVI	Register access clock	CPUCLK_UL

### 11A.1.4 Core Voltage Monitor (CVM)

The core voltage monitor (CVM) monitors the Isolated area (ISO area) voltage (referred to as “core voltage” below) in the microcontroller.

If the regulator output voltage is outside of the specified range, the internal reset signal ( $\overline{\text{CVMRES}}$ ) is generated.

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off in addition to a reset being generated.

When operation shifts to diagnostic mode (DIAG mode), the CVM enters the abnormal core voltage detection state. An abnormal core voltage detected state can be intentionally created by using the DIAG mode so that the CVM abnormal voltage detected flag can be checked for failures.

#### CAUTION

---

The CVM cannot detect drifts in the voltage of the Isolated area (ISO area) caused by the characteristics of the regulator, use conditions or the increase or decrease of voltage.

---

#### 11A.1.4.1 CVM Reset ( $\overline{\text{CVMRES}}$ )

If the core voltage exceeds the specified level while high-voltage monitor is enabled ( $\text{CVMDE.H\_D\_E} = 1$ ), then  $\overline{\text{CVMRES}}$  is generated and the power supply to the Isolated area (ISO area) is stopped.

If the core voltage falls below the specified level while low voltage monitor is enabled ( $\text{CVMDE.L\_D\_E} = 1$ ),  $\overline{\text{CVMRES}}$  is generated.

For the specification of  $\overline{\text{CVMRES}}$  generation, see **Section 9A.4.4, Core Voltage Monitor (CVM) Reset.**

#### 11A.1.4.2 CVM Setting

Use the option byte to enable the high-voltage monitor and the low-voltage monitor.

For details, see **Section 44.9, Option Bytes.**

### 11A.1.4.3 Diagnostic (DIAG) Mode

This product supports diagnostic mode.

In diagnostic (DIAG) mode, whether the CVM abnormal voltage detection flag is set to 1 can be checked.

In diagnostic mode,  $\overline{\text{CVMRES}}$  is not output.

The setting procedure for diagnostic mode is described below.

Set the registers according to this procedure. Otherwise the operation is not guaranteed.

1. Set CVMDIAG.CVM\_DIAG\_MASK.\*<sup>1</sup>
2. Set CVMDIAG.CVM\_DIAG.\*<sup>1</sup>
3. Wait for 12  $\mu\text{s}$ .\*<sup>2</sup>
4. Read the CVMF register to confirm that the H\_V\_F and L\_V\_F bits are set to 1 (if these bits are 0, the CVM does not operate normally, requiring error handling).
5. Clear CVMDIAG.CVM\_DIAG.\*<sup>1</sup>
6. Clear the CVMF register.\*<sup>1</sup>
7. Read the CVMF register to confirm that the H\_V\_F and L\_V\_F bits are set to 0 (if these bits are 1, go back to step 5 again).
8. Clear CVMDIAG.CVM\_DIAG\_MASK.\*<sup>1</sup>

**Note 1.** Follow the register protection sequence to set CVMF and CVMDIAG registers because these are write-protected registers. For details, see **Section 5, Write-Protected Registers**.

**Note 2.** At least 50  $\mu\text{s}$  must elapse after the following conditions are fulfilled before step (4) is started.

- Release from HALT state
- Release from STOP mode
- Release from the reset state, when a reset other than a reset due to the CVM is generated in RUN mode (include HALT state)
- The CPU clock is switched
- Operation of the MainOSC is started or stopped
- Operation of the PLL is started or stopped

### 11A.1.4.4 Clock Supply to the CVM

The clock supply to the CVM is shown in the following table.

Table 11A.3 Clock Supply to the CVM

Unit Name	Unit Clock Name	Supply Clock Name
CVM	Register access clock	CPUCLK_UL

### 11A.1.5 RAM Retention Voltage Indicator (Very-Low-Voltage Detection Circuit, VLVI)

The very-low-voltage detection circuit (VLVI) is used to detect the RAM retention voltage, and continuously compares the power supply voltage REG0VCC with the RAM retention voltage VVLVI.

See **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for the specification of the RAM retention voltage level VVLVI.

#### 11A.1.5.1 Clock Supply to the VLVI

The clock supply to the VLVI is shown in the following table.

Table 11A.4 Clock Supply to the VLVI

Unit Name	Unit Clock Name	Supply Clock Name
VLVI	Register access clock	CPUCLK_UL

#### 11A.1.5.2 Retention RAM Content Retention

If the power supply voltage REG0VCC does not fall below VVLVI, the content of the retention RAM (RRAM) is retained. See **Section 9A.1.1, Reset Sources** for retention during reset.

If REG0VCC falls below VVLVI, the RRAM content cannot be guaranteed. Thus the entire RRAM must be restored before continuing operation.

If REG0VCC falls below the RAM retention voltage ( $REG0VCC < VVLVI$ ), the VLVF.VLVF bit is set.

After that, even if REG0VCC exceeds VVLVI, the VLVF.VLVF bit is not cleared automatically. It is cleared by

- setting VLVFC.VLVFC bit to 1.

The following figure illustrates the timing of VLVF.

Figure 11A.2 VLVF Operation Timing

### 11A.1.6 Block Diagram

The block diagram of the supply voltage monitor is shown below.

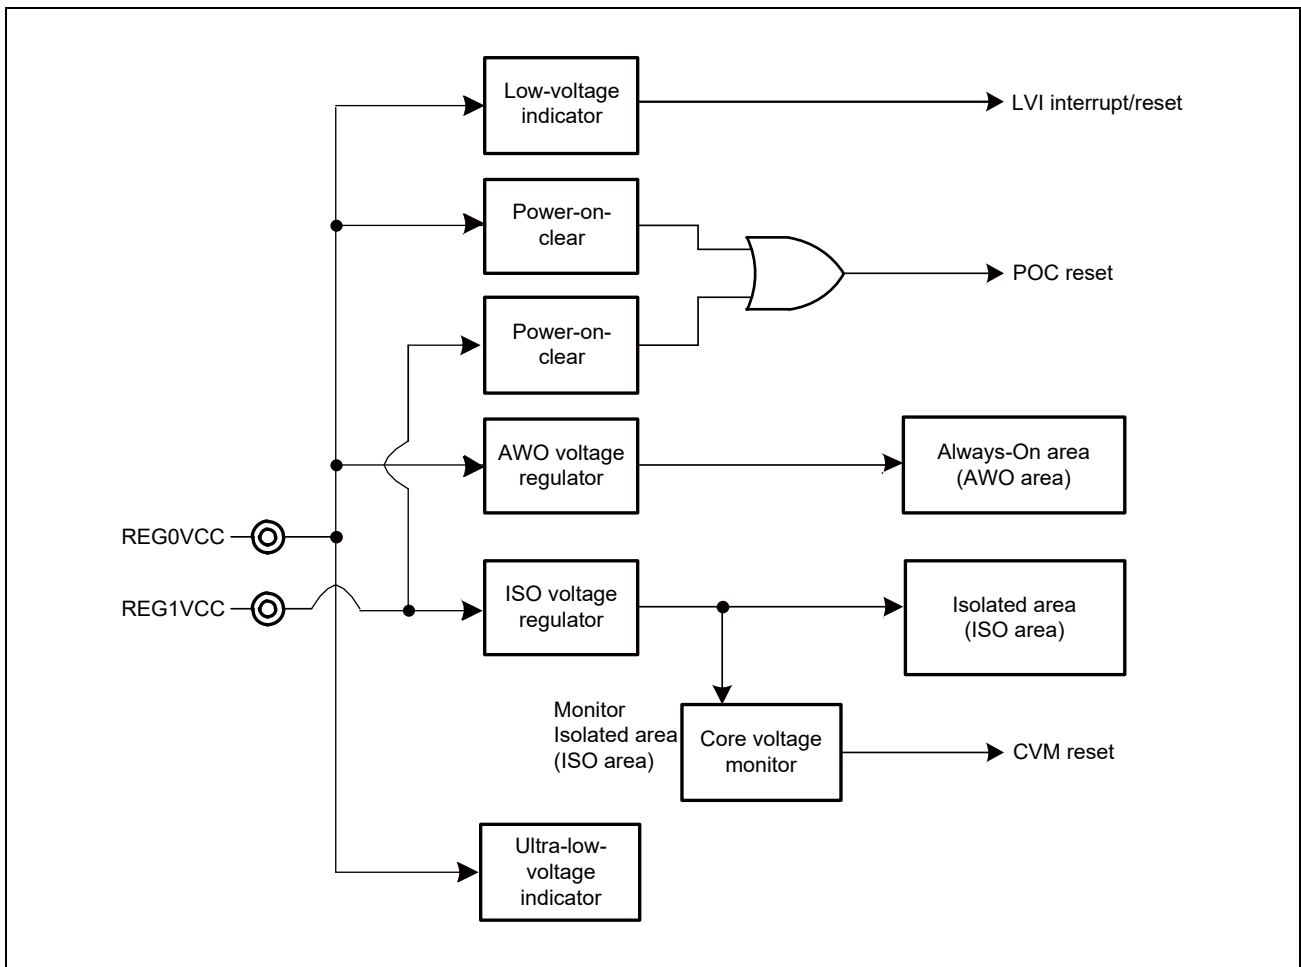

Figure 11A.3 Supply Voltage Monitor

## 11A.2 Registers

### 11A.2.1 List of Registers

The following table lists the supply voltage monitor registers.

Table 11A.5 List of Registers

Module Name	Register Name	Symbol	Address
SVM	Low-voltage indicator reset control register		
	LVI control register	LVICNT	FFF8 0A00 <sub>H</sub>
	Core voltage monitor control registers		
	CVM factor register	CVMF	FFF8 3100 <sub>H</sub>
	CVM detection enable register	CVMDE	FFF8 3104 <sub>H</sub>
	CVM diagnostic mode setting register	CVMDIAG	FFF8 3114 <sub>H</sub>
	Very-low-voltage detection control registers		
	Very-low-voltage detection register	VLVF	FFF8 0980 <sub>H</sub>
	Very-low-voltage detection clear register	VLVFC	FFF8 0988 <sub>H</sub>

## 11A.2.2 Low-Voltage Indicator Reset Control Register

### 11A.2.2.1 LVICNT — LVI Control Register

This register is used to control the Low-Voltage Indicator and to select the LVI detection level.

This register is initialized by power-up reset PURES.

The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 0A00<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LVIRESMK	LVICNT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 11A.6 LVICNT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LVIRESMK	Mask LVI Reset 0: LVI reset is not masked 1: LVI reset is masked
1, 0	LVICNT[1:0]	Detection Level 0 0: LVI is ignored 0 1: VLVI0 = 4.0 ± 0.1 V (fall), 4.0 ± 0.13 V (rise) 1 0: VLVI1 = 3.7 ± 0.1 V (fall), 3.7 ± 0.13 V (rise) 1 1: VLVI2 = 3.5 ± 0.1 V (fall), 3.5 ± 0.13 V (rise)

#### NOTE

To use an LVI interrupt, LVI reset must be masked (LVIRESMK = 1) by LVIRESMK.

## 11A.2.3 Core Voltage Monitor Control Registers

### 11A.2.3.1 CVMF — CVM Factor Register

This register records the core voltage failure state generated after the last power-on clear reset POCRES.

The L\_V\_F bit and the H\_V\_F bit are set to 1 by hardware when the CVM detects core voltage failure.

If the L\_V\_F or H\_V\_F bit of this register is set to 1, that bit is not updated until it is initialized by a power-on clear reset POCRES or by writing 0 to the CVMF.L\_V\_F or CVMF.H\_V\_F bit. However, it continuously monitors an error signal from the core voltage monitoring circuit in diagnostic mode.

The correct write sequence using the PROTCMDCVM register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 3100<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 11A.7 CVMF Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	H_V_F	High-Voltage Failure Detection of the Core Voltage by the CVM Read access 0: No high-voltage failure state is detected 1: High-voltage failure state is detected Write access 0: Clear the H_V_F bit 1: Invalid
0	L_V_F	Low-Voltage Failure Detection of the Core Voltage by the CVM Read access 0: No low-voltage failure state is detected 1: Low-voltage failure state is detected Write access 0: Clear the L_V_F bit 1: Invalid

### 11A.2.3.2 CVMDE — CVM Detection Enable Register

This register is used to indicate the voltage detection enabled or disabled state.

This register is initialized only by power-up reset PURES.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 3104<sub>H</sub>

**Value after reset:** The value after reset depends on the option byte setting.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	H_D_E	L_D_E

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The setting of the option byte OPBT0.CVM\_HD\_EN is reflected.

Note 2. The setting of the option byte OPBT0.CVM\_LD\_EN is reflected.

For details on the option byte, see **Section 44.9, Option Bytes**.

Table 11A.8 CVMDE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	H_D_E	High-Voltage Monitor Enable 0: High-voltage detection is disabled. 1: High-voltage detection is enabled.
0	L_D_E	Low-Voltage Monitor Enable 0: Low-voltage detection is disabled. 1: Low-voltage detection is enabled.

### 11A.2.3.3 CVMDIAG — CVM Diagnostic Mode Setting Register

This register sets the CVM diagnostic mode.

This register is initialized only by power-up reset PURES.

For details on the register settings in diagnostic mode, see **Section 11A.1.4.3, Diagnostic (DIAG) Mode**.

The correct write sequence using the PROTCMDCVM register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 3114<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	CVM_DIAG	CVM Diagnostic Mode Setting 0: Normal mode 1: Diagnostic mode

## 11A.2.4 Very-Low-Voltage Detection Control Registers

### 11A.2.4.1 VLVF — Very-Low-Voltage Detection Register

The very-low-voltage detection register (VLVF) shows the state of the RAM retention voltage detection.

This register is set upon detection of a voltage below the RAM retention voltage (VVLVI).

If VLVF is set, the retention RAM content cannot be guaranteed.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 0980<sub>H</sub>

**Value after power on:** 0000 0001<sub>H</sub>

This register is not initialized by any reset source.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	VLVFC	Clear VLVF.VLVF bit. 0: Do not clear 1: Clear

## Section 11BC Supply Voltage Monitor of RH850/F1KM

This section explains in general about the supply voltage monitor.

The first part in this section describes the supply voltage monitor function, and the ensuing sections describe the registers.

This supply voltage monitor is for detecting and control of a power supply failure. However, the supply voltage monitor does not detect all of the possible failures.

Therefore, a power supply monitoring with an external device is required for the following terminals, in case that the customer's system requires an appropriate failure detection and control for Functional Safety.

- REGVCC
- EVCC
- BVCC\*<sup>1</sup>
- A0VREF
- A1VREF\*<sup>1</sup>
- AWOVCL
- ISOVCL

**Note 1.** This is not supported for the 100-pin devices with RH850/F1KM-S4, RH850/F1KM-S2 and RH850/F1KM-S1.

The required power supply specification for power supply monitoring with external device is shown at **Section 47B.4.5, Power Management Characteristics, Section 47C.4.5, Power Management Characteristics.**

### 11BC.1 Overview

#### 11BC.1.1 Functional Overview

The supply voltage monitor continuously monitors multiple external and internal supply voltages in order to ensure that the device operates with a supply voltage within the specified range. If the voltage drops below the reference voltage or comparison voltage, an interrupt request signal or internal reset signal is generated. The following table lists the supply voltage monitor functions.

Table 11BC.1 Supply Voltage Monitor Functions

Function Name	Monitor Voltage	Signal Generated when Voltage Drops below Certain Level
Power-On Clear (POC)	REGVCC	Internal reset signal
Low-Voltage Indicator Circuit (LVI)	REGVCC	Internal reset signal, interrupt request signal
Core Voltage Monitor (CVM)	Isolated area (ISO area) voltage	Internal reset signal
RAM Retention Voltage Indicator (VLVI)	REGVCC	—

#### NOTES

1. The RAM Retention Voltage Indicator sets the very-low voltage detection flag (VLVF) when the voltage drops below the RAM retention voltage.
2. When the internal core voltage monitor (CVM) is used for customer's system as the functional safety measure, the voltage of the Always-On area (AWO area) shall be monitored by the external voltage monitor.

### 11BC.1.2 Power-On Clear (POC)

The POC continuously monitors the external power supply voltage REGVCC. This ensures that the microcontroller only operates at or above power-on clear detection voltage (VPOC).

If REGVCC falls below the POC detection voltage ( $REGVCC < VPOC$ ), the internal reset signal (POCRES) is generated.

For details, see **Section 9BC.4.2, Power-On Clear (POC) Reset**.

### 11BC.1.3 Low Voltage Indicator Circuit (LVI)

The LVI continuously compares the external power supply voltage REGVCC with the LVI reference voltage VLVI<sub>In</sub>.

If REGVCC falls below the reference voltage ( $REGVCC < VLVI_{In}$ ), an internal reset signal or interrupt request signal is generated.

#### 11BC.1.3.1 LVI Reference Voltage

The LVI reference voltage VLVI<sub>In</sub> can be selected from three different levels by LVICNT.LVICNT[1:0].

If LVICNT.LVICNT[1:0] is set to 00<sub>B</sub>, the LVI is disabled.

For the specification of the reference voltage level VLVI<sub>In</sub>, see **Section 11BC.2.2.1, LVICNT — LVI Control Register**.

#### 11BC.1.3.2 LVI Reset ( $\overline{LVIRES}$ )

When the LVI detection voltage is set and LVIRESMK is cleared, if REGVCC falls below the reference voltage ( $REGVCC < VLVI_{In}$ ), the internal reset signal  $\overline{LVIRES}$  is generated.

For the specification of  $\overline{LVIRES}$  generation, see **Section 9BC.4.3, Low-Voltage Indicator (LVI) Reset**.

### 11BC.1.3.3 LVI Interrupt (INTLVIL/INTLVIH)

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REGVCC falls below the reference voltage ( $\text{REGVCC (MIN)} < \text{VLVIn}$ ), the LVI interrupt INTLVIL is generated.

To use the LVI as an interrupt source, the INTLVIL interrupt must be unmasked.

INTLVIL interrupt can be used as wake-up source from all of standby modes. For details, see **Section 14, Stand-By Controller (STBC)**.

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REGVCC exceeds the reference voltage ( $\text{REGVCC (MIN)} > \text{VLVIn}$ ), LVI interrupt INTLVIH is generated.

When LVI is used as an interrupt source, INTLVIH interrupt must be unmasked.

The following figure illustrates the timing of INTLVIL/INTLVIH.

Figure 11BC.1 INTLVIL/INTLVIH Generation Timing

### 11BC.1.3.4 LVI Setting Procedure

The setting procedures for LVI are shown below.

#### (1) Using LVI as the Reset Source

- a. Mask LVI reset. (LVICNT.LVIRESMK = 1)\*<sup>1</sup>
- b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)
- c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])\*<sup>1</sup>
- d. Insert ample wait time by software (see **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2, Section 47C, Electrical Characteristics of RH850/F1KM-S1**).
- e. Unmask LVI reset. (LVICNT.LVIRESMK = 0)\*<sup>1</sup>

#### (2) Using LVI as the Interrupt Source (FEINT)

- a. Mask LVI reset. (LVICNT.LVIRESMK = 1)\*<sup>1</sup>
- b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)
- c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])\*<sup>1</sup>
- d. Insert ample wait time by software (see **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2, Section 47C, Electrical Characteristics of RH850/F1KM-S1**).
- e. Unmask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 0, FEINTFMSK.LVIHFEIFMSK = 0)

**Note 1.** Follow the register protection sequence to set LVICNT register because it is a write-protected register. For details on the write-protected registers, see **Section 5, Write-Protected Registers**.

#### CAUTION

If REGVCC is not stable around the LVI detection level (VLVIn), correct judgment of whether INTLVIH or INTLVIL interrupt processing should proceed may not be possible.

For example, if multiple interrupts consisting of both INTLVIH and INTLVIL occur during INTLVIL interrupt processing due to REGVCC being unstable, the software cannot detect which type of interrupt was generated last.

Consequently, if the last interrupt generated was an INTLVIL interrupt, regardless of REGVCC (min.) being greater than VLVIn, the software erroneously judges that REGVCC (min.) < VLVIn.

Accordingly, take measures such as programming the software so that LVI detection interrupt processing is completed before a next LVI interrupt. Also, consider control of REGVCC.

### 11BC.1.3.5 Clock Supply to the LVI

The clock supply to the LVI is shown in the following table.

Table 11BC.2 Clock Supply to the LVI (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
LVI	Register access clock	CPUCLK_UL

### 11BC.1.4 Core Voltage Monitor (CVM)

The core voltage monitor (CVM) monitors the Isolated area (ISO area) voltage (referred to as “core voltage” below) in the microcontroller.

If the regulator output voltage is outside of the specified range, the internal reset signal ( $\overline{\text{CVMRES}}$ ) is generated.

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off in addition to a reset being generated.

When operation shifts to diagnostic mode (DIAG mode), the CVM enters the abnormal core voltage detection state. An abnormal core voltage detected state can be intentionally created by using the DIAG mode so that the CVM abnormal voltage detected flag can be checked for failures.

#### CAUTION

The CVM cannot detect drifts in the voltage of the Isolated area (ISO area) caused by the characteristics of the regulator, use conditions or the increase or decrease of voltage.

#### 11BC.1.4.1 CVM Reset ( $\overline{\text{CVMRES}}$ )

If the core voltage exceeds the specified level while high-voltage monitor is enabled ( $\text{CVMDE.H\_D\_E} = 1$ ), then  $\overline{\text{CVMRES}}$  is generated and the power supply to the Isolated area (ISO area) is stopped.

If the core voltage falls below the specified level while low voltage monitor is enabled ( $\text{CVMDE.L\_D\_E} = 1$ ),  $\overline{\text{CVMRES}}$  is generated.

For the specification of  $\overline{\text{CVMRES}}$  generation, see **Section 9BC.4.4, Core Voltage Monitor (CVM) Reset.**

#### 11BC.1.4.2 CVM Setting

Use the option byte to enable the high-voltage monitor and the low-voltage monitor.

For details, see **Section 44.9, Option Bytes.**

### 11BC.1.4.3 Diagnostic (DIAG) Mode

This product supports diagnostic mode.

In diagnostic (DIAG) mode, whether the CVM abnormal voltage detection flag is set to 1 can be checked.

In diagnostic mode,  $\overline{\text{CVMRES}}$  is not output.

The setting procedure for diagnostic mode is described below.

Set the registers according to this procedure. Otherwise the operation is not guaranteed.

1. Set CVMDIAG.CVM\_DIAG\_MASK.\*<sup>1</sup>
2. Set CVMDIAG.CVM\_DIAG.\*<sup>1</sup>
3. Wait for 12  $\mu\text{s}$ .\*<sup>2</sup>
4. Read the CVMF register to confirm that the H\_V\_F and L\_V\_F bits are set to 1 (if these bits are 0, the CVM does not operate normally, requiring error handling).
5. Clear CVMDIAG.CVM\_DIAG.\*<sup>1</sup>
6. Clear the CVMF register.\*<sup>1</sup>
7. Read the CVMF register to confirm that the H\_V\_F and L\_V\_F bits are set to 0 (if these bits are 1, go back to step 5 again).
8. Clear CVMDIAG.CVM\_DIAG\_MASK.\*<sup>1</sup>

**Note 1.** Follow the register protection sequence to set CVMF and CVMDIAG registers because these are write-protected registers. For details, see **Section 5, Write-Protected Registers**.

**Note 2.** At least 50  $\mu\text{s}$  must elapse after the following conditions are fulfilled before step (4) is started.

- Release from HALT state
- Release from STOP mode
- Release from the reset state, when a reset other than a reset due to the CVM is generated in RUN mode (include HALT state)
- The CPU clock is switched
- Operation of the MainOSC is started or stopped
- Operation of the PLL is started or stopped

### 11BC.1.4.4 Clock Supply to the CVM

The clock supply to the CVM is shown in the following table.

Table 11BC.3 Clock Supply to the CVM (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
CVM	Register access clock	CPUCLK_UL

### 11BC.1.5 RAM Retention Voltage Indicator (Very-Low-Voltage Detection Circuit, VLVI)

The very-low-voltage detection circuit (VLVI) is used to detect the RAM retention voltage, and continuously compares the power supply voltage REGVCC with the RAM retention voltage VVLVI.

See **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for the specification of the RAM retention voltage level VVLVI.

#### 11BC.1.5.1 Clock Supply to the VLVI

The clock supply to the VLVI is shown in the following table.

Table 11BC.4 Clock Supply to the VLVI (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
VLVI	Register access clock	CPUCLK_UL

#### 11BC.1.5.2 Retention RAM Content Retention

If the power supply voltage REGVCC does not fall below VVLVI, the content of the retention RAM (RRAM) is retained. See **Section 9BC.1.1, Reset Sources** for retention during reset.

If REGVCC falls below VVLVI, the RRAM content cannot be guaranteed. Thus the entire RRAM must be restored before continuing operation.

If REGVCC falls below the RAM retention voltage ( $\text{REGVCC} < \text{VVLVI}$ ), the VLVF.VLVF bit is set.

After that, even if REGVCC exceeds VVLVI, the VLVF.VLVF bit is not cleared automatically. It is cleared by

- setting VLVFC.VLVFC bit to 1.

The following figure illustrates the timing of VLVF.

Figure 11BC.2 VLVF Operation Timing

### 11BC.1.6 Block Diagram

The block diagram of the supply voltage monitor is shown below.

Figure 11BC.3 Supply Voltage Monitor (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

## 11BC.2 Registers

### 11BC.2.1 List of Registers

The following table lists the supply voltage monitor registers.

Table 11BC.5 List of Registers

Module Name	Register Name	Symbol	Address
SVM	Low-voltage indicator reset control register		
	LVI control register	LVICNT	FFF8 0A00 <sub>H</sub>
	Core voltage monitor control registers		
	CVM factor register	CVMF	FFF8 3100 <sub>H</sub>
	CVM detection enable register	CVMDE	FFF8 3104 <sub>H</sub>
	CVM diagnostic mode setting register	CVMDIAG	FFF8 3114 <sub>H</sub>
	Very-low-voltage detection control registers		
	Very-low-voltage detection register	VLVF	FFF8 0980 <sub>H</sub>
	Very-low-voltage detection clear register	VLVFC	FFF8 0988 <sub>H</sub>

## 11BC.2.2 Low-Voltage Indicator Reset Control Register

### 11BC.2.2.1 LVICNT — LVI Control Register

This register is used to control the Low-Voltage Indicator and to select the LVI detection level.

This register is initialized by power-up reset PURES.

The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 0A00<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LVIRESMK	LVICNT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 11BC.6 LVICNT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LVIRESMK	Mask LVI Reset 0: LVI reset is not masked 1: LVI reset is masked
1, 0	LVICNT[1:0]	Detection Level 0 0: LVI is ignored 0 1: VLVI0 = 4.0 ± 0.1 V (fall), 4.0 ± 0.13 V (rise) 1 0: VLVI1 = 3.7 ± 0.1 V (fall), 3.7 ± 0.13 V (rise) 1 1: VLVI2 = 3.5 ± 0.1 V (fall), 3.5 ± 0.13 V (rise)

#### NOTE

To use an LVI interrupt, LVI reset must be masked (LVIRESMK = 1) by LVIRESMK.

## 11BC.2.3 Core Voltage Monitor Control Registers

### 11BC.2.3.1 CVMF — CVM Factor Register

This register records the core voltage failure state generated after the last power-on clear reset POCRES.

The L\_V\_F bit and the H\_V\_F bit are set to 1 by hardware when the CVM detects core voltage failure.

If the L\_V\_F or H\_V\_F bit of this register is set to 1, that bit is not updated until it is initialized by a power-on clear reset POCRES or by writing 0 to the CVMF.L\_V\_F or CVMF.H\_V\_F bit. However, it continuously monitors an error signal from the core voltage monitoring circuit in diagnostic mode.

The correct write sequence using the PROTCMDCVM register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 3100<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 11BC.7 CVMF Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	H_V_F	High-Voltage Failure Detection of the Core Voltage by the CVM Read access 0: No high-voltage failure state is detected 1: High-voltage failure state is detected Write access 0: Clear the H_V_F bit 1: Invalid
0	L_V_F	Low-Voltage Failure Detection of the Core Voltage by the CVM Read access 0: No low-voltage failure state is detected 1: Low-voltage failure state is detected Write access 0: Clear the L_V_F bit 1: Invalid

### 11BC.2.3.2 CVMDE — CVM Detection Enable Register

This register is used to indicate the voltage detection enabled or disabled state.

This register is initialized only by power-up reset PURES.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 3104<sub>H</sub>

**Value after reset:** The value after reset depends on the option byte setting.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	H_D_E	L_D_E
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0/1*1	0/1*2
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The setting of the option byte OPBT0.CVM\_HD\_EN is reflected.

Note 2. The setting of the option byte OPBT0.CVM\_LD\_EN is reflected.

For details on the option byte, see **Section 44.9, Option Bytes**.

Table 11BC.8 CVMDE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	H_D_E	High-Voltage Monitor Enable 0: High-voltage detection is disabled. 1: High-voltage detection is enabled.
0	L_D_E	Low-Voltage Monitor Enable 0: Low-voltage detection is disabled. 1: Low-voltage detection is enabled.

### 11BC.2.3.3 CVMDIAG — CVM Diagnostic Mode Setting Register

This register sets the CVM diagnostic mode.

This register is initialized only by power-up reset PURES.

For details on the register settings in diagnostic mode, see **Section 11BC.1.4.3, Diagnostic (DIAG) Mode**.

The correct write sequence using the PROTCMDCVM register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 3114<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

## 11BC.2.4 Very-Low-Voltage Detection Control Registers

### 11BC.2.4.1 VLVF — Very-Low-Voltage Detection Register

The very-low-voltage detection register (VLVF) shows the state of the RAM retention voltage detection.

This register is set upon detection of a voltage below the RAM retention voltage (VVLVI).

If VLVF is set, the retention RAM content cannot be guaranteed.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 0980<sub>H</sub>

**Value after power on:** 0000 0001<sub>H</sub>

This register is not initialized by any reset source.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VLVF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	VLVF	Very-Low-Voltage Detection Flag 0: Very-low-voltage is not detected. 1: Very-low-voltage is detected.

**NOTE:** Very-low-voltage is the voltage status of REGVCC < RAM retention voltage (VVLVI).  
For details, See **Section 11BC.1.5.2, Retention RAM Content Retention.**

### 11BC.2.4.2 VLVFC — Very-Low-Voltage Detection Clear Register

This register clears the VLVF.VLVF bit.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFF8 0988<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VLVFC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 11BC.11 VLVFC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	VLVFC	Clear VLVF.VLVF bit. 0: Do not clear 1: Clear

## Section 12AB Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2

This section explains in general about the clock controller.

The first part in this section describes the specific features of the clock controller of the RH850/F1KH, RH850/F1KM microcontrollers. The ensuing sections describe the clock oscillation circuit, clock selectors, and clock output function that make up the clock controller.

### 12AB.1 Features of RH850/F1KH, RH850/F1KM Clock Controller

The clock controller of the RH850/F1KH, RH850/F1KM microcontrollers has the following features.

- Six on-chip clock oscillators
  - Main Oscillator (MainOSC) with an oscillation frequency of 8, 16, 20, and 24 MHz
  - Sub Oscillator (SubOSC) with an oscillation frequency of 32.768 kHz\*<sup>1</sup>
  - High Speed Internal Oscillator (HS IntOSC) with a nominal frequency of 8 MHz (Typ.)
  - Low Speed Internal Oscillator (LS IntOSC) with a nominal frequency of 240 kHz (Typ.)
  - PLL with SSCG (PLL0)
  - PLL without SSCG (PLL1)
- Fine management of clock supply to peripheral modules through clock domains
- On-chip clock monitor that detects clock anomalies when the Main Oscillator, High Speed Internal Oscillator, or PLL are in use. See **Section 13, Clock Monitor (CLMA)**.
- Clock output (FOUT)

**Note 1.** It isn't supported with 100-pin product.

**Figure 12AB.1, Clock Controller Overview** shows the schematic diagram of the clock controller.

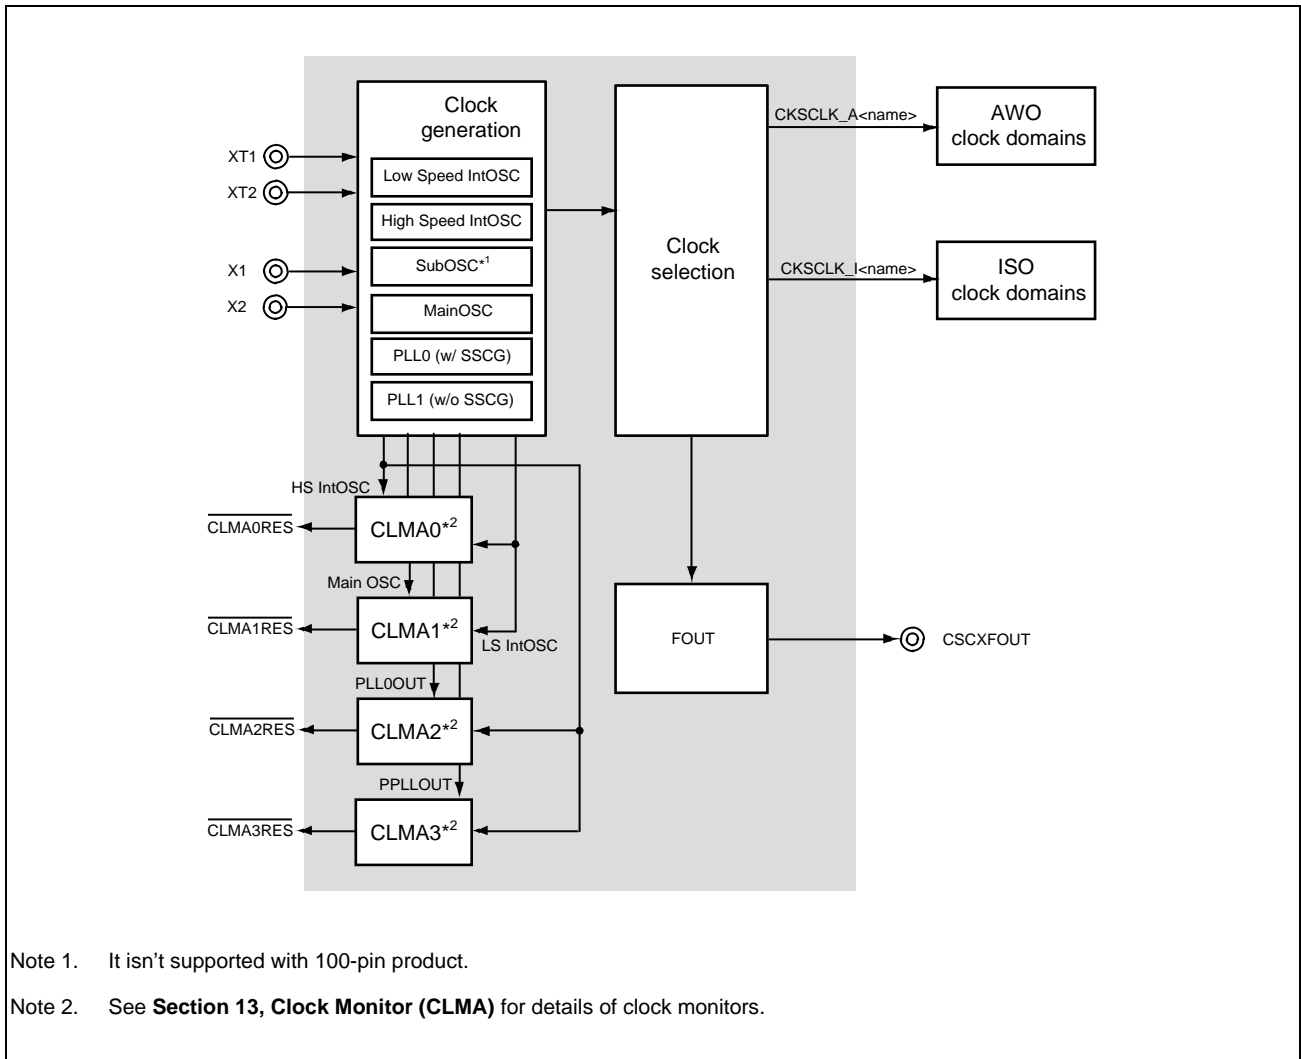

Figure 12AB.1 Clock Controller Overview

## 12AB.2 Configuration of Clock Controller

This section describes the configuration of the clock controller.

The clock controller is composed of clock oscillators and clock generation circuits that generate the clocks for the CPU and the peripheral modules, a clock selector for selecting the optimum clock, and clock domains for the CPU and the peripheral modules.

**Figure 12AB.2, Clock Controller Configuration** shows the configuration of the clock controller.

Figure 12AB.2 Clock Controller Configuration

**NOTE****Clock domain and clock control register naming conventions**

The clock signals and their control registers, etc., described in this section are named according to the following naming conventions to reflect the power domain or clock domain to which they belong. The placeholder “<name>” is used to identify the target module in the clock domain:

- Clock domain names:
  - C\_AWO\_<name>: Always-On area (AWO area)\*1 clock domain
  - C\_ISO\_<name>: Isolated area (ISO area)\*1 clock domain
- Domain clock names:
  - CKSCLK\_A<name>: Always-On area (AWO area) domain clock
  - CKSCLK\_I<name>: Isolated area (ISO area) domain clock
- Clock selector names:
  - CKSC\_A<name>: Always-On area (AWO area) clock selector
  - CKSC\_I<name>: Isolated area (ISO area) clock selector
- Clock selector registers:
  - CKSC\_A<name>S\_CTL: Always-On area (AWO area) source clock selector register
  - CKSC\_A<name>D\_CTL: Always-On area (AWO area) source clock divider register
  - CKSC\_I<name>S\_CTL: Isolated area (ISO area) source clock selector register
  - CKSC\_I<name>D\_CTL: Isolated area (ISO area) source clock divider register

**Example**

The clock signal CKSCLK\_AADCA (placeholder <name> = ADCA) is the clock supplied to the clock domain C\_AWO\_ADCA in the Always-On area (AWO area). This clock is selected by the clock selector register CKSC\_AADCAS\_CTL.

- Note 1.** Always-On area (AWO area) and Isolated area (ISO area) refer to the power supply domains. Always-On area (AWO area) is an always-on power supply, and Isolated area (ISO area) is an isolated power supply that is switched on or off by the operation mode.
- For details, see **Section 10A, Power Supply Circuit of RH850/F1KH-D8, Section 10B, Power Supply Circuit of RH850/F1KM-S4, RH850/F1KM-S2.**
-

## 12AB.2.1 Clock Generation Circuits

Six clock oscillators are provided:

Four clock oscillators are located on the Always-On area (AWO area) and two PLL (PLL0 and PLL1) are located on the Isolated area (ISO area).

### Main Oscillator (MainOSC)

The MainOSC generates the main clock X.

Generation of the clock X requires the connection of an external resonator to X1 and X2.

The clock X is used as the reference clock for the PLL.

### Sub Oscillator (SubOSC)

The SubOSC generates the sub-clock XT, which runs at a frequency of 32.768 kHz (Typ.). Generation of the sub clock XT requires the connection of an external resonator to XT1 and XT2.

This clock is mainly used for real-time clock applications.

### High Speed Internal Oscillator (HS IntOSC)

The HS IntOSC generates the clock RH, which runs at a frequency of 8 MHz (Typ.).

### Low Speed Internal Oscillator (LS IntOSC)

The LS IntOSC generates the clock RL, which runs at a frequency of 240 kHz (Typ.). It starts operation at power up and cannot be stopped, hence it is always operating.

### PLL

The PLL circuits generate high speed operation clocks CPLL0OUT, CPLL1OUT and PPLL0OUT for normal operation of the microcontroller.

The clocks supplied by the clock oscillators (X, XT, RH, RL, CPLL0OUT, CPLL1OUT, PPLL0OUT) and their divided clocks (CPUCLK\_H, CPUCLK\_M, CPUCLK\_L, CPUCLK\_UL, PPLLCLK, PPLLCLK2, and PPLLCLK4) are all generated in the clock generation circuit.

## 12AB.2.2 Clock Selection

The clocks generated by the clock oscillators are input to the clock selectors CKSC\_A<name>/CKSC\_I<name>.

Domain clocks CKSCLK\_A<name>/CKSCLK\_I<name> are selected by dedicated clock selectors from clocks directly input from the oscillators, or in some cases from clocks that have been divided by clock dividers.

- CKSC\_I<name>S\_CTL/CKSC\_I<name>D\_CTL registers: determine the clock for the Isolated area (ISO area) clock domains.
- CKSC\_A<name>S\_CTL/CKSC\_A<name>D\_CTL registers: determine the clock for the Always-On area (AWO area) clock domains.

Note that not all available clocks generated by the clock oscillators are input to each clock selector.

The following clocks are supplied to the CPU and related modules from the clock generation circuit.

### Emergency Clock (EMCLK)

The emergency clock EMCLK is supplied by the

- HS IntOSC, if it is active
- LS IntOSC, if HS IntOSC is inactive

The selection is done automatically after CLMA0 reset is occurred, so if the HS IntOSC becomes lower than the limit for any reason, vital modules of the microcontroller are still in operation, since the LS IntOSC does not stop.

### CPU Subsystem Clock (CPUCLK)

The CPU Subsystem clock CPUCLK is derived from PLL0 clock CPLL0OUT, PLL1 clock CPLL1OUT, MainOSC, and EMCLK. The CPU clock selector CKSC\_CPUCLK incorporates the selector CPUCLKS, followed by the clock divider CPUCLKD.

The CPUCLK clock divider provides the frequency-divided CPUCLK\_H, CPUCLK\_M, CPUCLK\_L clock signal and CPUCLK\_UL clock signal derived from CPUCLK. CPUCLK settings, see **Table 12AB.1, CPUCLK Divide Table**.

Table 12AB.1 CPUCLK Divide Table

	Products of CPU Frequency		
	240 MHz Max.		160 MHz Max.
CKDIVMD*1	1	0*2	1*3
CPUCLK_H	CPUCLK	CPUCLK	CPUCLK
CPUCLK_M	CPUCLK × 1/2	CPUCLK	CPUCLK × 1/2
CPUCLK_L	CPUCLK × 1/4	CPUCLK × 1/2	CPUCLK × 1/4
CPUCLK_UL	CPUCLK × 1/8	CPUCLK × 1/4	CPUCLK × 1/8

Note 1. For details, see **Section 44, Flash Memory, 44.9.2, OPBT0 — Option Byte 0**

Note 2. When setting "0", please set CPUCLK to 120 MHz or less.

Note 3. When writing, write "1" for products of CPU frequency 160 MHz max.

### 12AB.2.3 Clock Domains

The clock controller allows selection of the respective clocks for the CPU and peripheral modules. The clock control scope is called the clock domain. For the correspondence between the CPU and peripheral modules and clock domains, see **Section 12AB.5.3, Clock Domain Settings**.

### 12AB.2.4 Resetting Clock Oscillators

The clock oscillators on the Always-On area (AWO area) are reset by the PURES signal.

The HS IntOSC is reset when  $\overline{\text{CLMA0RES}}$  is generated and the MainOSC is reset when  $\overline{\text{CLMA1RES}}$  is generated.

The clock oscillator on the Isolated area (ISO area) is reset by the ISORES signal.

For further details on the clock oscillators, see **Section 12AB.3, Clock Oscillators**.

#### CAUTION

---

For the specifications of the frequencies, acceptable variation, and other parameters of the clock generators, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8, Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2**.

---

## 12AB.3 Clock Oscillators

### 12AB.3.1 Main Oscillator (MainOSC)

The Main Oscillator generates the clock X. X is also used as the PLL0 and PLL1 input clock PLL0CLKIN and PLL1CLKIN.

**Figure 12AB.3, Main Oscillator (MainOSC)** shows the basic configuration and signals of the MainOSC.

Figure 12AB.3 Main Oscillator (MainOSC)

#### MainOSC

The MainOSC stops operating after reset is released. To use the MainOSC, set the MainOSC enable trigger bit (MOSCE.MOSCENTRG) to 1 to start the MainOSC.

#### MainOSC Stabilization

The MOSCST.MOSCCLKST[16:0] bits set the MainOSC oscillation stabilization time.

The MainOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting. The oscillation stabilization time can be set to up to  $2^{17} - 1$  EMCLK cycles.

As long as the MainOSC is not stable, the MOSCCLKACT signal disables the X output.

When the MainOSC stabilization counter reaches the value specified in MOSCST.MOSCCLKST[16:0], X is assumed to be stable and MOSCCLKACT switches from 0 to 1 to enable output of X when a waveform is output from MainOSC.

Stable and active X clock is indicated by MOSCS.MOSCCLKACT = 1.

#### MainOSC Amplification Gain

By using MOSCC.MOSCAMSEL[1:0], the MainOSC's input frequency, determined by the external resonator, can be selected from 8 MHz, 16 MHz, 20 MHz, and 24 MHz.

### MainOSC STOP Requests in Stand-by Mode

The STOP signal from the Stand-by Controller requests the MainOSC Controller to switch off the X clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

The stop request mask bit MOSCSTPM.MOSCSTPMSK controls whether the MainOSC is stopped during stand-by or continues operation:

- MOSCSTPM.MOSCSTPMSK = 0:

The STOP request signal is not masked, so the MainOSC is stopped in stand-by.

If the MainOSC is in operation before stand-by, it is automatically re-started after wake-up from stand-by, and the MainOSC stabilization counter counts the oscillation stabilization time.

However, the STOP request is masked under the following conditions, even if MOSCSTPM.MOSCSTPMSK = 0.

Therefore, the MainOSC will continue to operate even in stand-by mode.

- If the stop mask is set (CKSC\_XXXX\_STPM = 0000 0003<sub>H</sub>) for a clock domain for which the MainOSC is selected.

- MOSCSTPM.MOSCSTPMSK = 1:

The STOP request signal is masked, so the MainOSC continues to operate in stand-by.

### Clock Monitor Control

The MainOSC activity signal MOSCCLKACT enables or disables supervision by the Clock Monitor CLMA1. In case the MainOSC is inactive (MOSCCLKACT = 0), supervision of its output clock X by CLMA1 is also disabled.

### MainOSC Enable/Disable Trigger

The MainOSC can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger MOSCE.MOSCENTRG = 1 starts the MainOSC.

Note that setting the enable trigger is only effective if the MainOSC is inactive, i.e. if MOSCS.MOSCCLKACT = 0.

- Disable trigger MOSCE.MOSCDISTRG = 1 stops the MainOSC.

Note that setting the disable trigger is only effective if the MainOSC is active (MOSCCLKACT = 1) and the MainOSC stop requests are not masked (MOSCSTPM.MOSCSTPMSK = 0).

### Direct Clock Input to X1 (EXCLK Mode)

A clock waveform from an external clock source can be supplied to X1 pin. In this case, set the MOSCM bit of MOSCM register to 1 before clock input to X1 pin is supplied.

### 12AB.3.2 Sub Oscillator (SubOSC)

The Sub Oscillator generates the sub clock XT. XT has usually a frequency of 32.768 kHz and is used for the Real-time Clock.

**Figure 12AB.4, Sub Oscillator (SubOSC)** shows the basic structure and signals of the SubOSC.

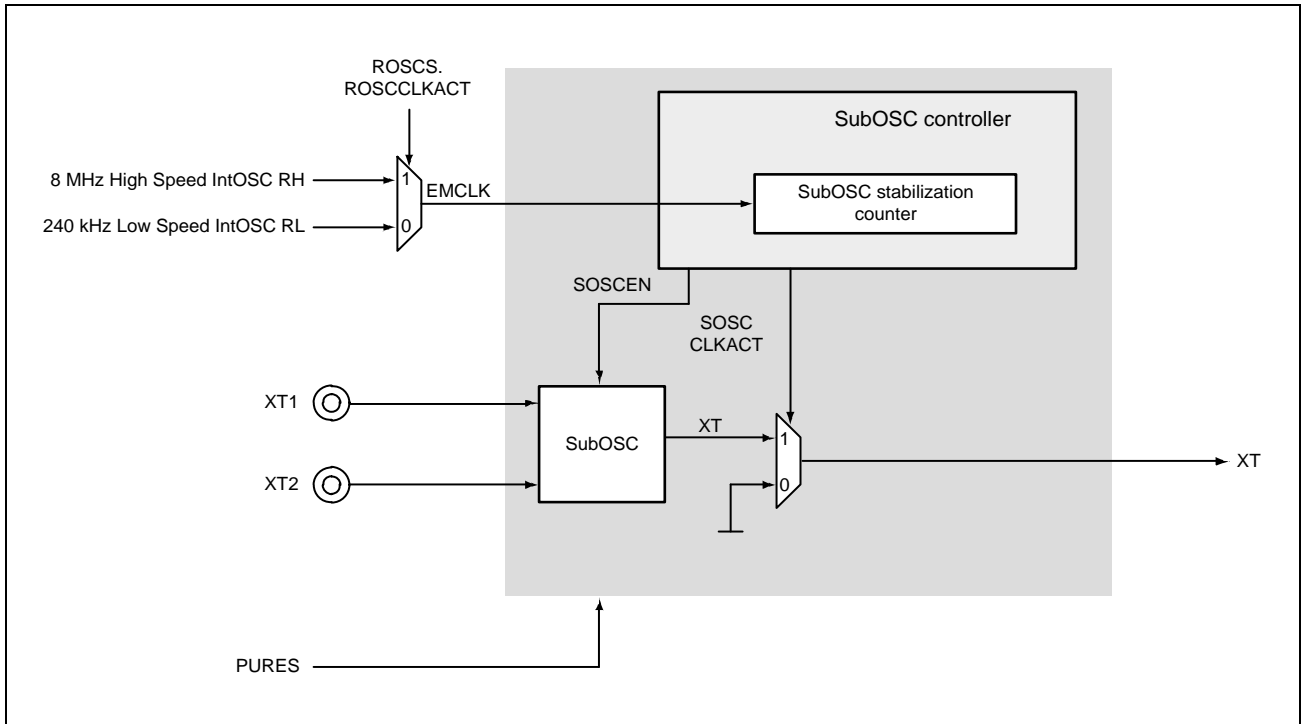

Figure 12AB.4 Sub Oscillator (SubOSC)

#### SubOSC Enable

The SubOSC stops operating after reset is released. To use the SubOSC, set SubOSC enable trigger bit (SOSCE.SOSCENTRG) to 1 to start the SubOSC.

#### SubOSC Stabilization

The SOSCST.SOSCCLKST[29:0] bits set the SubOSC oscillation stabilization time.

The SubOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting.

As long as the SubOSC is not stable, the SOSCCLKACT signal disables the XT output.

When the SubOSC stabilization counter reaches the value specified in SOSCST.SOSCCLKST[29:0], XT is assumed to be stable and SOSCCLKACT switches from 0 to 1 to enable output of XT.

Secure the stabilization time longer than 2 seconds.

Stable and active XT clock is indicated by SOSCS.SOSCCLKACT = 1.

#### SubOSC Input Frequencies

The SubOSC input frequency is 32.768 kHz (Typ.).

### SubOSC Enable/Disable Trigger

SubOSC can be enabled or disabled by using enable/disable trigger control bit.

- Enable trigger `SOSCE.SOSCENTRG = 1` starts the SubOSC.  
 Note that setting the enable trigger is only effective if the SubOSC is inactive, i.e. if `SOSCS.SOSCCLKACT = 0`.
- Disable trigger `SOSCE.SOSCDISTRG = 1` stops the SubOSC. Note that setting the disable trigger is only effective if the SubOSC is active; that is, if `SOSCS.SOSCCLKACT = 1`.

### 12AB.3.3 High Speed Internal Oscillator (HS IntOSC)

The High Speed Internal Oscillator generates the clock RH. RH has a nominal frequency of 8 MHz.

Figure 12AB.5, High Speed Internal Oscillator (HS IntOSC) shows the basic configuration and signals of the HS IntOSC.

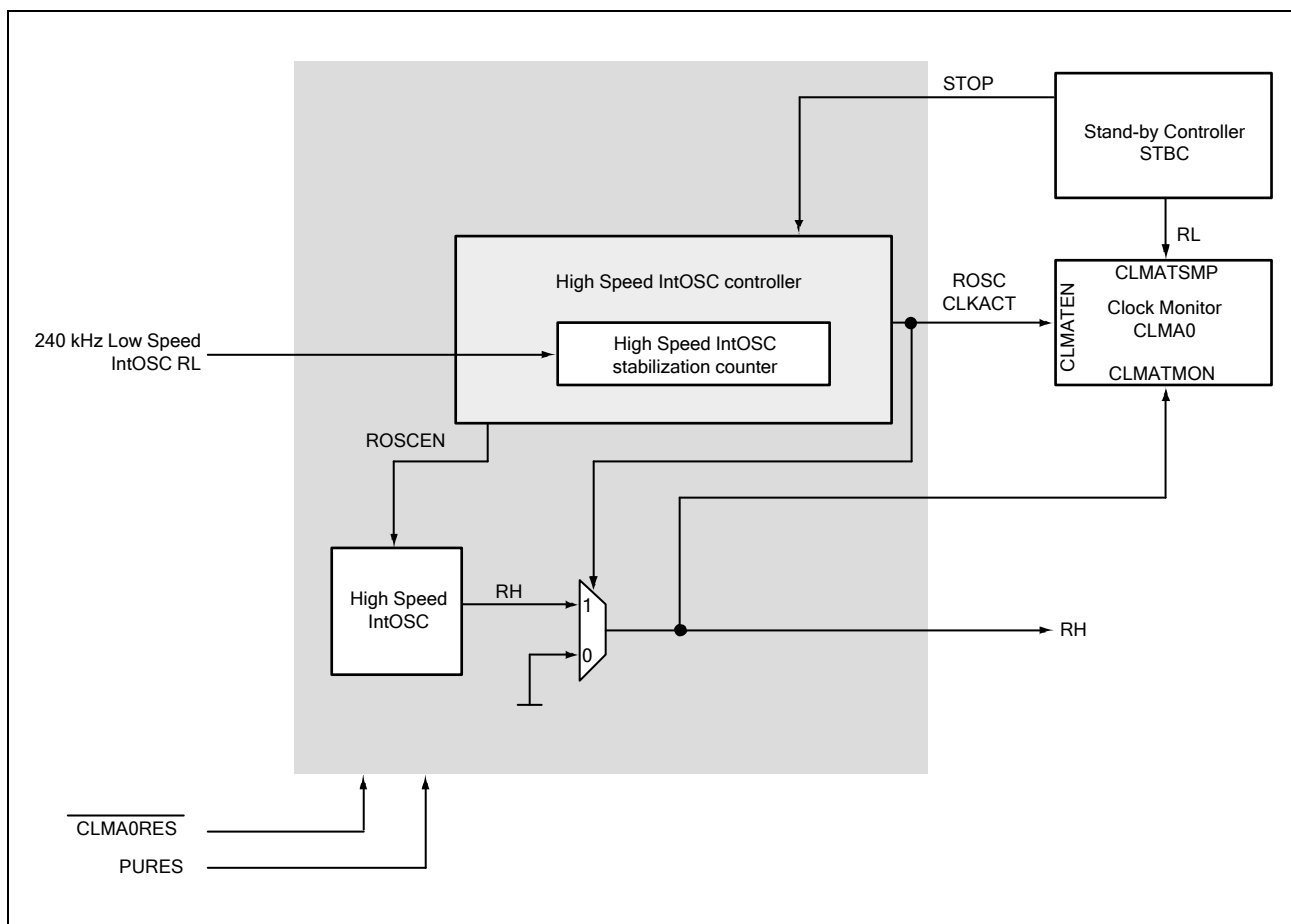

Figure 12AB.5 High Speed Internal Oscillator (HS IntOSC)

After reset release the HS IntOSC starts operation.

**NOTE**

The HS IntOSC can neither be stopped nor started by software. It can only be stopped in stand-by mode. On the other hand, when CLMA0 is reset, the HS IntOSC can be enabled to stop by software.

### HS IntOSC Stabilization

HS IntOSC outputs RH when it is stabilized.

Stable and active RH clock is indicated by `ROSCS.ROSCCLKACT = 1`.

### HS IntOSC STOP Requests in Stand-by Mode

The STOP signal from the Stand-By Controller requests the HS IntOSC Controller to switch off the RH clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

The stop request mask bit `ROSCSTPM.ROSCSTPMSK` controls whether the HS IntOSC is stopped during stand-by or continues operation:

- `ROSCSTPM.ROSCSTPMSK = 0`:

The STOP request signal is not masked, so the HS IntOSC is stopped during stand-by and automatically restarted after wake-up from stand-by.

However, the STOP request is masked under the following conditions, even if `ROSCSTPM.ROSCSTPMSK = 0`. Therefore, the HS IntOSC will continue to operate even in stand-by mode.

- If the stop mask is set (`CKSC_XXX_STPM = 0000 0003H`) for a clock domain for which the HS IntOSC is selected.
- If the low power sampler (LPS) is operating

- `ROSCSTPM.ROSCSTPMSK = 1`:

The STOP request signal is masked, so the HS IntOSC continues to operate during stand-by.

### Clock Monitor Control

The HS IntOSC activity signal `ROSCCLKACT` enables or disables supervision by the Clock Monitor `CLMA0`. In case the HS IntOSC is inactive (`ROSCCLKACT = 0`), supervision of its output clock by `CLMA0` is also deactivated.

The HS IntOSC clock RH is used as the sampling clock for Clock Monitor `CLMA2` and `CLMA3`.

### HS IntOSC Disable Trigger

The disable trigger, `ROSCS.ROSCDISTRG = 1` stops the HS IntOSC.

The setting of the disable trigger is enabled when HS IntOSC is active (`ROSCS.ROSCCLKACT = 1`) and HS IntOSC stop requests are not masked (`ROSCSTPM.ROSCSTPMSK = 0`).

### HS IntOSC User Calibration Function

The HS IntOSC user trimming register (`ROSCUT`) enables adjustment of the HS IntOSC frequency. The initial value of `ROSCUT` is the preset value of the HS IntOSC trimming data. Overwrite the value with “read value + 1” or “read value – 1” until the HS IntOSC frequency reaches the target frequency range.

### 12AB.3.4 Low Speed Internal Oscillator (LS IntOSC)

The Low Speed Internal Oscillator generates the clock RL. RL has a nominal frequency of 240 kHz.

**Figure 12AB.6, Low Speed Internal Oscillator (LS IntOSC)** shows the basic configuration and signals of the LS IntOSC.

Figure 12AB.6 Low Speed Internal Oscillator (LS IntOSC)

After reset release the LS IntOSC starts operation. It cannot be stopped.

The LS IntOSC clock RL is used as the sampling clock for the Clock Monitors CLMA0 and CLMA1.

### 12AB.3.5 PLL

MainOSC or HS IntOSC is input to a phase-locked loop (PLL0 and PLL1) clock oscillator as PLL0CLKIN and PLL1CLKIN.

The PLL0 output clock CPLL0OUT, PLL1 output clocks CPLL1OUT and PPLL0OUT serve as the main operation clocks for the microcontroller.

Figure 12AB.7, PLL shows the basic configuration and signals of the PLL.

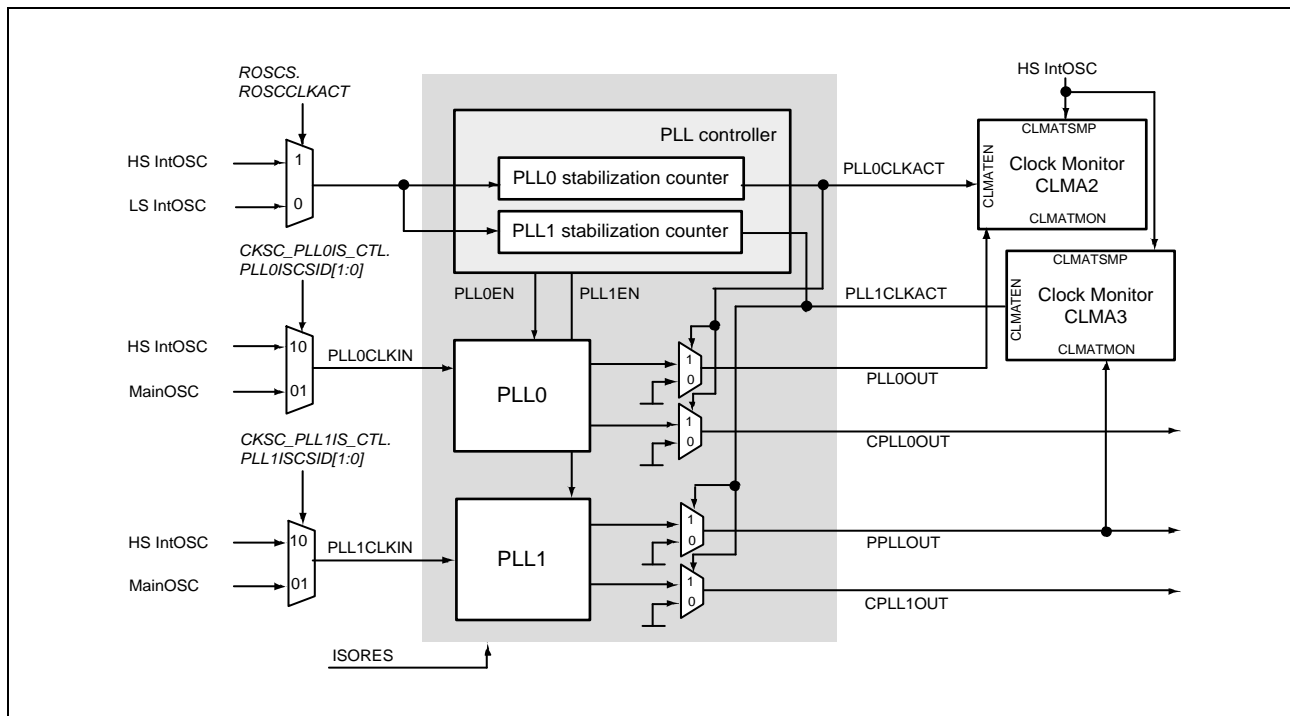

Figure 12AB.7 PLL

#### PLL Enable

The PLL0 stops operating after reset is released. To use the PLL0, set the PLL0 enable trigger bit (PLL0E.PLL0ENTRG) to 1 to start the PLL0.

The PLL1 stops operating after reset is released. To use the PLL1, set the PLL1 enable trigger bit (PLL1E.PLL1ENTRG) to 1 to start the PLL1.

#### PLL Stabilization

The PLL0 stabilization counter starts counting the stabilization time, after PLL0 enabled. As long as the PLL0 is not stable, the PLL0CLKACT signal disables the PLL0OUT and CPLL0OUT outputs.

When the PLL0 stabilization counter reaches the value set in PLL0ST.PLL0CLKST[12:0], PLL0OUT and CPLL0OUT are assumed to be stable and PLL0CLKACT switches from 0 to 1 to enable output of PLL0OUT and CPLL0OUT. The stable and active state of the PLL0OUT and CPLL0OUT clocks is indicated by PLLS.PLL0CLKACT = 1.

The PLL1 stabilization counter starts counting the stabilization time, after PLL1 enabled. As long as the PLL1 is not stable, the PLL1CLKACT signal disables the PPLL0OUT and CPLL1OUT outputs. When the PLL1 stabilization counter reaches the predefined value, PPLL0OUT and CPLL1OUT are assumed to be stable and PLL1CLKACT switches from 0 to 1 to enable output of PPLL0OUT and CPLL1OUT.

The stable and active state of the PPLL0OUT and CPLL1OUT clocks is indicated by PLL1S.PLL1CLKACT = 1.

### PLL in Stand-by Modes

In STOP mode, the PLL0 and PLL1 are automatically disabled and resumes operation after wake-up from STOP mode, if it was operating before entering STOP mode.

The PLL0 and PLL1 are also automatically disabled when transitioning to DeepSTOP mode. However, after restoring from DeepSTOP mode, the PLL0 and PLL1 need to be reconfigured.

In Cyclic RUN and Cyclic STOP mode, the PLL0 and PLL1 are not available. Do not enable the PLL0 and PLL1 in Cyclic RUN mode.

### Clock Monitor Control

The PLL0 activity signal PLL0CLKACT enables or disables supervision by the Clock Monitor CLMA2. In case the PLL0 is inactive (PLL0CLKACT = 0), supervision of the output clock PLL0OUT by CLMA2 is also deactivated.

The PLL1 activity signal PLL1CLKACT enables or disables supervision by the Clock Monitor CLMA3. In case the PLL1 is inactive (PLL1CLKACT = 0), supervision of the output clock PPLLOUT by CLMA3 is also deactivated.

### PLL Enable/Disable Trigger

The PLL0 and PLL1 can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger PLL0E.PLL0ENTRG = 1 starts the PLL0  
Note that setting the enable trigger is only effective if the PLL0 is inactive, i.e. if PLL0S.PLL0CLKACT = 0.
- Disable trigger PLL0E.PLL0DISTRG = 1 stops the PLL0  
Note that setting the disable trigger is only effective if the PLL0 is active, i.e. if PLL0S.PLL0CLKACT = 1.
- Enable trigger PLL1E.PLL1ENTRG = 1 starts the PLL1  
Note that setting the enable trigger is only effective if the PLL1 is inactive, i.e. if PLL1S.PLL1CLKACT = 0.
- Disable trigger PLL1E.PLL1DISTRG = 1 stops the PLL1  
Note that setting the disable trigger is only effective if the PLL1 is active, i.e. if PLL1S.PLL1CLKACT = 1.

### PLL Input Clock Selection

The PLL0 input clock (PLL0CLKIN) can be selectable from MainOSC and HS IntOSC by using the CKSC\_PLL0IS\_CTL register.

The maximum frequency of CPLL0OUT and PLL0OUT is limited in the case the HS IntOSC is selected as PLL0 input clock.

The PLL1 input clock (PLL1CLKIN) can be selectable from MainOSC and HS IntOSC by using the CKSC\_PLL1IS\_CTL register.

The maximum frequency of CPLL1OUT and PPLLOUT is limited in the case the HS IntOSC is selected as PLL1 input clock.

### 12AB.3.5.1 PLL0 Parameters

The PLL0 is configured by a set of parameters, loaded from the control register PLL0C and CKSC\_CPUCLKD\_CTL.

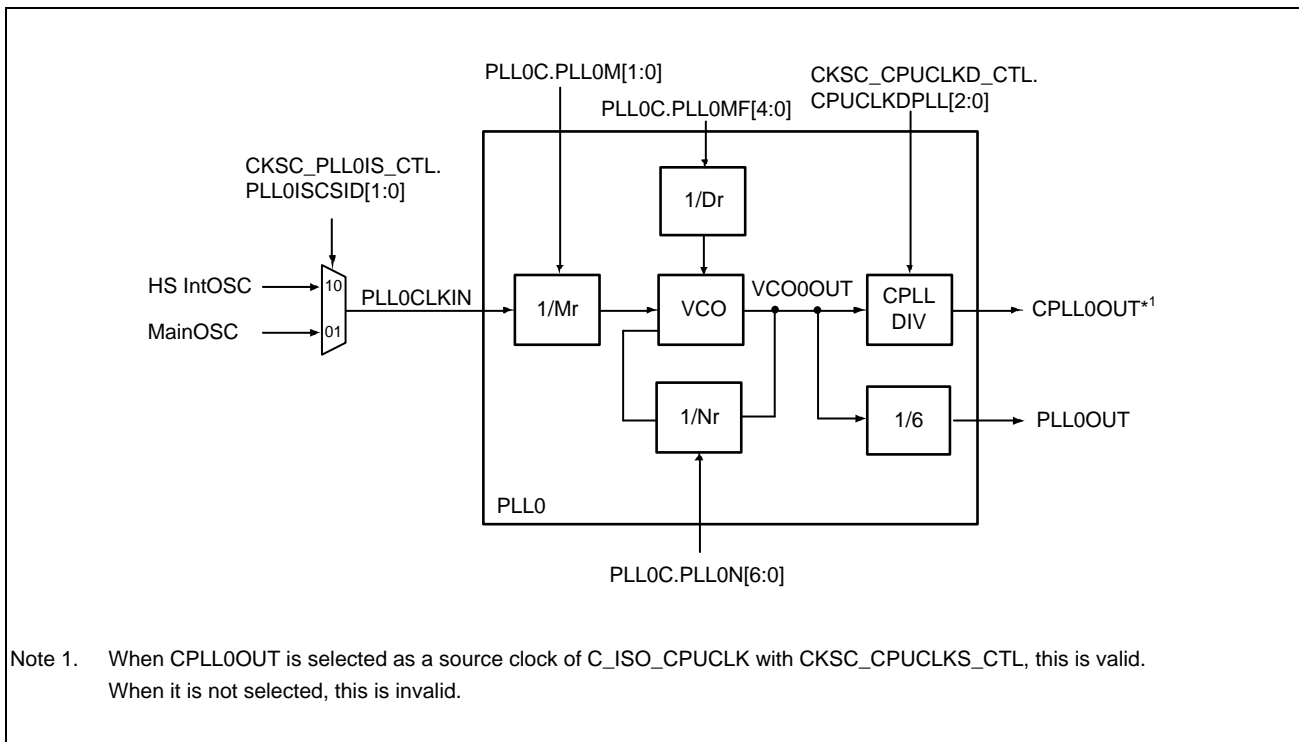

Figure 12AB.8 PLL0 Circuit

#### CPLL0OUT and PLL0OUT

The PLL0 has two clock outputs “CPLL0OUT” and “PLL0OUT”. The CPLL0OUT is one of the clock sources of the CPU subsystem, and the PLL0OUT is supervised by the Clock Monitor CLMA2. The CPLL0OUT and PLL0OUT shares the same clock source “VCO0OUT”, which is the output of Voltage Controlled Oscillator (VCO). The clock frequency of the VCO0OUT is calculated by the following formula:

$$f_{VCO0OUT} = f_{PLL0CLKIN} \times (Nr / Mr)$$

The clock frequency of CPLL0OUT “ $f_{CPLL0OUT}$ ” and that of PLL0OUT “ $f_{PLL0OUT}$ ” are integer fractions of the VCO output frequency  $f_{VCO0OUT}$ .  $f_{CPLL0OUT}$  and  $f_{PLL0OUT}$  are calculated by the following formulas:

$$f_{CPLL0OUT} = f_{VCO0OUT} \times 1/Pr = f_{PLL0CLKIN} \times (Nr / Mr) \times 1/Pr$$

$$f_{PLL0OUT} = f_{VCO0OUT} \times 1/6 = f_{PLL0CLKIN} \times (Nr / Mr) \times 1/6$$

The values Nr and Mr are derived from PLL0C register bits:

$$Nr = PLL0C.PLL0N[6:0] + 1$$

$$Mr = PLL0C.PLL0M[1:0] + 1$$

The setting range of Mr:  $1 \leq Mr \leq 3$

The value Pr is derived from CKSC\_CPUCLKD\_CTL.CPUCLKDPLL[2:0], and the value is 2, 3, 4, or 6.

### 12AB.3.5.2 PLL1 Parameters

The PLL1 is configured by a set of parameters, loaded from the control register PLL1C and CKSC\_CPUCLKD\_CTL.

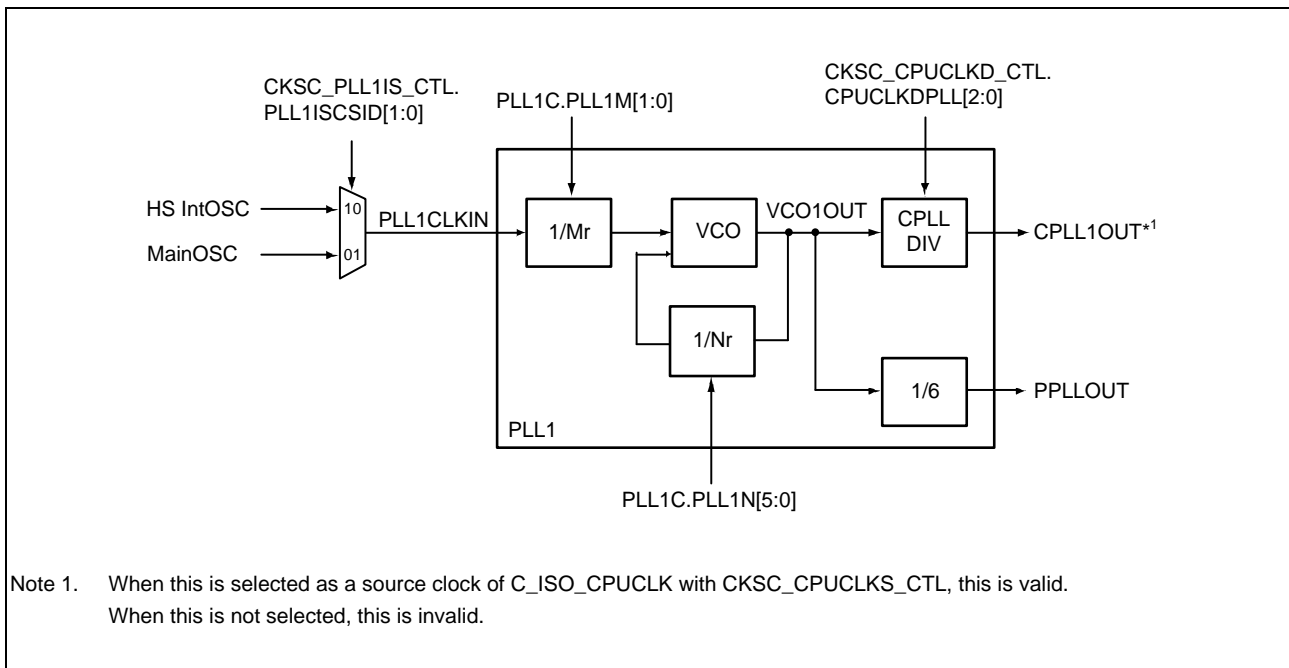

Figure 12AB.9 PLL1 Circuit

#### CPLL1OUT and PPLL1OUT

The PLL1 has two clock outputs “CPLL1OUT” and “PPLL1OUT”. The CPLL1OUT is one of the clock sources of the CPU subsystem, and the PPLL1OUT is one of the clock sources of the peripheral modules. CPLL1OUT and PPLL1OUT shares the same clock source “VCO1OUT”, which is the output of the voltage controlled oscillator (VCO). The clock frequency of VCO1OUT is calculated by the following formula:

$$f_{VCO1OUT} = f_{PLL1CLKIN} \times (Nr / Mr)$$

The clock frequency of CPLL1OUT “ $f_{CPLL1OUT}$ ” and that of PPLL1OUT “ $f_{PPLL1OUT}$ ” are integer fractions of the VCO output frequency  $f_{VCO1OUT}$ .  $f_{CPLL1OUT}$  and  $f_{PPLL1OUT}$  are calculated by the following formulas:

$$f_{CPLL1OUT} = f_{VCO1OUT} \times 1/Pr = f_{PLL1CLKIN} \times (Nr / Mr) \times 1/Pr$$

$$f_{PPLL1OUT} = f_{VCO1OUT} \times 1/6 = f_{PLL1CLKIN} \times (Nr / Mr) \times 1/6$$

The values Nr and Mr are derived from PLL1C register bits:

$$Nr = PLL1C.PLL1N[5:0] + 1$$

$$Mr = PLL1C.PLL1M[1:0] + 1$$

The setting range of Mr:  $1 \leq Mr \leq 3$

The value Pr is derived from CKSC\_CPUCLKD\_CTL. CPUCLKDPLL[2:0], and the value is 4 or 6.

## 12AB.4 Registers

### 12AB.4.1 List of Registers

The registers of the clock controller are listed below.

Table 12AB.2 List of Registers

Module Name	Register Name	Symbol	Address
CLKCTL	Clock oscillator registers:		
	MainOSC enable register	MOSCE	FFF8 1100 <sub>H</sub>
	MainOSC status register	MOSCS	FFF8 1104 <sub>H</sub>
	MainOSC control register	MOSCC	FFF8 1108 <sub>H</sub>
	MainOSC stabilization time register	MOSCST	FFF8 110C <sub>H</sub>
	MainOSC stop mask register	MOSCSTPM	FFF8 1118 <sub>H</sub>
	MainOSC mode control register	MOSCM	FFF8 111C <sub>H</sub>
	SubOSC enable register	SOSCE* <sup>1</sup>	FFF8 1200 <sub>H</sub>
	SubOSC status register	SOSCS* <sup>1</sup>	FFF8 1204 <sub>H</sub>
	SubOSC stabilization time register	SOSCST* <sup>1</sup>	FFF8 120C <sub>H</sub>
	HS IntOSC enable register	ROSCE	FFF8 1000 <sub>H</sub>
	HS IntOSC status register	ROSCS	FFF8 1004 <sub>H</sub>
	HS IntOSC stop mask register	ROSCSTPM	FFF8 1018 <sub>H</sub>
	HS IntOSC user trimming register	ROSCUT	FFF8 101C <sub>H</sub>
	PLL0 enable register	PLL0E	FFF8 9000 <sub>H</sub>
	PLL0 status register	PLL0S	FFF8 9004 <sub>H</sub>
	PLL0 control register	PLL0C	FFF8 9008 <sub>H</sub>
	PLL0 stabilization time register	PLL0ST	FFF8 900C <sub>H</sub>
	PLL1 enable register	PLL1E	FFF8 9100 <sub>H</sub>
	PLL1 status register	PLL1S	FFF8 9104 <sub>H</sub>
	PLL1 control register	PLL1C	FFF8 9108 <sub>H</sub>
	PLL0 input clock selection register	CKSC_PLL0IS_CTL	FFF8 A700 <sub>H</sub>
	PLL0 input clock active register	CKSC_PLL0IS_ACT	FFF8 A708 <sub>H</sub>

	C_ISO_IIC source clock selection register	CKSC_IICS_CTL	FFF8 AC00 <sub>H</sub>
C_ISO_IIC source clock active register	CKSC_IICS_ACT	FFF8 AC08 <sub>H</sub>	

Note 1. It isn't supported with 100-pin product.

## 12AB.4.2 Clock Oscillator Registers

### 12AB.4.2.1 MOSCE — MainOSC Enable Register

This register is used to start and stop the MainOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA1RES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1100<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCD ISTRG	MOSCE NTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.3 MOSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MOSCDISTRG	MainOSC Disable Trigger*1,*3 <u>MOSCSTPM.MOSCSTPMSK = 0</u> 0: No function 1: Stops MainOSC  <u>MOSCSTPM.MOSCSTPMSK = 1</u> When writing this bit while MOSCSTPM.MOSCSTPMSK = 1, the write value should be 0. 0: No function 1: Setting Prohibited This bit is automatically cleared to 0 by hardware after MainOSC is disabled.
0	MOSCENTRG	MainOSC Enable Trigger*2,*3 0: No function 1: Starts MainOSC This bit is automatically cleared to 0 by hardware after MainOSC is enabled.

- Note 1. Follow the procedure given below for stopping the MainOSC by using MOSCDISTRG.
1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
  2. Confirm that the MainOSC is active (MOSCS.MOSCCLKACT = 1).
  3. Check that there is no clock domain for which the MainOSC is selected. If the MainOSC is selected for a clock domain, disable the setting or select a clock source other than MainOSC.
  4. Confirm that the MainOSC stop mask register (MOSCSTPM) is NOT set to "MainOSC continues operation in standby mode" (MOSCSTPM.MOSCSTPMSK = 1). Otherwise, set the register to "MainOSC stops operation in stand-by mode" (MOSCSTPM.MOSCSTPMSK = 0).
  5. Stop the MainOSC (MOSCE.MOSCDISTRG = 1).
  6. Confirm that the MainOSC has been stopped (MOSCS.MOSCCLKACT = 0).
- Note 2. Follow the procedure given below for starting the MainOSC by using MOSCENTRG
1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
  2. Confirm that the MainOSC is inactive (MOSCS.MOSCCLKACT = 0).
  3. Start the MainOSC (MOSCE.MOSCENTRG = 1).
  4. Confirm that the MainOSC has been started (MOSCS.MOSCCLKACT = 1).
- Note 3. Starting and stopping the MainOSC at the same time by using the start and stop bits, i.e., by setting MOSCE.MOSCENTRG = 1 and MOSCE.MOSCDISTRG = 1 at the same time is not allowed.

### 12AB.4.2.2 MOSCS — MainOSC Status Register

This register provides active status information about the MainOSC.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA1RES}}$ .

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 1104<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1*1	0*1
	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCC LKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.  
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12AB.4 MOSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	MOSCCLKACT	MainOSC Active Status 0: MainOSC is inactive 1: MainOSC is active
1, 0	Reserved	When read, an undefined value is returned.

### 12AB.4.2.3 MOSCC — MainOSC Control Register

This register is used to specify amplification gain of the MainOSC.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA1RES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1108<sub>H</sub>

**Value after reset:** 0000 0004<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCAMPEL [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.5 MOSCC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	MOSCAMPEL[1:0]	MainOSC Amplification Gain Selection 00: Amplification gain for fx = 24 MHz 01: Amplification gain for fx = 20 MHz 10: Amplification gain for fx = 16 MHz 11: Amplification gain for fx = 8 MHz

**CAUTION**

Set this register when MainOSC is stopped.

### 12AB.4.2.4 MOSCST — MainOSC Stabilization Time Register

This register determines the MainOSC stabilization time.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA1RES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 110C<sub>H</sub>

**Value after reset:** 0000 44C0<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCCLKST16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MOSCCLKST[15:0]															
Value after reset	0	1	0	0	0	1	0	0	1	1	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12AB.6 MOSCST Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16 to 0	MOSCCLKST[16:0]	The MOSCCLKST[16:0] bits specify the count value for the MainOSC stabilization counter. <ul style="list-style-type: none"> <li>• If HS IntOSC active (ROSCS.ROSCCLKACT = 1): Stabilization time = MOSCCLKST[16:0] / f<sub>RH</sub></li> <li>• If HS IntOSC inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = MOSCCLKST[16:0] / f<sub>RL</sub></li> </ul>

**NOTE**

See **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2** for information about the MainOSC stabilization time.

**CAUTION**

Set this register when MainOSC is stopped.

### 12AB.4.2.5 MOSCSTPM — MainOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMAIRES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1118<sub>H</sub>

**Value after reset:** 0000 0002<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12AB.7 MOSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCSTPMSK	MainOSC Stop Request Mask 0: MainOSC stops operation in stand-by mode. MainOSC stops operation in the case the MainOSC disable trigger MOSCE.MOSCDISTRG is set to 1. 1: MainOSC continues operation in stand-by mode.

### 12AB.4.2.6 MOSCM — MainOSC Mode Control Register

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMAIRES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 111C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12AB.8 MOSCM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCM	MainOSC Mode control 0: OSC mode. (default) 1: EXCLK mode. MainOSC amplifier is disabled.

**CAUTION**

Set this register when MainOSC is stopped.

**NOTE**

EXCLK mode is a mode to directly input clock to X1. For details, see **Section 12AB.3.1, Main Oscillator (MainOSC)**.

### 12AB.4.2.7 SOSCE — SubOSC Enable Register

This register is used to start and stop the SubOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1200<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOSCD ISTRG	SOSCE NTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.9 SOSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SOSCDISTRG	SubOSC Disable Trigger* <sup>1,*3</sup> 0: No function 1: Stops SubOSC This bit is automatically cleared to 0 by hardware after SubOSC is disabled.
0	SOSCENTRG	SubOSC Enable Trigger* <sup>2,*3</sup> 0: No function 1: Starts SubOSC This bit is automatically cleared to 0 by hardware after SubOSC is enabled.

Note 1. Follow the procedure given below for stopping the SubOSC by using SOSCDISTRG.

1. Confirm that the SubOSC is neither waiting for being enabled nor stopped (SOSCE.SOSCDISTRG = 0 and SOSCE.SOSCENTRG = 0).
2. Confirm that the SubOSC is active (SOSCS.SOSCCLKACT = 1).
3. Check that there is no clock domain for which the SubOSC is selected. If the SubOSC is selected for a clock domain, disable the setting or select a clock source other than the SubOSC.
4. Stop the SubOSC (SOSCE.SOSCDISTRG = 1).
5. Confirm that the SubOSC has been stopped (SOSCS.SOSCCLKACT = 0).

Note 2. Follow the procedure given below for starting the SubOSC by using SOSCENTRG.

1. Confirm that the SubOSC is neither waiting for being enabled nor stopped (SOSCE.SOSCDISTRG = 0 and SOSCE.SOSCENTRG = 0).
2. Confirm that the SubOSC is inactive (SOSCS.SOSCCLKACT = 0).
3. Start the SubOSC (SOSCE.SOSCENTRG = 1).
4. Confirm that the SubOSC has been started (SOSCS.SOSCCLKACT = 1).

Note 3. Starting and stopping the SubOSC at the same time by using the start and stop bits, i.e., by setting SOSCE.SOSCENTRG = 1 and SOSCE.SOSCDISTRG = 1 at the same time is not allowed.

### 12AB.4.2.8 SOSCS — SubOSC Status Register

This register provides active status information about the SubOSC.

This register is initialized by the power-up reset signal PURES.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 1204<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1*1	0*1
	—	—	—	—	—	—	—	—	—	—	—	—	—	SOSCC LKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.  
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12AB.10 SOSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	SOSCCLKACT	SubOSC Activation Status 0: SubOSC is inactive 1: SubOSC is active
1, 0	Reserved	When read, an undefined value is returned.

### 12AB.4.2.9 SOSCST — SubOSC Stabilization Time Register

This register determines the SubOSC stabilization time.

This register is initialized by the power-up reset signal PURES.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 120C<sub>H</sub>

**Value after reset:** 010C 8E00<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SOSCCLKST[29:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12AB.11 SOSCST Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 0	SOSCCLKST[29:0]	The SOSCCLKST[29:0] bits specify the count value for the SubOSC stabilization time counter. <ul style="list-style-type: none"> <li>• If the HS IntOSC is active (ROSCS.ROSCCLKACT = 1): Stabilization time = SOSCCLKST[29:0] / f<sub>RH</sub></li> <li>• If the HS IntOSC is inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = SOSCCLKST[29:0] / f<sub>RL</sub></li> </ul>

**NOTE**

See **Section 47A, Electrical Characteristics of RH850/F1KH-D8, Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2** for information about the SubOSC stabilization time.

**CAUTION**

Set this register when SubOSC is stopped.

### 12AB.4.2.10 ROSCE — HS IntOSC Enable Register

This register is used to stop the HS IntOSC operation.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA0RES}}$ .

#### CAUTION

Set the ROSCE.ROSCDISTRG bit only when the  $\overline{\text{CLMA0RES}}$  has occurred. In other cases, setting this bit is prohibited.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 12AB.4.2.11 ROSCS — HS IntOSC Status Register

This register provides active status information about the HS IntOSC.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA0RES}}$ .

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 1004<sub>H</sub>

**Value after reset:** 0000 0007<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 12AB.14 ROSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ROSCSTPMSK	HS IntOSC Stop Request Mask 0: HS IntOSC stops operation in stand-by mode 1: HS IntOSC continues operation in stand-by mode Do not set the HS IntOSC disable trigger ROSCE.ROSCDISTRG to 1 while ROSCSTPMSK bit is set to 1.

### 12AB.4.2.13 PLL0E — PLL0 Enable Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 9000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL0DISTRG	PLL0ENTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.15 PLL0E Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PLL0DISTRG	PLL0 Disable Trigger*1,*4 0: No function 1: Stops PLL0 This bit is automatically cleared to 0 by hardware after PLL0 is disabled.
0	PLL0ENTRG	PLL0 Enable Trigger*2,*3,*4 0: No function 1: Starts PLL0 This bit is automatically cleared to 0 by hardware after PLL0 is activated.

- Note 1. Follow the procedure given below for stopping the PLL0 by using PLL0DISTRG.
1. Confirm that the PLL0 is neither waiting for being enabled nor stopped (both PLL0E.PLL0DISTRG = 0 and PLL0E.PLL0ENTRG = 0).
  2. Confirm that the PLL0 is active (PLL0S.PLL0CLKACT = 1).
  3. Check that there is no clock domain for which the PLL0 is selected. If the PLL0 is selected for a clock domain, disable the setting or select a clock source other than the PLL0.
  4. Stop the PLL0 (PLL0E.PLL0DISTRG = 1).
  5. Confirm that the PLL0 has been stopped (PLL0S.PLL0CLKACT = 0).
- Note 2. Before starting PLL0 using PLL0ENTRG, confirm that the PLL0 input clock (MainOSC or HS IntOSC, selected by the CKSC\_PLL0IS\_CTL) is operating.
- Note 3. Follow the procedure given below for starting the PLL0 by using PLL0ENTRG.
1. Confirm that the PLL0 is neither waiting for being enabled nor stopped (both PLL0E.PLL0DISTRG = 0 and PLL0E.PLL0ENTRG = 0).
  2. Confirm that the PLL0 is inactive (PLL0S.PLL0CLKACT = 0).
  3. Start the PLL0 (PLL0E.PLL0ENTRG = 1).
  4. Confirm that the PLL0 has been started (PLL0S.PLL0CLKACT = 1).
- Note 4. Starting and stopping the PLL0 at the same time by using the start and stop bits, i.e., by setting PLL0E.PLL0ENTRG = 1 and PLL0E.PLL0DISTRG = 1 at the same time is not allowed.

### 12AB.4.2.14 PLL0S — PLL0 Status Register

This register provides active status information about the PLL0.

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 9004<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1 <sup>*1</sup>	0 <sup>*1</sup>
	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL0CLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.  
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12AB.16 PLL0S Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	PLL0CLKACT	PLL0 Active Status 0: PLL0 is inactive 1: PLL0 is active
1, 0	Reserved	When read, an undefined value is returned.

### 12AB.4.2.15 PLL0C — PLL0 Control Register

This register is used to set the PLL0 VCO output clock frequency  $f_{VCO0OUT}$ , shown in **Section 12AB.3.5.1, PLL0 Parameters**.

This register can only be written, if the PLL0 is disabled.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 9008<sub>H</sub>

**Value after reset:** 6000 503B<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

		1	0	0	5%
		1	0	1	6%
		1	1	0	8%
1	1	1	10%		
19 to 15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.			
14	PLL0MD	Operating Mode Setting 0: Setting prohibited 1: SSCG mode (modulation frequency)			
13	PLL0SMD	Modulation Mode Setting in SSCG Mode 1: Setting prohibited 0: Down spread modulation			
12, 11	PLL0M[1:0]	Division ratio Mr is set. For PLL0M[1:0] settings, see <b>Table 12AB.18, PLL0 Output Table</b> .			
10 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.			
6 to 0	PLL0N[6:0]	Division ratio Nr is set. For PLL0N[6:0] settings, see <b>Table 12AB.18, PLL0 Output Table</b> .			

**CAUTION**

Set this register when PLL0 is stopped.

Table 12AB.18 PLL0 Output Table

PLL0CLKIN frequency $f_{\text{PLL0CLKIN}}$ (MHz)	PLL0C. PLL0M[1:0] (Mr) <sup>*3</sup>	PLL0C. PLL0N[6:0] (Nr) <sup>*3</sup>	VCO0OUT frequency $f_{\text{VCO0OUT}}$ (MHz)	CPLL0OUT frequency $f_{\text{CPLL0OUT}}$ (MHz) <sup>*1</sup>			
				VCO0OUT × 1/2 (Products of CPU frequency 240 MHz max. at CKDIVMD "1")	VCO0OUT × 1/3 (Products of CPU frequency 240 MHz max. at CKDIVMD "1" / Products of CPU frequency 160 MHz max.)	VCO0OUT × 1/4 (Products of CPU frequency 240 MHz max. / Products of CPU frequency 160 MHz max.)	VCO0OUT × 1/6 (Products of CPU frequency 240 MHz max. / Products of CPU frequency 160 MHz max.)
8 (MainOSC)	00 <sub>B</sub> (Mr = 1)	3B <sub>H</sub> (Nr = 60)	480.0	240.0	160.0	120.0	N/A
16 (MainOSC)	01 <sub>B</sub> (Mr = 2)	3B <sub>H</sub> (Nr = 60)	480.0	240.0	160.0	120.0	N/A
20 (MainOSC)	01 <sub>B</sub> (Mr = 2)	2F <sub>H</sub> (Nr = 48)	480.0	240.0	160.0	120.0	N/A
24 (MainOSC)	01 <sub>B</sub> (Mr = 2)	27 <sub>H</sub> (Nr = 40)	480.0	240.0	160.0	120.0	N/A
24 (MainOSC)	10 <sub>B</sub> (Mr = 3)	3B <sub>H</sub> (Nr = 60)	480.0	240.0	160.0	120.0	N/A
8 (HS IntOSC)	00 <sub>B</sub> (Mr = 1)	3B <sub>H</sub> (Nr = 60)	480.0	N/A	N/A	N/A	80.0 <sup>*2</sup>

Note 1. The CPLL0OUT frequency is defined by CKSC\_CPUCLKD\_CTL.CPUCLKDPLL[2:0]. Refer to the CKSC\_CPUCLKD\_CTL register description.

Note 2. The limit of CPLL0OUT frequency is 80 MHz (typ.) when HS IntOSC is selected as clock source of PLL0.

Note 3. Settings other than those shown in this table are prohibited.

### 12AB.4.2.16 PLL0ST — PLL0 Stabilization Time Register

This register specifies stabilization time of the PLL0.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 900C<sub>H</sub>

**Value after reset:** 0000 1B80<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12AB.19 PLL0ST Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 0	PLL0CLKST[12:0]	PLL0 Stabilization Time Setting The PLL0 stabilization counter counts cycles of the HS IntOSC. Set the following value as the PLL0 operating mode settings.
	Mode	PLL0CLKST[12:0]
	SSCG mode	1B80 <sub>H</sub>

### 12AB.4.2.17 PLL1E — PLL1 Enable Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 9100<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1DI STRG	PLL1EN TRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.20 PLL1E Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PLL1DISTRG	PLL1 Disable Trigger*1,*4 0: No function 1: Stops PLL1 This bit is automatically cleared to 0 by hardware after PLL1 is disabled.
0	PLL1ENTRG	PLL1 Enable Trigger*2,*3,*4 0: No function 1: Starts PLL1 This bit is automatically cleared to 0 by hardware after PLL1 is activated.

- Note 1. Follow the procedure given below for stopping the PLL1 by using PLL1DISTRG.
1. Confirm that the PLL1 is neither waiting for being enabled nor stopped (both PLL1E.PLL1DISTRG = 0 and PLL1E.PLL1ENTRG = 0).
  2. Confirm that the PLL1 is active (PLL1S.PLL1CLKACT = 1).
  3. Check that there is no clock domain for which the PLL1 is selected. If the PLL1 is selected for a clock domain, disable the setting or select a clock source other than the PLL1.
  4. Stop the PLL1 (PLL1E.PLL1DISTRG = 1).
  5. Confirm that the PLL1 has been stopped (PLL1S.PLL1CLKACT = 0).

Note 2. Before starting PLL1 using PLL1ENTRG, confirm that the PLL1 input clock (MainOSC or HS IntOSC, selected by the CKSC\_PLL1IS\_CTL) is operating.

- Note 3. Follow the procedure given below for starting the PLL1 by using PLL1ENTRG.
1. Confirm that the PLL1 is neither waiting for being enabled nor stopped (both PLL1E.PLL1DISTRG = 0 and PLL1E.PLL1ENTRG = 0).
  2. Confirm that the PLL1 is inactive (PLL1S.PLL1CLKACT = 0).
  3. Start the PLL1 (PLL1E.PLL1ENTRG = 1).
  4. Confirm that the PLL1 has been started (PLL1S.PLL1CLKACT = 1).

Note 4. Starting and stopping the PLL1 at the same time by using the start and stop bits, i.e., by setting PLL1E.PLL1ENTRG = 1 and PLL1E.PLL1DISTRG = 1 at the same time is not allowed.

### 12AB.4.2.18 PLL1S — PLL1 Status Register

This register provides active status information about the PLL1.

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 9104<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1*1	0*1
	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1CLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.  
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12AB.21 PLL1S Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	PLL1CLKACT	PLL1 Active Status 0: PLL1 is inactive 1: PLL1 is active
1, 0	Reserved	When read, an undefined value is returned.

### 12AB.4.2.19 PLL1C — PLL1 Control Register

This register is used to set the PLL1 VCO output clock frequency  $f_{VCO1OUT}$ , shown in **Section 12AB.3.5.2, PLL1 Parameters**.

This register can only be written, if the PLL1 is disabled.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 9108<sub>H</sub>

**Value after reset:** 0001 133B<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PLL1M[1:0]	—	—	—	—	—	—	PLL1N[5:0]					
Value after reset	0	0	0	1	0	0	1	1	0	0	1	1	1	0	1	1
R/W	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 12AB.22 PLL1C Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12, 11	PLL1M[1:0]	Division ratio $M_r$ is set. For PLL1M[1:0] settings, see <b>Table 12AB.23, PLL1 Output Table</b> .
10 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	PLL1N[5:0]	Division ratio $N_r$ is set. For PLL1N[5:0] settings, see <b>Table 12AB.23, PLL1 Output Table</b> .

**CAUTION**

Set this register when PLL1 is stopped.

Table 12AB.23 PLL1 Output Table

PLL1CLKIN frequency $f_{PLL1CLKIN}$ (MHz)	PLL1C. PLL1M[1:0] (Mr) <sup>*3</sup>	PLL1C. PLL1N[5:0] (Nr) <sup>*3</sup>	VCO1OUT frequency $f_{VCO1OUT}$ (MHz)	CPLL1OUT frequency $f_{CPLL1OUT}$ (MHz) <sup>*1</sup>		PPLL1OUT frequency $f_{PPLL1OUT}$ (MHz)
				VCO1OUT × 1/4	VCO1OUT × 1/6	
8 (Main OSC)	00 <sub>B</sub> (Mr = 1)	3B <sub>H</sub> (Nr = 60)	480.0	120.0	80.0	80.0
16 (MainOSC)	01 <sub>B</sub> (Mr = 2)	3B <sub>H</sub> (Nr = 60)	480.0	120.0	80.0	80.0
20 (MainOSC)	01 <sub>B</sub> (Mr = 2)	2F <sub>H</sub> (Nr = 48)	480.0	120.0	80.0	80.0
24 (MainOSC)	01 <sub>B</sub> (Mr = 2)	27 <sub>H</sub> (Nr = 40)	480.0	120.0	80.0	80.0
24 (MainOSC)	10 <sub>B</sub> (Mr = 3)	3B <sub>H</sub> (Nr = 60)	480.0	120.0	80.0	80.0
8 (HS IntOSC)	00 <sub>B</sub> (Mr = 1)	3B <sub>H</sub> (Nr = 60)	480.0	N/A	80.0 <sup>*2</sup>	80.0

Note 1. The CPLL1OUT frequency is defined by CKSC\_CPUCLKD\_CTL.CPUCLKDPLL[2:0]. Refer to the CKSC\_CPUCLKD\_CTL register description.

Note 2. The limit of CPLL1OUT frequency is 80 MHz (typ.) when HS IntOSC is selected as clock source of PLL1.

Note 3. Settings other than those shown in this table are prohibited.

### 12AB.4.2.20 PLL0 Input Clock Selection

#### (1) CKSC\_PLL0IS\_CTL — PLL0 Input Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A700<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL0ISCSID [1:0]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.24 CKSC\_PLL0IS\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PLL0ISCSID[1:0]	Source Clock Setting for PLL0 input clock 01 <sub>B</sub> : MainOSC (Default) 10 <sub>B</sub> : HS IntOSC*1 Other than above: Setting prohibited

Note 1. The maximum frequency of CPLLOUT and PLL0OUT is limited when the HS IntOSC is selected as the PLL0 input clock.

#### CAUTION

Set this register when PLL0 is stopped.

**(2) CKSC\_PLL0IS\_ACT — PLL0 Input Clock Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A708<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.25 CKSC\_PLL0IS\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PLL0ISACT[1:0]	Source clock for currently active PLL0 input clock

### 12AB.4.2.21 PLL1 Input Clock Selection

#### (1) CKSC\_PLL1IS\_CTL — PLL1 Input Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A710<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1ISCSID [1:0]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.26 CKSC\_PLL1IS\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PLL1ISCSID[1:0]	Source Clock Setting for PLL1 input clock 01 <sub>B</sub> : MainOSC (Default) 10 <sub>B</sub> : HS IntOSC*1 Other than above: Setting prohibited

Note 1. The maximum frequency of CPLL1OUT and PPLLOUT is limited when the HS IntOSC is selected as the PLL1 input clock.

#### CAUTION

Set this register when PLL1 is stopped.

**(2) CKSC\_PLL1IS\_ACT — PLL1 Input Clock Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A718<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1ISACT[1:0]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.27 CKSC\_PLL1IS\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PLL1ISACT[1:0]	Source clock for currently active PLL1 input clock

### 12AB.4.2.22 PPLLCLK Source Clock Selection

#### (1) CKSC\_PPLLCLKS\_CTL — PPLLCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A010<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPLLCLKSCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.28 CKSC\_PPLLCLKS\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PPLLCLKSCSID[1:0]	Source Clock Setting for PPLLCLK 00 <sub>B</sub> : Setting prohibited 01 <sub>B</sub> : EMCLK (default) 10 <sub>B</sub> : MainOSC 11 <sub>B</sub> : PPLLOUT

**(2) CKSC\_PPLLCLKS\_ACT — PPLLCLK Source Clock Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A018<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPLLCLKSACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.29 CKSC\_PPLLCLKS\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PPLLCLKSACT[1:0]	Source clock for currently active PPLLCLK*1

Note 1. The data read from this register is 00<sub>B</sub> when the following conditions is satisfied.

- The selected source clock for all of the following clock domains is other than PPLLCLK (or PPLLCLK2):  
C\_ISO\_PERI1, C\_ISO\_PERI2, C\_ISO\_LIN, C\_ISO\_ADCA, C\_ISO\_CAN, C\_ISO\_CSI, C\_ISO\_IIC, C\_ISO\_ADCA
- The OPBT0.FLXA0EN bit is set to 0 (FlexRay is disabled).(RH850/F1KH-D8, RH850F1KM-S4)

### 12AB.4.2.23 ROSCUT — HS IntOSC User Trimming Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA0RES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 101C<sub>H</sub>

**Value after reset:** 0000 0XXX<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FADJUST[8:0]

Table 12AB.30 ROSCUT Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	FADJUST[8:0]	Frequency Adjustment parameters of HS IntOSC. The value after reset of this register is pre-set value of HS IntOSC trimming data. Overwrite this register with “read value + 1” or “read value – 1” until the HS IntOSC frequency becomes target frequency range.

### 12AB.4.3 Clock Selector Control Register

#### 12AB.4.3.1 WDTA0 Clock Domain C\_AWO\_WDTA

##### (1) CKSC\_AWDTAD\_CTL — C\_AWO\_WDTA Clock Divider Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2000<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

**CAUTION**

Do not change the “1” value after reset of bit 1.

Table 12AB.33 CKSC\_AWDTAD\_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AWDTADSTPMSK*1	0: Clock domain C_AWO_WDTA is stopped in stand-by mode. 1: Clock domain C_AWO_WDTA is not stopped in stand-by mode.

Note 1. The return time from stand-by mode can be shortened by setting this bit to 1.

### 12AB.4.3.2 TAUJ Clock Domain C\_AWO\_TAUJ

#### (1) CKSC\_ATAUJS\_CTL — C\_AWO\_TAUJ Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2100<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**CAUTION**

Do not change the “1” value after reset of bit 1.

Table 12AB.38 CKSC\_ATAUJD\_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ATAUJDSTPMSK	0: Clock domain C_AWO_TAUJ is stopped in stand-by mode. 1: Clock domain C_AWO_TAUJ is not stopped in stand-by mode.

### 12AB.4.3.3 RTCA Clock Domain C\_AWO\_RTCA

#### (1) CKSC\_ARTCAS\_CTL — C\_AWO\_RTCA Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by a power-up reset PURES.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2300<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARTCASCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.39 CKSC\_ARTCAS\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	ARTCASCSID[1:0]	Source Clock Setting for C_AWO_RTCA 00 <sub>B</sub> : Disabled (default) 01 <sub>B</sub> : SubOSC* <sup>1</sup> 10 <sub>B</sub> : MainOSC* <sup>2</sup> 11 <sub>B</sub> : LS IntOSC

Note 1. It isn't supported with 100-pin product.

Note 2. To avoid supplying a clock signal equal to or higher than 4 MHz to the C\_AWO\_RTCA clock domain, check that CKSC\_ARTCAD\_ACT = 0000 0000<sub>H</sub> (disabled) before setting CKSC\_ARTCAS\_CTL to 10<sub>B</sub> (MainOSC).

**(2) CKSC\_ARTCAS\_ACT — C\_AWO\_RTCA Source Clock Active Register**

This register is initialized by a power-up reset PURES.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2308<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12AB.46 CKSC\_AADCAD\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	AADCADCSID[1:0]	Clock Divider Setting for C_AWO_ADCA 00 <sub>B</sub> : Setting prohibited 01 <sub>B</sub> : CKSC_AADCAS_CTL selection /1 (default) 10 <sub>B</sub> : CKSC_AADCAS_CTL selection /2*1 11 <sub>B</sub> : Setting prohibited

Note 1. Make sure that the frequency of CKSC\_AADCA is no less than 8 MHz after division by 2.

**(4) CKSC\_AADCAD\_ACT — C\_AWO\_ADCA Clock Divider Active Register**

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2608<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

**CAUTION**

Do not change the “1” value after reset of bit 1.

Table 12AB.48 CKSC\_AADCAD\_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AADCADSTPMSK	0: Clock domain C_AWO_ADCA is stopped in stand-by mode. 1: Clock domain C_AWO_ADCA is not stopped in stand-by mode.

### 12AB.4.3.5 FOUT Clock Domain C\_AWO\_FOUT

#### (1) CKSC\_AFOUTS\_CTL — C\_AWO\_FOUT Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2700<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 12AB.49 CKSC\_AFOUTS\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	AFOUTSCSID[2:0]	Source Clock Setting for C_AWO_FOUT*1 000 <sub>B</sub> : Disabled (default) 001 <sub>B</sub> : MainOSC 010 <sub>B</sub> : HS IntOSC 011 <sub>B</sub> : LS IntOSC 100 <sub>B</sub> : SubOSC*2 101 <sub>B</sub> : PPLLCLK4 110 <sub>B</sub> : PPLLCLK4 111 <sub>B</sub> : Setting prohibited

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK4.

Note 2. It isn't supported with 100-pin product.

**(2) CKSC\_AFOUTS\_ACT — C\_AWO\_FOUT Source Clock Active Register**

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2708<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

**CAUTION**

Do not change the “1” value after reset of bit 1.

Table 12AB.51 CKSC\_AFOUTS\_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AFOUTSSTPMSK	0: Clock domain C_AWO_FOUT is stopped in stand-by mode. 1: Clock domain C_AWO_FOUT is not stopped in stand-by mode.

12AB.4.3.6 CPU Clock Domain C\_ISO\_CPUCLK

(1) CKSC\_CPUCLKS\_CTL — C\_ISO\_CPUCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see Section 5, Write-Protected Registers.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A000<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUCLKSCSID [1:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.52 CKSC\_CPUCLKS\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	CPUCLKSCSID[1:0]	Source Clock Setting for C_ISO_CPUCLK 00 <sub>B</sub> : CPLL0OUT 01 <sub>B</sub> : EMCLK (default) 10 <sub>B</sub> : MainOSC 11 <sub>B</sub> : CPLL1OUT

**CAUTION**

The clock source selected for the C\_ISO\_CPUCLK clock domain should not be stopped by software.

For the setting procedure of this register, refer to Section 12AB.5.4, CPUCLK Source and Divided Clock Selection Method.

**(2) CKSC\_CPUCLKS\_ACT — C\_ISO\_CPUCLK Source Clock Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A008<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUCLKSACT [1:0]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.53 CKSC\_CPUCLKS\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	CPUCLKSACT[1:0]	Source clock for currently active C_ISO_CPUCLK

**(3) CKSC\_CPUCLKD\_CTL — C\_ISO\_CPUCLK Clock Divider Selection Register**

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A100<sub>H</sub>

**Value after reset:** 0000 0029<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	CPUCLKDPLL[2:0]		CPUCLKDCSID[2:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 12AB.54 CKSC\_CPUCLKD\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 3	CPUCLKDPLL[2:0] *1, *2	Clock Divider CPLLDIV Setting Specifies the CPLLDIV divisor, which determines maximum clock frequency of C_ISO_CPUCLK. 000 <sub>B</sub> : CPLL0/1OUT = VCO0/1OUT × 1/6 (80 MHz) (PLL0/1) 010 <sub>B</sub> : CPLL0/1OUT = VCO0/1OUT × 1/4 (120 MHz) (PLL0/1) 110 <sub>B</sub> : CPLL0OUT = VCO0OUT × 1/3 (160 MHz) (PLL0) 101 <sub>B</sub> : CPLL0OUT = VCO0OUT × 1/2 (240 MHz) (PLL0) Other than above: Setting prohibited
2 to 0	CPUCLKDCSID[2:0]	Clock Divider Setting for C_ISO_CPUCLK 000 <sub>B</sub> : Setting prohibited 001 <sub>B</sub> : CKSC_CPUCLKS_CTL selection /1 (Default) 010 <sub>B</sub> : CKSC_CPUCLKS_CTL selection /2 011 <sub>B</sub> : CKSC_CPUCLKS_CTL selection /4 100 <sub>B</sub> : CKSC_CPUCLKS_CTL selection /8 Other than above: Setting prohibited

Note 1. Setting of CKSC\_CPUCLKD\_CTL.CPUCLKDPLL[2:0] is effective only to the PLL selected by CKSC\_CPUCLKS\_CTL.

Note 2. For the supported settings, refer to **Table 12AB.18, PLL0 Output Table** and **Table 12AB.23, PLL1 Output Table**.

**CAUTION**

The clock source selected for the C\_ISO\_CPUCLK clock domain should not be stopped by software.

For the setting procedure of this register, refer to **Section 12AB.5.4, CPUCLK Source and Divided Clock Selection Method**.

**(4) CKSC\_CPUCLKD\_ACT — C\_ISO\_CPUCLK Clock Divider Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A108<sub>H</sub>

**Value after reset:** 0000 0029<sub>H</sub>

Table 12AB.55 CKSC\_CPUCLKD\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned.
5 to 3	CPUCLKDPLLACT [2:0]	Clock divider for currently active CPLL DIV.
2 to 0	CPUCLKDACT [2:0]	Clock divider for currently active C_ISO_CPUCLK

12AB.4.3.7 Peripheral Clock Domains C\_ISO\_PERI1 and C\_ISO\_PERI2

(1) CKSC\_IPERI1S\_CTL — C\_ISO\_PERI1 Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see Section 5, Write-Protected Registers.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A200<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

12AB.4.3.8 RLIN Clock Domains C\_ISO\_LIN

(1) CKSC\_ILINS\_CTL — C\_ISO\_LIN Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see Section 5, Write-Protected Registers.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A400<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ILINCSID[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 12AB.60 CKSC\_ILINS\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	ILINCSID[2:0]	Source Clock Setting for C_ISO_LIN*1 000 <sub>B</sub> : Disabled 001 <sub>B</sub> : PPLLCLK2 (default) 010 <sub>B</sub> : MainOSC 011 <sub>B</sub> : PPLLCLK2 100 <sub>B</sub> : HS IntOSC Other than above: Setting prohibited

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK2.

**(2) CKSC\_ILINS\_ACT — C\_ISO\_LIN Source Clock Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A408<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ILINSACT[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.61 CKSC\_ILINS\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2 to 0	ILINSACT[2:0]	Source clock for currently active C_ISO_LIN

**(3) CKSC\_ILIND\_CTL — C\_ISO\_LIN Clock Divider Selection Register**

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A800<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILINDCSID[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.62 CKSC\_ILIND\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	ILINDCSID[1:0]	Clock Divider Setting for C_ISO_LIN 00 <sub>B</sub> : Setting prohibited 01 <sub>B</sub> : CKSC_ILINS_CTL selection /1 (default) 10 <sub>B</sub> : CKSC_ILINS_CTL selection /4 11 <sub>B</sub> : CKSC_ILINS_CTL selection /8

**NOTE**

The setting of this register is only applicable to RLIN30. The settings 10<sub>B</sub> (CKSC\_ILINS\_CTL selection /4) and 11<sub>B</sub> (CKSC\_ILINS\_CTL selection /8) are only available in UART mode.

**(4) CKSC\_ILIND\_ACT — C\_ISO\_LIN Clock Divider Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A808<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILINDACT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.63 CKSC\_ILIND\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	ILINDACT[1:0]	Clock divider for currently active C_ISO_LIN

**(5) CKSC\_ILIND\_STPM — C\_ISO\_LIN Stop Mask Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A818<sub>H</sub>

**Value after reset:** 0000 0002<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILIND STP MSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

**CAUTION**

Do not change the “1” value after reset of bit 1.

Table 12AB.64 CKSC\_ILIND\_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ILINDSTPMSK	0: Clock domain C_ISO_LIN is stopped in stand-by mode. 1: Clock domain C_ISO_LIN is not stopped in stand-by mode.

12AB.4.3.9 ADCA1 Clock Domain C\_ISO\_ADCA

(1) CKSC\_IADCAS\_CTL — C\_ISO\_ADCA Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see Section 5, Write-Protected Registers.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A500<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IADCASCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.65 CKSC\_IADCAS\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	IADCASCSID[1:0]	Source Clock Setting for C_ISO_ADCA 00 <sub>B</sub> : Disabled 01 <sub>B</sub> : HS IntOSC (default) 10 <sub>B</sub> : MainOSC 11 <sub>B</sub> : PPLLCLK2

**CAUTION**

The CKSC\_IADCAS\_CTL register and the CKSC\_IADCAD\_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 4 to 9.6” at CKDIVMD = 1\*1.

The CKSC\_IADCAS\_CTL register and the CKSC\_IADCAD\_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 2 to 4.8” at CKDIVMD = 0\*1.

- (1) Frequency [MHz] specified by the C\_ISO\_CPUCLK source clock selection register (CKSC\_CPUCLKS\_CTL) and C\_ISO\_CPUCLK clock divider selection register (CKSC\_CPUCLKD\_CTL)
- (2) Frequency [MHz] specified by the C\_ISO\_ADCA source clock selection register (CKSC\_IADCAS\_CTL) and the C\_ISO\_ADCA clock divider selection register (CKSC\_IADCAD\_CTL)

**Note 1.** For details, see Section 44, Flash Memory, 44.9.2, OPBT0 — Option Byte 0.

**(2) CKSC\_IADCAS\_ACT — C\_ISO\_ADCA Source Clock Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A508<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IADCASACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.66 CKSC\_IADCAS\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	IADCASACT[1:0]	Source clock for currently active C_ISO_ADCA

**(3) CKSC\_IADCAD\_CTL — C\_ISO\_ADCA Clock Divider Selection Register**

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A600<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IADCADCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.67 CKSC\_IADCAD\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	IADCADCSID[1:0]	Clock Divider Setting for C_ISO_ADCA 00 <sub>B</sub> : Setting prohibited 01 <sub>B</sub> : CKSC_IADCAS_CTL selection /1 (default) 10 <sub>B</sub> : CKSC_IADCAS_CTL selection /2*1 11 <sub>B</sub> : Setting prohibited

Note 1. Make sure that the frequency of CKSC\_IADCA is no less than 8 MHz after division by 2.

**CAUTION**

The CKSC\_IADCAS\_CTL register and the CKSC\_IADCAD\_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 4 to 9.6” at CKDIVMD = 1\*1.

The CKSC\_IADCAS\_CTL register and the CKSC\_IADCAD\_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 2 to 4.8” at CKDIVMD = 0\*1.

- (1) Frequency [MHz] specified by the C\_ISO\_CPUCLK source clock selection register (CKSC\_CPUCLKS\_CTL) and C\_ISO\_CPUCLK clock divider selection register (CKSC\_CPUCLKD\_CTL)
- (2) Frequency [MHz] specified by the C\_ISO\_ADCA source clock selection register (CKSC\_IADCAS\_CTL) and the C\_ISO\_ADCA clock divider selection register (CKSC\_IADCAD\_CTL)

**Note 1.** For details, see **Section 44, Flash Memory, 44.9.2, OPBT0 — Option Byte 0**.

**(4) CKSC\_IADCAD\_ACT — C\_ISO\_ADCA Clock Divider Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A608<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12B.68 CKSC\_IADCAD\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	IADCADACT[1:0]	Clock divider for currently active C_ISO_ADCA

12AB.4.3.10 RS-CANFD Clock Domains C\_ISO\_CAN and C\_ISO\_CANOSC

(1) CKSC\_ICANS\_CTL — C\_ISO\_CAN Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see Section 5, Write-Protected Registers.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A900<sub>H</sub>

**Value after reset:** 0000 0003<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

## 12AB.5 Clock Domain Setting Method

### 12AB.5.1 Clock Domain Setting

#### 12AB.5.1.1 Overview of Clock Selector Register

The clock selector for a clock domain C\_AWO\_<name>/C\_ISO\_<name> can be controlled by the following registers:

- Source clock selection registers

These registers select the clock to be used as the domain clock from the available source clocks.

- AWO source clock selection: CKSC\_A<name>S\_CTL
- ISO source clock selection: CKSC\_I<name>S\_CTL

- Clock divider selection registers

These registers specify the clock division ratio for the selected source clock.

- AWO clock divider: CKSC\_A<name>D\_CTL
- ISO clock divider: CKSC\_I<name>D\_CTL

- Source clock active registers and clock divider active registers

These registers return the currently active source clock selection and division ratio, respectively.

- AWO source clock active register/clock divider active register:  
CKSC\_A<name>S\_ACT/CKSC\_A<name>D\_ACT
- ISO source clock active register/clock divider active register: CKSC\_I<name>S\_ACT/CKSC\_I<name>D\_ACT

#### NOTE

- Not all clock selectors provide all the control functions described above.
- The symbol “I”, which indicates the power domain, is not added to the names of registers within clock domain C\_ISO\_CPUCLK.

### 12AB.5.1.2 Setting Procedure for Clock Domain

Procedure of setting up clock domain is described as below:

1. Set up a source clock
  - Select a source clock. (CKSC\_A<name>S\_CTL, CKSC\_I<name>S\_CTL)
  - Confirm completion of selection. (CKSC\_A<name>S\_ACT, CKSC\_I<name>S\_ACT)\*<sup>1</sup>
2. Setting a clock divider
  - Select a clock divider. (CKSC\_A<name>D\_CTL, CKSC\_I<name>D\_CTL)
  - Confirm completion of selection. (CKSC\_A<name>D\_ACT, CKSC\_I<name>D\_ACT)\*<sup>2</sup>

**Note 1.** Continue processing after CKSC\_A<name>S\_ACT and CKSC\_I<name>S\_ACT are updated with the new values written to CKSC\_A<name>S\_CTL and CKSC\_I<name>S\_CTL.

**Note 2.** Continue processing after CKSC\_A<name>D\_ACT and CKSC\_I<name>D\_ACT are updated with the new values written to CKSC\_A<name>D\_CTL and CKSC\_I<name>D\_CTL.

#### CAUTION

The source clock to be selected must be operating before performing these settings.  
The behavior and performance are not guaranteed if setup is performed while the source clock is stopped.  
Access to a peripheral module is prohibited while the clock is not supplied to the module.

### 12AB.5.2 Stopping the Clock in Stand-by Mode

In stand-by mode (STOP mode, DeepSTOP mode, and Cyclic STOP mode), clock domain C\_AWO\_<name>/C\_ISO\_<name> can be configured to stop or continue its clock CKSCLK\_A<name>/CKSCLK\_I<name> in response to clock stop requests from the stand-by controller.

The clock stop mask registers are used to determine the operation status of the clock in stand-by mode:

- CKSC\_A<name>\_STPM.A<name>STPMSK/CKSC\_I<name>\_STPM.I<name>STPMSK = 0:  
The STOP request signal is not masked, so the domain clock CKSCLK\_A<name>/CKSCLK\_I<name> is stopped during stand-by mode.  
If the domain clock was in operation before transition to stand-by mode, it is automatically re-started after wake-up from stand-by mode.  
If there is another clock domain which the same source clock is selected and its stop mask setting is set to 1 (CKSC\_A<name>\_STPM.A<name>STPMSK/CKSC\_I<name>\_STPM.I<name>STPMSK=1), the source clock will continue operation in stand-by mode.  
The CPU clock domain C\_ISO\_CPUCLK is always stopped in stand-by mode.
- CKSC\_A<name>\_STPM.A<name>STPMSK/CKSC\_I<name>\_STPM.I<name>STPMSK = 1:  
The STOP request signal is masked, so CKSCLK\_A<name>/CKSCLK\_I<name> continues to operate during stand-by.  
The source clock selected for the target clock domain will also continue to operate in stand-by mode.  
Supply of a clock signal to the clock domains in the Isolated area (ISO area) will be stopped in DeepSTOP mode.

### 12AB.5.3 Clock Domain Settings

The following table shows a selectable source clock, a frequency division ratio, and a register to be used for each clock domain.

Table 12AB.79 List of Selectable Clocks (RH850/F1KH-D8)

Clock Domain	Clock Name	Selectable Register		Frequency Divided Register		Maximum Frequency	Applicable Unit
C_AWO_WDTA	CKSCLK_AWDTA	—	<b>LS IntOSC</b>	CKSC_AWDTAD_CTL	1/1 <b>1/128</b>	240 kHz	WDTA0

					1/2	
					<b>Disable</b>	
C_ISO_CSI	CKSCLK_ICSI	CKSC_ICSIS_CTL	<b>PPLLCLK</b>	—	1/1	80 MHz CSIGn CSIHn
			MainOSC			
			HS IntOSC			
			Disable			
C_ISO_IIC	CKSCLK_IIC	CKSC_IICs_CTL	<b>PPLLCLK2</b>	—	1/1	40 MHz RIICn
			Disable			

**Note:** The items written in bold are the initial setting clocks for each register.

Note 1. It isn't supported with 100-pin product.

Note 2. For the supported settings, refer to **Table 12AB.18, PLL0 Output Table** and **Table 12AB.23, PLL1 Output Table**.

Note 3. The setting of this register only applies to RLIN30. The settings 1/4 and 1/8 are only available in UART mode.

Note 4. CKSC\_CPUCLKS\_CTL selects selection of Main OSC, CPLL0OUT, CPLL1OUT and EMCLK.

CKSC\_CPUCLKD\_CTL.CPUCLKDPLL[2:0] selects clock frequency of CPLL0OUT or CPLL1OUT which is selected as a source clock of C\_ISO\_CPUCLK with CKSC\_CPUCLKS\_CTL.

## CAUTION

To stop the clock source selected for the clock domain before transitioning to STOP/DeepSTOP mode, select "Disable" for that clock domain in advance. Do not stop the source clock of a clock domain for which "Disable" cannot be selected while functions are operating on that clock domain. To stop the clock source selected for the domain by transitioning to STOP/DeepSTOP mode, "Disable" does not need to be selected.

Instead of setting "Disable", select "Stop" for the clock domain in stand-by mode by using the stop mask register.

### 12AB.5.4 CPUCLK Source and Divided Clock Selection Method

In case of changing CPUCLK frequency, follow the procedure below.

Figure 12AB.10 CPUCLK Source and Divided Clock Selection Method

**CAUTION**

In RH850/F1KH-D8, operation cannot be guaranteed unless the above procedure is conformed.

In RH850/F1KM-S4 and RH850/F1KM-S2, the above procedure is optional.

### 12AB.5.5 CPUCLK Setting in STOP Mode Method

Transition before STOP mode, follow the procedure below.

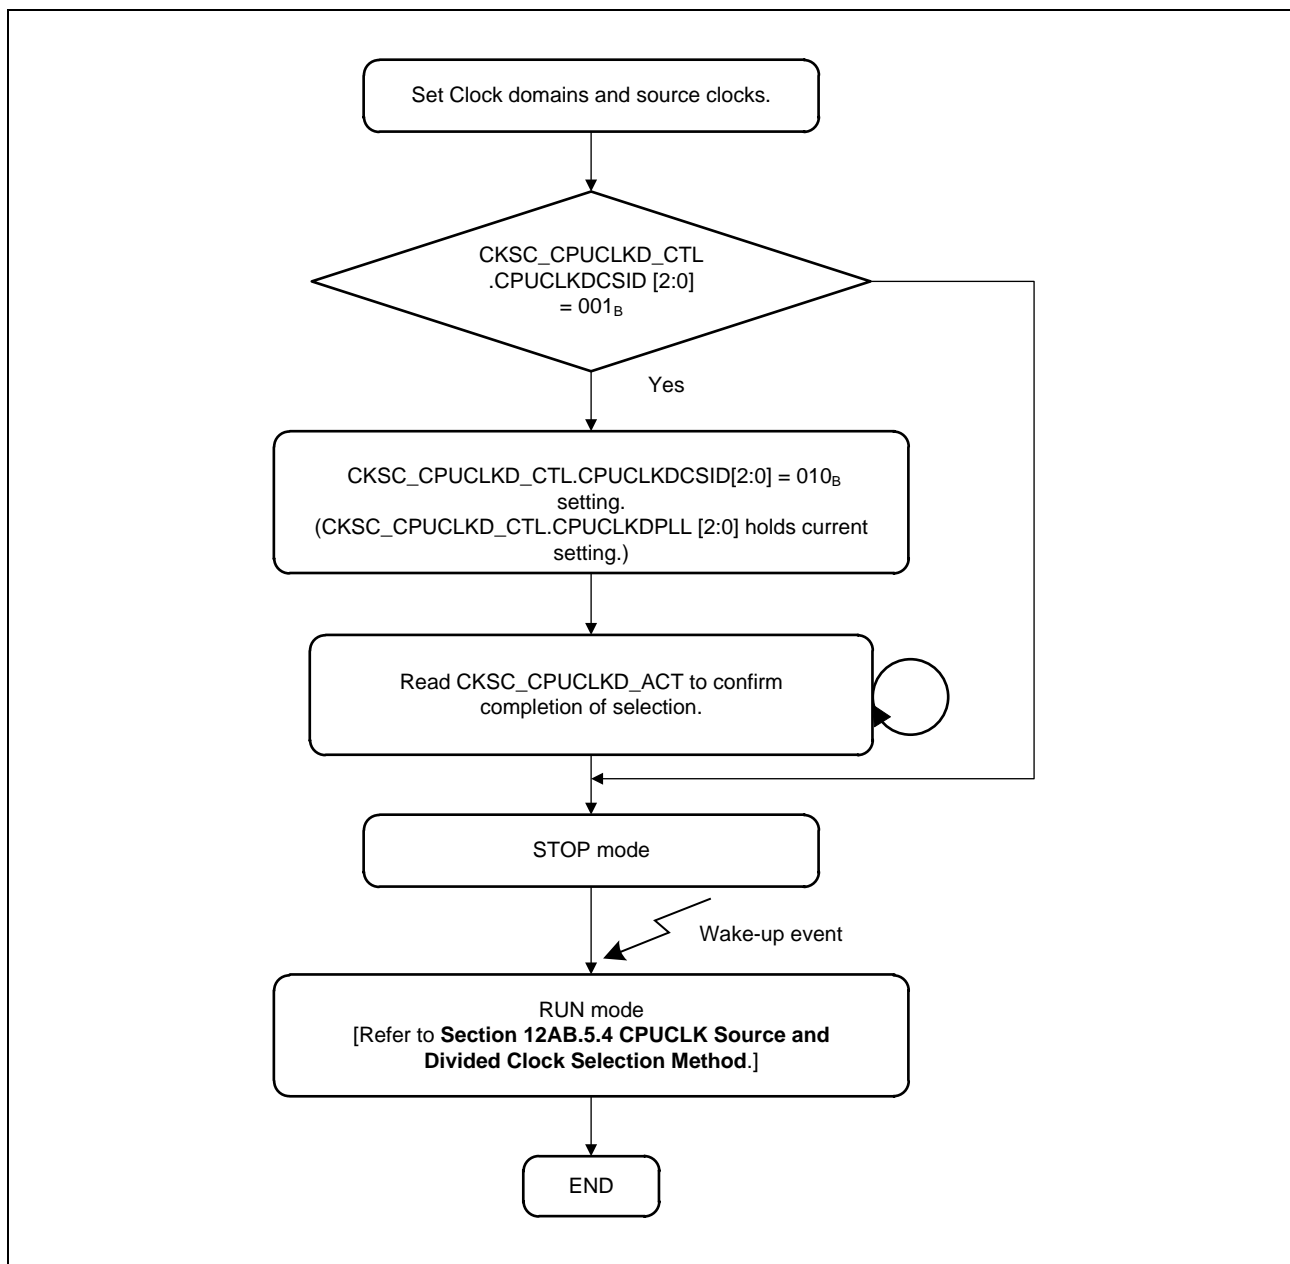

Figure 12AB.11 CPUCLK Setting in STOP Mode Method

#### CAUTION

In RH850/F1KH-D8, operation cannot be guaranteed unless the above procedure is conformed.

In RH850/F1KM-S4 and RH850/F1KM-S2, the above procedure is optional.

## 12AB.6 Frequency Output Function (FOUT)

The frequency output function (FOUT) allows the clock to be output the clock as the external signal. Furthermore, the frequency can be divided by the clock divider before it is output.

### 12AB.6.1 Functional Overview

**Figure 12AB.12, Frequency Output Function** shows the configuration of the frequency output function.

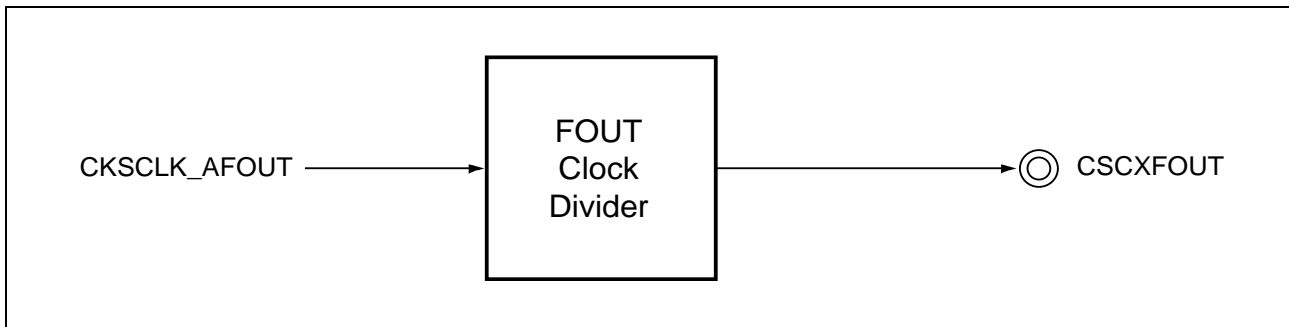

Figure 12AB.12 Frequency Output Function

The clock output function outputs the CKSCLK\_AFOUT clock divided by 1 to 63 through the clock divider from CSCXFOUT. Division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register. Clock output frequency  $f_{CSCXFOUT}$  is expressed by the following equation.

$$f_{CSCXFOUT} = (\text{CKSCLK\_AFOUT clock frequency}) / N$$

Clock output starts when, after CKSCLK\_AFOUT is set and the clock output for the pin function is selected, division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register.

When a new division ratio is written to the FOUTDIV.FOUTDIV[5:0] bits, it becomes effective in synchronization with the CSCXFOUT output clock. Accordingly, the division ratio can be changed even while the CSCXFOUT clock is operating. The clock output is stopped by writing 000<sub>H</sub> to the FOUTDIV[5:0] bits.

### 12AB.6.2 Clock Supply

The clock supply to the CSCXFOUT is shown in the following table.

Table 12AB.81 Clock Supply

Module	Unit Clock Name	Supply Clock Name	Description
CSCXFOUT	PCLK	CPUCLK_UL	Bus clock (Register access)
	CKSCLK_AFOUT	CKSCLK_AFOUT	Clock source of FOUT clock divider

## 12AB.6.3 Registers

### 12AB.6.3.1 List of Registers

The FOUT registers are listed in the following table.

Table 12AB.82 List of Registers

Module Name	Register Name	Symbol	Address
CLKCTL	Clock division ratio register	FOUTDIV	FFF8 2800 <sub>H</sub>
	Clock divider status register	FOUTSTAT	FFF8 2804 <sub>H</sub>

### 12AB.6.3.2 FOUTDIV — Clock Division Ratio Register

This register defines the clock divisor.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2800<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

### 12AB.6.3.3 FOUTSTAT — Clock Divider Status Register

This register indicates the clock output status.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2804<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 12AB.84 FOUTSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	FOUTCLKACT	Clock Divider Active 0: Frequency output is stopped. 1: Frequency output is ongoing.
0	FOUTSYNCR	Clock Divider Synchronized 0: The clock divider is in the process of synchronization. 1: The clock divider is stable (or stopped).

## Section 12C Clock Controller of RH850/F1KM-S1

This section explains in general about the clock controller.

The first part in this section describes the specific features of the clock controller of the RH850/F1KM microcontrollers. The ensuing sections describe the clock oscillation circuit, clock selectors, and clock output function that make up the clock controller.

### 12C.1 Features of RH850/F1KM Clock Controller

The clock controller of the RH850/F1KM microcontrollers has the following features.

- Four on-chip clock oscillators
  - Main Oscillator (MainOSC) with an oscillation frequency of 8, 16, 20, and 24 MHz
  - High Speed Internal Oscillator (HS IntOSC) with a nominal frequency of 8 MHz (Typ.)
  - Low Speed Internal Oscillator (LS IntOSC) with a nominal frequency of 240 kHz (Typ.)
  - PLL without SSCG (PLL1)
- Fine management of clock supply to peripheral modules through clock domains
- On-chip clock monitor that detects clock anomalies when the Main Oscillator, High Speed Internal Oscillator, or PLL are in use. See **Section 13, Clock Monitor (CLMA)**.
- Clock output (FOUT)

**Figure 12C.1, Clock Controller Overview** shows the schematic diagram of the clock controller.

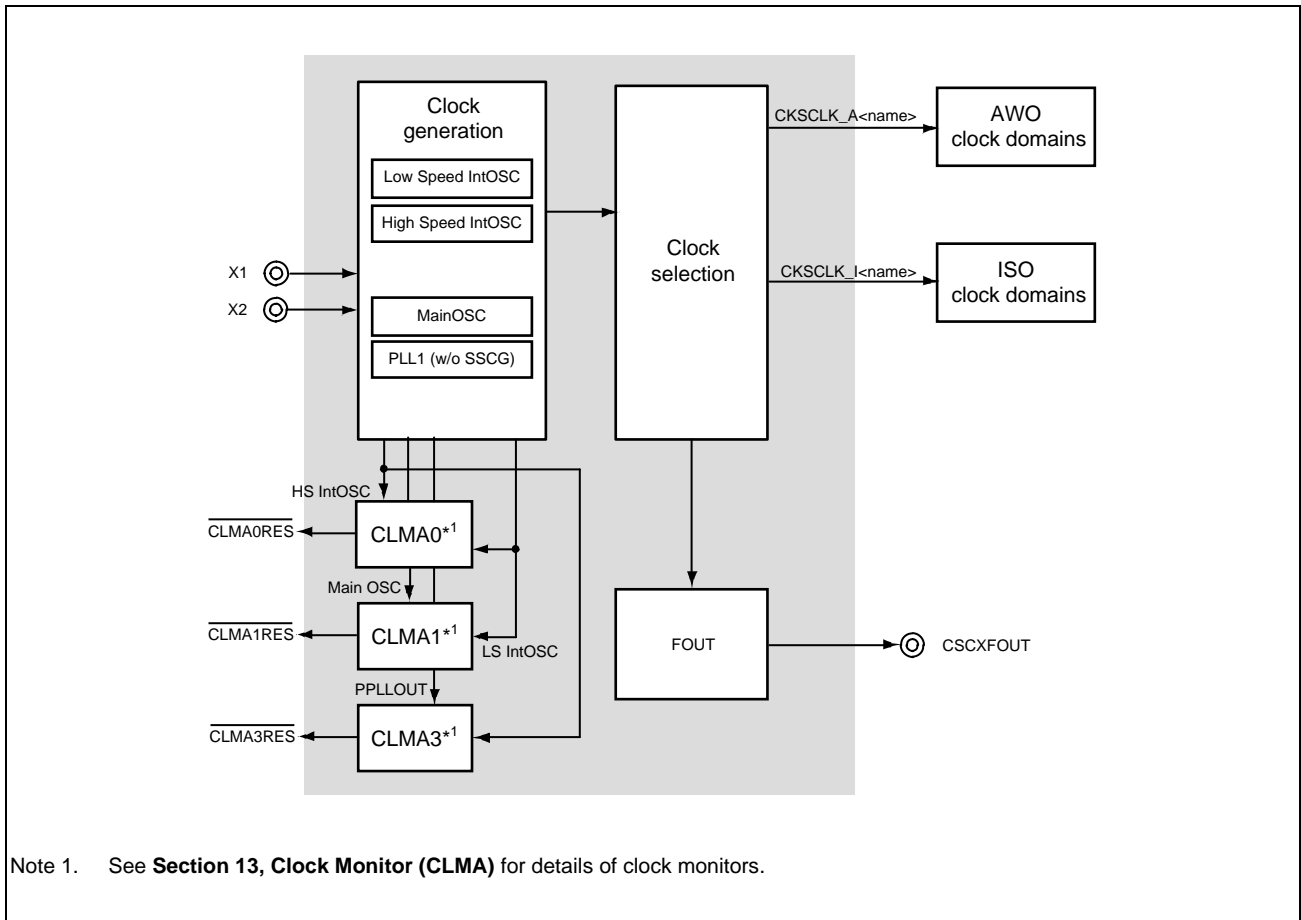

Figure 12C.1 Clock Controller Overview

### 12C.2 Configuration of Clock Controller

This section describes the configuration of the clock controller.

The clock controller is composed of clock oscillators and clock generation circuits that generate the clocks for the CPU and the peripheral modules, a clock selector for selecting the optimum clock, and clock domains for the CPU and the peripheral modules.

**Figure 12C.2, Clock Controller Configuration** shows the configuration of the clock controller.

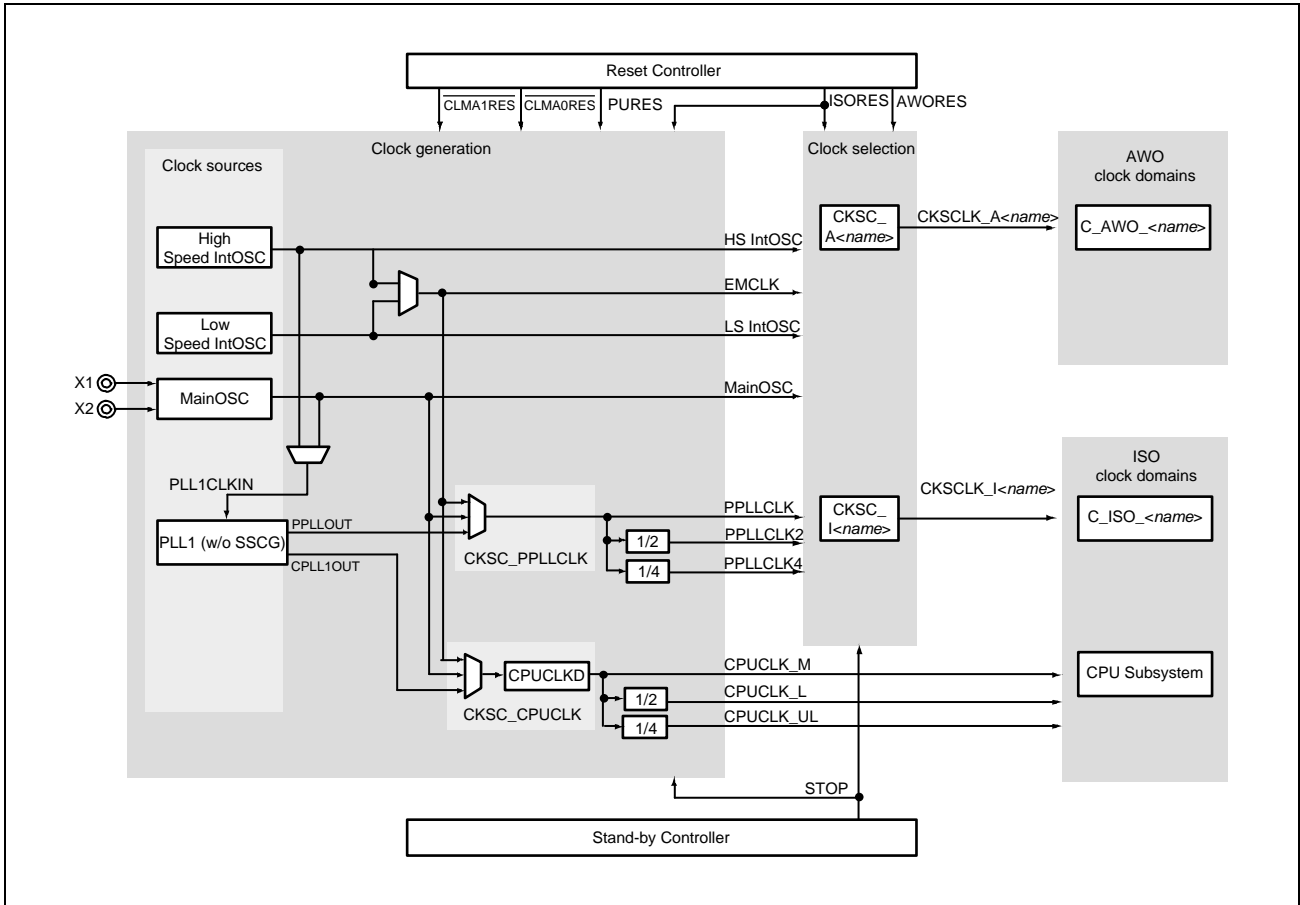

Figure 12C.2 Clock Controller Configuration

## NOTE

**Clock domain and clock control register naming conventions**

The clock signals and their control registers, etc., described in this section are named according to the following naming conventions to reflect the power domain or clock domain to which they belong. The placeholder “<name>” is used to identify the target module in the clock domain:

- Clock domain names:
  - C\_AWO\_<name>: Always-On area (AWO area)\*1 clock domain
  - C\_ISO\_<name>: Isolated area (ISO area)\*1 clock domain
- Domain clock names:
  - CKSCLK\_A<name>: Always-On area (AWO area) domain clock
  - CKSCLK\_I<name>: Isolated area (ISO area) domain clock
- Clock selector names:
  - CKSC\_A<name>: Always-On area (AWO area) clock selector
  - CKSC\_I<name>: Isolated area (ISO area) clock selector
- Clock selector registers:
  - CKSC\_A<name>S\_CTL: Always-On area (AWO area) source clock selector register
  - CKSC\_A<name>D\_CTL: Always-On area (AWO area) source clock divider register
  - CKSC\_I<name>S\_CTL: Isolated area (ISO area) source clock selector register
  - CKSC\_I<name>D\_CTL: Isolated area (ISO area) source clock divider register

**Example**

The clock signal CKSCLK\_AADCA (placeholder <name> = ADCA) is the clock supplied to the clock domain C\_AWO\_ADCA in the Always-On area (AWO area). This clock is selected by the clock selector register CKSC\_AADCAS\_CTL.

**Note 1.** Always-On area (AWO area) and Isolated area (ISO area) refer to the power supply domains. Always-On area (AWO area) is an always-on power supply, and Isolated area (ISO area) is an isolated power supply that is switched on or off by the operation mode.

For details, see **Section 10C, Power Supply Circuit of RH850/F1KM-S1**.

## 12C.2.1 Clock Generation Circuits

Four clock oscillators are provided:

Three clock oscillators are located on the Always-On area (AWO area) and PLL (PLL1) is located on the Isolated area (ISO area).

### Main Oscillator (MainOSC)

The MainOSC generates the main clock X.

Generation of the clock X requires the connection of an external resonator to X1 and X2.

The clock X is used as the reference clock for the PLL.

### High Speed Internal Oscillator (HS IntOSC)

The HS IntOSC generates the clock RH, which runs at a frequency of 8 MHz (Typ.).

### Low Speed Internal Oscillator (LS IntOSC)

The LS IntOSC generates the clock RL, which runs at a frequency of 240 kHz (Typ.). It starts operation at power up and cannot be stopped, hence it is always operating.

### PLL

The PLL circuits generate high speed operation clocks CPLL1OUT and PPLL0UT for normal operation of the microcontroller.

The clocks supplied by the clock oscillators (X, XT, RH, RL, CPLL1OUT, PPLL0UT) and their divided clocks (CPUCLK\_M, CPUCLK\_L, CPUCLK\_UL, PPLLCLK, PPLLCLK2, and PPLLCLK4) are all generated in the clock generation circuit.

## 12C.2.2 Clock Selection

The clocks generated by the clock oscillators are input to the clock selectors CKSC\_A<name>/CKSC\_I<name>.

Domain clocks CKSCLK\_A<name>/CKSCLK\_I<name> are selected by dedicated clock selectors from clocks directly input from the oscillators, or in some cases from clocks that have been divided by clock dividers.

- CKSC\_I<name>S\_CTL/CKSC\_I<name>D\_CTL registers: determine the clock for the Isolated area (ISO area) clock domains.
- CKSC\_A<name>S\_CTL/CKSC\_A<name>D\_CTL registers: determine the clock for the Always-On area (AWO area) clock domains.

Note that not all available clocks generated by the clock oscillators are input to each clock selector.

The following clocks are supplied to the CPU and related modules from the clock generation circuit.

### Emergency Clock (EMCLK)

The emergency clock EMCLK is supplied by the

- HS IntOSC, if it is active
- LS IntOSC, if the HS IntOSC is inactive

The selection is done automatically after CLMA0 reset is occurred, so if the HS IntOSC becomes lower than the limit for any reason, vital modules of the microcontroller are still in operation, since the LS IntOSC does not stop.

### CPU Subsystem Clock (CPUCLK)

The CPU Subsystem clock CPUCLK is derived from PLL1 clock CPLL1OUT, MainOSC, and EMCLK. The CPU clock selector CKSC\_CPUCLK incorporates the selector CPUCLKS, followed by the clock divider CPUCLKD.

The CPUCLK clock divider provides the frequency-divided CPUCLK\_L, CPUCLK\_M clock signal and CPUCLK\_UL clock signal derived from CPUCLK.

## 12C.2.3 Clock Domains

The clock controller allows selection of the respective clocks for the CPU and peripheral modules. The clock control scope is called the clock domain. For the correspondence between the CPU and peripheral modules and clock domains, see **Section 12C.5.3, Clock Domain Settings**.

## 12C.2.4 Resetting Clock Oscillators

The clock oscillators on the Always-On area (AWO area) are reset by the PURES signal.

The HS IntOSC is reset when  $\overline{\text{CLMA0RES}}$  is generated and the MainOSC is reset when  $\overline{\text{CLMA1RES}}$  is generated.

The clock oscillator on the Isolated area (ISO area) is reset by the ISORES signal.

For further details on the clock oscillators, see **Section 12C.3, Clock Oscillators**.

### CAUTION

For the specifications of the frequencies, acceptable variation, and other parameters of the clock generators, see **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.

## 12C.3 Clock Oscillators

### 12C.3.1 Main Oscillator (MainOSC)

The Main Oscillator generates the clock X. X is also used as the PLL1 input clock PLL1CLKIN.

**Figure 12C.3, Main Oscillator (MainOSC)** shows the basic configuration and signals of the MainOSC.

Figure 12C.3 Main Oscillator (MainOSC)

#### MainOSC

The MainOSC stops operating after reset is released. To use the MainOSC, set the MainOSC enable trigger bit (MOSCE.MOSCENTRG) to 1 to start the MainOSC.

#### MainOSC Stabilization

The MOSCST.MOSCCLKST[16:0] bits set the MainOSC oscillation stabilization time.

The MainOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting. The oscillation stabilization time can be set to up to  $2^{17} - 1$  EMCLK cycles.

As long as the MainOSC is not stable, the MOSCCLKACT signal disables the X output.

When the MainOSC stabilization counter reaches the value specified in MOSCST.MOSCCLKST[16:0], X is assumed to be stable and MOSCCLKACT switches from 0 to 1 to enable output of X when a waveform is output from MainOSC.

Stable and active X clock is indicated by MOSCS.MOSCCLKACT = 1.

#### MainOSC Amplification Gain

By using MOSCC.MOSCCAMPSEL[1:0], the MainOSC's input frequency, determined by the external resonator, can be selected from 8 MHz, 16 MHz, 20 MHz, and 24 MHz.

### MainOSC STOP Requests in Stand-by Mode

The STOP signal from the Stand-by Controller requests the MainOSC Controller to switch off the X clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

The stop request mask bit MOSCSTPM.MOSCSTPMSK controls whether the MainOSC is stopped during stand-by or continues operation:

- MOSCSTPM.MOSCSTPMSK = 0:

The STOP request signal is not masked, so the MainOSC is stopped in stand-by.

If the MainOSC is in operation before stand-by, it is automatically re-started after wake-up from stand-by, and the MainOSC stabilization counter counts the oscillation stabilization time.

However, the STOP request is masked under the following conditions, even if MOSCSTPM.MOSCSTPMSK = 0.

Therefore, the MainOSC will continue to operate even in stand-by mode.

- If the stop mask is set (CKSC\_XXX\_STPM = 0000 0003<sub>H</sub>) for a clock domain for which the MainOSC is selected.

- MOSCSTPM.MOSCSTPMSK = 1:

The STOP request signal is masked, so the MainOSC continues to operate in stand-by.

### Clock Monitor Control

The MainOSC activity signal MOSCCLKACT enables or disables supervision by the Clock Monitor CLMA1. In case the MainOSC is inactive (MOSCCLKACT = 0), supervision of its output clock X by CLMA1 is also disabled.

### MainOSC Enable/Disable Trigger

The MainOSC can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger MOSCE.MOSCENTRG = 1 starts the MainOSC.

Note that setting the enable trigger is only effective if the MainOSC is inactive, i.e. if MOSCS.MOSCCLKACT = 0.

- Disable trigger MOSCE.MOSCDISTRG = 1 stops the MainOSC.

Note that setting the disable trigger is only effective if the MainOSC is active (MOSCCLKACT = 1) and the MainOSC stop requests are not masked (MOSCSTPM.MOSCSTPMSK = 0).

### Direct Clock Input to X1 (EXCLK mode)

A clock waveform from an external clock source can be supplied to X1 pin. In this case, set the MOSCM bit of MOSCM register to 1 before clock input to X1 pin is supplied.

### 12C.3.2 High Speed Internal Oscillator (HS IntOSC)

The High Speed Internal Oscillator generates the clock RH. RH has a nominal frequency of 8 MHz.

**Figure 12C.4, High Speed Internal Oscillator (HS IntOSC)** shows the basic configuration and signals of the HS IntOSC.

Figure 12C.4 High Speed Internal Oscillator (HS IntOSC)

After reset release the HS IntOSC starts operation.

#### NOTE

The HS IntOSC can neither be stopped nor started by software. It can only be stopped in stand-by mode. On the other hand, when CLMA0 is reset, the HS IntOSC can be enabled to stop by software.

#### HS IntOSC Stabilization

HS IntOSC outputs RH when it is stabilized.

Stable and active RH clock is indicated by ROSC.ROSCCLKACT = 1.

### HS IntOSC STOP Requests in Stand-by Mode

The STOP signal from the Stand-By Controller requests the HS IntOSC Controller to switch off the RH clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

The stop request mask bit ROSCSTPM.ROSCSTPMSK controls whether the HS IntOSC is stopped during stand-by or continues operation:

- ROSCSTPM.ROSCSTPMSK = 0:

The STOP request signal is not masked, so the HS IntOSC is stopped during stand-by and automatically restarted after wake-up from stand-by.

However, the STOP request is masked under the following conditions, even if ROSCSTPM.ROSCSTPMSK = 0. Therefore, the HS IntOSC will continue to operate even in stand-by mode.

- If the stop mask is set (CKSC\_XXX\_STPM = 0000 0003<sub>H</sub>) for a clock domain for which the HS IntOSC is selected.
- If the low power sampler (LPS) is operating

- ROSCSTPM.ROSCSTPMSK = 1:

The STOP request signal is masked, so the HS IntOSC continues to operate during stand-by.

### Clock Monitor Control

The HS IntOSC activity signal ROSCCLKACT enables or disables supervision by the Clock Monitor CLMA0. In case the HS IntOSC is inactive (ROSCCLKACT = 0), supervision of its output clock by CLMA0 is also deactivated.

The HS IntOSC clock RH is used as the sampling clock for Clock Monitor CLMA3.

### HS IntOSC Disable Trigger

The disable trigger, ROSCE.ROSCDISTRG = 1 stops the HS IntOSC.

The setting of the disable trigger is enabled when HS IntOSC is active (ROSCS.ROSCCLKACT = 1) and HS IntOSC stop requests are not masked (ROSCSTPM.ROSCSTPMSK = 0).

### HS IntOSC User Calibration Function

The HS IntOSC User trimming register (ROSCUT) enables adjustment of HS IntOSC frequency. The initial value of ROSCUT is preset value of the HS IntOSC trimming data. Overwrite the value with “read value + 1” or “read value – 1” until the HS IntOSC frequency reaches the target frequency range.

### 12C.3.3 Low Speed Internal Oscillator (LS IntOSC)

The Low Speed Internal Oscillator generates the clock RL. RL has a nominal frequency of 240 kHz.

**Figure 12C.5, Low Speed Internal Oscillator (LS IntOSC)** shows the basic configuration and signals of the LS IntOSC.

Figure 12C.5 Low Speed Internal Oscillator (LS IntOSC)

After reset release the LS IntOSC starts operation. It cannot be stopped.

The LS IntOSC clock RL is used as the sampling clock for the Clock Monitors CLMA0 and CLMA1.

### 12C.3.4 PLL

MainOSC or HS IntOSC is input to the phase-locked loops (PLL1) clock oscillator as PLL1CLKIN. The PLL1 output clocks CPLL1OUT and PPLLOUT serve as the main operation clocks for the microcontroller.

**Figure 12C.6, PLL** shows the basic configuration and signals of the PLL.

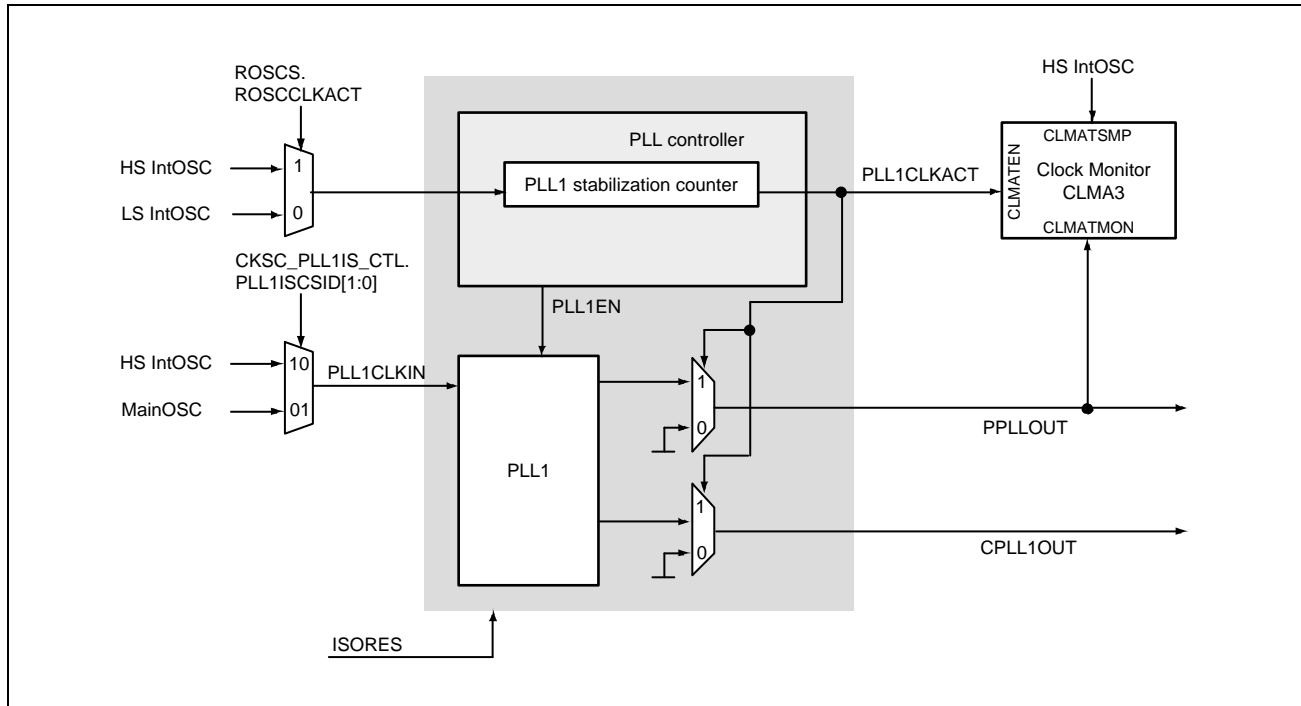

Figure 12C.6 PLL

#### PLL Enable

The PLL1 stops operating after reset is released. To use the PLL1, set the PLL1 enable trigger bit (PLL1E.PLL1ENTRG) to 1 to start the PLL1.

#### PLL Stabilization

The PLL1 stabilization counter starts counting the stabilization time, after PLL1 enabled.

As long as the PLL1 is not stable, the PLL1CLKACT signal disables the PPLLOUT and CPLL1OUT outputs.

When the PLL1 stabilization counter reaches the predefined value, PPLLOUT and CPLL1OUT are assumed to be stable and PLL1CLKACT switches from 0 to 1 to enable output of PPLLOUT and CPLL1OUT.

The stable and active state of the PPLLOUT and CPLL1OUT clocks is indicated by PLL1S.PLL1CLKACT = 1.

#### PLL in Stand-by Modes

In STOP mode, the PLL1 is automatically disabled and resumes operation after wake-up from STOP mode, if it was operating before entering STOP mode.

The PLL1 is also automatically disabled when transitioning to DeepSTOP mode. However, after restoring from DeepSTOP mode, the PLL1 needs to be reconfigured.

In Cyclic RUN and Cyclic STOP mode, the PLL1 is not available. Do not enable the PLL1 in Cyclic RUN mode.

**Clock Monitor Control**

The PLL1 activity signal PLL1CLKACT enables or disables supervision by the Clock Monitor CLMA3. In case the PLL1 is inactive (PLL1CLKACT = 0), supervision of the output clock PPLLOUT by CLMA3 is also deactivated.

**PLL Enable/Disable Trigger**

The PLL1 can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger PLL1E.PLL1ENTRG = 1 starts the PLL1  
Note that setting the enable trigger is only effective if the PLL1 is inactive, i.e. if PLL1S.PLL1CLKACT = 0.
- Disable trigger PLL1E.PLL1DISTRG = 1 stops the PLL1  
Note that setting the disable trigger is only effective if the PLL1 is active, i.e. if PLL1S.PLL1CLKACT = 1.

**PLL Input Clock Selection**

The PLL1 input clock (PLL1CLKIN) can be selected from MainOSC and HS IntOSC by using the CKSC\_PLL1IS\_CTL register.

The maximum frequency of CPLLIOUT and PPLLOUT is limited when the HS IntOSC is selected as PLL1 input clock.

### 12C.3.4.1 PLL1 Parameters

The PLL1 is configured by a set of parameters, loaded from the control register PLL1C and CKSC\_CPUCLKD\_CTL.

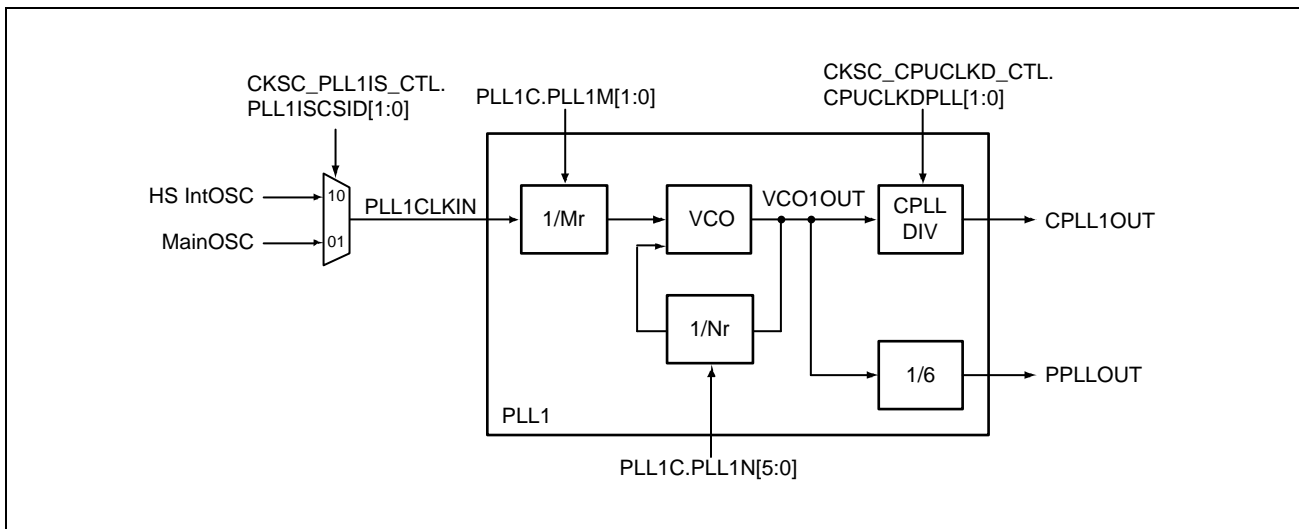

Figure 12C.7 PLL1 Circuit

#### CPLL1OUT and PPLLOUT

The PLL1 has two clock outputs “CPLL1OUT” and “PPLLOUT”. The CPLL1OUT is one of the clock sources of the CPU subsystem, and the PPLLOUT is one of the clock sources of the peripheral modules. CPLL1OUT and PPLLOUT shares the same clock source “VCO1OUT”, which is the output of the voltage controlled oscillator (VCO). The clock frequency of VCO1OUT is calculated by the following formula:

$$f_{VCO1OUT} = f_{PLL1CLKIN} \times (Nr / Mr)$$

The clock frequency of CPLL1OUT “ $f_{CPLL1OUT}$ ” and that of PPLLOUT “ $f_{PPLLOUT}$ ” are integer fractions of the VCO output frequency  $f_{VCO1OUT}$ .  $f_{CPLL1OUT}$  and  $f_{PPLLOUT}$  are calculated by the following formulas:

$$f_{CPLL1OUT} = f_{VCO1OUT} \times 1/Pr = f_{PLL1CLKIN} \times (Nr / Mr) \times 1/Pr$$

$$f_{PPLLOUT} = f_{VCO1OUT} \times 1/6 = f_{PLL1CLKIN} \times (Nr / Mr) \times 1/6$$

The values Nr and Mr are derived from PLL1C register bits:

$$Nr = PLL1C.PLL1N[5:0] + 1$$

$$Mr = PLL1C.PLL1M[1:0] + 1$$

The setting range of Mr:  $1 \leq Mr \leq 3$

The value Pr is derived from CKSC\_CPUCLKD\_CTL.CPUCLKDPLL[1:0], and the value is 4, 5, or 6.

## 12C.4 Registers

### 12C.4.1 List of Registers

The registers of the clock controller are listed below.

Table 12C.1 List of Registers

Module Name	Register Name	Symbol	Address
CLKCTL	Clock oscillator registers:		
	MainOSC enable register	MOSCE	FFF8 1100 <sub>H</sub>
	MainOSC status register	MOSCS	FFF8 1104 <sub>H</sub>
	MainOSC control register	MOSCC	FFF8 1108 <sub>H</sub>
	MainOSC stabilization time register	MOSCST	FFF8 110C <sub>H</sub>
	MainOSC stop mask register	MOSCSTPM	FFF8 1118 <sub>H</sub>
	MainOSC mode control register	MOSCM	FFF8 111C <sub>H</sub>
	HS IntOSC enable register	ROSCCE	FFF8 1000 <sub>H</sub>
	HS IntOSC status register	ROSCS	FFF8 1004 <sub>H</sub>
	HS IntOSC stop mask register	ROSCSTPM	FFF8 1018 <sub>H</sub>
	HS IntOSC user trimming register	ROSCUT	FFF8 101C <sub>H</sub>
	PLL1 enable register	PLL1E	FFF8 9000 <sub>H</sub>
	PLL1 status register	PLL1S	FFF8 9004 <sub>H</sub>
	PLL1 control register	PLL1C	FFF8 9008 <sub>H</sub>
	PLL1 input clock selection register	CKSC_PLL1IS_CTL	FFF8 A700 <sub>H</sub>
	PLL1 input clock active register	CKSC_PLL1IS_ACT	FFF8 A708 <sub>H</sub>
	PPLLCLK source clock selection register	CKSC_PPLLCLKS_CTL	FFF8 A010 <sub>H</sub>
	PPLLCLK source clock active register	CKSC_PPLLCLKS_ACT	FFF8 A018 <sub>H</sub>
	Clock selector control register:

## 12C.4.2 Clock Oscillator Registers

### 12C.4.2.1 MOSCE — MainOSC Enable Register

This register is used to start and stop the MainOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA1RES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1100<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.2 MOSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MOSCDISTRG	MainOSC Disable Trigger* <sup>1,*3</sup> <u>MOSCSTPM.MOSCSTPMSK = 0</u> 0: No function 1: Stops MainOSC <u>MOSCSTPM.MOSCSTPMSK = 1</u> When writing this bit while MOSCSTPM.MOSCSTPMSK = 1, the write value should be 0. 0: No function 1: Setting Prohibited This bit is automatically cleared to 0 by hardware after MainOSC is disabled.
0	MOSCENTRG	MainOSC Enable Trigger* <sup>2,*3</sup> 0: No function 1: Starts MainOSC This bit is automatically cleared to 0 by hardware after MainOSC is enabled.

Note 1. Follow the procedure given below for stopping the MainOSC by using MOSCDISTRG.

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
2. Confirm that the MainOSC is active (MOSCS.MOSCCLKACT = 1).
3. Check that there is no clock domain for which the MainOSC is selected. If the MainOSC is selected for a clock domain, disable the setting or select a clock source other than MainOSC.
4. Confirm that the MainOSC stop mask register (MOSCSTPM) is NOT set to "MainOSC continues operation in standby mode" (MOSCSTPM.MOSCSTPMSK = 1). Otherwise, set the register to "MainOSC stops operation in stand-by mode" (MOSCSTPM.MOSCSTPMSK = 0).
5. Stop the MainOSC (MOSCE.MOSCDISTRG = 1).
6. Confirm that the MainOSC has been stopped (MOSCS.MOSCCLKACT = 0).

Note 2. Follow the procedure given below for starting the MainOSC by using MOSCENTRG.

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
2. Confirm that the MainOSC is inactive (MOSCS.MOSCCLKACT = 0).
3. Start the MainOSC (MOSCE.MOSCENTRG = 1).
4. Confirm that the MainOSC has been started (MOSCS.MOSCCLKACT = 1).

Note 3. Starting and stopping the MainOSC at the same time by using the start and stop bits, i.e., by setting MOSCE.MOSCENTRG = 1 and MOSCE.MOSCDISTRG = 1 at the same time is not allowed.

### 12C.4.2.2 MOSCS — MainOSC Status Register

This register provides active status information about the MainOSC.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA1RES}}$ .

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 1104<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1 <sup>*1</sup>	0 <sup>*1</sup>
	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCC LKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.  
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12C.3 MOSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	MOSCCCLKACT	MainOSC Active Status 0: MainOSC is inactive 1: MainOSC is active
1, 0	Reserved	When read, an undefined value is returned.

### 12C.4.2.3 MOSCC — MainOSC Control Register

This register is used to specify amplification gain of the MainOSC.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA1RES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1108<sub>H</sub>

**Value after reset:** 0000 0004<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.4 MOSCC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	MOSCAMPEL[1:0]	MainOSC Amplification Gain Selection 00: Amplification gain for $f_x = 24$ MHz 01: Amplification gain for $f_x = 20$ MHz 10: Amplification gain for $f_x = 16$ MHz 11: Amplification gain for $f_x = 8$ MHz

#### CAUTION

Set this register when MainOSC is stopped.

### 12C.4.2.4 MOSCST — MainOSC Stabilization Time Register

This register determines the MainOSC stabilization time.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA1RES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 110C<sub>H</sub>

**Value after reset:** 0000 44C0<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCCLKST16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 12C.5 MOSCST Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16 to 0	MOSCCLKST[16:0]	The MOSCCLKST[16:0] bits specify the count value for the MainOSC stabilization counter. <ul style="list-style-type: none"> <li>• If HS IntOSC active (ROSCS.ROSCCLKACT = 1): Stabilization time = MOSCCLKST[16:0] / <math>f_{RH}</math></li> <li>• If HS IntOSC inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = MOSCCLKST[16:0] / <math>f_{RL}</math></li> </ul>

#### NOTE

See **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for information about the MainOSC stabilization time.

#### CAUTION

Set this register when MainOSC is stopped.

### 12C.4.2.5 MOSCSTPM — MainOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMAIRES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1118<sub>H</sub>

**Value after reset:** 0000 0002<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12C.6 MOSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCSTPMSK	MainOSC Stop Request Mask 0: MainOSC stops operation in stand-by mode. MainOSC stops operation in the case the MainOSC disable trigger MOSCE.MOSCDISTRG is set to 1. 1: MainOSC continues operation in stand-by mode.

### 12C.4.2.6 MOSCM — MainOSC Mode Control Register

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMAIRES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 111C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12C.7 MOSCM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCM	MainOSC Mode control 0: OSC mode. (default) 1: EXCLK mode. MainOSC amplifier is disabled.

#### CAUTION

Set this register when MainOSC is stopped.

#### NOTE

EXCLK mode is a mode to directly input clock to X1. For details, see **Section 12C.3.1, Main Oscillator (MainOSC)**.

### 12C.4.2.7 ROSCE — HS IntOSC Enable Register

This register is used to stop the HS IntOSC operation.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA0RES}}$ .

#### CAUTION

Set the ROSCE.ROSCDISTRG bit only when the  $\overline{\text{CLMA0RES}}$  has occurred. In other cases, setting this bit is prohibited.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ROSC DISTR G	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Table 12C.8 ROSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ROSCDISTRG	HS IntOSC Disable Trigger <u>ROSCSTPM.ROSCSTPMSK = 0</u> 0: No function 1: Stops HS IntOSC <u>ROSCSTPM.ROSCSTPMSK = 1</u> Setting prohibited
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 12C.4.2.8 ROSCS — HS IntOSC Status Register

This register provides active status information about the HS IntOSC.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA0RES}}$ .

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 1004<sub>H</sub>

**Value after reset:** 0000 0007<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1 <sup>*1</sup>	0 <sup>*1</sup>
	—	—	—	—	—	—	—	—	—	—	—	—	—	ROSCCLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.  
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12C.9 ROSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	ROSCCLKACT	HS IntOSC Active Status 0: HS IntOSC is inactive 1: HS IntOSC is active
1, 0	Reserved	When read, an undefined value is returned.

### 12C.4.2.9 ROSCSTPM — HS IntOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA0RES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 1018<sub>H</sub>

**Value after reset:** 0000 0002<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ROSCS TPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12C.10 ROSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ROSCSTPMSK	HS IntOSC Stop Request Mask 0: HS IntOSC stops operation in stand-by mode 1: HS IntOSC continues operation in stand-by mode Do not set the HS IntOSC disable trigger ROSCE.ROSCDISTRG to 1 while ROSCSTPMSK bit is set to 1.

### 12C.4.2.10 PLL1E — PLL1 Enable Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 9000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1DI STRG	PLL1EN TRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.11 PLL1E Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PLL1DISTRG	PLL1 Disable Trigger*1,*4 0: No function 1: Stops PLL1 This bit is automatically cleared to 0 by hardware after PLL1 is disabled.
0	PLL1ENTRG	PLL1 Enable Trigger*2,*3,*4 0: No function 1: Starts PLL1 This bit is automatically cleared to 0 by hardware after PLL1 is activated.

Note 1. Follow the procedure given below for stopping the PLL1 by using PLL1DISTRG.

1. Confirm that the PLL1 is neither waiting for being enabled nor stopped (both PLL1E.PLL1DISTRG = 0 and PLL1E.PLL1ENTRG = 0).
2. Confirm that the PLL1 is active (PLL1S.PLL1CLKACT = 1).
3. Check that there is no clock domain for which the PLL1 is selected. If the PLL1 is selected for a clock domain, disable the setting or select a clock source other than the PLL1.
4. Stop the PLL1 (PLL1E.PLL1DISTRG = 1).
5. Confirm that the PLL1 has been stopped (PLL1S.PLL1CLKACT = 0).

Note 2. Before starting PLL1 using PLL1ENTRG, confirm that the PLL1 input clock (MainOSC or HS IntOSC, selected by the CKSC\_PLL1IS\_CTL) is operating.

Note 3. Follow the procedure given below for starting the PLL1 by using PLL1ENTRG.

1. Confirm that the PLL1 is neither waiting for being enabled nor stopped (both PLL1E.PLL1DISTRG = 0 and PLL1E.PLL1ENTRG = 0).
2. Confirm that the PLL1 is inactive (PLL1S.PLL1CLKACT = 0).
3. Start the PLL1 (PLL1E.PLL1ENTRG = 1).
4. Confirm that the PLL1 has been started (PLL1S.PLL1CLKACT = 1).

Note 4. Starting and stopping the PLL1 at the same time by using the start and stop bits, i.e., by setting PLL1E.PLL1ENTRG = 1 and PLL1E.PLL1DISTRG = 1 at the same time is not allowed.

### 12C.4.2.11 PLL1S — PLL1 Status Register

This register provides active status information about the PLL1.

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 9004<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1*	0*
	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1CLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.  
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12C.12 PLL1S Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	PLL1CLKACT	PLL1 Active Status 0: PLL1 is inactive 1: PLL1 is active
1, 0	Reserved	When read, an undefined value is returned.

### 12C.4.2.12 PLL1C — PLL1 Control Register

This register is used to set the PLL1 VCO output clock frequency  $f_{VCO1OUT}$ , shown in **Section 12C.3.4.1, PLL1 Parameters**.

This register can only be written, if the PLL1 is disabled.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 9008<sub>H</sub>

**Value after reset:** 0001 133B<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	10 <sub>B</sub> (Mr = 3)	3B <sub>H</sub> (Nr = 60)	480.0	120.0	96.0	80.0	80.0
8 (HS IntOSC) <sup>*2, *4</sup>	00 <sub>B</sub> (Mr = 1)	3B <sub>H</sub> (Nr = 60)	480.0	N/A	N/A	80.0 <sup>*2, *3</sup>	80.0 <sup>*2</sup>

Note 1. The CPLL1OUT frequency is defined by CKSC\_CPUCLKD\_CTL.CPUCLKDPLL[1:0]. Refer to the CKSC\_CPUCLKD\_CTL register description.

Note 2. Typical frequencies. User calibration of HS IntOSC is required before setting HS IntOSC as PLL1CLKIN.

Note 3. The limit of CPLL1OUT frequency is 80 MHz (typ.) when HS IntOSC is selected as clock source of PLL1.

Note 4. See **Section 44.10, Usage Notes**.

Note 5. Settings other than those shown in this table are prohibited.

## 12C.4.2.13 PLL1 Input Clock Selection

## (1) CKSC\_PLL1IS\_CTL — PLL1 Input Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A700<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 12C.15 CKSC\_PLL1IS\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PLL1ISCSID[1:0]	Source Clock Setting for PLL1 input clock 01 <sub>B</sub> : MainOSC (Default) 10 <sub>B</sub> : HS IntOSC* <sup>1</sup> Other than above: Setting prohibited

Note 1. The maximum frequency of CPLL1OUT and PPLLOUT is limited when the HS IntOSC is selected as the PLL1 input clock.

**CAUTION**

Set this register when PLL1 is stopped.

**(2) CKSC\_PLL1IS\_ACT — PLL1 Input Clock Active Register**

This register is initialized by all reset sources (ISORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 A708<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12C.16 CKSC\_PLL1IS\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PLL1ISACT[1:0]	Source clock for currently active PLL1 input clock

## 12C.4.2.14 PPLLCLK Source Clock Selection

## (1) CKSC\_PPLLCLKS\_CTL — PPLLCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A010<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12C.18 CKSC\_PPLLCLKS\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PPLLCLKSACT[1:0]	Source clock for currently active PPLLCLK*1

Note 1. The data read from this register is 00<sub>B</sub> if the selected source clock for all of the following clock domains is other than PPLLCLK (or PPLLCLK2):  
C\_ISO\_PERI1, C\_ISO\_PERI2, C\_ISO\_LIN, C\_ISO\_CAN, C\_ISO\_CSI, C\_ISO\_IIC

### 12C.4.2.15 ROSCUT — HS IntOSC User Trimming Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and  $\overline{\text{CLMA0RES}}$ .

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 101C<sub>H</sub>

**Value after reset:** 0000 0XXX<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FADJUST[8:0]								
Value after reset	0	0	0	0	0	0	0	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12C.19 ROSCUT Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	FADJUST[8:0]	Frequency Adjustment parameters of HS IntOSC. The value after reset of this register is pre-set value of HS IntOSC trimming data. Overwrite this register with “read value + 1” or “read value – 1” until the HS IntOSC frequency becomes target frequency range.

## 12C.4.3 Clock Selector Control Register

### 12C.4.3.1 WDTA0 Clock Domain C\_AWO\_WDTA

#### (1) CKSC\_AWDTAD\_CTL — C\_AWO\_WDTA Clock Divider Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2000<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.20 CKSC\_AWDTAD\_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	AWDTADCSID[1:0]	Clock Divider Setting for C_AWO_WDTA 00 <sub>B</sub> : Setting prohibited 01 <sub>B</sub> : LS IntOSC / 128 (default) 10 <sub>B</sub> : LS IntOSC / 1 11 <sub>B</sub> : Setting prohibited

**(2) CKSC\_AWDTAD\_ACT — C\_AWO\_WDTA Clock Divider Active Register**

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 2008<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADACT [1:0]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12C.21 CKSC\_AWDTAD\_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	AWDTADACT[1:0]	Clock divider for currently active C_AWO_WDTA

**(3) CKSC\_AWDTAD\_STPM — C\_AWO\_WDTA Stop Mask Register**

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2018<sub>H</sub>

**Value after reset:** 0000 0002<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTA DSTPM SK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

**CAUTION**

Do not change the “1” value after reset of bit 1.

Table 12C.22 CKSC\_AWDTAD\_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AWDTADSTPMSK*1	0: Clock domain C_AWO_WDTA is stopped in stand-by mode. 1: Clock domain C_AWO_WDTA is not stopped in stand-by mode.

Note 1. The return time from stand-by mode can be shortened by setting this bit to 1.

## 12C.4.3.2 TAUJ Clock Domain C\_AWO\_TAUJ

## (1) CKSC\_ATAUJS\_CTL — C\_AWO\_TAUJ Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2100<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**CAUTION**

Do not change the “1” value after reset of bit 1.

Table 12C.27 CKSC\_ATAUJD\_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ATAUJDSTPMSK	0: Clock domain C_AWO_TAUJ is stopped in stand-by mode. 1: Clock domain C_AWO_TAUJ is not stopped in stand-by mode.

## 12C.4.3.3 RTCA Clock Domain C\_AWO\_RTCA

## (1) CKSC\_ARTCAS\_CTL — C\_AWO\_RTCA Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by a power-up reset PURES.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2300<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

1, 0	IPERI2SACT[1:0]	Source clock for currently active C_ISO_PERI2

## 12C.4.3.8 RLIN Clock Domains C\_ISO\_LIN

## (1) CKSC\_ILINS\_CTL — C\_ISO\_LIN Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 A400<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

## 12C.5 Clock Domain Setting Method

### 12C.5.1 Clock Domain Setting

#### 12C.5.1.1 Overview of Clock Selector Register

The clock selector for a clock domain C\_AWO\_<name>/C\_ISO\_<name> can be controlled by the following registers:

- Source clock selection registers
  - These registers select the clock to be used as the domain clock from the available source clocks.
  - AWO source clock selection: CKSC\_A<name>S\_CTL
  - ISO source clock selection: CKSC\_I<name>S\_CTL
- Clock divider selection registers
  - These registers specify the clock division ratio for the selected source clock.
  - AWO clock divider: CKSC\_A<name>D\_CTL
  - ISO clock divider: CKSC\_I<name>D\_CTL
- Source clock active registers and clock divider active registers
  - These registers return the currently active source clock selection and division ratio, respectively.
  - AWO source clock active register/clock divider active register:  
CKSC\_A<name>S\_ACT/CKSC\_A<name>D\_ACT
  - ISO source clock active register/clock divider active register:  
CKSC\_I<name>S\_ACT/CKSC\_I<name>D\_ACT

#### NOTE

- Not all clock selectors provide all of the control functions described above.
- The symbol “I”, which indicates the power domain, is not added to the names of registers within clock domain C\_ISO\_CPUCLK.

### 12C.5.1.2 Setting Procedure for Clock Domain

Procedure of setting up clock domain is described as below:

1. Set up a source clock
  - Select a source clock. (CKSC\_A<name>S\_CTL, CKSC\_I<name>S\_CTL)
  - Confirm completion of selection. (CKSC\_A<name>S\_ACT, CKSC\_I<name>S\_ACT)\*<sup>1</sup>
2. Setting a clock divider
  - Select a clock divider. (CKSC\_A<name>D\_CTL, CKSC\_I<name>D\_CTL)
  - Confirm completion of selection. (CKSC\_A<name>D\_ACT, CKSC\_I<name>D\_ACT)\*<sup>2</sup>

**Note 1.** Continue processing after CKSC\_A<name>S\_ACT and CKSC\_I<name>S\_ACT are updated with the new values written to CKSC\_A<name>S\_CTL and CKSC\_I<name>S\_CTL.

**Note 2.** Continue processing after CKSC\_A<name>D\_ACT and CKSC\_I<name>D\_ACT are updated with the new values written to CKSC\_A<name>D\_CTL and CKSC\_I<name>D\_CTL.

#### CAUTION

The source clock to be selected must be operating before performing these settings.  
The behavior and performance are not guaranteed if setup is performed while the source clock is stopped.  
Access to a peripheral module is prohibited while the clock is not supplied to the module.

### 12C.5.2 Stopping the Clock in Stand-by Mode

In stand-by mode (STOP mode, DeepSTOP mode, and Cyclic STOP mode), clock domain C\_AWO\_<name>/C\_ISO\_<name> can be configured to stop or continue its clock CKSCLK\_A<name>/CKSCLK\_I<name> in response to clock stop requests from the stand-by controller.

The clock stop mask registers are used to determine the operation status of the clock in stand-by mode:

- CKSC\_A<name>\_STPM.A<name>STPMSK/CKSC\_I<name>\_STPM.I<name>STPMSK = 0:  
The STOP request signal is not masked, so the domain clock CKSCLK\_A<name>/CKSCLK\_I<name> is stopped during stand-by mode.  
If the domain clock was in operation before transition to stand-by mode, it is automatically re-started after wake-up from stand-by mode.  
If there is another clock domain which the same source clock is selected and its stop mask setting is set to 1 (CKSC\_A<name>\_STPM.A<name>STPMSK/CKSC\_I<name>\_STPM.I<name>STPMSK = 1), the source clock will continue operation in stand-by mode.  
The CPU clock domain C\_ISO\_CPUCLK is always stopped in stand-by mode.
- CKSC\_A<name>\_STPM.A<name>STPMSK/CKSC\_I<name>\_STPM.I<name>STPMSK = 1:  
The STOP request signal is masked, so CKSCLK\_A<name>/CKSCLK\_I<name> continues to operate during stand-by.  
The source clock selected for the target clock domain will also continue to operate in stand-by mode.  
Supply of a clock signal to the clock domains in the Isolated area (ISO area) will be stopped in DeepSTOP mode.

### 12C.5.3 Clock Domain Settings

The following table shows a selectable source clock, a frequency division ratio, and a register to be used for each clock domain.

Table 12C.64 List of Selectable Clocks

Clock Domain	Clock Name	Selectable Register	Frequency Divided Register	Maximum Frequency	Applicable Unit
C_AWO_WDTA	CKSCLK_AWDTA	—	<b>LS IntOSC</b> CKSC_AWDTAD_CTL	1/1 240 kHz <b>1/128</b>	WDTA0
C_AWO_TAUJ	CKSCLK_ATAUJ	CKSC_ATAUJS_CTL	MainOSC <b>HS IntOSC</b> LS IntOSC PPLLCLK2 Disable	CKSC_ATAUJD_CTL 1/1 1/2 1/4 1/8 —	40 MHz TAUJ0 TAUJ2

C_ISO_LIN	CKSCLK_ILIN	CKSC_ILINS_CTL	MainOSC HS IntOSC <b>PPLLCLK2</b> Disable	CKSC_ILIND_CTL*1 1/1 1/4 1/8	40 MHz RLIN24n RLIN3n

Table 12C.64 List of Selectable Clocks

Clock Domain	Clock Name	Selectable Register	Frequency Divided Register		Maximum Frequency	Applicable Unit	
C_ISO_CAN	CKSCLK_ICAN	CKSC_ICANS_CTL	MainOSC	—	1/1	80 MHz	RCFDCn (PCLK)
			<b>PPLLCLK</b>				
			Disable				
C_ISO_CANOSC	CKSCLK_ICANOSC	—	MainOSC	CKSC_ICANOSCD_CTL	1/1	24 MHz	RCFDCn (clk_xincan)
					1/2		
					<b>Disable</b>		
C_ISO_CSI	CKSCLK_ICSI	CKSC_ICSIS_CTL	<b>PPLLCLK</b>	—	1/1	80 MHz	CSIGn CSIHn
			MainOSC				
			HS IntOSC				
			Disable				
C_ISO_IIC	CKSCLK_IIC	CKSC_IICCS_CTL	<b>PPLLCLK2</b>	—	1/1	40 MHz	RIICn
			Disable				

**Note:** The items written in bold are the initial setting clocks for each register.

Note 1. The setting of this register only applies to RLIN30. The settings 1/4 and 1/8 are only available in UART mode.

Note 2. CKSC\_CPUCLKS\_CTL selects selection of Main OSC, CPLL1OUT and EMCLK. CKSC\_CPUCLKD\_CTL.CPUCLKDPLL[1:0] selects CPLL1OUT clock frequency.

Note 3. For the supported settings, refer to **Table 12C.14, PLL1 Output Table**.

### CAUTION

To stop the clock source selected for the clock domain before transitioning to STOP/DeepSTOP mode, select "Disable" for that clock domain in advance. Do not stop the source clock of a clock domain for which "Disable" cannot be selected while functions are operating on that clock domain. To stop the clock source selected for the domain by transitioning to STOP/DeepSTOP mode, "Disable" does not need to be selected.

Instead of the setting "Disable", select "Stop" for the clock domain in stand-by mode by using the stop mask register.

## 12C.6 Frequency Output Function (FOUT)

The frequency output function (FOUT) allows the clock to be output the clock as the external signal. Furthermore, the frequency can be divided by the clock divider before it is output.

### 12C.6.1 Functional Overview

**Figure 12C.8, Frequency Output Function** shows the configuration of the frequency output function.

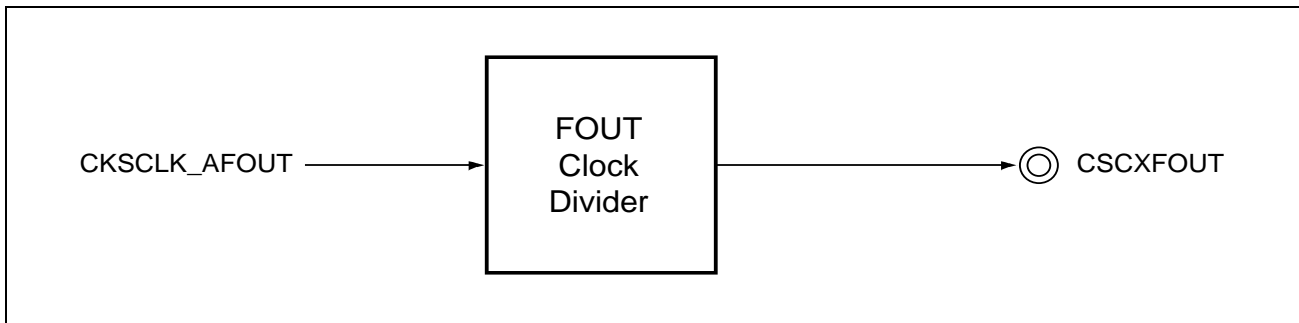

Figure 12C.8 Frequency Output Function

The clock output function outputs the CKSCLK\_AFOUT clock divided by 1 to 63 through the clock divider from CSCXFOUT. Division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register. Clock output frequency  $f_{CSCXFOUT}$  is expressed by the following equation.

$$f_{CSCXFOUT} = (\text{CKSCLK\_AFOUT clock frequency}) / N$$

Clock output starts when, after CKSCLK\_AFOUT is set and the clock output for the pin function is selected, division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register.

When a new division ratio is written to the FOUTDIV.FOUTDIV[5:0] bits, it becomes effective in synchronization with the CSCXFOUT output clock. Accordingly, the division ratio can be changed even while the CSCXFOUT clock is operating. The clock output is stopped by writing 000<sub>H</sub> to the FOUTDIV[5:0] bits.

### 12C.6.2 Clock Supply

The clock supply to the CSCXFOUT is shown in the following table.

Table 12C.65 Clock Supply

Module	Unit Clock Name	Supply Clock Name	Description
CSCXFOUT	PCLK	CPUCLK_UL	Bus clock (Register access)
	CKSCLK_AFOUT	CKSCLK_AFOUT	Clock source of FOUT clock divider

## 12C.6.3 Registers

### 12C.6.3.1 List of Registers

The FOUT registers are listed in the following table.

Table 12C.66 List of Registers

Module Name	Register Name	Symbol	Address
CLKCTL	Clock division ratio register	FOUTDIV	FFF8 2800 <sub>H</sub>
	Clock divider status register	FOUTSTAT	FFF8 2804 <sub>H</sub>

### 12C.6.3.2 FOUTDIV — Clock Division Ratio Register

This register defines the clock divisor.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 2800<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12C.68 FOUTSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	FOUTCLKACT	Clock Divider Active 0: Frequency output is stopped. 1: Frequency output is ongoing.
0	FOUTSYNC	Clock Divider Synchronized 0: The clock divider is in the process of synchronization. 1: The clock divider is stable (or stopped).

## Section 13 Clock Monitor (CLMA)

This section contains a generic description of the clock monitor (CLMA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of CLMA.

### 13.1 Features of RH850/F1KH, RH850/F1KM CLMA

#### 13.1.1 Number of Units

This microcontroller has the following number of CLMA units.

Each CLMA unit has single channel interface. “channel” is used with the same meaning as “unit” in this section.

Table 13.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	4	4	4
Name	CLMA <sub>n</sub> (n = 0 to 3)	CLMA <sub>n</sub> (n = 0 to 3)	CLMA <sub>n</sub> (n = 0 to 3)

Table 13.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	4	4	4	4	4
Name	CLMA <sub>n</sub> (n = 0 to 3)	CLMA <sub>n</sub> (n = 0 to 3)	CLMA <sub>n</sub> (n = 0 to 3)	CLMA <sub>n</sub> (n = 0 to 3)	CLMA <sub>n</sub> (n = 0 to 3)

Table 13.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	4	4	4
Name	CLMA <sub>n</sub> (n = 0 to 3)	CLMA <sub>n</sub> (n = 0 to 3)	CLMA <sub>n</sub> (n = 0 to 3)

Table 13.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	3	3	3	3
Name	CLMA <sub>n</sub> (n = 0, 1, 3)	CLMA <sub>n</sub> (n = 0, 1, 3)	CLMA <sub>n</sub> (n = 0, 1, 3)	CLMA <sub>n</sub> (n = 0, 1, 3)

Table 13.5 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2)

Index	Description
n	Throughout this section, the individual CLMA Channels are identified by the index “n”: for example, CLMA <sub>n</sub> CTLO (n = 0 to 3) is the CLMA <sub>n</sub> control register 0.

Table 13.6 Index (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual CLMA Channels are identified by the index “n”: for example, CLMA <sub>n</sub> CTLO (n = 0, 1, 3) is the CLMA <sub>n</sub> control register 0.

### 13.1.2 Register Base Addresses

The CLMA base addresses are listed in the following table.

The CLMA register addresses are given as offsets from the base addresses.

Table 13.7 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2)

Base Address Name	Base Address
<CLMA0_base>	FFF8 C000 <sub>H</sub>
<CLMA1_base>	FFF8 D000 <sub>H</sub>
<CLMA2_base>	FFF8 E000 <sub>H</sub>
<CLMA3_base>	FFF8 F000 <sub>H</sub>

Table 13.8 Register Base Addresses (RH850/F1KM-S1)

Base Address Name	Base Address
<CLMA0_base>	FFF8 C000 <sub>H</sub>
<CLMA1_base>	FFF8 D000 <sub>H</sub>
<CLMA3_base>	FFF8 E000 <sub>H</sub>

### 13.1.3 Clock Supply

The clocks monitored by CLMA and the CLMA sampling clocks are indicated below.

Table 13.9 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2)

Channel Name	Unit Clock Name	Supply Clock Name
CLMA0	CLMATMON (monitored clock)	HS IntOSC
	CLMATSM (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA1	CLMATMON (monitored clock)	MainOSC
	CLMATSM (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA2	CLMATMON (monitored clock)	PLL0OUT*1
	CLMATSM (sampling clock)	HS IntOSC
	Register access clock	CPUCLK_UL
CLMA3	CLMATMON (monitored clock)	PPLLOUT
	CLMATSM (sampling clock)	HS IntOSC
	Register access clock	CPUCLK_UL

Note 1. For details, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, Section 12AB.3.5.1, PLL0 Parameters, Figure 12AB.8, PLL0 Circuit.**

Table 13.10 Clock Supply (RH850/F1KM-S1)

Channel Name	Unit Clock Name	Supply Clock Name
CLMA0	CLMATMON (monitored clock)	HS IntOSC
	CLMATSM (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA1	CLMATMON (monitored clock)	MainOSC
	CLMATSM (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA3	CLMATMON (monitored clock)	PPLLOUT
	CLMATSM (sampling clock)	HS IntOSC
	Register access clock	CPUCLK_UL

### 13.1.4 Reset Sources

The reset sources of the CLMA are listed in the following table. The CLMA are initialized by these reset sources.

Table 13.11 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2)

Channel Name	Reset Source
CLMA0	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA1	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA2	All reset sources (ISOIRES)
CLMA3	All reset sources (ISOIRES)
Common Registers (CLMATTEST, CLMATTESTS)	Power-up reset PURES (power-on-clear or debugger reset)

Table 13.12 Reset Sources (RH850/F1KM-S1)

Channel Name	Reset Source
CLMA0	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA1	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA3	All reset sources (ISOIRES)
Common Registers (CLMATTEST, CLMATTESTS)	Power-up reset PURES (power-on-clear or debugger reset)

### 13.1.5 Internal Input/Output Signals

The internal input/output signals of CLMA are listed in the following table.

Table 13.13 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2)

Unit Signal Name	Description	Connection
$\overline{\text{CLMATRES}}$	CLMA0 error reset output	Reset controller ( $\overline{\text{CLMA0RES}}$ )
$\overline{\text{CLMATRES}}$	CLMA1 error reset output	Reset controller ( $\overline{\text{CLMA1RES}}$ )
$\overline{\text{CLMATRES}}$	CLMA2 error reset output	Reset controller ( $\overline{\text{CLMA2RES}}$ )
$\overline{\text{CLMATRES}}$	CLMA3 error reset output	Reset controller ( $\overline{\text{CLMA3RES}}$ )

Table 13.14 Internal Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Connection
$\overline{\text{CLMATRES}}$	CLMA0 error reset output	Reset controller ( $\overline{\text{CLMA0RES}}$ )
$\overline{\text{CLMATRES}}$	CLMA1 error reset output	Reset controller ( $\overline{\text{CLMA1RES}}$ )
$\overline{\text{CLMATRES}}$	CLMA3 error reset output	Reset controller ( $\overline{\text{CLMA3RES}}$ )

## 13.2 Overview

### 13.2.1 Functional Overview

Clock monitor CLMA detects frequency abnormalities in the monitored clock. It uses sampling clock CLMATSMPL to monitor whether the frequency of input clock CLMATMON is within a specific range.

Upon detection of an abnormal clock, it outputs a reset request signal.

The main components of the clock monitor are shown in **Figure 13.1, Block Diagram of the Clock Monitor**.

Figure 13.1 Block Diagram of the Clock Monitor

#### NOTE

Once enabled, only a reset can disable the CLMA.

### 13.3 Enabling CLMA

Clock monitoring is started by the clock monitor when  $CLMA_nCTL0.CLMA_nCLME = 1$ .

When the monitored clock is stopped by a register operation or transition to stand-by mode, the corresponding clock monitor is automatically disabled. After the monitored clock starts oscillation again and becomes stable, the clock monitor also starts operation.

Since CLMA2 and CLMA3 is initialized on return from DeepSTOP, the CLMA2 and CLMA3 register must be set again before further operation is started.

## 13.4 Functions

### 13.4.1 Detection of Abnormal Clock Frequencies

#### Detection Method

- CLMAn counts the rising edges of the monitored clock CLMATMON within 16 cycles of the sampling clock CLMATSMPL and then compares the counter value with the specified thresholds:
  - CLMAnCMPL.CLMAnCMPL[11:0] defines the lower threshold.
  - CLMAnCMPH.CLMAnCMPH[11:0] defines the upper threshold.
- When CLMATMON frequency\*<sup>1</sup> is lower than the limit, the counter falls below CLMAnCMPL.CLMAnCMPL[11:0].
- When the frequency of CLMATMON is higher than the limit, the counter exceeds CLMAnCMPH.CLMAnCMPH[11:0].

**Note 1.** There is a case that the abnormal state is not detected when the monitor clock completely stops.

Figure 13.2 Example:  $f_{\text{CLMATMON}}$  is Lower than the Specified Limit

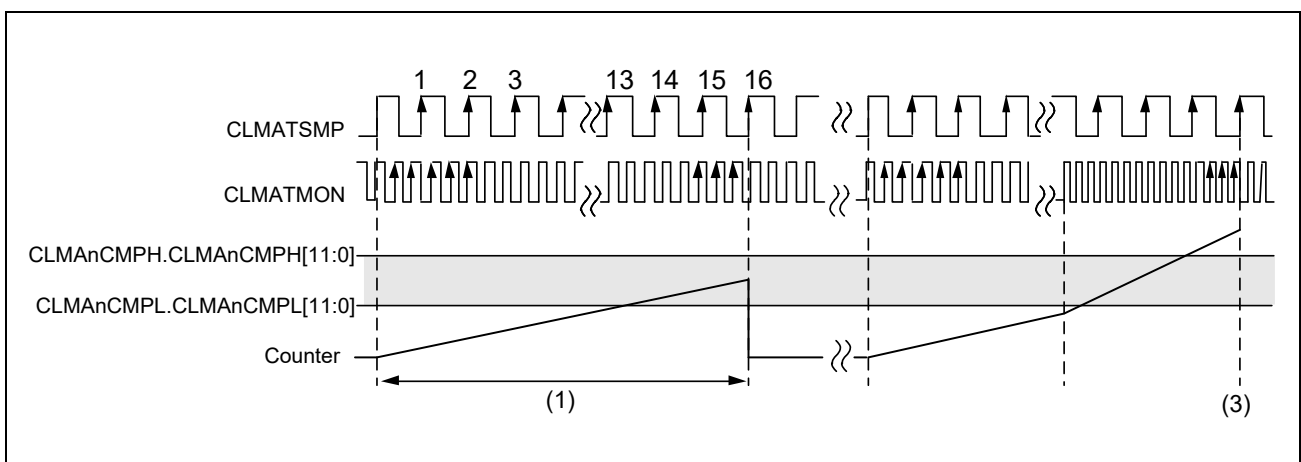

Figure 13.3 Example:  $f_{\text{CLMATMON}}$  is Higher than the Specified Limit

**NOTE**

Even if  $f_{CLMATMON}$  exceeds or falls below the specified limits during a sampling interval, the counter might be within the valid range.

Abnormal  $f_{CLMATMON}$  is detected after one sampling interval.

**(1) Calculation Method of the Thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**

The compare registers CLMAnCMPL and CLMAnCMPH are configured with the minimum and maximum number of clock cycles of CLMATMON that are assumed to be valid within 16 cycles of the sampling clock CLMATSMPL.

The expected number of clock cycles is denoted by N.

$$\frac{16}{f_{CLMATSMPL}} = \frac{N}{f_{CLMATMON}}$$

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMPL}} \times 16$$

Considering the allowed frequency deviations of CLMATMON and CLMATSMPL, the threshold values can be calculated by the following formulas:

$$\begin{aligned} \text{Lower threshold} &= N_{min} \\ &= \frac{f_{CLMATMON(dmin)}}{f_{CLMATSMPL(max)}} \times 16 - 1 \end{aligned}$$

$$\begin{aligned} \text{Upper threshold} &= N_{max} \\ &= \frac{f_{CLMATMON(max)}}{f_{CLMATSMPL(min)}} \times 16 + 1 \end{aligned}$$

**NOTE**

The jitter of the PLL is covered by "+1" and "-1" in the formulas.

**Example:**

When  $f_{\text{CLMATSMPL}} = 240 \text{ kHz } (\pm 8\%)$  and  $f_{\text{CLMATMON}} = 16 \text{ MHz } (\pm 5\%)$ , the recommended threshold values are as follows:

$$\begin{aligned} N_{\min} &= 15,200 / 259.2 \times 16 - 1 \\ &= 937.27 \\ \text{CLMA}_{\text{nCMPL}} &= 937 = 03\text{A9}_{\text{H}} \end{aligned}$$

$$\begin{aligned} N_{\max} &= 16,800 / 220.8 \times 16 + 1 \\ &= 1218.39 \\ \text{CLMA}_{\text{nCMPH}} &= 1219 = 04\text{C3}_{\text{H}} \end{aligned}$$

**Minimum Thresholds**

The following restrictions must be taken into account:

- $\text{CLMA}_{\text{nCMPL}} \geq 0001_{\text{H}}$
- $\text{CLMA}_{\text{nCMPH}} \geq \text{CLMA}_{\text{nCMPL}} + 0003_{\text{H}}$

**(2) Definition of the Initial Value Input to the Threshold Registers**

The reset values of the threshold registers are set as follows:

- $\text{CLMA}_{\text{nCMPL}}[11:0] = 001_{\text{H}}$
- $\text{CLMA}_{\text{nCMPH}}[11:0] = 3\text{FF}_{\text{H}}$

**13.4.2 Notification of Abnormal Clock Frequency**

If  $f_{\text{CLMATMON}}$  exceeds the upper threshold or falls below the lower threshold, this is indicated as follows:

1. The reset request signal  $\overline{\text{CLMATRES}}$  is set to low level.
2. The system reset (AWORES or ISORES) is generated and CLMA<sub>n</sub> is reset.

Figure 13.4 Error Request Signal Output if  $f_{\text{CLMATMON}}$  Exceeds Upper Threshold

**CAUTION**

For usage notes for CLMA<sub>n</sub> abnormality detection, see **Section 13.6, Usage Notes for CLMA<sub>n</sub>**.

## 13.5 Registers

### 13.5.1 List of Registers

The following table lists the CLMA registers.

<CLMA<sub>n</sub>\_base> is defined in **Section 13.1.2, Register Base Addresses**.

Table 13.15 List of Registers

Module Name	Register Name	Symbol	Address
CLMA <sub>n</sub>	CLMA <sub>n</sub> control register 0	CLMA <sub>n</sub> CTL0	<CLMA <sub>n</sub> _base> + 00 <sub>H</sub>
	CLMA <sub>n</sub> compare register L	CLMA <sub>n</sub> CMPL	<CLMA <sub>n</sub> _base> + 08 <sub>H</sub>
	CLMA <sub>n</sub> compare register H	CLMA <sub>n</sub> CMPH	<CLMA <sub>n</sub> _base> + 0C <sub>H</sub>
	CLMA <sub>n</sub> emulation register 0	CLMA <sub>n</sub> EMU0	<CLMA <sub>n</sub> _base> + 18 <sub>H</sub>
CLMA	CLMA test register	CLMATEST	FFF8 C100 <sub>H</sub>
	CLMA test status register	CLMATESTS	FFF8 C104 <sub>H</sub>

### 13.5.2 CLMA<sub>n</sub>CTL0 — CLMA<sub>n</sub> Control Register 0

This register enables the clock monitor CLMA<sub>n</sub>.

The correct write sequence using the CLMA<sub>n</sub>PCMD register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 8-bit units.

**Address:** <CLMA<sub>n</sub>\_base> + 00<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMA <sub>n</sub> CLME
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 13.16 CLMA<sub>n</sub>CTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CLMA <sub>n</sub> CLME	Enables or disables the clock monitor. 0: CLMA <sub>n</sub> is disabled. 1: CLMA <sub>n</sub> is enabled.

#### CAUTION

The CLMA<sub>n</sub>PRERR bit in CLMA<sub>n</sub>PS register is set to 1 when 0 is written to the CLMA<sub>n</sub>CTL0.CLMA<sub>n</sub>CLME bit. The only condition for clearing the bit is a reset (AWORES, ISORES). In addition, the bit is cleared when the CLMATEST.RESCLM bit is set to 1 during self-test of CLMA<sub>n</sub>.

### 13.5.3 CLMA<sub>n</sub>CMPL — CLMA<sub>n</sub> Compare Register H

This register specifies the upper limit of frequency.

It can only be written when CLMA<sub>n</sub> is disabled (CLMA<sub>n</sub>CTL0.CLMA<sub>n</sub>CLME = 0).

For details, see **Section 13.4.1(1), Calculation Method of the Thresholds CLMA<sub>n</sub>CMPL.CLMA<sub>n</sub>CMPL[11:0] and CLMA<sub>n</sub>CMPL.CLMA<sub>n</sub>CMPL[11:0]**.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CLMA<sub>n</sub>\_base> + 0C<sub>H</sub>

**Value after reset:** 03FF<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMA <sub>n</sub> CMPL[11:0]											
Value after reset	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.17 CLMA<sub>n</sub>CMPL Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CLMA <sub>n</sub> CMPL[11:0]	Specifies the upper threshold. <ul style="list-style-type: none"> <li>The recommended value is <math>f_{\text{CLMATMON (max)}} / f_{\text{CLMATSMPL (min)}} \times 16 + 1</math>.</li> <li>The minimum value is CLMA<sub>n</sub>CMPL + 0003<sub>H</sub>.</li> </ul>

### 13.5.4 CLMA<sub>n</sub>CMPL — CLMA<sub>n</sub> Compare Register L

This register specifies the lower limit of frequency.

It can only be written when CLMA<sub>n</sub> is disabled (CLMA<sub>n</sub>CTL0.CLMA<sub>n</sub>CLME = 0).

For details, see **Section 13.4.1(1), Calculation Method of the Thresholds CLMA<sub>n</sub>CMPL.CLMA<sub>n</sub>CMPL[11:0] and CLMA<sub>n</sub>CMPL.CLMA<sub>n</sub>CMPL[11:0]**.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CLMA<sub>n</sub>\_base> + 08<sub>H</sub>

**Value after reset:** 0001<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMA <sub>n</sub> CMPL[11:0]

Table 13.18 CLMA<sub>n</sub>CMPL Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CLMA <sub>n</sub> CMPL[11:0]	Specifies the lower threshold. <ul style="list-style-type: none"> <li>The recommended value is <math>f_{\text{CLMATMON (min)}} / f_{\text{CLMATSMPL (max)}} \times 16 - 1</math>.</li> <li>The minimum value is 0001<sub>H</sub>.</li> </ul>

### 13.5.5 CLMATEST — CLMA Test Register

This register is used to control self-test of CLMA0, CLMA1, CLMA2, and CLMA3.

The correct write sequence using the PROTCMDCLMA register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 C100<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub> This register is initialized by a power-up reset PURES (power-on clear or debugger reset).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 13.19 CLMATEST Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	CLMA3TESEN	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2: CLMA3 Self-Test Enable/Disable 0: Test disabled 1: Test enabled RH850/F1KM-S1: When read, the value after reset is returned. When writing, write the value after reset.
5	CLMA2TESEN	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2: CLMA2 Self-Test Enable/Disable 0: Test disabled 1: Test enabled RH850/F1KM-S1: CLMA3 Self-Test Enable/Disable 0: Test disabled 1: Test enabled
4	CLMA1TESEN	CLMA1 Self-Test Enable/Disable 0: Test disabled 1: Test enabled
3	CLMA0TESEN	CLMA0 Self-Test Enable/Disable 0: Test disabled 1: Test enabled
2	ERRMSK	CLMA Test Error Mask Setting Masks a reset request to the reset controller when CLMA <sub>n</sub> detects an error. When the ERRMSK is set for CLMA <sub>n</sub> , that CLMA <sub>n</sub> does not issue a reset request to the reset controller even if it detects an error. The ERRMSK setting is valid only for the CLMA <sub>n</sub> for which CLMA <sub>n</sub> TESEN bit is set to 1. 0: Reset request signal generation enabled 1: Reset request signal generation disabled (masked)

Table 13.19 CLMATEST Register Contents

Bit Position	Bit Name	Function
1	MONCLKMSK	<p>Monitor Clock Mask Setting</p> <p>Fixes the clock input to the CLMAn to low level. The MONCLKMSK setting is valid only for the CLMAn for which CLMAnTESEN bit is set to 1.</p> <p>0: Monitor clock enabled 1: Monitor clock disabled (masked)</p>
0	RESCLM	<p>CLMAn Test Reset Signal Control</p> <p>Initializes CLMAn forcibly. The RESCLM setting is valid only for the CLMAn for which CLMAnTESEN bit is set to 1.</p> <p>0: Reset released 1: Reset executed</p>

### 13.5.6 CLMATESTS — CLMA Test Status Register

This register is used to confirm the self-test result of CLMA0, CLMA1, CLMA2, and CLMA3.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 C104<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub> This register is initialized by a power-up reset PURES (power-on clear or debugger reset).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 13.20 CLMATESTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	CLMA3ERRS	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2: CLMA3 Error Status 0: Errors are not detected 1: Errors are detected RH850/F1KM-S1: When read, the value after reset is returned.
2	CLMA2ERRS	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2: CLMA2 Error Status 0: Errors are not detected 1: Errors are detected RH850/F1KM-S1: CLMA3 Error Status 0: Errors are not detected 1: Errors are detected
1	CLMA1ERRS	CLMA1 Error Status 0: Errors are not detected 1: Errors are detected
0	CLMA0ERRS	CLMA0 Error Status 0: Errors are not detected 1: Errors are detected

### 13.5.7 CLMAnEMU0 — CLMAn Emulation Register 0

This register intentionally generates CLMAn error at emulation.

This register can be accessed only during break by debugger and is reset by break release.

**Access:** This register can be read or written in 8-bit units.

**Address:** <CLMAn\_base> + 18<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLMAnSLFST	CLMAnSLSLW
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 13.21 CLMAnEMU0 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CLMAnSLFST	Specifies whether $f_{\text{CLMATMON}}$ is assumed to be high. 0: CLMATMON is assumed to be within the normal frequency range. 1: CLMATMON is assumed to exceed the upper threshold.
0	CLMAnSLSLW	Specifies whether $f_{\text{CLMATMON}}$ is assumed to be low. 0: CLMATMON is assumed to be within the normal frequency range. 1: CLMATMON is assumed to fall below the lower threshold.

#### CAUTION

It is prohibited to emulate a low and high CLMATMON at the same time. Thus CLMAnEMU0 must not be set to 03<sub>H</sub>.

## 13.6 Usage Notes for CLMA<sub>n</sub>

Do not use a clock for which the CLMA<sub>n</sub> bit indicates an abnormality. The behavior and performance are not guaranteed if such a clock is used. When CLMA0 detects clock abnormality, modifying the clock domain settings is prohibited.

**Table 13.22, Usage Notes for CLMA<sub>n</sub>** provides usage notes for each CLMA<sub>n</sub>.

Table 13.22 Usage Notes for CLMA<sub>n</sub>

Monitor Clock	CPU Clock after CLMA Reset Release	Note
HS IntOSC (CLMA0)	EMCLK* <sup>1</sup>	Set ROSCE.ROSCDISTRG to 1.* <sup>1</sup> Do not set the control registers of the MainOSC, the PLL0 and the PLL1. After $\overline{\text{CLMA0RES}}$ occurs, modifying any of the clock domain settings is prohibited.
MainOSC (CLMA1)	EMCLK (= HS IntOSC)	Do not set control registers of the MainOSC, the PLL0 (when it was a MainOSC source clock) and the PLL1 (when it was a MainOSC source clock). After occurrence of the $\overline{\text{CLMA1RES}}$ , do not select a clock whose source clock is the MainOSC, the PLL0 or the PLL1.
PLL0OUT (CLMA2)	EMCLK (= HS IntOSC)	Do not set control registers of the PLL0. After occurrence of the $\overline{\text{CLMA2RES}}$ , do not select a clock whose source clock is the PLL0.
PPLL0OUT (CLMA3)	EMCLK (= HS IntOSC)	Do not set control registers of the PLL1. After occurrence of the $\overline{\text{CLMA3RES}}$ , do not select a clock whose source clock is the PLL1.

Note 1. The state of EMCLK after reset by  $\overline{\text{CLMA0RES}}$  depends on the state of HS IntOSC oscillation. If HS IntOSC is completely stopped, LS IntOSC is supplied as EMCLK. If HS IntOSC continues oscillating, the HS IntOSC will be supplied as the clock source of EMCLK regardless of the frequency of the HS IntOSC. Therefore, it is necessary to change the source clock of EMCLK to LS IntOSC. After setting the ROSCE.ROSCDISTRG bit to 1, EMCLK is switched from HS IntOSC to LS IntOSC.

## Section 14 Stand-By Controller (STBC)

This section describes the functions, registers, and various stand-by modes of the stand-by controller (STBC).

### 14.1 Functions

#### 14.1.1 Types of Stand-By Mode

The RH850/F1KH, RH850/F1KM supports STOP mode and DeepSTOP mode for system-level low power status. In addition, the RH850/F1KH, RH850/F1KM supports cyclic operation (Cyclic RUN mode and Cyclic STOP mode) which supports low-power operation of limited functions. Transition between each mode is described in the **Section 14.1.5, Transition to Stand-By Mode**.

- RUN mode

RUN mode is a normal operation mode where the CPU is operating and all of other modules can operate. The CPU can enter “HALT” state by executing the “HALT” instruction to stop its operation in this mode.

- STOP mode

STOP mode is a chip-level stand-by mode in which the clock supply to a certain clock domain can be stopped.

STOP mode is entered when the STBC0STPT.STBC0STPTRG bit is set to 1.

The clock supply to clock domains can continue even in STOP mode by setting CKSC\_XXX\_STPM.XXXSTPMSK = 1. For details on the CKSC\_XXX\_STPM register, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, Section 12C, Clock Controller of RH850/F1KM-S1**.

- DeepSTOP mode

DeepSTOP mode is a chip-level stand-by mode to reduce power consumption further than STOP mode. In addition to the clock supply stop, the power supply to the Isolated area (ISO area) is switched off.

DeepSTOP mode is entered when the STBC0PSC.STBC0DISTRG is set to 1.

- Cyclic RUN mode

Cyclic RUN mode is a low-power operation mode in which limited modules can operate at low speed. In this mode, only the CPU1, the peripheral functions in the Always-On area (AWO area), RLIN3 and CSIG0 can operate.

Data/Code flash memory and PLL are not available. The CPU2 is also not available.

The CPU1 executes the instructions in the retention RAM.

In this mode, the CPU1 can issue the “HALT” instruction to enter HALT state.

The mode transition to Cyclic RUN mode from DeepSTOP mode is triggered by wake-up factor 2, and the mode transition to Cyclic RUN mode from Cyclic STOP mode is triggered by either wake-up factor 1 or wake-up factor 2. CSIG0 cannot be wake-up factor.

- Cyclic STOP mode

Cyclic STOP mode is a STOP mode in cyclic operation, and the CPU1 halts its operation.

This mode is entered by setting the STBC0STPT.STBC0STPTRG bit to 1 in Cyclic RUN mode.

## 14.1.2 Wake-Up Control

### 14.1.2.1 Wake-Up Factors for Stand-By Modes

The stand-by controller can initiate return from stand-by mode by the following wake-up factors.

Table 14.1 Wake-Up Factor 1 (RH850/F1KH-D8)

INTRCAN10REC*2	RCFDC1	✓	—	—	—
INTRCAN11REC*2	RCFDC1	✓	—	—	—

Note 1. The mode returns to RUN mode via DeepSTOP mode. When the transition from Cyclic STOP to Cyclic RUN is made by wake-up factor 1, if the transition to DeepSTOP by STBC0PSC.STBC0DISTRG is made without clearing wake-up factor 1, the transition to RUN mode is made.

Note 2. By using the INTP external interrupt assigned to the alternate-function pin shared with the CAN reception pin, wake-up from stand-by modes such as DeepSTOP is possible. As the trigger for waking up from DeepSTOP, use a pin of port P0, P1, P2, P3, or P8, which is assigned to the Always-On area (AWO area).  
To clear the wake-up factor flag, the interrupt request must be cleared in each CAN module.

Note 3. Cannot be cleared while REG0VCC is below the reference voltage (REG0VCC (min.) < VLVIn).  
To clear the wake-up factor flag (WUF0[2]), WUFC0[2] must be set while WUFMSK0[2] = 1 and REG0VCC is above the reference voltage (REG0VCC (min.) > VLVIn). The INTLVIH interrupt can be used to check that REG0VCC is above the reference voltage.

Note 1. These wake-up factors are only available in LPS analog input mode.

**CAUTION**

For the pins of the function used for the wake-up factors from DeepSTOP, use the multiplexed functions of the ports assigned to the Always-On area (AWO area).

**14.1.2.2 Setting of Wake-Up Factors**

Wake-up factors for returning from stand-by modes are controlled by the following stand-by controller registers:

- Wake-up factor registers: WUF0, WUF1, WUF20, WUF\_ISO0

Upon occurrence of an effective wake-up factor, the associated wake-up factor flag is set to 1. By checking these registers and their flags, it is possible to identify the wake-up factor.

- Wake-up factor mask registers: WUFMSK0, WUFMSK1, WUFMSK20, WUFMSK\_ISO0

Each bit of these registers is assigned to a certain wake-up factor. Wake-up by this factor is enabled if its mask bit is set to 0. Wake-up factors assigned to both wake-up factor 1 and 2 should not be enabled at the same time.

- Wake-up factor clear registers: WUFC0, WUFC1, WUFC20, WUFC\_ISO0

By setting the applicable bits in these registers to 1, the wake-up factor bit (WUF<sub>y</sub>) in the wake-up factor registers (WUF0, WUF1, WUF20, WUF\_ISO0) can be cleared.

**NOTE**

The wake-up factor flags in the wake-up factor registers (WUF0, WUF1, WUF20, and WUF\_ISO0) only indicate the occurrence of wake-up factor. These flags do not indicate a transition from stand-by mode to normal mode.

The assignment of the wake-up factors to the control register bits and status register bits are shown in the following tables.

For details about the wake-up control and status registers, see **Section 14.2.2.3, WUF0/WUF1/WUF20/WUF\_ISO0 — Wake-Up Factor Registers**, **Section 14.2.2.4, WUFMSK0/WUFMSK1/WUFMSK20/WUFMSK\_ISO0 — Wake-Up Factor Mask Registers**, and **Section 14.2.2.5, WUFC0/WUFC1/WUFC20/WUFC\_ISO0 — Wake-Up Factor Clear Registers**.

Table 14.7 Wake-Up Factor 1 Register Assignment (RH850/F1KH-D8)

### 14.1.3 On-Chip Debug Wake-Up

The On-Chip Debug unit (OCD) generates a wake-up event while the microcontroller runs the application program in the following cases:

- The debugger issues a stop request
- A breakpoint is hit

In either case all stand-by modes are terminated, provided the OCD debug event is enabled as a wake-up factor via the WUFMSK0 register.

#### **CAUTION**

---

If the OCD wake-up event is disabled, it is not possible to wake up from stand-by modes via an On-chip debugger request.

The OCD wake-up event can be enabled as a wake-up factor for all stand-by modes by setting WUFMSK0[31] = 0. When the hot plug-in function is used, make sure to enable the OCD wake-up event and return from stand-by mode by INTDCUTDI interrupt.

---

### 14.1.4 I/O Buffer Control

This section describes the behavior of the I/O buffers during various stand-by modes.

The port groups in the Isolated area (ISO area) support the I/O buffer hold state. The port groups in the Always-On area (AWO area) remain their state before entering stand-by mode.

For details on the port group assignment to the Isolated area (ISO area) and to the Always-On area (AWO area), see **Section 10A, Power Supply Circuit of RH850/F1KH-D8, Section 10B, Power Supply Circuit of RH850/F1KM-S4, RH850/F1KM-S2, Section 10C, Power Supply Circuit of RH850/F1KM-S1.**

#### 14.1.4.1 I/O Buffer Hold State

During the I/O buffer hold state, the I/O buffers maintains the state it was in before entering this state. Therefore, no external or internal signal can change the state of the I/O buffer until the I/O buffer hold state is terminated.

#### 14.1.4.2 I/O Buffers during STOP Mode

In STOP mode, the I/O buffers remain their state before entering STOP mode (I/O buffer hold state is not entered).

#### 14.1.4.3 I/O Buffers during DeepSTOP Mode

In DeepSTOP mode, the I/O buffers of port groups in the Isolated area (ISO area) transition to I/O buffer hold state.

After wake-up from DeepSTOP, the I/O buffers remain in I/O buffer hold state until the state is canceled by software. To cancel I/O buffer hold state, follow the steps shown below.

1. Re-configure the peripheral or port function.
2. Set IOHOLD.IOHOLD = 0.

The following table is a summary of the I/O buffer in the Isolated area (ISO area) during stand-by mode and after wake-up.

Table 14.15 Buffer Operation during Stand-by Mode and after Wake-Up (I/O buffers in the Isolated area (ISO area))

	Before Stand-By	During Stand-By	After Wake-Up
STOP mode	Normal operation		
DeepSTOP mode	Normal operation	I/O buffer hold state	I/O buffer hold state*1

Note 1. Set the IOHOLD.IOHOLD bit to "0" to release the I/O buffer hold state.

The port groups in the Always-On area (AWO area) don't support I/O buffer hold state. They continue operation and remain its state before entering DeepSTOP. In the case an alternative function of modules in Isolated area (ISO area) is assigned to the pin in the Always-On area (AWO area), the state of the I/O buffer may change in the transition to the DeepSTOP due to initialization of the modules in the Isolated area (ISO area) by ISORES. To avoid this behavior, it is recommended to change to function of modules in Always-On area (AWO area) (e. g. Port mode) before entering DeepSTOP.

### 14.1.5 Transition to Stand-By Mode

The figure below shows transition between RUN mode and stand-by mode.

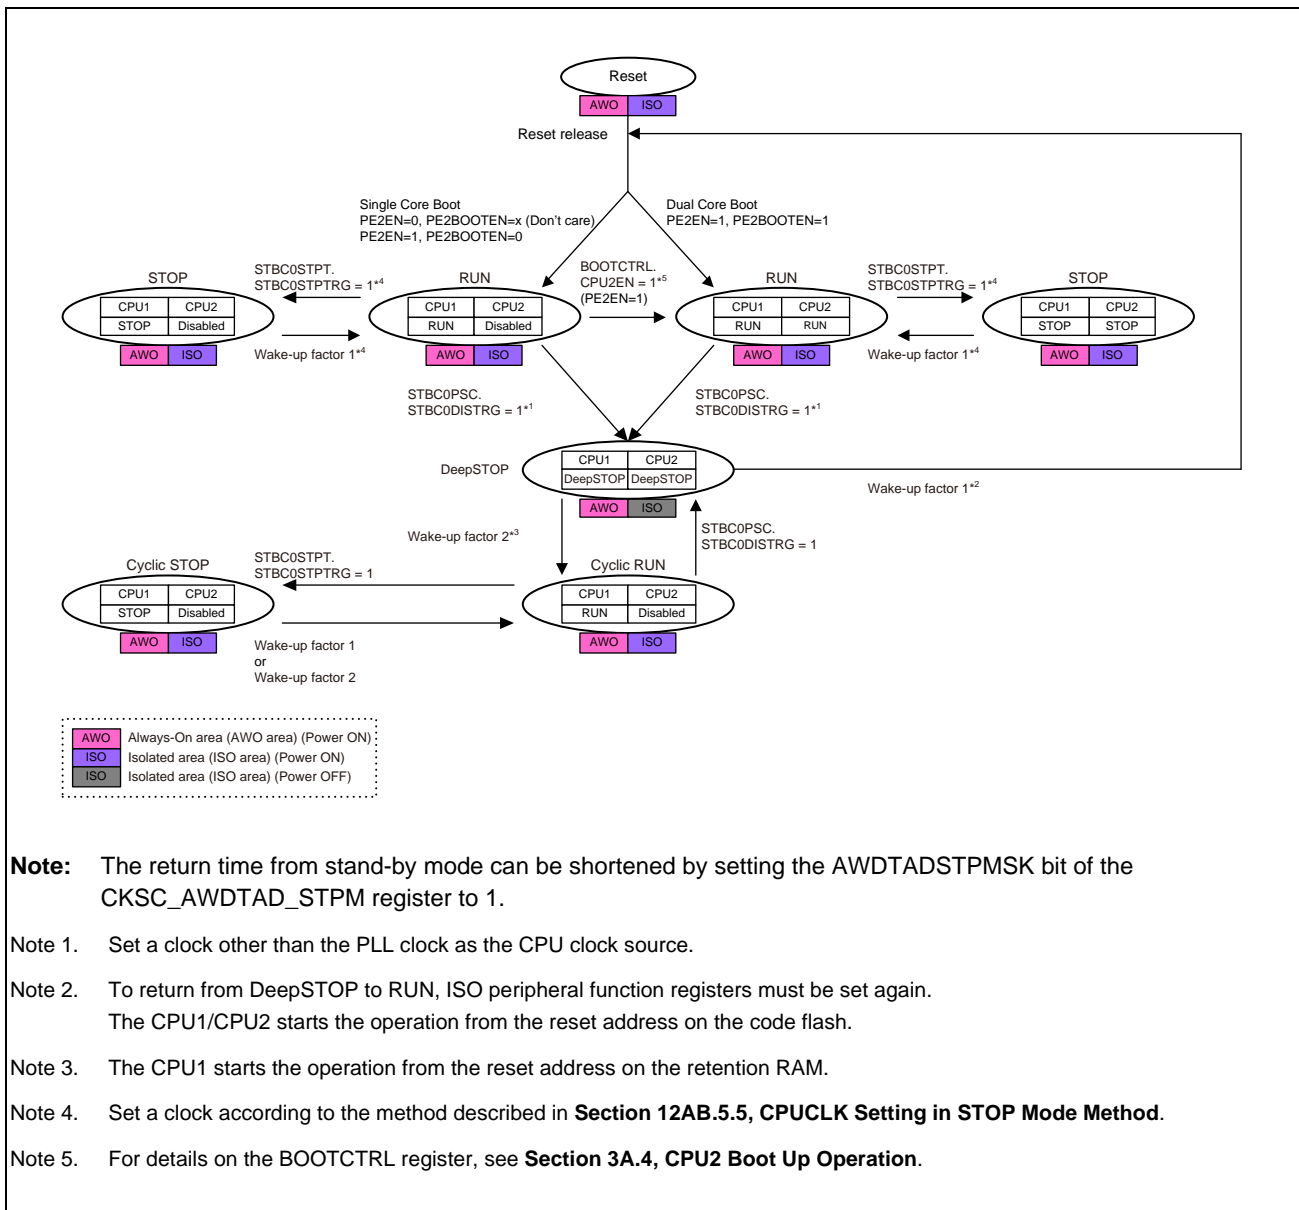

Figure 14.1 Transition to Stand-By Mode (RH850/F1KH-D8)

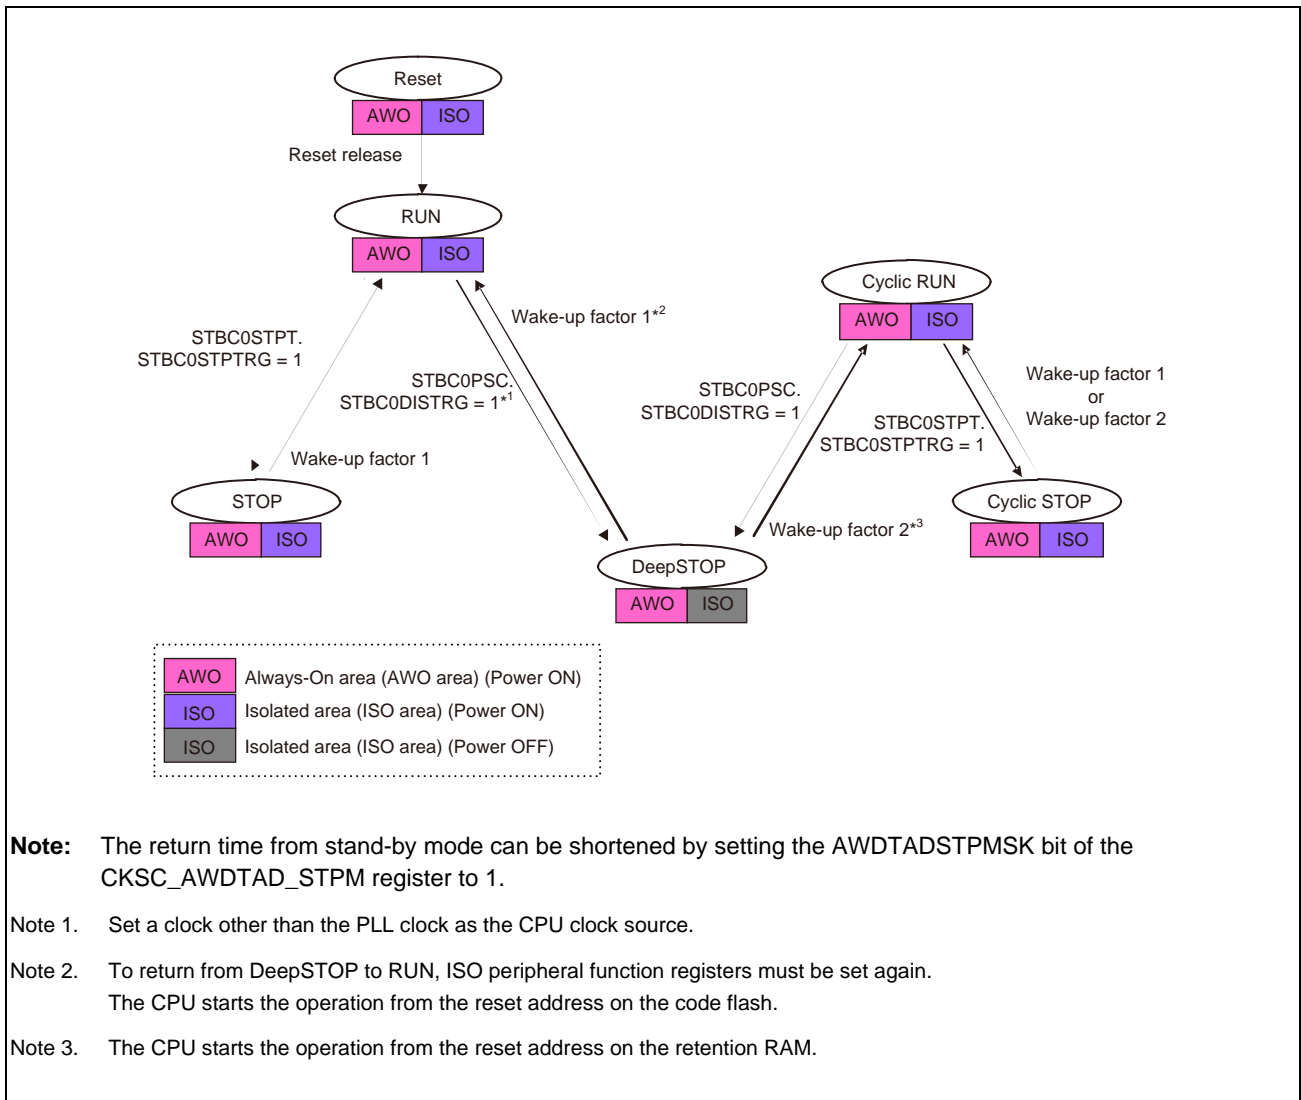

Figure 14.2 Transition to Stand-By Mode (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

### 14.1.6 Clock Supply

The clock supply to the stand-by controller is shown in the following table.

Table 14.16 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
Stand-by controller	Register access clock	CPUCLK_L, EMCLK

## 14.2 Registers

### 14.2.1 List of Registers

The following table lists the stand-by controller registers.

Table 14.17 List of Registers

Module Name	Register Name	Symbol	Address
STBC0	Power save control register	STBC0PSC	FFF8 0100 <sub>H</sub>
	Power stop trigger register	STBC0STPT	FFF8 0110 <sub>H</sub>

## 14.2.2 Details of Stand-By Controller Control Registers

### 14.2.2.1 STBC0PSC — Power Save Control Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 0100<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Table 14.18 STBC0PSC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	STBC0DISTRG	0: No effect 1: Transition to DeepSTOP mode This bit is cleared automatically after transition to the DeepSTOP mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 14.2.2.2 STBC0STPT — Power Stop Trigger Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 0110<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 14.19 STBC0STPT Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	STBC0STPTRG	0: No effect. 1: Transition to STOP mode <ul style="list-style-type: none"> <li>– In RUN mode: Transition to STOP mode</li> <li>– In Cyclic RUN mode: Transition to Cyclic STOP mode</li> </ul> This bit is cleared automatically after transition to the STOP / Cyclic STOP mode.

### 14.2.2.3 WUF0/WUF1/WUF20/WUF\_ISO0 — Wake-Up Factor Registers

These registers indicate the generation of wake-up factors.

WUF0, WUF1 and WUF20 are initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

WUF\_ISO0 is initialized by all reset sources (ISORES).

**Access:** These registers are read-only registers that can be read in 32-bit units.

**Address:** WUF0: FFF8 0400<sub>H</sub>  
 WUF1: FFF8 0410<sub>H</sub>  
 WUF20: FFF8 0520<sub>H</sub>  
 WUF\_ISO0: FFF8 8110<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WUF31	WUF30	WUF29	WUF28	WUF27	WUF26	WUF25	WUF24	WUF23	WUF22	WUF21	WUF20	WUF19	WUF18	WUF17	WUF16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.20 WUF0/WUF1/WUF20/WUF\_ISO0 Register Contents

Bit Position	Bit Name	Function
31 to 0	WUFy	Indicates the generation of a wake-up factor. 0: Wake-up factor is not generated 1: Wake-up factor is generated

#### NOTE

While the WUFMSKy bit in the wake-up factor mask register is 1, WUFy is not set to 1 at the generation of a wake-up factor.

### Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.7, Wake-Up Factor 1 Register Assignment (RH850/F1KH-D8)**, **Table 14.8, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S4)**, **Table 14.9, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S2)**, **Table 14.10, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S1)**, **Table 14.11, Wake-Up Factor 2 Register Assignment (RH850/F1KH-D8)**, **Table 14.12, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S4)**, **Table 14.13, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S2)** and **Table 14.14, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S1)**.

The bit to which a wake-up factor is not assigned is read as the value “0”.

#### 14.2.2.4 WUFMSK0/WUFMSK1/WUFMSK20/WUFMSK\_ISO0 — Wake-Up Factor Mask Registers

These registers enable wake-up factors.

WUFMSK0, WUFMSK1 and WUFMSK20 are initialized by all reset sources except the transition to DeepSTOP mode (AWORES). WUFMSK\_ISO0 is initialized by all reset sources (ISORES).

**Access:** These registers can be read or written in 32-bit units.

**Address:** WUFMSK0: FFF8 0404<sub>H</sub>

WUFMSK1: FFF8 0414<sub>H</sub>

WUFMSK20: FFF8 0524<sub>H</sub>

WUFMSK\_ISO0: FFF8 8114<sub>H</sub>

**Value after reset:** WUFMSK0: FFFF FFFF<sub>H</sub>

WUFMSK1: FFFF FFFF<sub>H</sub>

WUFMSK20: FFFF FFFF<sub>H</sub>

WUFMSK\_ISO0: FFFF FFFF<sub>H</sub>

Table 14.21 WUFMSK0/WUFMSK1/WUFMSK20/WUFMSK\_ISO0 Register Contents

Bit Position	Bit Name	Function
31 to 0	WUFMSKy	Enables/disables a wake-up factor. 0: Wake-up factor is enabled 1: Wake-up factor is disabled

#### NOTE

While the WUFMSKy bit is 1, WUFy of the wake-up factor register is not set to 1 at the generation of a wake-up factor.

#### Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.7, Wake-Up Factor 1 Register Assignment (RH850/F1KH-D8)**, **Table 14.8, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S4)**, **Table 14.9, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S2)**, **Table 14.10, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S1)**, **Table 14.11, Wake-Up Factor 2 Register Assignment (RH850/F1KH-D8)**, **Table 14.12, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S4)**, **Table 14.13, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S2)** and **Table 14.14, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S1)**.

When writing to these registers, write the value “1” to the bits to which wake-up factors are not assigned.

### 14.2.2.5 WUFC0/WUFC1/WUFC20/WUFC\_ISO0 — Wake-Up Factor Clear Registers

These registers clear the WUFy bits in the wake-up factor registers.

**Access:** These registers are write-only registers that can be written in 32-bit units.

**Address:** WUFC0: FFF8 0408<sub>H</sub>  
 WUFC1: FFF8 0418<sub>H</sub>  
 WUFC20: FFF8 0528<sub>H</sub>  
 WUFC\_ISO0: FFF8 8118<sub>H</sub>

**Value after reset:** Undefined

Table 14.22 WUFC0/WUFC1/WUFC20/WUFC\_ISO0 Register Contents

Bit Position	Bit Name	Function
31 to 0	WUFCy	Clears the wake-up factor bit WUFy in the wake-up factor registers. 0: WUFy is not modified 1: WUFy is cleared

### Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.7, Wake-Up Factor 1 Register Assignment (RH850/F1KH-D8)**, **Table 14.8, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S4)**, **Table 14.9, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S2)**, **Table 14.10, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S1)**, **Table 14.11, Wake-Up Factor 2 Register Assignment (RH850/F1KH-D8)**, **Table 14.12, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S4)**, **Table 14.13, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S2)** and **Table 14.14, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S1)**.

When writing to these registers, write the value “0” to the bits to which wake-up factors are not assigned.

### 14.2.2.6 IOHOLD — I/O Buffer Hold Control Register

This register specifies the hold state of the I/O buffer in DeepSTOP mode. The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFF8 0B00<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IOHOLD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 14.23 IOHOLD Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	IOHOLD	0: I/O hold state is released 1: I/O hold state  This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is prohibited. To release the I/O hold state after the wake-up, set this bit to 0 by software.

## 14.3 Mode Transition

This section explains the mode transition procedures.

### CAUTION

Transition to stand-by mode should be performed by CPU1. When CPU1 shifts to stand-by mode, CPU2 will also shift to stand-by mode.

### 14.3.1 STOP Mode

In STOP mode, most of the clock supplies to the Always-On area (AWO area) and the Isolated area (ISO area) are stopped. The clock stop mask registers control clock supply to related clock domains in stand-by mode. Stop all of the peripheral functions before transition to STOP mode if the clock supply to the function will be stopped in STOP mode.

The transition procedure (example) to STOP mode is shown below.

#### Preparation for stand-by

- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag (IC<sub>xxx</sub>.RF<sub>xxx</sub> = 0).
  - Mask the interrupts for non-wake-up factors (IC<sub>xxx</sub>.MK<sub>xxx</sub> = 1).
  - Release the masks of the interrupts for wake-up factors (IC<sub>xxx</sub>.MK<sub>xxx</sub> = 0).
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC1/WUFC\_ISO0 registers).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK1/WUFMSK\_ISO0 registers).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK1/WUFMSK\_ISO0 registers).
- Set the clock stop mask register to select the clock domains to be stopped and the ones to continue operating (using the CKSC\_<sub>xxx</sub>\_STPM.<sub>xxxx</sub>STPMSK bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register to select the clock sources to be stopped and the ones to continue operating (using the MOSCSTPMSK bit in the MOSCSTPM register and the ROSCSTPMSK bit in the ROSCSTPM register).
- RH850/F1KH-D8  
Set a clock according to the method described in **Section 12AB.5.5, CPUCLK Setting in STOP Mode Method**.

#### Start of stand-by

Set the STBC0STPTRG bit in the STBC0STPT register to 1 to transition to STOP mode.

#### End of stand-by

When a wake-up factor is generated, the microcontroller returns from STOP mode.

#### Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0, WUF1, WUF\_ISO0).

When an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.

Figure 14.3 Example of STOP Mode Transition (RH850/F1KH-D8) (1/2)

Figure 14.3 Example of STOP Mode Transition (RH850/F1KH-D8) (2/2)

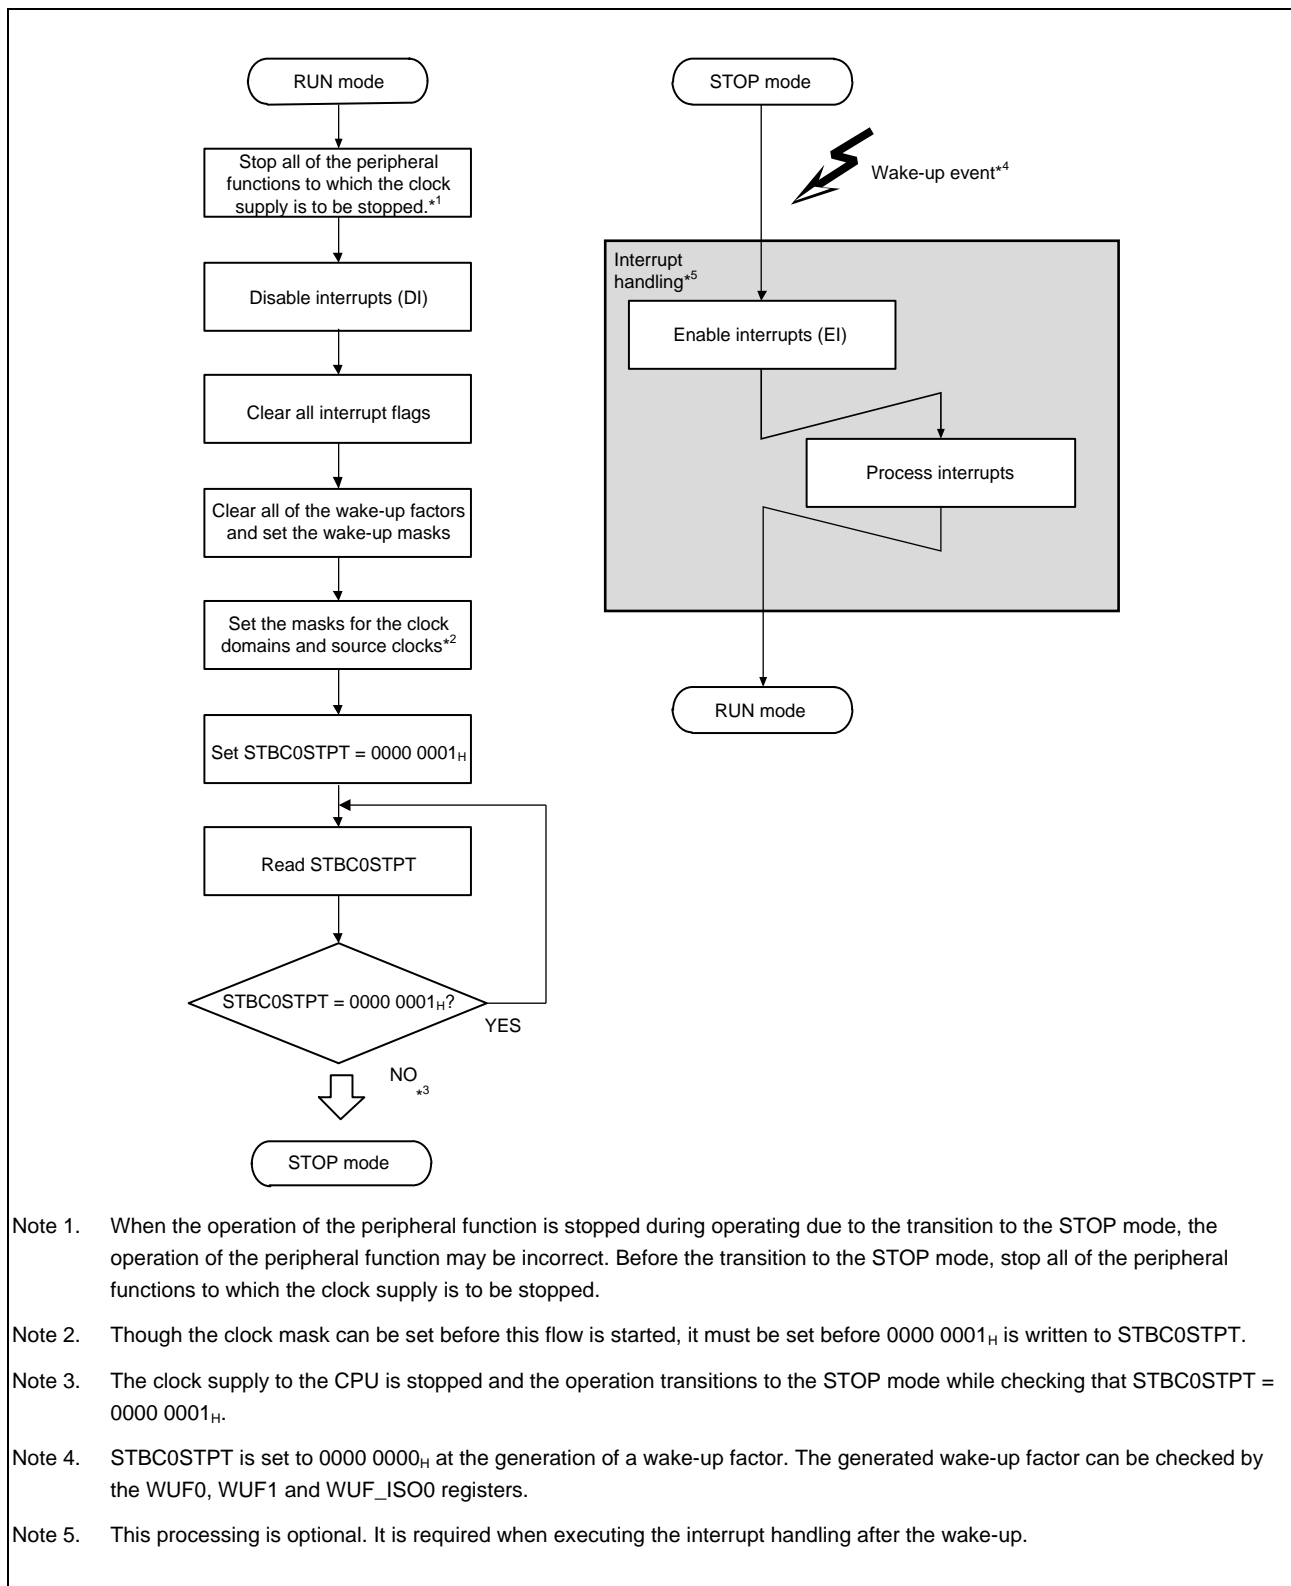

Figure 14.4 Example of STOP Mode Transition (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

### 14.3.2 DeepSTOP Mode

In DeepSTOP mode, the clock supply to all areas and the power supply to the Isolated area (ISO area) are stopped. However, clock supply to peripheral functions in the Always-On area (AWO area) can be continued by setting the clock stop mask register.

Select the clock other than the PLL as the CPU operating clock, before the transition to DeepSTOP mode.

The transition procedure (example) to DeepSTOP mode is shown below.

#### Preparation for stand-by

- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag ( $IC_{xxx}.RF_{xxx} = 0$ ).
  - Mask the interrupts for non-wake-up factors ( $IC_{xxx}.MK_{xxx} = 1$ ).
  - Release the masks of the interrupts for wake-up factors ( $IC_{xxx}.MK_{xxx} = 0$ ).
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC1/WUFC20 registers).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK1/WUFMSK20 registers).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK1/WUFMSK20 registers).

#### CAUTION

When a wake-up factor is assigned to both wake-up factor 1 registers and wake-up factor 2 registers, it can be used only in one of them.

- Set the clock stop mask register to select the clock domains to be stopped and the ones to continue operating (using the  $CKSC\_xxx\_STPM.xxxxSTPMSK$  bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register to select the clock sources to be stopped and the ones to continue operating (using the  $MOSCSTPMSK$  bit in the  $MOSCSTPM$  register and the  $ROSCSTPMSK$  bit in the  $ROSCSTPM$  register).

#### Start of stand-by

Set the  $STBC0DISTRG$  bit in the  $STBC0PSC$  register to 1 to transition to DeepSTOP mode.

#### End of stand-by

When a wake-up factor is generated, the microcontroller returns from DeepSTOP mode.

### Wake-up handling

- When returned from DeepSTOP mode due to wake-up factor 1, the microcontroller starts the operation from the reset vector address.

If one of the following interrupts has been generated before recovery from DeepSTOP mode to RUN mode, the microcontroller restarts operation from the exception handler address:

- FENMI: FENMI handler address (E0<sub>H</sub>)
- FEINT: FEINT handler address (F0<sub>H</sub>)

RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2:

Note that the general-purpose registers, local RAM and global RAM are undefined value after return from DeepSTOP mode.

RH850/F1KM-S1:

Note that the general-purpose registers and local RAM are undefined value after return from DeepSTOP mode.

- The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0, WUF1).
- The ports in the Isolated area (ISO area) maintain the I/O buffer hold state.  
Release the I/O buffer hold state by executing the following steps:
  1. Re-configure the peripheral functions and port functions.
  2. Set IOHOLD.IOHOLD = 0.
- To execute an interrupt of the wake-up factor after the wake-up, evaluate the information of wake-up factor flag by software and set the interrupt request flag in the interrupt control register. In addition, release the masking of the interrupt used as wake-up factors. Then, when an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.

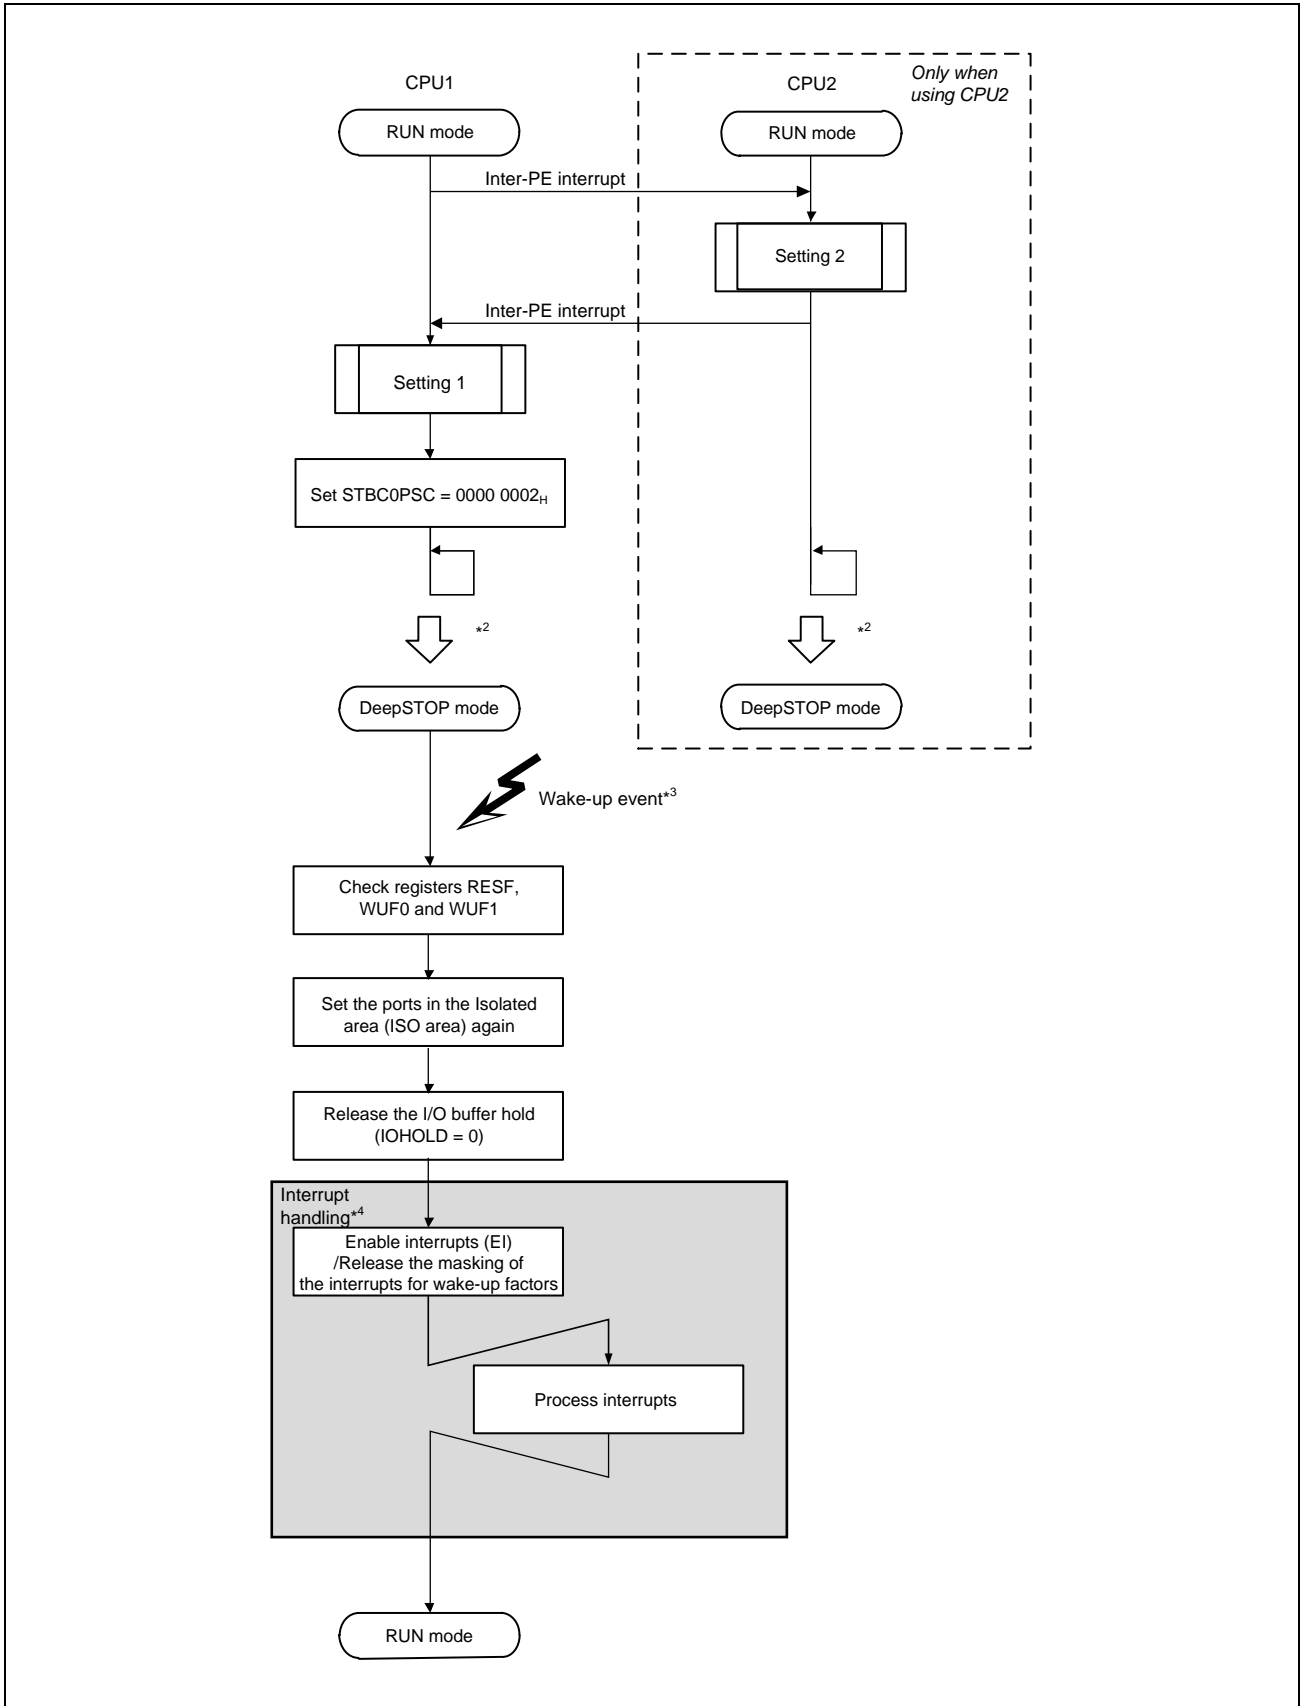

Figure 14.5 Example of DeepSTOP Mode Transition (RH850/F1KH-D8) (1/2)

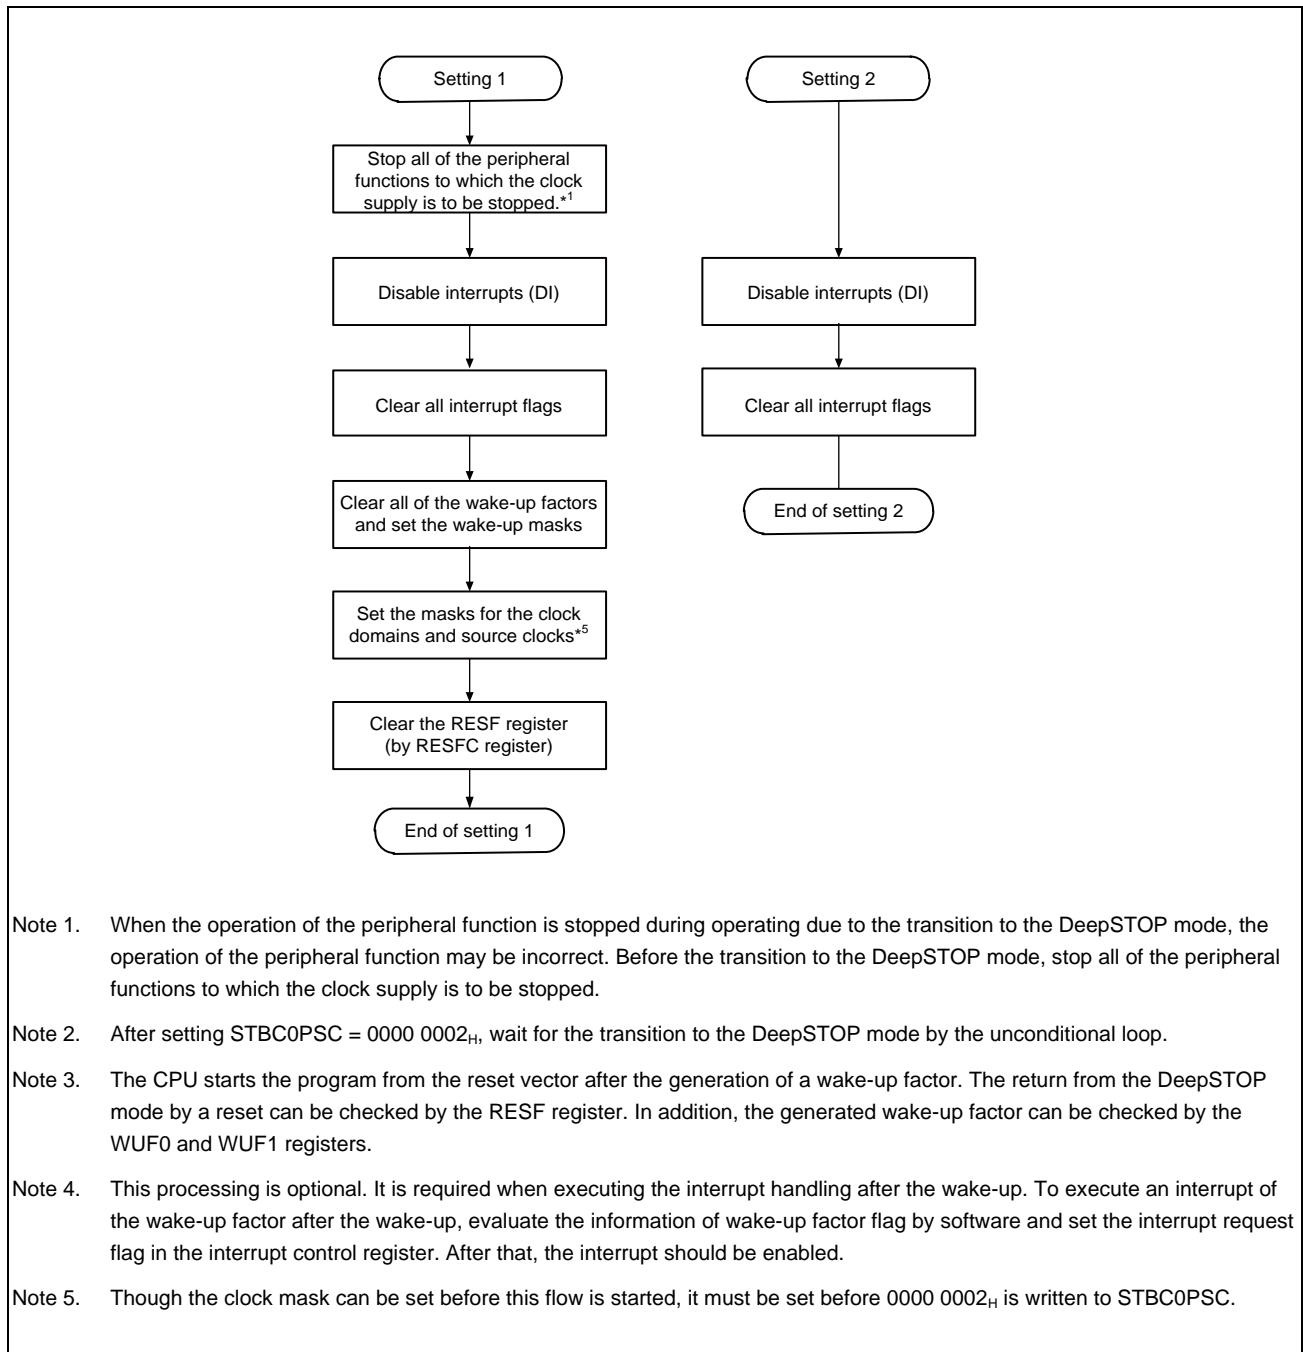

Figure 14.5 Example of DeepSTOP Mode Transition (RH850/F1KH-D8) (2/2)

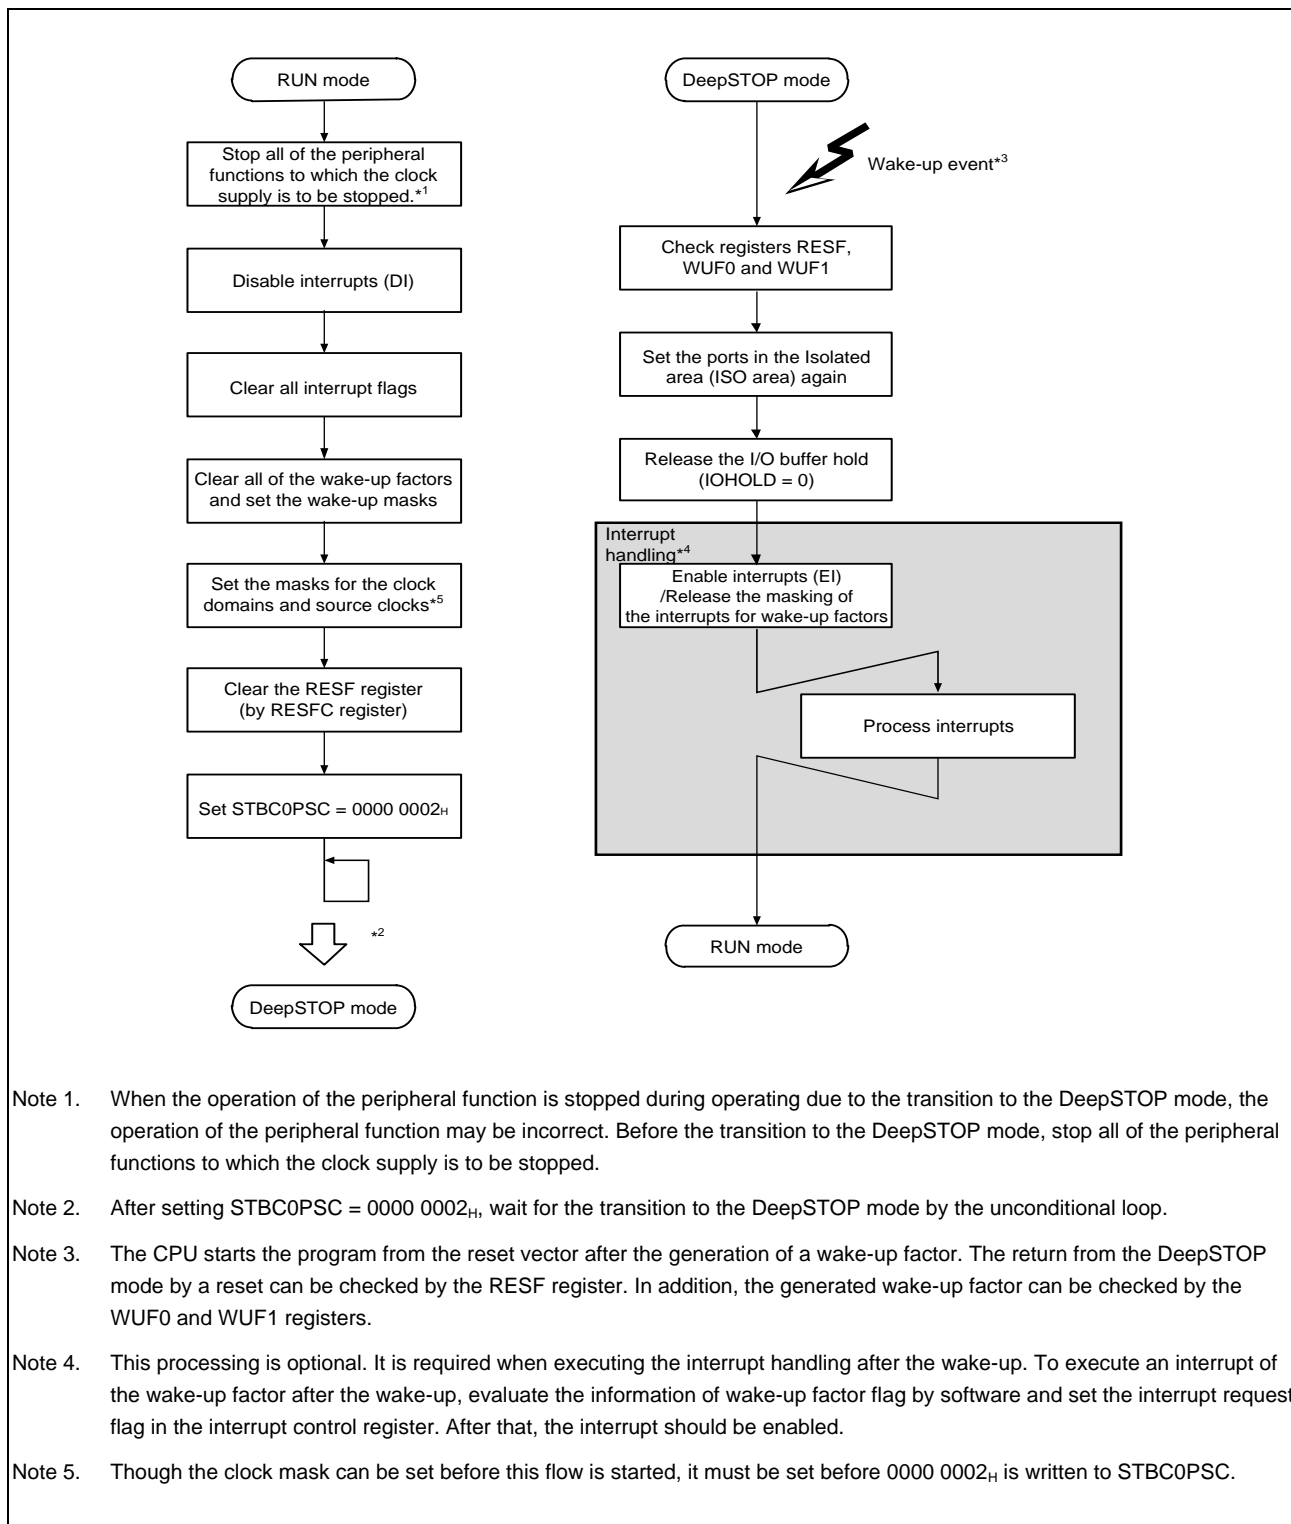

Figure 14.6 Example of DeepSTOP Mode Transition (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

### 14.3.3 Cyclic RUN Mode

In Cyclic RUN mode, the functions except the CPU1, peripheral functions in Always-On area (AWO area), RLIN3, and CSIG0 are stopped. In this mode, PLL and Flash Memory are not available. The CPU2 is also not available. The transition procedure (example) to Cyclic RUN mode is shown below.

#### Preparation of Cyclic RUN

- RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2

Allocate the program for Cyclic RUN to the retention RAM. The reset vector base address (RBASE) in Cyclic RUN operation is set to the first address of the retention RAM (FEF0 0000<sub>H</sub>). Note that neither the code flash memory nor the data flash memory is available in Cyclic RUN mode.

- RH850/F1KM-S1

Allocate the program for Cyclic RUN to the retention RAM. The reset vector base address (RBASE) in Cyclic RUN operation should be specified in the CYCRBASE register described in **Section 9BC, Reset Controller of RH850/F1KM**. Note that neither the code flash memory nor the data flash memory is available in Cyclic RUN mode.

The instruction to transition to DeepSTOP mode should be arranged in the interrupt exception handler or a polling routine of interrupt request which is used as the source of returning to the RUN mode.

For details on the exception vector, see *the RH850G3KH User's Manual: Software*.

#### CAUTION

Do not change the PSW.EBV bit from its value after reset in Cyclic RUN mode (Do not set the PSW.EBV bit to 1 in Cyclic RUN mode).

- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC20 register).
  - Mask the non-wake-up factor (the WUFMSK20 register).
  - Release the masks of the wake-up factors (the WUFMSK20 register).
- Transition to DeepSTOP mode. For details on the transition to DeepSTOP mode, see **Section 14.3.2, DeepSTOP Mode**.

#### Start of Cyclic RUN

The operation transitions to Cyclic RUN mode from DeepSTOP mode at the generation of wake-up factor 2.

The operation transitions to Cyclic RUN mode from Cyclic STOP mode at the generation of wake-up factors 1 and 2.

- RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2

The microcontroller starts operation from the reset vector address of Cyclic RUN mode (the first address of the retention RAM (FEF0 0000<sub>H</sub>)). If one of the following interrupts has been generated during recovery from DeepSTOP mode to Cyclic RUN mode, the microcontroller restart operation from the exception handler address:

- FENMI: FENMI handler address in Cyclic RUN mode (FEF0 0000<sub>H</sub> + E0<sub>H</sub>)
- FEINT: FEINT handler address in Cyclic RUN mode (FEF0 0000<sub>H</sub> + F0<sub>H</sub>)

Note that the general-purpose registers, local RAM and global RAM are undefined value after the transition to Cyclic RUN mode from DeepSTOP mode.

- RH850/F1KM-S1

The microcontroller starts operation from the reset vector address of Cyclic RUN mode specified by the CYCRBASE register. If one of the following interrupts has been generated during recovery from DeepSTOP mode to Cyclic RUN mode, the microcontroller restart operation from the exception handler address:

- FENMI: FENMI handler address in Cyclic RUN mode (CYCRBASE + E0<sub>H</sub>)
- FEINT: FEINT handler address in Cyclic RUN mode (CYCRBASE + F0<sub>H</sub>)

Note that the general-purpose registers and local RAM are undefined value after the transition to Cyclic RUN mode from DeepSTOP mode.

### End of Cyclic RUN

The Cyclic RUN mode ends at the transition to the Cyclic STOP mode by setting the STBC0STPT.STBC0STPTRG bit to 1, or at the transition to the DeepSTOP mode by setting the STBC0PSC.STBC0DISTRG bit to 1.

### Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF20).

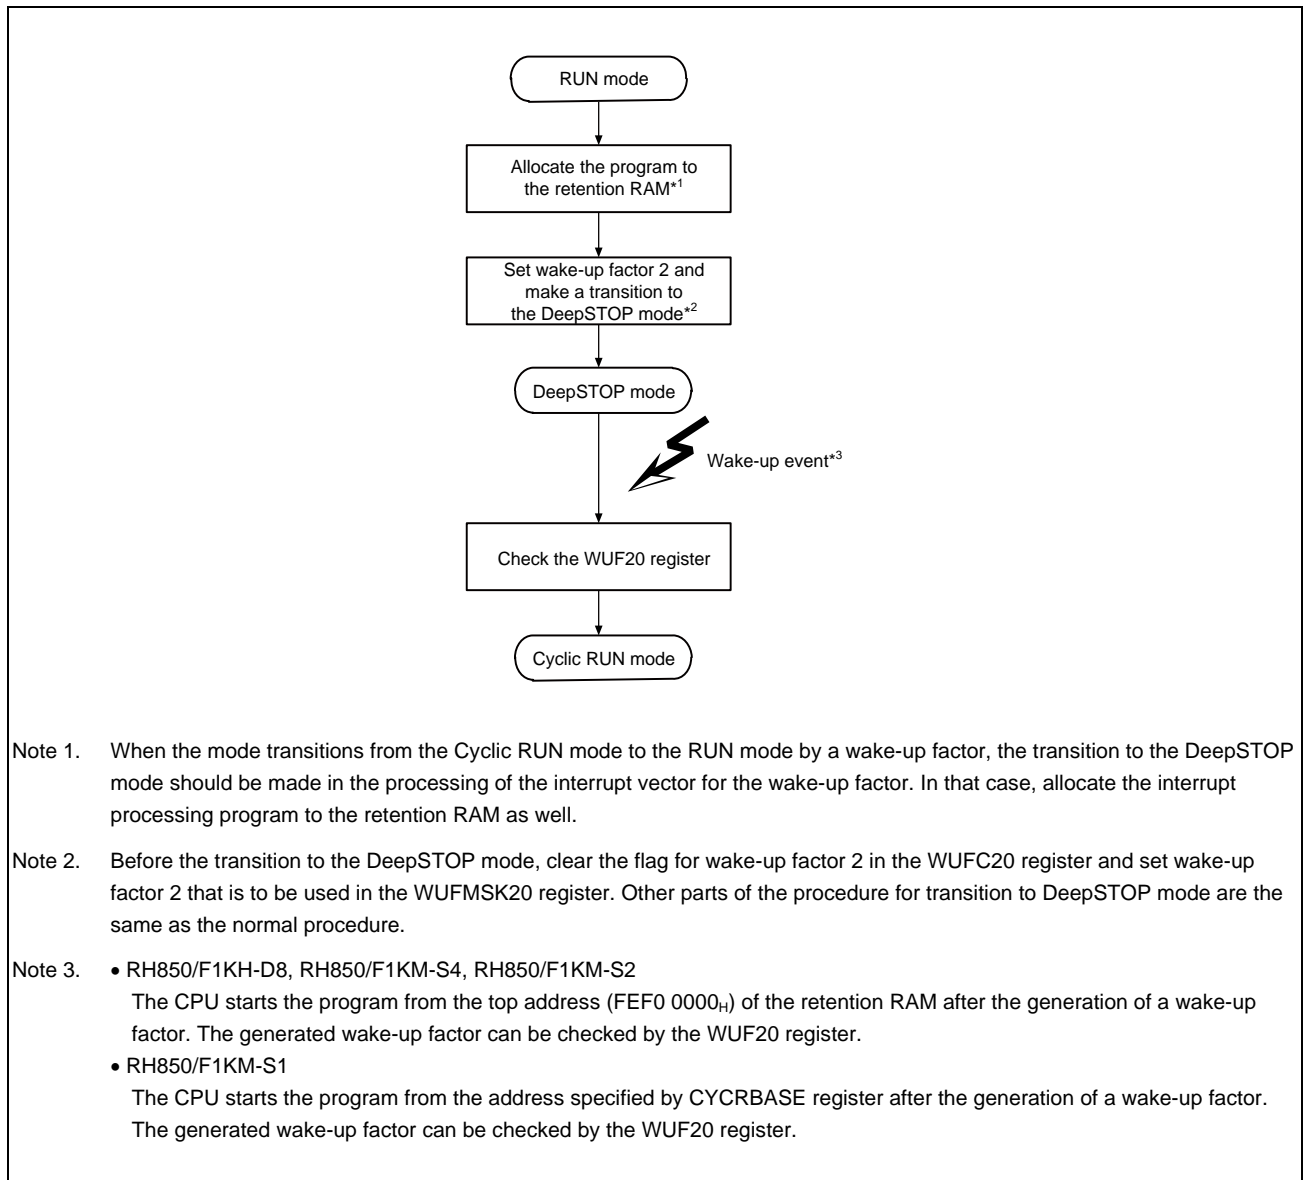

Figure 14.7 Example of Cyclic RUN Mode Transition

### 14.3.4 Cyclic STOP Mode

In Cyclic STOP mode, the functions except the peripheral functions in the Always-On area (AWO area) and RLIN3 are stopped.

The transition procedure (example) to Cyclic STOP mode is shown below.

#### Preparation for Cyclic STOP

- Transition to Cyclic RUN mode.
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC1/WUFC20 register).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK1/WUFMSK20 register).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK1/WUFMSK20 register).

#### Start of Cyclic STOP

Set the STBC0STPT.STBC0STPTRG bit to 1 to transition to Cyclic STOP mode.

#### End of Cyclic STOP

The operation transitions to Cyclic RUN mode at the generation of wake-up factor 1 or 2.

#### Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0, WUF1, WUF20).

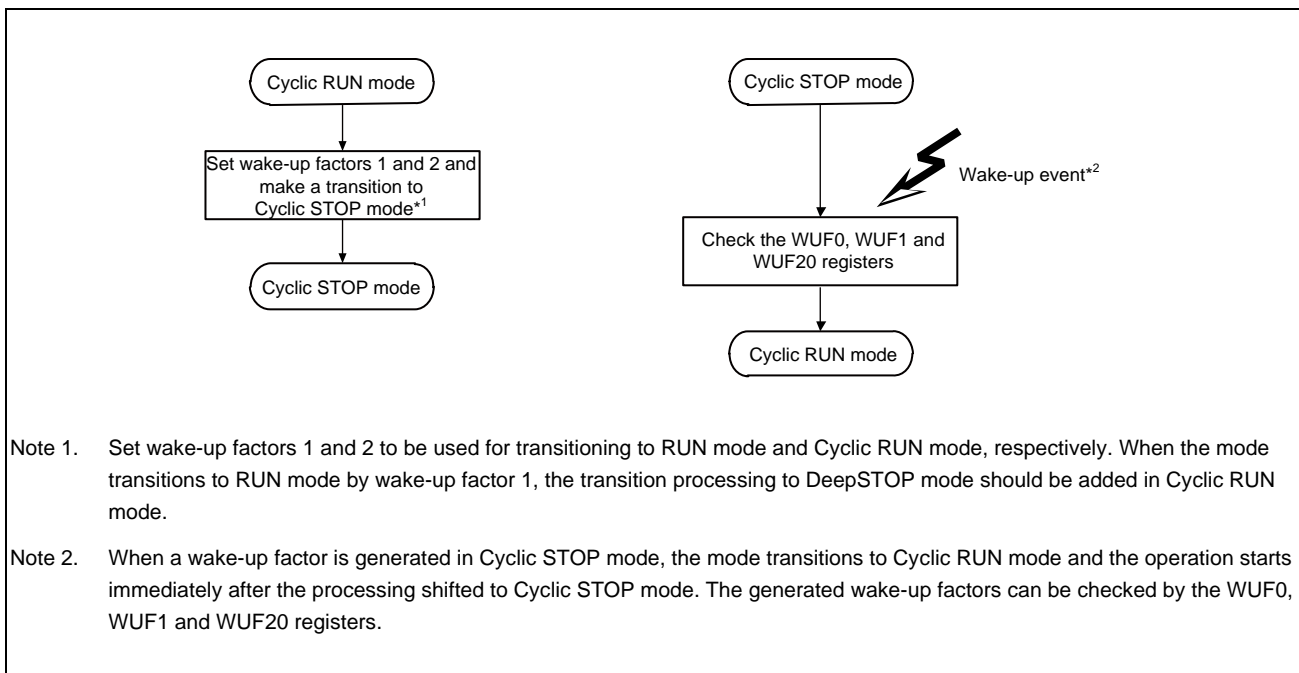

Figure 14.8 Example of Cyclic STOP Mode Transition

## 14.4 Writing to the Stand-By Controller Related Registers

The following stand-by controller registers are write-protected registers.

- STBC0PSC register
- STBC0STPT register
- IOHOLD register

The write-protected registers are protected against the illegal writing due to an incorrect program operation.

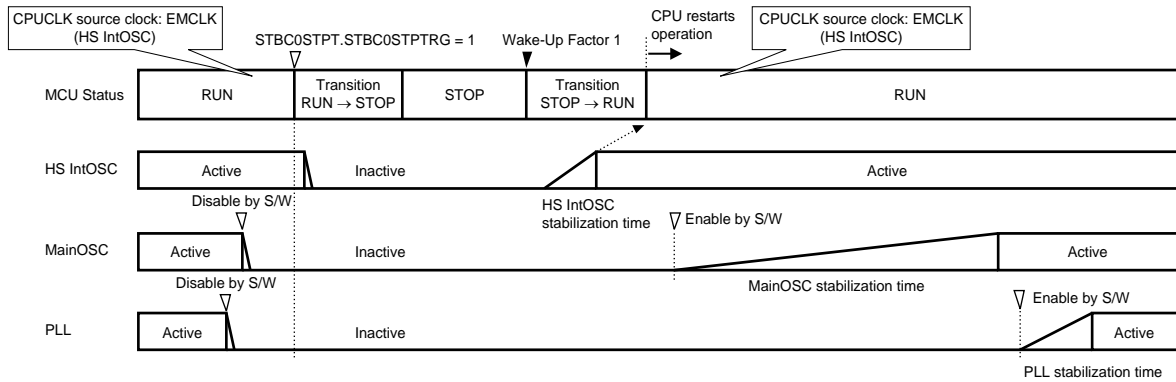

For details on the write-protected sequence, see **Section 5, Write-Protected Registers**.

## 14.5 Clock Oscillator Behavior During Stand-By Mode Transition

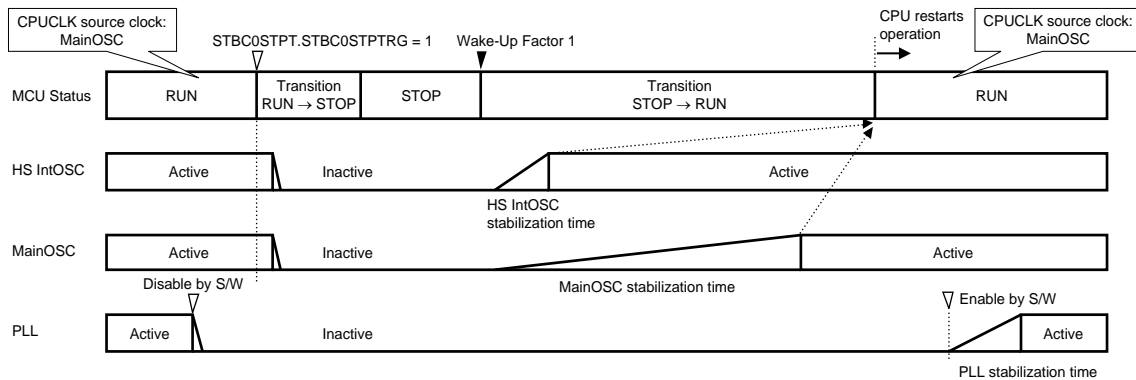

The following figures explain clock oscillator behavior during stand-by mode transition. The clock oscillators restart operation automatically if they are used before entering stand-by.

- If MainOSC and PLL are enabled before entering STOP mode, they restart oscillation automatically during wake-up from STOP mode, and CPU restarts operation after oscillations of these clock sources become stable.
- If MainOSC is enabled before entering DeepSTOP mode, it restarts oscillation automatically during wake-up from DeepSTOP mode, and CPU restarts operation after oscillation of MainOSC becomes stable. PLL is not restarted automatically even if it is enabled before entering DeepSTOP mode.
- If MainOSC is enabled before entering Cyclic STOP mode, it restarts oscillation automatically during wake-up from Cyclic STOP mode. CPU restarts operation after oscillation of MainOSC becomes stable.

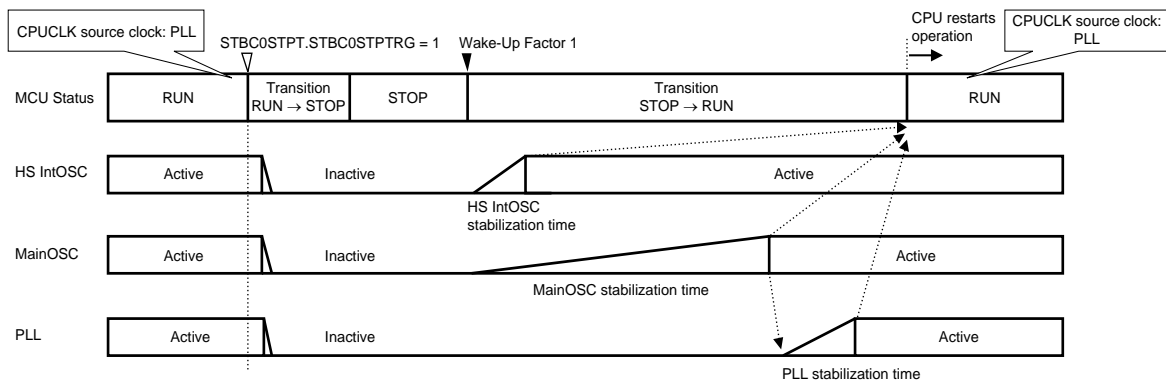

Note that behavior of HS IntOSC and MainOSC in the following figures is in the case they stop oscillation during stand-by mode. HS IntOSC and MainOSC continue oscillation during stand-by mode if their stop mask register is set to 1 (ROSCSTPMSK bit of ROSCSTPM register and MOSCSTPMSK bit of MOSCSTPM register respectively) or there is a clock domain which uses the source clock during stand-by by setting its stop mask bit (CKSC\_XXXX\_STPM = 0000 0003<sub>H</sub>).

- (a) PLL and MainOSC are disabled before entering STOP mode. Restart MainOSC and PLL by software after wake-up. CPUCLK source clock after wake-up from STOP mode is the same source clock before entering STOP mode.

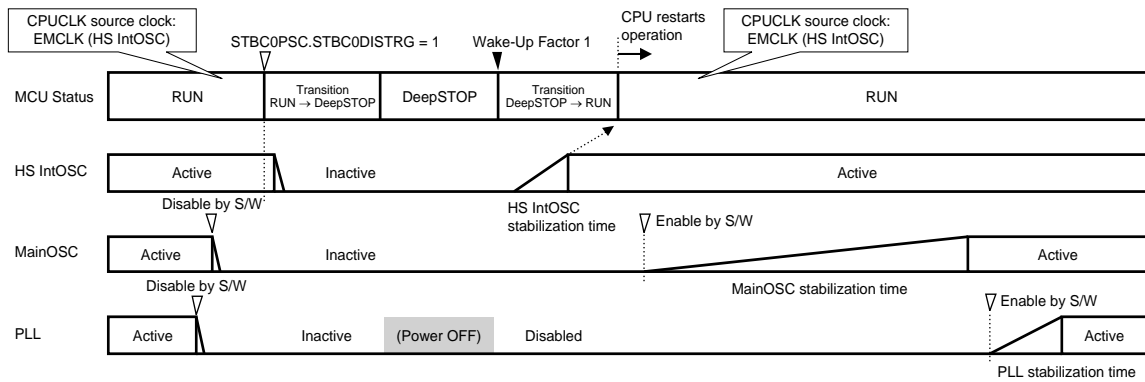

- (b) PLL is disabled, and MainOSC is enabled before entering STOP mode. MainOSC is restarted automatically during transition to RUN mode, and becomes stable before CPU restarts operation. Restart PLL by software after wake-up. CPUCLK source clock after wake-up from STOP mode is the same source clock before entering STOP mode.

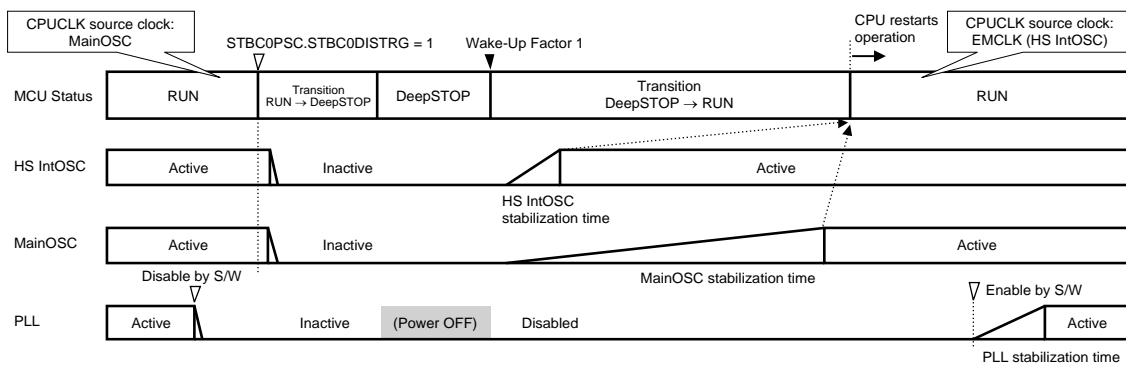

- (c) PLL and MainOSC are enabled before entering STOP mode. PLL and MainOSC are restarted automatically during transition to RUN mode, and become stable CPU restarts operation. CPUCLK source clock after wake-up from STOP mode is the same source clock before entering STOP mode.

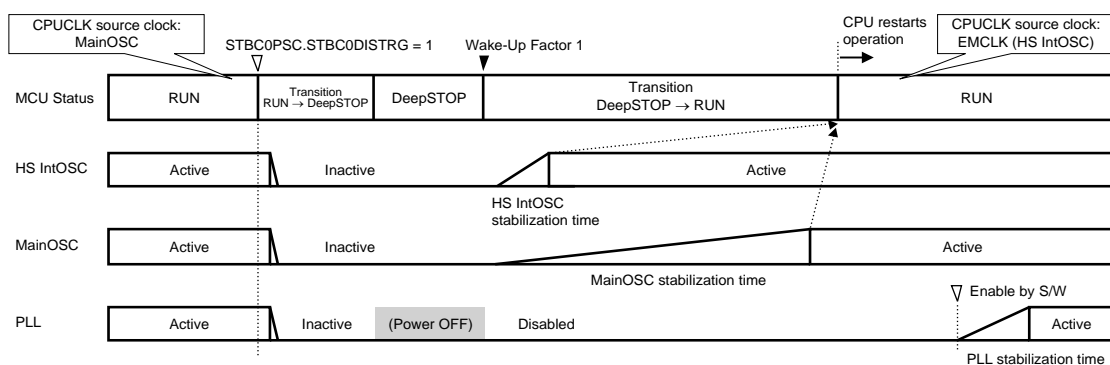

Figure 14.9 Clock Oscillators Behavior in Stand-By Mode Transition (RUN → STOP → RUN)

- (a) PLL and MainOSC are disabled before entering DeepSTOP mode.  
Restart MainOSC and PLL by software after wake-up.  
CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

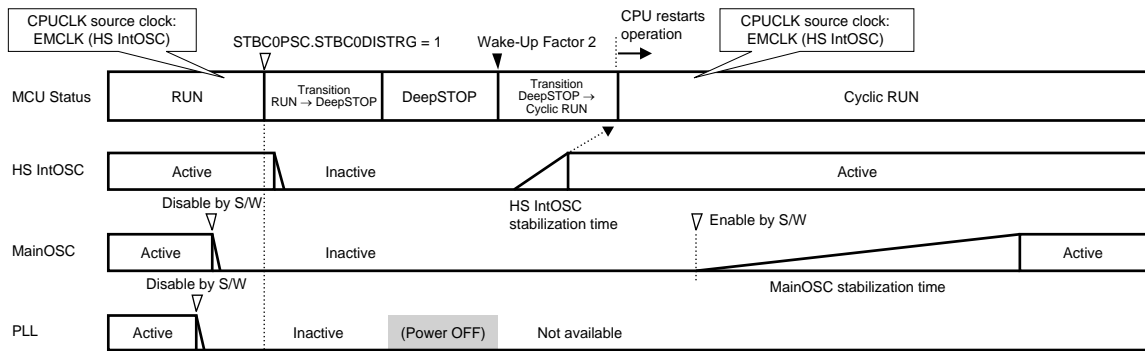

- (b) PLL is disabled, and MainOSC is enabled before entering DeepSTOP mode.  
MainOSC is restarted automatically during transition to RUN mode, and becomes stable before CPU restarts operation.  
Restart PLL by software after wake-up.  
CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

- (c) PLL and MainOSC are enabled before entering DeepSTOP mode.  
MainOSC is restarted automatically during transition to RUN mode, and becomes stable before CPU restarts operation.  
Restart PLL by software after wake-up.  
CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

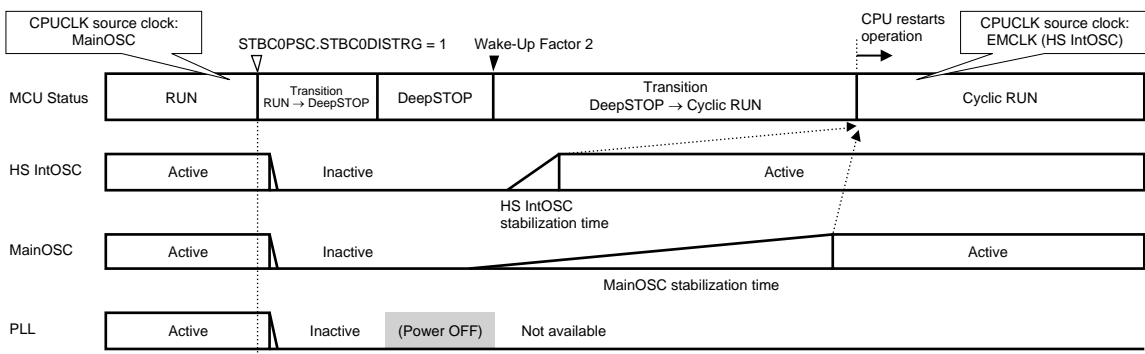

Figure 14.10 Clock Oscillators Behavior in Stand-By Mode Transition (RUN → DeepSTOP → RUN)

- (a) PLL and MainOSC are disabled before entering DeepSTOP mode. Restart MainOSC by software after wake-up. PLL is not available in Cyclic RUN mode. CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

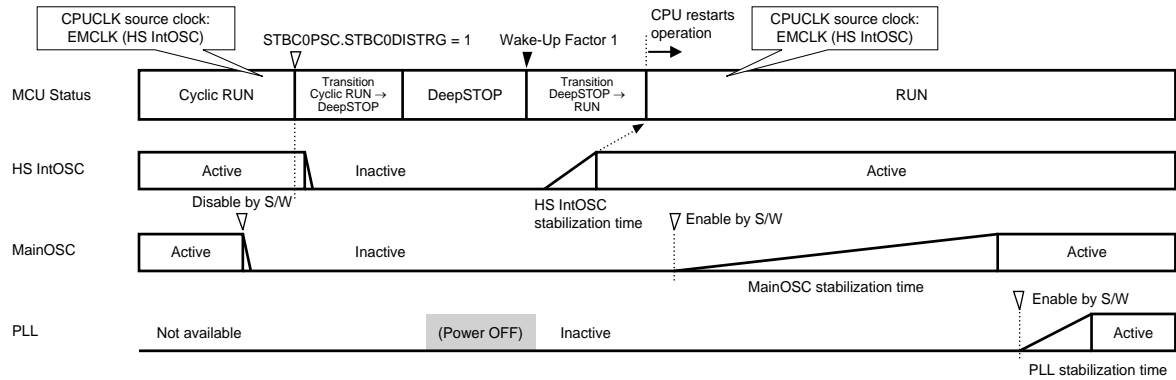

- (b) PLL is disabled, and MainOSC is enabled before entering DeepSTOP mode. MainOSC is restarted automatically during transition to Cyclic RUN mode, and becomes stable before CPU starts operation. PLL is not available in Cyclic RUN mode. CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

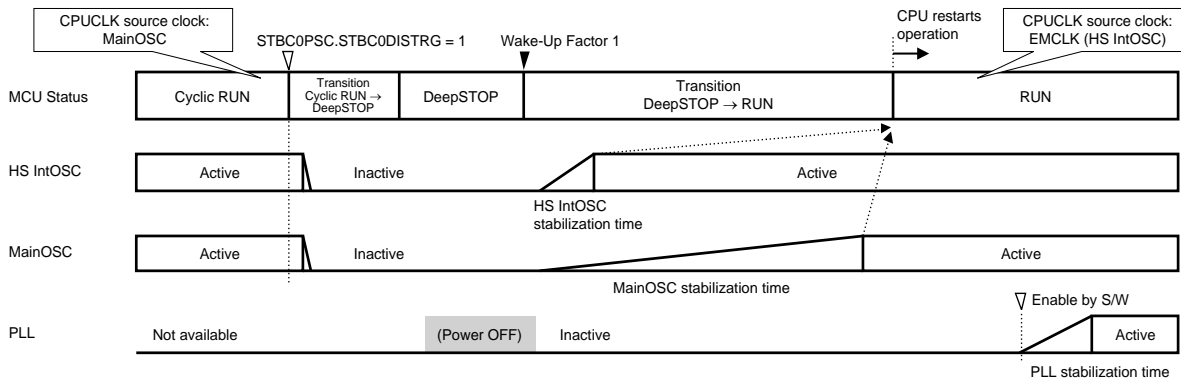

- (c) PLL and MainOSC are enabled before entering DeepSTOP mode. MainOSC is restarted automatically during transition to Cyclic RUN mode, and becomes stable before CPU starts operation. PLL is not available in Cyclic RUN mode. CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

Figure 14.11 Clock Oscillators Behavior in Stand-By Mode Transition (RUN → DeepSTOP → Cyclic RUN)

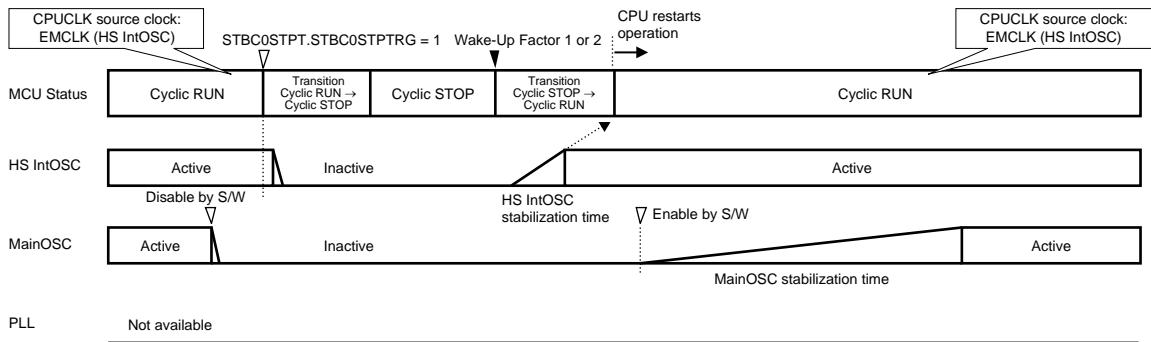

- (a) MainOSC is disabled before entering DeepSTOP mode.  
 Restart MainOSC and PLL by software after wake-up.  
 CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

- (b) MainOSC is enabled before entering DeepSTOP mode.  
 MainOSC is restarted automatically during transition to RUN mode, and becomes stable before CPU starts operation.  
 Restart PLL by software after wake-up.  
 CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

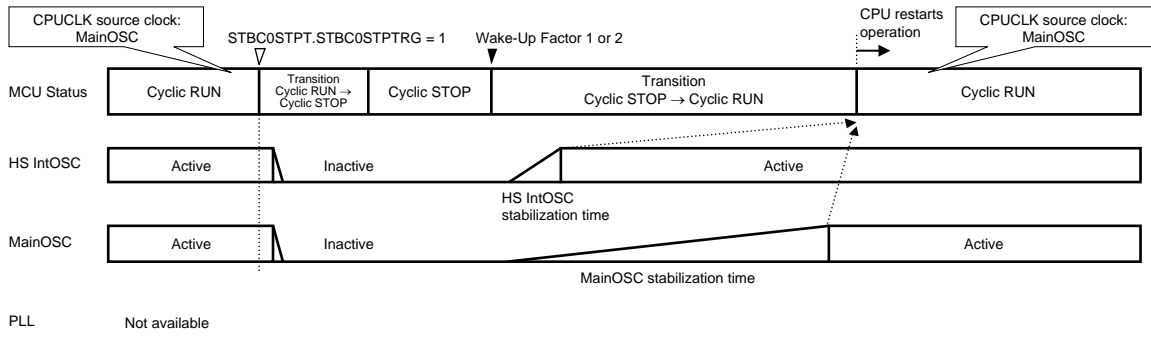

Figure 14.12 Clock Oscillators Behavior in Stand-By Mode Transition (Cyclic RUN → DeepSTOP → RUN)

(a) MainOSC is disabled before entering Cyclic STOP mode.

Restart MainOSC by software after wake-up.

CPUCLK source clock after wake-up from Cyclic STOP mode is the same source clock before entering Cyclic STOP mode.

(b) MainOSC is enabled before entering Cyclic STOP mode.

MainOSC is restarted automatically during transition to Cyclic RUN mode, and becomes stable before CPU starts operation.

CPUCLK source clock after wake-up from Cyclic STOP mode is the same source clock before entering Cyclic STOP mode.

Figure 14.13 Clock Oscillators Behavior in Stand-By Mode Transition (Cyclic RUN → Cyclic STOP → Cyclic RUN)

## 14.6 Cautions when Using Stand-By Modes

### 14.6.1 Cautions Concerning Transitioning to DeepSTOP Mode When Using a Debugger

When using a debugger, executing a program that causes the mode to transition to DeepSTOP mode immediately after the program is started may cause improper communication between the OCD emulator and microcontroller because the microcontroller will enter DeepSTOP mode before the preparations for communication between the OCD emulator and microcontroller are completed.

The communication preparation period depends on the OCD emulator's host PC environment and the operating frequency of the microcontroller, so when performing debugging that causes the program to enter DeepSTOP mode immediately after the program starts, insert a wait between reset release and the DeepSTOP execution instruction so that the debugger starts normally.

In DeepSTOP mode, the debugging controller stops. For return from DeepSTOP mode by the debugger, see **Section 14.1.3, On-Chip Debug Wake-Up**.

## Section 15 Low-Power Sampler (LPS)

This section contains a generic description of the low-power sampler (LPS).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of LPS.

### 15.1 Features of RH850/F1KH, RH850/F1KM LPS

#### 15.1.1 Number of Units

This microcontroller has the following number of LPS units.

Table 15.1 Number of Units (RH850/F1KH-D8)

	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)

Table 15.2 Number of Units (RH850/F1KM-S4)

	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)

Table 15.3 Number of Units (RH850/F1KM-S2)

	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	1	1	1
Name	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)

Table 15.4 Number of Units (RH850/F1KM-S1)

	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)

Table 15.5 Unit Configurations and Channels (RH850/F1KH-D8)

Unit Name	Number of Channels per Unit	Function	Channel Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
LPS0	1	Digital port input m for port polling	DPINm	24 ch	24 ch	24 ch

Table 15.9 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2)

Index	Description
n	Throughout this section, the individual LPS units are identified by the index "n" (n = 0).
m	Throughout this section, the number of digital port input channels for LPS port polling is indicated by the index "m" (m = 0 to 23) and the number of analog input channels for A/D converter is indicated by the index "m" (m = 0 to 15)
k	The external multiplexer select output signal is indicated by the index "k".
x	LPS sequence start trigger input signal is indicated by the index "x".
y	Throughout this section, the individual TAUJ units are identified by the index "y".

Table 15.10 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual LPS units are identified by the index "n" (n = 0).
m	Throughout this section, the number of digital port input channels for LPS port polling is indicated by the index "m" (m = 0 to 16) and the number of analog input channels for A/D converter is indicated by the index "m" (m = 0 to 15)
k	The external multiplexer select output signal for digital port is indicated by the index "k".
x	LPS sequence start trigger input signal is indicated by the index "x".
y	Throughout this section, the individual TAUJ units are identified by the index "y".

**NOTE**

Descriptions of functions and registers in this section are based on the maximum configurations. Adjust the indices in the text to the proper value for each product. When writing a value to a register that will result in writing to bits outside the range of the index for the product you are using, write the value after reset to these bits.

The following table shows values indicated by the indices of each product.

Table 15.11 Indices of Products (RH850/F1KH-D8)

Indices of Each Product		
176 Pins	233 Pins	324 Pins
m = 0 to 23 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>	m = 0 to 23 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>	m = 0 to 23 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>
k = 0 to 2	k = 0 to 2	k = 0 to 2
x = 0 to 3	x = 0 to 3	x = 0 to 3
y = 0, 2	y = 0, 2	y = 0, 2

Note 1. Digital port input m for port polling

Note 2. Analog input m for A/D converter

Table 15.12 Indices of Products (RH850/F1KM-S4)

Indices of Each Product				
100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
m = 1 to 16 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>	m = 0 to 23 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>	m = 0 to 23 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>	m = 0 to 23 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>	m = 0 to 23 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>
k = 0 to 2	k = 0 to 2	k = 0 to 2	k = 0 to 2	k = 0 to 2
x = 0 to 3	x = 0 to 3	x = 0 to 3	x = 0 to 3	x = 0 to 3
y = 0, 2	y = 0, 2	y = 0, 2	y = 0, 2	y = 0, 2

100 Pins	144 Pins	176 Pins
m = 1 to 16 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>	m = 0 to 23 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>	m = 0 to 23 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>
k = 0 to 2	k = 0 to 2	k = 0 to 2
x = 0 to 3	x = 0 to 3	x = 0 to 3
y = 0, 2	y = 0, 2	y = 0, 2

Note 1. Digital port input m for port polling

Note 2. Analog input m for A/D converter

Table 15.14 Indices of Products (RH850/F1KM-S1)

Indices of Each Product			
48 Pins	64 Pins	80 Pins	100 Pins
m = 0 to 2 <sup>*1</sup> m = 0 to 7 <sup>*2</sup>	m = 0 to 4, 8 to 10 <sup>*1</sup> m = 0 to 9 <sup>*2</sup>	m = 0 to 11 <sup>*1</sup> m = 0 to 10 <sup>*2</sup>	m = 0 to 16 <sup>*1</sup> m = 0 to 15 <sup>*2</sup>
— <sup>*3</sup>	k = 0 to 2	k = 0 to 2	k = 0 to 2
x = 0 to 3	x = 0 to 3	x = 0 to 3	x = 0 to 3
y = 0, 2	y = 0, 2	y = 0, 2	y = 0, 2

Note 1. Digital port input m for port polling

Note 2. Analog input m for A/D converter

Note 3. ADCA0SELk is k = 0 to 2.

For details, see **Section 38.1.6, External Input/Output Signals**.

### 15.1.2 Register Base Address

The LPS base address is listed in the following table.

LPS register addresses are given as an offset from the base address.

Table 15.15 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<LPS0_base>	FFF8 3000 <sub>H</sub>

### 15.1.3 Clock Supply

The LPS clock supply is shown in the following table.

If the operation request signal for the low-power sampler (LPS) is at the active level, the clock for C\_AWO\_ADCA for which the HS IntOSC is selected also operates.

Table 15.16 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
LPSn	Register access clock	CPUCLK_L, EMCLK
	Operating clock	EMCLK

### 15.1.4 Interrupt Requests

The LPS interrupt requests are listed in the following table.

Table 15.17 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
LPS0			
INTCWEND	Port polling end interrupt (LPS)	112	—
INTDPE	Digital port error interrupt (LPS)	356	—
INTAPE	Analog port error interrupt (LPS)	357	—
INTADCA0I0*1	ADCA0 SG1 end interrupt	18	4
INTADCA0I1*1	ADCA0 SG2 end interrupt	19	5
INTADCA0I2*1	ADCA0 SG3 end interrupt	20, 32	6

Note 1. These signals are output from ADCA0.

### 15.1.5 Reset Sources

The LPS reset sources are shown in the following table. The LPS is initialized by these reset sources.

Table 15.18 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
LPSn	All reset sources except transition to DeepSTOP mode (AWORES)

### 15.1.6 External Input/Output Signals

External input/output signals of LPS are listed below.

Table 15.19 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
LPS0		
DPO	Port output signal for digital input	DPO
DPSELk	External multiplexer select output signal for digital port	SELDPk
DPINm	Digital port input signal	DPINm
APO	Port output signal for analog input	APO
ADCA0SELk <sup>*1</sup>	External analog multiplexer (MPX) output pin	ADCA0SELk
ADCA0Im <sup>*1</sup>	ADCA input channel signal	ADCA0Im

Note 1. These signals are input/output of ADCA0. For details, see **Section 38.1.6, External Input/Output Signals**.

### 15.1.7 Internal Input/Output Signals

Internal input/output signals for connecting the LPS and the STBC or the LPS and the TAUJ are listed below.

Table 15.20 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
WUTRG0	LPS wake-up source trigger 0 output signal	STBC
WUTRG1	LPS wake-up source trigger 1 output signal	STBC
INTTAUJyIx	LPS sequence start trigger x input signal	TAUJy

## 15.2 Overview

### 15.2.1 Functional Overview

To monitor the external input without consuming CPU resources, the low-power sampler (LPS) can check the digital input ports and analog input ports without using the CPU. The figure below shows a connection example between the main components of the LPS and the external circuit.

Figure 15.1 Block Diagram of the LPS

#### CAUTION

DPSEL2 to DPSEL0 are assigned to the same pins as DPIN10 to DPIN8 as alternative function. They cannot be used simultaneously.

## 15.3 Registers

### 15.3.1 List of Registers

LPS registers are listed in the following table.

For details about <LPS0\_base>, see **Section 15.1.2, Register Base Address**.

Table 15.21 List of Registers

Module Name	Register Name	Symbol	Address
LPS0	LPS control register	SCTLR	<LPS0_base > + 00 <sub>H</sub>
	Event flag register	EVFR	<LPS0_base > + 04 <sub>H</sub>
	DPIN select register 0	DPSELR0	<LPS0_base > + 08 <sub>H</sub>
	DPIN select register M	DPSELRM	<LPS0_base > + 0C <sub>H</sub>
	DPIN select register H	DPSELRH	<LPS0_base > + 10 <sub>H</sub>
	DPIN data set register 0	DPDSR0	<LPS0_base > + 14 <sub>H</sub>
	DPIN data set register M	DPDSRM	<LPS0_base > + 18 <sub>H</sub>
	DPIN data set register H	DPDSRH	<LPS0_base > + 1C <sub>H</sub>
	DPIN data input monitor register 0	DPDIMR0	<LPS0_base > + 20 <sub>H</sub>
	DPIN data input monitor register 1	DPDIMR1	<LPS0_base > + 24 <sub>H</sub>
	DPIN data input monitor register 2	DPDIMR2	<LPS0_base > + 28 <sub>H</sub>
	DPIN data input monitor register 3	DPDIMR3	<LPS0_base > + 2C <sub>H</sub>
	DPIN data input monitor register 4	DPDIMR4	<LPS0_base > + 30 <sub>H</sub>
	DPIN data input monitor register 5	DPDIMR5	<LPS0_base > + 34 <sub>H</sub>
	DPIN data input monitor register 6	DPDIMR6	<LPS0_base > + 38 <sub>H</sub>
	DPIN data input monitor register 7	DPDIMR7	<LPS0_base > + 3C <sub>H</sub>
	Count value register	CNTVAL	<LPS0_base > + 40 <sub>H</sub>
	LPS operation status register	SOSTR	<LPS0_base > + 44 <sub>H</sub>

### 15.3.2 SCTLR — LPS Control Register

This register is used to configure the LPS.

**Access:** This register can be read or written in 32-bit units.

**Address:** <LPS0\_base> + 00H

**Value after reset:** 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.22 SCTLR Register Contents

Bit Position	Bit Name	Function																		
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.																		
6 to 4	NUMDP[2:0]	<p>These bits specify the number of times the port is read in digital input mode. If two or more times are specified, the external multiplexer is controlled by the DPSEL[2:0] pins.</p> <p>The bits for which comparison is enabled in the DPSELR0, DPSELRM, and DPSELRH registers are compared regardless of the repeat number setting, and WUTRG will be generated according to the results.</p> <table border="1"> <thead> <tr> <th>NUMDP[2:0]</th> <th>Number of Times the Port Is Read</th> </tr> </thead> <tbody> <tr> <td>000<sub>b</sub></td> <td>One time</td> </tr> <tr> <td>001<sub>b</sub></td> <td>Two times</td> </tr> <tr> <td>010<sub>b</sub></td> <td>Three times</td> </tr> <tr> <td>011<sub>b</sub></td> <td>Four times</td> </tr> <tr> <td>100<sub>b</sub></td> <td>Five times</td> </tr> <tr> <td>101<sub>b</sub></td> <td>Six times</td> </tr> <tr> <td>110<sub>b</sub></td> <td>Seven times</td> </tr> <tr> <td>111<sub>b</sub></td> <td>Eight times</td> </tr> </tbody> </table> <p>These bits should be set before the TAUJy and sequence operations are started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0). (When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.)</p>	NUMDP[2:0]	Number of Times the Port Is Read	000 <sub>b</sub>	One time	001 <sub>b</sub>	Two times	010 <sub>b</sub>	Three times	011 <sub>b</sub>	Four times	100 <sub>b</sub>	Five times	101 <sub>b</sub>	Six times	110 <sub>b</sub>	Seven times	111 <sub>b</sub>	Eight times
NUMDP[2:0]	Number of Times the Port Is Read																			
000 <sub>b</sub>	One time																			
001 <sub>b</sub>	Two times																			
010 <sub>b</sub>	Three times																			
011 <sub>b</sub>	Four times																			
100 <sub>b</sub>	Five times																			
101 <sub>b</sub>	Six times																			
110 <sub>b</sub>	Seven times																			
111 <sub>b</sub>	Eight times																			
7, 3, 2	TJIS[2:0]	<p>Sequence Start Trigger Select</p> <p>000: INTTAUJ010    100: INTTAUJ210            001: INTTAUJ011    101: INTTAUJ211            010: INTTAUJ012    110: INTTAUJ212            011: INTTAUJ013    111: INTTAUJ213</p> <p>These bits should be set before the sequence operation is started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0). (When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.)</p>																		
1	ADEN	0: Analog input mode is disabled 1: Analog input mode is enabled																		
0	DPEN	0: Digital input mode is disabled 1: Digital input mode is enabled																		

### 15.3.3 EVFR — Event Flag Register

This register indicates the result of comparing the data sequentially captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers.

**Access:** This register can be read or written in 32-bit units.

**Address:** <LPS0\_base> + 04<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.23 EVFR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DINEVF	<p>This bit indicates the result of comparing the data captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers.</p> <p>Read:</p> <ul style="list-style-type: none"> <li>0: The result of comparison is a match.</li> <li>1: The result of comparison is a mismatch.</li> </ul> <p>Write:</p> <ul style="list-style-type: none"> <li>0: Clear the bit.</li> <li>1: Prohibited.</li> </ul> <p>This bit is set to 1 when a mismatch is detected even in one bit. Only 0 can be written to clear this bit.</p>

### 15.3.4 DPSELR0 — DPIN Select Register 0

This register specifies the compare target bits in the DPDSR0 and DPDIMR0 registers.

Write to the DPSELR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** This register can be read or written in 32-bit units.

**Address:** <LPS0\_base> + 08<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	D0EN _23	D0EN _22	D0EN _21	D0EN _20	D0EN _19	D0EN _18	D0EN _17	D0EN _16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.24 DPSELR0 Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 0	D0EN_n (n = 23 to 0)	These bits enable or disable comparing each bit of the first data captured at the digital input pins and stored in the DPDIMR0 register with the comparison target data in the DPDSR0 register. 0: Disables comparison. 1: Enables comparison.

### 15.3.5 DPSELRM — DPIN Select Register M

This register specifies the compare target bits in the DPDSRM and DPDIMR<sub>m</sub> (m = 4 to 1) registers.

Write to the DPSELRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** DPSELRM can be read or written in 32-bit units.  
DPSELRML and DPSELRMH can be read or written in 16-bit units.  
DPSELR1, DPSELR2, DPSELR3, and DPSELR4 can be read or written in 8-bit units.

**Address:** DPSELRM: <LPS0\_base> + 0C<sub>H</sub>  
DPSELRML: <LPS0\_base> + 0C<sub>H</sub>,  
DPSELRMH: <LPS0\_base> + 0E<sub>H</sub>  
DPSELR1: <LPS0\_base> + 0C<sub>H</sub>,  
DPSELR2: <LPS0\_base> + 0D<sub>H</sub>,  
DPSELR3: <LPS0\_base> + 0E<sub>H</sub>,  
DPSELR4: <LPS0\_base> + 0F<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 15.25 DPSELRM Register Contents

Bit Position	Bit Name	Function
31 to 24	D4EN <sub>n</sub> (n = 7 to 0)	These bits enable or disable comparing each bit of the fifth data captured at the digital input pins and stored in the DPDIMR4 register with the comparison target data in the DPDSR4 register. 0: Disables comparison. 1: Enables comparison.
23 to 16	D3EN <sub>n</sub> (n = 7 to 0)	These bits enable or disable comparing each bit of the fourth data captured at the digital input pins and stored in the DPDIMR3 register with the comparison target data in the DPDSR3 register. 0: Disables comparison. 1: Enables comparison.
15 to 8	D2EN <sub>n</sub> (n = 7 to 0)	These bits enable or disable comparing each bit of the third data captured at the digital input pins and stored in the DPDIMR2 register with the comparison target data in the DPDSR2 register. 0: Disables comparison. 1: Enables comparison.
7 to 0	D1EN <sub>n</sub> (n = 7 to 0)	These bits enable or disable comparing each bit of the second data captured at the digital input pins and stored in the DPDIMR1 register with the comparison target data in the DPDSR1 register. 0: Disables comparison. 1: Enables comparison.

### 15.3.6 DPSELRH — DPIN Select Register H

This register specifies the compare target bits in the DPDSRH and DPDIMRm (m = 7 to 5) registers.

Write to the DPSELRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** DPSELRH can be read or written in 32-bit units.  
 DPSELRHL and DPSELRHH can be read or written in 16-bit units.  
 DPSELR5, DPSELR6, and DPSELR7 can be read or written in 8-bit units.

**Address:** DPSELRH: <LPS0\_base> + 10<sub>H</sub>  
 DPSELRHL: <LPS0\_base> + 10<sub>H</sub>,  
 DPSELRHH: <LPS0\_base> + 12<sub>H</sub>  
 DPSELR5: <LPS0\_base> + 10<sub>H</sub>,  
 DPSELR6: <LPS0\_base> + 11<sub>H</sub>,  
 DPSELR7: <LPS0\_base> + 12<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 15.26 DPSELRH Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	D7EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the eighth data captured at the digital input pins and stored in the DPDIMR7 register with the compare target data in the DPDSR7 register. 0: Disables comparison. 1: Enables comparison.
15 to 8	D6EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the seventh data captured at the digital input pins and stored in the DPDIMR6 register with the compare target data in the DPDSR6 register. 0: Disables comparison. 1: Enables comparison.
7 to 0	D5EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the sixth data captured at the digital input pins and stored in the DPDIMR5 register with the compare target data in the DPDSR5 register. 0: Disables comparison. 1: Enables comparison.

### 15.3.7 DPDSR0 — DPIN Data Set Register 0

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR0 register.

Write to the DPDSR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** This register can be read or written in 32-bit units.

**Address:** <LPS0\_base> + 14<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 0	D0_n (n = 23 to 0)	Data to be compared with the first digital port input (DPINm)

### 15.3.8 DPDSRM — DPIN Data Set Register M

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR4 to DPDIMR1 registers.

Write to the DPDSRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** DPDSRM can be read or written in 32-bit units.  
 DPDSRML and DPDSRMH can be read or written in 16-bit units.  
 DPDSR1, DPDSR2, DPDSR3, and DPDSR4 can be read or written in 8-bit units.

**Address:** DPDSRM: <LPS0\_base> + 18<sub>H</sub>  
 DPDSRML: <LPS0\_base> + 18<sub>H</sub>,  
 DPDSRMH: <LPS0\_base> + 1A<sub>H</sub>  
 DPDSR1: <LPS0\_base> + 18<sub>H</sub>,  
 DPDSR2: <LPS0\_base> + 19<sub>H</sub>,  
 DPDSR3: <LPS0\_base> + 1A<sub>H</sub>,

Table 15.28 DPDSRM Register Contents

Bit Position	Bit Name	Function
31 to 24	D4_n (n = 7 to 0)	Data to be compared with the fifth digital port input (DPINm)
23 to 16	D3_n (n = 7 to 0)	Data to be compared with the fourth digital port input (DPINm)
15 to 8	D2_n (n = 7 to 0)	Data to be compared with the third digital port input (DPINm)
7 to 0	D1_n (n = 7 to 0)	Data to be compared with the second digital port input (DPINm)

### 15.3.9 DPDSRH — DPIN Data Set Register H

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR7 to DPDIMR5 registers.

Write to the DPDSRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** DPDSRH can be read or written in 32-bit units.  
 DPDSRHL and DPDSRHH can be read or written in 16-bit units.  
 DPDSR5, DPDSR6, and DPDSR7 can be read or written in 8-bit units.

**Address:** DPDSRH: <LPS0\_base> + 1C<sub>H</sub>  
 DPDSRHL: <LPS0\_base> + 1C<sub>H</sub>,  
 DPDSRHH: <LPS0\_base> + 1E<sub>H</sub>  
 DPDSR5: <LPS0\_base> + 1C<sub>H</sub>,  
 DPDSR6: <LPS0\_base> + 1D<sub>H</sub>,  
 DPDSR7: <LPS0\_base> + 1E<sub>H</sub>

15 to 8	D6_n (n = 7 to 0)	Data to be compared with the seventh digital port input (DPINm)
7 to 0	D5_n (n = 7 to 0)	Data to be compared with the sixth digital port input (DPINm)

### 15.3.10 DPDIMR0 — DPIN Data Input Monitor Register 0

This register stores the data which the LPS acquired from the digital port input (DPIN<sub>m</sub> (m = 0 to 23)) in digital input mode. DPDIMR0 stores the data acquired for the first time.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <LPS0\_base> + 20<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 24	Reserved	When read, the value after reset is returned.
23 to 0	D0M_n (n = 23 to 0)	The first digital port input (DPIN <sub>m</sub> ) data

### 15.3.11 DPDIMR1 — DPIN Data Input Monitor Register 1

This register stores the data which the LPS acquired from the digital port input (DPIN<sub>m</sub> (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR1 stores the data acquired for the second time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0\_base> + 24<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	D1M_7	D1M_6	D1M_5	D1M_4	D1M_3	D1M_2	D1M_1	D1M_0

### 15.3.13 DPDIMR3 — DPIN Data Input Monitor Register 3

This register stores the data which the LPS acquired from the digital port input (DPIN<sub>m</sub> (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR3 stores the data acquired for the fourth time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0\_base> + 2C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	D3M_7	D3M_6	D3M_5	D3M_4	D3M_3	D3M_2	D3M_1	D3M_0

Table 15.33 DPDIMR3 Register Contents

Bit Position	Bit Name	Function
7 to 0	D3M_n (n = 7 to 0)	The fourth digital port input (DPIN <sub>m</sub> ) data

### 15.3.14 DPDIMR4 — DPIN Data Input Monitor Register 4

This register stores the data which the LPS acquired from the digital port input (DPIN<sub>m</sub> (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR4 stores the data acquired for the fifth time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0\_base> + 30<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	D4M_7	D4M_6	D4M_5	D4M_4	D4M_3	D4M_2	D4M_1	D4M_0
Value after reset	0	0	0	0	0	0	0	0

Table 15.34 DPDIMR4 Register Contents

Bit Position	Bit Name	Function
7 to 0	D4M_n (n = 7 to 0)	The fifth digital port input (DPIN <sub>m</sub> ) data

### 15.3.15 DPDIMR5 — DPIN Data Input Monitor Register 5

This register stores the data which the LPS acquired from the digital port input (DPIN<sub>m</sub> (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR5 stores the data acquired for the sixth time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0\_base> + 34<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	D5M_7	D5M_6	D5M_5	D5M_4	D5M_3	D5M_2	D5M_1	D5M_0

### 15.3.16 DPDIMR6 — DPIN Data Input Monitor Register 6

This register stores the data which the LPS acquired from the digital port input (DPIN<sub>m</sub> (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR6 stores the data acquired for the seventh time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0\_base> + 38<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	D6M_7	D6M_6	D6M_5	D6M_4	D6M_3	D6M_2	D6M_1	D6M_0

### 15.3.17 DPDIMR7 — DPIN Data Input Monitor Register 7

This register stores the data which the LPS acquired from the digital port input (DPIN<sub>m</sub> (m = 0 to 7)) in multiplexer mode. DPDIMR7 stores the data acquired for the eighth time.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0\_base> + 3C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	D7M_7	D7M_6	D7M_5	D7M_4	D7M_3	D7M_2	D7M_1	D7M_0

R/W	R	R	R	R	R	R	R	R

Table 15.37 DPDIMR7 Register Contents

Bit Position	Bit Name	Function
7 to 0	D7M_n (n = 7 to 0)	The eighth digital port input (DPIN <sub>m</sub> ) data

### 15.3.18 CNTVAL — Count Value Register

This register specifies the stabilization time of the external circuits (digital signal source and analog signal source).

- In digital mode

The time from when the DPO output is set to 1 to the time when the port input is acquired for the first time

- In analog mode

The time from when the APO output is set to 1 to the time when the LPS outputs the A/D conversion trigger to the ADCA0

Write to the CNTVAL register before the sequence operation is started (when the SOSTR.SOF bit = 0).

**Access:** This register can be read or written in 16-bit units.

**Address:** <LPS0\_base> + 40<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNT17	CNT16	CNT15	CNT14	CNT13	CNT12	CNT11	CNT10	CNT07	CNT06	CNT05	CNT04	CNT03	CNT02	CNT01	CNT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 15.38 CNTVAL Register Contents

Bit Position	Bit Name	Function
15 to 8	CNT1n (n = 7 to 0)	These bits set the stabilization time of the external circuit (analog signal source). Stabilization time = $(1/f_{RH}) \times 16 \times \text{CNT1n (set value)}$
7 to 0	CNT0n (n = 7 to 0)	These bits set the stabilization time of the external circuit (digital signal source). Stabilization time = $(1/f_{RH}) \times 16 \times \text{CNT0n (set value)}$

### 15.3.19 SOSTR — LPS Operation Status Register

This register indicates the operating state of the LPS.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <LPS0\_base> + 44<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SOF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 15.39 SOSTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	SOF	LPS Operation Status Flag 0: Initial state before the occurrence of the start trigger 1: LPS operation is in progress (after the start trigger occurs) If the start trigger occurs while the SOF bit is set to 1 (during the LPS operation), the start trigger is canceled.

#### NOTE

When DPEN or ADEN is set to 0 for stop of the LPS, SOF bit is set to 0 after the bit becomes 1 once by hardware.

## 15.4 Digital Input Mode

With the digital input port DPIN<sub>m</sub> and the externally connected multiplexer, up to 64 input ports can be monitored as shown in **Table 15.40, Combination of Monitored Ports**.

Port DPSEL<sub>k</sub> is used to switch the external multiplexer. The DPSEL<sub>k</sub> output is switched for the number of times specified in the SCTL<sub>R</sub> register.

TAU<sub>Jy</sub> is used to set the timing to check the value input to the port.

Table 15.40 Combination of Monitored Ports

Combination (Number of Ports × Number of Checks)	Ports Used	Total Number
Direct mode When input ports are checked simultaneously without using the external multiplexer Up to 24 ports × 1	DPIN23 to DPIN0	Up to 24
Multiplexer mode When input ports are checked by using a small number of pins and the external multiplexer Up to 8 ports × 8	DPIN7 to DPIN0 DPSEL2 to DPSEL0	Up to 64
MIX mode When input ports are checked using a combination of the above two modes Up to 14 ports × 1 + Up to 7 ports × 7	DPIN7 to DPIN0 DPIN16 to DPIN11 DPSEL2 to DPSEL0*1	Up to 63

Note 1. DPIN16 to DPIN11 and DPIN7 are checked only for the first time. DPIN10 to DPIN8 cannot be used because they are shared with DPSEL2 to DPSEL0.

Figure 15.2 Direct Mode Connection Example

Figure 15.3 Multiplexer Mode Connection Example

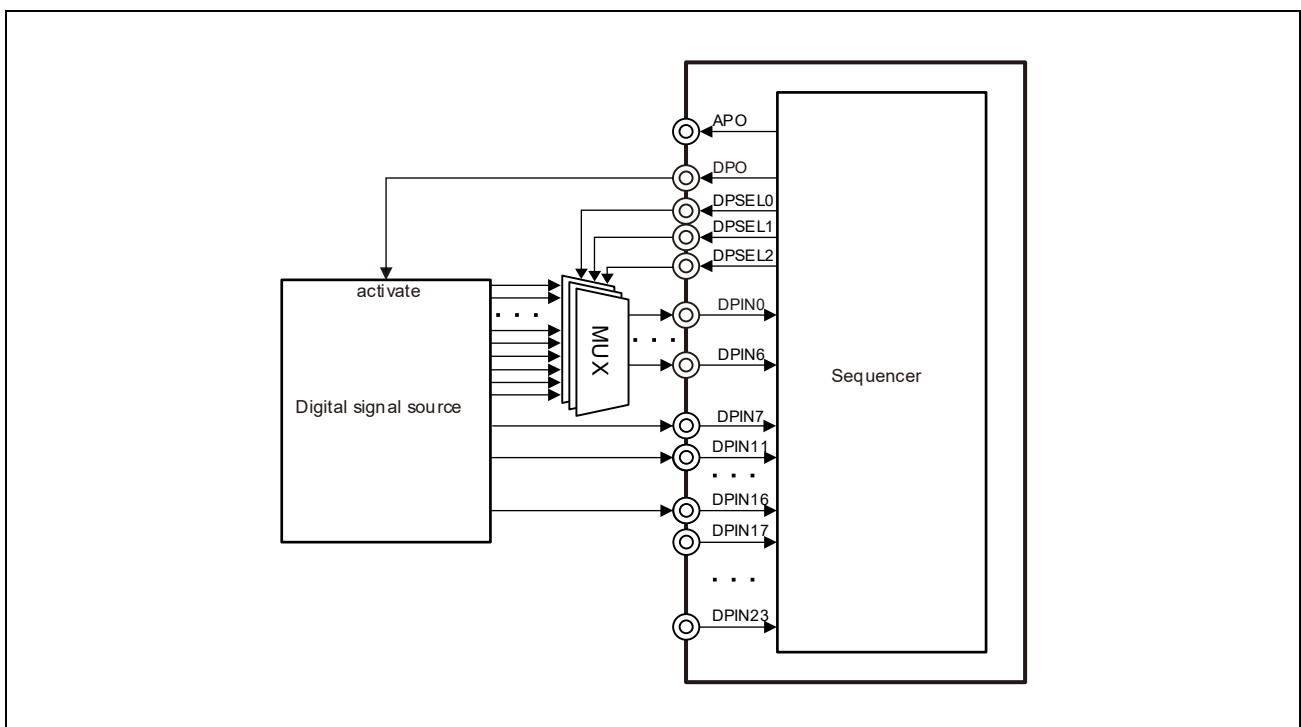

Figure 15.4 MIX Mode Connection Example

**CAUTION**

DPSEL2 to DPSEL0 are assigned to the same pins as DPIN10 to DPIN8 as alternative function.

They cannot be used simultaneously.

### Preparation

- Set NUMDP[2:0] and TJIS[2:0] bits in the SCTL register to specify the number of times the port is to be read, and the TAUJy interrupt to be used as sequence start trigger.
- Set TAUJy to interval timer mode.
- Set the wait time of the digital signal source by using the lower 8 bits in the CNTVAL register.
- Set expected values in the DPDSR0, DPDSRM and DPDSRH registers.
- Set the ports to be checked in the DPSELR0, DPSELRM, and DPSELRH registers.

### Start

- Start the TAUJy.
- Set the SCTL.DPEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJy. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in stand-by mode, it can only resume operation while the sequencer is running.

Upon completion of checking all ports that have been set, the INTCWEND interrupt occurs. In addition, if the input value of the port is different from the expected value set by the DPDSR0, DPDSRM, or DPDSRH register, the wake-up factor WUTRG0 occurs. The following figures show an example of the operation in digital input mode.

### Stop

To stop the LPS operation in Digital Input Mode (by changing the SCTL.DPEN bit setting from 1 to 0), follow the procedure shown below. In this example, the P0\_0 pin is used as DPO.

1. Set the port register to specify low level output on the pin ( $P0.P0_0 = 0$ ).
2. Change the setting for the P0\_0 pin from the alternative port mode to the port mode ( $PMC0.PMC0_0 = 0$ ).
3. Set  $SCTL.DPEN = 0$ .

### NOTE

The above procedure applies when the P0\_0 pin is used as DPO. If the P0\_2 pin is used as DPO, specify the P0\_2 pin settings in the same way.

Figure 15.5 Operation of Digital Input Mode (8 Ports x 8) when the Input Value is not Changed (RUN Mode)

- (1) Set the SCTL.RDPEN bit to 1 by software to enable the digital input mode of the LPS.
- (2) When the INTTAUJyIx interrupt specified by the SCTL.TJIS bit is generated, the sequencer outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.
- (3) After the completion of the signal source stabilization, the LPS stores the DPIN[7:0] input value to the DPDIMR0 register and increments the DPSEL[2:0] pins to switch the external multiplexer.
- (4) After the switching of the DPSEL[2:0] pins, the LPS stores the values in the DPDIMRn registers in order from DPDIMR1 and continues to increment the DPSEL[2:0] pins.
- (5) After the value is stored up to the DPDIMR7 register, the INTCWEND interrupt is generated and the value is compared with the expected value set in the DPDSR0, DPDSRM, and DPDSRH registers.
- (6) When the value is not different from the expected value, the wake-up factor WUTRG0 is not generated. The LPS stops the DPO output and returns to the waiting state for the trigger.

High level width of the DPO pin is calculated by the following formula. For the Stabilization time, see **Section 15.3.18, CNTVAL — Count Value Register**.

High level width of the DPO pin

$$= \text{Stabilization time} + (1/f_{RH}) \times 1 + (1/f_{RH}) \times 2 \times (\text{SCTL.NUMDP (set value)} + 1) + (1/f_{RH}) \times 4$$

$$= \text{Stabilization time} + (1/f_{RH}) \times (2 \times \text{SCTL.NUMDP (set value)} + 7)$$

Figure 15.6 Operation of Digital Input Mode (24 Ports × 1) when the Input Value is Changed (DeepSTOP Mode)

- (1) Set the STBC0PSC.STBC0DISTRG bit to 1 to transition to the DeepSTOP mode, while the SCTL.RDPEN bit is set to 1 by software to enable the digital input mode of the LPS.
- (2) When the INTTAUJyIx interrupt specified by the SCTL.R.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.
- (3) After the completion of the HS IntOSC stabilization time, the LPS outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.
- (4) After the completion of the signal source stabilization, the LPS stores the DPIN[23:0] input value to the DPDIMR0 register and the INTCWEND interrupt is generated.
- (5) The value stored in the DPDIMR0 register is compared with the expected value set in the DPDSR0 register. When the value is different from the expected value, the wake-up factor WUTRG0 is generated.
- (6) The CPU returns to RUN mode at the generation of WUTRG0. The DPO pin is driven high until the EVFR.DINEVF bit is cleared to 0 by software.

### 15.4.1 Digital Port Error Interrupt

A level sensitive interrupt indicating a data comparison mismatch is generated. This interrupt is generated not only in stand-by mode but also in RUN mode. The set and clear conditions are shown below.

Table 15.41 Digital Port Error Interrupt

Unit Interrupt Signal	Set Condition	Clear Condition
INTDPE	When EVFR.DINEVF is set to 1 by hardware	When EVFR.DINEVF is cleared to 0 by software

## 15.5 Analog Input Mode

The analog input port ADCA0Im ( $m = 0$  to 15) can be monitored.

TAUJy is used to set the timing to check the value input to the port.

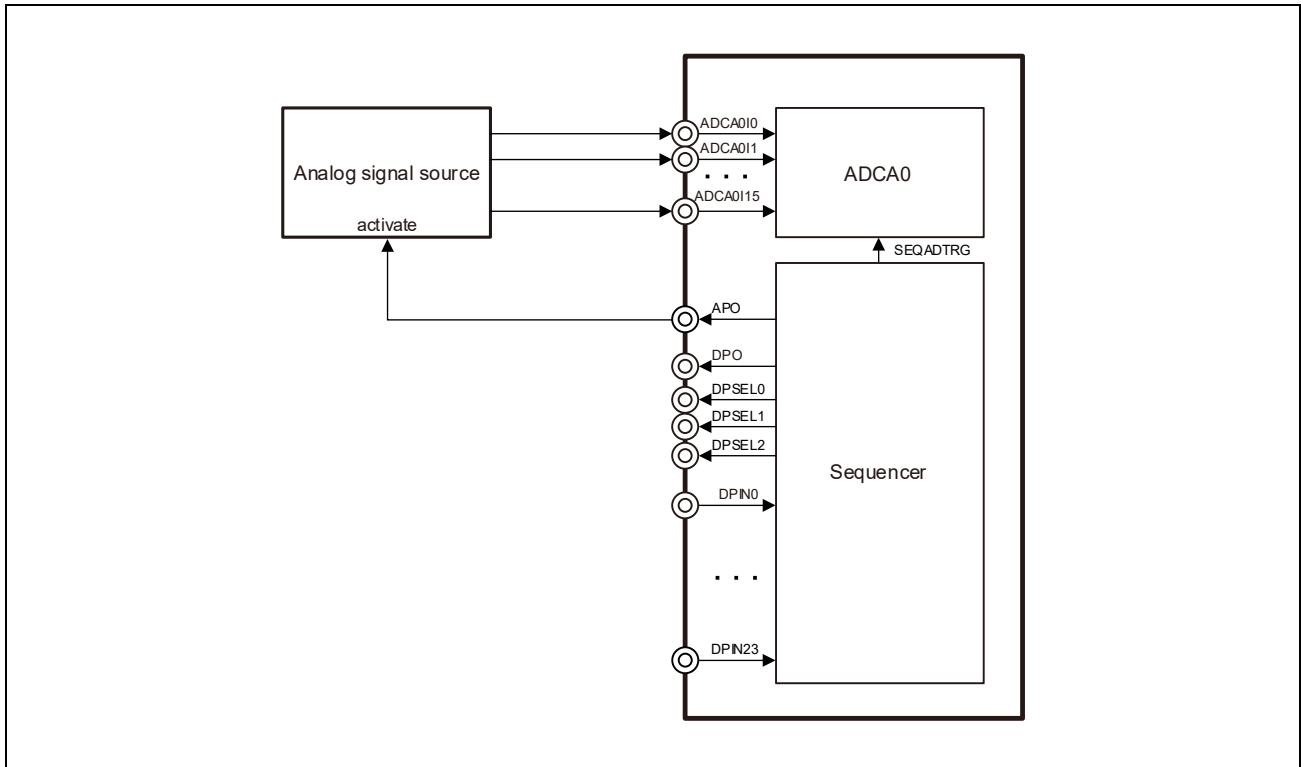

Figure 15.7 Analog Input Mode Connection Example 1

Figure 15.8 Analog Input Mode Connection Example 2

### Preparation

- Set TJIS[2:0] bits in the SCTRL register to specify the TAUJy interrupt to be used as sequence start trigger.
- Set TAUJy to interval timer mode.
- Set the wait time of the analog signal source by using the upper 8 bits in the CNTVAL register.
- Set the ADCA0.

### CAUTIONS

1. When the LPS is in use, the A/D conversion completion interrupt (INTADCA0Ix-1) should be output after the conversion of all channels of the LPS has been completed. The setting is as follows.
  - Set the ADIE bit in virtual channel register j (ADCA0VCRj) to 0 (a scan group x end interrupt (INTADCA0Ix-1) is not generated when A/D conversion for virtual channel j ends in SGx.).
  - Set the ADIE bit in the scan group x control register (ADCA0SGCRx) to 1 (INTADCA0Ix-1 is output when the scan for SGx ends).
2. Over the period from the generation of the LPS sequence start trigger set by the SCTRL.TJIS[2:0] bits to the completion of A/D conversion for all channels of the LPS, only proceed with A/D conversion for PWM-Diag. LPS acknowledges the A/D conversion completion interrupts of the scan group SG1, SG2 or SG3, but does not recognize the kind of SG (three interrupts are ORed to one interrupt). During LPS operation using one SG, an A/D conversion completion interrupt and A/D error interrupt cannot be set for another SG.
3. Over the period from the generation of the LPS sequence start trigger set by the SCTRL.TJIS[2:0] bits to the completion of A/D conversion for all channels of LPS, do not forcibly end A/D conversion by using the ADCA0ADHALTR.HALT bit.

4. When the LPS is in use, do not use the following modes.
    - Continuous scan mode  
(the setting ADCA0SGCRx.SCANMD = 1 is prohibited)
    - Multicycle scan mode with 2 or more cycles  
(the settings ADCA0SGMCYCRx.MCYC = 01<sub>B</sub> and 11<sub>B</sub> are prohibited)
    - Channel repeat mode with 2 or more cycles  
(the settings ADCA0SGCRx.SCT = 01<sub>B</sub> and 10<sub>B</sub> are prohibited)
- 

### Start

- Start the TAUJy.
- Set the SCTL.R.ADEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJy. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in stand-by mode, it can only resume operation while the sequencer is running.

To detect whether the analog input value differs from the expected value, use the A/D error interrupt request (INTADCA0ERR) of the A/D converter.

In addition, if the analog input value is different from the expected value, the wake-up factor WUTRG1 occurs.

For details on the A/D error interrupt request (INTADCA0ERR), see **Section 38.4.13, A/D Error Interrupt Request**\*1. The following figures show an example of the operation in analog input mode.

**Note 1.** In **Section 38, A/D Converter (ADCA)**, the name of the A/D error interrupt request is described as "INT\_ADE".

### Stop

To stop the LPS operation in Analog Input Mode (by changing the SCTL.R.ADEN bit setting from 1 to 0), follow the procedure shown below. Note that the P0\_1 pin is used as APO.

1. Set the port register to specify low level output on the pin (P0.P0\_1 = 0).
2. Change the setting for the P0\_1 pin from the alternative port mode to the port mode (PMC0.PMC0\_1 = 0).
3. Set SCTL.R.ADEN = 0.

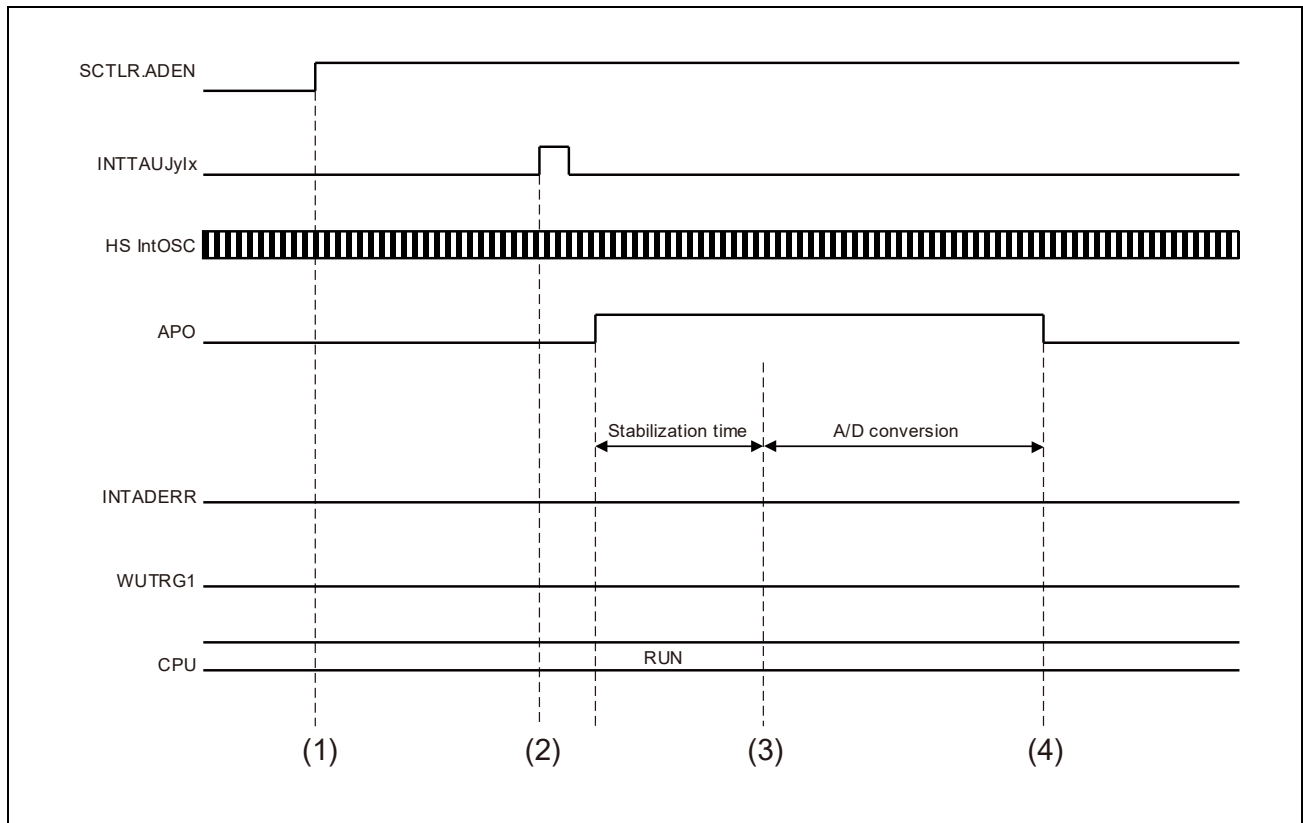

Figure 15.9 Operation of Analog Input Mode when the Conversion Result is within the Expected Range (RUN Mode)

- (1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTL.RADEN bit to 1 to enable the analog input mode of the LPS.
- (2) When the INTTAUJyIx interrupt specified by the SCTL.R.TJIS bit is generated, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source.
- (3) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCA0Im ( $m = 0$  to 15), set in the A/D converter scan group, is started.
- (4) When the INTADCA0ERR interrupt is not generated as a result of A/D conversion, the LPS halts the A/D converter and resets the APO pin.

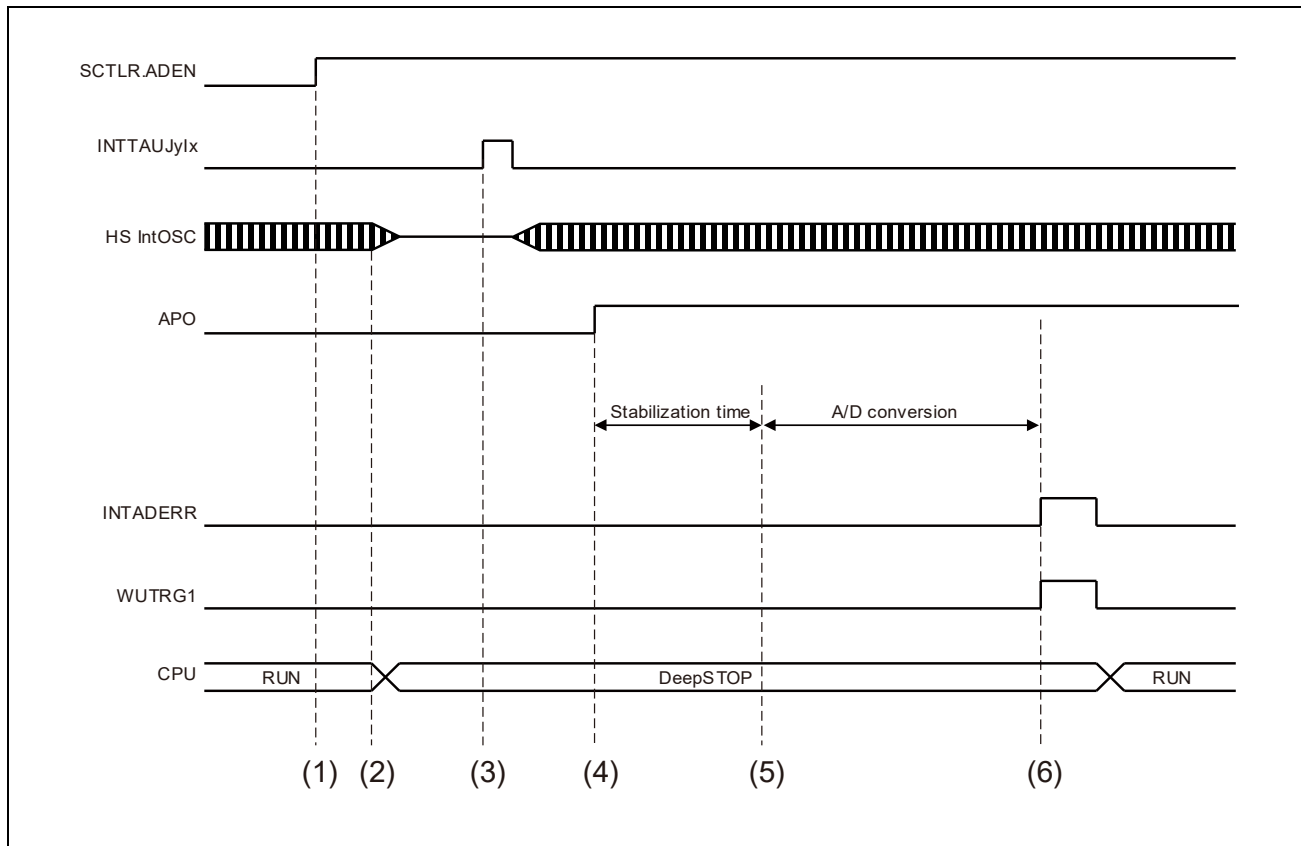

Figure 15.10 Operation of Analog Input Mode when the Conversion Result is not within the Expected Range (DeepSTOP Mode)

- (1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTL.RADEN bit to 1 to enable the analog input mode of the LPS.
- (2) Set the STBC0PSC.STBC0DISTRG bit to 1 by software to transition to the DeepSTOP mode.
- (3) When the INTTAUJyIx interrupt specified by the SCTL.R.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.
- (4) After the completion of the HS IntOSC stabilization, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source.
- (5) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCA0Im ( $m = 0$  to 15), set in the A/D converter scan group, is started.
- (6) When the INTADCA0ERR interrupt is generated as a result of A/D conversion, the wake-up factor WUTRG1 is generated and the CPU returns to RUN mode. The APO pin is driven high until the upper limit/lower limit error flag of the A/D converter is cleared to 0 by software.

#### NOTE

WUTRG1 is generated when the first ADCA0 SG interrupt occurred after ADCAnULER.UE or ADCAnULER.LE is set.

### 15.5.1 Analog Port Error Interrupt

A level sensitive interrupt indicating a data comparison mismatch is generated. This interrupt is generated not only in the stand-by mode but also in RUN mode. The set and clear conditions are shown below.

Table 15.42 Analog Port Error Interrupt

Unit Interrupt Signal	Set Condition	Clear Condition
INTAPE	When WUTRG1 is set to 1 by hardware	When both ADCAnULER.UE and ADCAnULER.LE are cleared to 0 by software

## Section 16 External Memory Access Controller (MEMC)

This section contains a generic description of the external memory access controller (MEMC).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of MEMC.

### 16.1 Features of RH850/F1KH, RH850/F1KM MEMC

#### 16.1.1 Number of Units

This microcontroller has the following number of MEMC units.

Table 16.1 Number of Units (RH850/F1KH-D8)

	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	MEMCn (n = 0)	MEMCn (n = 0)	MEMCn (n = 0)

Table 16.2 Number of Units (RH850/F1KM-S4)

	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	—	—	1	1	1
Name	—	—	MEMCn (n = 0)	MEMCn (n = 0)	MEMCn (n = 0)

Table 16.3 Number of Units (RH850/F1KM-S2)

	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	—	—	—
Name	—	—	—

Table 16.4 Number of Units (RH850/F1KM-S1)

	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	—	—
Name	—	—	—	—

Table 16.5 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual MEMC units are identified by the index "n" (n = 0).
x	Throughout this section, chip select areas are identified by "x". For example, the external memory area of CSx is described as the CSx (x = 0 to 3) area.

Table 16.6 Indices (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual MEMC units are identified by the index "n" (n = 0).
x	Throughout this section, chip select areas are identified by "x". For example, the external memory area of CSx is described as the CSx (x = 0 to 3) area.

Table 16.7 External Memory Access Functions (RH850/F1KH-D8)

Control Signal Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Address output	23 bits	23 bits	24 bits
Chip select output	4	4	4
Data bus	16 bits	16 bits	16 bits

Table 16.8 External Memory Access Functions (RH850/F1KM-S4)

Control Signal Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Address output	—	—	23 bits	23 bits	24 bits
Chip select output	—	—	4	4	4
Data bus	—	—	16 bits	16 bits	16 bits

### 16.1.2 Register Base Address

The MEMC base address is listed in the following table.

The MEMC register addresses are given as an offset from the base address.

Table 16.9 Register Base Address (RH850/F1KH-D8)

Base Address Name	Base Address
<MEMC0_base>	1003 0000 <sub>H</sub>

Table 16.10 Register Base Address (RH850/F1KM-S4)

Base Address Name	Base Address
<MEMC0_base>	1003 0000 <sub>H</sub>

### 16.1.3 Clock Supply

The MEMC clock supply is shown in the following table.

Table 16.11 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name	Description
MEMCn	MEMC0CLK	CPUCLK_L*1	Communication clock
	Register access clock	CPUCLK_L*1	Bus clock

Note 1. This supply clock runs at half the frequency of the CPUCLK\_L signal.

Table 16.12 Clock Supply (RH850/F1KM-S4)

Unit Name	Unit Clock Name	Supply Clock Name	Description
MEMCn	MEMC0CLK	CPUCLK_L*1	Communication clock
	Register access clock	CPUCLK_L*1	Bus clock

Note 1. This supply clock runs at half the frequency of the CPUCLK\_L signal.

### 16.1.4 Reset Sources

The MEMC reset sources are shown below. MEMC is initialized by the following reset sources.

Table 16.13 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
MEMCn	All reset sources (ISORES)

Table 16.14 Reset Sources (RH850/F1KM-S4)

Unit Name	Reset Source
MEMCn	All reset sources (ISORES)

### 16.1.5 External Input/Output Signals

External input/output signals of MEMC are listed below.

Table 16.15 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
MEMC0		
MEMC0A[23:16]	Address Bus Output Signal	MEMC0A[23:16]
MEMC0AD[15:0]	Address/Data Bus I/O Signal	MEMC0AD[15:0]
MEMC0ASTB	Address Strobe Output Signal	$\overline{\text{MEMC0ASTB}}$
MEMC0BEN[1:0]	Byte Enable Output Signal	$\overline{\text{MEMC0BEN[1:0]}}$
MEMC0CLK	Bus Clock Output Signal	MEMC0CLK
MEMC0CS[3:0]	Chip Select Output Signal	$\overline{\text{MEMC0CS[3:0]}}$
MEMC0RD	Read Strobe Output Signal	$\overline{\text{MEMC0RD}}$
MEMC0WAIT	External Wait Request Input Signal	$\overline{\text{MEMC0WAIT}}$
MEMC0WR	Write Strobe Output Signal	$\overline{\text{MEMC0WR}}$

**Note:** For the port to be used as MEMC, set the output driver strength to high (PDSCn\_m = 1).

Table 16.16 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
MEMC0		
MEMC0A[23:16]	Address Bus Output Signal	MEMC0A[23:16]
MEMC0AD[15:0]	Address/Data Bus I/O Signal	MEMC0AD[15:0]
MEMC0ASTB	Address Strobe Output Signal	$\overline{\text{MEMC0ASTB}}$
MEMC0BEN[1:0]	Byte Enable Output Signal	$\overline{\text{MEMC0BEN[1:0]}}$
MEMC0CLK	Bus Clock Output Signal	MEMC0CLK
MEMC0CS[3:0]	Chip Select Output Signal	$\overline{\text{MEMC0CS[3:0]}}$
MEMC0RD	Read Strobe Output Signal	$\overline{\text{MEMC0RD}}$
MEMC0WAIT	External Wait Request Input Signal	$\overline{\text{MEMC0WAIT}}$
MEMC0WR	Write Strobe Output Signal	$\overline{\text{MEMC0WR}}$

**Note:** For the port to be used as MEMC, set the output driver strength to high (PDSCn\_m = 1).

## 16.2 Overview

The external memory access controller provides four chip select areas, and wait time is selectable in each chip select area.

The bus clock runs at half the frequency of the MEMC supply clock.

### 16.2.1 Functional Overview

The main features of the external memory access controller:

- Multiplexed bus mode
- Four chip select areas and 16-bit bus width
- The data endian format can be selected for each chip select area individually.
- Various wait functions can be set individually for each chip select area.
- External wait on SRAM access cycles
- External wait error detection

#### 16.2.1.1 Multiplexed Bus

This is an operation mode that connects address output and data input/output to external memory using the same signal line, making it possible to reduce the number of pins required for external memory connection.

#### 16.2.1.2 Chip Select Output Function

The external bus area of the memory space is divided into four chip select areas, and a chip select signal can be output for each chip select area. The allocation of these chip select areas is fixed by the system and cannot be changed through programming.

In addition, the bus width is 16-bit fixed.

#### 16.2.1.3 Data Endian Setting Function

The data endian (little endian/big endian) can be specified for each chip select area.

#### 16.2.1.4 Programmable Wait Setting Functions

This microcontroller has the following wait functions, which can be set for each chip select area.

- Programmable data wait
- Data hold wait
- Data setup wait
- Address setup wait
- Address hold wait
- Idle cycle

#### 16.2.1.5 External Wait Function

Waits of any width can be inserted externally from the  $\overline{\text{MEMC0WAIT}}$  pin. The  $\overline{\text{MEMC0WAIT}}$  pin is sampled just before the data output cycle, and the data latch timing can be delayed by any amount.

### 16.2.1.6 External Wait Error Detection Function

This microcontroller has a function to forcibly cancel a wait state if an external wait is continuously input for 128 clock cycles, to prevent the system hanging up if an external wait is continuously input due to a defect of the MEMC0WAIT pin.

## 16.3 Registers

### 16.3.1 List of Registers

The MEMC registers are listed in the following table.

For details on <MEMCn\_base>, see **Section 16.1.2, Register Base Address**.

Table 16.17 List of Registers

Module Name	Register Name	Symbol	Address
MEMCn	Data endian configuration register	DEC	<MEMCn_base> + 02 <sub>H</sub>
	Data wait configuration register	DWC	<MEMCn_base> + 08 <sub>H</sub>
	Data hold wait configuration register	DHC	<MEMCn_base> + 0C <sub>H</sub>
	Data setup wait configuration register	DSC	<MEMCn_base> + 0E <sub>H</sub>
	Address wait configuration register	AWC	<MEMCn_base> + 10 <sub>H</sub>
	Idle cycle configuration register	ICC	<MEMCn_base> + 14 <sub>H</sub>
	External wait error configuration register	EWC	<MEMCn_base> + 1A <sub>H</sub>

### 16.3.2 DEC — Data Endian Configuration Register

The DEC register is used to set the endianness for the external bus.

**Access:** This register can be read or written in 16-bit units.

**Address:** <MEMCn\_base> + 02<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	DE3	—	DE2	—	DE1	—	DE0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R/W

Table 16.18 DEC Register Contents

Bit Position	Bit Name	Function
15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DE3	Data Endian Setting These bits set the endian of each chip select area. 0: Little endian 1: Big endian
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	DE2	Data Endian Setting These bits set the endian of each chip select area. 0: Little endian 1: Big endian
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	DE1	Data Endian Setting These bits set the endian of each chip select area. 0: Little endian 1: Big endian
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DE0	Data Endian Setting These bits set the endian of each chip select area. 0: Little endian 1: Big endian

The relationship between each chip select area and the control bits is shown below.

Table 16.19 Relationship between DEx Bit and Chip Select Area

Chip Select Area	DEx Bit
CS3 area	DE3
CS2 area	DE2
CS1 area	DE1
CS0 area	DE0

### 16.3.3 DWC — Data Wait Configuration Register

The DWC register is used to set the number of data wait states for the external bus.

**Access:** This register can be read or written in 16-bit units.

**Address:** <MEMCn\_base> + 08H

**Value after reset:** FFFF<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DW33	DW32	DW31	DW30	DW23	DW22	DW21	DW20	DW13	DW12	DW11	DW10	DW03	DW02	DW01	DW00

1	1	1	0	14 clock cycles																																																																																			
1	1	1	1	15 clock cycles																																																																																			

The relationship between each chip select area and the control bits is shown below.

Table 16.21 Relationship between DWx3 to DWx0 Bits and Chip Select Area

Chip Select Area	DWx3 to DWx0 Bits
CS3 area	DW33, DW32, DW31, DW30
CS2 area	DW23, DW22, DW21, DW20
CS1 area	DW13, DW12, DW11, DW10
CS0 area	DW03, DW02, DW01, DW00

### 16.3.4 DHC — Data Hold Wait Configuration Register

The DHC register is used to set the number of data hold waits for the external bus.

By setting this register, a data hold wait of “DHC register setting + one cycle” is inserted in a write cycle.

**Access:** This register can be read or written in 16-bit units.

**Address:** <MEMCn\_base> + 0C<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DH31	DH30	DH21	DH20	DH11	DH10	DH01	DH00

CS1 area	DH11, DH10
CS0 area	DH01, DH00

### 16.3.5 DSC — Data Setup Wait Configuration Register

The DSC register is used to set the number of data setup wait states for the external bus.

This wait is inserted in a write cycle.

**Access:** This register can be read or written in 16-bit units.

**Address:** <MEMCn\_base> + 0EH

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CS0 area	DS01, DS00

### 16.3.6 AWC — Address Wait Configuration Register

The AWC register is used to set the address wait period of the external bus for each chip select area.

**Access:** This register can be read or written in 16-bit units.

**Address:** <MEMCn\_base> + 10<sub>H</sub>

**Value after reset:** FFFF<sub>H</sub>

CS0 area	ASW01, ASW00, AHW01, AHW00

### 16.3.7 ICC — Idle Cycle Configuration Register

The ICC register is used to set the number of idle cycles of the external bus. The number of idle cycles can be set for each chip select area.

**Access:** This register can be read or written in 16-bit units.

**Address:** <MEMCn\_base> + 14<sub>H</sub>

**Value after reset:** 3333<sub>H</sub>

#### CAUTION

The Idle cycles set by the ICC register is invalid during bus sizing cycle. However, even in bus sizing cycle, idle cycles are valid during read cycle.

In this case, the number of idle cycles to be inserted depends on the ICC register setting. At least 1 clock cycle is inserted even when “no idle cycle” is selected.

CS0 area	RIC01, RIC00, WIC01, WIC00

### 16.3.8 EWC — External Wait Error Configuration Register

The EWC register is used to enable and disable the external wait error function.

**Access:** This register can be read or written in 16-bit units.

**Address:** <MEMCn\_base> + 1A<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	EW3	—	EW2	—	EW1	—	EW0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R/W

Table 16.30 EWC Register Contents

Bit Position	Bit Name	Function
15 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6	EW3	External wait error setting These bits are used to enable and disable the external wait error in each chip select area. 0: External wait error disabled 1: External wait error enabled When this function is enabled, a wait state is forcibly released and SYSERR exception is occurred if an external wait request is detected continuously for 128 clock cycles.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	EW2	External wait error setting These bits are used to enable and disable the external wait error in each chip select area. 0: External wait error disabled 1: External wait error enabled When this function is enabled, a wait state is forcibly released and SYSERR exception is occurred if an external wait request is detected continuously for 128 clock cycles.
3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2	EW1	External wait error setting These bits are used to enable and disable the external wait error in each chip select area. 0: External wait error disabled 1: External wait error enabled When this function is enabled, a wait state is forcibly released and SYSERR exception is occurred if an external wait request is detected continuously for 128 clock cycles.
1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	EW0	External wait error setting These bits are used to enable and disable the external wait error in each chip select area. 0: External wait error disabled 1: External wait error enabled When this function is enabled, a wait state is forcibly released and SYSERR exception is occurred if an external wait request is detected continuously for 128 clock cycles.

The relationship between each chip select area and the control bits is shown below.

Table 16.31 Relationship between EWx Bits and Chip Select Area

Chip Select Area	EWx
CS3 area	EW3
CS2 area	EW2
CS1 area	EW1
CS0 area	EW0

## 16.4 Functions

### 16.4.1 Bus Control Functions

#### 16.4.1.1 Chip Select Output Function

The connected external memory area is divided into and managed in 4 chip select areas, as shown in **Figure 16.1, External Memory Map (RH850/F1KH-D8)**, **Figure 16.2, External Memory Map (RH850/F1KM-S4)**.

When a bus cycle is generated for the external bus, this microcontroller makes the  $\overline{\text{MEMC0CS}}[3:0]$  output pin corresponding to the access target address active (low level), along with outputting the access target address from the  $\text{MEMC0A}[23:16]$  and  $\text{MEMC0AD}[15:0]$ .

The various settings for the external bus, such as the number of wait/idle states, can all be made for each chip select area.

By using these functions, different types of memory can be connected to each chip select area.

The allocation of the chip select areas is fixed by the system and cannot be changed through programming.

The memory map is shown below.

Figure 16.1 External Memory Map (RH850/F1KH-D8)

Figure 16.2 External Memory Map (RH850/F1KM-S4)

### 16.4.1.2 Bus Sizing Function

Access requests from the CPU (or DMA) are executed after being divided in accordance with the bit width of the external bus of the access destination.

Figure 16.3 Bus Cycles when Making a 32-Bit Write Access to the External Bus

### 16.4.1.3 Data Endian Setting Function

Either little endian or big endian can be selected as the data endian of the external bus interface. This setting can be made for each chip select area with the DEC register.

#### CAUTIONS

1. In this microcontroller, instruction fetch operations in big endian are not supported. The assembler and debugger were designed for little endian operations.
2. Misaligned access in big endian format is not supported.

## 16.4.2 Wait Functions

Wait functions are listed below.

Table 16.32 Wait Functions

Wait Function	Data Wait		Data Hold Wait	Data Setup Wait	Address Wait	Idle State
	Programmable	External Pin				
Read access	✓	✓	—	—	✓	✓
Write access	✓	✓	✓	✓	✓	✓
Setting register	DWC	—	DHC	DSC	AWC	ICC
Max. number of waits	15	—	3	3	3	3

### 16.4.2.1 Programmable Data Wait Function

This wait function is used to delay the data latch timing by extending the read strobe and write strobe periods.

This function is enabled during data transfer. Up to 15 cycles can be inserted.

Data waits can be set for each chip select area using the DWC register.

Figure 16.4 Bus Cycles when Inserting Programmable Data Waits

### 16.4.2.2 External Wait Function

Data waits of any length can be inserted from the  $\overline{\text{MEMC0WAIT}}$  pin.

The  $\overline{\text{MEMC0WAIT}}$  pin input level is sampled immediately after completion of the TA cycle and the TDPW, TDEW cycles.

Data wait cycles obtained by ORing the programmable data wait set by the data wait control register (DWC register) and the external wait set by the  $\overline{\text{MEMC0WAIT}}$  pin input, are inserted.

Figure 16.5 Internal Data Wait Generator

Figure 16.6 Bus Cycles when Inserting Programmable Data Waits and External Waits (while DWC = 1)

### 16.4.2.3 External Wait Error Detection Function

By setting the EWx bit in the external wait error configuration register (EWC register) to 1, a wait state is forcibly canceled and SYSERR exception is generated if an external wait request is input continuously for 128 clock cycles.

This function prevents the system hanging up due to an unexpected failure of the MEMC0WAIT input pin.

Figure 16.7 Operation Timing during External Wait Error Detection

### 16.4.2.4 Data Setup Wait Function

This function inserts waits before a transfer state to secure setup time for data write strobe, and is only valid during a write cycle.

Waits of up to 3 cycles per chip select area can be inserted by setting the DSC register.

Figure 16.8 Bus Cycles when Inserting Data Setup Waits

### 16.4.2.5 Data Hold Wait Function

This function inserts a wait in the state following the rising edge of the write strobe signal in order to secure the hold time for the data write strobe.

This microcontroller always inserts 1 data hold wait state upon occurrence of a write cycle. This data hold wait can be extended by up to 3 cycles by setting the DHC register, allowing insertion of 4 cycles.

The number of cycles to extend the data hold wait can be set for each chip select area with the DHC register.

Figure 16.9 Bus Cycles when Inserting Data Hold Waits

### 16.4.2.6 Address Setup Wait Function

The address setup wait function inserts a wait before the address transfer state in order to secure the setup time for the address strobe.

Up to 3 wait cycles can be inserted for each chip select area by setting the AWC register.

Figure 16.10 Bus Cycles when Inserting Address Setup Waits

### 16.4.2.7 Address Hold Wait Function

The address hold wait function inserts waits after the address transfer state to secure hold time for address strobe.

Up to 3 wait cycles can be inserted for each chip select area by setting the AWC register.

Figure 16.11 Bus Cycles when Inserting Address Hold Waits

### 16.4.2.8 Idle Insertion Function

This function inserts an idle state after the last state of each cycle in order to prevent bus conflicts between cycles.

This function can be set independently after a read cycle/write cycle for each chip select area by setting the ICC register.

Figure 16.12 Bus Cycles when Inserting Idle States

### 16.4.3 Memory Connection Example

#### 16.4.3.1 SRAM Connection Example

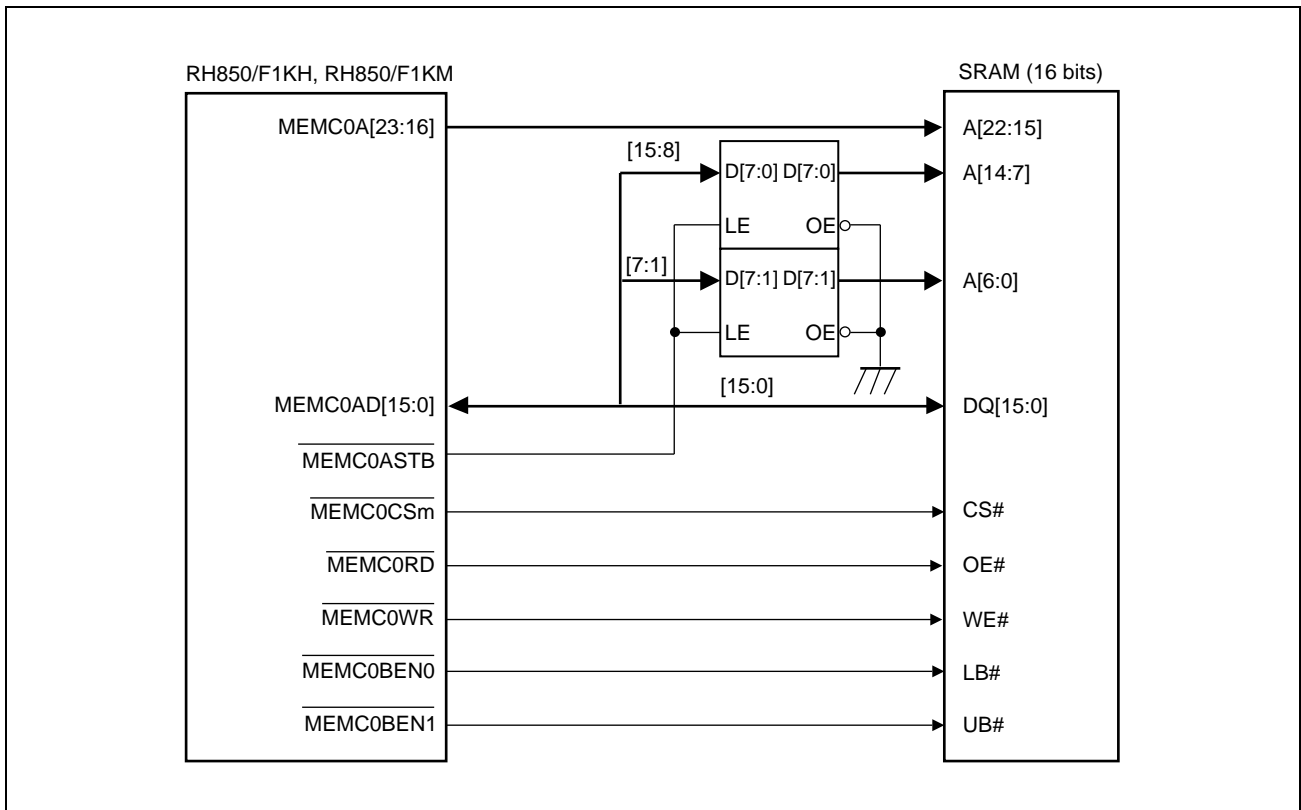

Figure 16.13 SRAM (16 Bits) Connection Example

### 16.4.4 Data Access Flow

The data transfer flow to the external memory differs according to the data width, specified endian, external bus width, and start address.

For misaligned access, the CPU performs the division and coupling of data. Whether the access is misaligned or not depends on the data width and start address.

#### Misaligned

As the accesses listed below are misaligned, the CPU divides the cycles.

- When half-word (16-bit) data is read from/written to an odd address
- When word (32-bit) data is read from/written to an address that is not a multiple of 4

Table 16.33 Misaligned Access Conditions

Access Conditions		Cycles Divided by the CPU		
Data Width	Address	1st	2nd	3rd
16 bits	$2n + 1$	8-bit access to $2n + 1$	8-bit access to $2n + 2$	—
32 bits	$4n + 1$	8-bit access to $4n + 1$	16-bit access to $4n + 2$	8-bit access to $4n + 4$
32 bits	$4n + 2$	16-bit access to $4n + 2$	16-bit access to $4n + 4$	—
32 bits	$4n + 3$	8-bit access to $4n + 3$	16-bit access to $4n + 4$	8-bit access to $4n + 6$

The data flows for each condition are shown on the following pages.

**16.4.4.1 Data Flow for Byte Access (for Reading and Writing)**

Table 16.34 Data Flow for Byte Access (Little Endian)

Address to be Accessed	Data Transfer Flow
4n	<p>Diagram for address 4n: The address bus (D) is 0-15. The data bus (D) is 0-8. The internal bus (I) and memory controller data buffer (M) are 0-31. Arrows show data flow from D to M, and then from M to I.</p>
4n + 1	<p>Diagram for address 4n+1: The address bus (D) is 0-15. The data bus (D) is 0-8. The internal bus (I) and memory controller data buffer (M) are 0-31. Arrows show data flow from D to M, and then from M to I.</p>

## 16.5 Notes on Use of MEMC

Stop MEMC before transitioning to standby mode.

## Section 17 Serial Flash Memory Interface A (SFMA)

This section contains a generic description of the Serial Flash Memory Interface A (SFMA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of SFMA.

### 17.1 Features of RH850/F1KH, RH850/F1KM SFMA

#### 17.1.1 Number of Units

This microcontroller has the following number of SFMA units.

Table 17.1 Number of Units (RH850/F1KH-D8)

	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	SFMA <sub>n</sub> (n = 0)	SFMA <sub>n</sub> (n = 0)	SFMA <sub>n</sub> (n = 0)

Table 17.2 Number of Units (RH850/F1KM-S4)

	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	—	1	1	1	1
Name	—	SFMA <sub>n</sub> (n = 0)	SFMA <sub>n</sub> (n = 0)	SFMA <sub>n</sub> (n = 0)	SFMA <sub>n</sub> (n = 0)

Table 17.3 Number of Units (RH850/F1KM-S2)

	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	—	1	1
Name	—	SFMA <sub>n</sub> (n = 0)	SFMA <sub>n</sub> (n = 0)

Table 17.4 Number of Units (RH850/F1KM-S1)

	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	—	—
Name	—	—	—	—

Table 17.5 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual SFMA units are identified by the index "n"; for example, SFMA <sub>n</sub> CMNCR (n = 0) is the SFMA <sub>n</sub> common control register.

Table 17.6 Index (RH850/F1KM-S4, RH850/F1KM-S2)

Index	Description
n	Throughout this section, the individual SFMA units are identified by the index "n"; for example, SFMA <sub>n</sub> CMNCR (n = 0) is the SFMA <sub>n</sub> common control register.

### 17.1.2 Register Base Address

SFMA<sub>n</sub> base address is listed in the following table.

SFMA<sub>n</sub> register addresses are given as an offset from the base address in general.

Table 17.7 Register Base Address (RH850/F1KH-D8)

Base Address Name	Base Address
<SFMA0_base>	1004 0000 <sub>H</sub>

Table 17.8 Register Base Address (RH850/F1KM-S4, RH850/F1KM-S2)

Base Address Name	Base Address
<SFMA0_base>	1004 0000 <sub>H</sub>

### 17.1.3 Clock Supply

The SFMA<sub>n</sub> clock supply is shown in the following table.

Table 17.9 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name	Description
SFMA <sub>n</sub>	B $\phi$	CKSCLK_IPERI1	SFMA clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	SFMA clock

Table 17.10 Clock Supply (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Name	Unit Clock Name	Supply Clock Name	Description
SFMA <sub>n</sub>	B $\phi$	CKSCLK_IPERI1	SFMA clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	SFMA clock

### 17.1.4 Reset Sources

SFMA<sub>n</sub> reset sources are listed in the following table. SFMA<sub>n</sub> is initialized by these reset sources.

Table 17.11 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
SFMA <sub>n</sub>	All reset sources (ISORES)

Table 17.12 Reset Sources (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Name	Reset Source
SFMA <sub>n</sub>	All reset sources (ISORES)

### 17.1.5 External Input/Output Signals

External input/output signals of SFMA are listed below.

Table 17.13 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
SFMA0		
SPBCLK	Clock output	SFMA0CLK
SPBSSL	Slave select signal output	SFMA0SSL
SPBMO/SPBIO0	Master transmit data/data 0	SFMA0IO0
SPBMI/SPBIO1	Master input data/data 1	SFMA0IO1
SPBIO2	Data 2	SFMA0IO2
SPBIO3	Data 3	SFMA0IO3

Table 17.14 External Input/Output Signals (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Signal Name	Description	Alternative Port Pin Signal
SFMA0		
SPBCLK	Clock output	SFMA0CLK
SPBSSL	Slave select signal output	SFMA0SSL
SPBMO/SPBIO0	Master transmit data/data 0	SFMA0IO0
SPBMI/SPBIO1	Master input data/data 1	SFMA0IO1
SPBIO2	Data 2	SFMA0IO2
SPBIO3	Data 3	SFMA0IO3

## 17.2 Overview

### 17.2.1 Functional Overview

The Serial Flash Memory Interface outputs control signals to the serial flash memory connected to the SPI multi I/O bus space, thus enabling direct connection of the serial flash memory.

This module allows the connected serial flash memory to be accessed by directly reading the SPI multi I/O bus space, or using SPI operating mode to transmit and receive data.

- Serial Flash Memory Interface

One serial flash memory device can be connected.

A data bus size of 1 bit, 2 bits, or 4 bits can be selected.

- External Address Space Read Mode

A maximum of 4-Gbyte address space is supported

The SPBSSL pin can be automatically controlled through access address monitoring

Efficient data reception due to built-in read cache (64-bit line × 16 entries)

- SPI Operating Mode

Desired read/write access to serial flash memory possible

- Bit rate

SPBCLK is generated by frequency division of Bφ by internal baud rate generator

SPBCLK frequency division ratio can be set from 2 to 4080

- SPBSSL Pin Control

Delay from SPBSSL signal assertion to SPBCLK operation (clock delay) can be set

Range: 1 to 8 SPBCLK cycles (set in SPBCLK-cycle units)

Delay from SPBCLK stop to SPBSSL output negation (SPBSSL negation delay) can be set

Range: 1.5 to 8.5 SPBCLK cycles (set in SPBCLK-cycle units)

SPBSSL output assertion wait before next access (next access delay) can be set

Range: 1 to 8 SPBCLK cycles (set in SPBCLK-cycle units)

SPBSSL polarity can be changed

### 17.2.2 Block Diagram

Figure 17.1 SFMA Block Diagram

## 17.3 Registers

### 17.3.1 List of Registers

SFMA registers are listed in the following table.

For details about <SFMA<sub>n</sub>\_base>, see **Section 17.1.2, Register Base Address**.

Table 17.15 List of Registers

Module Name	Register Name	Symbol	Address
SFMA <sub>n</sub>	SFMA <sub>n</sub> common control register	SFMA <sub>n</sub> CMNCR	<SFMA <sub>n</sub> _base> + 00 <sub>H</sub>
	SFMA <sub>n</sub> SSL delay register	SFMA <sub>n</sub> SSLDR	<SFMA <sub>n</sub> _base> + 04 <sub>H</sub>
	SFMA <sub>n</sub> bit rate register	SFMA <sub>n</sub> SPBCR	<SFMA <sub>n</sub> _base> + 08 <sub>H</sub>
	SFMA <sub>n</sub> data read control register	SFMA <sub>n</sub> DRCR	<SFMA <sub>n</sub> _base> + 0C <sub>H</sub>
	SFMA <sub>n</sub> data read command setting register	SFMA <sub>n</sub> DRCMR	<SFMA <sub>n</sub> _base> + 10 <sub>H</sub>
	SFMA <sub>n</sub> data read extended address setting register	SFMA <sub>n</sub> DREAR	<SFMA <sub>n</sub> _base> + 14 <sub>H</sub>
	SFMA <sub>n</sub> data read option setting register	SFMA <sub>n</sub> DROPR	<SFMA <sub>n</sub> _base> + 18 <sub>H</sub>
	SFMA <sub>n</sub> data read enable setting register	SFMA <sub>n</sub> DRENR	<SFMA <sub>n</sub> _base> + 1C <sub>H</sub>
	SFMA <sub>n</sub> SPI mode control register	SFMA <sub>n</sub> SMCR	<SFMA <sub>n</sub> _base> + 20 <sub>H</sub>
	SFMA <sub>n</sub> SPI mode command setting register	SFMA <sub>n</sub> SMCMR	<SFMA <sub>n</sub> _base> + 24 <sub>H</sub>
	SFMA <sub>n</sub> SPI mode address setting register	SFMA <sub>n</sub> SMADR	<SFMA <sub>n</sub> _base> + 28 <sub>H</sub>
	SFMA <sub>n</sub> SPI mode option setting register	SFMA <sub>n</sub> SMOPR	<SFMA <sub>n</sub> _base> + 2C <sub>H</sub>
	SFMA <sub>n</sub> SPI mode enable setting register	SFMA <sub>n</sub> SMENR	<SFMA <sub>n</sub> _base> + 30 <sub>H</sub>
	SFMA <sub>n</sub> SPI mode read data register	SFMA <sub>n</sub> SMRDR	<SFMA <sub>n</sub> _base> + 38 <sub>H</sub>
	SFMA <sub>n</sub> SPI mode write data register	SFMA <sub>n</sub> SMWDR	<SFMA <sub>n</sub> _base> + 40 <sub>H</sub>
	SFMA <sub>n</sub> common status register	SFMA <sub>n</sub> CMNSR	<SFMA <sub>n</sub> _base> + 48 <sub>H</sub>
	SFMA <sub>n</sub> data read dummy cycle setting register	SFMA <sub>n</sub> DRDMCR	<SFMA <sub>n</sub> _base> + 58 <sub>H</sub>
	SFMA <sub>n</sub> SPI mode dummy cycle setting register	SFMA <sub>n</sub> SMDMCR	<SFMA <sub>n</sub> _base> + 60 <sub>H</sub>

### 17.3.2 SFMA<sub>n</sub>CMNCR — SFMA<sub>n</sub> Common Control Register

SFMA<sub>n</sub>CMNCR is a 32-bit register that controls the SPI multi I/O bus controller. The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 00<sub>H</sub>

**Value after reset:** 01AA 4000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.16 SFMA<sub>n</sub>CMNCR Register Contents

Bit Position	Bit Name	Function
31	MD	Operating Mode Switch Switches the operating modes. 0: External address space read mode 1: SPI operating mode
30 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23, 22	MOIO3[1:0]	SPBSSL Output Idle Value Fix SPBIO3 Fixes the output value of SPBIO3 in SPBSSL negation period. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z
21, 20	MOIO2[1:0]	SPBSSL Output Idle Value Fix SPBIO2 Fixes the output value of SPBIO2 in SPBSSL negation period. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z
19, 18	MOIO1[1:0]	SPBSSL Output Idle Value Fix SPBIO1 Fixes the output value of SPBIO1 in SPBSSL negation period. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z

Table 17.16 SFMA<sub>n</sub>CMNCR Register Contents

Bit Position	Bit Name	Function															
17, 16	MOIO0[1:0]	SPBSSL Output Idle Value Fix SPBIO0 Fixes the output value of SPBIO0 in SPBSSL negation period. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z															
15, 14	IO3FV[1:0]	SPBIO3 Fixed Value for 1-bit/2-bit Size Fixes the output value of SPBIO3 pin for 1-bit/2-bit size. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z															
13, 12	IO2FV[1:0]	SPBIO2 Fixed Value for 1-bit/2-bit Size Fixes the output value of SPBIO2 pin for 1-bit/2-bit size. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z															
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															
9, 8	IO0FV[1:0]	SPBIO0 Fixed Value for 1-bit Size Input Fixes the output value of SPBIO0 pin for 1-bit size input. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z															
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															
6	CPHAT	Output Shift Sets the SPBCLK edge of the output data. CPHAT and CPHAR should be set according to the table in the description of CPHAR. 0: Data transmission at even edge 1: Data transmission at odd edge															
5	CPHAR	Input Latch Sets the SPBCLK edge of the reception data. CPHAT and CPHAR should be set according to the following table. 0: Data reception at odd edge 1: Data reception at even edge															
<table border="1"> <thead> <tr> <th>CPHAT</th> <th>CPHAR</th> <th></th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Setting enabled</td> </tr> <tr> <td>0</td> <td>1</td> <td>Setting enabled</td> </tr> <tr> <td>1</td> <td>0</td> <td>Setting prohibited</td> </tr> <tr> <td>1</td> <td>1</td> <td>Setting enabled</td> </tr> </tbody> </table>			CPHAT	CPHAR		0	0	Setting enabled	0	1	Setting enabled	1	0	Setting prohibited	1	1	Setting enabled
CPHAT	CPHAR																
0	0	Setting enabled															
0	1	Setting enabled															
1	0	Setting prohibited															
1	1	Setting enabled															
4	SSLP	SPBSSL Signal Polarity Sets the polarity of SPBSSL signal. 0: Active low SPBSSL signal 1: Active high SPBSSL signal															
3	CPOL	SPBSSL Negation Period SPBCLK Output Direction Sets the SPBCLK output direction during SPBSSL negation period. 0: SPBCLK output is 0 during SPBSSL negation period. 1: SPBCLK output is 1 during SPBSSL negation period.															
2 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															

### 17.3.3 SFMA<sub>n</sub>SSLDR — SFMA<sub>n</sub> SSL Delay Register

SFMA<sub>n</sub>SSLDR is a 32-bit register that adjusts the timing between the SPBSSL signal and the SPBCLK signal.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 04<sub>H</sub>

**Value after reset:** 0007 0707<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	—	—	—	—	—	—	—	—	SPNDL[2:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	—	SLNDL[2:0]			—	—	—	—	—	SCKDL[2:0]			
Value after reset	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1	
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	

Table 17.17 SFMA<sub>n</sub>SSLDR Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18 to 16	SPNDL[2:0]	Next Access Delay Sets the period from transfer end to next transfer start (next access). 000: 1 SPBCLK cycle 001: 2 SPBCLK cycles 010: 3 SPBCLK cycles 011: 4 SPBCLK cycles 100: 5 SPBCLK cycles 101: 6 SPBCLK cycles 110: 7 SPBCLK cycles 111: 8 SPBCLK cycles
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	SLNDL[2:0]	SPBSSL Negation Delay Sets the period from the time the last SPBCLK edge is sent of a transfer to SPBSSL pin negation (SPBSSL negation delay). 000: 1.5 SPBCLK cycles 001: 2.5 SPBCLK cycles 010: 3.5 SPBCLK cycles 011: 4.5 SPBCLK cycles 100: 5.5 SPBCLK cycles 101: 6.5 SPBCLK cycles 110: 7.5 SPBCLK cycles 111: 8.5 SPBCLK cycles
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.17 SFMA<sub>n</sub>SSLDR Register Contents

Bit Position	Bit Name	Function
2 to 0	SCKDL[2:0]	Clock Delay Sets the period from SPBSSL pin assertion to SPBCLK oscillation (clock delay). 000: 1 SPBCLK cycle 001: 2 SPBCLK cycles 010: 3 SPBCLK cycles 011: 4 SPBCLK cycles 100: 5 SPBCLK cycles 101: 6 SPBCLK cycles 110: 7 SPBCLK cycles 111: 8 SPBCLK cycles

### 17.3.4 SFMA<sub>n</sub>SPBCR — SFMA<sub>n</sub> Bit Rate Register

SFMA<sub>n</sub>SPBCR is a 32-bit register that sets the bit rate.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 08<sub>H</sub>

**Value after reset:** 0000 0003<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.18 SFMA<sub>n</sub>SPBCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	SPBR[7:0]	<p>Bit Rate</p> <p>Sets the bit rate. The bit rate is determined by a combination of these bits with the BRDV[1:0] bits.</p> <p>Setting SPBR[7:0] to 0 is prohibited. SPBR[7:0] needs to be changed to non-zero value before SPI communication starts.</p>
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	BRDV[1:0]	<p>Bit Rate Frequency Division</p> <p>Sets the bit rate. The bit rate is determined by a combination of these bits with the SPBR[7:0] bits. The SPBR value is used to set the base bit rate.</p> <p>The BRDV value is used to select a division ratio of the base bit rate from among no division, 2, 4, and 8.</p> <p>00: Base bit rate            01: Base bit rate divided by 2            10: Base bit rate divided by 4            11: Base bit rate divided by 8</p>

#### Bit Rate

SPBR[7:0] and BRDV[1:0] are used for setting the bit rate.

The following formula is used to calculate the bit rate when SPBR[7:0] ≠ 0.

$$\text{Bit rate} = B\phi / (2 \times n \times 2^N)$$

n: SPBR[7:0] setting (1, ..., 255)

N: BRDV[1:0] setting (0 to 3)

### 17.3.5 SFMA nDRCR — SFMA n Data Read Control Register

SFMA nDRCR is a 32-bit register that sets the operation in external address space read mode.

The bits except the SSLN bit should be changed when the TEND flag in SFMA nCMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA n\_base> + 0C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SSLN	—	—	—	—	R BURST[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W	R	R	R	R	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RCF	RBE	—	—	—	—	—	—	—	SSLE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	R/W	R	R	R	R	R	R	R	R/W

Table 17.19 SFMA nDRCR Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	SSLN	SPBSSL Negation Asserted SPBSSL can be negated by writing 1 to this bit when both the RBE and SSLE bits are 1. This bit is always read as 0. <b>NOTE:</b> To start next access after SPBSSL negation using this bit, read SSLF in SFMA nCMNSR = 0 to confirm that the SPBSSL has been negated.
23 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 16	R BURST[3:0]	Read Data Burst Length Sets the burst length (data unit count) when reading. This bit is enabled when the RBE bit is set to 1. 0000: 1 data unit 0001: 2 continuous data units : 1110: 15 continuous data units 1111: 16 continuous data units One data unit is 64 bits long.
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	RCF	Read cache Flush When 1 is written to this bit, all the entries in the read cache are cleared. This bit is always read as 0. <b>NOTE:</b> After flushing the read cache by writing 1 to the RCF bit, read the SFMA nDRCR before proceeding to read from the external address space.
8	RBE	Read Burst Turns burst ON or OFF when reading. 0: Data is read according to the access size. 1: Read cache is enabled, and as many data units as the burst count specified in R BURST[3:0] bits is read.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.19 SFMA nDRCR Register Contents

Bit Position	Bit Name	Function
0	SSLE	SPBSSL Negation Sets the conditions for SPBSSL negation during read burst. SPBSSL is negated for each access during normal read. 0: SPBSSL is negated after transfer of data set in burst length. 1: SPBSSL is negated when the accessed address is not continuous with the previously transferred address.

### 17.3.6 SFMA<sub>n</sub>DRCMR — SFMA<sub>n</sub> Data Read Command Setting Register

SFMA<sub>n</sub>DRCMR is a 32-bit register that sets the commands issued in external address space read mode.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 10<sub>H</sub>

**Value after reset:** 0003 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	CMD[7:0]	Command Sets the command.
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	OCMD[7:0]	Optional Command Sets the optional command.

### 17.3.7 SFMA<sub>n</sub>DREAR — SFMA<sub>n</sub> Data Read Extended Address Setting Register

SFMA<sub>n</sub>DREAR is a 32-bit register that sets the address when the serial flash address is output in 32-bit mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 14<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	EAV[5:0]						—

Table 17.21 SFMA<sub>n</sub>DREAR Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 17	EAV[5:0]	32-Bit Extended Upper Address Fixed Value Sets the serial flash address [31:26] fixed values to EAV[5:0]. This setting is valid when the ADE[3] bit in SFMA <sub>n</sub> DREN <sub>R</sub> is 1.
16 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 17.3.8 SFMA<sub>n</sub>DROPR — SFMA<sub>n</sub> Data Read Option Setting Register

SFMA<sub>n</sub>DROPR is a 32-bit register that sets the option data in external address space read mode.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 18<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.22 SFMA<sub>n</sub>DROPR Register Contents

Bit Position	Bit Name	Function
31 to 24	OPD3[7:0]	Option Data 3 Sets the option data 3.
23 to 16	OPD2[7:0]	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	Option Data 0 Sets the option data 0.

**Note:** OPD3, OPD2, OPD1, and OPD0 are output in this order.

### 17.3.9 SFMA<sub>n</sub>DREN<sub>R</sub> — SFMA<sub>n</sub> Data Read Enable Setting Register

SFMA<sub>n</sub>DREN<sub>R</sub> is a 32-bit register that sets the bit size of the command, optional command, address, option data, and read data in external address space read mode and enables outputting them other than read data.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 1C<sub>H</sub>

**Value after reset:** 0000 4700<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31, 30	CDB[1:0]	Command Bit Size Sets the command size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
29, 28	OCDB[1:0]	Optional Command Bit Size Sets the optional command size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
27, 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	ADB[1:0]	Address Bit Size Sets the address size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21, 20	OPDB[1:0]	Option Data Bit Size Sets the option data size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.23 SFMA<sub>n</sub>DREN<sub>R</sub> Register Contents

Bit Position	Bit Name	Function
17, 16	DRDB[1:0]	Data Read Bit Size Sets the data read size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15	DME	Dummy Cycle Enable Enables insertion of the dummy cycle before the read data.  <b>NOTE:</b> A setting is prohibited for a transfer starting with a dummy cycle. 0: Dummy cycle insertion disabled 1: Dummy cycle insertion enabled
14	CDE	Command Enable Sets the command to be output. 0: Command output disabled 1: Command output enabled
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	OCDE	Optional Command Enable Sets the optional command to be output. 0: Optional command output disabled 1: Optional command output enabled
11 to 8	ADE[3:0]	Address Enable Sets the address to be output. Be sure to use the following setting; otherwise, the operation is not guaranteed. 0000: Output disabled 0111: Address[23:0] 1111: Address[31:0] Other than above: Setting prohibited
7 to 4	OPDE[3:0]	Option Data Enable Sets the option data to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 1000: OPD3 1100: OPD3, OPD2 1110: OPD3, OPD2, OPD1 1111: OPD3, OPD2, OPD1, OPD0 Other than above: Setting prohibited
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 17.3.10 SFMA<sub>n</sub>SMCR — SFMA<sub>n</sub> SPI Mode Control Register

SFMA<sub>n</sub>SMCR is a 32-bit register that sets the operation in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 20<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SSLKP	—	—	—	—	—	SPIRE	SPIWE	SPIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	W

Table 17.24 SFMA<sub>n</sub>SMCR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	SSLKP	SPBSSL Signal Level Determines the SPBSSL status after the end of transfer. 0: SPBSSL signal is negated at the end of transfer. 1: SPBSSL signal level is maintained from the end of transfer to the start of next access.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	SPIRE	Data Read Enable Enables reading in SPI operating mode. 0: Data reading disabled 1: Data reading enabled  <b>NOTE:</b> When the transfer data bit size is set to 2 bits or 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time.
1	SPIWE	Data Write Enable Enables writing in SPI operating mode. 0: Data writing disabled 1: Data writing enabled  <b>NOTE:</b> When the transfer data bit size is set to 2 bits or 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time.
0	SPIE	SPI Data Transfer Enable Data is transferred by setting this bit to 1. This bit is enabled only when the TEND bit in SFMA <sub>n</sub> CMNSR is set to 1. The operation cannot be guaranteed when this bit is set to 1 with the TEND bit set to 0. This bit is always read as 0.  <b>NOTE:</b> When the SPBSSL pin is de-asserted, the command, optional command, address, and option data that are output enabled are output even if the SPIRE and SPIWE bits are set to 0. When the SPBSSL pin is asserted, follow the notes described in <b>Section 17.5.2, Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode.</b>

### 17.3.11 SFMA<sub>n</sub>SMCMR — SFMA<sub>n</sub> SPI Mode Command Setting Register

SFMA<sub>n</sub>SMCMR is a 32-bit register that sets the commands issued in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 24<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	CMD[7:0]	Command Sets the command.
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	OCMD[7:0]	Optional Command Sets the optional command.

### 17.3.12 SFMA<sub>n</sub>SMADR — SFMA<sub>n</sub> SPI Mode Address Setting Register

SFMA<sub>n</sub>SMADR is a 32-bit register that sets the addresses in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 28<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.26 SFMA<sub>n</sub>SMADR Register Contents

Bit Position	Bit Name	Function
31 to 24	ADR[31:24]	Address Sets the value of bits 31 to 24 when the serial flash address is output in 32-bit units. This setting is valid when ADE[3] in SFMA <sub>n</sub> SMENR is 1.
23 to 0	ADR[23:0]	Address Sets the address.

### 17.3.13 SFMA<sub>n</sub>SMOPR — SFMA<sub>n</sub> SPI Mode Option Setting Register

SFMA<sub>n</sub>SMOPR is a 32-bit register that sets the option data in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 2C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.27 SFMA<sub>n</sub>SMOPR Register Contents

Bit Position	Bit Name	Function
31 to 24	OPD3[7:0]	Option Data 3 Sets the option data 3.
23 to 16	OPD2[7:0]	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	Option Data 0 Sets the option data 0.

**Note:** OPD3, OPD2, OPD1, and OPD0 are output in this order.

### 17.3.14 SFMA<sub>n</sub>SMENR — SFMA<sub>n</sub> SPI Mode Enable Setting Register

SFMA<sub>n</sub>SMENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and transfer data in SPI operating mode and enables their output. SFMA<sub>n</sub>SMENR also enables dummy cycle insertion. Disabling all of the command, optional command, address, option data, dummy cycle, and transfer data is prohibited. At least one of them except dummy cycle must be enabled.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 30<sub>H</sub>

**Value after reset:** 0000 4000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

11 to 8	ADE[3:0]	Address Enable Sets the address to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 0100: ADR[23:16] 0110: ADR[23:8] 0111: ADR[23:0] 1111: ADR[31:0] Other than above: Setting prohibited
7 to 4	OPDE[3:0]	Option Data Enable Sets the option data to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 1000: OPD3 1100: OPD3, OPD2 1110: OPD3, OPD2, OPD1 1111: OPD3, OPD2, OPD1, OPD0 Other than above: Setting prohibited
3 to 0	SPIDE[3:0]	Transfer Data Enable Sets valid transfer data. The following settings must be used. Otherwise, the operation is not guaranteed. 0000: Not transferred 1000: 8 bits transferred (enables data at address 0 of the SPI mode read/write data register) 1100: 16 bits transferred (enables data at addresses 0 and 1 of the SPI mode read/write data register) 1111: 32 bits transferred (enables data at addresses 0 to 3 of the SPI mode read/write data register) Other than above: Setting prohibited

### 17.3.15 SFMA<sub>n</sub>SMRDR — SFMA<sub>n</sub> SPI Mode Read Data Register

SFMA<sub>n</sub>SMRDR is a 32-bit register that stores the read data in SPI operating mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SFMA<sub>n</sub>SMENR). Be sure to access from address 0.

The settings of this register should be read when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** SFMA<sub>n</sub>SMRDR is a read-only register that can be read in 32-bit units.

SFMA<sub>n</sub>SMRDRL, SFMA<sub>n</sub>SMRDRH are read-only registers that can be read in 16-bit units.

SFMA<sub>n</sub>SMRDRL, SFMA<sub>n</sub>SMRDRLH, SFMA<sub>n</sub>SMRDRHL, SFMA<sub>n</sub>SMRDRHH are read-only registers that can be read in 8-bit units.

**Address:** SFMA<sub>n</sub>SMRDR: <SFMA<sub>n</sub>\_base> + 38<sub>H</sub>

SFMA<sub>n</sub>SMRDRL: <SFMA<sub>n</sub>\_base> + 38<sub>H</sub>

SFMA<sub>n</sub>SMRDRL: <SFMA<sub>n</sub>\_base> + 38<sub>H</sub>

SFMA<sub>n</sub>SMRDRLH: <SFMA<sub>n</sub>\_base> + 39<sub>H</sub>

SFMA<sub>n</sub>SMRDRH: <SFMA<sub>n</sub>\_base> + 3A<sub>H</sub>

SFMA<sub>n</sub>SMRDRHL: <SFMA<sub>n</sub>\_base> + 3A<sub>H</sub>

SFMA<sub>n</sub>SMRDRHH: <SFMA<sub>n</sub>\_base> + 3B<sub>H</sub>

**Note:** The contents of this register are modified upon completion of reception in SPI operating mode. Be sure to read data when reception in SPI operating mode is completed.

### 17.3.16 SFMA<sub>n</sub>SMWDR — SFMA<sub>n</sub> SPI Mode Write Data Register

SFMA<sub>n</sub>SMWDR is a 32-bit register that sets the write data in SPI operating mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SFMA<sub>n</sub>SMENR). Be sure to access from address 0.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** SFMA<sub>n</sub>SMWDR can be read or written in 32-bit units.

SFMA<sub>n</sub>SMWDR<sub>L</sub>, SFMA<sub>n</sub>SMWDR<sub>H</sub> can be read or written in 16-bit units.

SFMA<sub>n</sub>SMWDR<sub>LL</sub>, SFMA<sub>n</sub>SMWDR<sub>LH</sub>, SFMA<sub>n</sub>SMWDR<sub>HL</sub>, SFMA<sub>n</sub>SMWDR<sub>HH</sub> can be read or written in 8-bit units.

**Address:** SFMA<sub>n</sub>SMWDR: <SFMA<sub>n</sub>\_base> + 40<sub>H</sub>

### 17.3.17 SFMA<sub>n</sub>CMNSR — SFMA<sub>n</sub> Common Status Register

SFMA<sub>n</sub>CMNSR is a 32-bit register that holds flags indicating the operating state.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 48<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

### 17.3.18 SFMA<sub>n</sub>DRDMCR — SFMA<sub>n</sub> Data Read Dummy Cycle Setting Register

SFMA<sub>n</sub>DRDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in external address space read mode.

The settings of this register are enabled when the DME bit in the data read enable setting register (SFMA<sub>n</sub>DREN<sub>R</sub>) is 1.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 58<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

17, 16	DMDB[1:0]	Dummy Cycle Bit Size Sets the dummy cycle size in bit units. The setting of these bits is combined with the setting of the IO0FV, IO2FV, and IO3FV bits in the common control register (SFMA <sub>n</sub> CMNCR) to determine the state of the unused pins during the dummy cycles. The state of the used pins is Hi-Z. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	DMCYC[2:0]	Number of Dummy Cycles Sets the number of dummy cycles to be inserted when the DME bit in the data read enable setting register (SFMA <sub>n</sub> DREN <sub>R</sub> ) is 1. 000: 1 cycle 001: 2 cycles 010: 3 cycles 011: 4 cycles 100: 5 cycles 101: 6 cycles 110: 7 cycles 111: 8 cycles

### 17.3.19 SFMA<sub>n</sub>SMDMCR — SFMA<sub>n</sub> SPI Mode Dummy Cycle Setting Register

SFMA<sub>n</sub>SMDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in SPI operating mode.

The settings of this register are enabled when the DME bit in the SPI mode enable setting register (SFMA<sub>n</sub>SMENR) is 1.

The settings of this register should be changed when the TEND flag in SFMA<sub>n</sub>CMNSR is 1; otherwise, the operation cannot be guaranteed.

**Access:** This register can be read or written in 32-bit units.

**Address:** <SFMA<sub>n</sub>\_base> + 60<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.33 SFMA<sub>n</sub>SMDMCR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	DMDB[1:0]	Dummy Cycle Bit Size Sets the dummy cycle size in bit units. The setting of these bits is combined with the setting of the IO0FV, IO2FV, and IO3FV bits in the common control register (SFMA <sub>n</sub> CMNCR) to determine the state of the unused pins during the dummy cycles. The state of the used pins is Hi-Z. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	DMCYC[2:0]	Number of Dummy Cycles Sets the number of dummy cycles to be inserted when the DME bit in the SPI mode enable setting register (SFMA <sub>n</sub> SMENR) is 1. 000: 1 cycle 001: 2 cycles 010: 3 cycles 011: 4 cycles 100: 5 cycles 101: 6 cycles 110: 7 cycles 111: 8 cycles

## 17.4 Operation

### 17.4.1 System Configuration

With this module, one serial flash memory can be directly connected (data size of 1, 2, and 4 bits).

The example of system configuration is shown in **Figure 17.2, System Configuration Example with 4-Bit Data Size**.

Figure 17.2 System Configuration Example with 4-Bit Data Size

### 17.4.2 Address Map

In external address space read mode, the serial flash connected is assigned in the SPI multi I/O bus space. In combination with DREAR, a maximum of 4 Gbytes can be accessed.

Table 17.34 Address Map

Internal Address	Max. Access Area
3000 0000 <sub>H</sub> to 33FF FFFF <sub>H</sub>	4 Gbytes

### 17.4.3 32-bit Serial Flash Addresses

Since the SPI multi I/O bus space is 64 Mbytes, only a part of the 32-bit serial flash address area can be directly accessed. Here, the fixed value set in the pertinent register is used as the upper bit value of a 32-bit address.

To output serial flash addresses in 32 bits, set the ADE[3] bit in SFMA<sub>n</sub>DREN<sub>R</sub> to 1, and set the serial flash address [31:26] fixed values to the EAV[5:0] bits in SFMA<sub>n</sub>DREAR.

Figure 17.3 32-Bit Address Setting

## 17.4.4 Operating Modes

This module has two operating modes: external address space read mode and SPI operating mode.

In external address space read mode, a read access to the SPI multi I/O bus space is converted into SPI communication and data is received. After data acquisition, data is returned to the bus master that is the issuing source. For details, see **Section 17.4.5, External Address Space Read Mode.**

In SPI operating mode, arbitrary SPI communication is carried out using register settings. For details, see **Section 17.4.8, SPI Operating Mode.**

## 17.4.5 External Address Space Read Mode

A read access to the SPI multi I/O bus space can be converted into SPI communication in external address space read mode. Further, the commands, optional commands, option data, and dummy cycle issued for reading can be modified using registers.

In external address space read mode, either normal read operation or burst read operation can be selected. The transfer format is determined based on the common control register (SFMA<sub>CMNCR</sub>), SSL delay register (SFMA<sub>SSLDR</sub>), bit rate setting register (SFMA<sub>SPBCR</sub>), data read control register (SFMA<sub>DRCR</sub>), data read command setting register (SFMA<sub>DRCMR</sub>), data read extended address setting register (SFMA<sub>DREAR</sub>), data read option setting register (SFMA<sub>DROPR</sub>), data read enable setting register (SFMA<sub>DRENR</sub>), and data read dummy cycle setting register (SFMA<sub>DRDMCR</sub>).

### 17.4.5.1 Normal Read Operation

When the RBE bit in SFMA<sub>DRCR</sub> is set to 0, normal read operation is performed.

In the normal read operation, the data of 8 bits, 16 bits, and 32 bits are read for respectively a byte, a half-word, and a word read access. After reading, the SPBSSL pin is negated.

The normal read operation timing is shown in **Figure 17.4, Normal Read Operation Timing.**

t1 is the time period from SPBSSL pin assertion to SPBCLK oscillation (clock delay), t2 is the time period from transmission of the last SPBCLK edge of a transfer to SPBSSL pin negation (SPBSSL negation delay), and t3 is the time period from one transfer end to the next transfer start (next access). For details of t1, t2, and t3, see **Section 17.4.9, Transfer Format.**

Figure 17.4 Normal Read Operation Timing

### 17.4.5.2 Burst Read Operation

When the RBE bit in SFMA<sub>n</sub>DRCR is set to 1, burst read operation is performed.

Read cache is enabled in the burst read operation. For read cache operation, see **Section 17.4.7, Read Cache**.

For reading bytes, words, or longwords, the read cache is first referred to for the data. When the read cache contains the data, the data is read from the read cache without accessing the serial flash memory. When the read cache does not contain the data, burst read operation is performed in the serial flash memory and the read data is stored in the read cache. The data transfer length at that time is 64 bits × RBURST[3:0] bits and the data is always read from the 64-bit boundary.

The SPBSSL pin status after data transfer can be selected by using the SSLE bit in SFMA<sub>n</sub>DRCR. When the SSLE bit is set to 0, the SPBSSL pin is negated after data transfer. For an operation performed when the SSLE bit is set to 1, see **Section 17.4.5.3, Burst Read Operation with Automatic SPBSSL Negation**, just below.

A pattern diagram of this operation and a burst read operation timing diagram when SSLE bit is set to 0 are shown in **Figure 17.5, Burst Read Operation** and **Figure 17.6, Burst Read Operation Timing (SSLE Bit = 0)**.

Figure 17.5 Burst Read Operation

Figure 17.6 Burst Read Operation Timing (SSLE Bit = 0)

### 17.4.5.3 Burst Read Operation with Automatic SPBSSL Negation

When SSLE bit in SFMA<sub>n</sub>DRCCR is set to 1, this module does not negate the SPBSSL pin after the burst read transfer. When accessing the next time, if the address is continuous with the previous read address, the burst read operation is performed without issuing the command, optional command, address, option data, or dummy cycle. If the address is not continuous with the previous read address, the SPBSSL pin is once negated and the burst read operation is performed after issuing the command, optional command, address, option data, or dummy cycle.

Burst read timing diagrams for continuous address and non-continuous address are shown in **Figure 17.7, Burst Read Timing for Continuous Address (SSLE Bit = 1)** and **Figure 17.8, Burst Read Timing for Non-Continuous Address (SSLE Bit = 1)**.

Figure 17.7 Burst Read Timing for Continuous Address (SSLE Bit = 1)

Figure 17.8 Burst Read Timing for Non-Continuous Address (SSLE Bit = 1)

For the next access after negation of the SPBSSL with the SSLN bit in SFMA<sub>n</sub>DRCCR with this operation, read SSLF = 0 in SFMA<sub>n</sub>CMNSR to confirm that the SPBSSL has been negated.

### 17.4.6 Initial Setting Flow

An example of an initial setting flow in external address space read mode is shown in **Figure 17.9, Example of Initial Setting Flow in External Address Space Read Mode.**

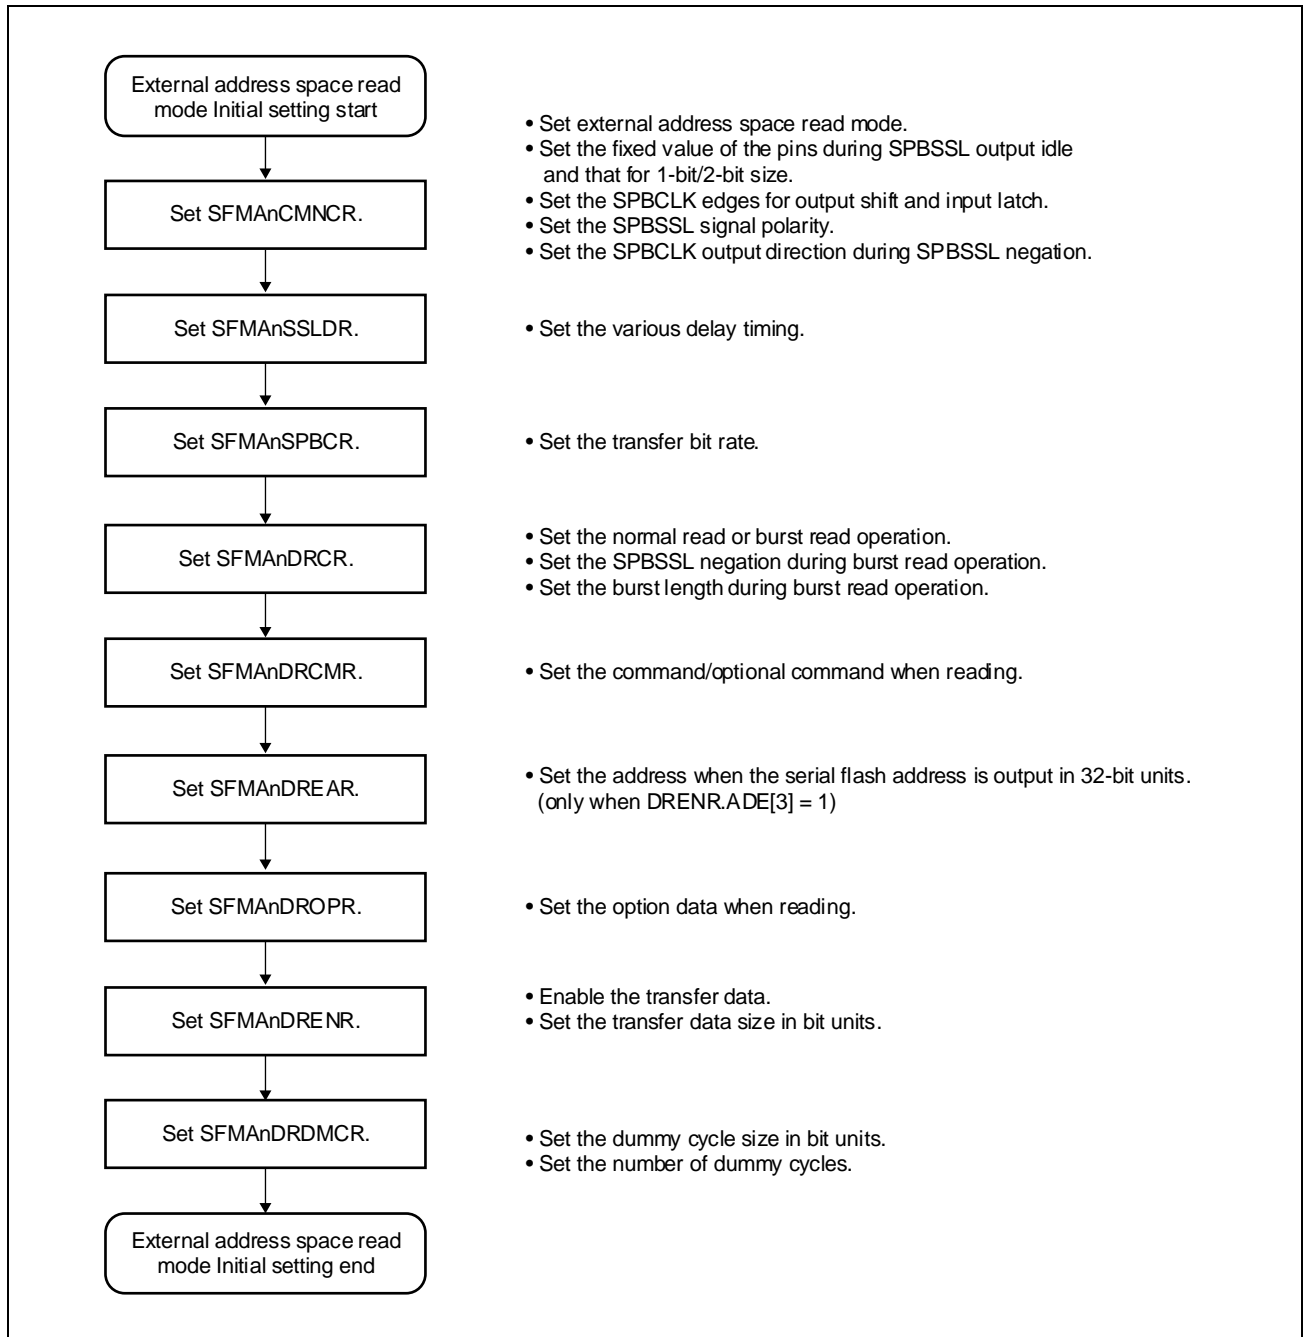

Figure 17.9 Example of Initial Setting Flow in External Address Space Read Mode

### 17.4.7 Read Cache

This module has a simple built-in read cache. The read cache can be used during external address space read mode and burst read operation. The read cache is configured with a line size of 64 bits and 16 entries.

Read cache configuration is shown in **Figure 17.10, Read Cache Configuration.**

Figure 17.10 Read Cache Configuration

#### 17.4.7.1 Address Array

The V bit indicates whether the entry data is valid. When the V bit is 1, the data is valid and when V bit is 0, the data is invalid.

The tag address bits hold the address used for the serial flash memory. Address bits 31 to 3 are used for the tag address.

Address bits 23 to 3 are enabled when address output is 24 bits.

Address bits 31 to 3 are enabled when address output is 32 bits.

#### 17.4.7.2 Data Array

It retains the 64-bit read data. Registration in the read cache is performed in line units.

#### 17.4.7.3 Read Operation

In case of read-hit, data is read from the read cache. In case of read-miss, after the  $64 \times \text{RBURST}$  (read burst length) data is read from the serial flash memory and the read cache is updated, the data is returned to the bus master.

#### 17.4.7.4 Data Replacement

The write pointer is used to update data. In case of read-miss, the RBURST (read burst length) portion data is replaced starting at the entry specified by the write pointer. In other words, the data is replaced in the storage order of the data. Whether data is referred to or not will not affect the replacement order of data.

### 17.4.8 SPI Operating Mode

This module can carry out an arbitrary SPI operation by using the register settings.

The transfer format is determined based on the common control register (SFMA<sub>n</sub>CMNCR), SSL delay register (SFMA<sub>n</sub>SSLDR), bit rate setting register (SFMA<sub>n</sub>SPBCR), SPI mode control register (SFMA<sub>n</sub>SMCR), SPI mode command setting register (SFMA<sub>n</sub>SMCMR), SPI mode address setting register (SFMA<sub>n</sub>SMADR), SPI mode option setting register (SFMA<sub>n</sub>SMOPR), and SPI mode enable setting register (SFMA<sub>n</sub>SMENR), SPI mode read data register (SFMA<sub>n</sub>SMRDR), SPI mode write data register (SFMA<sub>n</sub>SMWDR), and SPI mode dummy cycle setting register (SFMA<sub>n</sub>SMDMCR).

SPI operating mode can be used for reading the status of the serial flash memory and writing to the serial flash memory.

In this mode, one transfer refers to the operation from when the SPIE bit in SFMA<sub>n</sub>SMCR is set to 1 when the TEND bit in SFMA<sub>n</sub>CMNSR is set to 1.

#### 17.4.8.1 Transfer Start

The transfer of data is started in the set transfer format by setting the SPIE bit in SFMA<sub>n</sub>SMCR to 1. When write operation is enabled, the SPI mode write data register is transmitted to the serial flash memory. When read operation is enabled, data read from the serial flash memory is stored into the SPI mode read data register.

The SPI operation timing is shown in **Figure 17.11, SPI Operation Timing**.

Figure 17.11 SPI Operation Timing

#### 17.4.8.2 Read/Write Enable

- Read operation: Data can be read by setting the SPIRE bit in SFMA<sub>n</sub>SMCR to 1. The read data is stored into SFMA<sub>n</sub>SMRDR.
- Write operation: Data can be written by setting the SPIWE bit in SFMA<sub>n</sub>SMCR to 1. The data stored in SFMA<sub>n</sub>SMWDR is output.

When the data size is set to 1 bit using the SPIDB[1:0] bits in SFMA<sub>n</sub>SMENR, data can be transmitted and received by setting the SPIRE and SPIWE bits to 1. However, when the data size is set to 2 or 4 bits by using the SPIDB[1:0] bits, only one of the SPIRE and SPIWE bits should be enabled. The operation is not guaranteed if both the bits are enabled.

### 17.4.8.3 Retention of SPBSSL Pin Assertion

By setting the SSLKP bit in SFMA<sub>n</sub>SMCR to 1, assertion of the SPBSSL pin can be continued till the next transfer. With this function, the transfer can be carried out continuously with the SPBSSL kept in the asserted state.

The data transfer timing using the SSLKP bit is shown in **Figure 17.12, Data Transfer Timing using the SSLKP Bit**.

Figure 17.12 Data Transfer Timing using the SSLKP Bit

### 17.4.8.4 Initial Setting Flow

An example of an initial setting flow in SPI operating mode is shown in **Figure 17.13, Example of Initial Setting Flow in SPI Operating Mode**.

Figure 17.13 Example of Initial Setting Flow in SPI Operating Mode

### 17.4.8.5 Data Transfer Setting Flow

An example of a data transfer setting flow in SPI operating mode is shown in **Figure 17.14, Example of a Data Transfer Setting Flow in SPI Operating Mode.**

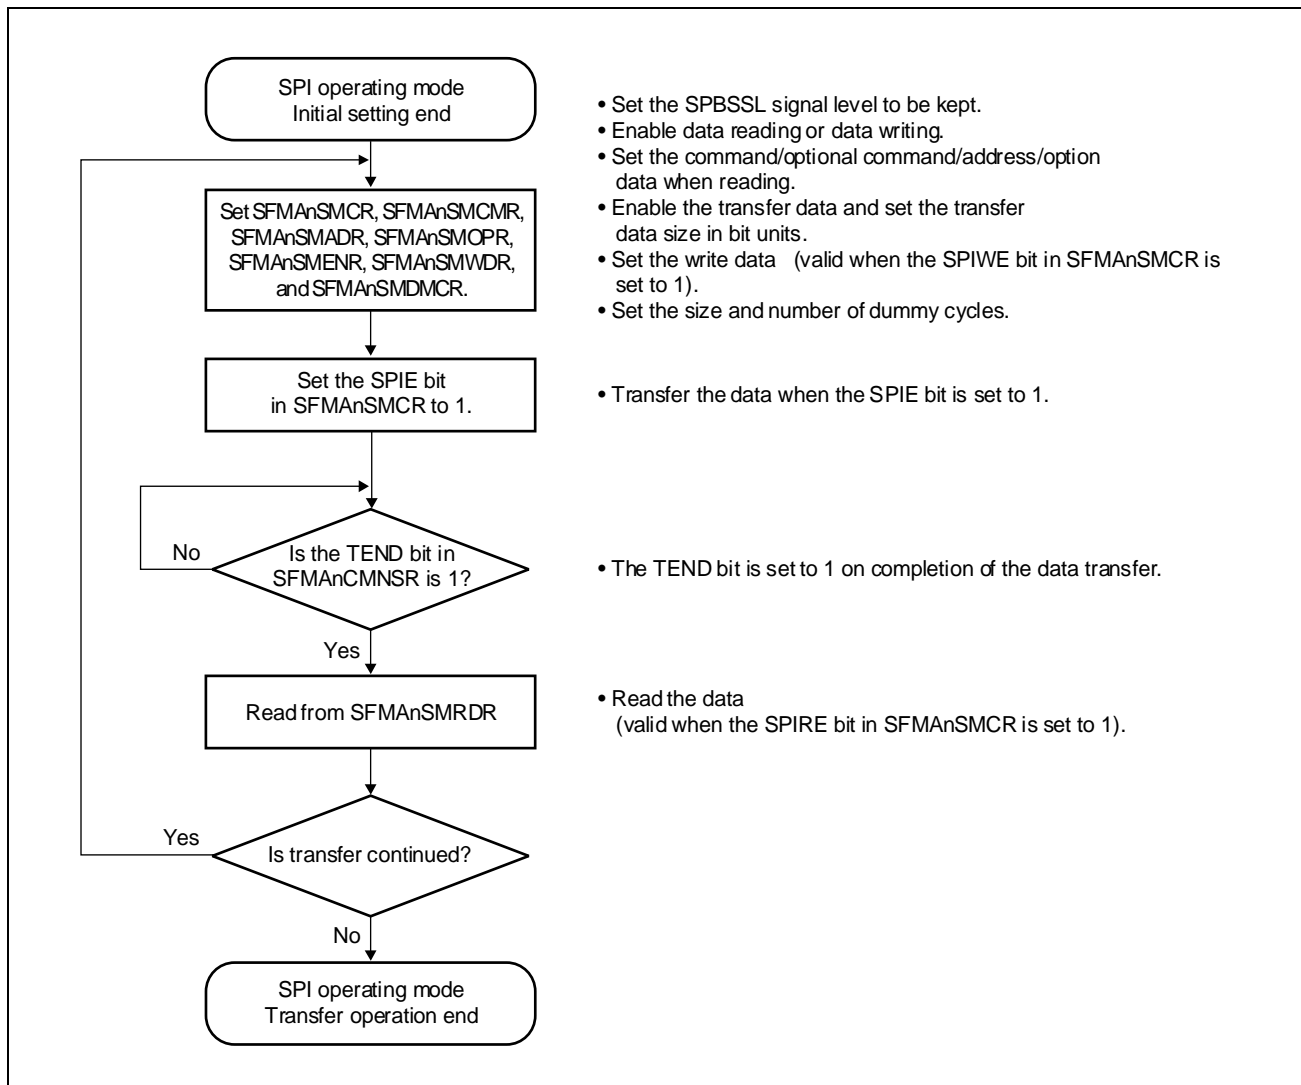

Figure 17.14 Example of a Data Transfer Setting Flow in SPI Operating Mode

## 17.4.9 Transfer Format

### 17.4.9.1 SPBSSL Pin Enable Polarity Control

The enable polarity of the SPBSSL pin can be changed with the SSLP bit in SFMA<sub>n</sub>CMNCR.

### 17.4.9.2 SPBCLK Output

The SPBCLK output direction during SPBSSL negation can be set with the CPOL bit in SFMA<sub>n</sub>CMNCR.

### 17.4.9.3 Data Transmission and Reception Timing

Data is transmitted and received at either the odd or even edges. The data transmission timing can be set to the odd or even edge with the CPHAT bit in SFMA<sub>n</sub>CMNCR. Similarly, the data reception timing can be set to the odd or even edge with the CPHAR bit in SFMA<sub>n</sub>CMNCR.

### 17.4.9.4 Delay Settings

$t_1$  is the time period from SPBSSL pin assertion to SPBCLK oscillation (clock delay). It can be set with the SCKDL[2:0] bits in SFMA<sub>n</sub>SSLDR.  $t_2$  is the time period till the SPBSSL signal negation after the SPBCLK oscillation is stopped (SPBSSL negation delay). It can be set with the SLNDL[2:0] bits in SFMA<sub>n</sub>SSLDR.  $t_3$  is the time period required to prevent SPBSSL signal assertion for the next transfer after the end of the previous transfer (next access delay). It can be set with the SPNDL[2:0] bits in SFMA<sub>n</sub>SSLDR.

Figure 17.15 Transfer Format

## 17.4.10 Data Format

This module can input and output data in the order of command, optional command, address, option data, dummy cycle and data.

### 17.4.10.1 Data Registers

**Table 17.35, Data Registers** shows the input and output data.

Table 17.35 Data Registers

Data	External Address Space Read Operation	SPI Operation
Command (8 bits)	CMD[7:0] bits in SFMAAnDRCMR	CMD[7:0] bits in SFMAAnSMCMR
Optional command (8 bits)	OCMD[7:0] bits in SFMAAnDRCMR	OCMD[7:0] bits in SFMAAnSMCMR
Address (32/24 bits)	32 bits: SFMAAnDREAR.EAV[5:0] + lower [25:0] bits of the read address. 24 bits: Lower [23:0] bits of the read address	32 bits: ADR[31:0] bits in SFMAAnSMADR 24 bits: ADR[23:0] bits in SFMAAnSMADR
Option data (8 bits × 4)	SFMAAnDROPR	SFMAAnSMOPR
Dummy cycle (1 to 8 cycles)	SFMAAnDRDMCR	SFMAAnSMDMCR (only when read)
Transfer data	Normal read: 8, 16, and 32 bits Burst read: 64 × RBURST bits	Read: SFMAAnSMRDR Write: SFMAAnSMWDR

### 17.4.10.2 Data Enable

In external address space read mode, transfer enable or disable of the command, optional command, address, option data, and dummy cycle can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in SFMAAnDRENr, respectively. The size and number of dummy cycles can be controlled with the data read dummy cycle setting register (SFMAAnDRDMCR).

Similarly, in SPI operating mode, enable or disable of the command, optional command, address, option data, dummy cycle, and transfer data can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], DME, and SPIDE[3:0] bits in SFMAAnSMENr, respectively. However, disabling all the above parameters is prohibited in SPI operating mode. At least one of them except dummy cycle must be enabled. The size and number of dummy cycles can be controlled with the SPI mode dummy cycle setting register (SFMAAnSMDMCR).

For the address and option data in external address space read mode; and the address, option data, and transfer data in SPI operating mode, the enable bit setting allowed is determined according to the transfer data size. For the allowed setting combinations of the enable bits and transfer data size, refer to the description of the pertinent registers.

If data is disabled, that data is skipped, and input and output of the next data is carried out. The command, optional command, address, and option data are always output. During dummy cycles, the state of the used pins is Hi-Z. In external address space read mode, data is always input; and in SPI operating mode, input and output of data is determined based on the settings of the SPIRE and SPIWE bits in SFMAAnSMCR.

There are some restrictions on dummy cycle insertion; refer to the description of the DME bits in SFMAAnDRENr and SFMAAnSMENr for details.

	Command	Optional command	Address				Option data				Dummy cycle	Transfer data
<b>Data</b>												
In external address space read mode	CMD	OCMD	EAV[5:0] + read address				OPD3	OPD2	OPD1	OPD0	DMCYC	Data read length
In SPI operating mode	CMD	OCMD	ADR [31:24]	ADR [23:16]	ADR [15:8]	ADR [7:0]	OPD3	OPD2	OPD1	OPD0	DMCYC	DATA[3]:DATA[2]:DATA[1]:DATA[0]
<b>Enable</b>												
In external address space read mode	CDE	OCDE	ADE[3]	ADE[2]	ADE[1]	ADE[0]	OPDE[3]	OPDE[2]	OPDE[1]	OPDE[0]	DME	Always enabled
In SPI operating mode	CDE	OCDE	ADE[3]	ADE[2]	ADE[1]	ADE[0]	OPDE[3]	OPDE[2]	OPDE[1]	OPDE[0]	DME	SPIDE [3] : SPIDE [2] : SPIDE [1] : SPIDE [0]

Figure 17.16 Data and Enable

### 17.4.10.3 Bit Size

In external address space read mode, the size of the command, optional command, address, option data, and the read data in bit units is respectively controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and DRDB[1:0] bits in SFMA<sub>n</sub>DREN<sub>R</sub>. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in SFMA<sub>n</sub>DRDM<sub>C</sub>R.

Similarly, in SPI operating mode, the size of the command, optional command, address, option data, and read write data in bit units is controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and SPIDB[1:0] bits in SFMA<sub>n</sub>SMEN<sub>R</sub>. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in SFMA<sub>n</sub>SMDM<sub>C</sub>R.

#### (1) 1-bit Size

When the size is set to 1 bit, SPB<sub>MI</sub> pin will be the input pin and SPB<sub>MO</sub> pin will be the output pin. SPB<sub>IO2</sub> and SPB<sub>IO3</sub> pins are not used.

Figure 17.17, Transfer Format Example with 1-Bit Data Size shows the transfer format example.

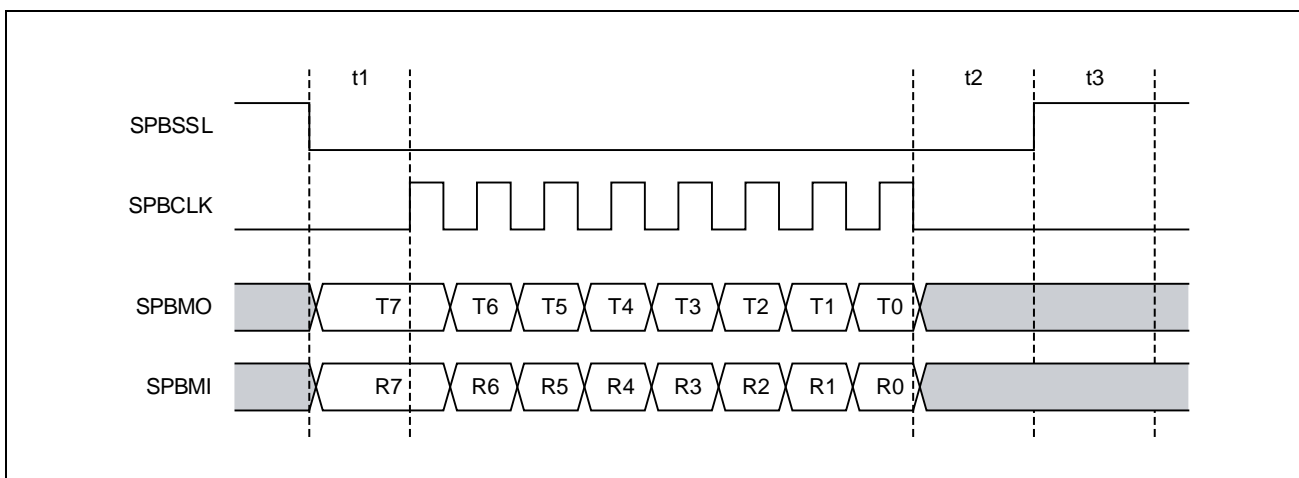

Figure 17.17 Transfer Format Example with 1-Bit Data Size

**(2) 2-bit Size**

When the size is set to 2 bits, SPBIO0 and SPBIO1 pins will be either the input pins or the output pins. SPBIO2 and SPBIO3 pins are not used.

**Figure 17.18, Transfer Format Example with 2-Bit Data Size** shows the transfer format example.

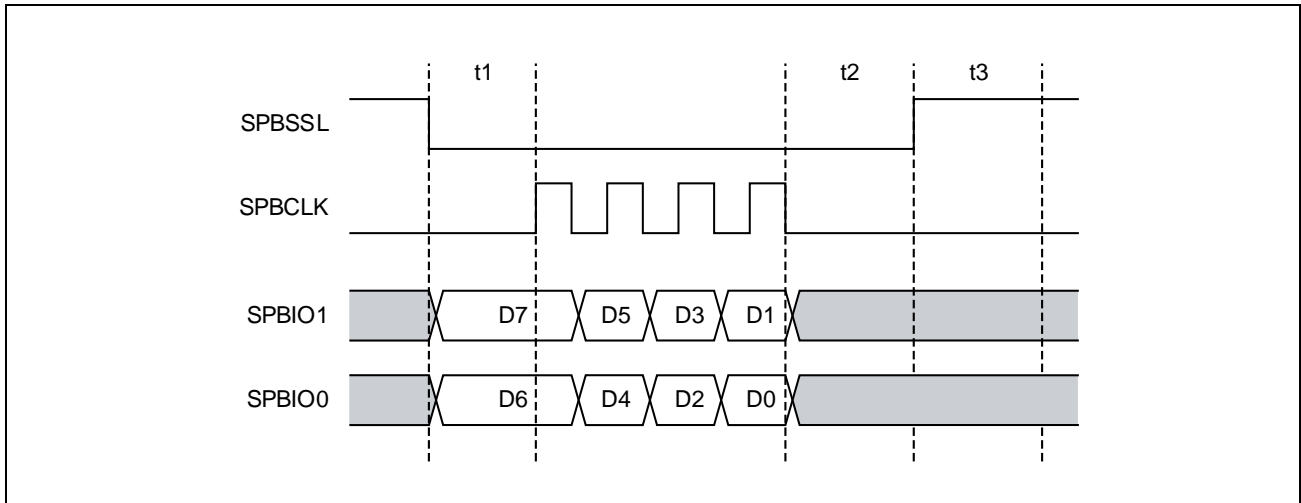

Figure 17.18 Transfer Format Example with 2-Bit Data Size

**(3) 4-bit Size**

When the size is set to 4 bits, SPBIO0, SPBIO1, SPBIO2, and SPBIO3 pins will be either the input pins or the output pins.

**Figure 17.19, Transfer Format Example with 4-Bit Data Size** shows the transfer format example.

Figure 17.19 Transfer Format Example with 4-Bit Data Size

### 17.4.11 Data Pin Control

With this module, the status of pins can be automatically changed based on the data size to be used and the read/write settings. The pin status during the SPBSSL negotiation can be set with the MOIIIO3, MOIIIO2, MOIIIO1, and MOIIIO0 bits in SFMAAnCMNCR. The SPBSSL and SPBCLK pins are always output pins. The status of respective pins is specified in **Table 17.36, Pin Status (1)** to **Table 17.39, Pin Status (4)**.

Table 17.36 Pin Status (1)

Pin	SPBSSL Negation	SPBSSL Assertion		
		Command, Optional Command, Address, Option Data		
		1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	MOIIIO0 bit value	Output	Output	Output
SPBMO/SPBIO1	MOIIIO1 bit value	Hi-Z	Output	Output
SPBIO2	MOIIIO2 bit value	IO2FV bit value	IO2FV bit value	Output
SPBIO3	MOIIIO3 bit value	IO3FV bit value	IO3FV bit value	Output

Table 17.37 Pin Status (2)

Pin	Transfer Data					
	External Address Space Read Operation			SPI Operation		
	1-bit Size	2-bit Size	4-bit Size	SPIRE Bit = 1, SPIWE Bit = 0		
				1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	IO0FV bit value	Input	Input	IO0FV bit value	Input	Input
SPBMO/SPBIO1	Input	Input	Input	Input	Input	Input
SPBIO2	IO2FV bit value	IO2FV bit value	Input	IO2FV bit value	IO2FV bit value	Input
SPBIO3	IO3FV bit value	IO3FV bit value	Input	IO3FV bit value	IO3FV bit value	Input

Table 17.38 Pin Status (3)

Pin	Transfer Data					
	SPI Operation					
	SPIRE Bit = 0, SPIWE Bit = 1			SPIRE Bit = 1, SPIWE Bit = 1		
	1-bit Size	2-bit Size	4-bit Size	1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	Output	Output	Output	Output	Setting prohibited	Setting prohibited
SPBMO/SPBIO1	Hi-Z	Output	Output	Input	Setting prohibited	Setting prohibited
SPBIO2	IO2FV bit value	IO2FV bit value	Output	IO2FV bit value	Setting prohibited	Setting prohibited
SPBIO3	IO3FV bit value	IO3FV bit value	Output	IO3FV bit value	Setting prohibited	Setting prohibited

Table 17.39 Pin Status (4)

Pin	Dummy Cycle		
	1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	IO0FV bit value	Hi-Z	Hi-Z
SPBMO/SPBIO1	Hi-Z	Hi-Z	Hi-Z
SPBIO2	IO2FV bit value	IO2FV bit value	Hi-Z
SPBIO3	IO3FV bit value	IO3FV bit value	Hi-Z

### 17.4.12 SPBSSL Pin Control

Negation conditions of the SPBSSL pin are as follows.

#### 17.4.12.1 External Address Space Read Mode

- (1) Normal read operation (RBE bit in SFMA<sub>n</sub>DRCCR = 0)  
SPBSSL negated after completing the data transfer and t<sub>2</sub> cycle.
- (2) Burst read without automatic SPBSSL negation (RBE bit in SFMA<sub>n</sub>DRCCR = 1, SSLE bit in SFMA<sub>n</sub>DRCCR = 0)  
SPBSSL negated after completing the data transfer and t<sub>2</sub> cycle.
- (3) Burst read with automatic SPBSSL negation (RBE bit in SFMA<sub>n</sub>DRCCR = 1, SSLE bit in SFMA<sub>n</sub>DRCCR = 1)
  - SPBSSL negated after t<sub>2</sub> cycle when the read address is not continuous with the previously read address
  - SPBSSL negated after the SSLN bit in SFMA<sub>n</sub>DRCCR is set to 1

#### 17.4.12.2 SPI Operating Mode

- (1) SPBSSL pin assertion not retained (SSLKP bit in SFMA<sub>n</sub>SMCR = 0)  
SPBSSL negated after completing the data transfer and t<sub>2</sub> cycle.
- (2) SPBSSL pin assertion retained (SSLKP bit in SFMA<sub>n</sub>SMCR = 1)  
SPBSSL not negated.  
When to be negated, data should be transferred after setting the SSLKP bit to 0.

### 17.4.13 Flags

This module has two flag bits SSLF and TEND in SFMA<sub>n</sub>CMNSR. These bits are read-only bits.

#### 17.4.13.1 SSLF Bit

This bit indicates the SPBSSL pin status. The status is 1 when the SPBSSL is asserted, and the status is 0 when the SPBSSL is negated.

#### 17.4.13.2 TEND Bit

This bit indicates whether transfer of data is in progress or the transfer of data has ended.

During t<sub>1</sub> time period, data transfer, t<sub>2</sub> time period, t<sub>3</sub> time period, and waiting for read access by burst read and SPBSSL automatic negation, the TEND bit is read as 0 to indicate that the transfer of data is in progress.

When other than the above, the TEND bit is read as 1 to indicate that transfer of data has ended.

#### 17.4.13.3 Register Re-writing Timing

The status of the TEND bit determines the rewritable registers.

The registers which can be written to, except the SSLN bit in SFMA<sub>n</sub>DRCCR, should be modified when TEND = 1. Read SFMA<sub>n</sub>SMRDR when TEND = 1. SFMA<sub>n</sub>CMNSR can always be read.

## 17.5 Usage Notes

### 17.5.1 Notes on Transfer to Read Data in SPI Operating Mode

In SPI operating mode, take note of the following points for caution when setting the SPI mode enable setting register (SFMA<sub>n</sub>SMENR) to enable transfer only for reading data.

“Transfer only for reading data” indicates transfer to read data while the CDE, OCDE, ADE[3:0], and OPDE[3:0] bits in SFMA<sub>n</sub>SMENR are all 0.

#### 17.5.1.1 Transfer to Read Data While the Signal on the SPBSSL Pin is De-asserted

Set the SFMA<sub>n</sub>SMENR.SPIDE[3:0] bits to 1100 or 1111 when transfer only for reading data is to proceed.

Transfer will not proceed normally if the setting of the SFMA<sub>n</sub>SMENR.SPIDE[3:0] bits is 1000.

#### 17.5.1.2 Transfer to Read Data While the Signal on the SPBSSL Pin is Asserted

When transfer only for reading data is to proceed, set the SFMA<sub>n</sub>SMENR.SPIDE[3:0] bits to 1100 or 1111, or end the immediately preceding transfer with reading data.

When the immediately preceding transfer is of a command, optional command, address, or option data, or is transfer for writing data, the subsequent transfer only for reading data will not proceed normally if the setting of the SFMA<sub>n</sub>SMENR.SPIDE[3:0] bits is 1000.

### 17.5.2 Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode

Be sure to set the SPIWE bit in the SFMA<sub>n</sub>SMCR register to 1 when the transfer of a command, optional command, address, or option data is started while the SPBSSL pin is being asserted in SPI operating mode.

## Section 18 Multi Media Card Interface A (MMCA)

This section contains a generic description of Multi Media Card Interface A (MMCA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of MMCA.

### 18.1 Features of RH850/F1KH, RH850/F1KM MMCA

#### 18.1.1 Number of Units

This microcontroller has the following number of MMCA units.

Table 18.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	—	—	1
Name	—	—	MMCA <sub>n</sub> (n = 0)

Table 18.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	—	—	—	—	—
Name	—	—	—	—	—

Table 18.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	—	—	—
Name	—	—	—

Table 18.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of units	—	—	—	—
Name	—	—	—	—

Table 18.5 Index

Index	Description
n	Throughout this section, the individual MMCA units are identified by the index "n"; for example, MMCA <sub>n</sub> CE_CMD_SET (n = 0) is the MMCA <sub>n</sub> command setting register.

### 18.1.2 Register Base Address

MMCA<sub>n</sub> base address is listed in the following table.

MMCA<sub>n</sub> register addresses are given as an offset from the base address.

Table 18.6 Register Base Address

Base Address Name	Base Address
<MMCA0_base>	FFED 9000 <sub>H</sub>

### 18.1.3 Clock Supply

The MMCA<sub>n</sub> clock supply is listed in the following table.

Table 18.7 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
MMCA <sub>n</sub>	MMCA module clock	CKSCLK_IPER12	MMCA module clock
	Register access clock	CPUCLK_L, CKSCLK_IPER12	Bus clock

### 18.1.4 Interrupt Requests

The MMCA<sub>n</sub> interrupts are listed in the following table.

Table 18.8 Interrupt Requests

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
MMCA0			
INTMMCA0	MMCA interrupt	354	—
DMAMMCA0	MMCA DMA request	—	127

### 18.1.5 Reset Sources

MMCA<sub>n</sub> reset sources are listed in the following table. MMCA<sub>n</sub> is initialized by these reset sources.

Table 18.9 Reset Sources

Unit Name	Reset Source
MMCA <sub>n</sub>	All reset sources (ISORES)

### 18.1.6 External Input/Output Signals

External input/output signals of MMCA<sub>n</sub> are listed below.

Table 18.10 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
MMCA0		
MMCA0CLK	MMCA Clock	MMCA0CLK
MMCA0CMD	MMCA Command / Response	MMCA0CMD
MMCA0DAT[7:0]	MMCA Data[7:0]	MMCA0DAT[7:0]

## 18.2 Overview

### 18.2.1 Features

- Compliant with JEDEC STANDARD JESD84-A441 (neither DDR mode nor 1.8-V operation is supported)
- Supports 1-/4-/8-bit MMC bus width
- Supports Backward-compatible mode.  
High-speed mode is not supported.
- MMC Clock frequency = MMCA module clock frequency/ $2^k$  ( $k = 1$  to 10)
- Supports block transfer  
Stream transfer is not supported.
- Supports boot operation  
The alternative boot operation is not supported.
- MMC clock frequency settings are adjustable in boot mode.
- Supports high priority interrupt (HPI)  
HPIs in the sequence of CMD6, CMD24, CMD25 (pre-defined), and CMD38 are supported.
- Supports background operation
- Interrupt requests: normal operation and error/timeout.
- DMA transfer requests: buffer write and buffer read

### 18.2.2 Block Diagram

Figure 18.1 Block Diagram of MMCA

## 18.3 Registers

### 18.3.1 List of Registers

MMCA registers are listed in the following table.

For details on <MMCA<sub>n</sub>\_base>, see **Section 18.1.2, Register Base Address**.

Table 18.11 List of Registers

Module Name	Register Name	Symbol	Address
MMCA <sub>n</sub>	MMCA <sub>n</sub> command setting register	MMCA <sub>n</sub> CE_CMD_SET	<MMCA <sub>n</sub> _base> + 00 <sub>H</sub>
	MMCA <sub>n</sub> argument register	MMCA <sub>n</sub> CE_ARG	<MMCA <sub>n</sub> _base> + 08 <sub>H</sub>
	MMCA <sub>n</sub> argument register for automatically-issued CMD12	MMCA <sub>n</sub> CE_ARG_CMD12	<MMCA <sub>n</sub> _base> + 0C <sub>H</sub>
	MMCA <sub>n</sub> command control register	MMCA <sub>n</sub> CE_CMD_CTRL	<MMCA <sub>n</sub> _base> + 10 <sub>H</sub>
	MMCA <sub>n</sub> transfer block setting register	MMCA <sub>n</sub> CE_BLOCK_SET	<MMCA <sub>n</sub> _base> + 14 <sub>H</sub>
	MMCA <sub>n</sub> clock control register	MMCA <sub>n</sub> CE_CLK_CTRL	<MMCA <sub>n</sub> _base> + 18 <sub>H</sub>
	MMCA <sub>n</sub> buffer access configuration register	MMCA <sub>n</sub> CE_BUF_ACC	<MMCA <sub>n</sub> _base> + 1C <sub>H</sub>
	MMCA <sub>n</sub> response register 3	MMCA <sub>n</sub> CE_RESP3	<MMCA <sub>n</sub> _base> + 20 <sub>H</sub>
	MMCA <sub>n</sub> response register 2	MMCA <sub>n</sub> CE_RESP2	<MMCA <sub>n</sub> _base> + 24 <sub>H</sub>
	MMCA <sub>n</sub> response register 1	MMCA <sub>n</sub> CE_RESP1	<MMCA <sub>n</sub> _base> + 28 <sub>H</sub>
	MMCA <sub>n</sub> response register 0	MMCA <sub>n</sub> CE_RESP0	<MMCA <sub>n</sub> _base> + 2C <sub>H</sub>
	MMCA <sub>n</sub> response register for automatically-issued CMD12	MMCA <sub>n</sub> CE_RESP_CMD12	<MMCA <sub>n</sub> _base> + 30 <sub>H</sub>
	MMCA <sub>n</sub> data register	MMCA <sub>n</sub> CE_DATA	<MMCA <sub>n</sub> _base> + 34 <sub>H</sub>
	MMCA <sub>n</sub> boot operation setting register	MMCA <sub>n</sub> CE_BOOT	<MMCA <sub>n</sub> _base> + 3C <sub>H</sub>
	MMCA <sub>n</sub> interrupt flag register	MMCA <sub>n</sub> CE_INT	<MMCA <sub>n</sub> _base> + 40 <sub>H</sub>
	MMCA <sub>n</sub> interrupt enable register	MMCA <sub>n</sub> CE_INT_EN	<MMCA <sub>n</sub> _base> + 44 <sub>H</sub>
	MMCA <sub>n</sub> status register 1	MMCA <sub>n</sub> CE_HOST_STS1	<MMCA <sub>n</sub> _base> + 48 <sub>H</sub>
	MMCA <sub>n</sub> status register 2	MMCA <sub>n</sub> CE_HOST_STS2	<MMCA <sub>n</sub> _base> + 4C <sub>H</sub>
	MMCA <sub>n</sub> software reset register	MMCA <sub>n</sub> CE_SWRESA	<MMCA <sub>n</sub> _base> + 7C <sub>H</sub>

### 18.3.2 MMCAnCE\_CMD\_SET — MMCAn Command Setting Register

MMCAnCE\_CMD\_SET sets a command sequence. For the setting values of MMCAnCE\_CMD\_SET, see **Section 18.4.4.13, Setting Values of MMCAnCE\_CMD\_SET**. The command sequence starts when the settings have been made in bits 31 to 16. Note that writing to MMCAnCE\_CMD\_SET is disabled while a command sequence is proceeding (the CMDSEQ bit in MMCAnCE\_HOST\_STS1 is 1).

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 00H

**Value after reset:** 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	BOOT	CMD[5:0]						RTYP[1:0]		RBSY	—	WDAT	DWEN	CMLTE	CMD 12EN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

	RIDXC[1:0]		RCRC7C[1:0]		—	CRC 16C	BOOT ACK	CRC STE	TBIT	OPDM	—	—	SBIT	—	DATW[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R	R/W	R/W

Table 18.12 MMCAnCE\_CMD\_SET Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30	BOOT	Boot Operation 0: Command sequence other than for boot operations 1: Command sequence for boot operations
29 to 24	CMD[5:0]	Command Index Set a command index ([45:40]).
23, 22	RTYP[1:0]	Response Type 00: No response 01: 6-byte response (R1, R1b, R3, R4, R5) 10: 17-byte response (R2) 11: Setting prohibited
21	RBSY	Response Busy Select Selects whether "busy" is involved in response reception. 0: No response busy 1: Response busy involved (R1b)
20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19	WDAT	Presence/Absence of Data 0: No data 1: With data
18	DWEN	Read/Write (valid when "with data" is selected) 0: Read from the card. 1: Write to the card.
17	CMLTE	Single/Multi Block Transfer Select (valid when "with data" is selected) 0: Single-block transfer 1: Multi-block transfer

Table 18.12 MMCAnCE\_CMD\_SET Register Contents

Bit Position	Bit Name	Function
16	CMD12EN	Automatic CMD12 Issuance (valid when multi-block transfer is selected)*1 0: Disables automatic CMD12 issuance. 1: Enables automatic CMD12 issuance. For details of automatic CMD12 issuance, see <b>Section 18.4.3.4, Automatic CMD12 Issuance.</b> <b>NOTE:</b> Set the transfer block size to 512 bytes. Set the RBSY bit to 0.
15, 14	RIDXC[1:0]	Response Index Check Specify the items to be checked in bits [45:40] of a 6-byte response or bits [133:128] of a 17-byte response. 00: Checks the response index (check whether matched with a command index). 01: Checks the check bits (check whether all the bits are set to 1). 10: No checking 11: Setting prohibited
13, 12	RCRC7C[1:0]	Response CRC7 Check Specify the items to be checked in bits [7:1] of a 6-byte response or of a 17-byte response. 00: Checks CRC7 (set the response type to 01). 01: Checks the check bits (check whether all the bits are set to 1) (set the response type to 01). 10: Checks internal CRC7 (R2 only) (set the response type to 10). 11: No checking
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	CRC16C	CRC16 Check in Reception (valid when “with data” and “read” are selected) 0: Checks CRC16 in reception. 1: Does not check CRC16 in reception (used when CMD14).
9	BOOTACK	Receive Boot Acknowledge (valid in boot mode) 0: Boot acknowledge is not received. 1: Boot acknowledge is received.
8	CRCSTE	CRC Status Reception (valid when “with data” and “write” are selected) 0: Receives CRC status. 1: Does not receive CRC status (used when CMD19).
7	TBIT	Transmission Bit Setting 0: Sets the transmission bit ([46]) to 1. 1: Sets the transmission bit ([46]) to 0.
6	OPDM	Open-Drain Output Mode 0: Normal output 1: Open-drain output This setting is only applied to the MMCAnCMD line.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SBIT	Read Data Start Bit Detection Setting (valid when “with data” and “read” are selected) 0: Detects a start bit when the valid MMCAnDAT signals specified by the DATW bits are all 0. 1: Detects a start bit when MMCAnDAT[0] is 0.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	DATW[1:0]	Data Bus Width Setting (valid when “with data” is selected) 00: 1 bit 01: 4 bits 10: 8 bits 11: Setting prohibited

Note 1. It is recommended to use the pre-defined multi-block transfer by setting this bit to 0 for a higher data transfer rate.

### 18.3.3 MMCAnCE\_ARG — MMCAn Argument Register

MMCAnCE\_ARG sets the argument for the command to be transmitted. Set this register before starting a command sequence.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 08<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARG[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ARG[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.13 MMCAnCE\_ARG Register Contents

Bit Position	Bit Name	Function
31 to 0	ARG[31:0]	Set bits [39:8] of the command.
<b>NOTE:</b> Set the argument of automatically-issued CMD12 by MMCAnCE_ARG_CMD12.		

### 18.3.4 MMCAnCE\_ARG\_CMD12 — MMCAn Argument Register for Automatically-Issued CMD12

MMCAnCE\_ARG\_CMD12 is used to set the argument for the automatically-issued CMD12. This register is valid when issuing CMD12 automatically in multi-block transfer. For automatic issuance of CMD12, see **Section 18.4.3.4, Automatic CMD12 Issuance**. Set this register before starting a command sequence.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 0C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	C12ARG[31:16]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.14 MMCAnCE\_ARG\_CMD12 Register Contents

Bit Position	Bit Name	Function
31 to 0	C12ARG[31:0]	Set bits [39:8] of the automatically-issued CMD12.

### 18.3.5 MMCAnCE\_CMD\_CTRL — MMCAn Command Control Register

MMCAnCE\_CMD\_CTRL is used to terminate a command sequence forcibly.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 10<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BREAK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 18.15 MMCAnCE\_CMD\_CTRL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BREAK	<p>Forcible Termination of Command Sequence</p> <p>Writing 1 to this bit while it is 0 and then writing 0 to it discontinues the current command sequence. After this bit is set as described above, check if the value of the CMDSEQ bit in MMCAnCE_HOST_STS1 has become 0. If this is the case, execute software reset.</p> <p><b>NOTE:</b> A software reset initializes the value of this register, so the setting in this register needs to be remade.</p>

### 18.3.6 MMCAnCE\_BLOCK\_SET — MMCAn Transfer Block Setting Register

MMCAnCE\_BLOCK\_SET specifies the size of the block and the number of blocks for the data to be transferred. Set this register before starting a command sequence.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 14<sub>H</sub>

**Value after reset:** 0000 0200<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BLKCNT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.16 MMCAnCE\_BLOCK\_SET Register Contents

Bit Position	Bit Name	Function
31 to 16	BLKCNT[15:0]	Number of Blocks for Transfer  <b>NOTE:</b> This setting is valid for multi-block transfer.
15 to 0	BLKSIZ[15:0]	Transfer Block Size  <b>NOTE:</b> Transfer block size should be set as follows. Single-block transfer: 1 to 512 bytes Multi-block transfer: 512 bytes

### 18.3.7 MMCAnCE\_CLK\_CTRL — MMCAn Clock Control Register

MMCAnCE\_CLK\_CTRL controls the MMC clock and sets timeout values. Do not change the setting of this register while a command sequence is in progress.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 18<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MMCBUSBSY	—	—	—	—	—	—	CLKEN	—	—	—	—	CLKDIV[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SRSPTO[1:0]		SRBSYTO[3:0]			SRWDTO[3:0]			—	—	—	—		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 18.17 MMCAnCE\_CLK\_CTRL Register Contents

Bit Position	Bit Name	Function
31	MMCBUSBSY	MMC Clock Output control / Division setting prohibition 0: MMC bus is NOT busy (During the command sequence + 10 cycle) 1: MMC bus is busy (During the command sequence + 10 cycle) When a command sequence is started with MMCAnCE_CMD_SET register setting, MMCBUSBSY bit is set to 1 at the same time as CMDSEQ bit is set to 1. After CMDSEQ bit is set to 0 at the command sequence end, MMCBUSBSY bit becomes 0 after 10 cycle of MMC Clock. <b>NOTE:</b> When MMC bus is busy, do not set CLKEN bit and the CLKDIV bit of the MMCAnCE_CLK_CTRL register.
30 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	CLKEN	MMC Clock Output Control 0: Does not output the MMC clock (fixed to low level). 1: Outputs the MMC clock.
23 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 16	CLKDIV[3:0]	MMC Clock Frequency Setting 0000: MMCA module clock/2 <sup>1</sup> 0001: MMCA module clock/2 <sup>2</sup> : 0111: MMCA module clock/2 <sup>8</sup> 1000: MMCA module clock/2 <sup>9</sup> 1001: MMCA module clock/2 <sup>10</sup> 1010 to 1111: Setting prohibited For details of MMC clock frequency settings in boot operations, see <b>Section 18.4.3.5, MMC Clock Frequency in Boot Operations</b> and <b>Section 18.3.12, MMCAnCE_BOOT — MMCAn Boot Operation Setting Register</b> .
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13, 12	SRSPTO[1:0]	Response Timeout Setting 00: 64 MMC clock cycles 01: 128 MMC clock cycles 10: 256 MMC clock cycles 11: Setting prohibited

Table 18.17 MMCAnCE\_CLK\_CTRL Register Contents

Bit Position	Bit Name	Function
11 to 8	SRBSYTO[3:0]	Response Busy Timeout Setting 0000: $2^{14} \times$ MMC clock cycles 0001: $2^{15} \times$ MMC clock cycles : 1110: $2^{28} \times$ MMC clock cycles 1111: $2^{29} \times$ MMC clock cycles
7 to 4	SRWDTO[3:0]	Write Data/Read Data Timeout Setting 0000: $2^{14} \times$ MMC clock cycles 0001: $2^{15} \times$ MMC clock cycles : 1110: $2^{28} \times$ MMC clock cycles 1111: $2^{29} \times$ MMC clock cycles
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 18.3.8 MMCAnCE\_BUF\_ACC — MMCAn Buffer Access Configuration Register

MMCAnCE\_BUF\_ACC configures the method of accessing data registers and mode of DMA transfer. Do not set this register again during a command sequence. For explanation of the buffers, see **Section 18.4.3.3, Buffer Structure and Buffer Access**.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 1C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	DMATYP	DMAWEN	DMAREN	—	—	—	—	—	—	—	ATYP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.18 MMCAnCE\_BUF\_ACC Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	DMATYP	DMA Transfer setting When DMAWEN or DMAREN is set to 1, set to 1
25	DMAWEN	Buffer Write DMA Transfer Request Enable 0: Disables DMA transfer request for buffer writing. 1: Enables DMA transfer request for buffer writing.
24	DMAREN	Buffer Read DMA Transfer Request Enable 0: Disables DMA transfer request for buffer reading. 1: Enables DMA transfer request for buffer reading.
23 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	ATYP	Buffer access selection 0: When not swapped byte-wise. 1: When swapped byte-wise.  <b>NOTE:</b> For buffer access, see <b>Section 18.4.3.3, Buffer Structure and Buffer Access</b> .
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 18.3.9 MMCAnCE\_RESP3 to MMCAnCE\_RESP0 — MMCAn Response Registers 3 to 0

MMCAnCE\_RESP3 to MMCAnCE\_RESP0 are the registers in which the response that has been received is stored. For the formats of response values, see **Section 18.4.3.1, Command/Response Formats**.

**Access:** These registers can be read only in 32-bit units.

**Address:** MMCAnCE\_RESP3: <MMCAn\_base> + 20<sub>H</sub>  
 MMCAnCE\_RESP2: <MMCAn\_base> + 24<sub>H</sub>  
 MMCAnCE\_RESP1: <MMCAn\_base> + 28<sub>H</sub>  
 MMCAnCE\_RESP0: <MMCAn\_base> + 2C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

#### MMCAnCE\_RESP3

Table 18.19 MMCAnCE\_RESP3 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[127:96]	Bits [127:96] of a 17-byte response are stored.

#### MMCAnCE\_RESP2

Table 18.20 MMCAnCE\_RESP2 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[95:64]	Bits [95:64] of a 17-byte response are stored.

#### MMCAnCE\_RESP1

Table 18.21 MMCAnCE\_RESP1 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[63:32]	Bits [63:32] of a 17-byte response are stored.

#### MMCAnCE\_RESP0

Table 18.22 MMCAnCE\_RESP0 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[31:0]	Bits [39:8] of a 6-byte response or bits [31:0] of a 17-byte response are stored.

**NOTE:** The response to an automatically issued CMD12 is stored in the MMCAnCE\_RESP\_CMD12 register.

### 18.3.10 MMCAnCE\_RESP\_CMD12 — MMCAn Response Register for Automatically-Issued CMD12

MMCAnCE\_RESP\_CMD12 is a register in which the response to the automatically-issued CMD12 is stored.

**Access:** This register can be read only in 32-bit units.

**Address:** <MMCAn\_base> + 30<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.23 MMCAnCE\_RESP\_CMD12 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP12[31:0]	Bits [39:8] of the response to automatically-issued CMD12 are stored.

### 18.3.11 MMCAnCE\_DATA — MMCAn Data Register

MMCAnCE\_DATA is used to access the buffers of this module. For the write/read data formats, see **Section 18.4.3.2, Data Block Format**.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 34<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 18.3.12 MMCAnCE\_BOOT — MMCAn Boot Operation Setting Register

MMCAnCE\_BOOT controls the MMC clock and sets timeout values in boot mode. Do not set this register again during a command sequence.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 3C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

For MMC clock frequency in boot mode, see <b>Section 18.4.3.5, MMC Clock Frequency in Boot Operations.</b>
27 to 24	SBTACKTO[3:0]	Boot Acknowledge Timeout Setting 0000: 2 <sup>14</sup> × MMC clock cycles 0001: 2 <sup>15</sup> × MMC clock cycles : 1110: 2 <sup>28</sup> × MMC clock cycles 1111: 2 <sup>29</sup> × MMC clock cycles
23 to 20	S1STBTDATTO [3:0]	1st Boot Data Timeout Setting 0000: 2 <sup>14</sup> × MMC clock cycles 0001: 2 <sup>15</sup> × MMC clock cycles : 1110: 2 <sup>28</sup> × MMC clock cycles 1111: 2 <sup>29</sup> × MMC clock cycles
19 to 16	SBTDATTO[3:0]	Interval Between Boot Data Timeout Setting 0000: 2 <sup>14</sup> × MMC clock cycles 0001: 2 <sup>15</sup> × MMC clock cycles : 1110: 2 <sup>28</sup> × MMC clock cycles 1111: 2 <sup>29</sup> × MMC clock cycles
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 18.3.13 MMCAnCE\_INT — MMCAn Interrupt Flag Register

MMCAnCE\_INT indicates various statuses during execution of a command sequence. Each bit is set when its setting condition has been met. To clear flag(s), write 0 only to the bit(s) to be cleared and write 1 to the other bits. For the handling of this module in the case of an error or timeout, see **Section 18.4.3.8, Handling of this Module in the Case of Error/Timeout.**

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 40<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. Writing 0 initializes the bit. Writing 1 is ignored.

Table 18.26 MMCAnCE\_INT Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write 1.
26	CMD12DRE	Automatic CMD12 Issuance & Buffer Read Complete [Setting condition] Response busy for automatically-issued CMD12 and buffer reading have been completed. [Clearing condition] Writing a 0 to this bit. <b>NOTE:</b> When CMD12DRE has been set, CMD12RBE, CMD12CRE, and BUFRE have also been set. So, these bits should be cleared as well.
25	CMD12RBE	Automatic CMD12 Issuance Response Busy Complete [Setting condition] Reception of the response and response busy for an automatically-issued CMD12 have been completed. [Clearing condition] Writing a 0 to this bit. <b>NOTE:</b> When CMD12RBE has been set, CMD12CRE has also been set. So, this bit should be cleared as well. When CMD12RBE is set during a multi-block write, DTRAN is also set. So clear the bit as well.
24	CMD12CRE	Automatic CMD12 Response Complete [Setting condition] The response to an automatically-issued CMD12 has been received. [Clearing condition] Writing a 0 to this bit.

Table 18.26 MMCAnCE\_INT Register Contents

Bit Position	Bit Name	Function
23	DTRANE	<p>Data Transmission Complete</p> <p>[Setting conditions] Transmission of all blocks of data has been completed.</p> <ul style="list-style-type: none"> <li>– When configured to receive CRC status: Completion of busy (data busy) after reception of CRC status</li> <li>– When configured not to receive CRC status: Completion of data transmission</li> </ul> <p>[Clearing condition] Writing a 0 to this bit.</p>
22	BUFRE	<p>Buffer Read Complete</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>– Other than in boot operations All blocks of data have been received and the data have been read from the buffer.</li> <li>– In boot operations All blocks of data have been received and the data have been read from the buffer, MMCAnCMD has been modified from 0 to 1, and 48 MMC clock cycles have elapsed.</li> </ul> <p>[Clearing condition] Writing a 0 to this bit</p>
21	BUFWEN	<p>Buffer Write Ready</p> <p>[Setting conditions] The buffer has become empty and ready for writing.</p> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> When writing data to MMCAnCE_DATA by the CPU, this bit should be cleared first and the data corresponding to the block size set in MMCAnCE_BLOCK_SET should be written. Note that this bit is not set when DMA transfer request for buffer writing is enabled.</p>
20	BUFREN	<p>Buffer Read Ready</p> <p>[Setting conditions] Transfer block size of data have been stored in the buffer and it has become ready for reading.</p> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> When reading data from MMCAnCE_DATA by the CPU, this bit should be cleared first and the data corresponding to the block size set in MMCAnCE_BLOCK_SET should be read. Note that this bit is not set when DMA transfer request for buffer reading is enabled.</p>
19, 18	Reserved	When read, the value after reset is returned. When writing, write 1.
17	RBSYE	<p>Response Busy Complete</p> <p>[Setting condition] Reception of a response and response busy have been completed.</p> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> When RBSYE has been set, CRSPE has also been set. So, this bit should be cleared as well. Completion of reception of the response and response busy for automatically-issued CMD12 is reflected in CMD12RBE.</p>

Table 18.26 MMCAnCE\_INT Register Contents

Bit Position	Bit Name	Function
16	CRSPE	<p>Command/Response Complete</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>– Other than in boot operations When configured not to receive response: A command has been transmitted.</li> <li>When configured to receive 6- or 17-byte response: A response has been received.</li> <li>– In boot operations When reception of boot acknowledge has been selected: The boot acknowledge pattern has been received.</li> </ul> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> Completion of reception of the response to automatically-issued CMD12 is reflected in CMD12CRE.</p>
15	CMDVIO	<p>Command Issuance Error</p> <p>[Setting conditions] Illegal setting has been made in MMCAnCE_CMD_SET or MMCAnCE_BLOCK_SET.</p> <ul style="list-style-type: none"> <li>– During execution of a command sequence: Writing to CMD[5:0] in MMCAnCE_CMD_SET. (The command sequence is not stopped automatically.)</li> <li>– At the start of command sequence: <ul style="list-style-type: none"> <li>• Writing to CMD[5:0] in MMCAnCE_CMD_SET when the registers have been set for one of the following combinations of selection.</li> <li>• No response + response busy</li> <li>• No response + with data + not during boot operations</li> <li>• No data + automatic CMD12 issuance</li> <li>• With data + single-block transfer + automatic CMD12 issuance</li> <li>• With data + response busy + automatic CMD12 issuance</li> <li>• With data + transfer block size = 0</li> <li>• With data + transfer block size ≥ 513</li> <li>• With data + multi-block transfer + number of blocks for transfer = 0</li> <li>• Boot operations + no data</li> <li>• Boot operations + write</li> <li>• Boot operations + response busy</li> <li>• Boot operations + automatic CMD12 issuance</li> <li>• Boot acknowledge reception + not during boot operations</li> </ul> </li> </ul> <p>[Clearing condition] Writing a 0 to this bit.</p>
14	BUFVIO	<p>Buffer Access Error</p> <p>[Setting conditions] Illegal buffer access has been attempted.</p> <ul style="list-style-type: none"> <li>– MMCAnCE_DATA has been accessed exceeding the block size set in BLKSIZ[15:0] in MMCAnCE_BLOCK_SET.</li> <li>– While data is being read from the card: MMCAnCE_DATA has been accessed with BUFREN not set (when DMA is used, with no DMA transfer request asserted for buffer reading).</li> <li>– While data is being written to the card: MMCAnCE_DATA has been accessed with BUFWEN not set (when DMA is used, with no DMA transfer request asserted for buffer writing).</li> </ul> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> When BUFVIO has been set, the command sequence is not stopped automatically. If an error occurs, this bit will be set.</p>
13, 12	Reserved	When read, the value after reset is returned. When writing, write 1.

Table 18.26 MMCAnCE\_INT Register Contents

Bit Position	Bit Name	Function
11	WDATERR	<p>Write Data Error</p> <p>[Setting conditions] Error is found in the data that has been written.</p> <ul style="list-style-type: none"> <li>– Error is in the status of the CRC status.</li> <li>– Error is in the end bits of the CRC status.</li> </ul> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> When WDATERR has been set, the command sequence is stopped automatically.</p>
10	RDATERR	<p>Read Data Error</p> <p>[Setting conditions] Error is found in the read data.</p> <ul style="list-style-type: none"> <li>– Error is in CRC16 of the read data.</li> <li>– Error is in the end bits of the read data.</li> </ul> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> When RDATERR has been set, the command sequence is stopped automatically.</p>
9	RIDXERR	<p>Response Index Error</p> <p>[Setting conditions] Error has been found in the index value of the response.</p> <ul style="list-style-type: none"> <li>– When an error has been found in bits [45:40] of a 6-byte response (including automatically-issued CMD12) or bits [133:128] of a 17-byte response. (The items to be checked are set by RIDXC in MMCAnCE_CMD_SET.)</li> </ul> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> When RIDXERR has been set, the command sequence is stopped automatically.</p>
8	RSPERR	<p>Response Error</p> <p>[Setting conditions] Error has been found in the response values of the response.</p> <ul style="list-style-type: none"> <li>– Transmission bit in the response is 1.</li> <li>– Error is in the end bits of the response.</li> <li>– When an error has been found in bits [7:1] of a 6-byte response (including automatically-issued CMD12) or a 17-byte response. (The items to be checked are set by RCRC7C in MMCAnCE_CMD_SET.)</li> <li>– Error in the boot acknowledge pattern</li> <li>– Error in the end bits of the boot acknowledge</li> </ul> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> When RSPERR has been set, the command sequence is stopped automatically.</p>
7 to 5	Reserved	When read, the value after reset is returned. When writing, write 1.
4	CRCSTO	<p>CRC Status Timeout</p> <p>[Setting condition] CRC status could not be received.</p> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> The command sequence is not stopped even if CRCSTO is set.</p>
3	WDATTO	<p>Write Data Timeout</p> <p>[Setting condition] The busy status remains unchanged after the period set by SRWDTO in MMCAnCE_CLK_CTRL after the CRC status was received.</p> <p>[Clearing condition] Writing a 0 to this bit.</p> <p><b>NOTE:</b> The command sequence is not stopped even if WDATTO is set.</p>

### 18.3.14 MMCAnCE\_INT\_EN — MMCAn Interrupt Enable Register

MMCAnCE\_INT\_EN controls output of the MMCAnCE\_INT-related interrupt signals. For details on interrupt requests, see **Section 18.4.1, Interrupt Requests**.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 44<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	MCMD 12DRE	MCMD 12RBE	MCMD 12CRE	MDTRA NE	MBUF RE	MBUF WEN	MBUF REN	—	—	MRB SYEE	MCR SPEE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 18.27 MMCAnCE\_INT\_EN Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	MCMD12DRE	CMD12DRE Interrupt Enable 0: Disables interrupt output by the CMD12DRE flag. 1: Enables interrupt output by the CMD12DRE flag.
25	MCMD12RBE	CMD12RBE Interrupt Enable 0: Disables interrupt output by the CMD12RBE flag. 1: Enables interrupt output by the CMD12RBE flag.
24	MCMD12CRE	CMD12CRE Interrupt Enable 0: Disables interrupt output by the CMD12CRE flag. 1: Enables interrupt output by the CMD12CRE flag.
23	MDTRANE	DTRANE Interrupt Enable 0: Disables interrupt output by the DTRANE flag. 1: Enables interrupt output by the DTRANE flag.
22	MBUFRE	BUFRE Interrupt Enable 0: Disables interrupt output by the BUFRE flag. 1: Enables interrupt output by the BUFRE flag.
21	MBUFWEN	BUFWEN Interrupt Enable 0: Disables interrupt output by the BUFWEN flag. 1: Enables interrupt output by the BUFWEN flag.
20	MBUFREN	BUFREN Interrupt Enable 0: Disables interrupt output by the BUFREN flag. 1: Enables interrupt output by the BUFREN flag.
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	MRBSYE	RBSYE Interrupt Enable 0: Disables interrupt output by the RBSYE flag. 1: Enables interrupt output by the RBSYE flag.
16	MCRSPE	CRSPE Interrupt Enable 0: Disables interrupt output by the CRSPE flag. 1: Enables interrupt output by the CRSPE flag.

Table 18.27 MMCAnCE\_INT\_EN Register Contents

Bit Position	Bit Name	Function
15	MCMDVIO	CMDVIO Interrupt Enable 0: Disables interrupt output by the CMDVIO flag. 1: Enables interrupt output by the CMDVIO flag.
14	MBUFVIO	BUFVIO Interrupt Enable 0: Disables interrupt output by the BUFVIO flag. 1: Enables interrupt output by the BUFVIO flag.
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	MWDATERR	WDATERR Interrupt Enable 0: Disables interrupt output by the WDATERR flag. 1: Enables interrupt output by the WDATERR flag.
10	MRDATERR	RDATERR Interrupt Enable 0: Disables interrupt output by the RDATERR flag. 1: Enables interrupt output by the RDATERR flag.
9	MRIDXERR	RIDXERR Interrupt Enable 0: Disables interrupt output by the RIDXERR flag. 1: Enables interrupt output by the RIDXERR flag.
8	MRSPEERR	RSPERR Interrupt Enable 0: Disables interrupt output by the RSPERR flag. 1: Enables interrupt output by the RSPERR flag.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	MCRCSTO	CRCSTO Interrupt Enable 0: Disables interrupt output by the CRCSTO flag. 1: Enables interrupt output by the CRCSTO flag.
3	MWDATTO	WDATTO Interrupt Enable 0: Disables interrupt output by the WDATTO flag. 1: Enables interrupt output by the WDATTO flag.
2	MRDATTO	RDATTO Interrupt Enable 0: Disables interrupt output by the RDATTO flag. 1: Enables interrupt output by the RDATTO flag.
1	MRBSYTO	RBSYTO Interrupt Enable 0: Disables interrupt output by the RBSYTO flag. 1: Enables interrupt output by the RBSYTO flag.
0	MRSPTO	RSPTO Interrupt Enable 0: Disables interrupt output by the RSPTO flag. 1: Enables interrupt output by the RSPTO flag.

### 18.3.15 MMCAnCE\_HOST\_STS1 — MMCAn Status Register 1

MMCAnCE\_HOST\_STS1 indicates the number of blocks that have been transferred, the states of the MMCAnCMD line and MMCAnDAT lines, the index of the response that has been received, and whether a command sequence is in progress.

**Access:** This register can be read only in 32-bit units.

**Address:** <MMCAn\_base> + 48<sub>H</sub>

**Value after reset:** X0XX 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMD SEQ	CMD SIG	RSPIDX[5:0]						DATSIG[7:0]							
Value after reset	0	—	0	0	0	0	0	0	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCVBLK[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.28 MMCAnCE\_HOST\_STS1 Register Contents

Bit Position	Bit Name	Function
31	CMDSEQ	Command Sequence in Progress 0: Command sequence is in the initial state. 1: Command sequence is being executed.
30	CMSIG	MMCAnCMD State Indicates the state on the MMCAnCMD line.
29 to 24	RSPIDX[5:0]	Response Index Indicate bits [45:40] of a 6-byte response or bits [133:128] of a 17-byte response.
23 to 16	DATSIG[7:0]	MMCAnDAT[7:0] State Indicate the state on the MMCAnDAT[7:0] lines. Note: When a communication error or a timeout error occurs, MMCAnDAT[0] may remain 0.
15 to 0	RCVBLK[15:0]	Number of Transferred Blocks Indicate the number of blocks that have been transferred. When the DWEN bit in MMCAnCE_CMD_SET is 0: Number of blocks read from the card When the DWEN bit in MMCAnCE_CMD_SET is 1: Number of blocks written to the card

### 18.3.16 MMCAnCE\_HOST\_STS2 — MMCAn Status Register 2

MMCAnCE\_HOST\_STS2 indicates timeout and error statuses.

**Access:** This register can be read only in 32-bit units.

**Address:** <MMCAn\_base> + 4C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.29 MMCAnCE\_HOST\_STS2 Register Contents

Bit Position	Bit Name	Function
31	CRCSTE	CRC Status Error This bit is set to 1 when an error is found in the CRC status value.
30	CRC16E	Read Data CRC16 Error This bit is set to 1 when an error is found in CRC16 in the read data.
29	AC12CRCE	Automatic CMD12 Response CRC7 Error This bit is set to 1 when an error is found in bits [7:1] of the response to the automatically-issued CMD12. <b>NOTE:</b> The items to be checked are set by RCRC7C in MMCAnCE_CMD_SET.
28	RSPCRC7E	Command Response CRC7 Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in bits [7:1] of a 6-byte response or a 17-byte response. <b>NOTE:</b> The items to be checked are set by RCRC7C in MMCAnCE_CMD_SET.
27	CRCSTEBE	CRC Status End Bit Error This bit is set to 1 when an error is found in the end bits in CRC status.
26	RDATEBE	Read Data End Bit Error This bit is set to 1 when an error is found in the end bits in the read data.
25	AC12REBE	Automatic CMD12 Response End Bit Error This bit is set to 1 when an error is found in the end bits of the response to the automatically-issued CMD12.
24	RSPEBE	Command Response End Bit Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in the end bits of the response.
23	AC12IDXE	Automatic CMD12 Response Index Error This bit is set to 1 when an error is found in bits [45:40] of the response to the automatically-issued CMD12. <b>NOTE:</b> The items to be checked are set by RIDXC in MMCAnCE_CMD_SET.
22	RSPIDXE	Command Response Index Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in bits [45:40] of a 6-byte response or bits [133:128] of a 17-byte response. <b>NOTE:</b> The items to be checked are set by RIDXC in MMCAnCE_CMD_SET.

Table 18.29 MMCAnCE\_HOST\_STS2 Register Contents

Bit Position	Bit Name	Function
21	BTACKPATE	Boot Acknowledge Pattern Error This bit is set to 1 when an error is found in the boot acknowledge pattern.
20	BTACKEBE	Boot Acknowledge End Bit Error This bit is set to 1 when an error is found in the end bits of the boot acknowledge.
19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18 to 16	CRCST[2:0]	CRC Status/Boot Acknowledge Pattern Indication This bit indicates the value for CRC status that was received or the pattern value from the boot-acknowledge.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	STRDATTO	Read Data Timeout (valid other than in boot operations) This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in MMCAnCE_CLK_CTRL after a read command was transmitted. This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in MMCAnCE_CLK_CTRL after a read data was received.
13	DATBSYTO	Data Busy Timeout This bit is set to 1 if busy status remains unchanged after the period set by the SRWDTO bits in MMCAnCE_CLK_CTRL after the CRC status was received.
12	CRCSTTO	CRC Status Timeout This bit is set to 1 if CRC status could not be received.
11	AC12BSYTO	Automatic CMD12 Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in MMCAnCE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
10	RSPBSYTO	Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in MMCAnCE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
9	AC12RSPTO	Automatic CMD12 Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in MMCAnCE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
8	STRSPTO	Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in MMCAnCE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
7	BTACKTO	Boot Acknowledge Timeout In boot operations, this bit is set to 1 if boot acknowledge is not received within the period set by the SBTACKTO bits in MMCAnCE_BOOT.
6	1STBTDATTO	1st Boot Data Timeout In boot operations, this bit is set to 1 if the 1st read data is not received within the period set by the S1STBTDATTO bits in MMCAnCE_BOOT.
5	BTDATTO	Interval between Boot Data Timeout In boot operations, this bit is set to 1 if read data is not received within the period set by the SBTDATTO bits in MMCAnCE_BOOT after a read data was received.
4 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

### 18.3.17 MMCAnCE\_SWRESA — MMCAn Software Reset Register

MMCAnCE\_SWRESA controls software reset of this module.

**Access:** This register can be read or written in 32-bit units.

**Address:** <MMCAn\_base> + 7CH

**Value after reset:** 0000 0004H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SWRST	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.30 MMCAnCE\_SWRESA Register Contents

Bit Position	Bit Name	Function
31	SWRST	Software Reset 0: Software reset cleared (normal operation). 1: Executes software reset. When this bit is set to 1, the values of all registers are initialized. (SWRST is not initialized.)
30 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

## 18.4 Operations

### 18.4.1 Interrupt Requests

The table below shows the specification of the interrupt requests. This module generates two types of interrupt requests: normal operation and error/timeout. When a bit in the flag register is set to 1 and also the corresponding bit in the interrupt enable register is set to 1 (enabled), an interrupt request is asserted.

Table 18.31 Specification of Interrupt Requests

Flag Register	Bit	Enable Register	Bit	Interrupt Request
MMCA <sub>n</sub> CE_INT	CMD12DRE	MMCA <sub>n</sub> CE_INT_EN	MCMD12DRE	Normal operation interrupt
	CMD12RBE		MCMD12RBE	
	CMD12CRE		MCMD12CRE	
	DTRANE		MDTRANE	
	BUFRE		MBUFRE	
	BUFWEN		MBUFWEN	
	BUFREN		MBUFREN	
	RBSYE		MRBSYE	
	CRSPE		MCRSPE	
	CMDVIO		MCMDVIO	
	BUFVIO		MBUFVIO	
	WDATERR		MWDATERR	
	RDATERR		MRDATERR	
	RIDXERR		MRIDXERR

	RSPTO		MRSPTO	

## 18.4.2 DMA Specifications

This module has two types of DMA transfer requests: for buffer reading and for buffer writing.

The method of DMA transfer is configured by `MMCAnCE_BUF_ACC`.

### 18.4.2.1 DMA for Buffer Writing

The DMA transfer request is asserted for buffer writing when the buffer has become empty while the `DMAWEN` bit in `MMCAnCE_BUF_ACC` is set to 1.

The DMA transfer request stays asserted for the amount of data specified by `BLKSIZ` (the block size set in `MMCAnCE_BLOCK_SET`)  $\times$  `BLKCNT` (the number of blocks for transfer set in `MMCAnCE_BLOCK_SET`), and negated after the last block has been transferred. Note that the `BUFWEN` bit in `MMCAnCE_INT` will not be asserted during DMA transfer.

If an error has occurred during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

### 18.4.2.2 DMA for Buffer Reading

The DMA transfer request is asserted for buffer reading when the buffer stores data of the block size specified in `MMCAnCE_BLOCK_SET` while the `DMAREN` bit in `MMCAnCE_BUF_ACC` is set to 1.

The DMA transfer request stays asserted for the amount of data specified by `BLKSIZ` (the block size set in `MMCAnCE_BLOCK_SET`)  $\times$  `BLKCNT` (the number of blocks for transfer set in `MMCAnCE_BLOCK_SET`), and negated after the last block has been transferred. Note that the `BUFREN` bit in `MMCAnCE_INT` will not be asserted during DMA transfer.

If an error has occurred during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

## 18.4.3 Operations

### 18.4.3.1 Command/Response Formats

The figure below shows the format of the command to be transferred. The command index that is set in the CMD[5:0] bits in MMCAAnCE\_CMD\_SET and the argument set in the ARG[31:0] bits in MMCAAnCE\_ARG are reflected in the command.

Figure 18.2 Command Format

**Figure 18.3, Format of 6-Byte Response** and **Figure 18.4, Format of 17-Byte Response (R2)** show the formats when a 6-byte response and 17-byte response (R2) are received, respectively. The received response is stored in MMCAAnCE\_RESP0 or MMCAAnCE\_RESP3 to MMCAAnCE\_RESP0. The items to be checked are set by the RIDXC bits and the RCRC7C bits in MMCAAnCE\_CMD\_SET.

Figure 18.3 Format of 6-Byte Response

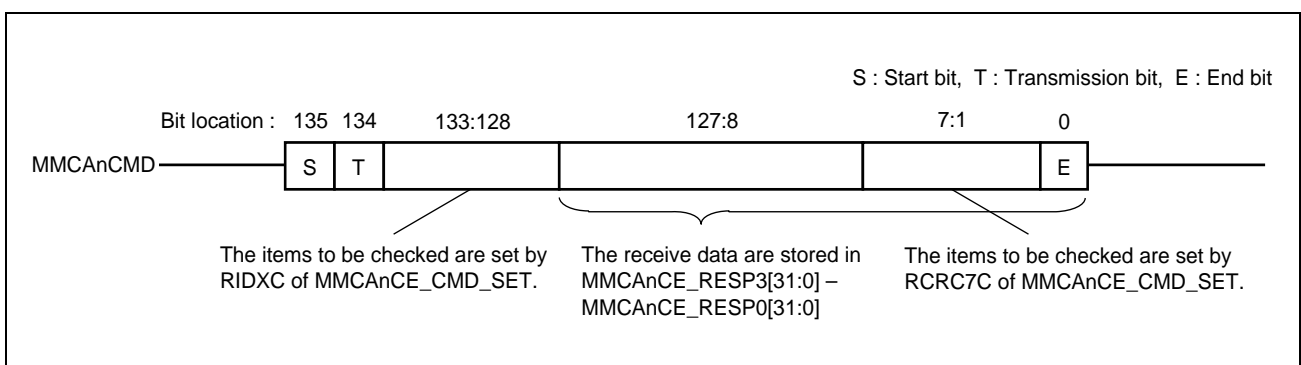

Figure 18.4 Format of 17-Byte Response (R2)

### 18.4.3.2 Data Block Format

The figure below shows the format of data blocks. For D0 to D3 in the figure, see **Section 18.4.3.3, Buffer Structure and Buffer Access**. When data are written to the card, the data stored in the buffer are transmitted. When data are read from the card, the received data are stored in the buffer.

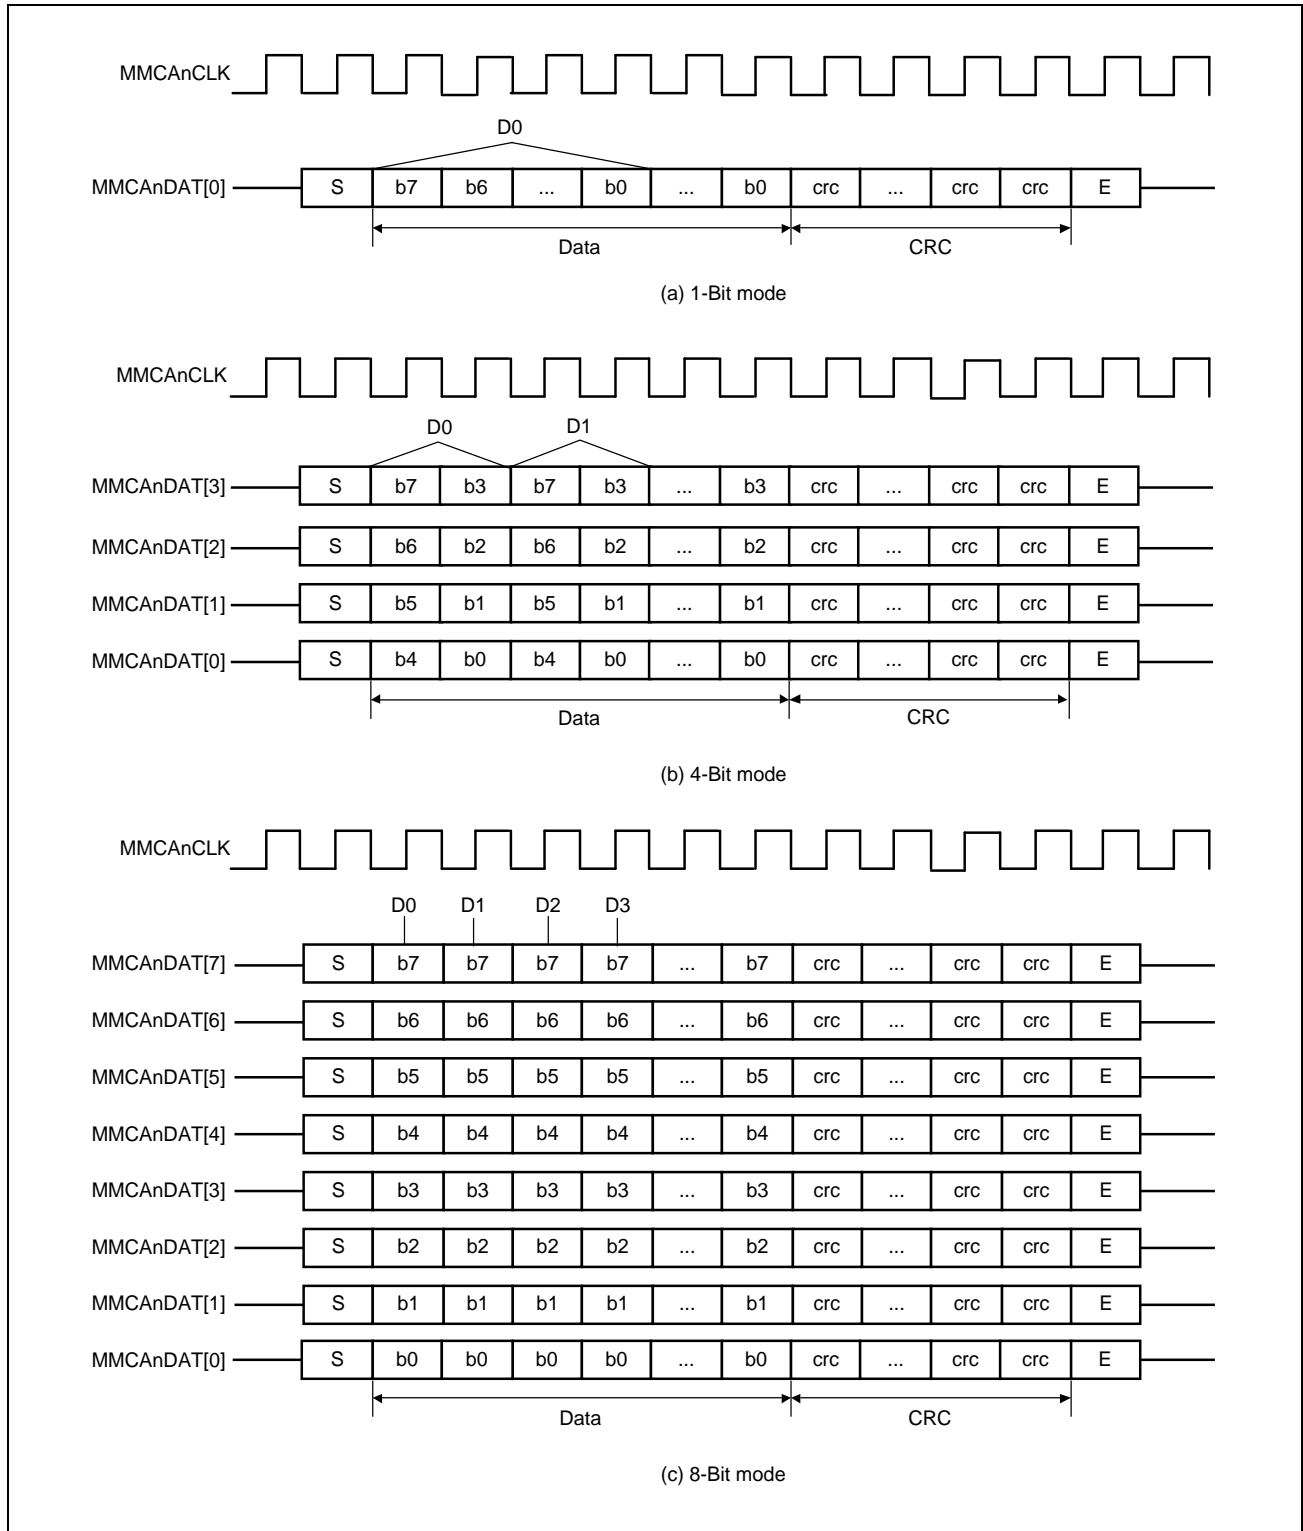

Figure 18.5 Data Block Format

### 18.4.3.3 Buffer Structure and Buffer Access

As shown in **Figure 18.6, Double Buffer Structure**, this module has two 512-byte RAM units for double buffering. If a block of data (512 bytes) stored in one buffer is transmitted during multi-block writing, the next block of data can be transmitted as soon as the other buffer is full. If a block of received data (512 bytes) is stored in one buffer during multi-block reading, the next block of received data can be stored in the other buffer once it is empty.

If neither buffer is empty during multi-block reading, the MMC clock is stopped, which in turn temporarily stops reception. Once either of the buffers becomes empty, supply of the MMC clock signal is re-started and data reception is resumed.

The buffers are accessed by MMCA<sub>n</sub>CE\_DATA. If the transfer block size is set to  $4 \times n + 1$  or  $4 \times n + 3$ , access should be made for  $4 \times (n + 1)$  bytes in 32-bit access. ( $n = 0, 1, 2, \dots, 127$ ).

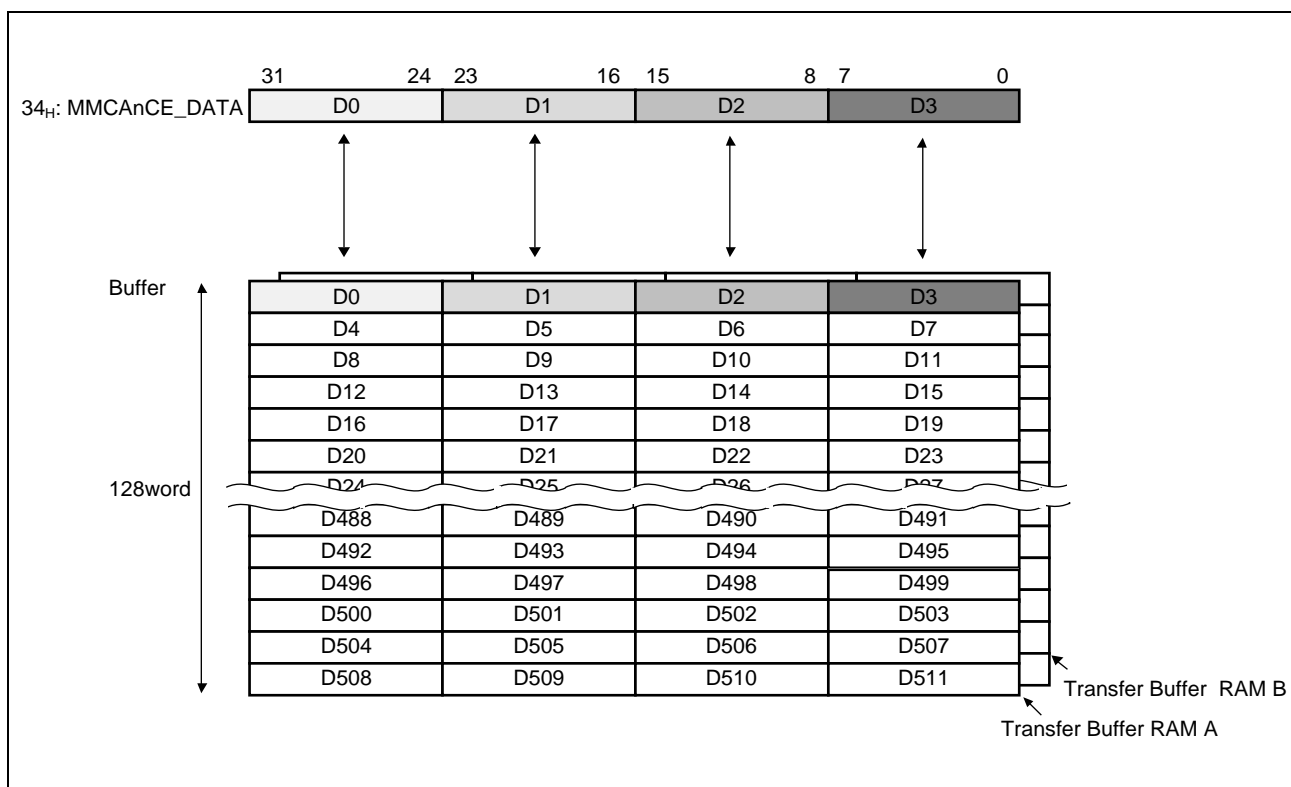

Figure 18.6 Double Buffer Structure

This module has the buffer access select function that allows byte-wise swapping of data when the buffer is accessed by writing to or reading from MMCA<sub>n</sub>CE\_DATA. This function is enabled by the setting of MMCA<sub>n</sub>CE\_BUFF\_ACC. The figure below shows the specification of 32-bit accesses.

Figure 18.7 Specification of Byte-Swapping

### 18.4.3.4 Automatic CMD12 Issuance

This module has the function that automatically issues CMD12 when multi-block transfer is performed with the CMD12EN bit in MMCAnCE\_CMD\_SET set to 1.

The figure below shows the timing of automatic CMD12 issuance in multi-block read. CMD12 is issued such that the end bit of the command is sent two bits before the end bit of the data during reception of the last block.

Figure 18.8 Timing of Automatically-Issued CMD12 in Multi-Block Read (1-Bit Mode)

The figure below shows the timing of automatic CMD12 issuance in multi-block write. CMD12 is issued after the data busy after transmission of the last block has ended.

Figure 18.9 Timing of Automatically-Issued CMD12 in Multi-Block Write (1-Bit Mode)

The argument for the automatically-issued CMD12 is set in MMCAnCE\_ARG\_CMD12. Bits [39:8] of the response to the CMD12 is stored in MMCAnCE\_RESP\_CMD12. "Busy" is involved in response reception.

### 18.4.3.5 MMC Clock Frequency in Boot Operations

The figure below shows the timing for changing the MMC clock frequency in boot operations. In boot operations, the MMC clock frequency can be switched to the value corresponding to the setting of the BTCLKDIV bits of MMCAAnCE\_BOOT 74 MMC clock cycles after MMCAAnCMD is modified from 1 to 0. Alternatively, it can be switched to the value corresponding to the setting of the CLKDIV bits of MMCAAnCE\_CLK\_CTRL 48 MMC clock cycles after MMCAAnCMD is modified from 0 to 1.

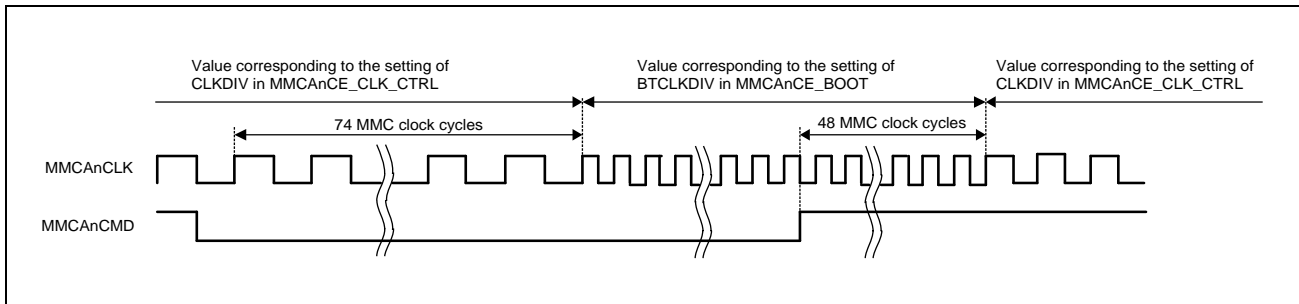

Figure 18.10 MMC Clock Frequency in Boot Operations

### 18.4.3.6 High Priority Interrupt (HPI)

The HPI should be processed according to the following procedure. See **Section 18.3, Registers**, and **Section 18.4.4, Examples of Setting**.

#### (a) To execute the HPI during a write to the device

- Terminate the command sequence forcibly.
- Wait until the CMDSEQ bit in MMCAAnCE\_HOST\_STS1 becomes 1.
- Issue CMD12 (R1) to cause a device state transition from rcv to prg. If the device is already in the prg state here, the device does not output a response.
- Issue CMD13 (R1).
- Issue the HPI command.\*<sup>1</sup>

#### (b) To execute the HPI in the response busy state not during a write to the device

- Terminate the command sequence forcibly.
- Wait until the CMDSEQ bit in MMCAAnCE\_HOST\_STS1 turns 0.
- Issue CMD13 (R1).
- Issue the HPI command.\*<sup>1</sup>

HPIs in the sequence of CMD6, CMD24, CMD25 (pre-defined), and CMD38 are supported.

**Note 1.** CMD12 (R1b) or CMD13 (R1b) differs depending on the e-MMC connected.

### 18.4.3.7 Background Operation

The background operation should be processed according to the following procedure. See **Section 18.3, Registers** and **Section 18.4.4, Examples of Setting**.

To execute background operation, issue CMD6 (R1) to write to the BKOPS\_START byte in the EXT\_CSD register of the device.

To confirm that background operation has been completed, issue CMD6 (R1) and then CMD13 (R1) to check the device state, or poll the MMCAnDAT[0]. If the device state is trans after issuing CMD13 (R1) or MMCAnDAT[0] is high, background operation has been completed.

To suspend background operation, use the HPI (see **Section 18.4.3.6, High Priority Interrupt (HPI)**).

### 18.4.3.8 Handling of this Module in the Case of Error/Timeout

This module may not be stopped when an error has occurred. If an error has occurred and the CMDSEQ bit in MMCAnCE\_HOST\_STS1 is still indicating that the command sequence is in progress, terminate the sequence forcibly and execute software reset. Note that the data for transmission or received data that had been stored in the buffers at the time of error occurrence are not guaranteed.

This module is not stopped when a timeout has occurred. Before issuing the next command after the timeout has occurred, terminate the sequence forcibly and execute software reset.

### 18.4.4 Examples of Setting

This section shows the procedures for executing typical command sequences.

#### 18.4.4.1 Legends

The figure below shows the legends for the symbols used in the figures in the following subsections.

## 18.5 Detection and Correction of Errors in MMCA RAM

For details of this ECC function, see **Section 40A.2.6, ECC for Peripheral RAM**.

## Section 19 Clocked Serial Interface G (CSIG)

This section contains a generic description of the Clocked Serial Interface G (CSIG).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of CSIG.

### 19.1 Features of RH850/F1KH, RH850/F1KM CSIG

#### 19.1.1 Number of Units

This microcontroller has the following number of CSIG units.

Each CSIG unit has single channel interface.

Table 19.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	5	5	5
Name	CSIGn (n = 0 to 4)	CSIGn (n = 0 to 4)	CSIGn (n = 0 to 4)

Table 19.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	2	4	4	4
Name	CSIGn (n = 0)	CSIGn (n = 0, 1)	CSIGn (n = 0 to 3)	CSIGn (n = 0 to 3)	CSIGn (n = 0 to 3)

Table 19.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	1	2	4
Name	CSIGn (n = 0)	CSIGn (n = 0, 1)	CSIGn (n = 0 to 3)

Table 19.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	CSIGn (n = 0)	CSIGn (n = 0)	CSIGn (n = 0)	CSIGn (n = 0)

Table 19.5 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual CSIG units are identified by the index "n": for example, CSIGnCTL0 (n = 0 to 4) is the CSIGn control register 0.

Table 19.6 Index (RH850/F1KM-S4, RH850/F1KM-S2)

Index	Description
n	Throughout this section, the individual CSIG units are identified by the index "n": for example, CSIGnCTL0 (n = 0 to 3) is the CSIGn control register 0.

Table 19.7 Index (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual CSIG units are identified by the index “n”: for example, CSIGnCTL0 (n = 0) is the CSIGn control register 0.

### 19.1.2 Register Base Addresses

CSIG base addresses are listed in the following table.

CSIG register addresses are given as offsets from the base addresses.

Table 19.8 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<CSIG0_base>	FFD8 8000 <sub>H</sub>
<CSIG1_base>	FFD8 A000 <sub>H</sub>
<CSIG2_base>	FFD8 C000 <sub>H</sub>
<CSIG3_base>	FFD8 E000 <sub>H</sub>
<CSIG4_base>	FFD9 2000 <sub>H</sub>

Table 19.9 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S2)

Base Address Name	Base Address
<CSIG0_base>	FFD8 8000 <sub>H</sub>
<CSIG1_base>	FFD8 A000 <sub>H</sub>
<CSIG2_base>	FFD8 C000 <sub>H</sub>
<CSIG3_base>	FFD8 E000 <sub>H</sub>

Table 19.10 Register Base Address (RH850/F1KM-S1)

Base Address Name	Base Address
<CSIG0_base>	FFD8 8000 <sub>H</sub>

### 19.1.3 Clock Supply

The CSIG clock supply is shown in the following table.

Table 19.11 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
CSIGn	PCLK	CKSCLK_ICSI	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_ICSI	Bus clock

### 19.1.4 Interrupt Requests

CSIG interrupt requests are listed in the following table.

Table 19.12 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
CSIG0			
INTCSIGTIC	Communication status interrupt	27,118	8
INTCSIGTIR	Receive status interrupt	28,119	9
INTCSIGTIRE	Communication error interrupt	57	—
CSIG1			
INTCSIGTIC	Communication status interrupt	223	66
INTCSIGTIR	Receive status interrupt	224	67
INTCSIGTIRE	Communication error interrupt	225	—
CSIG2			
INTCSIGTIC	Communication status interrupt	326	78
INTCSIGTIR	Receive status interrupt	327	79
INTCSIGTIRE	Communication error interrupt	328	—
CSIG3			
INTCSIGTIC	Communication status interrupt	329	125
INTCSIGTIR	Receive status interrupt	330	126
INTCSIGTIRE	Communication error interrupt	331	—
CSIG4			
INTCSIGTIC	Communication status interrupt	98	39
INTCSIGTIR	Receive status interrupt	99	40
INTCSIGTIRE	Communication error interrupt	100	—

Table 19.13 Interrupt Requests (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
CSIG0			
INTCSIGTIC	Communication status interrupt	27,118	8
INTCSIGTIR	Receive status interrupt	28,119	9
INTCSIGTIRE	Communication error interrupt	57	—
CSIG1			
INTCSIGTIC	Communication status interrupt	223	66
INTCSIGTIR	Receive status interrupt	224	67
INTCSIGTIRE	Communication error interrupt	225	—
CSIG2			
INTCSIGTIC	Communication status interrupt	326	78
INTCSIGTIR	Receive status interrupt	327	79
INTCSIGTIRE	Communication error interrupt	328	—
CSIG3			
INTCSIGTIC	Communication status interrupt	329	125
INTCSIGTIR	Receive status interrupt	330	126
INTCSIGTIRE	Communication error interrupt	331	—

Table 19.14 Interrupt Requests (RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
CSIG0			
INTCSIGTIC	Communication status interrupt	27,118	8
INTCSIGTIR	Receive status interrupt	28,119	9
INTCSIGTIRE	Communication error interrupt	57	—

### 19.1.5 Reset Sources

CSIG reset sources are listed in the following table. CSIG is initialized by these reset sources.

Table 19.15 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
CSIGn	All reset sources (ISORES)

### 19.1.6 External Input/Output Signals

External input/output signals of CSIG are listed below.

Table 19.16 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
CSIG0		
CSIGTSCK	Serial clock signal	CSIG0SC* <sup>1</sup>
CSIGTSI	Serial data input signal	CSIG0SI
CSIGTSO	Serial data output signal	CSIG0SO* <sup>1</sup>
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG0SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG0RYI
CSIGTRYO	Ready / busy output signal	CSIG0RYO
CSIG1		
CSIGTSCK	Serial clock signal	CSIG1SC* <sup>1</sup>
CSIGTSI	Serial data input signal	CSIG1SI
CSIGTSO	Serial data output signal	CSIG1SO* <sup>1</sup>
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG1SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG1RYI
CSIGTRYO	Ready / busy output signal	CSIG1RYO
CSIG2		
CSIGTSCK	Serial clock signal	CSIG2SC* <sup>1</sup>
CSIGTSI	Serial data input signal	CSIG2SI
CSIGTSO	Serial data output signal	CSIG2SO* <sup>1</sup>
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG2SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG2RYI
CSIGTRYO	Ready / busy output signal	CSIG2RYO
CSIG3		
CSIGTSCK	Serial clock signal	CSIG3SC* <sup>1</sup>
CSIGTSI	Serial data input signal	CSIG3SI
CSIGTSO	Serial data output signal	CSIG3SO* <sup>1</sup>
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG3SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG3RYI
CSIGTRYO	Ready / busy output signal	CSIG3RYO
CSIG4		
CSIGTSCK	Serial clock signal	CSIG4SC* <sup>1</sup>
CSIGTSI	Serial data input signal	CSIG4SI
CSIGTSO	Serial data output signal	CSIG4SO* <sup>1</sup>
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG4SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG4RYI
CSIGTRYO	Ready / busy output signal	CSIG4RYO

Note 1. For the port pins that are used as CSIGnSO and CSIGnSC, set the output driver strength to high (PDSn\_m = 1).

Table 19.17 External Input/Output Signals (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Signal Name	Description	Alternative Port Pin Signal
CSIG0		
CSIGTSCK	Serial clock signal	CSIG0SC*1
CSIGTSI	Serial data input signal	CSIG0SI
CSIGTSO	Serial data output signal	CSIG0SO*1
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG0SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG0RYI
CSIGTRYO	Ready / busy output signal	CSIG0RYO
CSIG1		
CSIGTSCK	Serial clock signal	CSIG1SC*1
CSIGTSI	Serial data input signal	CSIG1SI
CSIGTSO	Serial data output signal	CSIG1SO*1
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG1SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG1RYI
CSIGTRYO	Ready / busy output signal	CSIG1RYO
CSIG2		
CSIGTSCK	Serial clock signal	CSIG2SC*1
CSIGTSI	Serial data input signal	CSIG2SI
CSIGTSO	Serial data output signal	CSIG2SO*1
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG2SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG2RYI
CSIGTRYO	Ready / busy output signal	CSIG2RYO
CSIG3		
CSIGTSCK	Serial clock signal	CSIG3SC*1
CSIGTSI	Serial data input signal	CSIG3SI
CSIGTSO	Serial data output signal	CSIG3SO*1
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG3SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG3RYI
CSIGTRYO	Ready / busy output signal	CSIG3RYO

Note 1. For the port pins that are used as CSIGNSO and CSIGNSC, set the output driver strength to high (PDSCn\_m = 1).

Table 19.18 External Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
CSIG0		
CSIGTSCK	Serial clock signal	CSIG0SC*1
CSIGTSI	Serial data input signal	CSIG0SI
CSIGTSO	Serial data output signal	CSIG0SO*1
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG0SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG0RYI
CSIGTRYO	Ready / busy output signal	CSIG0RYO

Note 1. For the port pins that are used as CSIGNSO and CSIGNSC, set the output driver strength to high (PDSCn\_m = 1).

### 19.1.7 Data Consistency Check

The port and the alternative function for data consistency check of CSIGnSO (CSIGTSO) output are shown in the following table. See **Section 19.5.10, Error Detection** for details on data consistency checking.

Table 19.19 Port Pins for Data Consistency Checking (RH850/F1KH-D8)

Unit Signal Name	Port Pin Name	Alternative Function

## 19.2 Overview

### 19.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode or slave mode is selectable.
- Slave select input signal (  $\overline{\text{CSIGTSSI}}$  ) is available.
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, whereas it is determined by the input clock in slave mode.
- Maximum transfer clock frequency:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6)
- Clock phases and data phases are selectable.
- Data transfer with MSB first or LSB first is selectable.
- Transfer data length is selectable from 7 to 16 bits in 1-bit units
- Built-in EDL (extended data length) function for transferring more than 16 bits of data.
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Built-in handshake function
- Built-in error detection (data consistency check, parity, overrun)
- Three different interrupt request signals (INTCSIGTIC, INTCSIGTIR, INTCSIGTIRE)
- Built-in LBM (Loop Back Mode) function for self-test

### 19.2.2 Functional Overview Description

The CSIG uses three signals for communication:

- Transmission clock CSIGTSCK (output in master mode, input in slave mode)
- Serial data output signal CSIGTSO
- Serial data input signal CSIGTSI

The CSIGNCTL2 register is used to select whether the CSIG should be operated in master mode or slave mode.

Additional signals can be used for external control and monitoring:

- $\overline{\text{CSIGTSSI}}$  : Slave select input signal
- CSIGTRYO: Ready/busy output signal (handshake signal)
- CSIGTRYI: Ready/busy input signal (handshake signal)

Data transmission is bit-wise and serial and synchronous to the transmission clock.

The following table shows the most important registers for setting up CSIG.

Table 19.22 Main Registers of CSIG

Register	Function
CSIGnCTL0	Provides and stops operating clock and enables/disables data transmission and data reception.
CSIGnCTL1	Controls options such as interrupt timing, extended data length, data consistency check, loop-back mode, handshake, etc.
CSIGnCTL2	Selects master or slave mode, and the transfer clock frequency of the built-in baud rate generator (BRG) in master mode.
CSIGnCFG0	Configures the communication protocol.

### 19.2.3 Block Diagram

The following block diagram shows the main components of the CSIG.

Figure 19.1 CSIG Block Diagram

In master mode, the transmission clock CSIGTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

## 19.3 Registers

### 19.3.1 List of Registers

CSIG registers are listed in the following table.

For details on <CSIGn\_base>, see **Section 19.1.2, Register Base Addresses**.

Table 19.23 List of Registers

Module Name	Register Name	Symbol	Address
CSIGn	CSIGn control register 0	CSIGnCTL0	<CSIGn_base> + 0000 <sub>H</sub>
	CSIGn control register 1	CSIGnCTL1	<CSIGn_base> + 0010 <sub>H</sub>
	CSIGn control register 2	CSIGnCTL2	<CSIGn_base> + 0014 <sub>H</sub>
	CSIGn status register 0	CSIGnSTR0	<CSIGn_base> + 0004 <sub>H</sub>
	CSIGn status clear register 0	CSIGnSTCR0	<CSIGn_base> + 0008 <sub>H</sub>
	CSIGn Rx-only mode control register 0	CSIGnBCTL0	<CSIGn_base> + 1000 <sub>H</sub>
	CSIGn configuration register 0	CSIGnCFG0	<CSIGn_base> + 1010 <sub>H</sub>
	CSIGn transmission register 0 for word access	CSIGnTX0W	<CSIGn_base> + 1004 <sub>H</sub>
	CSIGn transmission register 0 for half word access	CSIGnTX0H	<CSIGn_base> + 1008 <sub>H</sub>
	CSIGn reception register 0	CSIGnRX0	<CSIGn_base> + 100C <sub>H</sub>
	CSIGn emulation register	CSIGnEMU	<CSIGn_base> + 0018 <sub>H</sub>

### 19.3.2 CSIGNCTL0 — CSIGN Control Register 0

This register controls the operation clock, and enables or disables transmission/reception.

**Access:** This register can be read or written in 8-bit units.

**Address:** <CSIGN\_base> + 0000<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	CSIGNPWR	CSIGNTXE	CSIGNRXE	—	—	—	—	CSIGNMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R/W

Table 19.24 CSIGNCTL0 Register Contents

Bit Position	Bit Name	Function
7	CSIGNPWR	Controls operation clock. 0: Stops operation clock. 1: Supplies operation clock. Clearing CSIGNPWR to 0 resets the internal circuits, stops operation, and sets the CSIG to standby state. Clock supply to internal circuits stops. If CSIGNPWR is cleared during communication, ongoing communication is aborted. In this case, communication setting must be started from the beginning.
6	CSIGNTXE	Enables/disables transmission. 0: Transmission disabled 1: Transmission enabled
5	CSIGNRXE	Enables/disables reception. 0: Reception disabled 1: Reception enabled
4 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CSIGNMBS	When setting CSIGNCTL0.CSIGNPWR = 1, be sure to set to this bit to 1. (The value after reset is "0".)

#### CAUTION

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers.**

### 19.3.3 CSIGNCTL1 — CSIGN Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake function, and slave select function.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIGN\_base> + 0010<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CSIGNCKR	CSIGNSLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CSIGNEDLE	—	CSIGNDCS	—	CSIGNLBM	CSIGNSIT	CSIGNHSE	CSIGNSSE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 19.25 CSIGNCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	CSIGNCKR	CSIGTSCK clock inversion function 0: Default level of CSIGTSCK is high. 1: Default level of CSIGTSCK is low. The CSIGNCKR bit is used in combination with the CSIGNCFG0.CSIGNDAP bit. For details, see <b>Section 19.3.8, CSIGNCFG0 — CSIGN Configuration Register 0</b> .
16	CSIGNSLIT	Selects the timing of interrupt INTCSIGTIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: Interrupt generation when CSIGNTXOW/H is empty and available for storing the next data. For details, see <b>Section 19.4.2, INTCSIGTIC (Communication Status Interrupt)</b> .
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	CSIGNEDLE	Enables/disables extended data length (EDL) mode. 0: Extended data length mode disabled 1: Extended data length mode enabled For details, see <b>Section 19.5.5.2, Data Length Selection with Extended Data Length</b> .
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CSIGNDCS	Enables/disables data consistency check. 0: Data consistency check disabled 1: Data consistency check enabled For details, see <b>Section 19.5.10.1, Data Consistency Check</b> .
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	CSIGNLBM	Controls loop-back mode (LBM). 0: Loop-back mode deactivated 1: Loop-back mode activated Loop-back mode can be set only in master mode. Set this bit to 0 in slave mode. For details, see <b>Section 19.5.9, Loop-Back Mode</b> .

Table 19.25 CSIGnCTL1 Register Contents

Bit Position	Bit Name	Function
2	CSIGnSIT	Selects interrupt delay mode. 0: No delay 1: Half clock delay for all interrupts This bit is only valid in master mode. In slave mode, no delay is generated. For details, see <b>Section 19.4.1, Interrupt Delay</b> .
1	CSIGnHSE	Enables/disables handshake function. 0: Handshake function disabled 1: Handshake function enabled For details, see <b>Section 19.5.8, Handshake Function</b> .
0	CSIGnSSE	Enables/disables slave select function. 0: Input signal $\overline{\text{CSIGTSSI}}$ disabled. 1: Input signal $\overline{\text{CSIGTSSI}}$ enabled. If the slave select function is not used, this bit must be set to 0 (see also <b>Section 19.5.2, Master/Slave Connections</b> ).

Details about CSIGnCTL1.CSIGnSSE:

Table 19.26 Operation of the Slave Select Function during Reception

CSIGnCTL0.CSIGnRXE	CSIGnCTL1.CSIGnSSE	$\overline{\text{CSIGTSSI}}$	Receive Operation
0	—	—	Reception disabled
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

Table 19.27 Operation of the Slave Select Function during Transmission

CSIGnCTL0.CSIGnTXE	CSIGnCTL1.CSIGnSSE	$\overline{\text{CSIGTSSI}}$	Transmit Operation
0	—	—	Transmission disabled
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

#### CAUTION

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers**.

### 19.3.4 CSIGNCTL2 — CSIGN Control Register 2

This register selects the communication clock.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIGN\_base> + 0014<sub>H</sub>

**Value after reset:** E000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### CAUTION

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers.**

### 19.3.5 CSIGNSTR0 — CSIGN Status Register 0

This register indicates the status of the CSIG.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <CSIGN\_base> + 0004<sub>H</sub>

**Value after reset:** 0000 0010<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.29 CSIGNSTR0 Register Contents

Bit Position	Bit Name	Function																								
31 to 8	Reserved	When read, the value after reset is returned.																								
7	CSIGNTSF	Transfer Status Flag 0: Idle state 1: Communication is in progress or being prepared The timing to set or clear this bit is as follows: <table border="1" style="width: 100%; margin-top: 5px;"> <thead> <tr> <th>Master Mode</th> <th>Timing to Set</th> <th>Timing to Clear</th> </tr> </thead> <tbody> <tr> <td>Tx-only mode</td> <td>Writing to transmission register</td> <td>Within a half clock cycle from the last serial clock edge</td> </tr> <tr> <td>Tx/Rx mode</td> <td></td> <td></td> </tr> <tr> <td>Rx-only mode</td> <td>Reading from reception register</td> <td></td> </tr> </tbody> </table> <table border="1" style="width: 100%; margin-top: 5px;"> <thead> <tr> <th>Slave Mode</th> <th>Timing to Set</th> <th>Timing to Clear</th> </tr> </thead> <tbody> <tr> <td>Tx-only mode</td> <td>Writing to transmission register</td> <td>Within a half clock cycle from the last serial clock edge</td> </tr> <tr> <td>Tx/Rx mode</td> <td></td> <td></td> </tr> <tr> <td>Rx-only mode</td> <td>CSIGNTSCK input</td> <td></td> </tr> </tbody> </table>	Master Mode	Timing to Set	Timing to Clear	Tx-only mode	Writing to transmission register	Within a half clock cycle from the last serial clock edge	Tx/Rx mode			Rx-only mode	Reading from reception register		Slave Mode	Timing to Set	Timing to Clear	Tx-only mode	Writing to transmission register	Within a half clock cycle from the last serial clock edge	Tx/Rx mode			Rx-only mode	CSIGNTSCK input	
Master Mode	Timing to Set	Timing to Clear																								
Tx-only mode	Writing to transmission register	Within a half clock cycle from the last serial clock edge																								
Tx/Rx mode																										
Rx-only mode	Reading from reception register																									
Slave Mode	Timing to Set	Timing to Clear																								
Tx-only mode	Writing to transmission register	Within a half clock cycle from the last serial clock edge																								
Tx/Rx mode																										
Rx-only mode	CSIGNTSCK input																									
6 to 4	Reserved	When read, the value after reset is returned.																								
3	CSIGNDCE	Data Consistency Check Error Flag 0: No data consistency check error detected 1: Data consistency check error detected This bit is cleared by writing 1 to CSIGNSTR0.CSIGNDCEC. When setting to 1 due to data consistency check error detection and clearing to 0 by CSIGNSTR0.CSIGNDCEC occur simultaneously, setting to 1 due to data consistency check error detection takes precedence. This bit is initialized when CSIGNCTL0.CSIGNPWR changes from 0 to 1, or from 1 to 0.																								
2	Reserved	When read, the value after reset is returned.																								

Table 19.29 CSIGNSTR0 Register Contents

Bit Position	Bit Name	Function
1	CSIGNPE	<p>Parity Error Flag</p> <p>0: No parity error detected</p> <p>1: Parity error detected</p> <p>This bit is cleared by writing 1 to CSIGNSTCR0.CSIGNPEC.</p> <p>When setting to 1 due to parity error detection and clearing to 0 by writing to CSIGNSTCR0.CSIGNPEC occur simultaneously, setting to 1 due to parity error detection takes precedence.</p> <p>This bit is initialized when CSIGNCTL0.CSIGNPWR changes from 0 to 1, or from 1 to 0.</p>
0	CSIGNOVE	<p>Overrun Error Flag</p> <p>0: No overrun error detected</p> <p>1: Overrun error detected</p> <p>This bit is cleared by writing 1 to CSIGNSTCR0.CSIGNOVEC.</p> <p>When setting to 1 due to overrun error detection and clearing to 0 by writing to CSIGNSTCR0.CSIGNOVEC occur simultaneously, setting to 1 due to overrun error detection takes precedence.</p> <p>This bit is initialized by the value of CSIGNCTL0.CSIGNPWR changes from 0 to 1, or from 1 to 0.</p>

**CAUTION**

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers.**

### 19.3.6 CSIGNSTCR0 — CSIGN Status Clear Register 0

This register clears the status flags of the CSIGNSTR0 status register.

**Access:** This register can be read or written in 16-bit units.

When read, the value 0000<sub>H</sub> is always returned.

**Address:** <CSIGN\_base> + 0008<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CSIGN DCEC	—	CSIGN PEC	CSIGN OVEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W

Table 19.30 CSIGNSTCR0 Register Contents

Bit Position	Bit Name	Function
15 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	CSIGNDCEC	Controls the data consistency check error flag clear command. 0: No operation. Read value is always 0. 1: Clears the data consistency check error flag (CSIGNSTR0.CSIGNDCE).
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CSIGNPEC	Controls the parity error flag clear command. 0: No operation. Read value is always 0. 1: Clears the parity error flag (CSIGNSTR0.CSIGNPE).
0	CSIGNOVEC	Controls the overrun error flag clear command. 0: No operation. Read value is always 0. 1: Clears the overrun error flag (CSIGNSTR0.CSIGNOVE).

### 19.3.7 CSIGNBCTL0 — CSIGN Rx-Only Mode Control Register 0

This register enables/disables the data transfer in Rx-only mode.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** <CSIGN\_base> + 1000H

**Value after reset:** 01H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CSIGNSCE
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R/W

Table 19.31 CSIGNBCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CSIGNSCE	Disables/enables the start of the next data reception by reading CSIGNRX0. 0: Next reception disabled 1: Next reception enabled For details, see <b>Section 19.5.4.2, Receive-Only Mode</b> .

#### CAUTION

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers**.

### 19.3.8 CSIGNCFG0 — CSIGN Configuration Register 0

This register configures the communication protocols such as data length, parity, transfer direction, clock phase, and data phase.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIGN\_base> + 1010<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**CAUTION**

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers.**

### 19.3.9 CSIGNTX0W — CSIGN Transmission Register 0 for Word Access

This register stores the transmission data and specifies the extended data length.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIGN\_base> + 1004<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29	CSIGNEDL	Specifies the extended data length. 0: Normal operation 1: Extended data length enabled The associated data is transmitted as 16-bit data. This bit can only be set if CSIGNCTL1.CSIGNEDLE = 1.
28 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	CSIGNTX[15:0]	Data to be transmitted

#### CAUTION

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers.**

### 19.3.10 CSIGNTX0H — CSIGN Transmission Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of CSIGNTX0W register.

The settings specified by the upper 16 bits of CSIGNTX0W are applied to the transmission.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIGN\_base> + 1008<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15 to 0	CSIGNTX[15:0]	Data to be transmitted

#### CAUTION

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers.**

### 19.3.11 CSIGNRX0 — CSIGN Reception Register 0

This register stores the received data.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <CSIGN\_base> + 100C<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 19.35 CSIGNRX0 Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIGNRX[15:0]	Received Data These bits are initialized when CSIGNCTL0.CSIGNPWR changes from 0 to 1 or from 1 to 0. When reading, the values of these bits must be read at least 1 clock before the generation of CSIGTIR interrupt.

#### CAUTION

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers.**

### 19.3.12 CSIGNEMU — CSIGN Emulation Register

This register controls operation by SVSTOP.

**Access:** This register can be read or written in 8-bit or 1-bit units.

Write to this register when EPC.SVSTOP = 0.

**Address:** <CSIGN\_base> + 0018<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	CSIGNSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 19.36 CSIGNEMU Register Contents

Bit Position	Bit Name	Function
7	CSIGNSVSDIS	Selects whether to continue or stop transmit/receive operation during debugging. <ul style="list-style-type: none"> <li>When the EPC.SVSTOP bit is set to 0:               <ul style="list-style-type: none"> <li>Continues transmit/receive operation regardless of the setting of this bit.</li> </ul> </li> <li>When the EPC.SVSTOP bit is set to 1:               <ul style="list-style-type: none"> <li>0: Stops transmit/receive operation.</li> <li>1: Continues transmit/receive operation.</li> </ul> </li> </ul>
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### CAUTION

When configuring this register, see **Table 19.37, List of Cautions when Configuring the Registers.**

### 19.3.13 List of Cautions

Table 19.37 List of Cautions when Configuring the Registers

Register Name	Bit Name	Cautions
CSIGnCTL0	CSIGnPWR	If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, it is necessary to restart the communication.
CSIGnCTL0	CSIGnTXE CSIGnRXE	Do not modify any of these bits while CSIGnCTL0.CSIGnPWR = 0. (These bits can be modified simultaneously with the CSIGnCTL0.CSIGnPWR bit.) Do not modify these bits while CSIGnSTR0.CSIGnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted.
CSIGnCTL0	CSIGnMBS	When setting CSIGnCTL0.CSIGnPWR = 1, be sure to set this bit to 1. (The value after reset is "0".) This bit must be modified simultaneously with CSIGnCTL0.CSIGnPWR bit.
CSIGnCTL1	CSIGnCKR	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnCTL1	CSIGnSLIT CSIGnEDLE CSIGnDCS CSIGnHSE	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnCTL1	CSIGnLBM	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting this bit to 1 is prohibited in slave mode.
CSIGnCTL1	CSIGnSSE	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting this bit to 1 is prohibited in master mode.
CSIGnCTL1	CSIGnSIT	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIGnCTL2	CSIGnPRS[2:0] CSIGnBRS[11:0]	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting of the maximum transfer clock frequency is as follows. <ul style="list-style-type: none"> <li>• Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)</li> <li>• Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6)</li> </ul>
CSIGnSTR0	CSIGnTSF	Writing to this bit is prohibited, and only reading is permitted.
CSIGnSTR0	CSIGnDCE CSIGnPE CSIGnOVE	Writing to these bits is prohibited, and only reading is permitted. These bits are initialized when CSIGnCTL0.CSIGnPWR = 0 → 1 or CSIGnCTL0.CSIGnPWR = 1 → 0.
CSIGnBCTL0	CSIGnSCE	Write to this bit before CSIGnRX0 is read. Fix the CSIGnSCE bit to 0 when the transfer mode is transmit mode or transmit/receive mode.
CSIGnCFG0	CSIGnPS[1:0] CSIGnDLS[3:0] CSIGnDIR CSIGnDAP	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnTX0W	CSIGnEDL	This bit is valid only when CSIGnCTL1.CSIGnEDLE = 1.
CSIGnTX0W CSIGnTX0H		Write access to these bits are prohibited when CSIGnCTL0.CSIGnTXE = CSIGnCTL0.CSIGnRXE = 0.
CSIGnRX0		These bits are initialized when CSIGnCTL0.CSIGnPWR = 0 → 1 or CSIGnCTL0.CSIGnPWR = 1 → 0. Read access to this bit is prohibited when CSIGnCTL0.CSIGnTXE = CSIGnCTL0.CSIGnRXE = 0.
CSIGnEMU	CSIGnSVSDIS	Modification of this bit is prohibited while SVSTOP = 1.

## 19.4 Interrupt Sources

CSIG can generate the following interrupts:

- INTCSIGTIC (communication status interrupt)
- INTCSIGTIR (reception status interrupt)
- INTCSIGTIRE (communication error interrupt)

### 19.4.1 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half cycle of the transmission clock CSIGTSCK. This function is not available in slave mode.

The delay is specified by setting CSIGnCTL1.CSIGnSIT = 1. (The setting of the CSIGnSIT bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIGnCTL1.CSIGnSIT = 1 (interrupt delay enabled), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), and CSIGnCFG0.CSIGnDLS[3:0] = 1000<sub>B</sub> (data length 8 bits).

Figure 19.2 Interrupt Delay Function (CSIGnCTL1.CSIGnSIT = 1)

### 19.4.2 INTCSIGTIC (Communication Status Interrupt)

This interrupt is normally generated after every data transfer. It can be used to trigger a DMA for writing new transmission data to register CSIGNTX0W or CSIGNTX0H.

The following example assumes master mode and a setting of CSIGNCTL1.CSIGNSIT = 0 (no interrupt delay), CSIGNCTL1.CSIGNCKR = 0, CSIGNCFG0.CSIGNDAP = 0 (normal clock and data phase), CSIGNCFG0.CSIGNDLS[3:0] = 1000<sub>B</sub> (data length 8 bits), and CSIGNCTL1.CSIGNSLIT = 0 (normal interrupt timing).

Figure 19.3 Generation of INTCSIGTIC after Communication (CSIGNCTL1.CSIGNSLIT = 0)

However, INTCSIGTIC can also be set up to occur when the CSIGNTX0W/H register is empty and available for receiving the next data. This is specified by setting CSIGNCTL1.CSIGNSLIT = 1.

This mode allows more efficient data transfers.

The effect is illustrated in the figure below.

Figure 19.4 Generation of INTCSIGTIC at the Beginning of Communication

### 19.4.3 INTCSIGTIR (Reception Status Interrupt)

This interrupt is generated in receive-only and transmit/receive mode after data has been received and is available in the reception register. It can be used to trigger a DMA for reading the received data from CSIGNRX0 register.

The following example assumes master mode and a setting of CSIGNCTL1.CSIGNSIT = 0 (no interrupt delay), CSIGNCTL1.CSIGNCKR = 0, CSIGNCFG0.CSIGNDAP = 0 (normal clock and data phase), and CSIGNCFG0.CSIGNDLS[3:0] = 1000<sub>B</sub> (data length 8 bits).

Figure 19.5 Generation of INTCSIGTIR

### 19.4.4 INTCSIGTIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

Table 19.38 Data Error Types

Error Type	Communication Status After Error Interrupt	Note
Parity error	Interrupt is generated and communication continues.	—
Data consistency check error	Interrupt is generated and communication continues.	—
Overrun error*1	When CSIGNCTL1.CSIGNHSE = 0 (handshake function disabled) in slave mode, interrupt is generated and communication continues.	When CSIGNCTL1.CSIGNHSE = 1 (handshake function enabled) in slave mode, communication stops due to the handshake. An interrupt is not generated and an overrun error does not occur.

Note 1. In master mode, overrun errors do not occur.  
In slave mode, communication cannot be stopped.

The type of error that caused the generation of INTCSIGTIRE is indicated in register CSIGNSTR0.

For details about the various error types, see **Section 19.5.10, Error Detection**.

## 19.5 Operation

### 19.5.1 Master/Slave Mode

Whether CSIG operates in master mode or in slave mode depends on the setting of bits CSIGNCTL2.CSIGNPRS[2:0]. If master mode is selected, the source of the transmission clock must be selected as well.

#### 19.5.1.1 Master Mode

In master mode, the serial transmission clock is generated by the built-in baud rate generator (BRG) and supplied to the slave via signal CSIGTSCK.

Master mode is enabled by setting bits CSIGNCTL2.CSIGNPRS[2:0] to values other than 111<sub>B</sub>. In master mode, the frequency of BRG can be configured by setting bits CSIGNCTL2.CSIGNPRS[2:0] and bits CSIGNCTL2.CSIGNBRS[11:0].

The default level of CSIGTSCK depends on the CSIGTSCK clock inversion function bit; it is high when CSIGNCTL1.CSIGNCKR = 0, and is low when CSIGNCTL1.CSIGNCKR = 1.

The example below shows the communication in master mode for 8-bit data, CSIGNCTL1.CSIGNCKR = 0, CSIGNCFG0.CSIGNDAP = 0, and MSB first:

Figure 19.6 Transmission/Reception in Master Mode

### 19.5.1.2 Slave Mode

In slave mode, another device is the communication master. The external clock is supplied via the signal CSIGTSCK. Transmit/receive operation starts as soon as a clock signal is detected.

Slave mode is selected by setting CSIGnCTL2.CSIGnPRS[2:0] to 111<sub>B</sub>.

#### NOTE

When using slave mode, disable the baud rate generator (BRG) by setting bits CSIGnCTL2.CSIGnBRS[11:0] to 000<sub>H</sub>.

The example below shows the communication in slave mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

Figure 19.7 Transmission/Reception in Slave Mode

## 19.5.2 Master/Slave Connections

### 19.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

Figure 19.8 Direct Master/Slave Connection

### 19.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this case, the master must provide one slave select (SS) signal to each of the slaves. This signal is connected to the slave select input  $\overline{\text{CSIGTSSI}}$  of the slave.

The  $\overline{\text{CSIGTSSI}}$  signal can be enabled or disabled by the CSIGnCTL1.CSIGnSSE bit.

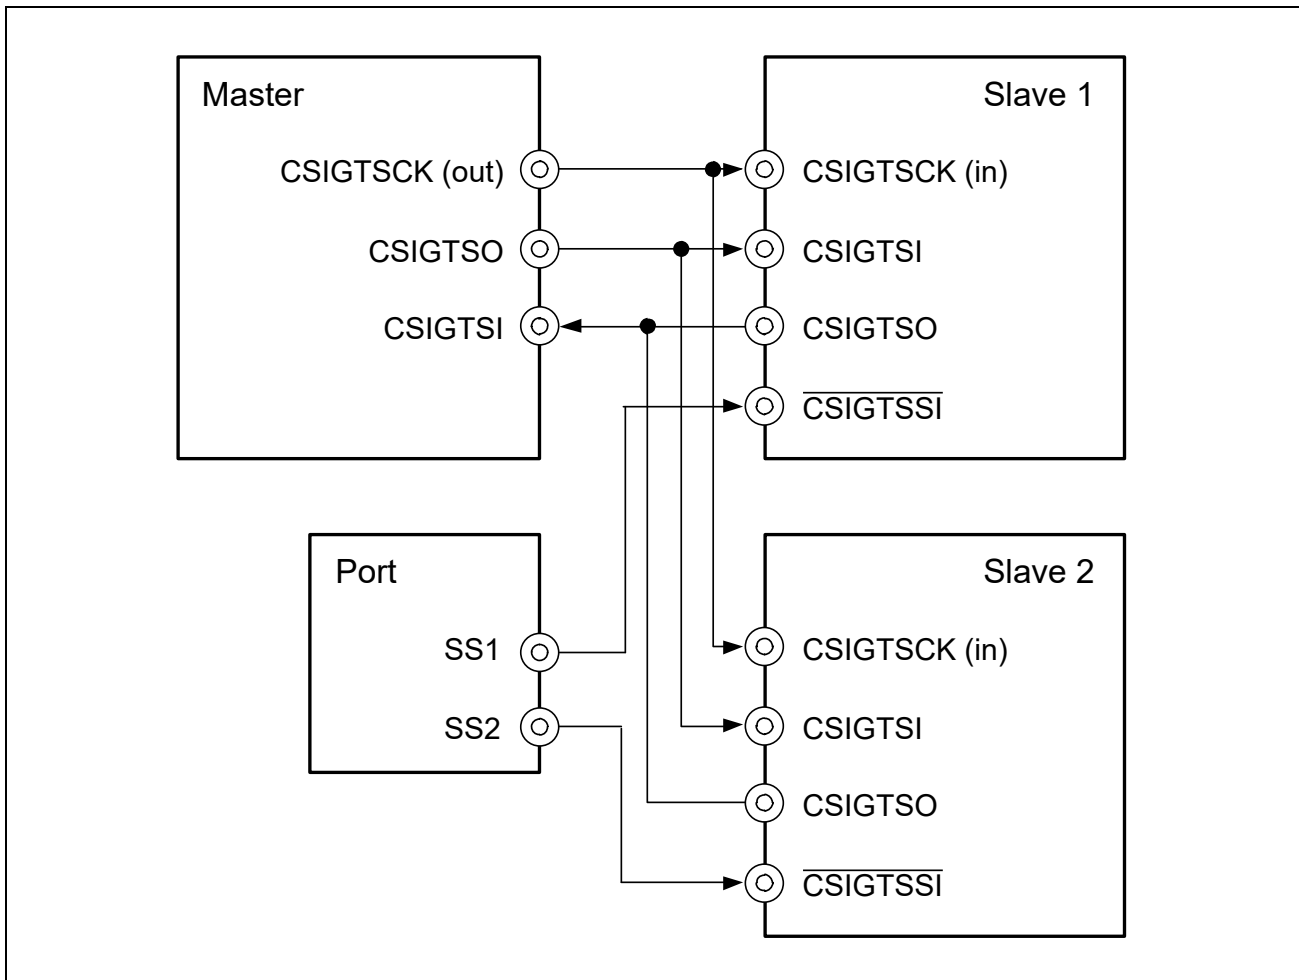

Figure 19.9 Master to Multiple Slaves Connection

A slave is selected (enabled) when its  $\overline{\text{CSIGTSSI}}$  signal is low.

If it is not selected, the slave will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set (CSIGnCTL0.CSIGnTXE = 1), the CSIGTSO output buffer of the slave which is not selected is disabled and set to input mode in order to avoid interference with the outputs of other selected slaves.

### 19.5.3 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the CSIGNPRS[2:0] and CSIGNBRS[11:0] bits in the CSIGNCTL2 register.

The following figure shows a block diagram of the BRG.

Figure 19.10 BRG Block Diagram

Setting CSIGNCTL2.CSIGNBRS[11:0] to 000<sub>H</sub> disables the BRG.

#### Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated as:

$$\text{Transfer clock frequency (CSIGTSCK)} = \text{PCLK} / (\text{division ratio of PCLK}) = \text{PCLK} / (2^{\alpha} \times k \times 2) \text{ where:}$$

$$\alpha = \text{CSIGNCTL2.CSIGNPRS}[2:0] = 0 \text{ to } 6$$

$$k = \text{CSIGNCTL2.CSIGNBRS}[11:0] = 1 \text{ to } 4095$$

#### Transfer clock frequency upper and lower limits

When specifying the transfer clock frequency, please note the following:

- For the maximum transfer clock frequency of this product in master mode or slave mode, refer to the CSIG timing shown in the electrical characteristics. In addition, in either mode, specify a frequency within the defined range.
- The minimum transfer clock frequency in master mode and slave mode is PCLK/524160.
- The maximum transfer clock frequency is as follows:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6)

## 19.5.4 Data Transfer Modes

### 19.5.4.1 Transmit-Only Mode

Setting CSIGNCTL0.CSIGNTXE = 1 and CSIGNCTL0.CSIGNRXE = 0 places CSIG in transmit-only mode. Transmission starts when data to be transmitted is written in the CSIGNTX0W or CSIGNTX0H register.

#### CAUTION

When the mode transitions from one of the receive modes to transmit-only mode, the data in the CSIGNRX0 buffer becomes undefined after completion of the first transmission.

Therefore, the reception register CSIGNRX0 has to be read before switching to transmit-only mode.

### 19.5.4.2 Receive-Only Mode

Setting CSIGNCTL0.CSIGNTXE = 0 and CSIGNCTL0.CSIGNRXE = 1 puts the CSIG in receive-only mode.

In master mode, reception starts when dummy data is read from the CSIGNRX0 register.

All subsequent receptions are triggered by reads from the CSIGNRX0 register, as long as CSIGNBCTL0.CSIGNSCE = 1.

Moreover, CSIGNBCTL0.CSIGNSCE has to be set to 0 before reading the last received data from CSIGNRX0.

The recommended procedure is:

1. Set CSIGNBCTL0.CSIGNSCE = 1.
2. Read CSIGNRX0 (dummy data).
3. Wait for the reception interrupt INTCSIGTIR.
4. Read CSIGNRX0 (received data).

In case more data receptions follow at step 3, continue to read until all data is received.

Before reading the last received data from CSIGNRX0, set CSIGNBCTL0.CSIGNSCE = 0.

In slave mode, reception starts when the communication clock CSIGTSCK is received from the master. In this case, it is not necessary to read data from the CSIGNRX0 register of the slave.

#### NOTE

In slave mode, any previously received data must be read from the reception register CSIGNRX0 in order to avoid any overwrite situation.

### 19.5.4.3 Transmit/Receive Mode

Setting CSIGNCTL0.CSIGNTXE = 1 and CSIGNCTL0.CSIGNRXE = 1 puts the CSIG in transmit/receive mode.

Data transfer (transmission and reception) starts when the data to be transmitted is written to the CSIGNTX0W or CSIGNTX0H register.

## 19.5.5 Data Length Selection

### 19.5.5.1 Data Length Selection without Extended Length

Transmission data length is selectable from 7 to 16 bits using the CSIGnDLS[3:0] bits in the CSIGnCFG0 register. The examples below show the communication with MSB first (CSIGnCFG0.CSIGnDIR = 0):

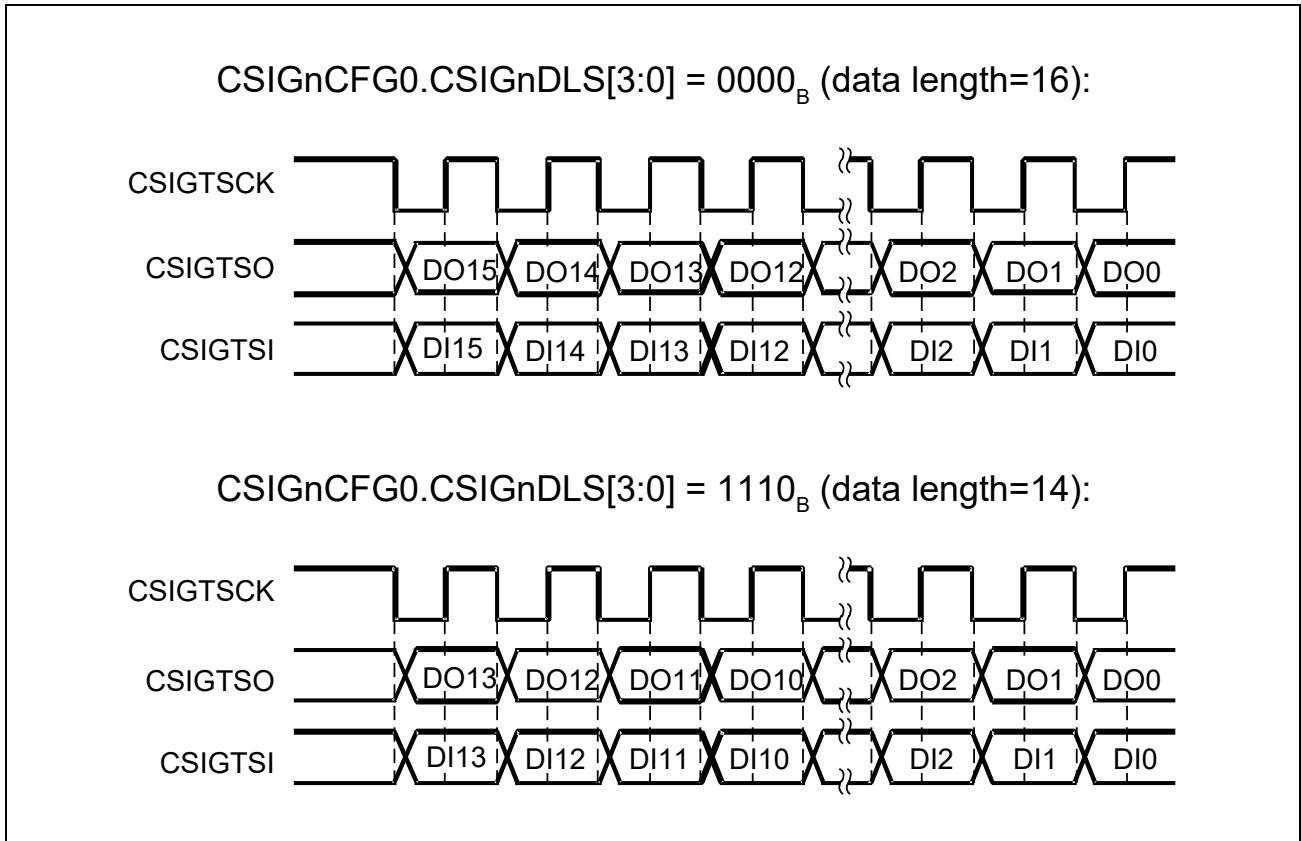

Figure 19.11 Data Length Selection Function

### 19.5.5.2 Data Length Selection with Extended Data Length

If the data to be transmitted/received exceeds 16 bits, the extended data length (EDL) function can be used.

The EDL function is enabled by setting the CSIGNCTL1.CSIGNEDLE bit to 1.

The following describes how the EDL function works and how to specify the EDL setting.

- The data has to be broken into 16-bit blocks plus remainder. For example, data of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as “data length” in CSIGNCFG0.CSIGNDLS[3:0] bits.
- Set the CSIGNTX0W.CSIGNEDL bit to 1 to transmit the 16-bit blocks. In this case, the data written to the CSIGNTX0W register is sent as 16-bit data regardless of the setting of the CSIGNCFG0.CSIGNDLS[3:0] bits.
- The transfer completes after the data with the specified data length (the remainder when CSIGNTX0W.CSIGNEDL = 0) has been sent.

#### Example

Example of sending 40 bits of data, 123456789A<sub>H</sub>:

40 bits are split into 2 × 16 bits plus 8 bits.

- Initialize CSIGNCFG0.CSIGNDLS[3:0] = 8D.
- To transmit the data 123456789A<sub>H</sub> with MSB first, write the following sequence to CSIGNTX0W:
  - 2000 1234<sub>H</sub> (CSIGNTX0W.CSIGNEDL = 1)
  - 2000 5678<sub>H</sub> (CSIGNTX0W.CSIGNEDL = 1)
  - 0000 009A<sub>H</sub> (CSIGNTX0W.CSIGNEDL = 0)

The following figure illustrates the timing.

Figure 19.12 EDL Timing Diagram

**NOTES**

---

1. Data length with less than 7 bits can be set only when EDL mode is used.
  2. It is not possible to transmit two consecutive data with a data length of less than 7 bits.
  3. If parity is enabled, the parity bit is added after the last bit.
  4. Example for setting the data direction:
    - Data to be transmitted: 123456<sub>H</sub>
    - MSB first:  
Set CSIGnCFG0.CSIGnDIR to 0.  
Write 2000 1234<sub>H</sub> to CSIGnTX0W (EDL bit = 1).  
Write 0000 0056<sub>H</sub> to CSIGnTX0W (EDL bit = 0).
    - LSB first:  
Set CSIGnCFG0.CSIGnDIR to 1.  
Write 2000 3456<sub>H</sub> to CSIGnTX0W (EDL bit = 1).  
Write 0000 0012<sub>H</sub> to CSIGnTX0W (EDL bit = 0).
  5. EDL mode cannot be used in the slave mode configured for receive-only mode.  
(CSIGnCTL2.CSIGnPRS[2:0] = 111<sub>B</sub>, CSIGnCTL0.CSIGnTXE = 0, CSIGnCTL0.CSIGnRXE = 1)
-

### 19.5.6 Serial Data Direction Selection Function

The serial data direction is selectable using the CSIGNDIR bit in the CSIGNCFG0 register. The examples below show the communication for 8-bit data (CSIGNCFG0.CSIGNDLS[3:0] = 1000<sub>B</sub>):

Figure 19.13 Serial Data Direction Select Function — MSB First (CSIGNDIR = 0)

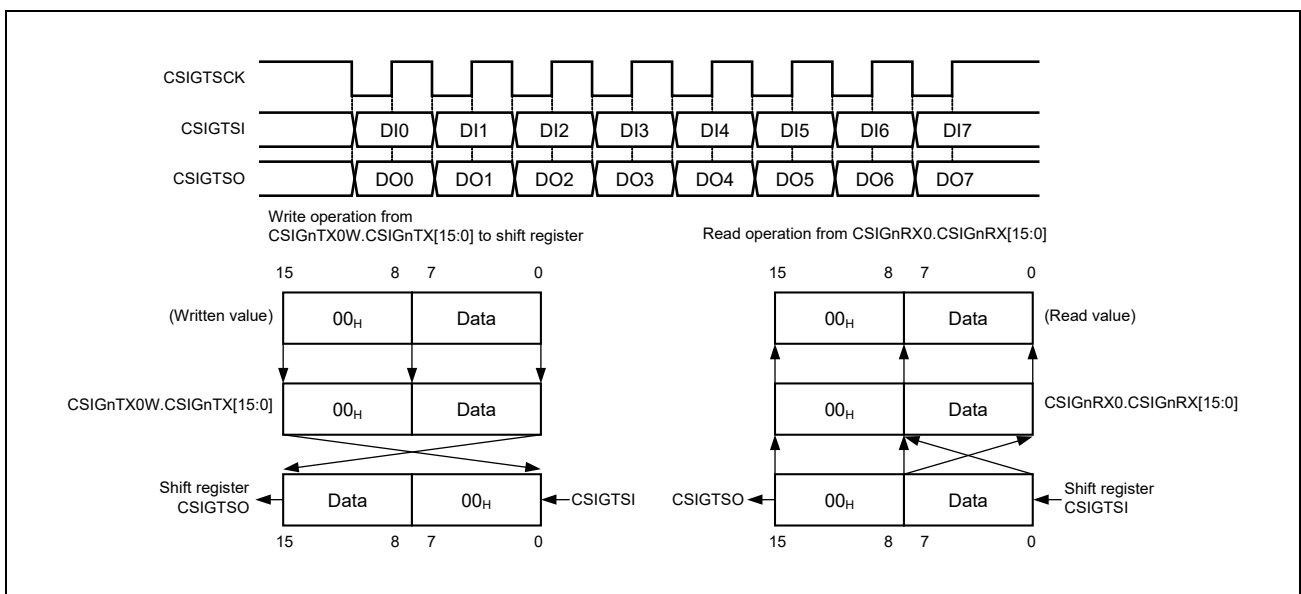

Figure 19.14 Serial Data Direction Select Function — LSB First (CSIGNDIR = 1)

### 19.5.7 Communication in Slave Mode

The following figure illustrates the communication signals and timing in slave mode.

Figure 19.15 Rx/Tx Communication Timing in Slave Mode

1. Slave mode is selected ( $\text{CSIGnCTL2.CSIGnPRS}[2:0] = 111_B$ ), the  $\overline{\text{CSIGTSSI}}$  signal is enabled ( $\text{CSIGnCTL1.CSIGnSSE} = 1$ ) and the clock phase is set to the high level ( $\text{CSIGnCTL1.CSIGnCKR} = 0$ ).
2. Data length is 8 bits ( $\text{CSIGnCFG0.CSIGnDLS}[3:0] = 1000_B$ ).  
Data direction is set to MSB first ( $\text{CSIGnCFG0.CSIGnDIR} = 0$ ).
3. CSIG is set to transmit/receive mode ( $\text{CSIGnCTL0.CSIGnPWR} = 1$ ,  $\text{CSIGnCTL0.CSIGnTXE} = 1$ ,  $\text{CSIGnCTL0.CSIGnRXE} = 1$ ).
4. When transfer data is written to the transmission register  $\text{CSIGnTX0H}$ , the transfer status flag  $\text{CSIGnSTR0.CSIGnTSF}$  is automatically set and the CSIG waits until signal  $\overline{\text{CSIGTSSI}}$  goes low.
5. While signal  $\overline{\text{CSIGTSSI}}$  is high, transmission/reception is not started even if the serial clock is input.  $\text{CSIGTSO}$  retains the values and input at  $\text{CSIGTSI}$  is ignored.
6. As soon as  $\overline{\text{CSIGTSSI}}$  falls to low level,  $\text{CSIGTSO}$  is enabled.
7. If the serial clock is input to the CSIG while  $\overline{\text{CSIGTSSI}}$  is low, transfer data is sent to  $\text{CSIGTSO}$  in synchronization with the serial clock, and simultaneously data is received from  $\text{CSIGTSI}$ .
8. The register  $\text{CSIGnRX0}$  is read.

## 19.5.8 Handshake Function

CSIG features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIGNCTL1.CSIGNHSE bit. For handshake, the signals CSIGTRYI and CSIGTRYO are used.

The busy timing depends on the setting of the data phase selection bit CSIGNCFG0.CSIGNDAP.

### 19.5.8.1 Slave Mode

If CSIGNCTL1.CSIGNHSE = 1, a low-level CSIGTRYO signal is output when the slave becomes busy. This happens when previously received data is still in the CSIGNRX0 register, and the new data cannot be copied from the shift register to CSIGNRX0 (CSIGNRX0 full condition).

The following examples assume a data length of 8 bits.

Figure 19.16 Ready/Busy Signal from Slave (CSIGNCFG0.CSIGNDAP = 0)

While the slave is busy, the master has to wait (i.e. suspend the transmission clock). The slave sets CSIGTRYO to high (“ready”) as soon as the read from the reception register CSIGNRX0 completes.

Figure 19.17 Ready/Busy Signal from Slave (CSIGNCFG0.CSIGNDAP = 1)

### 19.5.8.2 Master Mode

When the master detects low level of the CSIGTRYI while CSIGNCTL1.CSIGNHSE = 1, subsequent transfers are put on hold, the master goes into wait state and suspends the CSIGTSCK clock.

The CSIGTRYI level is checked at each half clock cycle of CSIGTSCK.

Figure 19.18 Master's Reaction to CSIGTRYI (CSIGNCFG0.CSIGNDAP = 0)

If the CSIGTRYI low signal from the slave is received while data transfer is in progress, the serial clock is suspended after the transfer is complete.

The master resumes the communication as soon as CSIGTRYI becomes high (slave is “ready”).

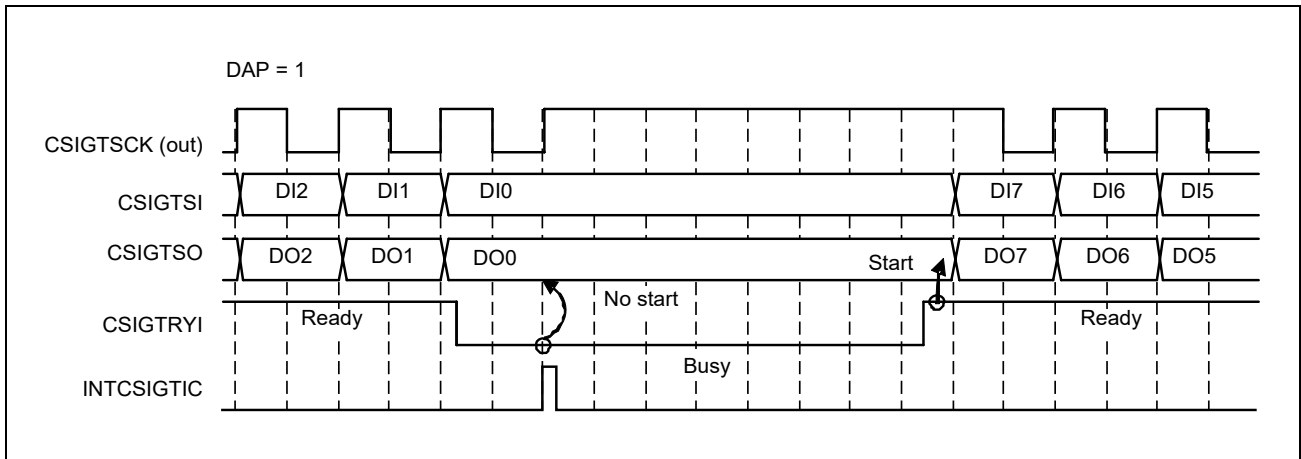

Figure 19.19 Master's Reaction to CSIGTRYI (CSIGNCFG0.CSIGNDAP = 1)

**CAUTION**

If multiple slaves are connected, the master must only detect the CSIGTRYI signal of the slave it has selected for communication.

CSIGTRYI of the master must be pulled down by the slave before the next transfer starts. Even if the signal is pulled down by the slave during the transfer, the transfer will continue until it completes.

### 19.5.9 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active ( $\text{CSIGNCTL1.CSIGNLBM} = 1$ ), the transmit and receive signals are internally connected, as shown in the figures below. The signals CSIGTSCK, CSIGTSO, and CSIGTSI are disconnected from the ports. In addition, the CSIGTSO output level is fixed to low, and CSIGTSCK is set to reset level (High). The rest of CSIG works as in normal operation.

In order to test the CSIG, set the loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data.

Table 19.39 Output Level of Pins

Pin	Output Level
CSIGTSCK(out)	High level
CSIGTSO	Low level (not dependent on the previous value)
Interrupt	Normal function
CSIGTRYO	Normal function (Low level)

Figure 19.20 Normal Operation

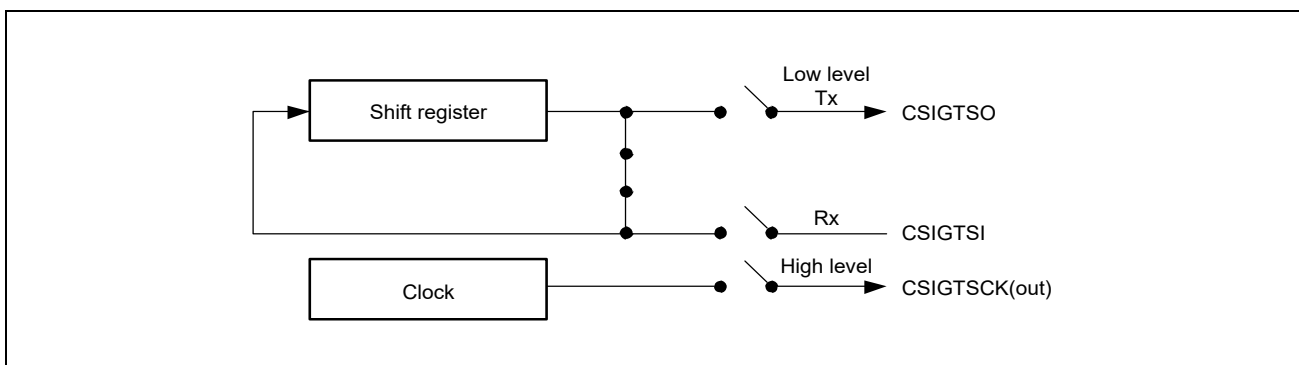

Figure 19.21 Operation in Loop-Back Mode

### 19.5.10 Error Detection

CSIG can detect three error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)

Data consistency check error and parity error check functions can be individually enabled or disabled.

If one of these errors is detected, the interrupt INTCSIGTIRE is generated.

#### 19.5.10.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent as an output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIGNCTL1.CSIGNDCS bit (when checking data consistency, make sure that PIPCN.PIPCN\_m = 1 for CSIGTSO). It will not be enabled if data transmission is disabled (CSIGNCTL0.CSIGNTXE = 0).

When the data consistency check is enabled, the data transferred from CSIGNTX0W or CSIGNTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIGTSO are captured and their logical interpretation is written to the corresponding shift register.

After completion of the transmission, the data sent is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIGTIRE is generated.
- The CSIGNSTR0.CSIGNDCE bit is set.

The data consistency check function is illustrated in the following block diagram.

Figure 19.22 Functional Block Diagram of the Data Consistency Check

### 19.5.10.2 Parity Check

Parity is a common mean to detect a single bit error during data transmission. CSIG can append a parity bit after the last data bit (even if extended data length is used).

The use and type of parity is specified by CSIGNCFG0.CSIGNPS[1:0].

Parity check is enabled if CSIGNCFG0.CSIGNPS[1] = 1.

The parity bit is checked after reception is complete. If a parity error occurs:

- Interrupt INTCSIGTIRE is generated.
- The CSIGNSTR0.CSIGNPE bit is set.

The following figure shows an example.

Data length is 8 bits. The data transmitted is 05<sub>H</sub> and 35<sub>H</sub>. Parity type is odd.

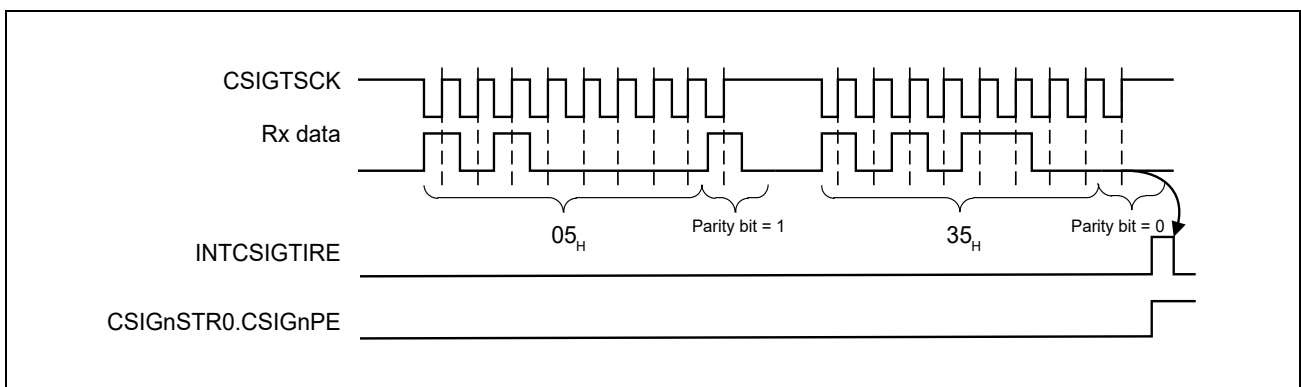

Figure 19.23 Parity Check Example

For the first 8 bits, the parity bit is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

For the second 8 bits, the parity bit is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last data bit.

### 19.5.10.3 Overrun Error

This error occurs when previously received data still resides in the reception register CSIGNRX0 because it has not been read, and new data is received.

The overrun error is not generated if data reception is disabled (CSIGNCTL0.CSIGNRXE = 0).

If overrun occurs:

- Interrupt INTCSIGTIRE is generated
- The CSIGNSTR0.CSIGNOVE bit is set
- Data in the CSIGNRX0 register is overwritten and communication continues.

The following figure illustrates the overrun error detection function.

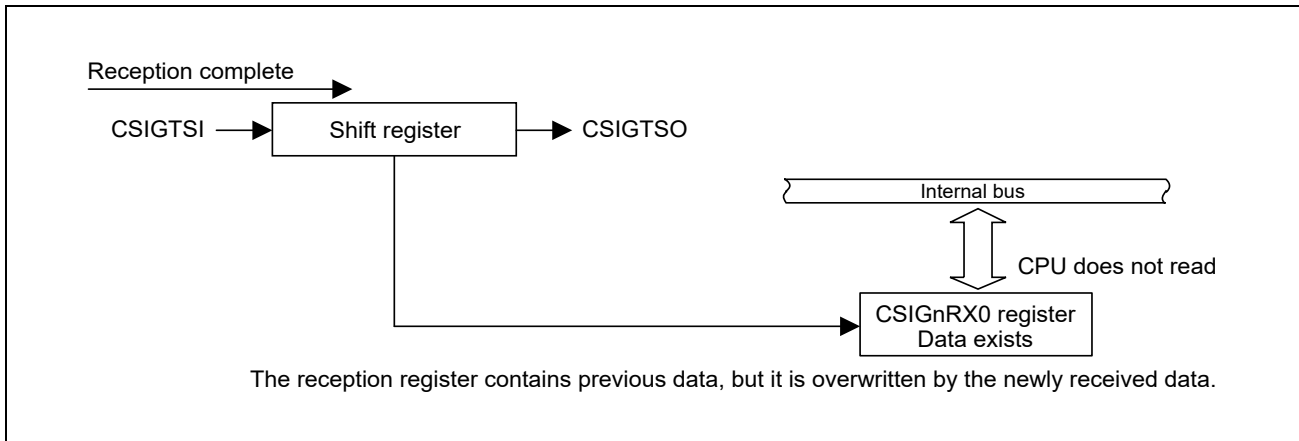

Figure 19.24 Overrun Error Detection

The following figure illustrates an example where:

- Rx data 3 is not read
- Rx data 4 is received, and data is overwritten.

Thus an overrun error occurs.

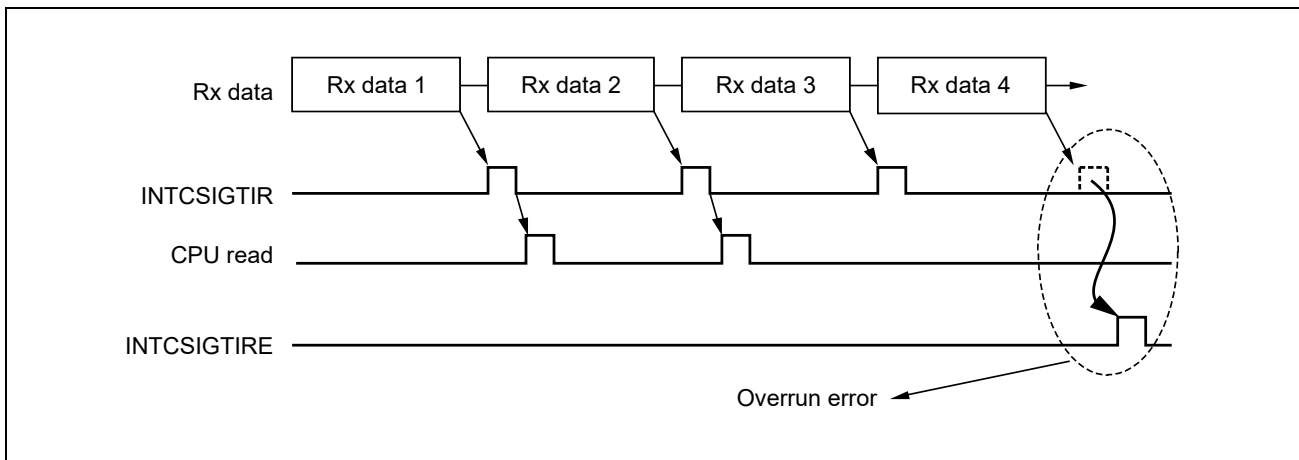

Figure 19.25 Overrun Error Detection — Example

**NOTE**

An overrun error can be avoided by using the handshake.

When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

For details see **Section 19.5.8, Handshake Function.**

## 19.6 Operating Procedures

### 19.6.1 Master Mode Transmission/Reception by DMA

This section describes an example of performing the transmission/reception in master mode in combination with a DMA.

The following instructions are based on the assumption that:

- Transmission data length is 8 bits (CSIGNCFG0.CSIGNDLS[3:0] = 1000<sub>B</sub>)
- MSB is transmitted first (CSIGNCFG0.CSIGNDIR = 0)
- INTCSIGTIC interrupt is generated at the end of the transfer (CSIGNCTL1.CSIGNSLIT = 0)
- Normal clock and data phase (CSIGNCTL1.CSIGNCKR = 0, CSIGNCFG0.CSIGNDAP = 0)
- The number of data is 10 (0 to 9)

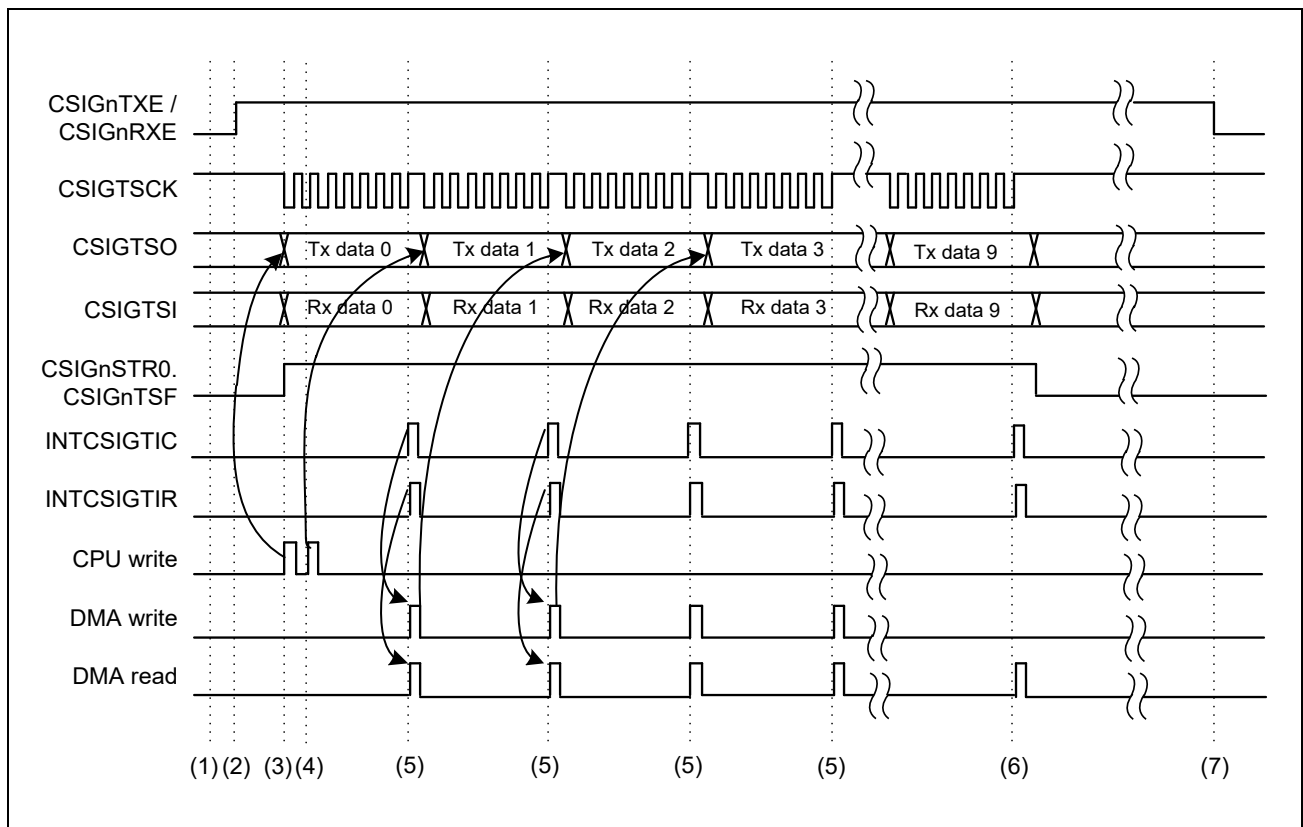

Figure 19.26 Communication in Master Mode

**Procedure:**

1. Configure the communication protocol in register CSIGNCFG0. Specify the interrupt timing and operation mode by setting the corresponding bits of the CSIGNCTL1 register and CSIGNCTL2 register.
2. In the CSIGNCTL0 register, set CSIGNPWR = 1 (enable clock), CSIGNTXE = 1 (enable transmission), and CSIGNRXE = 1 (enable reception).
3. Write the first data to be sent to the transmission register CSIGNTX0H. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIGNTX0H. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After the transmission or reception of each data, INTCSIGTIC or INTCSIGTIR interrupt is generated. INTCSIGTIC indicates that the next data can be written to CSIGNTX0H. INTCSIGTIR indicates that the reception register CSIGNRX0 must be read.  
In this example, CPU write and DMA write are assumed as equivalent.
6. No more write action is required after the transmission of data 8 completes. Data 9 (the last data) has been written after the transmission of data 7. However, the reception register CSIGNRX0 must be read after the reception of data 8 and 9 completes.
7. Finally, to disable the transmit/receive operation, clear CSIGNCTL0.CSIGNTXE and CSIGNCTL0.CSIGNRXE. When no communication is taking place, set CSIGNCTL0.CSIGNPWR to "0" to minimize the power consumption of the CSIGN.

## Section 20 Clocked Serial Interface H (CSIH)

This section contains a generic description of the Clocked Serial Interface H (CSIH).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of CSIH.

### 20.1 Features of RH850/F1KH, RH850/F1KM CSIH

#### 20.1.1 Number of Units

This microcontroller has the following number of CSIH units.

Each CSIH unit has single channel interface.

Table 20.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of units	5	5	5
Name	CSIHn (n = 0 to 4)	CSIHn (n = 0 to 4)	CSIHn (n = 0 to 4)

Table 20.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of units	4	4	4	4	4
Name	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)

Table 20.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of units	4	4	4
Name	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)

Table 20.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of units	1	1	3	4
Name	CSIHn (n = 0)	CSIHn (n = 0)	CSIHn (n = 0 to 2)	CSIHn (n = 0 to 3)

Table 20.5 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual CSIH units are identified by the index "n": for example, CSIHnCTL0 (n = 0 to 4) is the CSIHn control register 0.
x	CSIHn has a maximum of 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index "x": that is, CSx denotes a non-specified chip select signal.
y	A variable used for explanation is identified by the index "y": for example, CSIHnBRSy is the baud rate setting register of CSIHn.

Table 20.6 Indices (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual CSIH units are identified by the index "n": for example, CSIHnCTL0 (n = 0 to 3) is the CSIHn control register 0.
x	CSIHn has a maximum of 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index "x": that is, CSx denotes a non-specified chip select signal.
y	A variable used for explanation is identified by the index "y": for example, CSIHnBRSy is the baud rate setting register of CSIHn.

The following table shows values indicated by the indices of each product.

Table 20.7 Indices of Products (RH850/F1KH-D8)

Indices of Each Product		
176 Pins	233 Pins	324 Pins
For the value of x, see <b>Table 20.11, Number of Chip Select Signals (RH850/F1KH-D8)</b> .		
y = 0 to 3		

Table 20.8 Indices of Products (RH850/F1KM-S4)

Indices of Each Product				
100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
For the value of x, see <b>Table 20.12, Number of Chip Select Signals (RH850/F1KM-S4)</b> .				
y = 0 to 3				

Table 20.9 Indices of Products (RH850/F1KM-S2)

Indices of Each Product		
100 Pins	144 Pins	176 Pins
For the value of x, see <b>Table 20.13, Number of Chip Select Signals (RH850/F1KM-S2)</b> .		
y = 0 to 3		

Table 20.10 Indices of Products (RH850/F1KM-S1)

Indices of Each Product			
48 Pins	64 Pins	80 Pins	100 Pins
For the value of x, see <b>Table 20.14, Number of Chip Select Signals (RH850/F1KM-S1)</b> .			
y = 0 to 3			

The numbers of chip select signals for each of the CSIH units are listed in the following table.

Table 20.11 Number of Chip Select Signals (RH850/F1KH-D8)

Unit Name	Chip Select Index		
	176 Pins	233 Pins	324 Pins
CSIH0	CSx (x = 0 to 7)	CSx (x = 0 to 7)	CSx (x = 0 to 7)
CSIH1	CSx (x = 0 to 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)
CSIH2	CSx (x = 0 to 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)
CSIH3	CSx (x = 0 to 3)	CSx (x = 0 to 3)	CSx (x = 0 to 3)
CSIH4	CSx (x = 0,1)	CSx (x = 0,1)	CSx (x = 0,1)

CSIH3	—	—	—	CSx (x = 0 to 3)

### 20.1.2 Register Base Addresses

CSIH base addresses are listed in the following table.

CSIH register addresses are given as offsets from the base addresses.

Table 20.15 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<CSIH0_base>	FFD8 0000 <sub>H</sub>
<CSIH1_base>	FFD8 2000 <sub>H</sub>
<CSIH2_base>	FFD8 4000 <sub>H</sub>
<CSIH3_base>	FFD8 6000 <sub>H</sub>
<CSIH4_base>	FFD9 0000 <sub>H</sub>

Table 20.16 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<CSIH0_base>	FFD8 0000 <sub>H</sub>
<CSIH1_base>	FFD8 2000 <sub>H</sub>
<CSIH2_base>	FFD8 4000 <sub>H</sub>
<CSIH3_base>	FFD8 6000 <sub>H</sub>

### 20.1.3 Clock Supply

The CSH clock supply is shown in the following table.

Table 20.17 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
CSIHn	PCLK	CKSCLK_ICSI	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_ICSI	Bus clock

## 20.1.4 Interrupt Requests

CSIH interrupt requests are listed in the following table.

Table 20.18 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
CSIH0			
INTCSIHTIC	Communication status interrupt	29	70
INTCSIHTIR	Receive status interrupt	30	71
INTCSIHTIRE	Communication error interrupt	31	—
INTCSIHTIJC	Job completion interrupt	20, 32	72
CSIH1			
INTCSIHTIC	Communication status interrupt	16, 116	28
INTCSIHTIR	Receive status interrupt	17, 117	29
INTCSIHTIRE	Communication error interrupt	27, 118	—
INTCSIHTIJC	Job completion interrupt	28, 119	30
CSIH2			
INTCSIHTIC	Communication status interrupt	8, 132	89
INTCSIHTIR	Receive status interrupt	10, 133	90
INTCSIHTIRE	Communication error interrupt	11, 134	—
INTCSIHTIJC	Job completion interrupt	12, 135	91
CSIH3			
INTCSIHTIC	Communication status interrupt	9, 158	41
INTCSIHTIR	Receive status interrupt	13, 159	42
INTCSIHTIRE	Communication error interrupt	14, 160	—
INTCSIHTIJC	Job completion interrupt	15, 161	43
CSIH4			
INTCSIHTIC	Communication status interrupt	124	58
INTCSIHTIR	Receive status interrupt	125	59
INTCSIHTIRE	Communication error interrupt	126	—
INTCSIHTIJC	Job completion interrupt	127	76

Table 20.19 Interrupt Requests (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
CSIH0			
INTCSIHTIC	Communication status interrupt	29	70
INTCSIHTIR	Receive status interrupt	30	71
INTCSIHTIRE	Communication error interrupt	31	—
INTCSIHTIJC	Job completion interrupt	20, 32	72
CSIH1			
INTCSIHTIC	Communication status interrupt	16, 116	28
INTCSIHTIR	Receive status interrupt	17, 117	29
INTCSIHTIRE	Communication error interrupt	27, 118	—
INTCSIHTIJC	Job completion interrupt	28, 119	30
CSIH2			
INTCSIHTIC	Communication status interrupt	8, 132	89
INTCSIHTIR	Receive status interrupt	10, 133	90
INTCSIHTIRE	Communication error interrupt	11, 134	—
INTCSIHTIJC	Job completion interrupt	12, 135	91
CSIH3			
INTCSIHTIC	Communication status interrupt	9, 158	41
INTCSIHTIR	Receive status interrupt	13, 159	42
INTCSIHTIRE	Communication error interrupt	14, 160	—
INTCSIHTIJC	Job completion interrupt	15, 161	43

### 20.1.5 Reset Sources

CSIH reset sources are listed in the following table. CSIH is initialized by these reset sources.

Table 20.20 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
CSIHn	All reset sources (ISORES)

## 20.1.6 External Input/Output Signals

External input/output signals of CSIH are listed below.

Table 20.21 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
<b>CSIH0</b>		
CSIH0TSC	Serial clock signal	CSIH0SC* <sup>2</sup>
CSIH0TSI	Serial data input signal	CSIH0SI
$\overline{\text{CSIH0TSS}}$	Slave select input signal	$\overline{\text{CSIH0SS}}$
CSIH0TRYI	Ready/busy input signal	CSIH0RYI
CSIH0TSO	Serial data output signal	CSIH0SO* <sup>2</sup>
CSIH0TRYO	Ready/busy output signal	CSIH0RYO
CSIH0TCSS[7:0]* <sup>1</sup>	Chip select signal	CSIH0CSS[7:0]* <sup>1</sup>
<b>CSIH1</b>		
CSIH1TSC	Serial clock signal	CSIH1SC* <sup>2</sup>
CSIH1TSI	Serial data input signal	CSIH1SI
$\overline{\text{CSIH1TSS}}$	Slave select input signal	$\overline{\text{CSIH1SS}}$
CSIH1TRYI	Ready/busy input signal	CSIH1RYI
CSIH1TSO	Serial data output signal	CSIH1SO* <sup>2</sup>
CSIH1TRYO	Ready/busy output signal	CSIH1RYO
CSIH1TCSS[5:0]* <sup>1</sup>	Chip select signal	CSIH1CSS[5:0]* <sup>1</sup>
<b>CSIH2</b>		
CSIH2TSC	Serial clock signal	CSIH2SC* <sup>2</sup>
CSIH2TSI	Serial data input signal	CSIH2SI
$\overline{\text{CSIH2TSS}}$	Slave select input signal	$\overline{\text{CSIH2SS}}$
CSIH2TRYI	Ready/busy input signal	CSIH2RYI
CSIH2TSO	Serial data output signal	CSIH2SO* <sup>2</sup>
CSIH2TRYO	Ready/busy output signal	CSIH2RYO
CSIH2TCSS[5:0]* <sup>1</sup>	Chip select signal	CSIH2CSS[5:0]* <sup>1</sup>
<b>CSIH3</b>		
CSIH3TSC	Serial clock signal	CSIH3SC* <sup>2</sup>
CSIH3TSI	Serial data input signal	CSIH3SI
$\overline{\text{CSIH3TSS}}$	Slave select input signal	$\overline{\text{CSIH3SS}}$
CSIH3TRYI	Ready/busy input signal	CSIH3RYI
CSIH3TSO	Serial data output signal	CSIH3SO* <sup>2</sup>
CSIH3TRYO	Ready/busy output signal	CSIH3RYO
CSIH3TCSS[3:0]* <sup>1</sup>	Chip select signal	CSIH3CSS[3:0]* <sup>1</sup>
<b>CSIH4</b>		
CSIH4TSC	Serial clock signal	CSIH4SC* <sup>2</sup>
CSIH4TSI	Serial data input signal	CSIH4SI
$\overline{\text{CSIH4TSS}}$	Slave select input signal	$\overline{\text{CSIH4SS}}$
CSIH4TRYI	Ready/busy input signal	CSIH4RYI
CSIH4TSO	Serial data output signal	CSIH4SO* <sup>2</sup>
CSIH4TRYO	Ready/busy output signal	CSIH4RYO
CSIH4TCSS[1:0]* <sup>1</sup>	Chip select signal	CSIH4CSS[1:0]* <sup>1</sup>

Note 1. For the number of chip select signals, see **Table 20.11, Number of Chip Select Signals (RH850/F1KH-D8)**.

Note 2. For the port pins that are used as CSIHnSO and CSIHnSC, set the output driver strength to high (PDSCn\_m = 1).

Table 20.22 External Input/Output Signals (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
CSIH0		
CSIH0TSC	Serial clock signal	CSIH0SC* <sup>2</sup>
CSIH0TSI	Serial data input signal	CSIH0SI
$\overline{\text{CSIH0TSSI}}$	Slave select input signal	$\overline{\text{CSIH0SSI}}$
CSIH0TRYI	Ready/busy input signal	CSIH0RYI
CSIH0TSO	Serial data output signal	CSIH0SO* <sup>2</sup>
CSIH0TRYO	Ready/busy output signal	CSIH0RYO
CSIH0TCSS[7:0]* <sup>1</sup>	Chip select signal	CSIH0CSS[7:0]* <sup>1</sup>
CSIH1		
CSIH1TSC	Serial clock signal	CSIH1SC* <sup>2</sup>
CSIH1TSI	Serial data input signal	CSIH1SI
$\overline{\text{CSIH1TSSI}}$	Slave select input signal	$\overline{\text{CSIH1SSI}}$
CSIH1TRYI	Ready/busy input signal	CSIH1RYI
CSIH1TSO	Serial data output signal	CSIH1SO* <sup>2</sup>
CSIH1TRYO	Ready/busy output signal	CSIH1RYO
CSIH1TCSS[5:0]* <sup>1</sup>	Chip select signal	CSIH1CSS[5:0]* <sup>1</sup>
CSIH2		
CSIH2TSC	Serial clock signal	CSIH2SC* <sup>2</sup>
CSIH2TSI	Serial data input signal	CSIH2SI
$\overline{\text{CSIH2TSSI}}$	Slave select input signal	$\overline{\text{CSIH2SSI}}$
CSIH2TRYI	Ready/busy input signal	CSIH2RYI
CSIH2TSO	Serial data output signal	CSIH2SO* <sup>2</sup>
CSIH2TRYO	Ready/busy output signal	CSIH2RYO
CSIH2TCSS[5:0]* <sup>1</sup>	Chip select signal	CSIH2CSS[5:0]* <sup>1</sup>
CSIH3		
CSIH3TSC	Serial clock signal	CSIH3SC* <sup>2</sup>
CSIH3TSI	Serial data input signal	CSIH3SI
$\overline{\text{CSIH3TSSI}}$	Slave select input signal	$\overline{\text{CSIH3SSI}}$
CSIH3TRYI	Ready/busy input signal	CSIH3RYI
CSIH3TSO	Serial data output signal	CSIH3SO* <sup>2</sup>
CSIH3TRYO	Ready/busy output signal	CSIH3RYO
CSIH3TCSS[3:0]* <sup>1</sup>	Chip select signal	CSIH3CSS[3:0]* <sup>1</sup>

Note 1. For the number of chip select signals, see **Table 20.12, Number of Chip Select Signals (RH850/F1KM-S4)**, **Table 20.13, Number of Chip Select Signals (RH850/F1KM-S2)**, **Table 20.14, Number of Chip Select Signals (RH850/F1KM-S1)**.

Note 2. For the port pins that are used as CSIHnSO and CSIHnSC, set the output driver strength to high (PDSn\_m = 1).

### CAUTION

When port P8\_6 is used as CSIH0CSS4, port P8\_6 pin outputs a low-level  $\overline{\text{RESETOUT}}$  signal while a reset is asserted and continues to output a low level after the reset is deasserted.

For details, see **Section 2A.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$** , **Section 2B.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  and **Section 2C.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$** .

### 20.1.7 Data Consistency Check

The port and the alternative function for data consistency check of CSIHnSO (CSIHTSO) output are shown in the following table. See **Section 20.5.12, Error Detection** for details on data consistency checking.

Table 20.23 Port Pins for Data Consistency Checking (RH850/F1KH-D8)

## 20.2 Overview

### 20.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode or slave mode is selectable
- Multiple slaves configuration and RCB (Recessive Configuration for Broadcasting) are possible since there are to eight configurable chip select output signals
- Slave select input signal (  $\overline{\text{CSIHTSSI}}$  ) is usable
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, whereas it is determined by the input clock in slave mode.
- Maximum transfer clock frequency:
  - Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6) for all products
  - Slave mode: 8.0 MHz (however, it must be equal to or lower than PCLK/6) for CSIH0 in RH850/F1KM-S1 48- and 64-pin products, CSIH2 for other products
- Clock phases and data phases are selectable
- Data transfer with MSB first or LSB first is selectable
- Transfer data length is selectable from 2 to 16 bits in 1-bit units
- Built-in EDL (extended data length) function for transferring more than 16 bits of data
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Built-in handshake function
- Built-in error detection (data consistency check, parity, time-out, overflow, and overrun)
- Support of job concept
- 128 words I/O buffer memory
- Direct access mode or memory mode (FIFO, dual buffer, and transmit-only buffer) is selectable
- Four different interrupt request signals (INTCSIHTIC, INTCSIHTIR, INTCSIHTIRE, INTCSIHTIJC)
- Built-in LBM (Loop Back Mode) function for self-test
- CPU-controlled high-priority communication function
- Enforced chip select idle setting
- Built-in RCB (Recessive Configuration for Broadcasting) bit
- Built-in JOB enable control bit for AUTOSAR

## 20.2.2 Functional Overview Description

The CSIH uses three signals for communication:

- Transmission clock CSIH<sub>T</sub>SCK (output in master mode, input in slave mode)
- Data output signal CSIH<sub>T</sub>SO
- Data input signal CSIH<sub>T</sub>SI

Additional signals are available for external control and monitoring:

- $\overline{\text{CSIH}}\text{TSSI}$  : Slave select input signal
- CSIH<sub>T</sub>RYO: Ready/busy output signal (handshake signal)
- CSIH<sub>T</sub>RYI: Ready/busy input signal (handshake signal)
- CSIH<sub>T</sub>CS[7:0]: Chip select signals

Data transmission is bit-wise and serial, and performed synchronously with the transmission clock.

The following table shows the most important registers for setting up the CSIH.

Table 20.26 Main Registers of CSIH

Register	Function
CSIH <sub>n</sub> CTL0	Enables/disables serial clock, and permits/ prohibits data transmission and data reception. Defines end-of-job behavior and enables/disables (bypasses) buffering.
CSIH <sub>n</sub> CTL1	Controls options such as interrupt timing, extended data length, job feature, data consistency check, loop-back mode, handshake, etc.
CSIH <sub>n</sub> CTL2	Selects master or slave mode, and the transfer clock frequency of the built-in baud rate generator (BRG) in master mode.
CSIH <sub>n</sub> BRSy	Specifies the transfer clock frequency for each chip select signal.
CSIH <sub>n</sub> MCTL0	Selects memory mode and specifies the time-out value.
CSIH <sub>n</sub> MCTL1	Controls the memory in FIFO mode.
CSIH <sub>n</sub> MCTL2	Controls the memory in dual buffer mode.
CSIH <sub>n</sub> CFGx	Configures the communication protocol for each chip select signal.

### 20.2.3 Block Diagram

The following block diagram shows the main components of the CSIH.

Figure 20.1 CSIH Block Diagram

In master mode, the transmission clock CSIHNTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

The built-in memory can be configured as FIFO, dual buffer (separate transmit and receive buffers), or transmit-only buffer. It can also be bypassed for data transmission and reception without buffering.

The loop back circuit disconnects the CSIH completely from the ports and supports internal self-test.

#### NOTE

This section describes the following modes:

- The “operating mode” is either master mode or slave mode. The master can control and communicate with several slaves only in master mode (for details, see **Section 20.5.1, Operating Modes (Master/Slave)**).
- The “job mode” is related to the AUTOSAR job concept (for details, see **Section 20.5.3.3, Job Concept**).
- The “memory mode” accords with the various configurations of the associated buffer memory (for details, see **Section 20.5.6, CSIH Buffer Memory**).
- The “data transfer mode” specifies the type of communication – transmit-only, receive-only, or transmit/receive (for details, see **Section 20.5.7, Data Transfer Modes**).

## 20.3 Registers

### 20.3.1 List of Registers

CSIH registers are listed in the following table.

For details about <CSIHn\_base>, see **Section 20.1.2, Register Base Addresses**.

Table 20.27 List of Registers

Module Name	Register Name	Symbol	Address
CSIHn	CSIHn control register 0	CSIHnCTL0	<CSIHn_base> + 0000 <sub>H</sub>
	CSIHn control register 1	CSIHnCTL1	<CSIHn_base> + 0010 <sub>H</sub>
	CSIHn control register 2	CSIHnCTL2	<CSIHn_base> + 0014 <sub>H</sub>
	CSIHn status register 0	CSIHnSTR0	<CSIHn_base> + 0004 <sub>H</sub>
	CSIHn status clear register 0	CSIHnSTCR0	<CSIHn_base> + 0008 <sub>H</sub>
	CSIHn memory control register 0	CSIHnMCTL0	<CSIHn_base> + 1040 <sub>H</sub>
	CSIHn memory control register 1	CSIHnMCTL1	<CSIHn_base> + 1000 <sub>H</sub>
	CSIHn memory control register 2	CSIHnMCTL2	<CSIHn_base> + 1004 <sub>H</sub>
	CSIHn memory read/write pointer register 0	CSIHnMRWP0	<CSIHn_base> + 1018 <sub>H</sub>
	CSIHn configuration register 0	CSIHnCFG0	<CSIHn_base> + 1044 <sub>H</sub>
	CSIHn configuration register 1	CSIHnCFG1	<CSIHn_base> + 1048 <sub>H</sub>
	CSIHn configuration register 2	CSIHnCFG2	<CSIHn_base> + 104C <sub>H</sub>
	CSIHn configuration register 3	CSIHnCFG3	<CSIHn_base> + 1050 <sub>H</sub>
	CSIHn configuration register 4	CSIHnCFG4	<CSIHn_base> + 1054 <sub>H</sub>
	CSIHn configuration register 5	CSIHnCFG5	<CSIHn_base> + 1058 <sub>H</sub>
	CSIHn configuration register 6	CSIHnCFG6	<CSIHn_base> + 105C <sub>H</sub>
	CSIHn configuration register 7	CSIHnCFG7	<CSIHn_base> + 1060 <sub>H</sub>
	CSIHn transmit data register 0 for word access	CSIHnTX0W	<CSIHn_base> + 1008 <sub>H</sub>
	CSIHn transmit data register 0 for half word access	CSIHnTX0H	<CSIHn_base> + 100C <sub>H</sub>
	CSIHn receive data register 0 for word access	CSIHnRX0W	<CSIHn_base> + 1010 <sub>H</sub>
	CSIHn receive data register 0 for half word access	CSIHnRX0H	<CSIHn_base> + 1014 <sub>H</sub>
	CSIHn emulation register	CSIHnEMU	<CSIHn_base> + 0018 <sub>H</sub>
	CSIHn baud rate setting register 0	CSIHnBRS0	<CSIHn_base> + 1068 <sub>H</sub>
	CSIHn baud rate setting register 1	CSIHnBRS1	<CSIHn_base> + 106C <sub>H</sub>
	CSIHn baud rate setting register 2	CSIHnBRS2	<CSIHn_base> + 1070 <sub>H</sub>
	CSIHn baud rate setting register 3	CSIHnBRS3	<CSIHn_base> + 1074 <sub>H</sub>

### 20.3.2 CSIHnCTL0 — CSIHn Control Register 0

This register controls the operation clock, enables/disables transmission/reception, and enables/disables the memory allocated for transmission and/or reception. It forces the stop of communication at the end of the current job.

**Access:** This register can be read or written in 8-bit units.

**Address:** <CSIHn\_base> + 0000<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	CSIHnPWR	CSIHnTXE	CSIHnRXE	—	—	—	CSIHnJOBE	CSIHnMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R/W	R/W

Table 20.28 CSIHnCTL0 Register Contents

Bit Position	Bit Name	Function
7	CSIHnPWR	Controls the operation clock. 0: Stops operation clock. 1: Supplies operation clock. Clearing CSIHnPWR to 0 resets the internal circuits, stops operation, and sets CSIH to standby state. Clock supply to internal circuits stops.  If CSIHnPWR is cleared (to 0) during communication, ongoing communication is immediately aborted. In this case, the communication setting must be reconfigured.
6	CSIHnTXE	Enables/disables transmission. 0: Disables transmission. 1: Enables transmission.
5	CSIHnRXE	Enables/disables reception. 0: Disables reception. 1: Enables reception.
4 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CSIHnJOBE	Stops communication at the end of the current job (communication ends if data is written to the transmission buffer when CSIHnTX0W.CSIHnEOJ = 1 (job completion)). 0: Communication stop is not requested. 1: Stops communication. This bit can be used to abort an ongoing job. This bit is cleared to 0 automatically. Even if this bit is set to 1, the read value is always 0. In FIFO mode, the pointer must be cleared by setting CSIHnSTCR0.CSIHnPCT = 1 before the next communication is started
0	CSIHnMBS	Bypasses the memory for transmission and/or reception data. 0: Memory mode CSIH memory is used for transmission and/or reception data. 1: Direct access mode CSIH memory is bypassed.

#### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.3 CSIHnCTL1 — CSIHn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake functionality, and job mode. It selects the active output level of each chip select signal and the behavior of the chip select signals after the transfer of the final data.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIHn\_base> + 0010<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CSIHn SLRS	—	—	—	—	—	CSIHn PHE	CSIHn CKR	CSIHn SLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn CSL7	CSIHn CSL6	CSIHn CSL5	CSIHn CSL4	CSIHn CSL3	CSIHn CSL2	CSIHn CSL1	CSIHn CSL0	CSIHn EDLE	CSIHn JE	CSIHn DCS	CSIHn CSRI	CSIHn LBM	CSIHn SIT	CSIHn HSE	CSIHn SSE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.29 CSIHnCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	CSIHnSLRS	Sets the internal synchronization timing for receive data input. 0: Rising edge of PCLK 1: Falling edge of PCLK For differences by the setting, see <b>Section 47A, Electrical Characteristics of RH850/F1KH-D8</b> , <b>Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2</b> and <b>Section 47C, Electrical Characteristics of RH850/F1KM-S1</b> .
23 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	CSIHnPHE	Sets the CPU-controlled priority-based communication function. 0: The CPU-controlled high-priority communication function is disabled. 1: The CPU-controlled high-priority communication function is enabled. To enable the CPU-controlled high-priority communication function, set this bit to 1 and set CSIHnJE = 1. This bit can only be set in transmit-only buffer mode.
17	CSIHnCKR	CSIHTSCK Clock Inversion Function 0: The default level of CSIHTSCK is high 1: The default level of CSIHTSCK is low For details, see <b>Section 20.3.11, CSIHnCFGx — CSIHn Configuration Register x (x = 0 to 7)</b> .
16	CSIHnSLIT	Selects the timing of interrupt INTCSIHTIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: As soon as the contents of the CSIHnTX0W/H register are transferred to the shift register, an interrupt is generated (this function is activated only in direct access mode/transmit-only buffer mode). For details, see <b>Section 20.4.3, INTCSIHTIC (Communication Status Interrupt)</b> .
15 to 8	CSIHnCSLx	Selects the active output level of chip select signal x (CSIHTCSSx). 0: Chip select is active low. 1: Chip select is active high. For details, see <b>Section 20.5.3, Chip Selection (CS) Features</b> .

Table 20.29 CSIHnCTL1 Register Contents

Bit Position	Bit Name	Function
7	CSIHnEDLE	Enables/disables extended data length (EDL) mode. 0: Disables extended data length mode. 1: Enables extended data length mode. For details, see <b>Section 20.5.8.2, Data Length Greater than 16 Bits.</b>
6	CSIHnJE	Enables/disables job mode. 0: Disables job mode. 1: Enables job mode. For details, see <b>Section 20.5.3.3, Job Concept.</b> The CSIHnCTL0.CSIHnJOBE, CSIHnTX0W.CSIHnEOJ, and CSIHnTX0W.CSIHnCIRE bits are enabled only when CSIHnJE = 1. Setting this bit in slave mode is prohibited. In addition, to enable the CPU-controlled high-priority communication function, set this bit to 1 as well as CSIHnPHE = 1.
5	CSIHnDCS	Enables/disables data consistency check. 0: Disables data consistency check. 1: Enables data consistency check. For details, see <b>Section 20.5.12.1, Data Consistency Check.</b>
4	CSIHnCSRI	Defines chip select signal behavior after last data transfer. 0: Chip select signal retains the active level. 1: Chip select signal returns to the inactive level. The last data is determined at the interrupt timing in direct access mode or FIFO mode.
3	CSIHnLBM	Controls loop-back mode (LBM). 0: Deactivates loop-back mode. 1: Activates loop-back mode. For details, see <b>Section 20.5.13, Loop-Back Mode.</b>
2	CSIHnSIT	Selects interrupt delay mode. 0: No delay is generated. 1: Half clock delay is generated for all interrupts. This bit is only valid in master mode. In slave mode, no delay is generated. For details, see <b>Section 20.4.2, Interrupt Delay.</b>
1	CSIHnHSE	Enables/disables the handshake function. 0: Disables the handshake function. 1: Enables the handshake function. For details see <b>Section 20.5.11, Handshake Function.</b>
0	CSIHnSSE	Enables/disables the slave select function. 0: Input signal $\overline{\text{CSIHTSSI}}$ is disabled. 1: Input signal $\overline{\text{CSIHTSSI}}$ is recognized. If the slave select function is not used, this bit must be set to 0 (see also <b>Section 20.5.2, Master/Slave Connections</b> ).

Details about CSIHnCTL1.CSIHnSSE are shown in the following tables.

Table 20.30 Operation of the Slave Select Function during Reception

CSIHnCTL0.CSIHnRXE	CSIHnCTL1.CSIHnSSE	$\overline{\text{CSIHTSSI}}$	Receive Operation
0	—	—	Reception is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

Table 20.31 Operation of the Slave Select Function during Transmission

CSIHnCTL0. CSIHnTXE	CSIHnCTL1. CSIHnSSE	$\overline{\text{CSIHnTSSI}}$	Transmit Operation
0	—	—	Transmission is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

**CAUTION**

When setting this register, see **Table 20.47, Notes on Setting Registers**.

**20.3.4 CSIHnCTL2 — CSIHn Control Register 2**

This register selects operating mode and the reference clock value, and specifies the transfer clock frequency.

For details see **Section 20.5.5, Transmission Clock Selection**.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIHn\_base> + 0014<sub>H</sub>

**Value after reset:** E000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
15 to 13	CSIHnPRS[2:0]	These bits select the operation mode and the reference clock value.
		<b>CSIHnPRS2</b> <b>CSIHnPRS1</b> <b>CSIHnPRS0</b> Selection of Reference Clock (PRSOUT)
		0            0            0            PCLK (Master mode)
		0            0            1            PCLK/2 (Master mode)
		0            1            0            PCLK/4 (Master mode)
		0            1            1            PCLK/8 (Master mode)
		1            0            0            PCLK/16 (Master mode)
		1            0            1            PCLK/32 (Master mode)
		1            1            0            PCLK/64 (Master mode)
1            1            1            External clock via CSIHnTSSCK(in) (Slave mode)		
12 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

In master mode, the following bits are used to set the transfer clock frequency:

CSIHnCTL2.CSIHnPRS[2:0], CSIHnCFGx.CSIHnBRSS[1:0], CSIHnBRSy.CSIHnBRS[11:0]

In addition, any of the four different transfer clock frequency settings that are specified by the CSIHnBRSy.CSIHnBRS[11:0] bits is selected for each chip select signal. To select the transfer clock frequency setting for each chip select signal, use the CSIHnCFGx.CSIHnBRSS[1:0] bits.

The following table shows the relationship between CSIHnCFGx.CSIHnBRSS[1:0] and CSIHnBRSy.CSIHnBRS[11:0].

CSIHnCFGx.CSIHnBRSS[1:0]	Transfer Clock Frequency Setting Bit to be Selected
00	CSIHnBRS0.CSIHnBRS[11:0]
01	CSIHnBRS1.CSIHnBRS[11:0]
10	CSIHnBRS2.CSIHnBRS[11:0]
11	CSIHnBRS3.CSIHnBRS[11:0]

The following table shows the relationship between the transfer clock frequency and the transfer clock frequency setting (CSIHnBRSy[11:0]) selected by the CSIHnBRSS[1:0] bits when the bit value of the CSIHnPRS[2:0] bits is  $\alpha$ .

CSIHnBRSy[11:0]	Transfer Clock Frequency
0	BRG stopped
1	PCLK / ( $2^\alpha \times 1 \times 2$ )
2	PCLK / ( $2^\alpha \times 2 \times 2$ )
3	PCLK / ( $2^\alpha \times 3 \times 2$ )
4	PCLK / ( $2^\alpha \times 4 \times 2$ )
...	...
4095	PCLK / ( $2^\alpha \times 4095 \times 2$ )

When a time-out error is used in slave mode, the clock selected by this setting is used. In slave mode, the CSIHnPRS[2:0] bits are set to 111<sub>B</sub>. In this case, the prescaler has the same setting as when the CSIHnPRS[2:0] bits are set to 000<sub>B</sub>. When using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000<sub>H</sub>.

#### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.5 CSIHnSTR0 — CSIHn Status Register 0

This register indicates the status of CSIH.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <CSIHn\_base> + 0004<sub>H</sub>

**Value after reset:** 0000 0010<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**CAUTION**

When setting this register, see **Table 20.47, Notes on Setting Registers.**

### 20.3.6 CSIHnSTCR0 — CSIHn Status Clear Register 0

This register clears the status flags of the CSIHnSTR0 status register.

**Access:** This register can be read or written in 16-bit units.

When read, the value 0000<sub>H</sub> is always returned.

**Address:** <CSIHn\_base> + 0008<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnTMOEC	CSIHnOFEC	—	—	—	—	—	CSIHnPCT	—	—	—	—	CSIHnDCEC	—	CSIHnPEC	CSIHnOVEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R	R	R/W	R	R/W	R/W

Table 20.35 CSIHnSTCR0 Register Contents

Bit Position	Bit Name	Function										
15	CSIHnTMOEC	Controls the time-out error flag clear command. 0: No operation. The read value is always 0. 1: Clears the time-out error flag (CSIHnSTR0.CSIHnTMOE).										
14	CSIHnOFEC	Controls the overflow error flag clear command. 0: No operation. The read value is always 0. 1: Clears the overflow error flag (CSIHnSTR0.CSIHnOFE).										
13 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.										
8	CSIHnPCT	Controls the FIFO pointer clear command. 0: No operation. The read value is always 0. 1: Clears the following FIFO buffer pointers (in FIFO mode, dual buffer mode, and transmit-only buffer mode) and status bits. <table border="1" data-bbox="539 1205 1423 1355"> <thead> <tr> <th>FIFO Buffer Pointer</th> <th>Status Bit</th> </tr> </thead> <tbody> <tr> <td>CSIHnMRWP0.CSIHnTRWA[6:0]</td> <td>CSIHnSTR0.CSIHnSPF[7:0]</td> </tr> <tr> <td>CSIHnMRWP0.CSIHnRRA[6:0]</td> <td>CSIHnSTR0.CSIHnSRP[7:0]</td> </tr> <tr> <td>CSIHnMCTL2.CSIHnSOP[6:0]</td> <td>CSIHnSTR0.CSIHnFLF</td> </tr> <tr> <td></td> <td>CSIHnSTR0.CSIHnTSF</td> </tr> </tbody> </table>	FIFO Buffer Pointer	Status Bit	CSIHnMRWP0.CSIHnTRWA[6:0]	CSIHnSTR0.CSIHnSPF[7:0]	CSIHnMRWP0.CSIHnRRA[6:0]	CSIHnSTR0.CSIHnSRP[7:0]	CSIHnMCTL2.CSIHnSOP[6:0]	CSIHnSTR0.CSIHnFLF		CSIHnSTR0.CSIHnTSF
FIFO Buffer Pointer	Status Bit											
CSIHnMRWP0.CSIHnTRWA[6:0]	CSIHnSTR0.CSIHnSPF[7:0]											
CSIHnMRWP0.CSIHnRRA[6:0]	CSIHnSTR0.CSIHnSRP[7:0]											
CSIHnMCTL2.CSIHnSOP[6:0]	CSIHnSTR0.CSIHnFLF											
	CSIHnSTR0.CSIHnTSF											
		Additionally, the CSIHnSTR0.CSIHnEMF bit is set to 1 (FIFO empty) (in FIFO mode only).										
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.										
3	CSIHnDCEC	Controls the data consistency check error flag clear command. 0: No operation. The read value is always 0. 1: Clears the data consistency check error flag (CSIHnSTR0.CSIHnDCE).										
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.										
1	CSIHnPEC	Controls the parity error flag clear command. 0: No operation. The read value is always 0. 1: Clears the parity error flag (CSIHnSTR0.CSIHnPE).										
0	CSIHnOVEC	Controls the overrun error flag clear command. 0: No operation. The read value is always 0. 1: Clears the overrun error flag (CSIHnSTR0.CSIHnOVE).										

#### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.7 CSIHnMCTL0 — CSIHn Memory Control Register 0

This register selects the memory mode and the time-out setting.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIHn\_base> + 1040<sub>H</sub>

**Value after reset:** 001F<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

4 to 0	CSIHnTO[4:0]	<p>Selects the time-out setting in FIFO mode.</p> <table border="1"> <thead> <tr> <th>CSIHnTO[4:0]</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0000<sub>B</sub></td> <td>No time-out is detected</td> </tr> <tr> <td>00001<sub>B</sub></td> <td>00001<sub>B</sub> Time-out is (1 × 8 × BRG output clocks)</td> </tr> <tr> <td>00010<sub>B</sub></td> <td>00010<sub>B</sub> Time-out is (2 × 8 × BRG output clocks)</td> </tr> <tr> <td>...</td> <td>...</td> </tr> <tr> <td>11111<sub>B</sub></td> <td>Time-out is (31 × 8 × BRG output clocks)</td> </tr> </tbody> </table>	CSIHnTO[4:0]	Description	0000 <sub>B</sub>	No time-out is detected	00001 <sub>B</sub>	00001 <sub>B</sub> Time-out is (1 × 8 × BRG output clocks)	00010 <sub>B</sub>	00010 <sub>B</sub> Time-out is (2 × 8 × BRG output clocks)	...	...	11111 <sub>B</sub>	Time-out is (31 × 8 × BRG output clocks)			
CSIHnTO[4:0]	Description																
0000 <sub>B</sub>	No time-out is detected																
00001 <sub>B</sub>	00001 <sub>B</sub> Time-out is (1 × 8 × BRG output clocks)																
00010 <sub>B</sub>	00010 <sub>B</sub> Time-out is (2 × 8 × BRG output clocks)																
...	...																
11111 <sub>B</sub>	Time-out is (31 × 8 × BRG output clocks)																

**CAUTION:** Changing the time-out setting is only permitted when CSIHnCTL0.CSIHnPWR = 0.

Set the CSIHnTO[4:0] bits to 00000<sub>B</sub> in direct access mode, dual buffer mode, or transmit-only buffer mode (except FIFO mode).

For details about time-out detection, see also **Section 20.5.12.3, Time-Out Error**.

#### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1

This register selects the conditions to generate the interrupt requests INTCSIHTIC and INTCSIHTIR in FIFO mode.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIHn\_base> + 1000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnFES[6:0]

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.37 CSIHnMCTL1 Register Contents

Bit Position	Bit name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	CSIHnFES[6:0]	Selects the conditions to generate the INTCSIHTIC interrupt (transmit data empty) in FIFO mode. When the number of unsend data to be transmitted in FIFO (checked by the CSIHnSTR0.CSIHnSPF[7:0] bit) and CSIHnMCTL1.CSIHnFES[6:0] match, the FIFO empty flag (CSIHnSTR0.CSIHnEMF bit) is set to 1, and the INTCSIHTIC interrupt request is generated.
15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	CSIHnFFS[6:0]	Selects the conditions to generate the INTCSIHTIR interrupt (receive data full) in FIFO mode. When the number of received data in FIFO (checked by the CSIHnSTR0.CSIHnSRP[7:0] bit) and (128 - CSIHnMCTL1.CSIHnFFS[6:0]) match, the INTCSIHTIR interrupt request is generated.

#### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2

This register controls the operation of the memory in dual buffer or transmit-only buffer mode and triggers to start communication.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIHn\_base> + 1004<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

These bits are automatically incremented when the transmission data is written or read.

These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.

In direct access mode, these bits are not incremented.

In FIFO mode, these bits indicate the read/write address of transmission data.

### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.11 CSIHnCFGx — CSIHn Configuration Register x (x = 0 to 7)

These eight registers configure the prescaler, parity, data length, recessive configuration for broadcasting, serial data direction, clock phase and data phase, idle enforcement configuration, idle time, hold time, inter-data time, and setup for each chip select signal, CSIHnCSSx.

#### Slave mode

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is effective.

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock phase and data phase

In slave mode, set all bits other than above in the CSIHnCFG0 register, and the CSIHnCFG1 to CSIHnCFG7 registers to 0.

**Access:** This register can be read or written in 32-bit units.

**Address:** CSIHnCFG0: <CSIHn\_base> + 1044<sub>H</sub>  
 CSIHnCFG1: <CSIHn\_base> + 1048<sub>H</sub>  
 CSIHnCFG2: <CSIHn\_base> + 104C<sub>H</sub>  
 CSIHnCFG3: <CSIHn\_base> + 1050<sub>H</sub>  
 CSIHnCFG4: <CSIHn\_base> + 1054<sub>H</sub>  
 CSIHnCFG5: <CSIHn\_base> + 1058<sub>H</sub>  
 CSIHnCFG6: <CSIHn\_base> + 105C<sub>H</sub>  
 CSIHnCFG7: <CSIHn\_base> + 1060<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

**CAUTION**

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.12 CSIHnTX0W — CSIHn Transmit Data Register 0 for Word Access

This register stores transmission data. In addition, it specifies the communication interrupt request, the end-of-job, the extended data length, and the chip select activation.

**Access:** This register can be read or written in 32-bit units.

**Address:** <CSIHn\_base> + 1008<sub>H</sub>

**Value after reset:** XXXX XXXX<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHn CIRE	CSIHn EOJ	CSIHn EDL	—	—	—	—	—	CSIHnC S7	CSIHnC S6	CSIHnC S5	CSIHnC S4	CSIHnC S3	CSIHnC S2	CSIHnC S1	CSIHnC S0

Table 20.41 CSIHnTX0W Register Contents

Bit Position	Bit Name	Function
31	CSIHnCIRE	<p>Enables the communication interrupt request INTCSIHTIC in dual buffer or transmit-only buffer mode, or the job completion interrupt request INTCSIHTIJC in FIFO mode.</p> <p>0: No interrupt is requested. 1: An interrupt is requested. Generates interrupt INTCSIHTIC or INTCSIHTIJC after transmission. For details, see <b>Section 20.4.3, INTCSIHTIC (Communication Status Interrupt)</b> and <b>Section 20.4.6, INTCSIHTIJC (Job Completion Interrupt)</b>.</p> <p><b>CAUTION:</b> This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1).</p>
30	CSIHnEOJ	<p>Specifies the end of a job.</p> <p>0: Indicates that it is not end-of-job data. The job continues. 1: Indicates end-of-job data.</p> <p><b>CAUTION:</b> This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). This bit must be set to 0 in slave mode.</p>
29	CSIHnEDL	<p>Specifies whether the associated data requires the extended data length (EDL) option.</p> <p>0: Normal operation 1: Enables the extended data length. The associated data is transmitted as a 16-bit packet. No inter-data time or idle time will be inserted after the data is transmitted.</p> <p>If CSIHnCTL1.CSIHnEDLE = 1 and CSIHnTX0W.CSIHnEDL = 1, the subsequent data must have the same CS selection. If CS is modified for the subsequent data, the correct operation is not assured.</p> <p><b>CAUTION:</b> This bit is only available if CSIHnCTL1.CSIHnEDLE = 1.</p>
28 to 24	Reserved	When read, an undefined value is returned. When writing to these bits, write 0.

Table 20.41 CSIHnTX0W Register Contents

Bit Position	Bit Name	Function
23 to 16	CSIHnCS[7:0]	<p>Activates one or more chip select signals.</p> <p>0: Activates chip select signals x for the associated transmission.</p> <p>1: Deactivates chip select signals x for the associated transmission.</p> <p>Setting CSIHnTX0W.CSIHnCS[7:0] = FF<sub>H</sub> is prohibited.</p> <p><b>CAUTION:</b> If several chip select signals are enabled for broadcasting, the configuration of one with CSIHnCFGx.CSIHnRCBx = 0 (dominant) is used. In this case, all dominant chip select signals must be set to precisely the same value.</p> <p>In slave mode, set the CSIHnCS[7:0] bit to FE<sub>H</sub>.</p>
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

**CAUTION**

When setting this register, see **Table 20.47, Notes on Setting Registers**.

**20.3.13 CSIHnTX0H — CSIHn Transmit Data Register 0 for Half Word Access**

This register stores the transmission data. This register is the same as bits 15 to 0 of register CSIHnTX0W.

The settings specified by the upper 16 bits of CSIHnTX0W are applied to the transmission. Set transmit data to CSIHnTX0W before using this register because the value of CSIHnTX0W is undefined after the reset.

**Access:** This register can be read or written in 16-bit units.

**Address:** <CSIHn\_base> + 100C<sub>H</sub>

**Value after reset:** Undefined

Table 20.42 CSIHnTX0H Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

**CAUTION**

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.14 CSIHnRX0W — CSIHn Receive Data Register 0 for Word Access

This register stores the received data.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <CSIHn\_base> + 1010<sub>H</sub>

**Value after reset:** 0XXX XXXX<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	CSIHn RPE	CSIHn TDCE	CSIHn CS7	CSIHn CS6	CSIHn CS5	CSIHn CS4	CSIHn CS3	CSIHn CS2	CSIHn CS1	CSIHn CS0
Value after reset	0	0	0	0	0	0	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnRX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 20.43 CSIHnRX0W Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25	CSIHnRPE	Indicates whether a reception data parity error was detected. 0: No parity error was detected on the associated reception data. 1: A parity error was detected on the associated reception data.
24	CSIHnTDCE	Indicates whether a transmission data consistency check error was detected. 0: No consistency error was detected on the associated transmission data. 1: A consistency error was detected on the associated transmission data.
23 to 16	CSIHnCS <sub>x</sub> (x = 7 to 0)	Indicates which chip select signal was activated. 0: Chip select x was activated for the associated reception. 1: Chip select x was deactivated for the associated reception.
15 to 0	CSIHnRX[15:0]	Stores the received data.

#### NOTE

This register stores the received data when an INTCSIHTIR interrupt is generated. Read the received data stored in this register before generation of an INTCSIHTIR interrupt. Otherwise the data is rewritten with the next received data.

#### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.15 CSIHnRX0H — CSIHn Receive Data Register 0 for Half Word Access

This register stores the received data. This register is the same as bits 15 to 0 of register CSIHnRX0W.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <CSIHn\_base> + 1014<sub>H</sub>

**Value after reset:** Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnRX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 20.44 CSIHnRX0H Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIHnRX[15:0]	Stores the received data.

#### NOTE

This register stores the received data when an INTCSIHTIR interrupt is generated. Read the received data stored in this register before generation of an INTCSIHTIR interrupt. Otherwise the data is rewritten with the next received data.

#### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.16 CSIHnEMU — CSIHn Emulation Register

This register controls operation of SVSTOP.

**Access:** This register can be read or written in 8-bit or 1-bit units.

Perform write operation when (EPC.SVSTOP = 0).

**Address:** <CSIHn\_base> + 0018<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	CSIHnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 20.45 CSIHnEMU Register Contents

Bit Position	Bit Name	Function
7	CSIHnSVSDIS	Selects whether to continue or stop transmit/receive operation during debugging. <ul style="list-style-type: none"> <li>When the EPC.SVSTOP bit is set to 0 Continues transmit/receive operation regardless of the setting of this bit.</li> <li>When the EPC.SVSTOP bit is set to 1 0: Stops transmit/receive operation. 1: Continues transmit/receive operation.</li> </ul>
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.17 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3)

This register sets the transfer clock frequency for each chip select signal.

With CSIHnCFG0 to 7.CSIHnBRSSx[1:0] bits, one of the four types of transfer clock frequency settings can be selected for each chip select signal. For details of transfer clock frequency setting, see **Section 20.5.5, Transmission Clock Selection**.

**Access:** This register can be read or written in 16-bit units.

**Address:** CSIHnBRS0: <CSIHn\_base> + 1068<sub>H</sub>  
 CSIHnBRS1: <CSIHn\_base> + 106C<sub>H</sub>  
 CSIHnBRS2: <CSIHn\_base> + 1070<sub>H</sub>  
 CSIHnBRS3: <CSIHn\_base> + 1074<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CSIHnBRS[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.46 CSIHnBRSy Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CSIHnBRS[11:0]	0: BRG stopped 1: PCLK / ( $2^\alpha \times 1 \times 2$ ) 2: PCLK / ( $2^\alpha \times 2 \times 2$ ) 3: PCLK / ( $2^\alpha \times 3 \times 2$ ) 4: PCLK / ( $2^\alpha \times 4 \times 2$ ) . . . 4095: PCLK / ( $2^\alpha \times 4095 \times 2$ )
$\alpha$ is the value of CSIHnCTL2.CSIHnPRS[2:0].		

#### CAUTION

When setting this register, see **Table 20.47, Notes on Setting Registers**.

### 20.3.18 List of Cautions

Table 20.47 Notes on Setting Registers

Register Name	Bit Name	Cautions
CSIHnCTL0	CSIHnPWR	If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, it is necessary to restart the communication.
CSIHnCTL0	CSIHnTXE CSIHnRXE	Do not modify any of these bits while CSIHnCTL0.CSIHnPWR = 0. (These bits can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Do not modify these bits while CSIHnSTR0.CSIHnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted.
CSIHnCTL0	CSIHnJOBE	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid when CSIHnCTL1.CSIHnJE = 1. Setting this bit is prohibited in slave mode.
CSIHnCTL0	CSIHnMBS	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. (This bit can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Modification of this bit is only permitted while CSIHnSTR0.CSIHnTSF = 0. Do not change the mode between FIFO mode and direct access mode while CSIHnCTL0.CSIHnPWR = 1. When the CPU-controlled high-priority communication is enabled, the operation is the same as that in direct access mode regardless of the CSIHnMBS bit setting.
CSIHnCTL1	CSIHnCKR	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. When CS is not used, use this bit instead of CSIHnCFGx.CSIHnCKPx and set CSIHnCFGx.CSIHnCKPx to 0. This bit must be used in slave mode.
CSIHnCTL1	CSIHnSLIT CSIHnCSL[7:0] CSIHnEDLE CSIHnDCS CSIHnCSRI CSIHnHSE	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.
CSIHnCTL1	CSIHnPHE CSIHnJE CSIHnLBM	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting this bit to 1 is prohibited in slave mode.
CSIHnCTL1	CSIHnSSE	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting this bit to 1 is prohibited in master mode.
CSIHnCTL1	CSIHnSIT	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIHnCTL2	CSIHnPRS[2:0]	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of the maximum transfer clock frequency is as follows. <ul style="list-style-type: none"> <li>• Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)</li> <li>• Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6) for all products</li> <li>• Slave mode: 8.0 MHz (however, it must be equal to or lower than PCLK/6) for CSIH0 in RH850/F1KM-S1 48- and 64-pin products, CSIH2 for other products</li> </ul>
CSIHnSTR0	CSIHnSRP[7:0] CSIHnSPF[7:0] CSIHnHPST CSIHnFLF CSIHnEMF CSIHnTSF	Writing to these bits is prohibited, and only reading is permitted.
CSIHnSTR0	CSIHnTMOE CSIHnOFE CSIHnDCE CSIHnPE CSIHnOVE	Writing to these bits is prohibited, and only reading is permitted. These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0.
CSIHnSTCR0	CSIHnPCT	If this bit is set to 1 during communication, ongoing communication is aborted.

CSIHnMCTL0	CSIHnMMS[1:0]	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0 and CSIHnCTL0.CSIHnMBS = 0.
------------	---------------	---

Table 20.47 Notes on Setting Registers

Register Name	Bit Name	Cautions
CSIHnMCTL0	CSIHnTO[4:0]	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Set these bits to 0 in master mode. Set these bits to 0 in direct access, dual buffer, and transmit-only buffer mode.
CSIHnMCTL1	CSIHnFES[6:0] CSIHnFFS[6:0]	Writing to these bits while communication is ongoing is permitted.
CSIHnMCTL2	CSIHnBTST CSIHnND[7:0] CSIHnSOP[6:0]	Writing to these bits is prohibited when CSIHnCTL0.CSIHnPWR = 0. Writing to these bits is prohibited when CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0. Writing to these bits is prohibited when CSIHnSTR0.CSIHnTSF = 1. Writing to these bits is prohibited in direct access or FIFO mode.
CSIHnMRWP0	CSIHnRRA[6:0]	Writing to these bits while communication is ongoing is permitted. Writing to these bits is prohibited in direct access or FIFO mode. When writing is required, set "00 <sub>H</sub> " to these bits in transmit-only buffer mode.
CSIHnMRWP0	CSIHnTRWA[6:0]	Writing to these bits while communication is ongoing is permitted. Writing to these bits is prohibited in direct access or FIFO mode.
CSIHnCFGx x = 0 to 7	CSIHnBRSSx[1:0] CSIHnRCBx CSIHnIDLx CSIHnIDx[2:0] CSIHnHDx[3:0] CSIHnINx[3:0] CSIHnSPx[3:0]	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. These bits must be set to 0 in slave mode.
CSIHnCFGx x = 0 to 7	CSIHnPSx[1:0] CSIHnDLSx[3:0] CSIHnDIRx CSIHnDAPx	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. In slave mode, the CSIHnCFG0 setting is used for the configuration. Therefore, all the bits in CSIHnCFG1 to CSIHnCFG7 must be set to 0.
CSIHnCFGx x = 0 to 7	CSIHnCKPx	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. This bit must be set to 0 in slave mode as CSIHnCTL1.CSIHnCKR must be used in slave mode. If CS is not used, the CSIHnCTL1.CSIHnCKR bit instead of this bit, and clear this bit to 0.
CSIHnTX0W	CSIHnEOJ CSIHnCIRE	These bits are only valid when CSIHnCTL1.CSIHnJE = 1. While CSIHnCTL1.CSIHnJE = 0, the values of these bits are ignored even if 1 is read. Set these bits to 0 in slave mode.
CSIHnTX0W	CSIHnEDL	This bit is only valid when CSIHnCTL1.CSIHnEDLE = 1. While CSIHnCTL1.CSIHnEDLE = 0, the value of this bit is ignored even if 1 is read.
CSIHnTX0W	CSIHnCS[7:0]	In master mode, setting this bit to "FF <sub>H</sub> " is prohibited. In slave mode, set this bit to "FE <sub>H</sub> ".
CSIHnTX0W CSIHnTX0H		Reading these bits while communication is ongoing is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0, reading and writing to these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0, writing to these bits are prohibited in direct access mode.
CSIHnRX0W		These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is permitted in the mode (Transmit-only buffer, Dual buffer and Direct access modes) except FIFO mode. While CSIHnCTL0.CSIHnPWR = 1, reading these bits is permitted.

Table 20.47 Notes on Setting Registers

Register Name	Bit Name	Cautions
CSIHnRX0H		<p>These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0.</p> <p>While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode.</p> <p>While CSIHnCTL0.CSIHnPWR = 1, reading these bits is permitted in the FIFO mode.</p> <p>In spite of CSIHnCTL0.CSIHnPWR value, reading is permitted of these bits in the mode (Transmit-only buffer, Dual buffer and Direct access modes) except FIFO mode.</p>
CSIHnEMU	CSIHnSVSDIS	Modification of this bit is only permitted while SVSTOP = 0.
CSIHnBRSy		Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.
	y = 0 to 3	

## 20.4 Interrupt Sources

CSIH can generate the following interrupt requests:

- INTCSIHTIC (communication status interrupt)
- INTCSIHTIR (reception status interrupt)
- INTCSIHTIRE (communication error interrupt)
- INTCSIHTIJC (job completion interrupt)

### 20.4.1 Overview

The communication error interrupt INTCSIHTIRE is generated when an error is detected. The generation of the other interrupts depends on the memory mode, the job mode, and – in case of the job completion interrupt INTCSIHTIJC – also the operating mode.

The job completion interrupt INTCSIHTIJC is only generated when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). It is not available in slave mode.

The following table gives an overview.

Table 20.48 Interrupt Generation

Memory Mode	Interrupt	Interrupt Source	
		Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	INTCSIHTIC	Tx data empty* <sup>1</sup>	Tx data empty* <sup>1</sup> except job abort* <sup>4</sup>
	INTCSIHTIR	Rx data full* <sup>2</sup> and CSIHnCTL0.CSIHnRXE = 1	Rx data full* <sup>2</sup> and CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC* <sup>3</sup>	Not applicable	CSIHnTX0W.CSIHnCIRE = 1 (except Tx data empty), or job abort* <sup>4</sup>
Transmit-only buffer	INTCSIHTIC	End of communication	CSIHnTX0W.CSIHnCIRE = 1 and (CSIHnCTL0.CSIHnJOBE = 0 or CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHTIR	Data received and CSIHnCTL0.CSIHnRXE = 1	Data received and CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC* <sup>3</sup>	Not applicable	Job abort* <sup>4</sup>
Dual buffer	INTCSIHTIC	End of communication	CSIHnTX0W.CSIHnCIRE = 1 and (CSIHnCTL0.CSIHnJOBE = 0 or CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHTIR	End of communication and CSIHnCTL0.CSIHnRXE = 1	Data received and CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC* <sup>3</sup>	Not applicable	Job abort* <sup>4</sup>
Direct access	INTCSIHTIC	One data transfer	One data transfer except the state of job abort* <sup>4</sup>
	INTCSIHTIR	Data received and CSIHnCTL0.CSIHnRXE = 1	Data received and CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC* <sup>3</sup>	Not applicable	Job abort* <sup>4</sup>

Note 1. "Tx data empty" refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFES[6:0].

Note 2. "Rx data full" refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFFS[6:0].

Note 3. INTCSIHTIJC is not available in slave mode.

Note 4. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1

During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

## 20.4.2 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half a cycle of the transmission clock, CSIHTSCK. This is not possible in slave mode.

The delay is specified by setting `CSIHnCTL1.CSIHnSIT = 1`. (The setting of the `CSIHnSIT` bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of `CSIHnCTL1.CSIHnSIT = 1` (interrupt delay enabled), `CSIHnCFGx.CSIHnCKPx = 0`, `CSIHnCFGx.CSIHnDAPx = 0` (clock phase and data phase), and `CSIHnCFGx.CSIHnDLSx[3:0] = 1000B` (data length 8 bits).

Figure 20.2 Interrupt Delay Function (`CSIHnCTL1.CSIHnSIT = 1`)

Setting `CSIHnCTL1.CSIHnSIT = 1` adds a half cycle delay to the transmission clock. This also delays the end of the current chip select signal (`CSIHTCSSx`).

### 20.4.3 INTCSIHTIC (Communication Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions shown in the following table.

Table 20.49 INTCSIHTIC Interrupt Generation

Memory Mode	Interrupt Source	
	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	This interrupt is generated just before transmission data in the FIFO runs out, notifying the application that new data should be added. INTCSIHTIC is generated if the number of transmit data remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMTCL1.CSIHnFES[6:0].	Similar to "when JE is 0", an interrupt is generated when the number of transmit data remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMCTL1.CSIHnFES[6:0]. However, it is not generated if a job is aborted.
Transmit-only buffer, dual buffer	An interrupt is generated at the end of communication. (specified by the CSIHnMCTL2.CSIHnND[7:0] bit)	Generated when data is transmitted while CSIHnTX0W.CSIHnCIRE = 1. Note that if data and job abort* <sup>1</sup> are transmitted while CSIHnTX0W.CSIHnCIRE = 1, the INTCSIHTIJC interrupt is generated instead of INTCSIHTIC.
Direct access	Generated after every data transfer.	Generated after every data transfer, except when the communication was aborted.

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1.  
During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

### 20.4.3.1 INTCSIHTIC in Direct Access Mode

The examples below show the INTCSIHTIC behavior in direct access mode.

The examples assume:

- Master mode
- Direct access mode
- No interrupt delay ( $\text{CSIHnCTL1.CSIHnSIT} = 0$ )
- Normal clock phase and data phase  
( $\text{CSIHnCFGx.CSIHnCKPx} = 0$ ,  $\text{CSIHnCFGx.CSIHnDAPx} = 0$ )
- Data length 8 bits ( $\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 1000_{\text{B}}$ )
- Normal INTCSIHTIC interrupt timing ( $\text{CSIHnCTL1.CSIHnSLIT} = 0$ )

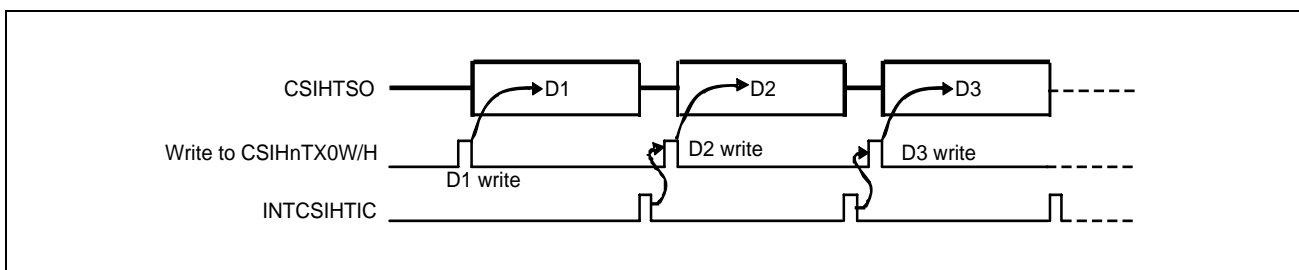

Figure 20.3 Generation of INTCSIHTIC after Transfer ( $\text{CSIHnCTL1.CSIHnSLIT} = 0$ )

If job mode is enabled ( $\text{CSIHnCTL1.CSIHnJE} = 1$ ) and a job ends because data is sent with  $\text{CSIHnTXOW.CSIHnEOJ} = 1$  and communication stop is requested ( $\text{CSIHnCTL0.CSIHnJOB} = 1$ ), then INTCSIHTIC is replaced by the job completion interrupt INTCSIHTIJC.

INTCSIHTIC can also be set up to occur as soon as the CSIHnTX0W/H register becomes empty and available for storing the next data. This is specified by setting  $\text{CSIHnCTL1.CSIHnSLIT} = 1$ .

The effect is illustrated in the figure below.

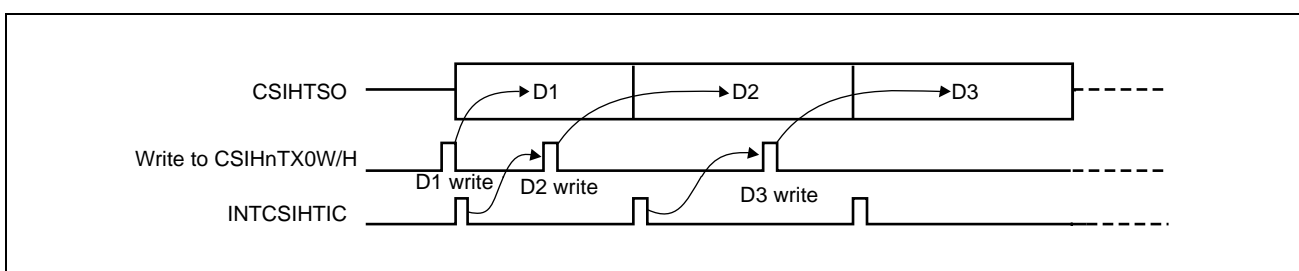

Figure 20.4 Immediate Generation of INTCSIHTIC ( $\text{CSIHnCTL1.CSIHnSLIT} = 1$ )

Thus, the new data can be written in advance.

#### NOTE

During high priority communication in transmit-only buffer mode, the operation is in the same as that in direct access mode.

### 20.4.3.2 INTCSIHTIC in FIFO Mode

The example below shows the INTCSIHTIC behavior in FIFO mode.

The example assumes:

- Master mode
- FIFO mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>)

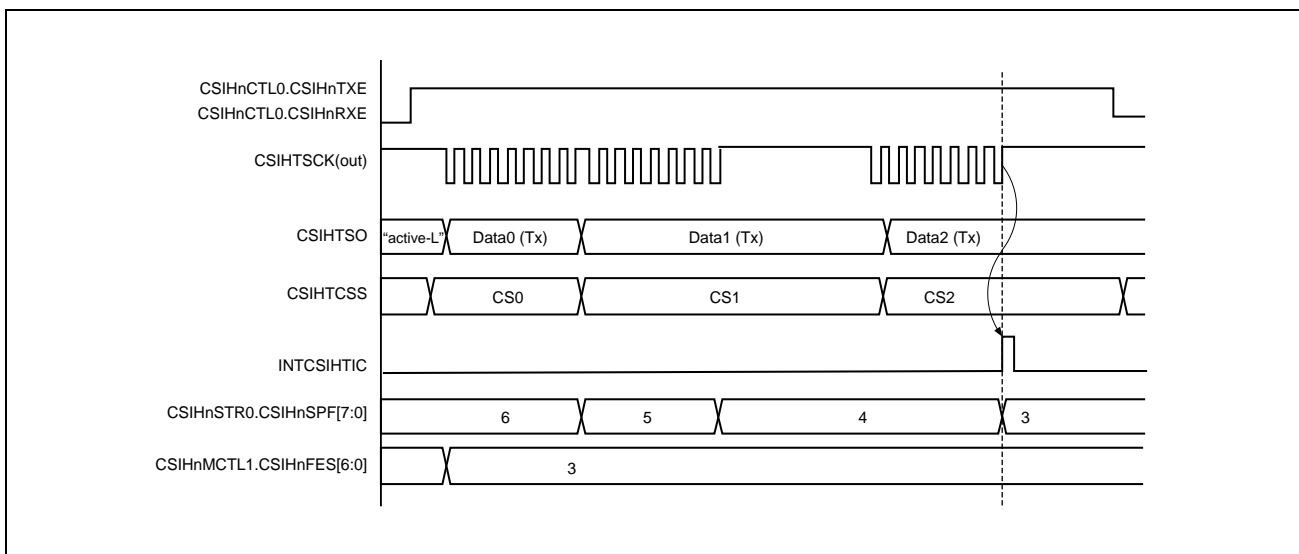

Figure 20.5 Generation of INTCSIHTIC in FIFO Memory Mode

The condition for “FIFO empty” is specified in CSIHnMCTL1.CSIHnFES[6:0]. In the example of the diagram above, the number of unsent data in FIFO is set to 3.

CSIHnSTR0.CSIHnSPF[7:0] indicates the number of unsent data. When both match, the interrupt INTCSIHTIC occurs.

### 20.4.3.3 INTCSIHTIC in Job Mode

The example below shows the INTCSIHTIC behavior in job mode.

The example assumes:

- Master mode
- Job mode enabled ( $\text{CSIHnCTL1.CSIHnJE} = 1$ )
- No interrupt delay ( $\text{CSIHnCTL1.CSIHnSIT} = 0$ )
- Normal clock phase and data phase  
( $\text{CSIHnCFGx.CSIHnCKPx} = 0$ ,  $\text{CSIHnCFGx.CSIHnDAPx} = 0$ )
- Data length 8 bits ( $\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 1000_{\text{B}}$ )
- Normal INTCSIHTIC interrupt timing ( $\text{CSIHnCTL1.CSIHnSLIT} = 0$ )

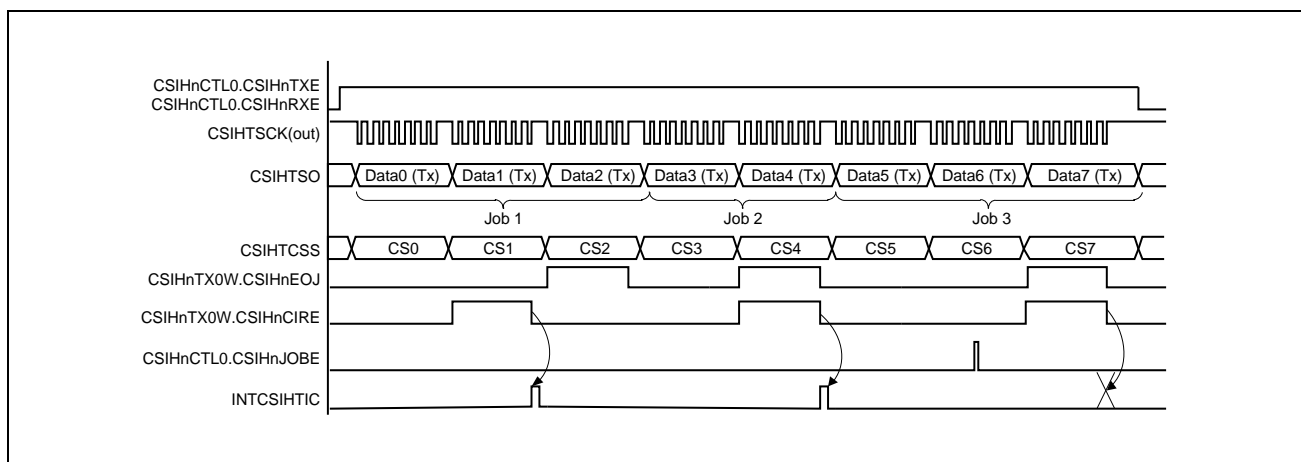

Figure 20.6 Generation of INTCSIHTIC in Job Mode

The rules for generating INTCSIHTIC in job mode are shown in the following table.

Table 20.50 Generation of INTCSIHTIC in Job Mode

CSIHnTX0W.CSIHnEOJ	CSIHnTX0W.CSIHnCIRE	INTCSIHTIC
0	0	Not generated
0	1	Generated
1	0	Not generated
1	1	CSIHnCTL0.CSIHnJOBE = 0: Generated
1	1	CSIHnCTL0.CSIHnJOBE = 1: Not generated, replaced by interrupt INTCSIHTIJC

## 20.4.4 INTCSIHTIR (Reception Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions below.

Table 20.51 INTCSIHTIR Interrupt Generation

Memory Mode	Interrupt Source	
	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	This interrupt occurs when CSIHnCTL0.CSIHnRXE is 1 and the FIFO buffer is almost full with received data, notifying the application that the FIFO must be emptied. INTCSIHTIR is generated, if the number of received data in the FIFO (CSIHnSTR0.CSIHnSRP[7:0]) equals (128 – CSIHnMCTL1.CSIHnFFS[6:0]).	
Dual buffer	An interrupt is generated when the communication has finished (as specified by the CSIHnMCTL2.CSIHnND[7:0] bits) and CSIHnCTL0.CSIHnRXE = 1.	An interrupt is generated after every data transfer.
Transmit-only buffer, Direct access	An interrupt is generated after every data transfer.	

### 20.4.4.1 INTCSIHTIR in Direct Access Mode

The example below shows the INTCSIHTIR behavior in direct access mode.

The example below assumes:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase  
(CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>)

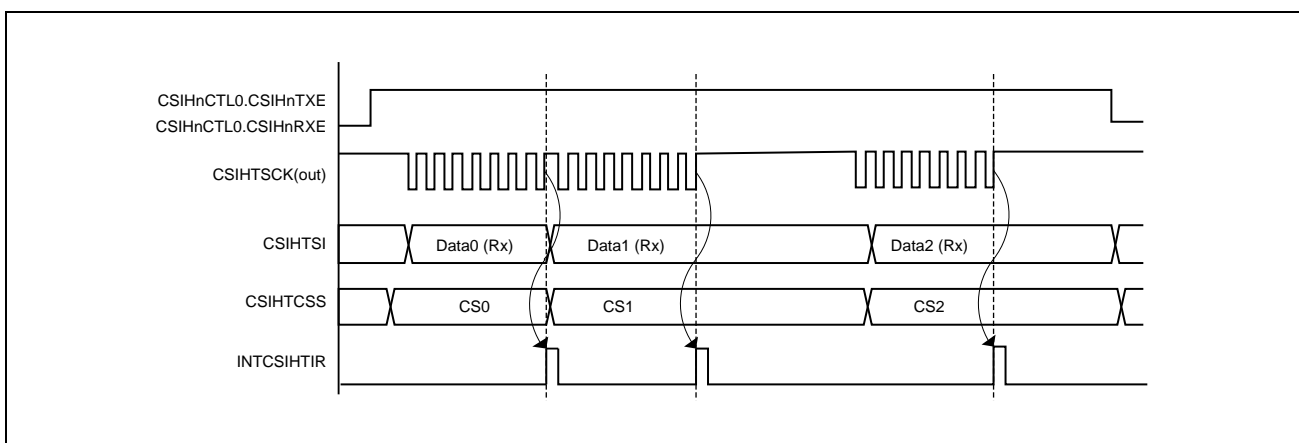

Figure 20.7 Generation of INTCSIHTIR in Direct Access Mode

### 20.4.4.2 INTCSIHTIR in Dual Buffer Mode

The example below shows the INTCSIHTIR behavior in dual buffer mode.

The example assumes:

- Master mode
- Dual buffer mode
- No interrupt delay ( $\text{CSIHnCTL1.CSIHnSIT} = 0$ )
- Default clock phase and data phase  
( $\text{CSIHnCFGx.CSIHnCKPx} = 0$ ,  $\text{CSIHnCFGx.CSIHnDAPx} = 0$ )
- Data length 8 bits ( $\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 1000_{\text{B}}$ )

Figure 20.8 Generation of INTCSIHTIR in Dual Buffer Mode

### 20.4.5 INTCSIHTIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

For details about interrupt generation timing, see **Section 20.5.12, Error Detection**.

Table 20.52 Data Error Types

Error Type	Communication Status after Error Interrupt	Note
FIFO overflow error	Communication continues even if an interrupt is generated.	The data is not written to the FIFO buffer and the data that overflowed is lost, but communications started before the error continue.
Parity error	Communication continues even if an interrupt is generated.	—
Data consistency check error	Communication continues even if an interrupt is generated.	—
Time-out error	Communication continues even if an interrupt is generated.	—
Overrun error	Condition for errors 1: In FIFO mode, when the number of received data is 0 and CPU reads the CSIHnRX0W/H register, an interrupt is generated and communication continues.  Condition for errors 2: In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled): [1] In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data is retained in the CSIHnRX0W/H register, an interrupt is generated, and communication continues. [2] In FIFO mode, when reception by the FIFO buffer is completed and the buffer is in the full state, an interrupt is generated. Communication continues.	In slave mode, when CSIHnCTL1.CSIHnHSE = 1 (handshake function enabled), communication is suspended due to handshake, an overrun error is not generated.

The type of error that caused the generation of INTCSIHTIRE is flagged in register CSIHnSTR0.

Additionally a parity error flag and a data consistency check error flag are attached to the received data in CSIHnRX0W.

For details about the various error types, see **Section 20.5.12, Error Detection**.

### 20.4.6 INTCSIHTIJC (Job Completion Interrupt)

This interrupt supports the handling of jobs. See **Section 20.5.3.3, Job Concept**. This interrupt is only available in master mode.

Job mode is enabled by setting  $CSIHnCTL1.CSIHnJE = 1$ . When  $CSIHnCTL1.CSIHnJE = 0$ , INTCSIHTIJC is not generated.

Depending on the memory mode, this interrupt is generated according to the condition shown in the following table.

Table 20.53 INTCSIHTIJC Interrupt Generation

Memory Mode	Job Mode Disabled $CSIHnCTL1.CSIHnJE = 0$	Job Mode Enabled $CSIHnCTL1.CSIHnJE = 1$
FIFO	Not applicable	Indicates that the communication stopped at the end of a job after a job abort* <sup>1</sup> was triggered If FIFO empty is not detected, INTCSIHTIJC is generated when $CSIHnCIRE$ is 1.
Transmit-only buffer		Indicates that the communication stopped at the end of a job after a job abort* <sup>1</sup> was triggered.
Dual buffer		
Direct access		

Note 1. Job abort condition:  $CSIHnTX0W.CSIHnEOJ = 1$  and  $CSIHnCTL0.CSIHnJOBE = 1$

## 20.5 Operation

### 20.5.1 Operating Modes (Master/Slave)

Whether CSIH operates in the master or slave mode determines the source of the serial clock.

#### 20.5.1.1 Master Mode

In master mode, the serial transmission clock is generated by the internal baud rate generator (BRG) and supplied to the slave(s) by signal CSIHTSCK.

Master mode is enabled by setting `CSIHnCTL2.CSIHnPRS[2:0]` to values other than `111B`. In master mode, the BRG frequency can be specified by setting the `CSIHnCTL2.CSIHnPRS[2:0]` bits in combination with the `CSIHnBRSy.CSIHnBRS[11:0]` bits.

#### (1) Chip select signals

In master mode, one or more chip select signals can be used. If several slaves are connected to the master, the chip select signals can be used to select one or more slaves. Only the selected slave is then enabled for communication.

The communication protocol as well as additional parameters are stored separately for each chip select signal. This makes it possible to adapt the data transfer individually to the requirements of each slave. For details, see **Section 20.5.3, Chip Selection (CS) Features**.

#### (2) Clock defaults

The default level of CSIHTSCK depends on the clock phase inversion function bit of the CSIHTSCK, and is high when `CSIHnCTL1.CSIHnCKR = 0` and is low when `CSIHnCTL1.CSIHnCKR = 1`.

The example below shows the communication in master mode for 8-bit data, `CSIHnCTL1.CSIHnCKR = 0`, `CSIHnCFGx.CSIHnCKPx = 0`, `CSIHnCFGx.CSIHnDAPx = 0`, and MSB first.

Figure 20.9 Transmission/Reception in Master Mode

### 20.5.1.2 Slave Mode

In slave mode, another device is the communication master and supplies the transmission clock. Normal transmit/receive operation is started as soon as a clock signal is detected.

Slave mode is selected by setting the CSIHnCTL2.CSIHnPRS[2:0] bits to 111<sub>B</sub>.

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is enabled (settings of the CSIHnCFG1 - CSIHnCFG7 registers are disabled).

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock phase and data phase

#### NOTE

When using slave mode, disable the baud rate generator (BRG) by setting the CSIHnBRSy.CSIHnBRS[11:0] bits to 000<sub>H</sub>. However, if you are using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000<sub>H</sub>.

Figure 20.10 Transmission/Reception in Slave Mode

## 20.5.2 Master/Slave Connections

### 20.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

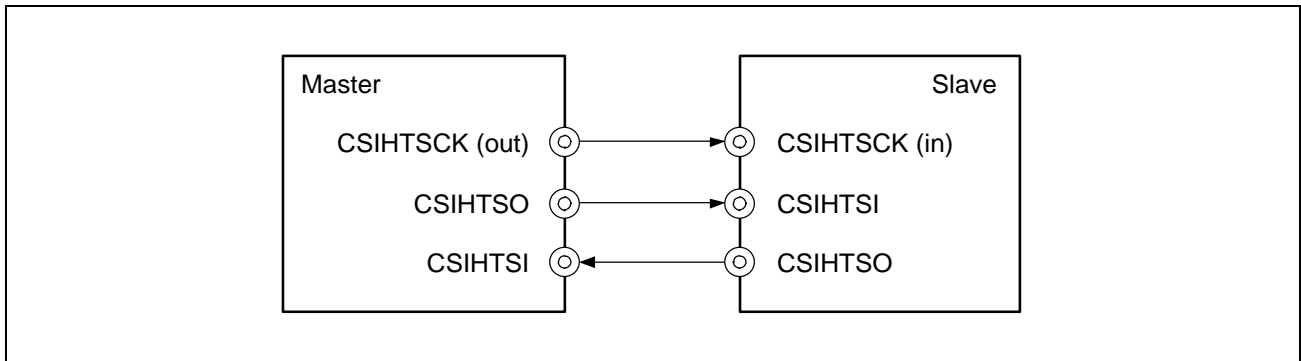

Figure 20.11 Direct Master/Slave Connection

### 20.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this example, the master supplies one chip select (CS) signal to each of the slaves. This signal is connected to the slave select input  $\overline{\text{CSIHTSSI}}$  of the slave.

The  $\overline{\text{CSIHTSSI}}$  signal can be enabled/disabled by using the  $\text{CSIHnCTL1.CSIHnSSE}$  bit.

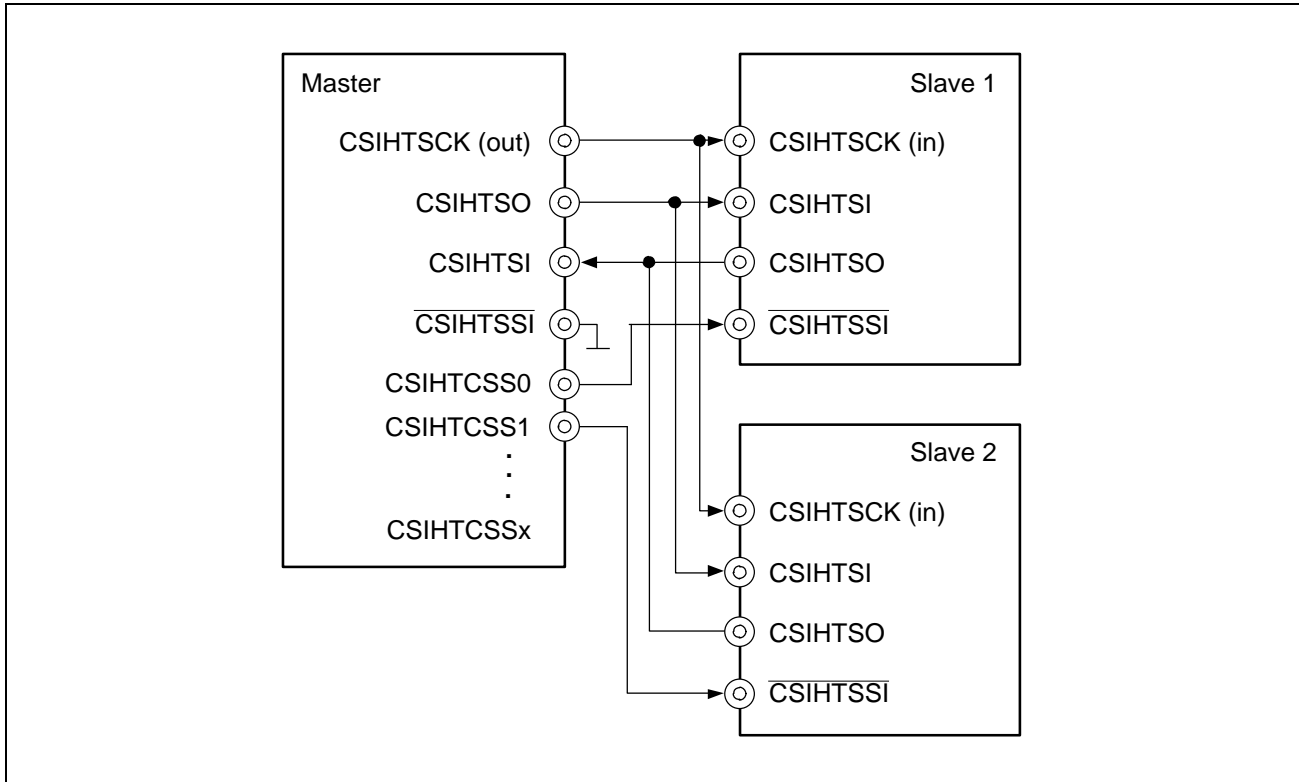

Figure 20.12 Connections between One Master and Multiple Slaves

By default, the chip select level is active low. That means, a slave is selected (enabled) as a CSIH slave when its  $\overline{\text{CSIHTSSI}}$  signal is low level. However, to adapt the CS to other devices, the output level of each chip select signal can also be programmed to be active high.

If a slave is not selected, it will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set ( $\text{CSIHnCTL0.CSIHnTXE} = 1$ ), the CSIHTSO output of the slaves that are not selected is disabled and set to input mode in order to avoid interference with the output of the selected slave.

### 20.5.3 Chip Selection (CS) Features

The chip select signal, CSIHnCSSx can be used by the master to select one or more slaves for communication.

#### 20.5.3.1 Configuration Registers

The parameters for each chip select signal CSIHnCSSx are defined in the corresponding configuration register CSIHnCFGx. The parameters include the communication protocol and additional CS parameters.

The communication protocol specifies:

- Data length: The number of bits to be sent or received.  
(CSIHnCFGx.CSIHnDLSx[3:0])
- Transfer direction: MSB or LSB first.  
(CSIHnCFGx.CSIHnDIRx)
- Parity usage: Odd, even, 0 parity or none.  
(CSIHnCFGx.CSIHnPSx[1:0])
- Clock phase and data phase.  
(CSIHnCFGx.CSIHnCKPx, CSIHnCFGx.CSIHnDAPx)

Additional parameters for each chip select signal that are only available in master mode are:

- Individual selection of the baud rate generator prescaler for each chip select signal  
(CSIHnCFGx.CSIHnBRSSx[1:0])
- Chip select priority: Categorizes chip select signals into “dominant” and “recessive”. The priority applies if two or more chip selects signals with different configurations are simultaneously activated for message broadcasting. In this case, the configuration specified for dominant chip select signals is used. (CSIHnCFGx.CSIHnRCBx)

The principle is also called “Recessive Configuration for Broadcasting” (RCB).

#### CAUTION

When specifying multiple chip select signals as dominant, be sure to configure the same settings for all dominant signals.

- Chip select timing:
  - Setup time Tsetup: The time from when the CS signal becomes active to the start of data output.  
(CSIHnCFGx.CSIHnSPx[3:0])
  - Inter-data time Tinter: The time between one data and the next data while the same CS signal is active.  
(CSIHnCFGx.CSIHnINx[3:0])
  - Hold time Thold: The time during which the CS signal remains active until CS is switched.  
(CSIHnCFGx.CSIHnHDx[3:0])
  - Idle time Tidle: Inactive time after terminating a CS signal or after every data transfer to the same CSx.  
(CSIHnCFGx.CSIHnIDx[2:0])

The CS timings of the setup time, the inter-data time, the hold time, and the idle time are illustrated in the figure below. When CSIHnCFGx.CSIHnIDLx bit is set to 1, IDLE time is inserted for every transfer regardless of CS signal.

**Figure 20.13, Chip Select Timings** provides an example of when the default active low setting is specified for the CSIHnCSS1 and CSIHnCSS2 signals (CSIHnCTL1.CSIHnCSL1 bit = 0, CSIHnCTL1.CSIHnCSL2 bit = 0). The active level can be specified individually for each CS.

Figure 20.13 Chip Select Timings

Note that each CS signal can have a different value for the setup time, inter-data time, hold time, and idle time.

A particular chip select signal is activated by setting the appropriate bit in the transmission register CSIHnTX0W.CSIHnCSx.

CSIHnRX0W.CSIHnCSx in the reception register indicates the chip select signal associated with the received data.

#### CAUTION

When high priority communication function by CPU control is enabled (CSIHnCTL1.CSIHnPHE = 1), IDLE state is inserted regardless of IDLn bit settings when priority communication mode is changed from low to high and from high to low.

### 20.5.3.2 CS Example

The following figure shows an example of two consecutive data transmissions.

The first communication uses CS0 to communicate with a single slave. The second enables CS0 and CS1 to broadcast a message to two slaves. The priority of CS0 is set to “recessive: low priority” and the priority of CS1 to “dominant: high priority”. Consequently, the second communication is conducted using the CS1 settings, which are set as dominant.

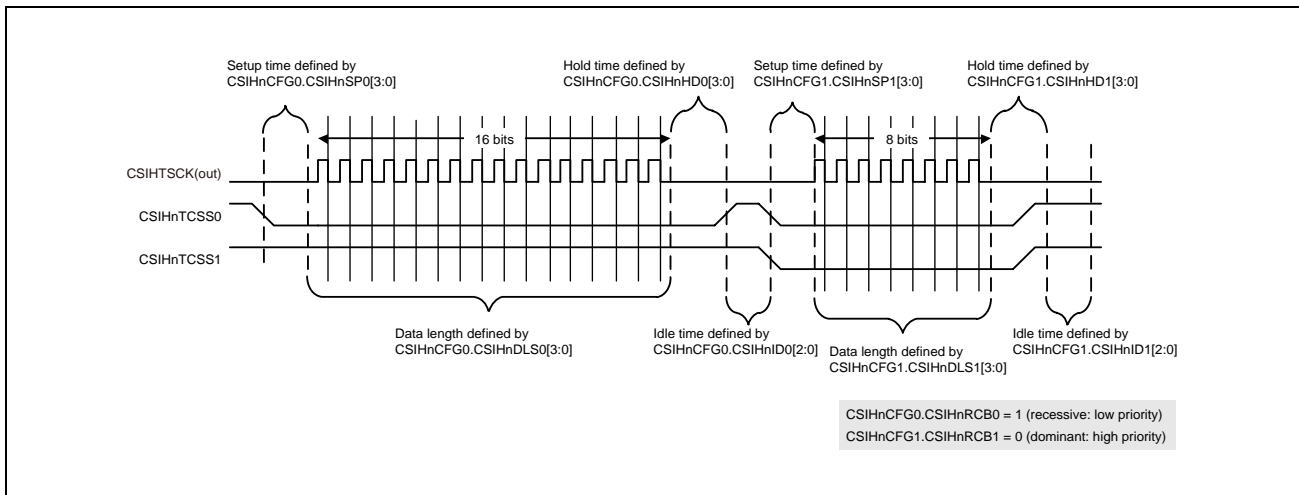

Figure 20.14 Chip Select and RCB Example

### 20.5.3.3 Job Concept

In CSIH, a job consists of the number of data targeted for transfer.

#### Job mode enable

The job mode can only be enabled in master mode. The job mode is enabled or disabled by CSIHnCTL1.CSIHnJE, while the CSIH is disabled by CSIHnCTL0.CSIHnPWR = 0.

Figure 20.15 Job Examples

A job ends by transmitting data with CSIHnTX0W.CSIHnEOJ = 1.

Communication can be specified to stop when a job is finished. This is done by setting CSIHnCTL0.CSIHnJOB. When CSIHnJOB is set, the communication continues until the data for which the CSIHnEOJ bit is set is transmitted. After this data is sent, the communication is stopped and the job completion interrupt INTCSIHnIJC is generated.

## 20.5.4 Details of Chip Select Timing

### 20.5.4.1 Changing the Clock Phase

The serial clock level specified by `CSIHnCFGx.CSIHnCKPx` can be changed while communication is stopped. The minimum value of an idle time is one transmission clock (`CSIHTSCK(out)`) cycle.

If the idle time is set to 0.5 transmission clock cycles (in `CSIHnCFGx.CSIHnIDx[2:0]`) and two consecutive data is sent with different `CSIHnCFGx.CSIHnCKPx` configurations, the idle time is automatically extended to one `CSIHTSCK(out)` cycle.

Figure 20.16 Clock Phase Timing with  $PCLK/4$ ,  $T_{hold0} = T_{setup1} = 0.5CSIHTSCK$ ,  
 $T_{idle0} = 0.5CSIHTSCK$ , `CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0)` → `CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)`

Figure 20.17 Clock Phase Timing with  $PCLK/4$ ,  $T_{hold0} = T_{setup1} = 0.5CSIHTSCK$ ,  
 $T_{idle0} = 1CSIHTSCK$ , `CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0)` → `CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)`

Figure 20.18 Clock Phase Timing with  $PCLK/4$ ,  $T_{hold0} = T_{setup1} = 0.5CSIHTSCK$ ,  
 $T_{idle0} = 0.5CSIHTSCK$ ,  $CSIHnCFG0.CSIHnCKP0 = 0$  (CSIHTCSS0) →  $CSIHnCFG2.CSIHnCKP2 = 0$   
 (CSIHTCSS2)

### 20.5.4.2 Changing the Data Phase

The  $\text{CSIHnCFGx.CSIHnDAPx}$  bit defines the phase of the data bits relative to the clock.

The relation between the setting of the  $\text{CSIHnCFGx.CSIHnDAPx}$  bit and the hold and setup times is as follows:

Hold time is the period from the last edge of the serial clock ( $\text{CSIHTSCK}$ ) until the signals on  $\text{CSIHTCSS}[7:0]$  change to the inactive level.

Setup time is the period from when the signals on  $\text{CSIHTCSS}[7:0]$  change to the active level until to when the transmission data ( $\text{CSIHTSO}$ ) is output.

Therefore, there is a gap of 0.5  $\text{CSIHTSCK}$  cycles until the edge of the serial clock signal ( $\text{CSIHTSCK}$ ) is output according to the  $\text{CSIHnCFGx.CSIHnDAPx}$  setting.

Figure 20.19 Data Phase Timing with  
 $\text{CSIHnCFG1.CSIHnCKP1} = 0$ ,  $\text{CSIHnCFG1.CSIHnDAP1} = 0$  and  
 $\text{CSIHnCFG2.CSIHnCKP2} = 0$ ,  $\text{CSIHnCFG2.CSIHnDAP2} = 0$

Figure 20.20 Data Phase Timing with  
 $\text{CSIHnCFG1.CSIHnCKP1} = 1$ ,  $\text{CSIHnCFG1.CSIHnDAP1} = 0$  and  
 $\text{CSIHnCFG2.CSIHnCKP2} = 0$ ,  $\text{CSIHnCFG2.CSIHnDAP2} = 1$

### 20.5.5 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the following bits:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnBRSy.CSIHnBRS[11:0]
- CSIHnCFGx.CSIHnBRSSx[1:0]

The transfer clock frequency of transmission clock CSIHTSCK is determined by the setting of the CSIHnCTL2.CSIHnPRS[2:0] bits and the setting of the CSIHnBRSy.CSIHnBRS[11:0] bits, but any one of CSIHnBRS3 to CSIHnBRS0 can be selected for each chip select signal by using the CSIHnCFGx.CSIHnBRSSx[1:0] bits.

The following figure shows a block diagram of the baud rate generator.

Figure 20.21 Baud Rate Generator Block Diagram

By setting CSIHnBRSy.CSIHnBRS[11:0] to 000H, the baud rate generator is disabled and CSIHTSCK of the corresponding channels are stopped.

#### Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated as:

$$\text{Transfer clock frequency (CSIHTSCK)} = \text{PCLK} / (\text{division ratio of PCLK}) = \text{PCLK} / (2^\alpha \times k \times 2),$$

where:

$$\alpha = \text{CSIHnCTL2.CSIHnPRS}[2:0] = 0 \text{ to } 6$$

$$k = \text{CSIHnBRS0.CSIHnBRS}[11:0] = 1 \text{ to } 4095$$

(when CSIHnCFGx.CSIHnBRSSx[1:0] = 0)

$$\text{CSIHnBRS1.CSIHnBRS}[11:0] = 1 \text{ to } 4095$$

(when CSIHnCFGx.CSIHnBRSSx[1:0] = 1)

$$\text{CSIHnBRS2.CSIHnBRS}[11:0] = 1 \text{ to } 4095$$

(when CSIHnCFGx.CSIHnBRSSx[1:0] = 2)

$$\text{CSIHnBRS3.CSIHnBRS}[11:0] = 1 \text{ to } 4095$$

(when CSIHnCFGx.CSIHnBRSSx[1:0] = 3)

Transfer clock frequency upper and lower limits

When setting the transfer clock frequency, please note the following:

- The minimum transfer clock frequency in master mode and slave mode is  $PCLK/524160$ .
- The maximum transfer clock frequency is as follows:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than  $PCLK/4$ )
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than  $PCLK/6$ ) for all products
  - Slave mode: 8.0 MHz (however, it must be equal to or lower than  $PCLK/6$ ) for CSIH0 in RH850/F1KM-S1 48- and 64-pin products, CSIH2 for other products

## 20.5.6 CSIH Buffer Memory

The CSIH has a configurable RAM that can be used for buffered I/O. The size is 128 words. One word is comprised of 32-bit data and 7-bit ECC.

The following configurations are available:

Table 20.54 Configurations of CSIH buffer

Mode	CSIHnCTL0.CSIHnMBS	CSIHnMCTL0.CSIHnMMS[1:0]
FIFO mode	0	00 <sub>B</sub>
Dual buffer mode		01 <sub>B</sub>
Transmit-only buffer mode		10 <sub>B</sub>
Direct access mode	1	X

### 20.5.6.1 FIFO Mode

In FIFO mode, data can be written to the CSIHnTX0W register without waiting for completion of the transmission, and data can be received without reading the CSIHnRX0W register immediately, provided the FIFO is not full.

Data to be transmitted is stored in the FIFO memory. Transmission and reception occur simultaneously – one data is received as one data is transmitted. That means, received data overwrites the transmitted data in the FIFO.

The CSIH automatically updates the respective FIFO memory pointers when data is written to or read from the FIFO memory, or data is transmitted to or received from the FIFO memory.

Table 20.55 FIFO Mode

Pointer Description	Pointer*1	Range
Number of untransmitted words	CSIHnSTR0.CSIHnSPF[7:0]	0 to 128
Number of words received and stored in the FIFO	CSIHnSTR0.CSIHnSRP[7:0]	0 to 128
Address for write/read of transmit data	CSIHnMRWP0.CSIHnTRWA[6:0]	0000 <sub>H</sub> to 01FC <sub>H</sub>
Address for read of received data	CSIHnMRWP0.CSIHnRRA[6:0]	0000 <sub>H</sub> to 01FC <sub>H</sub>
Address to be sent	CSIHnMCTL2.CSIHnSOP[6:0]	0000 <sub>H</sub> to 01FC <sub>H</sub>

Note 1. The values are automatically updated after each read/write or data transmit/receive operation.

The CSIH status register contains two FIFO status flags:

- CSIHnSTR0.CSIHnFLF: FIFO full
- CSIHnSTR0.CSIHnEMF: FIFO empty

When this mode is started, bit CSIHnSTCR0.CSIHnPCT must be set. By doing this, CSIHnSTR0.CSIHnEMF is not reset, but set.

All FIFO pointers and FIFO flags except CSIHnSTR0.CSIHnEMF are reset and CSIHnSTR0.CSIHnEMF is set.

### 20.5.6.2 Dual Buffer Mode

In this mode, the memory is divided into two parts of equal size; 64 words are allocated to transmission data and 64 words to received data. In dual buffer mode, the respective buffer pointers indicate the values shown in the following table.

Table 20.56 Dual Buffer Mode

Pointer Description	Pointer* <sup>1</sup>	Range
Address of data written to and read from transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000 <sub>H</sub> to 00FC <sub>H</sub>
Address of data read from receive buffer	CSIHnMRWP0.CSIHnRRA[6:0]	0000 <sub>H</sub> to 00FC <sub>H</sub>
The number of transmit data remaining in the transmit buffer	CSIHnMCTL2.CSIHnND[6:0]	0 to 64
Address to which data is transmitted	CSIHnMCTL2.CSIHnSOP[6:0]	0000 <sub>H</sub> to 00FC <sub>H</sub>

Note 1. Pointers are automatically incremented after each read/write.

### 20.5.6.3 Transmit-Only Buffer Mode

In this mode, the entire memory is used to save transmission data.

Received data must be read directly from CSIHnRX0W/H.

In transmit-only buffer mode, the respective buffer pointer indicates the values shown in the following table.

Table 20.57 Transmit-Only Buffer Mode

Pointer Description	Pointer* <sup>1</sup>	Range
Address of data written to and read from transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000 <sub>H</sub> to 01FC <sub>H</sub>
The number of transmit data remained in the transmit buffer	CSIHnMCTL2.CSIHnND[6:0]	0 to 128
Address to which data is transmitted	CSIHnMCTL2.CSIHnSOP[6:0]	0000 <sub>H</sub> to 01FC <sub>H</sub>

Note 1. Pointers are automatically incremented after each read/write.

### 20.5.6.4 Direct Access Mode

In direct access mode, the CSIH memory is completely bypassed:

- Transmission data provided by the CPU to the transmission register CSIHnTX0W or CSIHnTX0H is directly copied to the shift register.
- Reception data is directly copied from the shift register to the reception register CSIHnRX0W or CSIHnRX0H.

## 20.5.7 Data Transfer Modes

The following table summarizes this section. It shows how data transfer is started in the various memory, operating, and transfer modes.

Table 20.58 Start of Data Transfer

Memory and Operating Mode		Transfer Mode	
		Transmit-Only Transmit/Receive	Receive-Only
FIFO, direct access	Master	Writing to the CSIHnTX0W register or the CSIHnTX0H register	Writing to the CSIHnTX0W register or the CSIHnTX0H register
	Slave	Clock reception from master	Incoming clock from the master
Transmit-only buffer, dual buffer	Master	CSIHnMCTL2.CSIHnBTST = 1	CSIHnMCTL2.CSIHnBTST = 1
	Slave	Clock reception from master	Clock reception from master

### 20.5.7.1 Transmit-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 0 puts the CSIH in transmit-only mode. Start of transmission depends on the memory mode:

- In case of FIFO or direct access mode, transmission starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, transmission starts when the CSIHnMCTL2.CSIHnBTST bit is set.

### 20.5.7.2 Transmit/Receive Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in transmit/receive mode.

Start of communication (transmission and reception) depends on the memory mode:

- In case of FIFO or direct access mode, communication starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, communication starts when the CSIHnMCTL2.CSIHnBTST bit is set.

### 20.5.7.3 Receive-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 0 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in receive-only mode.

In master mode, start of reception depends on the memory mode:

- In case of FIFO or direct access mode, reception starts when dummy data is written to the CSIHnTX0W or CSIHnTX0H register.

In slave mode, reception starts as soon as the CSIHnSCK transmission clock is received from the master. It is not necessary to write data to the CSIHnTX0W or CSIHnTX0H register of the slave.

- In case of dual buffer mode or transmit-only buffer mode, reception starts when the CSIHnMCTL2.CSIHnBTST bit is set.

## 20.5.8 Data Length Selection

### 20.5.8.1 Data Length from 2 to 16 Bits

The length of a data packet is selectable for each chip select signal from 2 to 16 bits using  $\text{CSIHnCFGx.CSIHnDLSx}[3:0]$ . The examples below show the communication with MSB first ( $\text{CSIHnCFGx.CSIHnDIRx} = 0$ ).

Data length = 16 bits ( $\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 0000_{\text{B}}$ ):

Figure 20.22 16 Bit Data Length, MSB First

Data length = 14 bits ( $\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 1110_{\text{B}}$ ):

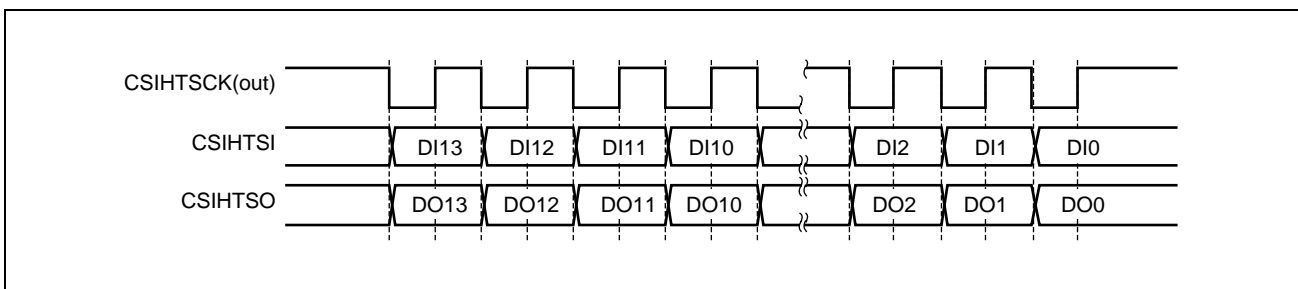

Figure 20.23 14 Bit Data Length, MSB First

### 20.5.8.2 Data Length Greater than 16 Bits

If the data to be sent/received exceeds 16 bits, the extended data length (EDL) function can be used.

EDL function is enabled by setting the `CSIHnCTL1.CSIHnEDLE` bit to 1.

EDL function works as follows:

- The data has to be broken into 16-bit blocks plus remainder. For example, data of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as “data length” in `CSIHnCFGx.CSIHnDLSx[3:0]`.
- For transmitting the 16-bit blocks, `CSIHnTX0W.CSIHnEDL` must be set to 1. In this case, the data written to `CSIHnTX0W` is sent as a 16-bit data length regardless of the `CSIHnCFGx.CSIHnDLSx[3:0]` bit setting.
- The transfer is complete after a block with the specified data length (the remainder of data specified with `CSIHnTX0W.CSIHnEDL = 0`) has been sent.

#### Example

Example for sending 40-bit data (123456789A<sub>H</sub>) to CS0:

40 bits are split into two 16-bit blocks plus 8 bits.

- Initialize `CSIHnCFG0.CSIHnDLS0[3:0] = 8`.
- To transmit 123456789A<sub>H</sub> with MSB first, write the following sequence to `CSIHnTX0W`:
  - 20FE 1234<sub>H</sub> (`CSIHnTX0W.CSIHnEDL = 1`)
  - 20FE 5678<sub>H</sub> (`CSIHnTX0W.CSIHnEDL = 1`)
  - 00FE 009A<sub>H</sub> (`CSIHnTX0W.CSIHnEDL = 0`)

The following figure illustrates the timing.

Figure 20.24 EDL Timing Diagram

#### NOTES

- 1-bit data length is allowed only when using the EDL mode.
- If parity is enabled, the parity bit is added after the last bit.
- When data is sent using extended data length (EDL) function, use the same chip select signal.
- Example for configuring the data direction:
  - Data to be sent: 123456<sub>H</sub>
  - MSB first:  
Set CSIHnCFGx.CSIHnDIRx = 0  
Write CSIHnTX0W = 20FE 1234<sub>H</sub> (EDL bit = 1)  
Write CSIHnTX0W = 00FE 0056<sub>H</sub> (EDL bit = 0)
  - LSB first:  
Set CSIHnCFGx.CSIHnDIRx = 1  
Write CSIHnTX0W = 20FE 3456<sub>H</sub> (EDL bit = 1)  
Write CSIHnTX0W = 00FE 0012<sub>H</sub> (EDL bit = 0)
- Operation is not guaranteed if CSIHnTX0W.CSIHnEOJ and CSIHnTX0W.CSIHnEDL are simultaneously set to "1" while CSIHnCTL1.CSIHnJE = 1 and CSIHnCTL1.CSIHnEDLE = 1.
- EDL mode cannot be used in receive-only mode of slave mode.  
(CSIHnCTL2.CSIHnPRS[2:0] = 111<sub>B</sub>, CSIHnCTL0.CSIHnTXE = 0, CSIHnCTL0.CSIHnRXE = 1)

### 20.5.9 Serial Data Direction Selection

The serial data direction is selectable for each chip select signal using the CSIHnDIRx bit in the CSIHnCFGx register.

The examples below show communication for a data length of 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>).

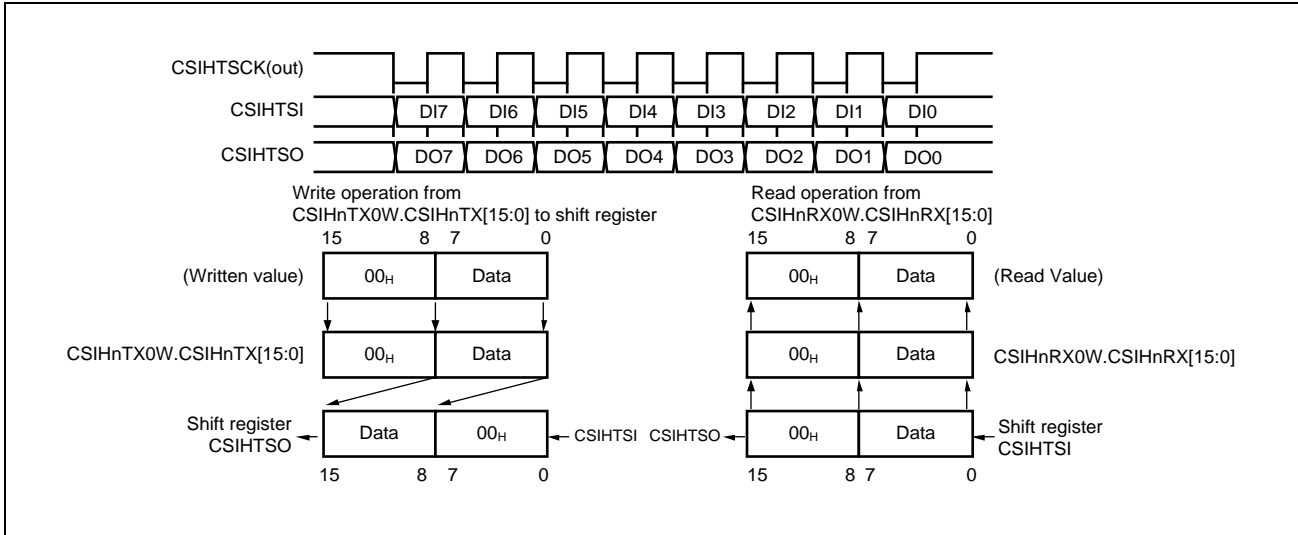

Figure 20.25 Serial Data Direction Select Function — MSB First (CSIHnDIRx = 0)

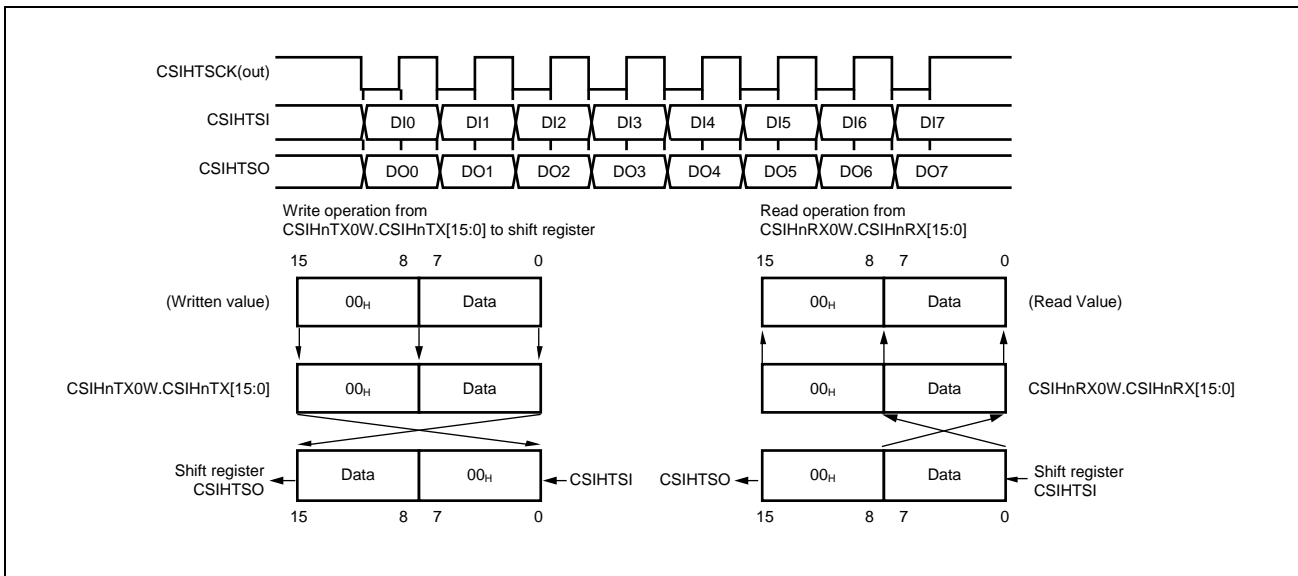

Figure 20.26 Serial Data Direction Select Function — LSB First (CSIHnDIRx = 1)

### 20.5.10 Slave Select (SS) Function

The Slave Select (SS) function enables communication between one master and multiple slaves (SPI communications).

In master mode, the master device outputs the slave select signal (CSIHTCSS<sub>x</sub>) to a slave. Communication by a device in slave mode is enabled when the slave input select signal (CSIHTSSI) is at the low level.

See **Section 20.5.2, Master/Slave Connections**, for examples of connections using the SS function.

#### 20.5.10.1 Communication Timing Using SS Function

The following figure illustrates the communication signal and timings using the SS function.

In slave mode, the data transfer configuration is determined by the CSIHnCFG0 register.

Figure 20.27 Tx/Rx Timing of Communication Using SS Function

- (1) CSIH enters slave mode by setting CSIHnCTL2.CSIHnPRS[2:0] = 111<sub>B</sub>. CSIHnCFG0.CSIHnCKP0 and CSIHnCFG0.CSIHnDAP0 are 0.
- (2) The data length is 8 bits (CSIHnCFG0.CSIHnDLS0[3:0] = 1000<sub>B</sub>). The data direction is MSB first (CSIHnCFG0.CSIHnDIR0 = 0).
- (3) The transmit/receive mode is set (CSIHnCTL0.CSIHnTXE = 1, CSIHnCTL0.CSIHnRXE = 1, and CSIHnCTL0.CSIHnPWR = 1). Communication start is permitted.
- (4) The transfer status flag CSIHnSTR0.CSIHnTSF is automatically set when transfer data is written to the CSIHnTX0W or CSIHnTX0H transmission register during direct access mode or FIFO mode.
- (5) While the signal  $\overline{\text{CSIHTSSI}}$  is at high level, transmission/reception is not started, even if an external transmission clock CSIHTSCK is input. Input to CSIHTSI is ignored.
- (6)  $\overline{\text{CSIHTSSI}}$  falling to low level indicates that CSIHTSO is enabled and ready for transmission.
- (7) As soon as the external clock signal CSIHTSCK is detected, the slave transmits data to CSIHTSO and simultaneously captures data from CSIHTSI.
- (8) Interrupt INTCSIHTIR indicates that the reception is complete. The CSIHnRX0W/H register can be read.

### 20.5.10.2 CSIHTSSO Operation

CSIHnPWR	CSIHnTXE	CSIHnRXE	CSIHnSSE	CSIHTSSO
0	—	—	—	H
1	—	—	0	H
	0	—	1	H
	1	—	1	Inverse value of $\overline{\text{CSIHTSSI}}$ level

The CSIHTSSO pin is a signal to control the I/O function of the chip's SO pin when using the SS function.

The CSIHTSSO pin is enabled when the CSIHTSSO pin is "High" (the chip's SO pin is being driven).

The CSIHTSSO pin is disabled when the CSIHTSSO pin is "Low" (the chip's SO pin is not being driven).

Figure 20.28 Operation of CSIHTSSO

#### CAUTION

If  $\overline{\text{CSIHTSSI}}$  pin is changed during communication (CSIHnSTR0.CSIHnTSF = 1), current communication is not guaranteed.

## 20.5.11 Handshake Function

CSIH features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIHnCTL1.CSIHnHSE bit. For handshake, the signals CSIHTRYI and CSIHTRYO are used.

The busy timing depends on the data phase selection bit CSIHnCFGx.CSIHnDAPx.

### 20.5.11.1 Slave Mode

If CSIHnCTL1.CSIHnHSE = 1, a low-level CSIHTRYO signal is output when the slave becomes busy. This can happen in two cases:

1. When the next data to be sent is not ready:

When the slave is in transmit-only mode or transmit/receive mode (CSIHnCTL0.CSIHnTXE = 1) and is in any of the states listed below, the CSIHTRYO outputs the busy state (low level).

Table 20.59 Memory Mode and Slave Transfer State

Memory Mode	Slave Transfer State
Direct access mode	When there is no more data to be sent
FIFO mode	When there is no more data to be sent (CSIHnSTR0.CSIHnEMF = 1)
Dual buffer mode	When CSIHnMCTL2.CSIHnBTST is not set to 1
Transmit-only buffer mode	

The following examples assume an eight-bit data length.

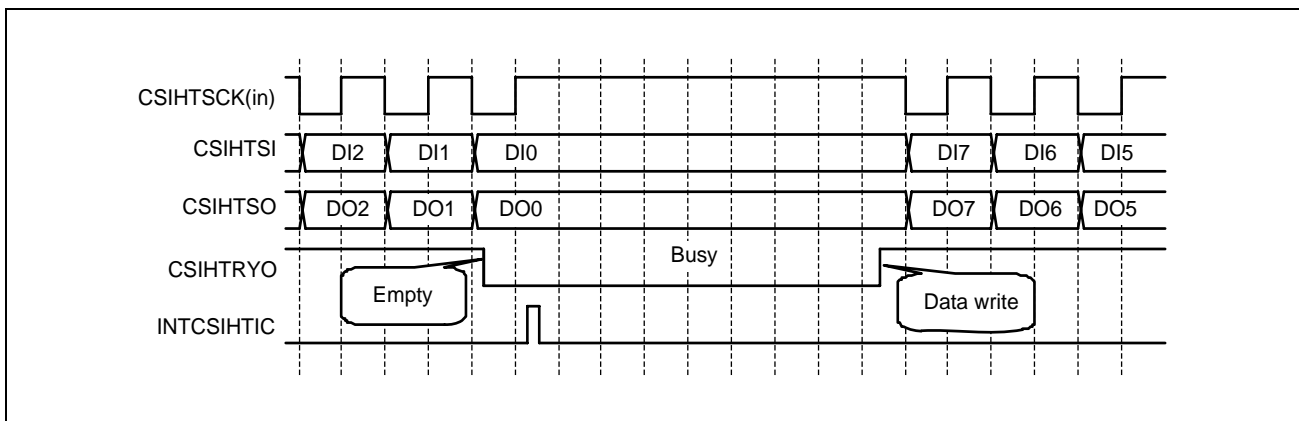

Figure 20.29 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 0)

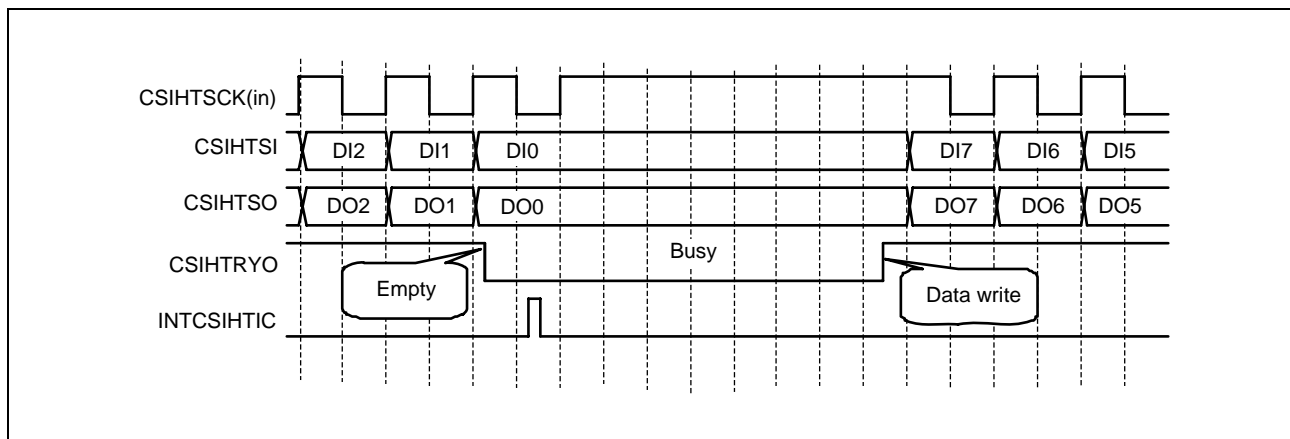

Figure 20.30 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 1)

2. When receive register is full:

When slave is configured in receive-only mode or transmit/receive mode (CSIHnCTL0.CSIHnRXE = 1), and new data cannot be copied from a shift register to CSIHnRX0W/H because the previously received data is still in the CSIHnRX0W/H register (CSIHnRX0W/H is full).

When CSIHnCTL0.CSIHnRXE is 1 and is in any of the following states, CSIHTRYO outputs busy state (low level).

Table 20.60 Memory Mode and Slave Reception State

Memory Mode	Slave Reception State
Direct access mode	When CSIHnRX0W or CSIHnRX0H is full
FIFO mode	When received data is remaining in buffer (CSIHnSTR0.CSIHnFLF = 1)
Dual buffer mode	No applicable case
Transmit-only buffer mode	When CSIHnRX0W or CSIHnRX0H is full

The following examples assume an eight-bit data length.

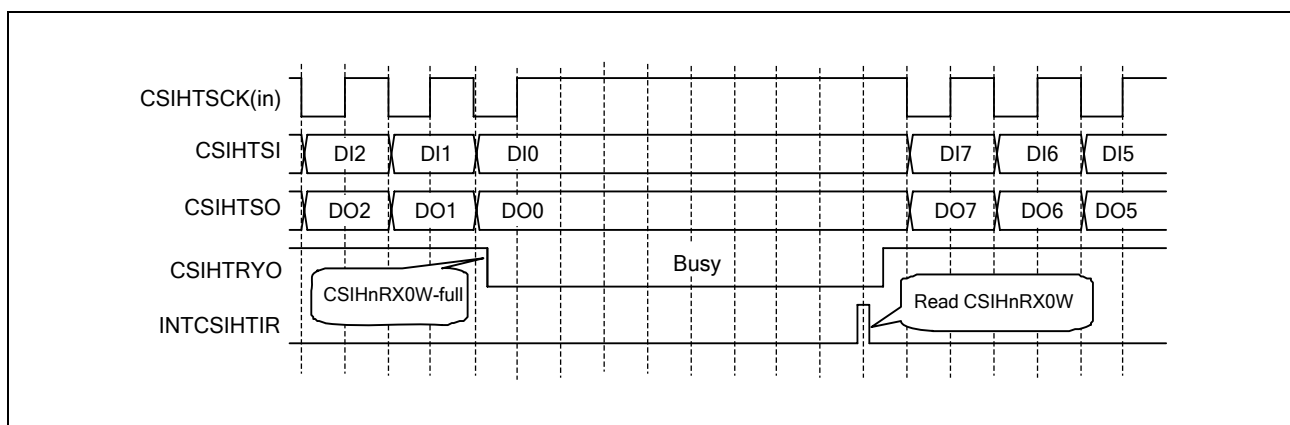

Figure 20.31 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 0)

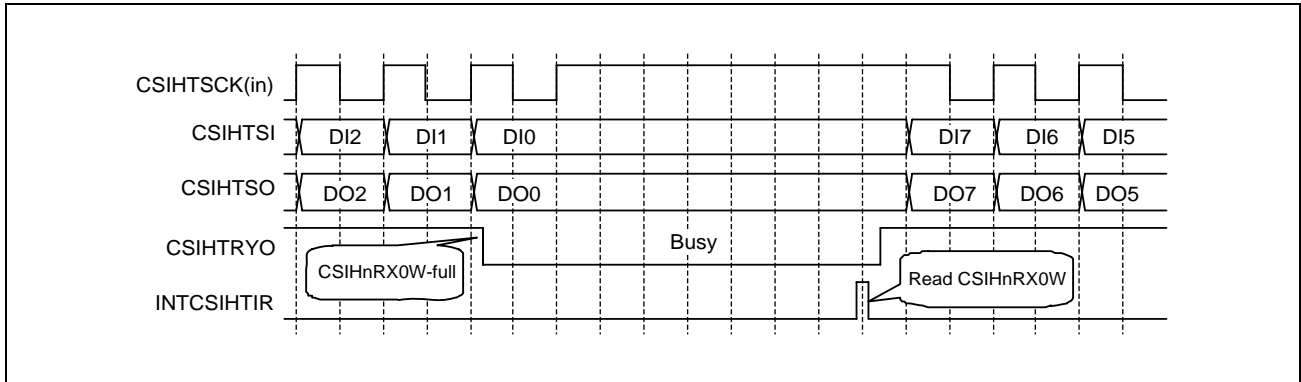

Figure 20.32 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 1)

### 20.5.11.2 Master Mode

When the master detects  $CSIHTRYI = 0$  while  $CSIHnCTL1.CSIHnHSE = 1$ , the subsequent transfers are put on hold, the master goes into wait state and suspends the  $CSIHTSCK$  clock.

The  $CSIHTRYI$  level is checked at each half clock cycle of  $CSIHTSCK$ .

Figure 20.33 Master's Reaction to  $CSIHTRYI$  ( $CSIHnCFGx.CSIHnDAPx = 0$ )

The  $CSIHTRYI$  signal must be pulled down by the slave before the next transfer starts. If this is done while data transfer is in progress, the serial clock from the master is suspended after the transfer is complete.

The master resumes the communication as soon as  $CSIHTRYI$  becomes high (the slave is "ready").

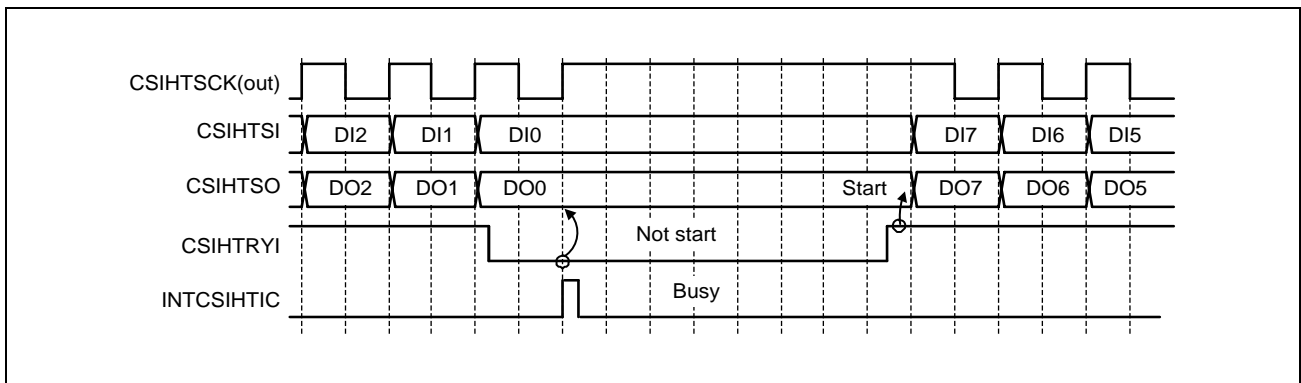

Figure 20.34 Master's Reaction to  $CSIHTRYI$  ( $CSIHnCFGx.CSIHnDAPx = 1$ )

#### CAUTIONS

1. If multiple slaves are connected, the master must only detect the  $CSIHTRYI$  signal of the slave it has selected for communication.
2. Even when the  $CSIHTRYI$  pin of the master detects a  $CSIHTRYO$  signal from the slave during data transfer, the communication is not put on hold but continues until the data transfer is completed.

## 20.5.12 Error Detection

CSIH can detect five error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)
- Time-out error (in FIFO mode)
- Overflow error (in FIFO mode)

Check for parity, data consistency and time-out errors can be enabled/disabled individually.

If any of these errors is detected, the interrupt request INTCSIHTIRE is generated and the corresponding flags are set.

### 20.5.12.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent as output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIHnCTL1.CSIHnDCS bit (when checking data consistency, make sure that PIPn.PIPn\_m = 1). It will not be enabled if data transmission is disabled (CSIHnCTL0.CSIHnTXE = 0).

When the data consistency check is active, the data transferred from CSIHnTX0W or CSIHnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIHTSO are read back via the CSIHTDCS signal into the corresponding shift register.

After completion of the transmission, the sent data is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnDCE bit is set.

Additionally, CSIHnRX0W.CSIHnTDCE of data that contains the error is set.

The data consistency check function is illustrated in the following block diagram.

Figure 20.35 Data Consistency Check Functional Block Diagram

### 20.5.12.2 Parity Check

CSIH can append a parity bit to the last data bit (even if extended data length is used).

The use and type of parity is specified in `CSIHnCFGx.CSIHnPSx[1:0]`.

Parity check is enabled if `CSIHnCFGx.CSIHnPSx[1] = 1`.

The parity bit is checked after a reception is complete. In case of parity error:

- Interrupt `INTCSIHTIRE` is generated.
- The `CSIHnSTR0.CSIHnPE` bit is set.

Additionally, `CSIHnRX0W.CSIHnRPE` of data that contains the error is set.

The figure below shows an example.

- Data length is 8 bits.
- The data to be transmitted is `05H` and `35H`.
- Data direction is LSB first.
- Parity type is odd.

Figure 20.36 Parity Check Example

The parity bit of the first data is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

The parity bit of the second data is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last bit of the data.

### 20.5.12.3 Time-Out Error

Time-out errors can be checked only in slave FIFO mode.

This error occurs if neither of the following occurred within a certain period of time:

- Received data in FIFO is read
- FIFO receives data from CSIHTSI

The time-out time is defined in `CSIHnMCTL0.CSIHnTO[4:0]` in units of “8 x transmission clock `CSIHTSCK`”. A time-out error occurs when the specified time is exceeded (the time-out time is not detected when `CSIHnMCTL0.CSIHnTO[4:0] = 00000B`).

The dedicated time-out counter is set by the `CSIHnCTL2.CSIHnPRS[2:0]` and `CSIHnBRSy.CSIHnBRS[11:0]` bits.

If the value of the `CSIHnBRSy.CSIHnBRS[11:0]` bits is left as `000H`, the dedicated time-out counter does not operate.

The dedicated time-out counter measures the time between the last and the next read operation.

Figure 20.37 Time-Out Check Functional Timing Diagram

The start timing of the time-out counter is as follows:

- When reception is completed
- When data read from the CPU is completed  
(The counter does not start if the buffer is empty.)
- When a time-out error is detected

After a time-out error is detected, if data is still available in FIFO, the time-out counter restarts.

If the value set by bits `CSIHnMCTL0.CSIHnTO[4:0]` is reached again, the `INTCSIHTIRE` interrupt is output again.

The timeout counter continues to count until received data is read. To stop the counter, read all received data or set `CSIHnSTCR0.CSIHnPCT` to 1. Note that the pointer is cleared if you perform the latter.

The counter is reset at the following timing:

- Data is read once.
- A new data item is received.
- A timeout error is detected.
- The `CSIHnSTCR0.CSIHnPCT` bit is set to 1.

If a timeout error occurs, the following occur:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnTMOE bit is set.

#### 20.5.12.4 Overflow Error

An overflow error can occur in FIFO mode. It occurs when transmission data is written to the CSIHnTX0W register while the FIFO buffer is filled with received data.

##### Example

100 data packets have been transmitted. That means, the FIFO contains 100 received data packets. The application starts to read the received data.

While the read operation is in progress, the application begins to write another set of 50 transmission data packets to the FIFO. However, only 10 received data packets have been read up to now, and 90 are still in the FIFO.

In this case, only 38 buffers are available for new transmission data. When the CPU tries to write the 39th data, an overflow error occurs.

This is illustrated in the following figure.

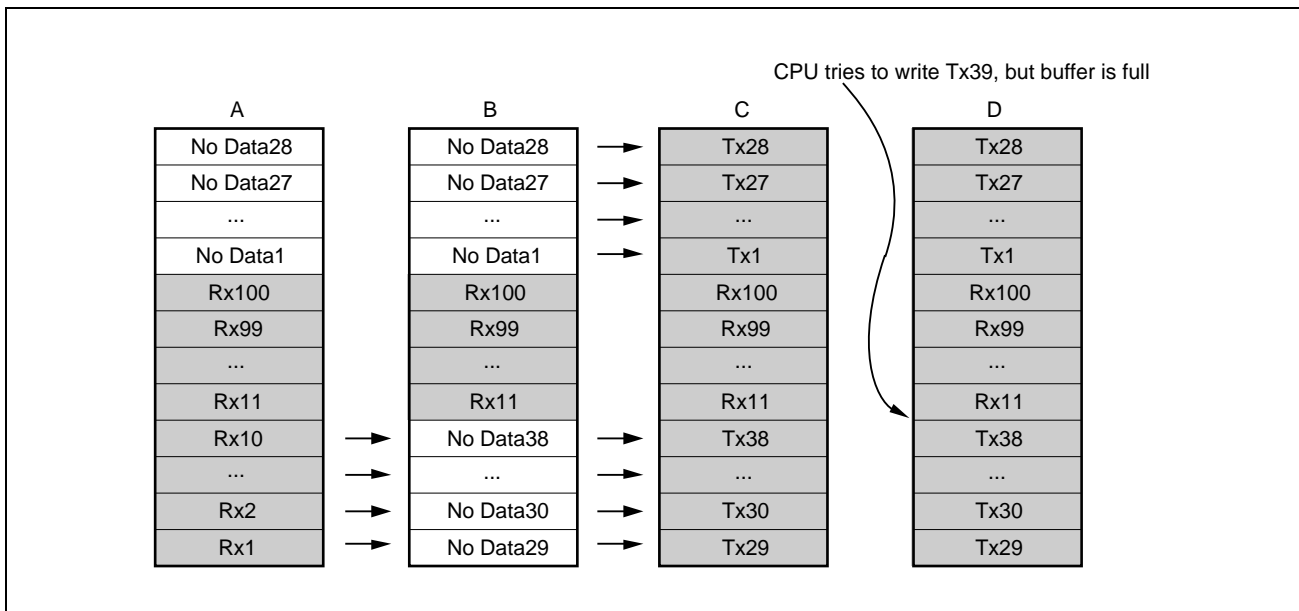

Figure 20.38 FIFO Overview

The 39th and subsequent data packets are discarded. The figure below shows the overflow timing.

Figure 20.39 FIFO Overflow Timing

In case of overflow error:

- Interrupt INTCSIHnTIRE is generated.
- The CSIHnSTR0.CSIHnOFE bit is set.

### 20.5.12.5 Overrun Error

An overrun error can occur in direct access, transmit-only buffer, and FIFO modes. It does not occur in dual buffer mode. The overrun error does not occur if data reception is disabled (CSIHnCTL0.CSIHnRXE = 0).

There are two conditions for overrun errors.

#### Condition for errors 1

- In FIFO mode, if the CPU reads the CSIHnRX0W/H register when the number of received data is 0.

#### Condition for errors 2

- In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled):
  - In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data remains in the CSIHnRX0W/H register.
  - In FIFO mode, when reception is completed while the FIFO buffer is still full of receive data.

#### (1) Direct access/transmit-only buffer

In direct access and transmit-only buffer modes, this error occurs when newly received data cannot be transferred from the shift register to the reception register CSIHnRX0W/H. This happens when CSIHnRX0W/H was not read and therefore contains previously received data.

The following figure illustrates the overrun error detection function.

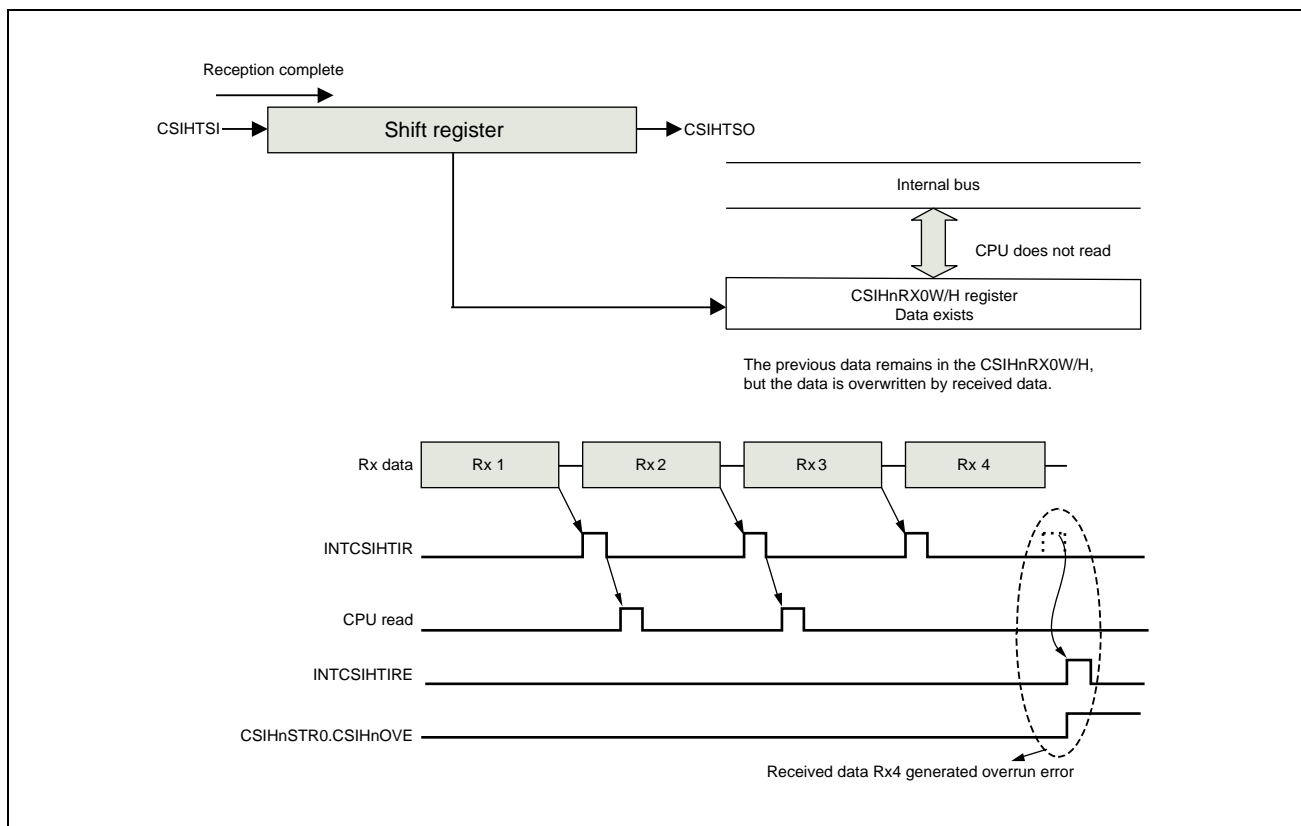

Figure 20.40 Overrun Error Detection in Direct Access and Transmit-Only Buffer Modes

**NOTE**

An overrun error can be avoided in slave mode by using handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

**(2) FIFO mode**

In FIFO mode, this error occurs if:

1. Newly received data cannot be transferred from the shift register to the FIFO because the FIFO is full.

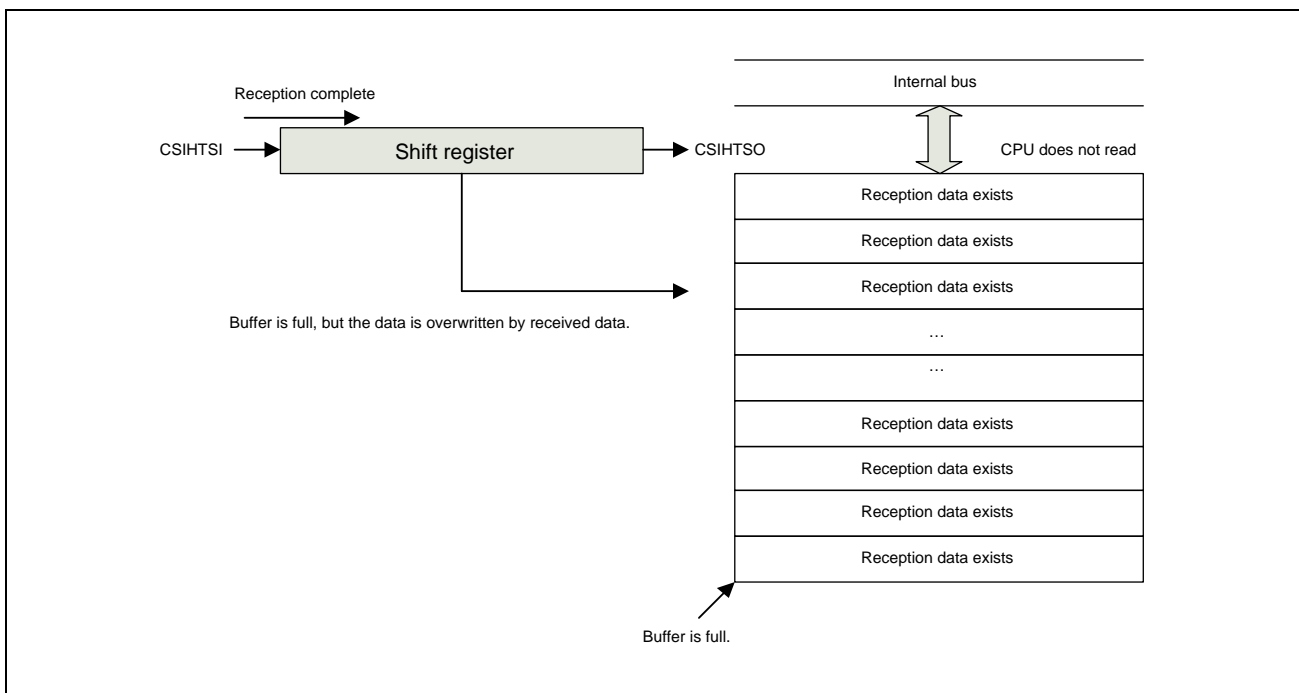

Figure 20.41 Overrun Error Detection in FIFO Mode (FIFO Full)

**NOTE**

An overrun error can be avoided in slave mode by using the handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

2. The CPU attempts to read non-existent receive data.

Figure 20.42 Overrun Error Detection in FIFO Mode (No Data)

In case of overrun error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnOVE bit is set.
- Received data is overwritten and the communication continues.  
(When the CPU tries to read non-existent data, it waits until reception is completed and then resumes reading.)

For details see **Section 20.5.11, Handshake Function.**

### 20.5.13 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active ( $\text{CSIHnCTL1.CSIHnLBM} = 1$ ),  $\text{CSIHTCSSx}$  is fixed to the inactive level (the active level is defined by the  $\text{CSIHnCTL1.CSIHnCSLx}$  value). The transmit and receive signals are internally connected, as shown in the figures below. The signals  $\text{CSIHTSCK}$ ,  $\text{CSIHTSO}$ ,  $\text{CSIHTSI}$ , and  $\text{CSIHTCSSx}$  are disconnected from the ports. In addition, the  $\text{CSIHTSO}$  output level is fixed to low, and  $\text{CSIHTSCK}$  is set to reset level (High) regardless of the value of the  $\text{CSIHnCFGx.CSIHnCKPx}$ . The rest of CSIH works as in normal operation.

In order to test CSIH, put it in loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data. Any connected device remains unaffected by the loop-back test.

Table 20.61 Pin Output Level in Loop-Back Mode

Pin Name	Output Level
$\text{CSIHTSCK(out)}$	High level
$\text{CSIHTCSS}[7:0]$	Inactive level
$\text{CSIHTSO}$	Low level (not dependent on the previous value)
Interrupt	Normal function
$\text{CSIHTRYO}$	Normal function (Low level)

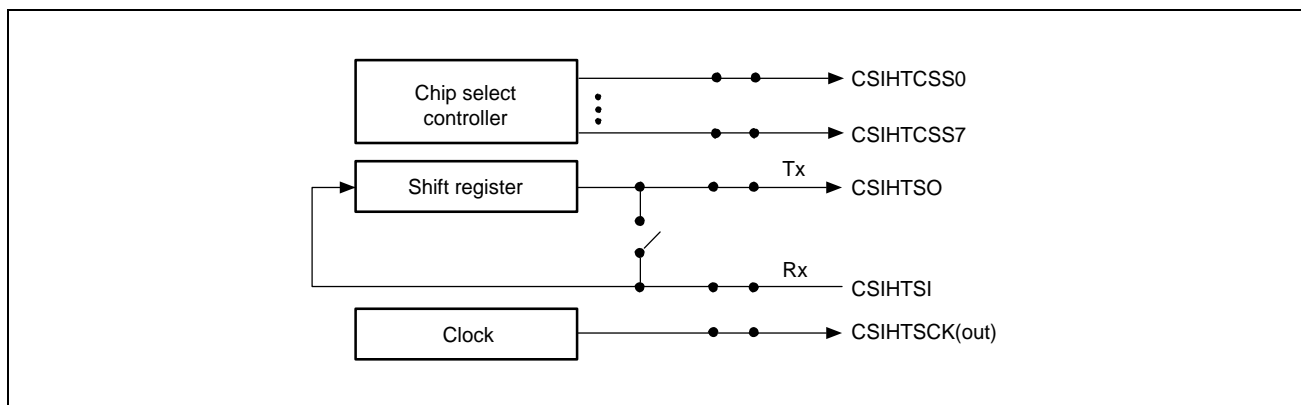

Figure 20.43 Normal Operation

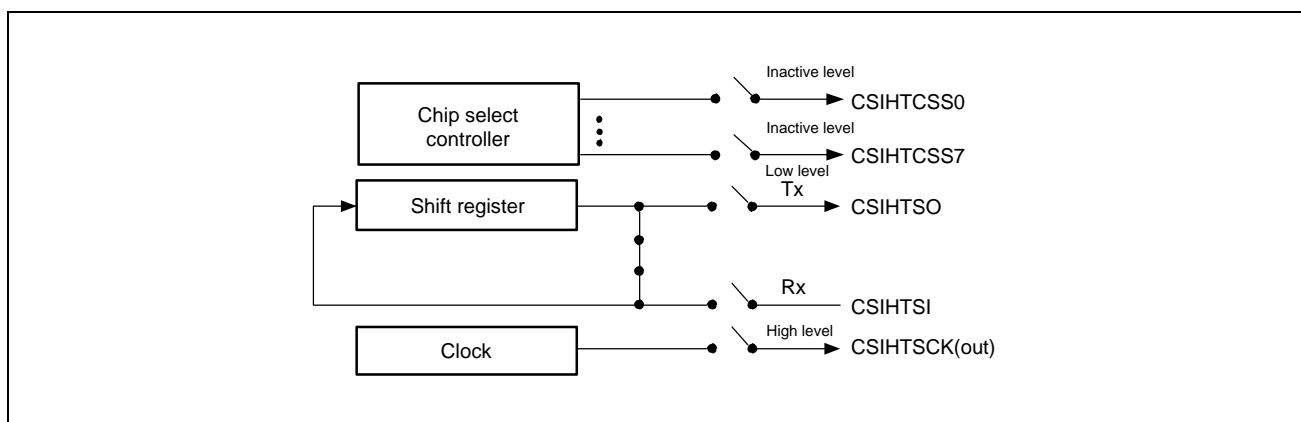

Figure 20.44 Loop-Back Mode Operation

### 20.5.14 CPU-Controlled High Priority Communication Function

CSIH has a function to abort low priority communication to perform high priority communication if it receives a high-priority communication request from the CPU while low-priority communication is being used. This function supports transmit-only buffer mode as low priority communication and only direct access mode as high-priority communication. To enable this function, CSIHnCTL1.CSIHnPHE and CSIHnCTL1.CSIHnJE must be set to 1.

The following figure illustrates CPU-controlled high-priority communication.

Figure 20.45 Example of CPU-Controlled High-Priority Communication

- (1) By setting CSIHnCTL0.CSIHnJOBE = 1 during low-priority communication, start of high-priority communication following end-of-job data is notified, and the internal signal flag is set.
- (2) When end-of-job data is detected, the current low-priority communication is aborted and the INTCSIHnTJC interrupt occurs. The internal signal job completion flag is cleared due to the communication abort, and memory mode is automatically switched to direct access mode for the subsequent high-priority communication.
- (3) The CPU detects the interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H.
- (4) When end-of-job data is detected, communication is aborted. At this time, because the internal signal end-of-job flag is set to 0, the CSIH determines that the next communication is low-priority, automatically switches memory mode to transmit-only buffer mode, and then resumes the aborted low-priority communication.
- (5) Same as (1) above.
- (6) Same as (2) above.
- (7) The CPU detects an interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H. The CPU sets CSIHnCTL0.CSIHnJOBE = 1 again to notify that the next communication is high-priority.
- (8) When end-of-job data is detected, communication is aborted and the INTCSIHnTJC interrupt is generated. At this time, the CPU determines that the subsequent communication is also high-priority because the internal signal JOB completion flag is 1, and waits for communication to start.
- (9) Same as (3) above.

(10) Same as (4) above.

**CAUTION**

Memory mode is switched automatically when communication is changed from low priority to high priority (from transmit-only buffer mode to direct access mode) and from high priority to low priority (from direct access mode to transmit-only buffer mode).

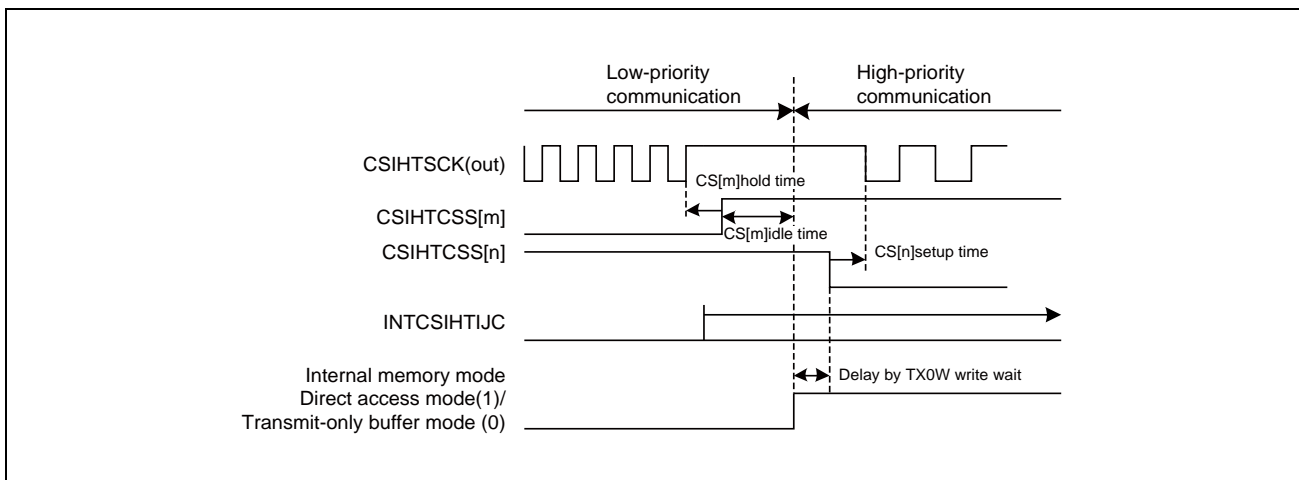

Figure 20.46 Transition from Low-Priority Mode to High-Priority Mode

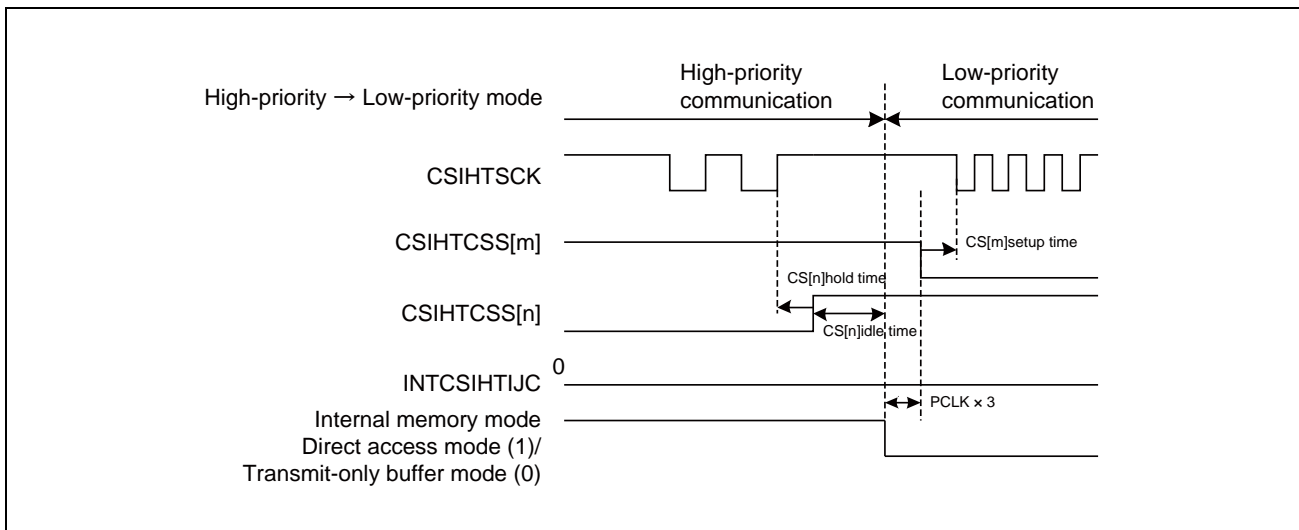

Figure 20.47 Transition from High-Priority Mode to Low-Priority Mode

Do not conduct write operation of communication data or CSIHnCTL0.CSIHnJOB bit operation during setting inhibited period to switch low and high priority communication mode correctly.

CSIHnTX0W register write inhibited period:

- Period from when CSIHnJOB bit is set for switching to high priority communication mode to when INTCSIHTIJC interrupt is detected.
- Period from when the last data of high priority communication (End of JOB data) is written to when the CSIHnHPST state = 0 is detected.

CSIHnJOB register write inhibited period:

- Period from when CSIHnJOB bit is set for switching to high priority communication mode to when INTCSIHTIJC interrupt is detected.

During high communication mode period, there is no setting inhibited period for CSIHnJOB bit. It is possible to set CSIHnJOB bit before writing communication data. For example, to communicate multiple JOB data in high priority mode, it is possible to set CSIHnJOB bit before writing the first communication data.

#### **CAUTION**

---

When CSIHnJOB bit is set right before the last communication of high priority communication ends, different operations are required depending on the timing at which setting of CSIHnJOB bit is internally detected.

If the setting of the CSIHnJOB bit is detected before the transfer of the last bit is completed, high priority communication mode continues.

When setting of the CSIHnJOB bit is detected after the transfer of the last bit is completed, the mode temporarily returns to low priority communication. After detection of End of JOB data in low priority communication, the mode changes back to high priority communication.

---

### 20.5.15 Enforced Chip Select Idle Setting

It is possible to insert an idle state between two consecutive data transfers by setting  $CSIHnCFGx.CSIHnIDLx$ .

1. When  $CSIHnCFGx.CSIHnIDLx = 0$

If the next  $CSIHTCSSx$  is the same as the previous one, an idle state is not inserted, but an inter-data time is inserted instead.

If the next  $CSIHTCSSx$  is different from the previous one, an idle state is inserted.

2. When  $CSIHnCFGx.CSIHnIDLx = 1$

An idle state is always inserted even if a next  $CSIHTCSSx$  is not different from the previous one.

Figure 20.48 Enforced Chip Select Idle Setting Example

#### CAUTION

If the CPU-controlled high priority communication function is enabled

( $CSIHnCTL1.CSIHnPHE = 1$ ), when the mode is switched from low priority communication to high priority communication or from high priority communication to low priority communication, an IDLE state is inserted regardless of the setting of  $CSIHnCFGx.CSIHnIDLx$  bit.

## 20.6 Operating Procedures

The examples and procedures below are described according to the memory mode in the following order:

- Direct access mode
- Transmit-only buffer mode
- Dual buffer mode
- FIFO mode

### 20.6.1 Procedures in Direct Access Mode

Two examples for a master are provided, one with job mode disabled, and the other with job mode enabled.

#### 20.6.1.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below assumes the following conditions:

- The transmission data length is 8 bits ( $\text{CSIHnCFGx.CSIHnDLSx}[3:0] = 1000_{\text{B}}$ ).
- Transmission direction is MSB first ( $\text{CSIHnCFGx.CSIHnDIRx} = 0$ ).
- Normal clock phase and data phase ( $\text{CSIHnCFGx.CSIHnCKPx} = 0$ ,  $\text{CSIHnCFGx.CSIHnDAPx} = 0$ )
- No interrupt delay ( $\text{CSIHnCTL1.CSIHnSIT} = 0$ )
- Job mode is disabled ( $\text{CSIHnCTL1.CSIHnJE} = 0$ ).
- Normal INTCSIHTIC interrupt timing ( $\text{CSIHnCTL1.CSIHnSLIT} = 0$ )
- Direct access mode ( $\text{CSIHnCTL0.CSIHnMBS} = 1$ )

Figure 20.49 Master in Direct Access Mode,  $\text{CSIHnCTL1.CSIHnJE} = 0$

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHnCSS0 to CSIHnCSS3.  
Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register, CSIHnTX0W. Within the same write operation, activate CS0. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIHnTX0W. If required, you can change the CS to address a different device. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated:
  - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
  - INTCSIHTIR indicates that the reception register CSIHnRX0W must be read.
6. No more write action is required after completion of data 8. Data 9 (the last data) has been written in advance. However, reception register CSIHnRX0W must be read after completion of writing data 8 and 9.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 20.6.1.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)
- Two jobs, each transmitting three data.

Figure 20.50 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 1

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1 and CS2. Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits the reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register CSIHnTX0W. Transmission starts automatically when the first data becomes available.  
The CSIHnSTR0.CSIHnTSF flag indicates that communication is in progress.
4. Write the second data to CSIHnTX0W. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
  - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
  - INTCSIHTIR indicates that the reception register, CSIHnRX0W must be read.
6. Setting CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent. After that, the next job may begin.
7. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of the current job (JOB2).
8. After the forced stop of communication, the interrupt request, INTCSIHTIC is replaced by INTCSIHTIJC. INTCSIHTIR is generated as usual.  
The interrupt request, INTCSIHTIJC indicates that the communication was forcibly stopped at the end of the current job. The interrupt request, INTCSIHTIC is not generated. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.  
To start another transmission without stopping communication, perform steps 3 and later.

## 20.6.2 Procedures in Transmit-Only Buffer Mode

Two examples for a master is provided, one with job mode disabled, and the other one with job mode enabled.

### 20.6.2.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09<sub>H</sub>).
- The transfer start address is 0040<sub>H</sub> (CSIHnMCTL2.CSIHnSOP[6:0] = 10<sub>H</sub>).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 10<sub>B</sub>)

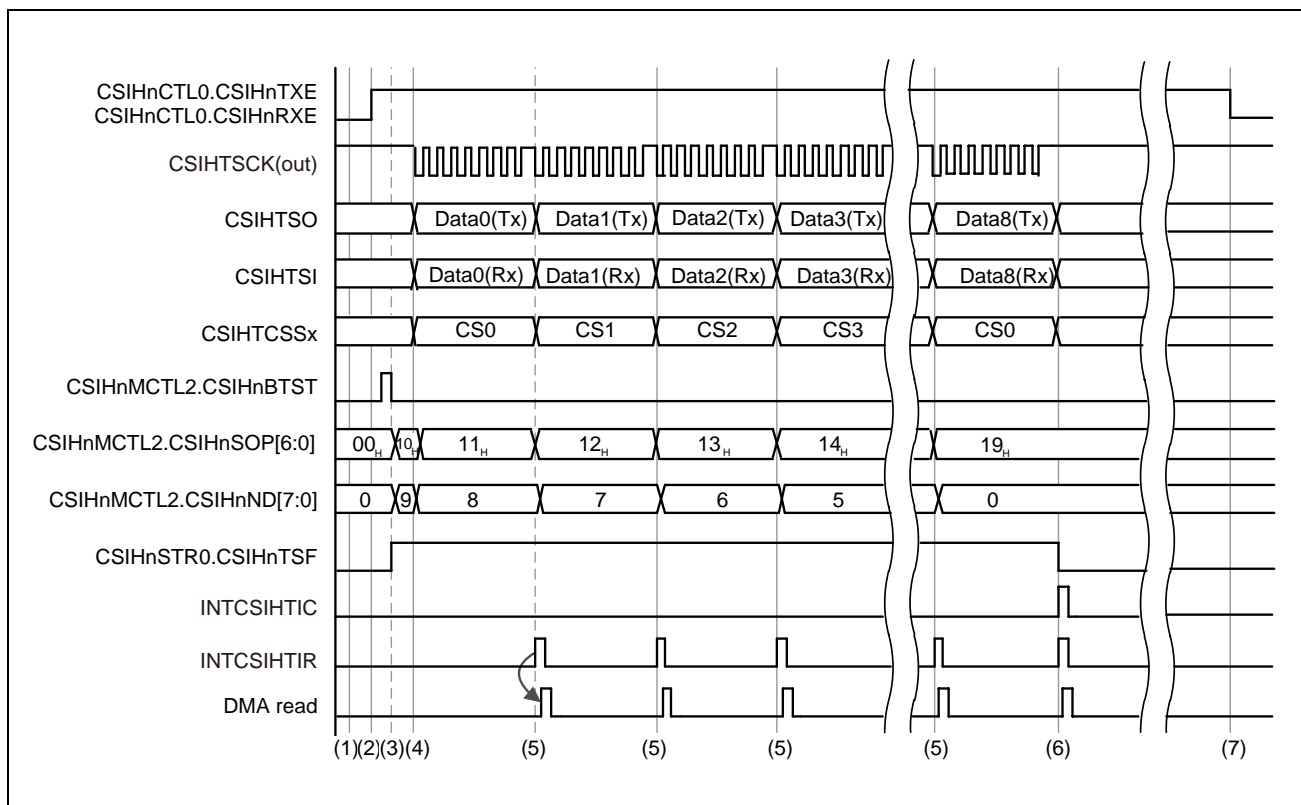

Figure 20.51 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 0

#### NOTE

The procedure of writing the data into the buffer is not described here.

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHnCSS0 to CSIHnCSS3.  
Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.  
Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].  
Set CSIHnMCTL0.CSIHnMMS[1:0] = 10<sub>B</sub> (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission/reception is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates that the receive register CSIHnRX0W must be read.
6. When all transmissions are complete, the interrupt request, INTCSIHTIC is generated.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 20.6.2.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08<sub>H</sub>).
- The transfer start address is 0040<sub>H</sub> (CSIHnMCTL2.CSIHnSOP[6:0] = 10<sub>H</sub>).
- Normal INTCSIH TIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 10<sub>B</sub>)

Figure 20.52 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 1

**NOTE**

The process of writing the data into the buffer is not described.

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1, CS3, and CS7.  
Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.  
Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].  
Set CSIHnMCTL0.CSIHnMMS[1:0] = 10<sub>B</sub> (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates that the receive register CSIHnRX0W must be read.
6. The CSIHnTX0W.CSIHnEOJ = 1 setting indicates that the last data of the current job is sent.
7. The interrupt request INTCSIHTIC is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
10. After the forced stop of communication, interrupt requests INTCSIHTIJC and INTCSIHTIR are generated at the end of job3.  
The INTCSIHTIJC interrupt request indicates that the communication was forcibly stopped at the end of the current job.  
The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.  
When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 20.6.3 Procedures in Dual Buffer Mode

Examples when job mode is enabled in master mode, disabled in master mode, and disabled in slave mode are provided below.

#### 20.6.3.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09<sub>H</sub>).
- The transfer start address is 0040<sub>H</sub> (CSIHnMCTL2.CSIHnSOP[6:0] = 10<sub>H</sub>).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01<sub>B</sub>)

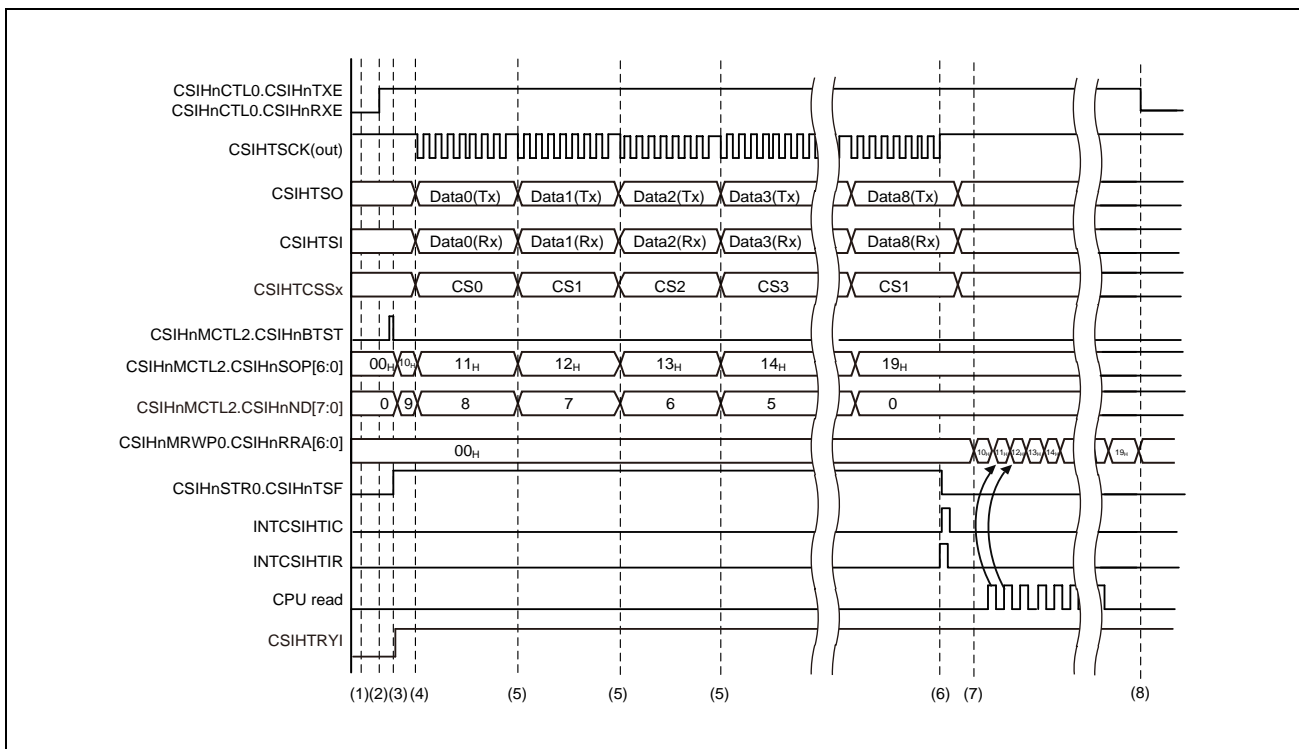

Figure 20.53 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

#### NOTE

The process of writing the data into the buffer is not described.

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHnCSS0 to CSIHnCSS3.  
Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.  
Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0]. Set CSIHnMCTL0.CSIHnMMS[1:0] = 01<sub>B</sub> (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits the reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Permit buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.  
The interrupt requests INTCSIHTIC and INTCSIHTIR are not generated.
6. When the last data is transmitted/received, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.  
The CPU starts to read the received data from the receive buffer.
7. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0]. These bits are incremented after each data is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.  
When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 20.6.3.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08<sub>H</sub>).
- The transfer start address is 00<sub>H</sub> (CSIHnMCTL2.CSIHnSOP[6:0] = 00<sub>H</sub>).
- Normal INTCSIH TIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01<sub>B</sub>)

Figure 20.54 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 1

**NOTE**

The process of writing the data into the buffer is not described.

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS0 to CS7. Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.  
Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].  
Set CSIHnMCTL0.CSIHnMMS[1:0] = 01<sub>B</sub> (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented, and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission. This is repeated until the last data is transmitted/received.
5. The INTCSIHTIR interrupt request is generated everytime data is received.  
The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
6. CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent.
7. The INTCSIHTIC interrupt request is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. By setting CSIHnCTL0.CSIHnJOB3 = 1, communication is forced to stop at the end of JOB3.
9. After the forced stop of communication, interrupt requests INTCSIHTIJC and INTCSIHTIR are generated at the end of JOB3.  
The INTCSIHTIJC interrupt request indicates that the communication was forcibly stopped at the end of the current job.  
The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. Additionally, the transmission data available in register CSIHnTX0W is not sent.
10. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.  
When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 20.6.3.3 Transmit/Receive in Slave Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCTL1.CSIHnCKR = 0, CSIHnCFG0.CSIHnDAP0 = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09<sub>H</sub>).
- The transfer start address is 0040<sub>H</sub> (CSIHnMCTL2.CSIHnSOP[6:0] = 10<sub>H</sub>).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01<sub>B</sub>)
- Handshake function is enabled (CSIHnCTL1.CSIHnHSE = 1)

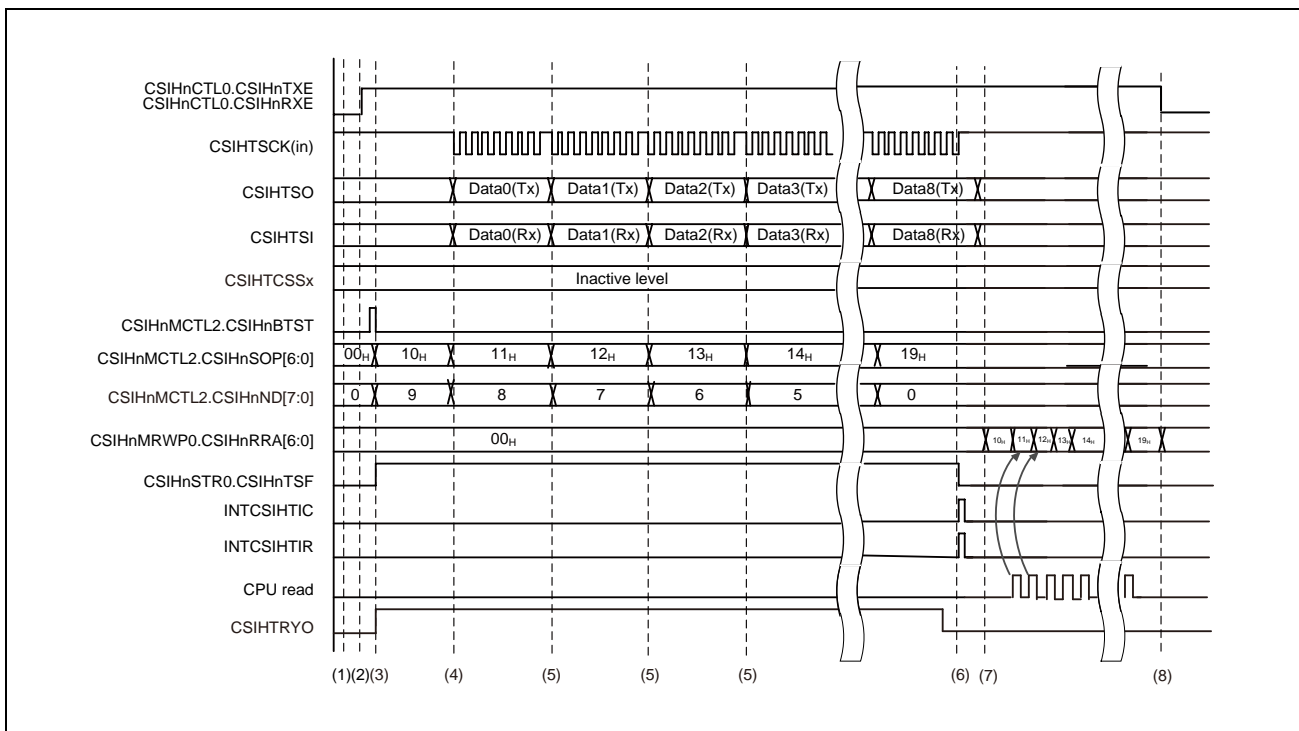

Figure 20.55 Slave in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

#### NOTE

The process of writing the data into the buffer is not described.

**Procedure:**

1. Configure the communication protocol in register CSIHnCFG0.  
Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.  
Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].  
Set CSIHnMCTL0.CSIHnMMS[1:0] = 01<sub>B</sub> (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Specify the transfer start address by setting the CSIHnMCTL2.CSIHnSOP[6:0] bits and the number of data by setting the CSIHnMCTL2.CSIHnND[7:0] bits. Permit the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started when the input clock is received from the master. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.  
The interrupt requests INTCSIHTIC and INTCSIHTIR are not generated because transmission data is sent from the buffer, and received data is stored in the buffer.
6. When the last data is transmitted/received, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.  
The CPU starts to read the received data that is stored in the receive buffer.
7. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0]. These bits are incremented after each data is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.  
When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

### 20.6.4 Procedures in FIFO Mode

Two examples for a master is provided, one with job mode disabled, the other one with job mode enabled.

#### 20.6.4.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00<sub>B</sub>)

Figure 20.56 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 0

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. Specify the job mode disable and master mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2. Specify the FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] = 00<sub>B</sub>. This example uses chip select signals CSIHnCSS0 to CSIHnCSS3.
2. Set CSIHnSTCR0.CSIHnPCT = 1 to clear all buffer pointers.  
(CSIHnSTR0.CSIHnFLF = 0, CSIHnSTR0.CSIHnEMF = 1, and CSIHnSTR0.CSIHnSPF[7:0] = 00<sub>H</sub>.)
3. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the INTCSIHTIC interrupt output. Specify the conditions for generating the INTCSIHTIR interrupt request in the CSIHnMCTL1.CSIHnFFS[6:0] bits.
4. Set CSIHnCTL0.CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
5. Write the first transmit data to the transmit register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
6. The current transmission is completed. As the CSIHnFES[6:0] bits are not the same as the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is not generated.
7. As the CSIHnFES[6:0] bits are the same as the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is generated.
8. When CSIHnFFS[6:0] = 128 - CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. Since CSIHnFES[6:0] = CSIHnSPF[7:0], the interrupt request INTCSIHTIC is generated.  
After the generation of an interrupt, the CPU starts reading received data that is stored in the receive buffer.
9. When the CPU completes reading the received data that is stored in the receive buffer, CSIHnSTR0.CSIHnEMF is set to 1 and the FIFO buffer becomes empty.
10. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. In addition, if communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

**20.6.4.2 Transmit/Receive Mode when Job Mode is Enabled in Master Mode**

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000<sub>B</sub>).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- JOB1 consists of four data, JOB2 consists of three data, and JOB3 consists of five data.
- Normal INTCSIH TIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00<sub>B</sub>)

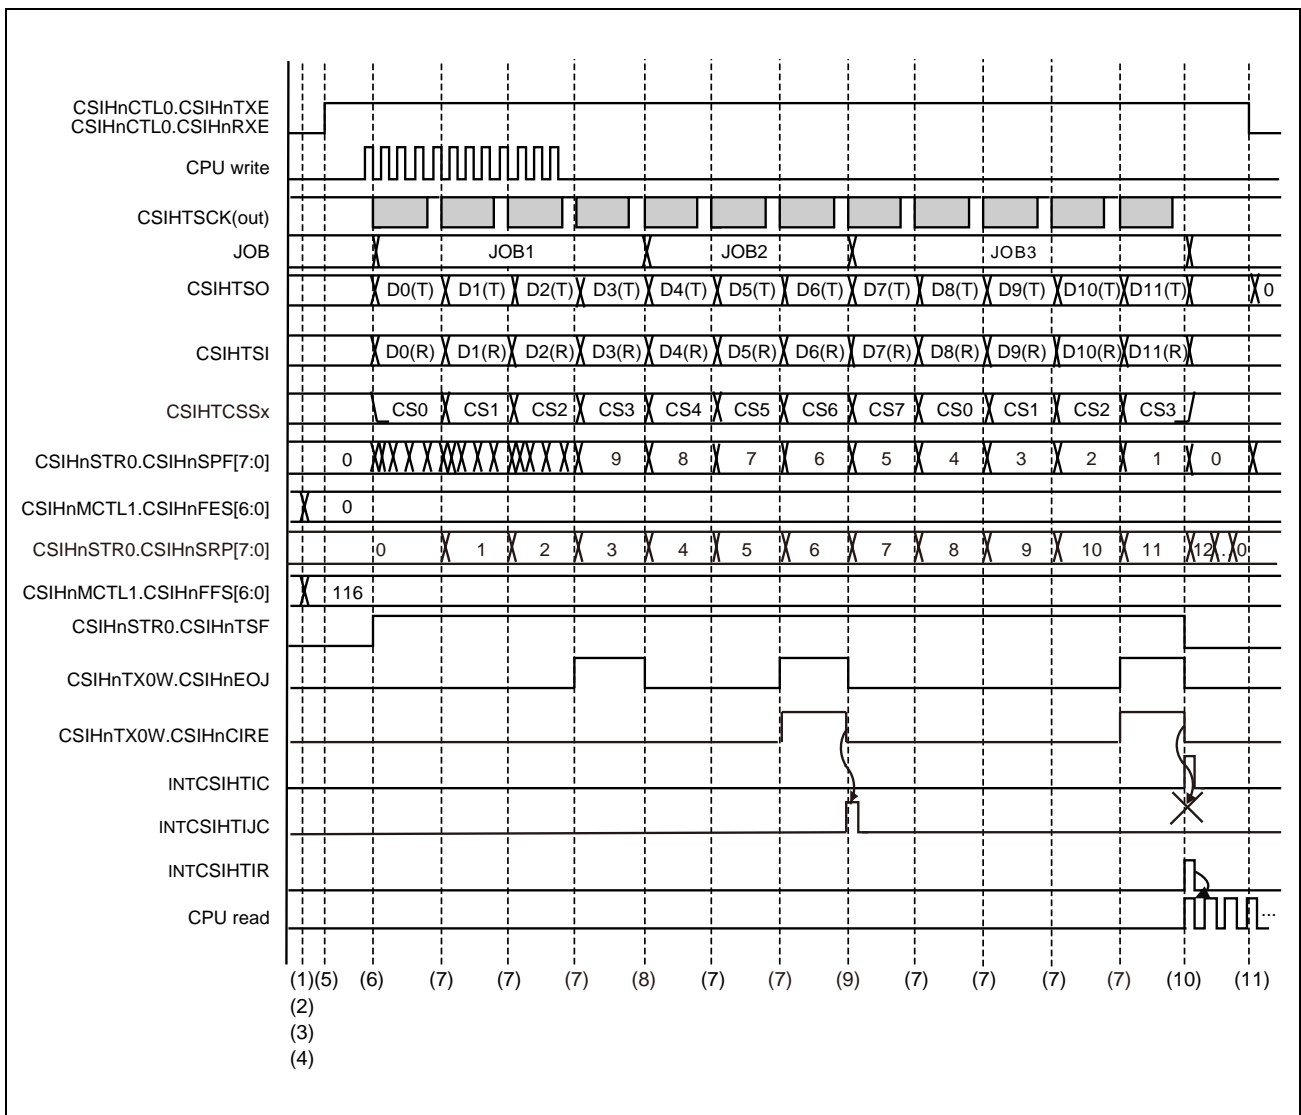

Figure 20.57 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 1

**Procedure:**

1. Configure the communication protocol in the CSIHnCFGx register. Set job mode enable and master mode in the corresponding bits of the CSIHnCTL1 and CSIHnCTL2 registers. Set FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] to 00<sub>B</sub>. This example uses chip select signals CS0 to CS7.
2. Set CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
3. Make sure that CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00<sub>H</sub>.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the INTCSIHTIC interrupt request. With CSIHnMCTL1.CSIHnFFS[6:0], specify the conditions for generating the INTCSIHTIR interrupt request.
5. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the first data to be sent to the CSIHnTX0W transmission register. Transmission starts automatically when the first data becomes available.
7. The current transmission is completed. Since CSIHnFES[6:0] is not the same as CSIHnSPF[7:0], the interrupt request INTCSIHTIC is not generated.
8. The INTCSIHTIJC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. The INTCSIHTIJC interrupt request is generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
10. The INTCSIHTIC interrupt request is generated because CSIHnFES[6:0] = CSIHnSPF[7:0]. INTCSIHTIC is generated so that INTCSIHTIJC is not generated.  
When CSIHnFFS[6:0] = 128 - CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. After the generation of the INTCSIHTIR interrupt, CPU starts reading the received data stored in received buffer.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

## 20.7 Detection and Correction of Errors in CSIHn RAM

For details of ECC, see **Section 40A.2.6, ECC for Peripheral RAM, Section 40B.2.6, ECC for Peripheral RAM, Section 40C.2.5, ECC for Peripheral RAM.**

## Section 21 LIN Master Interface (RLIN2)

This section contains a generic description of the LIN master interface (RLIN2).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RLIN2.

### 21.1 Features of RH850/F1KH, RH850/F1KM RLIN2

#### 21.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN2 units and channels.

Table 21.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	3	3	4
Name	RLIN24n (n = 0 to 2)	RLIN24n (n = 0 to 2)	RLIN24n (n = 0 to 3)

Table 21.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	2	3	3	3
Name	RLIN24n (n = 0)	RLIN24n (n = 0, 1)	RLIN24n (n = 0 to 2)	RLIN24n (n = 0 to 2)	RLIN24n (n = 0 to 2)

Table 21.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	1	2	3
Name	RLIN24n (n = 0)	RLIN24n (n = 0, 1)	RLIN24n (n = 0 to 2)

Table 21.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	RLIN24n (n = 0)	RLIN24n (n = 0)	RLIN24n (n = 0)	RLIN24n (n = 0)

Table 21.9 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual RLIN2 units are identified by the index “n” (n = 0 to 3).
m	Throughout this section, the individual channels are identified by the index “m” (m = 0 to 15).
i	Throughout this section, the individual channels of units that compose RLIN2 are identified by the index “i” (i = 0 to 3).
b	Throughout this section, the individual data buffers implemented in RLIN2 are identified by the index “b” (b = 1 to 8).

Table 21.10 Indices (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual RLIN2 units are identified by the index “n” (n = 0 to 2).
m	Throughout this section, the individual channels are identified by the index “m” (m = 0 to 11).
i	Throughout this section, the individual channels of units that compose RLIN2 are identified by the index “i” (i = 0 to 3).
b	Throughout this section, the individual data buffers implemented in RLIN2 are identified by the index “b” (b = 1 to 8).

Table 21.11 Indices (RH850/F1KM-S2)

Index	Description
n	Throughout this section, the individual RLIN2 units are identified by the index “n” (n = 0 to 2).
m	Throughout this section, the individual channels are identified by the index “m” (m = 0 to 9).
i	Throughout this section, the individual channels of units that compose RLIN2 are identified by the index “i” (i = 0 to 3).
b	Throughout this section, the individual data buffers implemented in RLIN2 are identified by the index “b” (b = 1 to 8).

Table 21.12 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RLIN2 units are identified by the index "n" (n = 0).
m	Throughout this section, the individual channels are identified by the index "m" (m = 0 to 2).
i	Throughout this section, the individual channels of units that compose RLIN2 are identified by the index "i" (i = 0 to 2).
b	Throughout this section, the individual data buffers implemented in RLIN2 are identified by the index "b" (b = 1 to 8).

For example, RLN24nGLWBR are the LIN wake-up baud rate select registers, which are the global registers of RLIN2. RLN24nmLiMD are the LIN mode registers, which are the channel registers.

The following lists the indices corresponding to each product.

Table 21.13 Indices Correspondence of Each Product (RH850/F1KH-D8)

Indices Correspondence of Each Product		
176 Pins	233 Pins	324 Pins
i = 0 to 3 (RLIN240, 1) i = 0, 1 (RLIN242)	i = 0 to 3 (RLIN240, 1, 2)	i = 0 to 3 (RLIN240, 1, 2, 3)
b = 1 to 8	b = 1 to 8	b = 1 to 8

Table 21.14 Indices Correspondence of Each Product (RH850/F1KM-S4)

Indices Correspondence of Each Product				
100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
i = 0 to 2 (RLIN240)	i = 0 to 3 (RLIN240) i = 0, 1 (RLIN241)	i = 0 to 3 (RLIN240, 1) i = 0, 1 (RLIN242)	i = 0 to 3 (RLIN240, 1, 2)	i = 0 to 3 (RLIN240, 1, 2)
b = 1 to 8	b = 1 to 8	b = 1 to 8	b = 1 to 8	b = 1 to 8

Table 21.15 Indices Correspondence of Each Product (RH850/F1KM-S2)

Indices Correspondence of Each Product		
100 Pins	144 Pins	176 Pins
i = 0 to 2 (RLIN240)	i = 0 to 3 (RLIN240) i = 0, 1 (RLIN241)	i = 0 to 3 (RLIN240, 1) i = 0, 1 (RLIN242)
b = 1 to 8	b = 1 to 8	b = 1 to 8

Table 21.16 Indices Correspondence of Each Product (RH850/F1KM-S1)

Indices Correspondence of Each Product			
48 Pins	64 Pins	80 Pins	100 Pins
i = 0, 1 (RLIN240)	i = 0, 1 (RLIN240)	i = 0, 1 (RLIN240)	i = 0 to 2 (RLIN240)
b = 1 to 8	b = 1 to 8	b = 1 to 8	b = 1 to 8

### 21.1.2 Register Base Addresses

RLIN2 base addresses are listed in the following table.

RLIN2 register addresses are given as offsets from the base addresses.

Table 21.17 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<RLIN240_base>	FFCE 0000 <sub>H</sub>
<RLIN241_base>	FFCE 0080 <sub>H</sub>
<RLIN242_base>	FFCE 0100 <sub>H</sub>
<RLIN243_base>	FFCE 0180 <sub>H</sub>

Table 21.18 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S2)

Base Address Name	Base Address
<RLIN240_base>	FFCE 0000 <sub>H</sub>
<RLIN241_base>	FFCE 0080 <sub>H</sub>
<RLIN242_base>	FFCE 0100 <sub>H</sub>

Table 21.19 Register Base Address (RH850/F1KM-S1)

Base Address Name	Base Address
<RLIN240_base>	FFCE 0000 <sub>H</sub>

### 21.1.3 Clock Supply

The RLIN2 clock supply is shown in the following table.

Table 21.20 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RLIN24n	LIN communication clock sources	CKSCLK_ILIN	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_ILIN	Bus clock

### 21.1.4 Interrupt Requests

RLIN2 interrupt requests are listed in the following table.

Table 21.21 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number
RLIN240		
INTRLIN20	RLIN20 interrupt	58
INTRLIN21	RLIN21 interrupt	59
INTRLIN22	RLIN22 interrupt	162
INTRLIN23	RLIN23 interrupt	163
RLIN241		
INTRLIN24	RLIN24 interrupt	226
INTRLIN25	RLIN25 interrupt	227
INTRLIN26	RLIN26 interrupt	275
INTRLIN27	RLIN27 interrupt	276
RLIN242		
INTRLIN28	RLIN28 interrupt	285
INTRLIN29	RLIN29 interrupt	286
INTRLIN210	RLIN210 interrupt	324
INTRLIN211	RLIN211 interrupt	325
RLIN243		
INTRLIN212	RLIN212 interrupt	184
INTRLIN213	RLIN213 interrupt	185
INTRLIN214	RLIN214 interrupt	186
INTRLIN215	RLIN215 interrupt	187

Table 21.22 Interrupt Requests (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number
RLIN240		
INTRLIN20	RLIN20 interrupt	58
INTRLIN21	RLIN21 interrupt	59
INTRLIN22	RLIN22 interrupt	162
INTRLIN23	RLIN23 interrupt	163
RLIN241		
INTRLIN24	RLIN24 interrupt	226
INTRLIN25	RLIN25 interrupt	227
INTRLIN26	RLIN26 interrupt	275
INTRLIN27	RLIN27 interrupt	276
RLIN242		
INTRLIN28	RLIN28 interrupt	285
INTRLIN29	RLIN29 interrupt	286
INTRLIN210	RLIN210 interrupt	324
INTRLIN211	RLIN211 interrupt	325

Table 21.23 Interrupt Requests (RH850/F1KM-S2)

Unit Interrupt Signal	Description	Interrupt Number
RLIN240		
INTRLIN20	RLIN20 interrupt	58
INTRLIN21	RLIN21 interrupt	59
INTRLIN22	RLIN22 interrupt	162
INTRLIN23	RLIN23 interrupt	163
RLIN241		
INTRLIN24	RLIN24 interrupt	226
INTRLIN25	RLIN25 interrupt	227
INTRLIN26	RLIN26 interrupt	275
INTRLIN27	RLIN27 interrupt	276
RLIN242		
INTRLIN28	RLIN28 interrupt	285
INTRLIN29	RLIN29 interrupt	286

Table 21.24 Interrupt Requests (RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number
RLIN240		
INTRLIN20	RLIN20 interrupt	58
INTRLIN21	RLIN21 interrupt	59
INTRLIN22	RLIN22 interrupt	162

### 21.1.5 Reset Sources

RLIN2 reset sources are listed in the following table. RLIN2 is initialized by these reset sources.

Table 21.25 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
RLIN24n	All reset sources (ISORES)

### 21.1.6 External Input/Output Signals

External input/output signals of RLIN2 are listed in the following table.

Table 21.26 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN240		
RLIN2mRX (m = 0 to 3)	RLIN240 receive data input	RLIN2mRX (m = 0 to 3)
RLIN2mTX (m = 0 to 3)	RLIN240 transmit data output	RLIN2mTX (m = 0 to 3)
RLIN241		
RLIN2mRX (m = 4 to 7)	RLIN241 receive data input	RLIN2mRX (m = 4 to 7)
RLIN2mTX (m = 4 to 7)	RLIN241 transmit data output	RLIN2mTX (m = 4 to 7)
RLIN242		
RLIN2mRX (m = 8 to 11)	RLIN242 receive data input	RLIN2mRX (m = 8 to 11)
RLIN2mTX (m = 8 to 11)	RLIN242 transmit data output	RLIN2mTX (m = 8 to 11)
RLIN243		
RLIN2mRX (m = 12 to 15)	RLIN243 receive data input	RLIN2mRX (m = 12 to 15)
RLIN2mTX (m = 12 to 15)	RLIN243 transmit data output	RLIN2mTX (m = 12 to 15)

Table 21.27 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN240		
RLIN2mRX (m = 0 to 3)	RLIN240 receive data input	RLIN2mRX (m = 0 to 3)
RLIN2mTX (m = 0 to 3)	RLIN240 transmit data output	RLIN2mTX (m = 0 to 3)
RLIN241		
RLIN2mRX (m = 4 to 7)	RLIN241 receive data input	RLIN2mRX (m = 4 to 7)
RLIN2mTX (m = 4 to 7)	RLIN241 transmit data output	RLIN2mTX (m = 4 to 7)
RLIN242		
RLIN2mRX (m = 8 to 11)	RLIN242 receive data input	RLIN2mRX (m = 8 to 11)
RLIN2mTX (m = 8 to 11)	RLIN242 transmit data output	RLIN2mTX (m = 8 to 11)

Table 21.28 External Input/Output Signals (RH850/F1KM-S2)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN240		
RLIN2mRX (m = 0 to 3)	RLIN240 receive data input	RLIN2mRX (m = 0 to 3)
RLIN2mTX (m = 0 to 3)	RLIN240 transmit data output	RLIN2mTX (m = 0 to 3)
RLIN241		
RLIN2mRX (m = 4 to 7)	RLIN241 receive data input	RLIN2mRX (m = 4 to 7)
RLIN2mTX (m = 4 to 7)	RLIN241 transmit data output	RLIN2mTX (m = 4 to 7)
RLIN242		
RLIN2mRX (m = 8, 9)	RLIN242 receive data input	RLIN2mRX (m = 8, 9)
RLIN2mTX (m = 8, 9)	RLIN242 transmit data output	RLIN2mTX (m = 8, 9)

Table 21.29 External Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN240		
RLIN2mRX (m = 0 to 2)	RLIN240 receive data input	RLIN2mRX (m = 0 to 2)
RLIN2mTX (m = 0 to 2)	RLIN240 transmit data output	RLIN2mTX (m = 0 to 2)

## 21.2 Overview

### 21.2.1 Functional Overview

The LIN Master Interface is a hardware LIN communication controller that complies with LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005), and automatically performs frame communication and error determination.

**Table 21.30, LIN Master Interface Specifications** shows the LIN Master Interface specifications.

Table 21.30 LIN Master Interface Specifications

Item	Specifications																								
Channel count	16 channels (In this product, 4-channel version of RLIN2 is included.)																								
LIN communication function	<table border="1"> <thead> <tr> <th>Protocol</th> <th>Specifications</th> </tr> </thead> <tbody> <tr> <td>LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005)</td> <td></td> </tr> <tr> <td>Variable frame structure</td> <td> <ul style="list-style-type: none"> <li>Transmission break width: 13 to 28 Tbits</li> <li>Transmission break delimiter width: 1 to 4 Tbits</li> <li>Inter-byte space (header): 0 to 7 Tbits (space between Sync field and ID field)*<sup>1</sup></li> <li>Response space: 0 to 7 Tbits*<sup>1</sup></li> <li>Inter-byte space: 0 to 3 Tbits (space between data bytes in response area)</li> <li>Transmit wake-up: 1 to 16 Tbits</li> </ul> </td> </tr> <tr> <td>Checksum</td> <td> <ul style="list-style-type: none"> <li>Automatic operation for both transmission and reception</li> <li>Classic or enhanced selectable (for each frame)</li> </ul> </td> </tr> <tr> <td>Response field data byte count</td> <td>Variable from 0 to 8 bytes</td> </tr> <tr> <td>Frame communication modes</td> <td> <ul style="list-style-type: none"> <li>Mode in which header transmission and response transmission/reception are started with a single transmission start request</li> <li>Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)</li> </ul> </td> </tr> <tr> <td>Wake-up transmission and reception</td> <td>           Available in LIN wake-up mode           <ul style="list-style-type: none"> <li>Wake-up transmission (1 to 16 Tbits)</li> <li>Wake-up reception</li> </ul>           Low-level width of input signals measured         </td> </tr> <tr> <td>Status</td> <td> <ul style="list-style-type: none"> <li>Successful frame/wake-up transmission</li> <li>Successful header transmission</li> <li>Successful frame/wake-up reception*<sup>2</sup></li> <li>Successful data 1 reception</li> <li>Error detection</li> <li>Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)</li> </ul> </td> </tr> <tr> <td>Error status</td> <td> <ul style="list-style-type: none"> <li>Bit error</li> <li>Checksum error</li> <li>Frame timeout error</li> <li>Physical bus error</li> <li>Framing error</li> </ul> </td> </tr> <tr> <td>Baud rate selection</td> <td>Baud rate conforming to the LIN specifications generated using baud rate generator</td> </tr> <tr> <td>Test mode</td> <td>Self-test mode for user evaluation</td> </tr> <tr> <td>Interrupt function</td> <td> <ul style="list-style-type: none"> <li>Successful frame/wake-up transmission</li> <li>Successful frame/wake-up reception*<sup>2</sup></li> <li>Error detection</li> </ul> </td> </tr> </tbody> </table>	Protocol	Specifications	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005)		Variable frame structure	<ul style="list-style-type: none"> <li>Transmission break width: 13 to 28 Tbits</li> <li>Transmission break delimiter width: 1 to 4 Tbits</li> <li>Inter-byte space (header): 0 to 7 Tbits (space between Sync field and ID field)*<sup>1</sup></li> <li>Response space: 0 to 7 Tbits*<sup>1</sup></li> <li>Inter-byte space: 0 to 3 Tbits (space between data bytes in response area)</li> <li>Transmit wake-up: 1 to 16 Tbits</li> </ul>	Checksum	<ul style="list-style-type: none"> <li>Automatic operation for both transmission and reception</li> <li>Classic or enhanced selectable (for each frame)</li> </ul>	Response field data byte count	Variable from 0 to 8 bytes	Frame communication modes	<ul style="list-style-type: none"> <li>Mode in which header transmission and response transmission/reception are started with a single transmission start request</li> <li>Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)</li> </ul>	Wake-up transmission and reception	Available in LIN wake-up mode <ul style="list-style-type: none"> <li>Wake-up transmission (1 to 16 Tbits)</li> <li>Wake-up reception</li> </ul> Low-level width of input signals measured	Status	<ul style="list-style-type: none"> <li>Successful frame/wake-up transmission</li> <li>Successful header transmission</li> <li>Successful frame/wake-up reception*<sup>2</sup></li> <li>Successful data 1 reception</li> <li>Error detection</li> <li>Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)</li> </ul>	Error status	<ul style="list-style-type: none"> <li>Bit error</li> <li>Checksum error</li> <li>Frame timeout error</li> <li>Physical bus error</li> <li>Framing error</li> </ul>	Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator	Test mode	Self-test mode for user evaluation	Interrupt function	<ul style="list-style-type: none"> <li>Successful frame/wake-up transmission</li> <li>Successful frame/wake-up reception*<sup>2</sup></li> <li>Error detection</li> </ul>
Protocol	Specifications																								
LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005)																									
Variable frame structure	<ul style="list-style-type: none"> <li>Transmission break width: 13 to 28 Tbits</li> <li>Transmission break delimiter width: 1 to 4 Tbits</li> <li>Inter-byte space (header): 0 to 7 Tbits (space between Sync field and ID field)*<sup>1</sup></li> <li>Response space: 0 to 7 Tbits*<sup>1</sup></li> <li>Inter-byte space: 0 to 3 Tbits (space between data bytes in response area)</li> <li>Transmit wake-up: 1 to 16 Tbits</li> </ul>																								
Checksum	<ul style="list-style-type: none"> <li>Automatic operation for both transmission and reception</li> <li>Classic or enhanced selectable (for each frame)</li> </ul>																								
Response field data byte count	Variable from 0 to 8 bytes																								
Frame communication modes	<ul style="list-style-type: none"> <li>Mode in which header transmission and response transmission/reception are started with a single transmission start request</li> <li>Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)</li> </ul>																								
Wake-up transmission and reception	Available in LIN wake-up mode <ul style="list-style-type: none"> <li>Wake-up transmission (1 to 16 Tbits)</li> <li>Wake-up reception</li> </ul> Low-level width of input signals measured																								
Status	<ul style="list-style-type: none"> <li>Successful frame/wake-up transmission</li> <li>Successful header transmission</li> <li>Successful frame/wake-up reception*<sup>2</sup></li> <li>Successful data 1 reception</li> <li>Error detection</li> <li>Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)</li> </ul>

Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator																								
Test mode	Self-test mode for user evaluation																								
Interrupt function	<ul style="list-style-type: none"> <li>Successful frame/wake-up transmission</li> <li>Successful frame/wake-up reception*<sup>2</sup></li> <li>Error detection</li> </ul>																								

The logical OR of these three events is the interrupt source (INTRLIN2m) for each channel.

Note 1. Since the same register is used for configuration, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the input signal low-level width count is indicated.

### 21.2.2 Block Diagram

Figure 21.1, LIN Master Interface Block Diagram (324 Pins, RLIN2 16 Channels Embedded) shows a block diagram of the LIN master interface.

Figure 21.1 LIN Master Interface Block Diagram (324 Pins, RLIN2 16 Channels Embedded)

## 21.3 Registers

The registers of the LIN master interface include global registers and channel registers. As the global registers are allocated for each unit, they can be individually set for each unit. As the channel registers are allocated for each channel, they can individually control each channel.

### 21.3.1 List of Registers

RLIN2 registers are listed in the following table.

For details about <RLIN24n\_base>, see **Section 21.1.2, Register Base Addresses**.

Table 21.31 List of Registers

Module Name	Register Name	Symbol	Address
Global registers			
RLN24n	LIN wake-up baud rate select register	RLN24nGLWBR	<RLIN24n_base> + 01 <sub>H</sub>
	LIN baud rate prescaler 0 register	RLN24nGLBRP0	<RLIN24n_base> + 02 <sub>H</sub>
	LIN baud rate prescaler 1 register	RLN24nGLBRP1	<RLIN24n_base> + 03 <sub>H</sub>
	LIN self-test control register	RLN24nGLSTC	<RLIN24n_base> + 04 <sub>H</sub>
Channel registers			
RLN24nm	LIN mode register	RLN24nmLiMD	<RLIN24n_base> + 08 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN break field configuration register	RLN24nmLiBFC	<RLIN24n_base> + 09 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN space configuration register	RLN24nmLiSC	<RLIN24n_base> + 0A <sub>H</sub> + i × 20 <sub>H</sub>
	LIN wake-up configuration register	RLN24nmLiWUP	<RLIN24n_base> + 0B <sub>H</sub> + i × 20 <sub>H</sub>
	LIN interrupt enable register	RLN24nmLiIE	<RLIN24n_base> + 0C <sub>H</sub> + i × 20 <sub>H</sub>
	LIN error detection enable register	RLN24nmLiEDE	<RLIN24n_base> + 0D <sub>H</sub> + i × 20 <sub>H</sub>
	LIN control register	RLN24nmLiCUC	<RLIN24n_base> + 0E <sub>H</sub> + i × 20 <sub>H</sub>
	LIN transmission control register	RLN24nmLiTRC	<RLIN24n_base> + 10 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN mode status register	RLN24nmLiMST	<RLIN24n_base> + 11 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN status register	RLN24nmLiST	<RLIN24n_base> + 12 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN error status register	RLN24nmLiEST	<RLIN24n_base> + 13 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN data field configuration register	RLN24nmLiDFC	<RLIN24n_base> + 14 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN ID buffer register	RLN24nmLiIDB	<RLIN24n_base> + 15 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN checksum buffer register	RLN24nmLiCBR	<RLIN24n_base> + 16 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN data buffer 1 register	RLN24nmLiDBR1	<RLIN24n_base> + 18 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN data buffer 2 register	RLN24nmLiDBR2	<RLIN24n_base> + 19 <sub>H</sub> + i × 20 <sub>H</sub>
	LIN data buffer 3 register	RLN24nmLiDBR3	<RLIN24n_base> + 1A <sub>H</sub> + i × 20 <sub>H</sub>
	LIN data buffer 4 register	RLN24nmLiDBR4	<RLIN24n_base> + 1B <sub>H</sub> + i × 20 <sub>H</sub>
	LIN data buffer 5 register	RLN24nmLiDBR5	<RLIN24n_base> + 1C <sub>H</sub> + i × 20 <sub>H</sub>
	LIN data buffer 6 register	RLN24nmLiDBR6	<RLIN24n_base> + 1D <sub>H</sub> + i × 20 <sub>H</sub>
LIN data buffer 7 register	RLN24nmLiDBR7	<RLIN24n_base> + 1E <sub>H</sub> + i × 20 <sub>H</sub>	
LIN data buffer 8 register	RLN24nmLiDBR8	<RLIN24n_base> + 1F <sub>H</sub> + i × 20 <sub>H</sub>	

**Note:** When writing to a register not used, write the value after reset.

## 21.3.2 Global Registers

### 21.3.2.1 RLN24nGLWBR — LIN Wake-Up Baud Rate Select Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nGLWBR: <RLIN24n\_base> + 01<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LWBR0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 21.32 RLN24nGLWBR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified by the LCKS bit setting in the RLN24nmLiMD registers is used (when LIN 1.3 is used). 1: In LIN wake-up mode, the clock fa is used regardless of the setting of the LCKS bit in the RLN24nmLiMD registers (when LIN 2.X is used).

Set the RLN24nGLWBR register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

#### LWBR0 Bit (Wake-Up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN24nGLWBR register to 0. This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.

When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. With this setting, fa is selected as the LIN system clock ( $f_{LIN}$ ) during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register (the LCKS bit is not changed) and the 2.5-Tbit or longer low-level width of the input signal can be measured. Setting the baud rate to 19200 bps while fa is selected allows the 130  $\mu$ s or longer low-level width of the input signal to be detected during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register.

### 21.3.2.2 RLN24nGLBRP0 — LIN Baud Rate Prescaler 0 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nGLBRP0: <RLIN24n\_base> + 02<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Table 21.33 RLN24nGLBRP0 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the LIN communication clock source by N+1. Setting range: 00 <sub>H</sub> to FF <sub>H</sub>

Set the RLN24nGLBRP0 register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

The value set in this register is used to control the frequency of baud rate clock source  $f_a$ ,  $f_b$ , and  $f_c$ .

Assuming that the value set in this register is N, baud rate prescaler 0 divides the LIN communication clock source by N+1.

### 21.3.2.3 RLN24nGLBRP1 — LIN Baud Rate Prescaler 1 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nGLBRP1: <RLIN24n\_base> + 03<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.34 RLN24nGLBRP1 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the LIN communication clock source by M+1. Setting range: 00 <sub>H</sub> to FF <sub>H</sub>

Set the RLN24nGLBRP1 register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the LIN communication clock source by M+1.

### 21.3.2.4 RLN24nGLSTC — LIN Self-Test Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nGLSTC: <RLIN24n\_base> + 04<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.35 RLN24nGLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	—	Writing A7 <sub>H</sub> , 58 <sub>H</sub> , and 01 <sub>H</sub> successively to the RLN24nGLSTC register places the module in LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN24nGLSTC register cancels protection of LIN self-test mode.

Set the RLN24nGLSTC register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

Writing A7<sub>H</sub>, 58<sub>H</sub>, and 01<sub>H</sub> successively to the RLN24nGLSTC register places the module into LIN self-test mode.

When successive writing is completed and the module is placed in LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For details about transitioning to LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

When read, bits 6 to 1 return “000000<sub>B</sub>”, and bit 7 returns an undefined value.

#### LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For details about exiting LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

Writing 1 to this bit does not affect the value of the RLN24nGLSTC register if it is not a part of successive writing of A7<sub>H</sub>, 58<sub>H</sub>, and 01<sub>H</sub>.

## 21.3.3 Channel Registers

### 21.3.3.1 RLN24nmLiMD — LIN Mode Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiMD: <RLIN24n\_base> + 08<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	LCKS[1:0]		—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R

Table 21.36 RLN24nmLiMD Register Contents

Bit Position	Bit Name	Function															
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															
3, 2	LCKS[1:0]	LIN System Clock Select <table border="0" style="margin-left: 20px;"> <tr> <td>b3</td> <td>b2</td> <td></td> </tr> <tr> <td>0</td> <td>0</td> <td>0: fa (Clock generated by baud rate prescaler 0)</td> </tr> <tr> <td>0</td> <td>1</td> <td>fb (1/2 clock generated by baud rate prescaler 0)</td> </tr> <tr> <td>1</td> <td>0</td> <td>fc (1/8 clock generated by baud rate prescaler 0)</td> </tr> <tr> <td>1</td> <td>1</td> <td>fd (1/2 clock generated by baud rate prescaler 1)</td> </tr> </table>	b3	b2		0	0	0: fa (Clock generated by baud rate prescaler 0)	0	1	fb (1/2 clock generated by baud rate prescaler 0)	1	0	fc (1/8 clock generated by baud rate prescaler 0)	1	1	fd (1/2 clock generated by baud rate prescaler 1)
b3	b2																
0	0	0: fa (Clock generated by baud rate prescaler 0)															
0	1	fb (1/2 clock generated by baud rate prescaler 0)															
1	0	fc (1/8 clock generated by baud rate prescaler 0)															
1	1	fd (1/2 clock generated by baud rate prescaler 1)															
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															

Set the RLN24nmLiMD register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

#### LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.

With 00<sub>B</sub> set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).

With 01<sub>B</sub> set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).

With 10<sub>B</sub> set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).

With 11<sub>B</sub> set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When the LWBR0 bit in the RLN24nGLWBR is 1 (when LIN 2.x is used) and the RLN24nmLiMST register is 01<sub>H</sub> (LIN wake-up mode), regardless of the setting of the LCKS bit, fa is input to the protocol controller (LCKS bit is not changed).

### 21.3.3.2 RLN24nmLiBFC — LIN Break Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiBFC: <RLIN24n\_base> + 09<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Value after reset	0	0	0	0	0	0	0	0

7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	BDT[1:0]	Transmission Break Delimiter (High Level) Width Select b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmission Break (Low Level) Width Select b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN24nmLiBFC register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

#### BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header. 1 Tbit to 4 Tbits can be specified.

#### BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header. 13 Tbits to 28 Tbits can be specified.

### 21.3.3.3 RLN24nmLiSC — LIN Space Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiSC: <RLIN24n\_base> + 0A<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 21.38 RLN24nmLiSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN24nmLiSC register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

#### IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.

0 Tbit to 3 Tbits can be specified.

These bits are enabled only during response transmission; they are disabled during response reception.

#### IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.

0 Tbit to 7 Tbits can be specified.

The response space setting is enabled only during response transmission; the setting is disabled during response reception.

The inter-byte space (header) value is equal to the response space value.

### 21.3.3.4 RLN24nmLiWUP — LIN Wake-Up Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiWUP: <RLIN24n\_base> + 0B<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 21.39 RLN24nmLiWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Set the RLN24nmLiWUP register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

#### WUTL[3:0] Bits (Wake-Up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.

1 Tbit to 16 Tbits can be specified.

When the LWBR0 bit in the RLN24nGLWBR is 1 (when LIN 2.x is used), regardless of the setting of the LCKS bit in the RLN24nmLiMD register,  $f_a$  is selected as the LIN system clock ( $f_{LIN}$ ) (LCKS bit is not changed).

### 21.3.3.5 RLN24nmLiIE — LIN Interrupt Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiIE: <RLIN24n\_base> + 0C<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 21.40 RLN24nmLiIE Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Set the RLN24nmLiIE register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

#### ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables interrupt request upon detection of an error.

With 0 set, the interrupt request is not generated when the ERR flag in the RLN24nmLiST register is set to 1.

With 1 set, the interrupt request is generated when the ERR flag in the RLN24nmLiST register is set to 1.

Errors that constitute interrupt sources are bit errors, physical bus errors, frame timeout errors, framing errors, and checksum errors.

Detection of a bit error, physical bus error, frame timeout error, and framing error can be enabled or disabled using the RLN24nmLiEDE register.

#### FRCIE Bit (Successful Frame/Wake-Up Reception Interrupt Request Enable)

The FRCIE bit enables or disables interrupt request upon successful reception of a frame or a wake-up signal (counting of low level width of the input signal).

With 0 set, the interrupt request is not generated when the FRC flag in the RLN24nmLiST register is set to 1.

With 1 set, the interrupt request is generated when the FRC flag in the RLN24nmLiST register is set to 1.

#### FTCIE Bit (Successful Frame/Wake-Up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables interrupt request upon successful transmission of a frame or a wake-up signal.

With 0 set, the interrupt request is not generated when the FTC flag in the RLN24nmLiST register is set to 1.

With 1 set, the interrupt request is generated when the FTC flag in the RLN24nmLiST register is set to 1.

### 21.3.3.6 RLN24nmLiEDE — LIN Error Detection Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiEDE: <RLIN24n\_base> + 0D<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FERE	FTERE	PBERE	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 21.41 RLN24nmLiEDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Frame Timeout Error Detection Enable 0: Disables frame timeout error detection. 1: Enables frame timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN24nmLiEDE register while the OMM0 bit in the RLN24nmLiMST register is 0<sub>B</sub> (LIN reset mode).

#### FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

When this bit is set to 1, the detection result is indicated in the FER flag in the RLN24nmLiEST register.

For details on the framing error, see **Section 21.14, Error Status**.

#### FTERE Bit (Frame Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error.

With 0 set, the frame timeout error is not detected.

With 1 set, the frame timeout error is detected.

When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN24nmLiEST register.

For details on the frame timeout error, see **Section 21.14, Error Status**.

**PBERE Bit (Physical Bus Error Detection Enable)**

The PBERE bit enables or disables detection of the physical bus error.

With 0 set, the physical bus error is not detected.

With 1 set, the physical bus error is detected.

When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN24nmLiEST register.

For details on the physical bus error, see **Section 21.14, Error Status**.

**BERE Bit (Bit Error Detection Enable)**

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

When this bit is set to 1, the detection result is indicated in the BER flag in the RLN24nmLiEST register.

For details on the bit error, see **Section 21.14, Error Status**.

### 21.3.3.7 RLN24nmLiCUC — LIN Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiCUC: <RLIN24n\_base> + 0E<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 21.42 RLN24nmLiCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode. 1: LIN operation mode.
0	OM0	LIN Reset 0: Transition to LIN reset mode. 1: Exit LIN reset mode.

Set the RLN24nmLiCUC register to 01<sub>H</sub> to transition to LIN wake-up mode or to 03<sub>H</sub> to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN24nmLiCUC register to 03<sub>H</sub> after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN24nmLiMST register before writing another value.

#### OM1 Bit (LIN Mode Select)

The OM1 bit selects the operating mode (LIN wake-up mode or LIN operation mode) that is entered after exiting LIN reset mode.

Setting this bit to 0 selects LIN wake-up mode.

Setting this bit to 1 selects LIN operation mode.

This bit is enabled only when the OMM0 bit in the RLN24nmLiMST register is 1.

Writing a value to this bit is disabled while the FTS bit in the RLN24nmLiTRC register is 1.

#### OM0 Bit (LIN Reset)

The OM0 bit selects whether to transition to or exit LIN reset mode.

Setting this bit to 0 causes RLIN2 to enter LIN reset mode.

Setting this bit to 1 causes RLIN2 to exit LIN reset mode.

### 21.3.3.8 RLN24nmLiTRC — LIN Transmission Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiTRC: <RLIN24n\_base> + 10<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 21.43 RLN24nmLiTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTS	Response Transmission Start 0: Response transmission is stopped in frame separate mode. 1: Response transmission is started in frame separate mode.
0	FTS	Frame Transmission/Wake-up Transmission/Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission/reception is started.

#### RTS Bit (Response Transmission Start)

Set the RTS bit (response transmit start bit) to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame transmission and transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 02<sub>H</sub> to the RLN24nmLiTRC register using the store instruction.

Writing a value to this bit is disabled when the OMM0 bit is 0 (LIN reset mode). When the OMM1 bit is 0 (LIN wake-up mode), do not write 1.

Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is stopped).

#### FTS Bit (Frame Transmission/Wake-Up Transmission/Reception Start)

Set the FTS bit to 1 to start frame/wake-up transmission.

Also set this bit to 1 to allow wake-up reception (counting of the low level width of the input signal).

Only 1 can be written to this bit; 0 cannot be written.

Writing a value to this bit is disabled when the OMM0 bit is 0 (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

### 21.3.3.9 RLN24nmLiMST — LIN Mode Status Register

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** RLN24nmLiMST: <RLIN24n\_base> + 11<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 21.44 RLN24nmLiMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

#### OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

When the OMM0 bit is 0<sub>B</sub> (LIN reset mode), the value of this bit is disabled.

#### OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

### 21.3.3.10 RLN24nmLiST — LIN Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiST: <RLIN24n\_base> + 12<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 21.45 RLN24nmLiST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN24nmLiST register is automatically cleared to 00<sub>H</sub> upon transition to LIN reset mode and start of the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00<sub>H</sub>.

Writing to this register is prohibited while the FTS bit in the RLN24nmLiTRC register is 1 (frame transmission or wake-up transmission/reception is started)

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value from before 1 was written.

“1” is set upon completion of header transmission, but an interrupt request is not generated.

To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

**D1RC Flag (Successful Data 1 Reception Flag)**

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value from before 1 is written.

“1” is set upon completion of Data 1 reception, but an interrupt request is not generated.

To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

**ERR Flag (Error Detection Flag)**

The ERR flag is set to 1 upon detection of an error (when the value of any of the flags of the RLN24nmLiEST registers is 1). Here, an interrupt request is generated if the ERRIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled).

To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN24nmLiEST register while in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

**FRC Flag (Successful Frame/Wake-Up Reception Flag)**

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value from before 1 is written.

The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request is generated if the FRCIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled).

To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

**FTC Flag (Successful Frame/Wake-Up Transmission Flag)**

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value from before 1 is written.

The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request is generated if the FTCIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled).

To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

### 21.3.3.11 RLN24nmLiEST — LIN Error Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiEST: <RLIN24n\_base> + 13<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	CSER	—	FER	FTER	PBER	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 21.46 RLN24nmLiEST Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Frame Timeout Error Flag 0: Frame timeout error has not been detected. 1: Frame timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN24nmLiEST register is automatically cleared to 00<sub>H</sub> upon transition to LIN reset mode and start of the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00<sub>H</sub>.

When the FTS bit in the RLN24nmLiTRC register is 1 (frame transmission or wake-up transmission/reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value from before 1 is written.

The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

**FER Flag (Framing Error Flag)**

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value from before 1 is written.

The FER flag is set to 1 upon framing error detection when the FERE bit of the RLN24nmLiEST register is 1 (framing error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

**FTER Flag (Frame Timeout Error Flag)**

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value from before 1 is written.

The FTER flag is set to 1 upon frame timeout error detection when the FTERE bit of the RLN24nmLiEDE register is 1 (frame timeout error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

**PBER Flag (Physical Bus Error Flag)**

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value from before 1 is written.

The PBER flag is set to 1 upon physical bus error detection when the PBERE bit of the RLN24nmLiEDE register is 1 (physical bus error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

**BER Flag (Bit Error Flag)**

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value from before 1 is written.

The BER flag is set to 1 upon bit error detection when the BERE bit of the RLN24nmLiEDE register is 1 (bit error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

### 21.3.3.12 RLN24nmLiDFC — LIN Data Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiDFC: <RLIN24n\_base> + 14<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	FSM	CSM	RFT	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.47 RLN24nmLiDFC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 bytes + checksum 0 0 0 1: 1 byte + checksum 0 0 1 0: 2 bytes + checksum : 0 1 1 1: 7 bytes + checksum 1 0 0 0: 8 bytes + checksum Settings other than the above are prohibited.

Set the RLN24nmLiDFC register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

#### FSM Bit (Frame Separate Mode Select)

The FSM bit sets the response transmission mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN24nmLiTRC register is 1), response is transmitted/received without the RTS bit in the RLN24nmLiTRC register being set.

With 1 set, frame separate mode is selected. When the RTS bit of the RLN24nmLiTRC register is set to 1 during header transmission, response transmission is executed after header transmission has ended.

For response reception (the RFT bit is 0), set the FSM bit to 0.

When transitioning to LIN self-test mode, set this bit to 0 before transition.

For details on frame separate mode, see **Section 21.11.1, Transmission of LIN Frames**.

**CSM Bit (Checksum Select)**

The CSM bit sets checksum mode.

With 0 set, classic checksum mode is selected.

With 1 set, enhanced checksum mode is selected.

When frame timeout error detection is enabled (the FTERE bit in the RLN24nmLiEDE register is 1), the timeout time depends on the setting of this bit. For details, see **Section 21.14, Error Status**.

**RFT Bit (Response Field Communication Direction Select)**

The RFT bit sets the direction of the response field/wake-up signal communication.

With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).

With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

**RFDL[3:0] Bits (Response Field Length Select)**

The RFDL bits set the length of the response field data.

The data length can be 0 to 8 bytes excluding the checksum size.

### 21.3.3.13 RLN24nmLiIDB — LIN ID Buffer Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiIDB: <RLIN24n\_base> + 15<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** Undefined

Table 21.48 RLN24nmLiIDB Register Contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bit (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bit (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN24nmLiIDB register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted prior to communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

#### IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 sets P0 and IDP1 sets P1.

Since parity is not automatically calculated, set the calculation value. Note that even if the specified calculation result is incorrect, it is transmitted as is.

#### ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

### 21.3.3.14 RLN24nmLiCBR — LIN Checksum Buffer Register

**Access:** This register is a read-only register that can be read in 8-bit units. In LIN self-test mode, this register can be read or written in 8-bit units.

**Address:** RLN24nmLiCBR: <RLIN24n\_base> + 16<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** Undefined

Table 21.49 RLN24nmLiCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

while in LIN operation mode, this register operates as follows:

- When the RFT bit in the RLN24nmLiDFC register is 1 (transmission):  
The value transmitted can be read from the register. Read the value after transmission is completed.  
Writing to this register is invalid.
- When the RFT bit in the RLN24nmLiDFC register is 0 (reception):  
The value received can be read from the register. Read the value after reception is completed.  
Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN24nmLiDFC register is 1 (transmission):  
After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.  
Writing to this register is invalid.
- When the RFT bit in the RLN24nmLiDFC register is 0 (reception):  
Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

Set the RLN24nmLiCBR register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

### 21.3.3.15 RLN24nmLiDBRb — LIN Data Buffer b Register

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN24nmLiDBR1: <RLIN24n\_base> + 18<sub>H</sub> + i × 20<sub>H</sub>  
 RLN24nmLiDBR2: <RLIN24n\_base> + 19<sub>H</sub> + i × 20<sub>H</sub>  
 RLN24nmLiDBR3: <RLIN24n\_base> + 1A<sub>H</sub> + i × 20<sub>H</sub>  
 RLN24nmLiDBR4: <RLIN24n\_base> + 1B<sub>H</sub> + i × 20<sub>H</sub>  
 RLN24nmLiDBR5: <RLIN24n\_base> + 1C<sub>H</sub> + i × 20<sub>H</sub>  
 RLN24nmLiDBR6: <RLIN24n\_base> + 1D<sub>H</sub> + i × 20<sub>H</sub>  
 RLN24nmLiDBR7: <RLIN24n\_base> + 1E<sub>H</sub> + i × 20<sub>H</sub>  
 RLN24nmLiDBR8: <RLIN24n\_base> + 1F<sub>H</sub> + i × 20<sub>H</sub>

**Value after reset:** Undefined

Table 21.50 RLN24nmLiDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting range: 00 <sub>H</sub> to FF <sub>H</sub>

- For response transmission:

The LiDBRb registers specify the data to be transmitted in the response field.

Configure these registers when:

- The RFT bit in RLN24nmLiDFC register is 1 (transmission).
- The FSM bit in RLN24nmLiDFC register is 0 (not frame separate mode).
- The FTS bit in RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

or

- The RFT bit in RLN24nmLiDFC register is 1 (transmission).
- The FSM bit in RLN24nmLiDFC register is 1 (frame separate mode).
- The RTS bit in RLN24nmLiTRC register is 0 (response transmission is stopped).

- For response reception:

The LiDBRb registers hold the data received in the response field.

The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.

Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started).

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted prior to communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

## 21.4 Interrupt Sources

The LIN interrupts are interrupt requests generated by the LIN master interface.

There are three interrupt sources for each channel; successful frame/wake-up transmission, successful frame/wake-up reception, and error detection.

Interrupt requests from these three sources are ORed to generate one interrupt request “LIN interrupt”.

The respective interrupt request is output when the corresponding flag in the RLN24nmLiST register is set to 1 while the corresponding bit in the RLN24nmLiIE register is 1 (interrupt enabled). However, if an interrupt is requested when the corresponding flag in the RLN24nmLiST register has been set to 1, it is ignored. Therefore, clear the corresponding flag to 0 to enable the interrupt again.

**Figure 21.2, LIN Interrupt Block Diagram** shows a block diagram of the LIN interrupt.

Figure 21.2 LIN Interrupt Block Diagram

## 21.5 Modes

The LIN master interface provides the following four modes:

- LIN reset mode
- LIN operation mode
- LIN wake-up mode
- LIN self-test mode

The mode transitions except LIN self-test mode is controlled independently for respective channels.

**Figure 21.3, Mode Transitions** shows mode transitions. **Table 21.51, Transition Condition of Each Mode** describes mode transition conditions.

**Table 21.52, Operations Available in Each Mode** lists operations available in each mode.

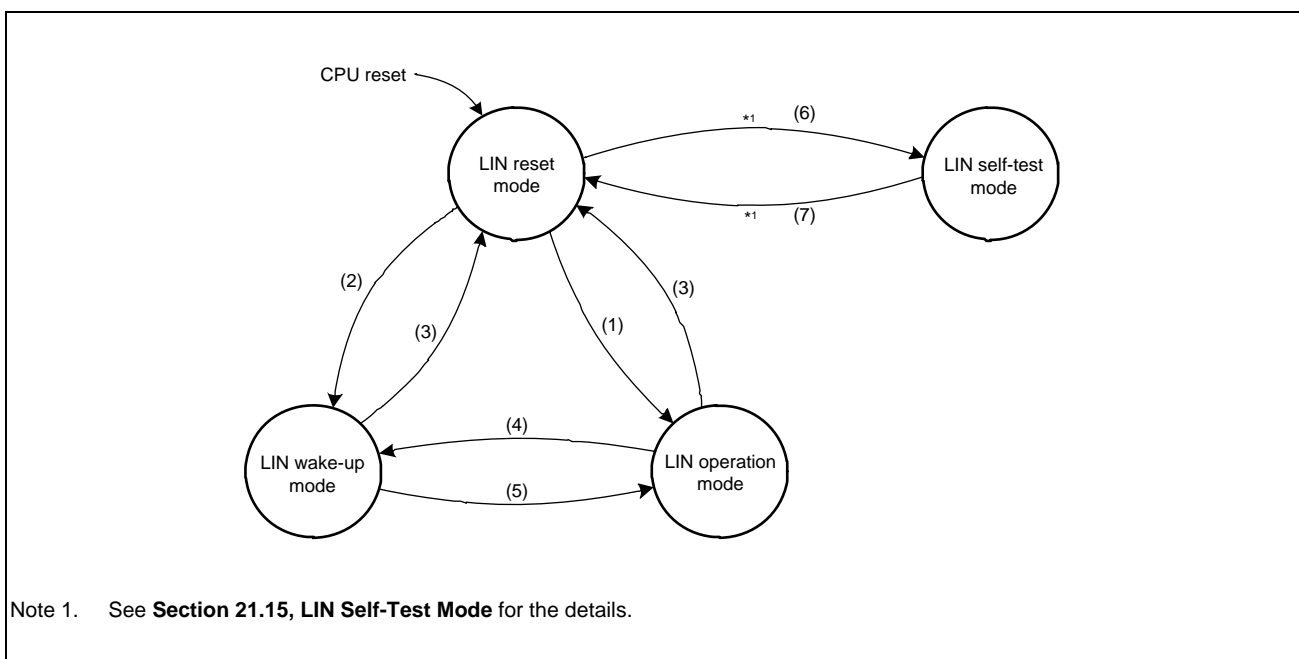

Figure 21.3 Mode Transitions

Table 21.51 Transition Condition of Each Mode

Mode Transition	Transition Condition
(1) LIN reset mode → LIN operation mode	RLN24nmLiCUC.OM1,OM0 = 11 <sub>B</sub>
(2) LIN reset mode → LIN wake-up mode	RLN24nmLiCUC.OM1,OM0 = 01 <sub>B</sub>
(3) LIN wake-up mode → LIN reset mode LIN operation mode	RLN24nmLiCUC.OM0 = 0 <sub>B</sub>
(4) LIN operation mode → LIN wake-up mode	RLN24nmLiCUC.OM1,OM0 = 01 <sub>B</sub>
(5) LIN wake-up mode → LIN operation mode	RLN24nmLiCUC.OM1,OM0 = 11 <sub>B</sub>
(6) LIN reset mode → LIN self-test mode	See <b>Section 21.15, LIN Self-Test Mode</b> .
(7) LIN self-test mode → LIN reset mode	See <b>Section 21.15, LIN Self-Test Mode</b> .

Table 21.52 Operations Available in Each Mode

LIN Operation Mode	LIN Wake-Up Mode	LIN Self-Test Mode
Header transmission	Wake-up transmission	self-test
Response transmission	Wake-up reception	
Response reception	Error detection	
Error detection		

Whether a transition has been made to LIN reset mode, LIN operation mode, or LIN wake-up mode can be verified by reading the OMM1 and OMM0 bits in the RLN24nmLiMST register.

For a description of LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

## 21.6 LIN Reset Mode

Setting the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The transition to LIN reset mode can be verified by determining that the OMM0 bit in the RLN24nmLiMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication stops.

From LIN reset mode, transitions to LIN operation mode, LIN wake-up mode, and LIN self-test mode can be made.

When the mode transitions to LIN reset mode, the following registers are initialized to their reset values and retain their initial values while in LIN reset mode:

- RLN24nmLiTRC register
- RLN24nmLiST register
- RLN24nmLiEST register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN24nGLWBR register
- RLN24nGLBRP0 register
- RLN24nGLBRP1 register
- RLN24nmLiMD register
- RLN24nmLiBFC register
- RLN24nmLiSC register
- RLN24nmLiWUP register
- RLN24nmLiIE register
- RLN24nmLiEDE register
- RLN24nmLiDFC register
- RLN24nmLiIDB register
- RLN24nmLiCBR register
- RLN24nmLiDBRb register

## 21.7 LIN Operation Mode

While in LIN operation mode, frame processing (header transmission, response transmission, response reception, and error detection) is performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN24nmLiCUC register to 11<sub>B</sub> changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN24nmLiMST register to 11<sub>B</sub>. Communication settings should be performed after the RLN24nmLiMST register has become 11<sub>B</sub>.

## 21.8 LIN Wake-Up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) is performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN24nmLiCUC register to 01<sub>B</sub> changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN24nmLiMST register to 01<sub>B</sub>. Communication settings should be performed after the RLN24nmLiMST register has become 01<sub>B</sub>.

## 21.9 Header Transmission/Response Transmission/Response Reception

### 21.9.1 Header Transmission

Figure 21.4, Operation in Header Transmission shows the operation of the LIN master interface in header transmission. Table 21.53, Processing in Header Transmission shows processing in header transmission.

Figure 21.4 Operation in Header Transmission

Table 21.53 Processing in Header Transmission

Software Processing	LIN Master Interface Processing
(1) <ul style="list-style-type: none"> <li>• Sets a baud rate</li> <li>• Enables interrupts</li> <li>• Enables error detection</li> <li>• Sets frame configuration parameters</li> <li>• Transitions to LIN operation mode</li> <li>• Sets information on the frame to be transmitted (ID, parity, data length, response direction, checksum method, and transmission data)</li> </ul>	Waits for the FTS bit in the RLIN24nmLiTRC register to be set by software (idle).
(2) Sets the FTS bit in the RLIN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3) Waits for an interrupt request	Transmits a break delimiter.
(4)	Transmits a sync field (55 <sub>H</sub> ).
(5)	Transmits an inter-byte space (header).
(6)	Transmits an ID field.
(7)	Sets the successful header transmission flag.

#### NOTE

For information about error detection, see **Section 21.14, Error Status**.

### 21.9.2 Response Transmission

Figure 21.5, Operation in Response Transmission shows the operation of the LIN master interface in response transmission. Table 21.54, Processing in Response Transmission shows the processing in response transmission.

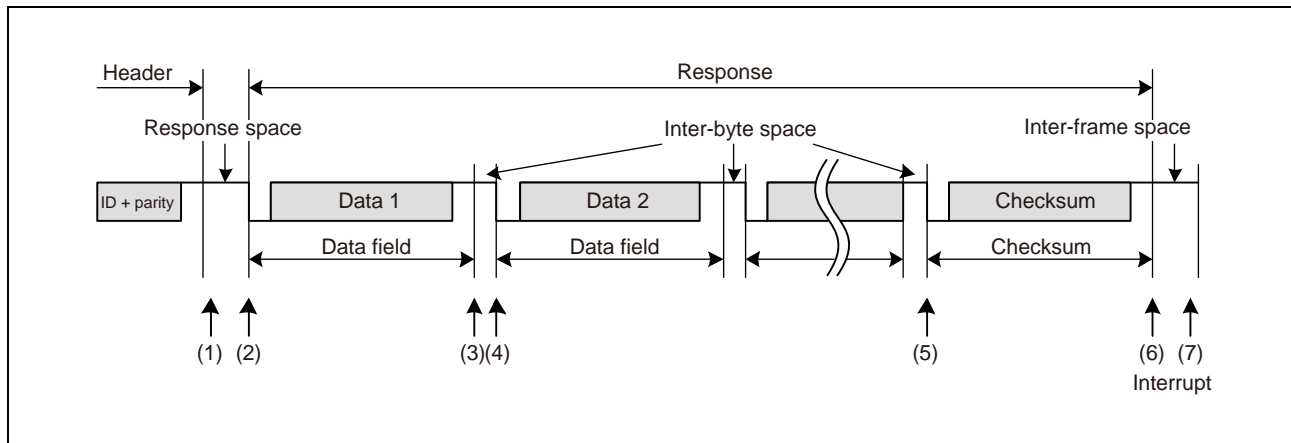

Figure 21.5 Operation in Response Transmission

Table 21.54 Processing in Response Transmission

Software Processing	LIN Master Interface Processing

(During this time, “1” is output.)</li> </ul> (When not in frame separate mode) <ul style="list-style-type: none"> <li>• Sends a response space.</li> </ul>
(2) Waits for an interrupt request	Transmits data 1.
(3)	Transmits an inter-byte space.
(4)	<ul style="list-style-type: none"> <li>• Transmits data 2.</li> <li>• Transmits an inter-byte space</li> <li>• Transmits data 3.</li> <li>• Transmits an inter-byte space</li> </ul> (Repeats the transmission of data and inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN24nmLiDFC register.) <p style="text-align: center;">:</p> <p style="text-align: center;">:</p>
(5)	Transmits the checksum.
(6)	<ul style="list-style-type: none"> <li>• Sets the successful frame/wake-up transmission flag.</li> <li>• Sets the FTS bit in the RLN24nmLiTRC register to 0 (frame transmission or wake-up transmission/reception stopped)</li> </ul> (When in frame separate mode) <ul style="list-style-type: none"> <li>• Sets the RTS bit in the RLN24nmLiTRC register to 0 (response transmission stopped).</li> </ul>
(7) <ul style="list-style-type: none"> <li>• Processing after communication</li> </ul> Checks the RLN24nmLiST register, and clears flags.	Idle

**NOTE**

For information about error detection, see Section 21.14, Error Status.

### 21.9.3 Response Reception

**Figure 21.6, Operation in Response Reception** shows the operation of the LIN master interface in response reception. **Table 21.55, Processing in Response Reception** shows the processing in response reception.

Figure 21.6 Operation in Response Reception

Table 21.55 Processing in Response Reception

Software Processing	LIN Master Interface Processing
(1) Waits for an interrupt request (no processing).	Waits for detection of a start bit.
(2) Waits for an interrupt request.	Receives data 1 when the start bit is detected.
(3)	Sets the successful data 1 reception flag.
(4)	<ul style="list-style-type: none"> <li>Receives data 2 when the start bit is detected.</li> <li>Receives data 3 when the start bit is detected. (Repeats the reception of data as many times as the data length specified in bits RFDL[3:0] in the RLN24nmLiDFC register.)</li> <li>⋮</li> <li>⋮</li> <li>Receives the checksum when the start bit is detected.</li> </ul>
(5)	<ul style="list-style-type: none"> <li>Evaluates the checksum.</li> <li>Sets the successful frame/wake-up reception flag.</li> <li>Sets the FTS bit in the RLN24nmLiTRC register to 0 (frame transmission or wake-up transmission/reception stopped).</li> </ul>
(6) <ul style="list-style-type: none"> <li>Processing after communication</li> <li>Reads the received data.</li> <li>Checks the RLN24nmLiST register, and clears flags.</li> </ul>	Idle

**NOTE**

For information about error detection, see **Section 21.14, Error Status**.

## 21.10 Data Transmission/Reception

### 21.10.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag of the RLIN24nmLiEST register (see **Section 21.14, Error Status**).

In the LIN master interface, because data is generated every 1 Tbit =  $16f_{LIN}$ , the sampling point for received data is the 13th clock cycle (81.25% position).

**Figure 21.7, Example of Data Transmission Timing** shows an example of data transmission timing.

Figure 21.7 Example of Data Transmission Timing

### 21.10.2 Data Reception

Data reception is performed by using the synchronized RLIN2mRX signal (an internal signal) that is the input from the RLIN2mRX pin synchronized with the LIN system clock ( $f_{LIN}$ ).

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN2mRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN2mRX signal is low level. The falling edge is not recognized as a start bit if the RLIN2mRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

The bit sampling period after detection of the start bit is one Tbit.

**Figure 21.8, Example of Data Reception Timing** shows an example of data reception timing.

Figure 21.8 Example of Data Reception Timing

## 21.11 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN master interface sends or receives data continuously.

### 21.11.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-byte transmission, the contents stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN24nmLiDBR5 to RLN24nmLiDBR8 are not transmitted. The transmitted checksum data is stored in the RLN24nmLiCBR register.

**Figure 21.9, LIN Transmission Processing and Corresponding Buffers** shows the LIN transmission processing and the corresponding buffers.

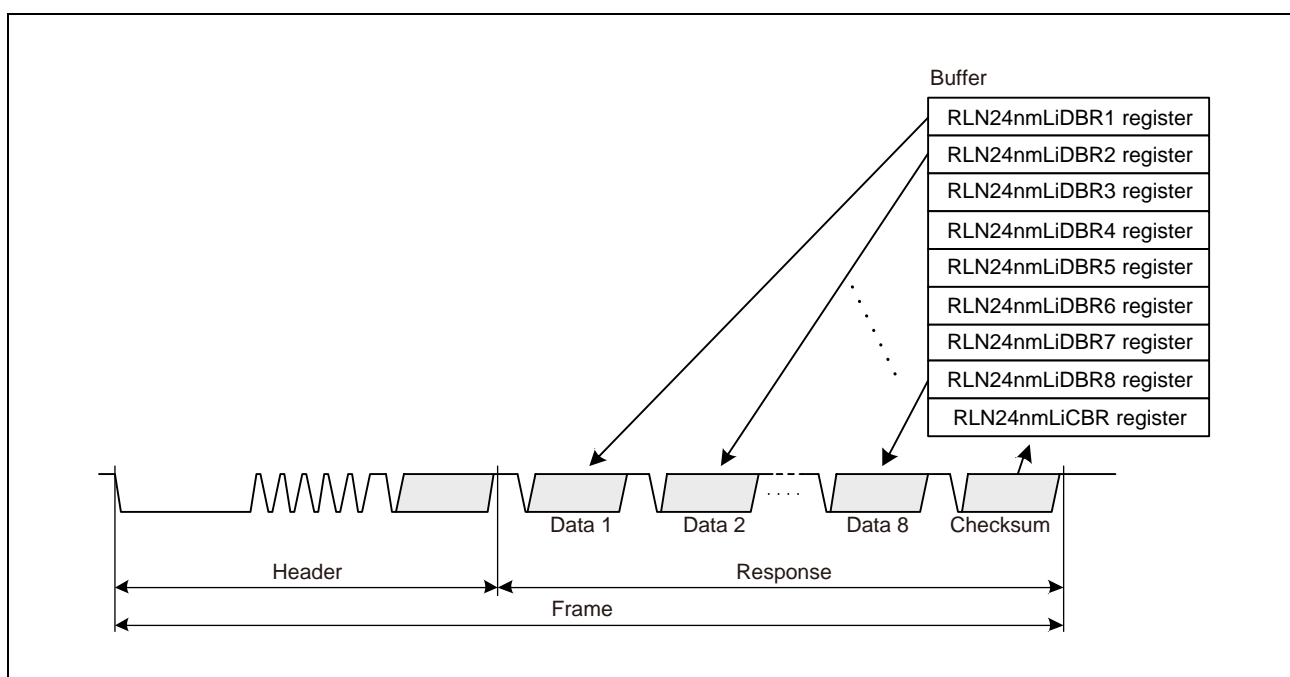

Figure 21.9 LIN Transmission Processing and Corresponding Buffers

#### (1) Frame Separate Mode

Setting the FSM bit in the RLN24nmLiDFC register to 1 sets the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN24nmLiST register is set to 1 (successful header transmission).

### 21.11.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame are stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR4, respectively; no data is stored in registers RLN24nmLiDBR5 to RLN24nmLiDBR8. The received checksum data is stored in the RLN24nmLiCBR register.

**Figure 21.10, LIN Reception Processing and Corresponding Buffers** shows the LIN reception processing and the corresponding buffers.

Figure 21.10 LIN Reception Processing and Corresponding Buffers

#### (1) Reception of Data 1

When the reception of the first byte of data is finished, the D1RC flag in the RLN24nmLiST register is set to 1 (successful data 1 reception).

## 21.12 Wake-Up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

### 21.12.1 Wake-Up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN24nmLiDFC register to 1 (transmission) and the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal is set using the WUTL[3:0] bits in the RLN24nmLiWUP register. However, if the value of the LWBR0 bit of the RLN24nGLWBR register is 1 (when LIN 2.x is used), the LIN system clock ( $f_{LIN}$ ) has the low-level width of  $f_a$  (JW) regardless of the setting of the LCKS bit of the RLN24nmLiMD register. By setting the baud rate to 19200 bps when  $f_a$  is selected and setting the WUTL[3:0] bits of the RLN24nmLiWUP register to 0100<sub>B</sub> (5 Tbits), 260  $\mu$ s low level width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN24nmLiMD register.

If a wake-up low level is output without any error, the FTC flag in the RLN24nmLiST register is set to 1 (successful frame or wake-up transmission); when the FTCIE bit in the RLN24nmLiIE register is 1 (successful frame/wake-up transmission interrupt enabled), an interrupt request is generated.

If an error is detected, wake-up transmission is aborted and the error flag for the error detected (the PBER flag or BER flag in the RLN24nmLiEST register) is set to 1 (physical bus error detection / bit error detection).

**Figure 21.11, Wake-Up Transmission Timing** shows the wake-up transmission timing.

Figure 21.11 Wake-Up Transmission Timing

### 21.12.2 Wake-Up Reception

The detection of a wake-up signal involves the use of an input signal low level width count function.

The input signal low level width count function measures the low level width of the input signal to the RLIN2mRX pin, using the same sampling point as data reception. This allows an input signal of  $f_{LIN}$  with a low-level width of 2.5-Tbit or longer to be measured.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN24nGLWBR register to 0. When LIN Specification Package Revision 2.x is used, set LWBR0 bit to 1.

When LWBR0 bit is set to 1, regardless of the setting of the LCKS bit in the RLN24nmLiMD register,  $f_a$  is selected as the LIN system clock ( $f_{LIN}$ ) (the LCKS bit is not changed).

Setting the baud rate to 19200 bps while  $f_a$  is selected allows an input signal with a low-level width of 130  $\mu$ s or longer to be detected during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register.

When using this function, in LIN wake-up mode set the RFT bit in the RLN24nmLiDFC register to 0 (reception), and the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN24nmLiST register is set to 1 (successful frame or wake-up reception) and if the FRCIE bit in the RLN24nmLiIE register is 1 (successful frame or wake-up reception interrupt enabled), an interrupt request is generated.

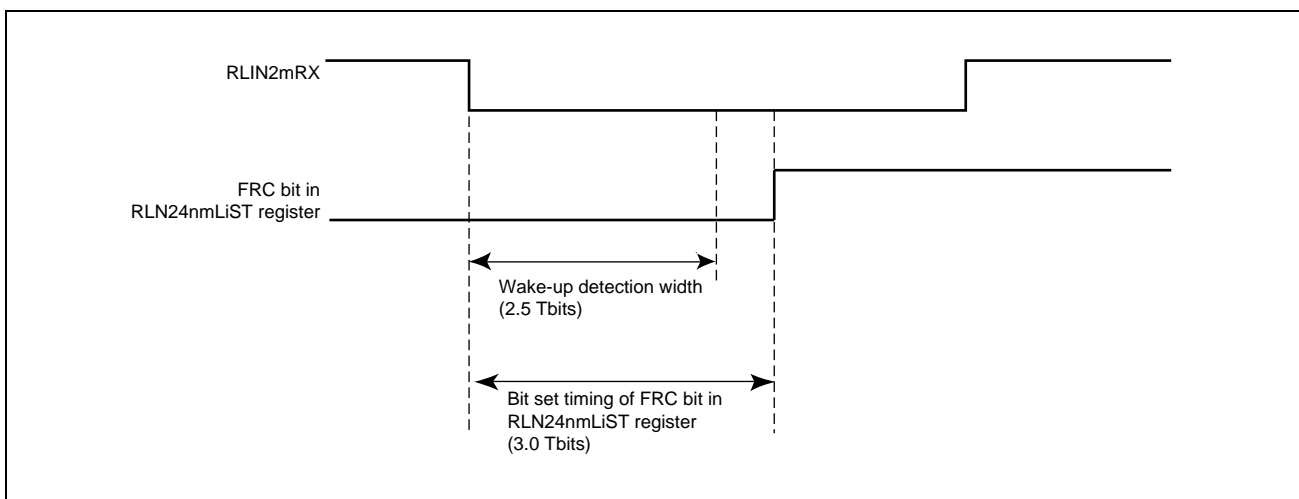

Figure 21.12 Input Signal Low Level Count Function

### 21.12.3 Wake-Up Collision

If the master node and the slave node transmit wake-up signals simultaneously, a collision will occur on the LIN bus; however the a collision of wake-up signals is not detected in the LIN master interface.

## 21.13 Status

During LIN mode operation, the LIN master interface can detect seven types of statuses.

Three of these statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, can generate interrupt requests.

**Table 21.56, Types of Statuses** shows the types of statuses.

Table 21.56 Types of Statuses

Status	Status Set Condition	Status Clear Condition	Operation Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN24nmLiCUC register is set to not-LIN-reset-mode, if the LIN master interface actually exits LIN reset mode.	After the OM0 bit in the RLN24nmLiCUC register is set to LIN reset mode, if the LIN master interface enters LIN reset mode.	All modes	OMM0 bit in the RLN24nmLiMST register	—
Operation mode	After the OM1 bit in the RLN24nmLiCUC register is set to LIN operation mode, if the LIN master interface actually enters LIN operation mode.	After the OM1 bit in the RLN24nmLiCUC register is set to LIN wake-up mode, if the LIN master interface enters LIN wake-up mode.	<ul style="list-style-type: none"> <li>• LIN operation mode</li> <li>• LIN wake-up mode</li> </ul>	OMM1 bit in the RLN24nmLiMST register	—
Successful frame/wake-up transmission	When a frame (header transmission + response transmission) or a wake-up signal is transmitted successfully.	<ul style="list-style-type: none"> <li>• When the next communication is started</li> <li>• When cleared by software</li> <li>• After transition to LIN reset mode</li> </ul>	<ul style="list-style-type: none"> <li>• LIN operation mode</li> <li>• LIN wake-up mode</li> </ul>	FTC flag in the RLN24nmLiST register	✓
Successful frame/wake-up reception	When a frame (header transmission + response reception) or a wake-up signal is received successfully.	<ul style="list-style-type: none"> <li>• When the next communication is started</li> <li>• When cleared by software</li> <li>• After transition to LIN reset mode</li> </ul>	<ul style="list-style-type: none"> <li>• LIN operation mode</li> <li>• LIN wake-up mode</li> </ul>	FRC flag in the RLN24nmLiST register	✓
Error detection	If any of the CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN24nmLiEST register is set to 1 (error detected).	<ul style="list-style-type: none"> <li>• When the next communication is started</li> <li>• When cleared by software*<sup>1</sup></li> <li>• After transition to LIN reset mode</li> </ul>	<ul style="list-style-type: none"> <li>• LIN operation mode</li> <li>• LIN wake-up mode</li> </ul>	ERR flag in the RLN24nmLiST register	✓
Successful data 1 reception	When the RFT bit in the RLN24nmLiDFC register is 0 (reception) and the first byte of the response field is received successfully.* <sup>2</sup>	<ul style="list-style-type: none"> <li>• When the next communication is started</li> <li>• When cleared by software</li> <li>• After transition to LIN reset mode</li> </ul>	LIN operation mode	D1RC flag in the RLN24nmLiST register	—
Successful header transmission	When a header field is transmitted successfully.	<ul style="list-style-type: none"> <li>• When the next communication is started</li> <li>• When cleared by software</li> <li>• After transition to LIN reset mode</li> </ul>	LIN operation mode	HTRC flag in the RLN24nmLiST register	—

Note 1. While in LIN operation mode, the ERR flag in the RLN24nmLiST register is cleared to 0 by writing 0 to the CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN24nmLiEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN24nmLiDFC register are 0000<sub>b</sub> (0 bytes + checksum).

## 21.14 Error Status

### 21.14.1 Types of Error Statuses

The LIN master interface can detect five types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN24nmLiEST register.

All error statuses represent interrupt sources.

**Table 21.57, Types of Error Statuses** shows the types of error statuses.

Table 21.57 Types of Error Statuses

Status	Error Detection Condition	Operating Mode Capable of Error Detection	Communication	Selection of Detection Enable/Disable	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1	<ul style="list-style-type: none"> <li>• LIN operation mode</li> <li>• LIN wake-up mode</li> </ul>	Aborted	✓	BER flag in the RLN24nmLiEST register
Physical bus error	<ul style="list-style-type: none"> <li>• LIN bus is detected to be high level when sending a break</li> <li>• LIN bus is detected to be low level when sending a break delimiter</li> <li>• LIN bus is detected to be high level when sending a wake-up</li> </ul>	<ul style="list-style-type: none"> <li>• LIN operation mode</li> <li>• LIN wake-up mode</li> </ul>	Aborted	✓	PBER flag in the RLN24nmLiEST register
Frame timeout error	A frame transmission/reception does not complete within a given time*2	LIN operation mode	Aborted	✓	FTER flag in the RLN24nmLiEST register
Framing error	In response field reception, the stop bit of each data byte is low level	LIN operation mode	Aborted	✓	FER flag in the RLN24nmLiEST register
Checksum error	In response field reception, checksum test results in an error	LIN operation mode	—	×	CSER flag in the RLN24nmLiEST register

Note 1. If a bit error is detected, the process is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. The timeout time depends on the response field data length (the RFDL[3:0] bits in the RLN24nmLiDFC register) and the checksum selection (the CSM bit in the RLN24nmLiDFC register), and this can be calculated according to the following formula:

When classic checksum is selected (when the CSM bit in the RLN24nmLiDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

When enhanced checksum is selected (when the CSM bit in the RLN24nmLiDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is longer than the TFRAME\_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME\_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.

The error status is cleared when the next communication is started, when it is cleared by software, or at a transition to LIN reset mode.

### 21.14.2 Target Time Domain for Error Detection

Figure 21.13, Target Time Domain for Error Detection shows the time domain in which the LIN master interface monitors for error detection.

Figure 21.13 Target Time Domain for Error Detection

## 21.15 LIN Self-Test Mode

The LIN master interface provides LIN self-test mode. When the LIN master interface enters LIN self-test mode, RLIN2mTX and RLIN2mRX are disconnected from the external pins, and are internally connected in the LIN master interface. Thus, the frame transmitted from RLIN2mTX is looped back to RLIN2mRX.

Two types of self-test can be performed:

- LIN self-test mode (transmission): header transmission and response transmission
- LIN self-test mode (reception): header transmission and response reception

In LIN self-test mode, the operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator. Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps].

In LIN self-test mode, the following functions are not supported:

- LIN wake-up mode
- Frame separate mode

Do not use these functions.

Figure 21.14 Connection in LIN Reset Mode, LIN Wake-Up Mode, and LIN Operation Mode

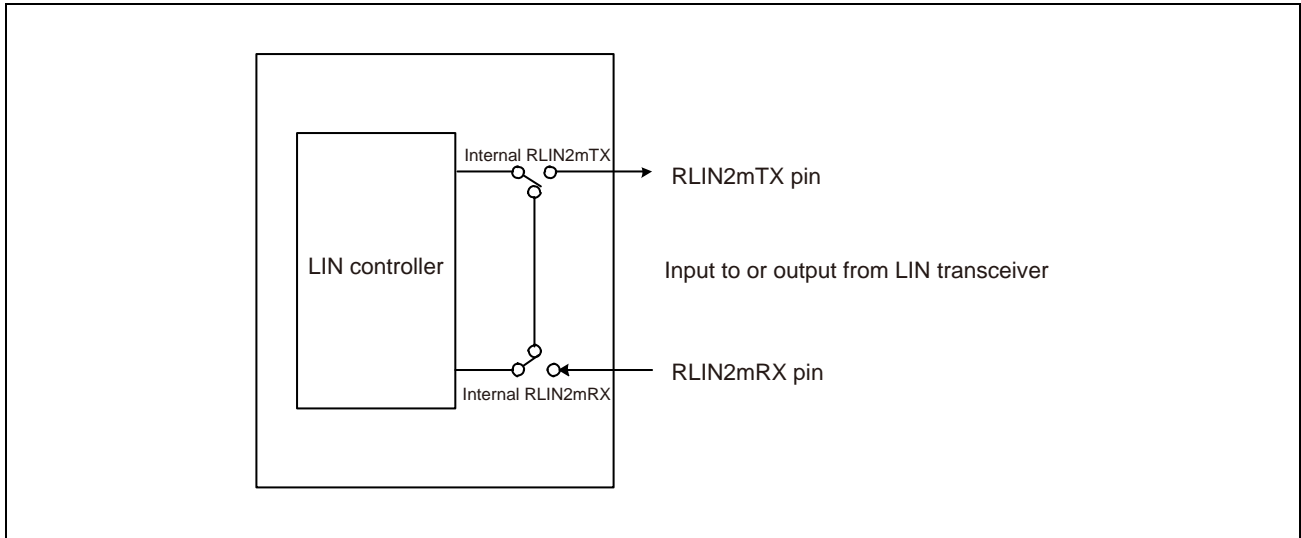

Figure 21.15 Connection in LIN Self-Test Mode

### 21.15.1 Transition to LIN Self-Test Mode

Writing to the RLN24nGLSTC register enables LIN self-test mode.

The LSTM bit in the RLN24nGLSTC register being set to 1 indicates that the mode has transitioned to LIN self-test mode.

A specific sequence is required to transition to LIN self-test mode. In this sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Switch all channels of the unit to LIN reset mode.  
Set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode).  
Read the OMM0 bit in the RLN24nmLiMST register and confirm that it is 0 (LIN reset mode).
- 1st write: RLN24nGLSTC register = 1010 0111<sub>B</sub> (A7<sub>H</sub>)
- 2nd write: RLN24nGLSTC register = 0101 1000<sub>B</sub> (58<sub>H</sub>)
- 3rd write: RLN24nGLSTC register = 0000 0001<sub>B</sub> (01<sub>H</sub>)
- Confirm that all channels have transitioned to LIN self-test mode  
Read the LSTM bit in the RLN24nGLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write (A7<sub>H</sub>) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the 1st write step. In addition, if a write to another LIN-related register in the same unit is performed during transition to LIN self-test mode (three consecutive write operations to the RLN24nGLSTC register), the transition is also canceled.

### 21.15.2 Transmission in LIN Self-Test Mode

To execute a self-test on transmission, perform the procedure below:

- Set the baud rate related registers.
  - RLN24nGLBRP0 register = xxxx xxxxB<sup>\*1</sup>
  - RLN24nGLBRP1 register = xxxx xxxxB<sup>\*1</sup>
  - RLN24nmLiMD register = 0000 xx00B<sup>\*1</sup>
- Set interrupt enable register and error enable related registers.
  - RLN24nmLiIE register = 0000 0xxxB<sup>\*2</sup>
  - RLN24nmLiEDE register = 0000 xxxxB
- Set the break field and space related registers.
  - RLN24nmLiBFC register = 00xx xxxxB
  - RLN24nmLiSC register = 00xx 0xxxB
- Exit the LIN reset mode.
 

Write 11<sub>B</sub> to the OM1 and OM0 bits in the RLN24nmLiCUC register, and check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are 11<sub>B</sub>.
- Set the transmit frame related registers.
  - RLN24nmLiDFC register = 00x1 xxxxB
  - RLN24nmLiIDB register = xxxx xxxxB
  - RLN24nmLiDBR1 to RLN24nmLiDBR8 registers = xxxx xxxxB
- Start header transmission → response transmission
 

Set the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN self-test mode (transmission) is executed, interrupts are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN master interface.

To suspend the LIN self-test mode (transmission) while it is running, set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode), which causes a transition to the LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN24nmLiIDB, RLN24nmLiDBRb, and RLN24nmLiCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN24nmLiTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN24nmLiTRC register is cleared.

#### NOTE

x: Don't care

- Note 1.** The settings of the following registers are not reflected in the operation of the LIN self-test mode: the RLN24nGLBRP0 register, the RLN24nGLBRP1 register, and the LCKS bit in the RLN24nmLiMD register. Therefore, setting these registers is not necessary.
- Note 2.** If necessary, set the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**, **Section 7BC, Exception/Interrupts of RH850/F1KM**.

### 21.15.3 Reception in LIN Self-Test Mode

To execute a self-test on reception, perform the procedure below:

- Set the baud rate related registers.
  - RLN24nGLBRP0 register = xxxx xxxxB<sup>\*1</sup>
  - RLN24nGLBRP1 register = xxxx xxxxB<sup>\*1</sup>
  - RLN24nmLiMD register = 0000 xx00B<sup>\*1</sup>
- Set the interrupt enable and error enable related registers.
  - RLN24nmLiIE register = 0000 0xxxB<sup>\*2</sup>
  - RLN24nmLiEDE register = 0000 x0xxB
- Set the break field and space related registers.
  - RLN24nmLiBFC register = 00xx xxxxB
  - RLN24nmLiSC register = 00xx 0xxxB<sup>\*1</sup>
- Exit the LIN reset mode.
 

Write 11<sub>B</sub> to the OM1 and OM0 bits in the RLN24nmLiCUC register, and check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are 11<sub>B</sub>.
- Set the receive frame related registers.
  - RLN24nmLiDFC register = 00x0 xxxxB
  - RLN24nmLiIDB register = xxxx xxxxB
  - RLN24nmLiDBR1 to RLN24nmLiDBR8 registers = xxxx xxxxB
  - RLN24nmLiCBR register = xxxx xxxxB

Since the checksum value to be transmitted is not automatically calculated, perform the calculation and specify the calculated value in the RLN24nmLiCBR register. By specifying an incorrect checksum, the checksum error can be tested.
- Start header transmission → response reception
 

Set the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN self-test mode (reception) is executed, interrupts are generated, and status and error status are also updated. To suspend the LIN self-test mode (reception) while it is running, set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode), which causes a transition to the LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN24nmLiIDB, RLN24nmLiDBRb, and RLN24nmLiCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN24nmLiTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN24nmLiTRC register is cleared.

#### NOTE

x: Don't care

- Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode: the RLN24nGLBRP0 register, the RLN24nGLBRP1 register, the LCKS bit in the RLN24nmLiMD register, and the IBS bit and IBHS bit (response space only) in the RLN24nmLiSC register. Therefore, setting these registers is not necessary.
- Note 2.** If necessary, set the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**, **Section 7BC, Exception/Interrupts of RH850/F1KM**.

### 21.15.4 Exiting LIN Self-Test Mode

To exit LIN self-test mode, perform the procedure below:

- Switch all channels of the unit to LIN reset mode.  
Write 0 to the OM0 bit in the RLN24nmLiCUC register to make a transition to LIN reset mode. However, if the OMM1 and OMM0 bits in the RLN24nmLiMST register are not 11<sub>B</sub> in any channels of the unit after the transition to LIN self-test mode, write 11<sub>B</sub> to the OM1 and OM0 bits in the RLN24nmLiCUC register in any one channel. Check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are set to 11<sub>B</sub>, and then make a transition to LIN reset mode.
- Verify that the LIN master interface has exited LIN self-test mode.  
Read the LSTM bit in the RLN24nGLSTC register and confirm that it is not 0 (not in LIN self-test mode)
- Verify the transition to LIN reset mode.  
Read the OMM0 bit in the RLN24nmLiMST register and confirm that it is 0 (LIN reset mode).

## 21.16 Baud Rate Generator

The LIN system clock ( $f_{LIN}$ ) is obtained by dividing the LIN communication clock source frequency by the baud rate generator, and the baud rate is obtained by dividing that clock by 16. The inverse of this baud rate is called the bit time (Tbit).

**Figure 21.16, Block Diagram of Baud Rate Generation** shows a block diagram of baud rate generation.

Figure 21.16 Block Diagram of Baud Rate Generation

Set the LIN communication clock source in a range from 4 MHz to 40 MHz.

By setting the RLN24nGLBRP0 register so that  $f_a$  is 307200 Hz ( $= 19200 \times 16$ ), the resulting system clock frequencies are  $f_a = 19200 \times 16$ ,  $f_b = 9600 \times 16$ , and  $f_c = 2400 \times 16$ . These system clock frequencies are divided by 16 in the bit timing generator, enabling baud rates of 19200 bps, 9600 bps, and 2400 bps to be generated. Also, by setting the RLN24nGLBRP1 register so that  $f_d$  is 166672 Hz ( $= 10417 \times 16$ ), the resulting system clock frequency is  $f_d = 10417 \times 16$ . This system clock frequency is divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

The formula for calculating baud rate is shown below.

*Baud rate:*

$$\begin{aligned}
 &= \{\text{Frequency of LIN communication clock source}\} \div (\text{RLN24nGLBRP0} + 1) \div 16 \text{ [bps]} \text{ (When } f_a \text{ is selected)} \\
 &= \{\text{Frequency of LIN communication clock source}\} \div (\text{RLN24nGLBRP0} + 1) \div 2 \div 16 \text{ [bps]} \text{ (When } f_b \text{ is selected)} \\
 &= \{\text{Frequency of LIN communication clock source}\} \div (\text{RLN24nGLBRP0} + 1) \div 8 \div 16 \text{ [bps]} \text{ (When } f_c \text{ is selected)} \\
 &= \{\text{Frequency of LIN communication clock source}\} \div (\text{RLN24nGLBRP1} + 1) \div 2 \div 16 \text{ [bps]} \text{ (When } f_d \text{ is selected)}
 \end{aligned}$$

## Section 22 LIN/UART Interface (RLIN3)

This section contains a generic description of the LIN/UART interface (RLIN3).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RLIN3.

### 22.1 Features of RH850/F1KH, RH850/F1KM RLIN3

#### 22.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN3 units.

Each RLIN3 unit has a single channel interface.

Table 22.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of units	8	8	8
Name	RLIN3n (n = 0 to 7)	RLIN3n (n = 0 to 7)	RLIN3n (n = 0 to 7)

Table 22.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of units	3	6	8	8	8
Name	RLIN3n (n = 0 to 2)	RLIN3n (n = 0 to 5)	RLIN3n (n = 0 to 7)	RLIN3n (n = 0 to 7)	RLIN3n (n = 0 to 7)

Table 22.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of units	3	6	8
Name	RLIN3n (n = 0 to 2)	RLIN3n (n = 0 to 5)	RLIN3n (n = 0 to 7)

Table 22.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of units	1	2	3	4
Name	RLIN3n (n = 0)	RLIN3n (n = 0, 1)	RLIN3n (n = 0 to 2)	RLIN3n (n = 0 to 3)

Table 22.9 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual RLIN3 units are identified by the index "n": for example, RLIN3nLCUC (n = 0 to 7) is the LIN control register.
b	Throughout this section, the individual transmit/received data buffers of RLIN3n are identified by the index "b": for example, RLIN3nLDBRb (b = 1 to 8) is the data buffer register.

Table 22.10 Indices (RH850/F1KM-S4, RH850/F1KM-S2)

Index	Description
n	Throughout this section, the individual RLIN3 units are identified by the index "n": for example, RLIN3nLCUC (n = 0 to 7) is the LIN control register.
b	Throughout this section, the individual transmit/received data buffers of RLIN3n are identified by the index "b": for example, RLIN3nLDBRb (b = 1 to 8) is the data buffer register.

Table 22.11 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RLIN3 units are identified by the index "n": for example, RLIN3nLCUC (n = 0 to 3) is the LIN control register.
b	Throughout this section, the individual transmit/received data buffers of RLIN3n are identified by the index "b": for example, RLIN3nLDBRb (b = 1 to 8) is the data buffer register.

The following lists the index value corresponding to each product.

Table 22.12 Index Correspondence of Each Product (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index Correspondence to Product	
All Products	
b = 1 to 8	

### 22.1.2 Register Base Addresses

RLIN3 base addresses are listed in the following table.

RLIN3 register addresses are given as offsets from the base addresses.

Table 22.13 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<RLIN30_base>	FFCE 2000 <sub>H</sub>
<RLIN31_base>	FFCE 2040 <sub>H</sub>
<RLIN32_base>	FFCE 2080 <sub>H</sub>
<RLIN33_base>	FFCE 20C0 <sub>H</sub>
<RLIN34_base>	FFCE 2100 <sub>H</sub>
<RLIN35_base>	FFCE 2140 <sub>H</sub>
<RLIN36_base>	FFCE 2180 <sub>H</sub>
<RLIN37_base>	FFCE 21C0 <sub>H</sub>

Table 22.14 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S2)

Base Address Name	Base Address
<RLIN30_base>	FFCE 2000 <sub>H</sub>
<RLIN31_base>	FFCE 2040 <sub>H</sub>
<RLIN32_base>	FFCE 2080 <sub>H</sub>
<RLIN33_base>	FFCE 20C0 <sub>H</sub>
<RLIN34_base>	FFCE 2100 <sub>H</sub>
<RLIN35_base>	FFCE 2140 <sub>H</sub>
<RLIN36_base>	FFCE 2180 <sub>H</sub>
<RLIN37_base>	FFCE 21C0 <sub>H</sub>

Table 22.15 Register Base Addresses (RH850/F1KM-S1)

Base Address Name	Base Address
<RLIN30_base>	FFCE 2000 <sub>H</sub>
<RLIN31_base>	FFCE 2040 <sub>H</sub>
<RLIN32_base>	FFCE 2080 <sub>H</sub>
<RLIN33_base>	FFCE 20C0 <sub>H</sub>

### 22.1.3 Clock Supply

The RLIN3 clock supply is shown in the following table.

Table 22.16 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RLIN3n	LIN communication clock sources	CKSCLK_ILIN*1,*2	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_ILIN	Bus clock

Note 1. The clock domain CKSCLK\_ILIN divided clock can be supplied only to RLIN30 channel.

Note 2. Set the LIN communication clock source in the range of 4 MHz to 40 MHz.

## 22.1.4 Interrupt Requests

RLIN3 interrupt requests are listed in the following table.

Table 22.17 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RLIN30			
INTRLIN3n (n = 0)	RLIN30 interrupt	33	—
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	34	10
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	35	11
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	36	—
RLIN31			
INTRLIN3n (n = 1)	RLIN31 interrupt	120	—
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	121	86
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	122	87
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	123	—
RLIN32			
INTRLIN3n (n = 2)	RLIN32 interrupt	164	—
INTRLIN3nUR0 (n = 2)	RLIN32 transmit interrupt	165	44
INTRLIN3nUR1 (n = 2)	RLIN32 receive completion interrupt	166	45
INTRLIN3nUR2 (n = 2)	RLIN32 status interrupt	167	—
RLIN33			
INTRLIN3n (n = 3)	RLIN33 interrupt	228	—
INTRLIN3nUR0 (n = 3)	RLIN33 transmit interrupt	229	111
INTRLIN3nUR1 (n = 3)	RLIN33 receive completion interrupt	230	112
INTRLIN3nUR2 (n = 3)	RLIN33 status interrupt	231	—
RLIN34			
INTRLIN3n (n = 4)	RLIN34 interrupt	232	—
INTRLIN3nUR0 (n = 4)	RLIN34 transmit interrupt	233	50
INTRLIN3nUR1 (n = 4)	RLIN34 receive completion interrupt	234	51
INTRLIN3nUR2 (n = 4)	RLIN34 status interrupt	235	—
RLIN35			
INTRLIN3n (n = 5)	RLIN35 interrupt	236	—
INTRLIN3nUR0 (n = 5)	RLIN35 transmit interrupt	237	121
INTRLIN3nUR1 (n = 5)	RLIN35 receive completion interrupt	238	122
INTRLIN3nUR2 (n = 5)	RLIN35 status interrupt	239	—
RLIN36			
INTRLIN3n (n = 6)	RLIN36 interrupt	360	—
INTRLIN3nUR0 (n = 6)	RLIN36 transmit interrupt	361	119
INTRLIN3nUR1 (n = 6)	RLIN36 receive completion interrupt	362	120
INTRLIN3nUR2 (n = 6)	RLIN36 status interrupt	363	—
RLIN37			
INTRLIN3n (n = 7)	RLIN37 interrupt	364	—
INTRLIN3nUR0 (n = 7)	RLIN37 transmit interrupt	365	16
INTRLIN3nUR1 (n = 7)	RLIN37 receive completion interrupt	366	77
INTRLIN3nUR2 (n = 7)	RLIN37 status interrupt	367	—

Table 22.18 Interrupt Requests (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RLIN30			
INTRLIN3n (n = 0)	RLIN30 interrupt	33	—
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	34	10
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	35	11
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	36	—
RLIN31			
INTRLIN3n (n = 1)	RLIN31 interrupt	120	—
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	121	86
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	122	87
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	123	—
RLIN32			
INTRLIN3n (n = 2)	RLIN32 interrupt	164	—
INTRLIN3nUR0 (n = 2)	RLIN32 transmit interrupt	165	44
INTRLIN3nUR1 (n = 2)	RLIN32 receive completion interrupt	166	45
INTRLIN3nUR2 (n = 2)	RLIN32 status interrupt	167	—
RLIN33			
INTRLIN3n (n = 3)	RLIN33 interrupt	228	—
INTRLIN3nUR0 (n = 3)	RLIN33 transmit interrupt	229	111
INTRLIN3nUR1 (n = 3)	RLIN33 receive completion interrupt	230	112
INTRLIN3nUR2 (n = 3)	RLIN33 status interrupt	231	—
RLIN34			
INTRLIN3n (n = 4)	RLIN34 interrupt	232	—
INTRLIN3nUR0 (n = 4)	RLIN34 transmit interrupt	233	50
INTRLIN3nUR1 (n = 4)	RLIN34 receive completion interrupt	234	51
INTRLIN3nUR2 (n = 4)	RLIN34 status interrupt	235	—
RLIN35			
INTRLIN3n (n = 5)	RLIN35 interrupt	236	—
INTRLIN3nUR0 (n = 5)	RLIN35 transmit interrupt	237	121
INTRLIN3nUR1 (n = 5)	RLIN35 receive completion interrupt	238	122
INTRLIN3nUR2 (n = 5)	RLIN35 status interrupt	239	—
RLIN36			
INTRLIN3n (n = 6)	RLIN36 interrupt	360	—
INTRLIN3nUR0 (n = 6)	RLIN36 transmit interrupt	361	119
INTRLIN3nUR1 (n = 6)	RLIN36 receive completion interrupt	362	120
INTRLIN3nUR2 (n = 6)	RLIN36 status interrupt	363	—
RLIN37			
INTRLIN3n (n = 7)	RLIN37 interrupt	364	—
INTRLIN3nUR0 (n = 7)	RLIN37 transmit interrupt	365	16
INTRLIN3nUR1 (n = 7)	RLIN37 receive completion interrupt	366	77
INTRLIN3nUR2 (n = 7)	RLIN37 status interrupt	367	—

Table 22.19 Interrupt Requests (RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RLIN30			
INTRLIN3n (n = 0)	RLIN30 interrupt	33	—
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	34	10
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	35	11
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	36	—
RLIN31			
INTRLIN3n (n = 1)	RLIN31 interrupt	120	—
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	121	86
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	122	87
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	123	—
RLIN32			
INTRLIN3n (n = 2)	RLIN32 interrupt	164	—
INTRLIN3nUR0 (n = 2)	RLIN32 transmit interrupt	165	44
INTRLIN3nUR1 (n = 2)	RLIN32 receive completion interrupt	166	45
INTRLIN3nUR2 (n = 2)	RLIN32 status interrupt	167	—
RLIN33			
INTRLIN3n (n = 3)	RLIN33 interrupt	228	—
INTRLIN3nUR0 (n = 3)	RLIN33 transmit interrupt	229	111
INTRLIN3nUR1 (n = 3)	RLIN33 receive completion interrupt	230	112
INTRLIN3nUR2 (n = 3)	RLIN33 status interrupt	231	—

### 22.1.5 Reset Sources

RLIN3 reset sources are listed in the following table. RLIN3 is initialized by these reset sources.

Table 22.20 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
RLIN3n	All reset sources (ISORES)

## 22.1.6 External Input/output Signals

External input/output signals of RLIN3 are listed below.

Table 22.21 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN30		
RLIN3nRX (n = 0)	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	RLIN30 transmit data output	RLIN30TX
RLIN31		
RLIN3nRX (n = 1)	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	RLIN31 transmit data output	RLIN31TX
RLIN32		
RLIN3nRX (n = 2)	RLIN32 receive data input	RLIN32RX
RLIN3nTX (n = 2)	RLIN32 transmit data output	RLIN32TX
RLIN33		
RLIN3nRX (n = 3)	RLIN33 receive data input	RLIN33RX
RLIN3nTX (n = 3)	RLIN33 transmit data output	RLIN33TX
RLIN34		
RLIN3nRX (n = 4)	RLIN34 receive data input	RLIN34RX
RLIN3nTX (n = 4)	RLIN34 transmit data output	RLIN34TX
RLIN35		
RLIN3nRX (n = 5)	RLIN35 receive data input	RLIN35RX
RLIN3nTX (n = 5)	RLIN35 transmit data output	RLIN35TX
RLIN36		
RLIN3nRX (n = 6)	RLIN36 receive data input	RLIN36RX
RLIN3nTX (n = 6)	RLIN36 transmit data output	RLIN36TX
RLIN37		
RLIN3nRX (n = 7)	RLIN37 receive data input	RLIN37RX
RLIN3nTX (n = 7)	RLIN37 transmit data output	RLIN37TX

Table 22.22 External Input/Output Signals (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN30		
RLIN3nRX (n = 0)	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	RLIN30 transmit data output	RLIN30TX
RLIN31		
RLIN3nRX (n = 1)	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	RLIN31 transmit data output	RLIN31TX
RLIN32		
RLIN3nRX (n = 2)	RLIN32 receive data input	RLIN32RX
RLIN3nTX (n = 2)	RLIN32 transmit data output	RLIN32TX
RLIN33		
RLIN3nRX (n = 3)	RLIN33 receive data input	RLIN33RX
RLIN3nTX (n = 3)	RLIN33 transmit data output	RLIN33TX
RLIN34		
RLIN3nRX (n = 4)	RLIN34 receive data input	RLIN34RX
RLIN3nTX (n = 4)	RLIN34 transmit data output	RLIN34TX
RLIN35		
RLIN3nRX (n = 5)	RLIN35 receive data input	RLIN35RX
RLIN3nTX (n = 5)	RLIN35 transmit data output	RLIN35TX
RLIN36		
RLIN3nRX (n = 6)	RLIN36 receive data input	RLIN36RX
RLIN3nTX (n = 6)	RLIN36 transmit data output	RLIN36TX
RLIN37		
RLIN3nRX (n = 7)	RLIN37 receive data input	RLIN37RX
RLIN3nTX (n = 7)	RLIN37 transmit data output	RLIN37TX

Table 22.23 External Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN30		
RLIN3nRX (n = 0)	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	RLIN30 transmit data output	RLIN30TX
RLIN31		
RLIN3nRX (n = 1)	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	RLIN31 transmit data output	RLIN31TX
RLIN32		
RLIN3nRX (n = 2)	RLIN32 receive data input	RLIN32RX
RLIN3nTX (n = 2)	RLIN32 transmit data output	RLIN32TX
RLIN33		
RLIN3nRX (n = 3)	RLIN33 receive data input	RLIN33RX
RLIN3nTX (n = 3)	RLIN33 transmit data output	RLIN33TX

## 22.2 Overview

### 22.2.1 Functional Overview

The LIN/UART interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602, and automatically performs frame communication and error determination.

The LIN/UART interface is provided with UART mode and can also be used as a UART.

The appropriate mode should be used for the LIN/UART interface according to the application: LIN master, LIN slave, or UART.

#### LIN master

- LIN reset mode
- LIN mode (LIN master mode)
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

#### LIN slave

- LIN reset mode
- LIN mode (LIN slave mode [auto baud rate] or LIN slave mode [fixed baud rate])
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

#### UART

- LIN reset mode
- UART mode

**Table 22.24, LIN/UART Interface Specifications** shows the LIN/UART interface specifications.

Table 22.24 LIN/UART Interface Specifications

Item	Specifications		
	Channel count	Up to 8 channels	
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602	
	Variable frame structure	Master	<ul style="list-style-type: none"> <li>Break transmission width: 13 to 28 Tbits</li> <li>Break delimiter transmission width: 1 to 4 Tbits</li> <li>Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*<sup>1</sup></li> <li>Transmission response space width: 0 to 7 Tbits*<sup>1</sup></li> <li>Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area)</li> <li>Transmission wake-up width: 1 to 16 Tbits</li> </ul>
		Slave	<ul style="list-style-type: none"> <li>Break reception width: 9.5 or 10.5 Tbits [for fixed baud rate] : 10 or 11 Tbits [for auto baud rate]</li> <li>Transmission response space width: 0 to 7 Tbits</li> <li>Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area)</li> <li>Transmission wake-up width: 1 to 16 Tbits</li> </ul>
	Checksum	<ul style="list-style-type: none"> <li>Automatic operation for both transmission and reception</li> <li>Classic or enhanced selectable (for each frame)</li> </ul>	
	Response field data byte count	Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible	
	Frame communication modes	Master	<ul style="list-style-type: none"> <li>Mode in which header transmission and response transmission/reception are started with a single transmission start request</li> <li>Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)</li> </ul>
Slave		<ul style="list-style-type: none"> <li>Mode in which header is automatically received with fixed baud rate</li> <li>Mode in which header is automatically received with the baud rate set according to the sync field measurement result of the sync field and break field detected</li> </ul>	
Wake-up transmission and reception	LIN wake-up mode provided	<ul style="list-style-type: none"> <li>Wake-up transmission (1 to 16 Tbits)</li> <li>Wake-up reception</li> </ul> Low-level width of input signals measured	
Status	Master	<ul style="list-style-type: none"> <li>Successful frame/wake-up transmission</li> <li>Successful header transmission</li> <li>Successful frame/wake-up reception*<sup>2</sup></li> <li>Successful data 1 reception</li> <li>Error detection</li> <li>Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)</li> </ul>	
	Slave	<ul style="list-style-type: none"> <li>Successful response/wake-up transmission</li> <li>Successful response/wake-up reception*<sup>2</sup></li> <li>Successful header reception</li> <li>Successful data 1 reception</li> <li>Error detection</li> <li>Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)</li> </ul>	

Table 22.24 LIN/UART Interface Specifications

Item	Specifications	
LIN communication function	Error status	Master <ul style="list-style-type: none"> <li>• Bit error</li> <li>• Checksum error</li> <li>• Frame timeout error/response timeout error</li> <li>• Physical bus error</li> <li>• Framing error</li> <li>• Response preparation error</li> </ul>
		Slave <ul style="list-style-type: none"> <li>• Bit error</li> <li>• Checksum error</li> <li>• Frame timeout error/response timeout error</li> <li>• Sync field error</li> <li>• ID parity error</li> <li>• Framing error</li> <li>• Response preparation error</li> </ul>
	Baud rate selection	Baud rates conforming to the LIN specifications generated using baud rate generator
	Test mode	Self-test mode for user evaluation
	Interrupt function	Master <ul style="list-style-type: none"> <li>• Successful header/frame/wake-up transmission</li> <li>• Successful frame/wake-up reception*<sup>2</sup></li> <li>• Error detection</li> </ul>
Slave <ul style="list-style-type: none"> <li>• Successful response/wake-up transmission</li> <li>• Successful Header/response/wake-up reception*<sup>2</sup></li> <li>• Error detection</li> </ul>		
UART communication function	Data buffer	<ul style="list-style-type: none"> <li>• Transmission data buffer/transmission data buffer for wait (exclusively for transmission; data length of 1. Character length of 7, 8, and 9 bits supported)</li> <li>• UART buffer (exclusively for transmission; variable data length from 1 to 9. Character length of 7 and 8 bits supported)</li> <li>• Reception data buffer (exclusively for reception; data length of 1. Character length of 7, 8, and 9 bits supported)</li> </ul>
	Data format	Character length: 7 or 8 bits Length of 9 bits supported by using the expansion bit.
		Transmission stop bit: 1 or 2 bits
		Parity function: odd, even, 0, or none
		LSB- or MSB-first transfer selectable
		Reverse input/output of transmission/reception data possible
	Status	<ul style="list-style-type: none"> <li>• Transmission status</li> <li>• Reception status</li> <li>• Successful UART buffer transmission</li> <li>• Error detection</li> <li>• Expansion bit detection</li> <li>• ID match</li> <li>• Reset mode status</li> </ul>
Error status	<ul style="list-style-type: none"> <li>• Bit error</li> <li>• Framing error</li> <li>• Parity error</li> <li>• Overrun error</li> </ul>	
Baud rate selection	With the built-in baud rate generator, any baud rate can be set.	
	When a certain expansion bit is at the expected level, the data received can be compared to the 8-bit data preset in the register.	

Table 22.24 LIN/UART Interface Specifications

Item	Specifications
UART communication function	Reception of the stop bit is guaranteed. (Start of transmission can be delayed when start of transmission is attempted during reception of the stop bit).
Interrupt function	<ul style="list-style-type: none"><li>• Transmission start/complete</li><li>• Reception complete</li><li>• Status/error detection</li></ul>

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the input signal low-level width count is indicated.

## 22.2.2 Block Diagram

Figure 22.1, LIN/UART Interface Block Diagram shows a block diagram of the LIN/UART interface.

Figure 22.1 LIN/UART Interface Block Diagram

## 22.2.3 Terms Used in Block Diagram

- RLIN3nTX, RLIN3nRX: LIN/UART interface I/O pins
- LINn baud rate generator: Generates the LIN/UART interface communication clock
- LINn registers: LIN/UART interface registers
- LINn interrupt control circuit: Controls interrupt requests generated by the LIN/UART interface

## 22.3 Registers

### 22.3.1 List of Registers

RLIN3 registers are listed in the following table.

For details about <RLIN3n\_base>, see **Section 22.1.2, Register Base Addresses**.

Table 22.25 List of Registers

Module Name	Register Name	Symbol	Address	LIN Master	LIN Slave	UART
RLN3n	LIN wake-up baud rate select register	RLN3nLWBR	<RLIN3n_base> + 01 <sub>H</sub>	✓	✓	✓
	LIN / UART baud rate prescaler 01 register	RLN3nLBRP01	<RLIN3n_base> + 02 <sub>H</sub>	—	✓	✓
	LIN / UART baud rate prescaler 0 register	RLN3nLBRP0	<RLIN3n_base> + 02 <sub>H</sub>	✓	✓	✓
	LIN / UART baud rate prescaler 1 register	RLN3nLBRP1	<RLIN3n_base> + 03 <sub>H</sub>	✓	✓	✓
	LIN self-test control register	RLN3nLSTC	<RLIN3n_base> + 04 <sub>H</sub>	✓	✓	—
	LIN / UART mode register	RLN3nLMD	<RLIN3n_base> + 08 <sub>H</sub>	✓	✓	✓
	LIN break field configuration register/ UART configuration register	RLN3nLBFC	<RLIN3n_base> + 09 <sub>H</sub>	✓	✓	✓
	LIN / UART space configuration register	RLN3nLSC	<RLIN3n_base> + 0A <sub>H</sub>	✓	✓	✓
	LIN wake-up configuration register	RLN3nLWUP	<RLIN3n_base> + 0B <sub>H</sub>	✓	✓	—
	LIN interrupt enable register	RLN3nLIE	<RLIN3n_base> + 0C <sub>H</sub>	✓	✓	—
	LIN / UART error detection enable register	RLN3nLEDE	<RLIN3n_base> + 0D <sub>H</sub>	✓	✓	✓
	LIN / UART control register	RLN3nLCUC	<RLIN3n_base> + 0E <sub>H</sub>	✓	✓	✓
	LIN / UART transmission control register	RLN3nLTRC	<RLIN3n_base> + 10 <sub>H</sub>	✓	✓	✓
	LIN / UART mode status register	RLN3nLMST	<RLIN3n_base> + 11 <sub>H</sub>	✓	✓	✓
	LIN / UART status register	RLN3nLST	<RLIN3n_base> + 12 <sub>H</sub>	✓	✓	✓
	LIN / UART error status register	RLN3nLEST	<RLIN3n_base> + 13 <sub>H</sub>	✓	✓	✓
	LIN / UART data field configuration register	RLN3nLDFC	<RLIN3n_base> + 14 <sub>H</sub>	✓	✓	✓
	LIN / UART ID buffer register	RLN3nLIDB	<RLIN3n_base> + 15 <sub>H</sub>	✓	✓	✓
	LIN checksum buffer register	RLN3nLCBR	<RLIN3n_base> + 16 <sub>H</sub>	✓	✓	—
	UART data buffer 0 register	RLN3nLUDB0	<RLIN3n_base> + 17 <sub>H</sub>	—	—	✓
	LIN / UART data buffer 1 register	RLN3nLDBR1	<RLIN3n_base> + 18 <sub>H</sub>	✓	✓	✓
	LIN / UART data buffer 2 register	RLN3nLDBR2	<RLIN3n_base> + 19 <sub>H</sub>	✓	✓	✓
	LIN / UART data buffer 3 register	RLN3nLDBR3	<RLIN3n_base> + 1A <sub>H</sub>	✓	✓	✓
	LIN / UART data buffer 4 register	RLN3nLDBR4	<RLIN3n_base> + 1B <sub>H</sub>	✓	✓	✓
	LIN / UART data buffer 5 register	RLN3nLDBR5	<RLIN3n_base> + 1C <sub>H</sub>	✓	✓	✓
	LIN / UART data buffer 6 register	RLN3nLDBR6	<RLIN3n_base> + 1D <sub>H</sub>	✓	✓	✓
	LIN / UART data buffer 7 register	RLN3nLDBR7	<RLIN3n_base> + 1E <sub>H</sub>	✓	✓	✓
	LIN / UART data buffer 8 register	RLN3nLDBR8	<RLIN3n_base> + 1F <sub>H</sub>	✓	✓	✓
	UART operation enable register	RLN3nLUOER	<RLIN3n_base> + 20 <sub>H</sub>	—	—	✓
	UART option register 1	RLN3nLUOR1	<RLIN3n_base> + 21 <sub>H</sub>	—	—	✓
	UART transmission data register	RLN3nLUTDR	<RLIN3n_base> + 24 <sub>H</sub>	—	—	✓
	UART transmission data register L	RLN3nLUTDRL	<RLIN3n_base> + 24 <sub>H</sub>	—	—	✓
	UART transmission data register H	RLN3nLUTDRH	<RLIN3n_base> + 25 <sub>H</sub>	—	—	✓

Table 22.25 List of Registers

Module Name	Register Name	Symbol	Address	LIN Master	LIN Slave	UART
RLN3n	UART reception data register	RLN3nLURDR	<RLIN3n_base> + 26 <sub>H</sub>	—	—	✓
	UART reception data register L	RLN3nLURDRL	<RLIN3n_base> + 26 <sub>H</sub>	—	—	✓
	UART reception data register H	RLN3nLURDRH	<RLIN3n_base> + 27 <sub>H</sub>	—	—	✓
	UART wait transmission data register	RLN3nLUWTDRL	<RLIN3n_base> + 28 <sub>H</sub>	—	—	✓
	UART wait transmission data register L	RLN3nLUWTDRL	<RLIN3n_base> + 28 <sub>H</sub>	—	—	✓
	UART wait transmission data register H	RLN3nLUWTDRLH	<RLIN3n_base> + 29 <sub>H</sub>	—	—	✓

**Remark:** ✓: Used, —: Not used

**Note:** When writing to an unused register, write the value after reset.

## 22.3.2 LIN Master Related Registers

### 22.3.2.1 RLIN3nLWBR — LIN Wake-Up Baud Rate Select Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 01<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			LWBR0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.26 RLIN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 samplings 1 1 1 1: 16 samplings Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified in the LCKS bit of the RLIN3nLMD register is used. (LIN1.3) 1: In LIN wake-up mode, the clock fa is used regardless of the setting in the LCKS bit of the RLIN3nLMD register. (LIN2.x)

Configure the RLIN3nLWBR register when the OMM0 bit in the RLIN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### NSPB[3:0] Bits (Bit Sampling Count Select)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).

In LIN master mode (LIN/UART mode select bits in LIN mode register = 00<sub>B</sub>), set these bits to 0000<sub>B</sub> or 1111<sub>B</sub> (16 sampling).

#### LPRS[2:0] Bits (Prescaler Clock Select)

These bits select the frequency division ratio for the prescaler.

The LIN communication clock source is divided by this prescaler.

### LWBR0 Bit (Wake-up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.

When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects  $f_a$  as the LIN system clock ( $f_{LIN}$ ) during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.

Setting the baud rate to 19200 bps while  $f_a$  is selected allows an input signal with a low-level width of 130  $\mu$ s or longer to be detected in the LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

### 22.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 02<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.27 RLN3nLBRP0 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting range: 00 <sub>H</sub> to FF <sub>H</sub>

Configure the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources  $f_a$ ,  $f_b$ , and  $f_c$ .

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by N + 1.

### 22.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 03<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.28 RLN3nLBRP1 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting range: 00 <sub>H</sub> to FF <sub>H</sub>

Configure the RLN3nLBRP1 register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M + 1.

### 22.3.2.4 RLN3nLSTC — LIN Self-Test Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 04<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.29 RLN3nLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	—	Writing A7 <sub>H</sub> , 58 <sub>H</sub> , and 01 <sub>H</sub> successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Configure the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Writing A7<sub>H</sub>, 58<sub>H</sub>, and 01<sub>H</sub> successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the mode is changed to LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return “000000<sub>B</sub>”, and bit 7 returns an undefined value.

#### LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For exiting LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of A7<sub>H</sub>, 58<sub>H</sub>, and 01<sub>H</sub>.

### 22.3.2.5 RLN3nLMD — LIN Mode Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base>+ 08<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	LCKS[1:0]		LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.30 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: RLIN3n interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 0: LIN master mode

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.

With 0 set, the noise filter is enabled when receiving data.

With 1 set, the noise filter is disabled when receiving data.

#### LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.

With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.

With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are generated from the LIN/UART interface.

For each interrupt source, see **Section 22.4, Interrupt Sources**.

**LCKS[1:0] Bits (LIN System Clock Select)**

The LCKS bits select the clock to be input to the protocol controller.

With 00<sub>B</sub> set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).

With 01<sub>B</sub> set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).

With 10<sub>B</sub> set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).

With 11<sub>B</sub> set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When 1<sub>B</sub> is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x), and the RLN3nLMST register is 01<sub>H</sub> (LIN wake-up mode), the protocol controller is supplied with fa regardless of the setting of this bit (the LCKS bit is not changed).

**LMD[1:0] Bits (LIN/UART Mode Select)**

The LMD bits select the LIN/UART interface mode.

To use the LIN/UART interface as an LIN master, set these bits to 00<sub>B</sub>.

### 22.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 09<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.31 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function																					
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.																					
5, 4	BDT[1:0]	Transmission Break Delimiter (High Level) Width Select <table border="0" style="margin-left: 20px;"> <tr> <td>b5</td> <td>b4</td> <td></td> </tr> <tr> <td>0</td> <td>0</td> <td>1 Tbit</td> </tr> <tr> <td>0</td> <td>1</td> <td>2 Tbits</td> </tr> <tr> <td>1</td> <td>0</td> <td>3 Tbits</td> </tr> <tr> <td>1</td> <td>1</td> <td>4 Tbits</td> </tr> </table>	b5	b4		0	0	1 Tbit	0	1	2 Tbits	1	0	3 Tbits	1	1	4 Tbits						
b5	b4																						
0	0	1 Tbit																					
0	1	2 Tbits																					
1	0	3 Tbits																					
1	1	4 Tbits																					
3 to 0	BLT[3:0]	Transmission Break (Low Level) Width Select <table border="0" style="margin-left: 20px;"> <tr> <td>b3</td> <td>b0</td> <td></td> </tr> <tr> <td>0</td> <td>0</td> <td>0: 13 Tbits</td> </tr> <tr> <td>0</td> <td>0</td> <td>1: 14 Tbits</td> </tr> <tr> <td>0</td> <td>0</td> <td>1: 15 Tbits</td> </tr> <tr> <td></td> <td></td> <td>:</td> </tr> <tr> <td>1</td> <td>1</td> <td>1: 27 Tbits</td> </tr> <tr> <td>1</td> <td>1</td> <td>1: 28 Tbits</td> </tr> </table>	b3	b0		0	0	0: 13 Tbits	0	0	1: 14 Tbits	0	0	1: 15 Tbits			:	1	1	1: 27 Tbits	1	1	1: 28 Tbits
b3	b0																						
0	0	0: 13 Tbits																					
0	0	1: 14 Tbits																					
0	0	1: 15 Tbits																					
		:																					
1	1	1: 27 Tbits																					
1	1	1: 28 Tbits																					

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Some combinations of the specified values result in a frame length exceeding the timeout time. Set the appropriate values in this register.

#### BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header.

1 Tbit to 4 Tbits can be set.

#### BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header.

13 Tbits to 28 Tbits can be set.

### 22.3.2.7 RLN3nLSC — LIN Space Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0A<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 22.32 RLN3nLSC Register Contents

Bit Position	Bit Name	Function																											
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.																											
5, 4	IBS[1:0]	Inter-Byte Space Select <table border="0" style="margin-left: 20px;"> <tr> <td>b5</td> <td>b4</td> <td></td> </tr> <tr> <td>0</td> <td>0</td> <td>0 Tbit</td> </tr> <tr> <td>0</td> <td>1</td> <td>1 Tbit</td> </tr> <tr> <td>1</td> <td>0</td> <td>2 Tbits</td> </tr> <tr> <td>1</td> <td>1</td> <td>3 Tbits</td> </tr> </table>	b5	b4		0	0	0 Tbit	0	1	1 Tbit	1	0	2 Tbits	1	1	3 Tbits

0	1	2 Tbits																											
0	1	3 Tbits																											
1	0	4 Tbits																											
1	0	5 Tbits																											
1	1	6 Tbits																											
1	1	7 Tbits																											

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Specify the appropriate values in this register.

#### IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.

0 Tbit to 3 Tbits can be set.

These bits are enabled only during response transmission; these are disabled during response reception.

#### IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.

0 Tbit to 7 Tbits can be set.

The response space setting is enabled only during response transmission; setting is disabled during response reception.

The inter-byte space (header) is equal to the response space.

### 22.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0B<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 22.33 RLN3nLWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.

1 Tbit to 16 Tbits can be set.

With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x),  $f_a$  is selected as the LIN system clock ( $f_{LIN}$ ) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

### 22.3.2.9 RLN3nLIE — LIN Interrupt Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 22.34 RLN3nLIE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SHIE	Successful Header Transmission Interrupt Request Enable 0: Disables successful header transmission interrupt request. 1: Enables successful header transmission interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Configure the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### SHIE Bit (Successful Header Transmission Interrupt Request Enable)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.

With 0 set, the interrupt request for RLIN3n transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

#### ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.

With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.

Occurrence factors are bit errors, physical bus errors, frame/response timeout errors, framing errors, checksum errors, and response preparation errors. Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

**FRCIE Bit (Successful Frame/Wake-up Reception Interrupt Request Enable)**

The FRCIE bit enables or disables an interrupt request upon successful reception of a frame or a wake-up signal (input signal low-level width count).

With 0 set, the interrupt request for RLIN3n successful reception is not generated when the FRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for successful RLIN3n reception is generated when the FRC flag in the RLN3nLST register is set to 1.

**FTCIE Bit (Successful Frame/Wake-up Transmission Interrupt Request Enable)**

The FTCIE bit enables or disables an interrupt request upon successful transmission of a frame or a wake-up signal.

With 0 set, the interrupt request for RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

### 22.3.2.10 RLN3nLEDE —LIN Error Detection Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0D<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LTES	—	—	—	FERE	FTERE	PBERE	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 22.35 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable* <sup>1</sup> 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable* <sup>1</sup> 0: Disables bit error detection. 1: Enables bit error detection.

Note 1. Set FERE bit and BERE bit to 1.

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.

With 0 set, the timeout function applies to frame timeout.

With 1 set, the timeout function applies to response timeout.

For details on the timeout error, see **Section 22.7.7, Error Statuses**.

#### FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

Set this bit to 1. The detection result of the framing error is indicated in the FER flag in the RLN3nLEST register.

For details on the framing error, see **Section 22.7.7, Error Statuses**.

**FTERE Bit (Timeout Error Detection Enable)**

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.

With 0 set, the frame timeout error or response timeout error is not detected.

With 1 set, the frame timeout error or response timeout error is detected.

When this bit is set to 1, the detection result is reflected in the FTER flag of the RLN3nLEST register.

With the LTES bit, either the frame timeout error or response timeout error can be selected.

Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.

For details on the timeout error, see **Section 22.7.7, Error Statuses**.

If RLIN3 transitions to LIN reset mode by clearing RLN3nLCUC.OM0 to 0 when the timeout function is used (RLN3nLEDE.FTERE = 1), users should take the procedure shown in **Figure 22.4, LIN Reset Sequence by Clearing RLN3nLCUC.OM0 to 0 When the Timeout Function is Used**.

**PBERE Bit (Physical Bus Error Detection Enable)**

The PBERE bit enables or disables detection of the physical bus error.

With 0 set, the physical bus error is not detected.

With 1 set, the physical bus error is detected.

When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register.

For details on the physical bus error, see **Section 22.7.7, Error Statuses**.

**BERE Bit (Bit Error Detection Enable)**

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

Set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register.

For details on the bit error, see **Section 22.7.7, Error Statuses**.

### 22.3.2.11 RLN3nLCUC — LIN Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0E<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 22.36 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode 1: LIN operation mode
0	OM0	LIN Reset 0: LIN reset mode 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01<sub>H</sub> to transition to LIN wake-up mode or to 03<sub>H</sub> to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN3nLCUC register to 03<sub>H</sub> after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

#### OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.

With 0 set, LIN wake-up mode.

With 1 set, LIN operation mode.

This bit is enabled only when the OMM0 bit in the RLN3nLMST register is 1.

Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

#### OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.

With 0 set, LIN reset mode.

With 1 set, LIN reset mode is canceled.

If RLIN3 transitions to LIN reset mode by clearing RLN3nLCUC.OM0 to 0 when the timeout function is used (RLN3nLEDE.FTERE = 1), users should take the procedure shown in **Figure 22.4, LIN Reset Sequence by Clearing RLN3nLCUC.OM0 to 0 When the Timeout Function is Used.**

### 22.3.2.12 RLN3nLTRC — LIN Transmission Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 10<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 22.37 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode.
0	FTS	Frame Transmission/Wake-up Transmission/Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission/reception is started.

#### RTS Bit (Response Transmission/Reception Start)

In frame separate mode, set the RTS bit to 1 after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 02<sub>H</sub> to the RLN3nLTRC register using the store instruction.

Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is stopped).

When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 at the end of data group communication or transition to LIN reset mode.

#### FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)

Set the FTS bit to 1 to start frame transmission and reception.

Also set this bit to 1 to allow wake-up transmission and reception (input signal low-level width count).

Only 1 can be written to this bit; 0 cannot be written.

Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

### 22.3.2.13 RLN3nLMST — LIN Mode Status Register

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RLIN3n\_base> + 11<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.38 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

#### OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

#### OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

### 22.3.2.14 RLN3nLST — LIN Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 12<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 22.39 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00<sub>H</sub> upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00<sub>H</sub>.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value it had before 1 is written.

The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for RLN3n transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

**D1RC Flag (Successful Data 1 Reception Flag)**

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value it had before 1 is written.

The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

**ERR Flag (Error Detection Flag)**

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register while in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

**FRC Flag (Successful Frame/Wake-up Reception Flag)**

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value it had before 1 is written.

The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for RLN3n successful reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

**FTC Flag (Successful Frame/Wake-up Transmission Flag)**

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value it had before 1 is written.

The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for RLN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

### 22.3.2.15 RLN3nLEST — LIN Error Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 13<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 22.40 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00<sub>H</sub> upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00<sub>H</sub>.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value it had before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

**CSER Flag (Checksum Error Flag)**

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value it had before 1 is written. The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

**FER Flag (Framing Error Flag)**

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value it had before 1 is written. When the value of the FER bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

**FTER Flag (Timeout Error Flag)**

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value it had before 1 is written. When the FTER bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), the FTER flag is set to 1 upon frame timeout error or response timeout error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

**PBER Flag (Physical Bus Error Flag)**

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value it had before 1 is written. When the PBER bit of the RLN3nLEDE register is 1 (physical bus error detection enabled), the PBER flag is set to 1 upon physical bus error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

**BER Flag (Bit Error Flag)**

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written. When the BER bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

### 22.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 14<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.41 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function																					
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)																					
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set.																					
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode																					
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission																					
3 to 0	RFDL[3:0]	Response Field Length Select <table border="0"> <tr> <td>b3</td> <td>b0</td> <td></td> </tr> <tr> <td>0 0 0 0</td> <td></td> <td>0 byte (+ checksum)</td> </tr> <tr> <td>0 0 0 1</td> <td></td> <td>1 byte (+ checksum)</td> </tr> <tr> <td>0 0 1 0</td> <td></td> <td>2 bytes (+ checksum)</td> </tr> <tr> <td></td> <td></td> <td>:</td> </tr> <tr> <td>0 1 1 1</td> <td></td> <td>7 bytes (+ checksum)</td> </tr> <tr> <td>1 0 0 0</td> <td></td> <td>8 bytes (+ checksum)</td> </tr> </table> Settings other than the above are prohibited.	b3	b0		0 0 0 0		0 byte (+ checksum)	0 0 0 1		1 byte (+ checksum)	0 0 1 0		2 bytes (+ checksum)			:	0 1 1 1		7 bytes (+ checksum)	1 0 0 0		8 bytes (+ checksum)
b3	b0																						
0 0 0 0		0 byte (+ checksum)																					
0 0 0 1		1 byte (+ checksum)																					
0 0 1 0		2 bytes (+ checksum)																					
		:																					
0 1 1 1		7 bytes (+ checksum)																					
1 0 0 0		8 bytes (+ checksum)																					

#### LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.

With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

### FSM Bit (Frame Separate Mode Select)

The FSM bit selects the response communication mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without setting the RTS bit in the RLN3nLTRC register.

With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0.

When transitioning to LIN self-test mode, set this bit to 0 before transition.

For details on frame separate mode, see **Section 22.7.4.1, Transmission of LIN Frames**.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

### CSM Bit (Checksum Select)

The CSM bit selects the checksum mode.

With 0 set, classic checksum mode is selected.

With 1 set, enhanced checksum mode is selected.

When the timeout error detection is enabled (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details, see **Section 22.7.7, Error Statuses**.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.

During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

### RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.

With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).

With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

### RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.

The data length can be 0 to 8 bytes excluding the checksum size.

To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the RTS bit in the RLN3nLTRC register is 0).

To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).

Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

### 22.3.2.17 RLN3nLIDB — LIN ID Buffer Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 15<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.42 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bits (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bits (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

In LIN self-test mode, this register operates as described below.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

#### IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.

Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

#### ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

### 22.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register

**Access:** This register is a read-only register that can be read in 8-bit units. In LIN self-test mode, this register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 16<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.43 RLN3nLCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Stores the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):  
The value transmitted can be read from the register. Read the value after transmission is completed.  
Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):  
The value received can be read from the register. Read the value after reception is completed.  
Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):  
After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):  
Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

### 22.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN3nLDBR1: <RLIN3n\_base> + 18<sub>H</sub>  
 RLN3nLDBR2: <RLIN3n\_base> + 19<sub>H</sub>  
 RLN3nLDBR3: <RLIN3n\_base> + 1A<sub>H</sub>  
 RLN3nLDBR4: <RLIN3n\_base> + 1B<sub>H</sub>  
 RLN3nLDBR5: <RLIN3n\_base> + 1C<sub>H</sub>  
 RLN3nLDBR6: <RLIN3n\_base> + 1D<sub>H</sub>  
 RLN3nLDBR7: <RLIN3n\_base> + 1E<sub>H</sub>  
 RLN3nLDBR8: <RLIN3n\_base> + 1F<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.44 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or reads the received data. Setting range: 00 <sub>H</sub> to FF <sub>H</sub>

- For response transmission:

These registers set the data to be transmitted in the response field.

Use these registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 0 (not frame separate mode)
- FTS in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped)

or

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is stopped)

- For response reception:

These registers store the data received in the response field.

The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.

Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started).

- For transmission of response data of 9 bytes or more:

Use these registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is stopped)

- For reception of response data of 9 bytes or more:

Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as described below.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

## 22.3.3 LIN Slave Related Registers

### 22.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 01<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 22.45 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 samplings 0 0 1 1: 4 samplings 0 1 1 1: 8 samplings 1 1 1 1: 16 samplings Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).

When the frame communication is performed in LIN slave mode (fixed baud rate) (LMD[1:0] bits in the RLN3nLMD register = 11<sub>B</sub>), set these bits to “0000<sub>B</sub>” or “1111<sub>B</sub>” (16 samplings).

When the frame communication is performed in LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10<sub>B</sub>), set these bits to “0011<sub>B</sub>” (4 samplings) or “0111<sub>B</sub>” (8 samplings).

**LPRS[2:0] Bits (Prescaler Clock Select)**

The LPRS bits select the frequency division ratio for the prescaler. The LIN communication clock source is divided by this prescaler.

In LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10<sub>B</sub>), set these bits so that the prescaler clock becomes as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4 MHz* <sup>1</sup>
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

**Note 1.** Use the clock with NSPB bits set to "0011<sub>B</sub>" (4 samplings).

### 22.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register

**Access:** RLN3nLBRP01 can be read or written in 16-bit units.

RLN3nLBRP0 can be read or written in 8-bit units.

RLN3nLBRP1 can be read or written in 8-bit units.

**Address:** RLN3nLBRP01: <RLIN3n\_base> + 02<sub>H</sub>

RLN3nLBRP0: <RLIN3n\_base> + 02<sub>H</sub>

RLN3nLBRP1: <RLIN3n\_base> + 03<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.46 RLN3nLBRP01 Register Contents

Bit Position	Bit Name	Function
15 to 0	BRP[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000 <sub>H</sub> to FFFF <sub>H</sub>

Configure the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units using registers RLN3nLBRP0 and RLN3nLBRP1.

#### NOTE

In LIN slave mode [auto baud rate], the system automatically sets the result of baud rate correction to the RLN3nLBRP01 register on successful reception of the sync field.

### 22.3.3.3 RLN3nLSTC — LIN Self-Test Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 04<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.47 RLN3nLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	—	Writing A7 <sub>H</sub> , 58 <sub>H</sub> , and 01 <sub>H</sub> successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Configure the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Writing A7<sub>H</sub>, 58<sub>H</sub>, and 01<sub>H</sub> successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the module is placed in LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return “000000<sub>B</sub>”, and bit 7 returns an undefined value.

#### LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For exiting LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of A7<sub>H</sub>, 58<sub>H</sub>, and 01<sub>H</sub>.

### 22.3.3.4 RLN3nLMD — LIN Mode Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 08<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 22.48 RLN3nLMD Register Contents

Bit Position	Bit Name	Function									
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.									
5	LRDNFS	LIN Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.									
4	LIOS	LIN Interrupt Output Select 0: RLIN3 interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are used.									
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.									
1, 0	LMD[1:0]	LIN/UART Mode Select <table border="0" style="margin-left: 20px;"> <tr> <td>b1</td> <td>b0</td> <td></td> </tr> <tr> <td>1</td> <td>0</td> <td>0: LIN Slave mode (auto baud rate)</td> </tr> <tr> <td>1</td> <td>1</td> <td>1: LIN Slave mode (fixed baud rate)</td> </tr> </table>	b1	b0		1	0	0: LIN Slave mode (auto baud rate)	1	1	1: LIN Slave mode (fixed baud rate)
b1	b0										
1	0	0: LIN Slave mode (auto baud rate)									
1	1	1: LIN Slave mode (fixed baud rate)									

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.

With 0 set, the noise filter is enabled when receiving data.

With 1 set, the noise filter is disabled when receiving data.

#### LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.

With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.

With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are generated from the LIN/UART interface.

For each interrupt source, see **Section 22.4, Interrupt Sources**.

#### LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.

To use this module as an LIN slave, set these bits to “10<sub>B</sub>” (auto baud rate) or “11<sub>B</sub>” (fixed baud rate).

### 22.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 09<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LBLT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.49 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LBLT	Reception Break (Low-Level) Detection Width Setting 0: A break (low-level) is detected in 9.5 or 10 Tbits 1: A break (low-level) is detected in 10.5 or 11 Tbits

Configure the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### LBLT Bit (Reception Break (Low-Level) Detection Width Setting)

- When RLN3nLMD.LMD is “10<sub>B</sub>” (LIN slave mode (auto baud rate))
  - 0: Low-level width of 10 Tbits or longer is detected.
  - 1: Low-level width of 11 Tbits or longer is detected.
- When RLN3nLMD.LMD is “11<sub>B</sub>” (LIN slave mode (fixed baud rate))
  - 0: Low-level width of 9.5 Tbits or longer is detected.
  - 1: Low-level width of 10.5 Tbits or longer is detected.

### 22.3.3.6 RLN3nLSC — LIN Space Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0A<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 22.50 RLN3nLSC Register Contents

Bit Position	Bit Name	Function																											
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.																											
5, 4	IBS[1:0]	Inter-Byte Space Select <table border="0"> <tr> <td>b5</td> <td>b4</td> <td></td> </tr> <tr> <td>0</td> <td>0</td> <td>0: 0 Tbit</td> </tr> <tr> <td>0</td> <td>1</td> <td>1: 1 Tbit</td> </tr> <tr> <td>1</td> <td>0</td> <td>2: 2 Tbits</td> </tr> <tr> <td>1</td> <td>1</td> <td>3: 3 Tbits</td> </tr> </table>	b5	b4		0	0	0: 0 Tbit	0	1	1: 1 Tbit	1	0	2: 2 Tbits	1	1	3: 3 Tbits

0	0	0: 0 Tbit																											
0	1	1: 1 Tbit																											
1	0	2: 2 Tbits																											
1	1	3: 3 Tbits																											
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.																											
2 to 0	IBHS[2:0]	Response Space Setting <table border="0"> <tr> <td>b2</td> <td>b0</td> <td></td> </tr> <tr> <td>0</td> <td>0</td> <td>0: 0 Tbit</td> </tr> <tr> <td>0</td> <td>0</td> <td>1: 1 Tbit</td> </tr> <tr> <td>0</td> <td>1</td> <td>0: 2 Tbits</td> </tr> <tr> <td>0</td> <td>1</td> <td>1: 3 Tbits</td> </tr> <tr> <td>1</td> <td>0</td> <td>0: 4 Tbits</td> </tr> <tr> <td>1</td> <td>0</td> <td>1: 5 Tbits</td> </tr> <tr> <td>1</td> <td>1</td> <td>0: 6 Tbits</td> </tr> <tr> <td>1</td> <td>1</td> <td>1: 7 Tbits</td> </tr> </table>	b2	b0		0	0	0: 0 Tbit	0	0	1: 1 Tbit	0	1	0: 2 Tbits	0	1	1: 3 Tbits	1	0	0: 4 Tbits	1	0	1: 5 Tbits	1	1	0: 6 Tbits	1	1	1: 7 Tbits
b2	b0																												
0	0	0: 0 Tbit																											
0	0	1: 1 Tbit																											
0	1	0: 2 Tbits																											
0	1	1: 3 Tbits																											
1	0	0: 4 Tbits																											
1	0	1: 5 Tbits																											
1	1	0: 6 Tbits																											
1	1	1: 7 Tbits																											

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

This register is enabled only during response transmission, and disabled during response reception.

Some combinations of the specified values result in a frame or response length exceeding the timeout time. Specify the appropriate values in this register.

#### IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the inter-byte space width of the response transmission.

0 Tbit to 3 Tbits can be set.

#### IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the transmission width of the response space.

0 Tbit to 7 Tbits can be set.

### 22.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0B<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 22.51 RLN3nLWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low-level width of the wake-up frame transmission.

1 Tbit to 16 Tbits can be set.

### 22.3.3.8 RLN3nLIE — LIN Interrupt Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 22.52 RLN3nLIE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SHIE	Successful Header Reception Interrupt Request Enable 0: Disables successful header reception interrupt request. 1: Enables successful header reception interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Response/Wake-up Reception Interrupt Request Enable 0: Disables successful Response/wake-up reception interrupt request. 1: Enables successful Response/wake-up reception interrupt request.
0	FTCIE	Successful Response/Wake-up Transmission Interrupt Request Enable 0: Disables successful Response/wake-up transmission interrupt request. 1: Enables successful Response/wake-up transmission interrupt request.

Configure the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### SHIE Bit (Successful Header Reception Interrupt Request Enable)

The SHIE bit enables or disables an interrupt request upon successful reception of a header.

With 0 set, the interrupt request for RLIN3n successful reception is not generated when the HTRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n successful reception is generated when the HTRC flag in the RLN3nLST register is set to 1.

#### ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.

With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.

Error types that are interrupt sources are the bit error, frame/response timeout error, framing error, sync filed error, ID parity error, checksum error, and response preparation error.

Detection of the bit error, frame/response timeout error, sync filed error, ID parity error, and framing error can be enabled or disabled using the RLN3nLEDE register.

**FRCIE Bit (Successful Response/Wake-up Reception Interrupt Request Enable)**

The FRCIE bit enables or disables an interrupt request upon successful reception of a response or a wake-up frame (input signal low-level width count).

With 0 set, the interrupt request for RLIN3n successful reception is not generated when the FRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n successful reception is generated when the FRC flag in the RLN3nLST register is set to 1.

**FTCIE Bit (Successful Response/Wake-up Transmission Interrupt Request Enable)**

The FTCIE bit enables or disables an interrupt request upon successful transmission of a response or a wake-up frame.

With 0 set, the interrupt request for RLIN3n successful transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for RLIN3n successful transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

### 22.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0D<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LTES	IPERE	—	SFERE	FERE	TERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W

Table 22.53 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6	IPERE	ID Parity Error Detection Enable 0: Disables ID Parity error detection. 1: Enables ID Parity error detection.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	SFERE	Sync Field Error Detection Enable 0: Disables Sync Field error detection. 1: Enables Sync Field error detection.
3	FERE	Framing Error Detection Enable* <sup>1</sup> 0: Disables framing error detection. 1: Enables framing error detection.
2	TERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BERE	Bit Error Detection Enable* <sup>1</sup> 0: Disables bit error detection. 1: Enables bit error detection.

Note 1. Set FERE bit and BERE bit to 1

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.

With 0 set, the timeout function applies to frame timeout.

With 1 set, the timeout function applies to response timeout.

For details on the timeout error, see **Section 22.7.7, Error Statuses**.

**IPERE Bit (ID Parity Error Detection Enable)**

This bit enables or disables detection of the ID parity error.

With 0 set, the ID parity error is not detected.

With 1 set, the ID parity error is detected.

When this bit is set to 1, the detection result is reflected in the IPER flag of the RLN3nLEST register.

For details on the ID parity error, see **Section 22.7.7, Error Statuses**.

**SFERE Bit (Sync Field Error Detection Enable)**

This bit enables or disables detection of the sync field error.

With 0 set, the sync field error is not detected.

With 1 set, the sync field error is detected.

Regardless of the setting of this bit, when a sync field error is detected, this module waits for the next header.

When this bit is set to 1, the detection result is reflected in the SFER flag of the RLN3nLEST register.

For details on the sync field error, see **Section 22.7.7, Error Statuses**.

**FERE Bit (Framing Error Detection Enable)**

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

Set this bit to 1. The detection result of the framing error is indicated in the FER flag in the RLN3nLEST register.

For details on the framing error, see **Section 22.7.7, Error Statuses**.

**TERE Bit (Timeout Error Detection Enable)**

The TERE bit enables or disables detection of the frame timeout error or the response timeout error.

With 0 set, the frame timeout error or response timeout error is not detected.

With 1 set, the frame timeout error or response timeout error is detected.

When this bit is set to 1, the detection result is reflected in the TER flag of the RLN3nLEST register.

With the LTES bit, either the frame timeout error or response timeout error can be selected.

The timeout error should not be used in LIN slave mode [auto baud rate] (when the LMD[1:0] bits in the RLN3nLMD register are "10<sub>B</sub>").

Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.

For details on the timeout error, see **Section 22.7.7, Error Statuses**.

If RLIN3 transitions to LIN reset mode by clearing RLN3nLCUC.OM0 to 0 when the timeout function is used (RLN3nLEDE.TERE = 1), users should take the procedure shown in **Figure 22.4, LIN Reset Sequence by Clearing RLN3nLCUC.OM0 to 0 When the Timeout Function is Used**.

**BERE Bit (Bit Error Detection Enable)**

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

Set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register.

For details on the bit error, see **Section 22.7.7, Error Statuses**.

### 22.3.3.10 RLN3nLCUC — LIN Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0E<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 22.54 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode 1: LIN operation mode
0	OM0	LIN Reset 0: LIN reset mode 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01<sub>H</sub> to transition to LIN wake-up mode or to 03<sub>H</sub> to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN3nLCUC register to 03<sub>H</sub> after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

#### OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific LIN operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.

With 0 set, LIN/UART interface enters LIN wake-up mode.

With 1 set, LIN/UART interface enters LIN operation mode.

This bit is enabled only when the OMM0 bit in the RLN3nLMST register is 1.

Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

#### OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.

With 0 set, LIN/UART interface enters LIN reset mode.

With 1 set, LIN reset mode of LIN/UART interface is canceled.

If RLIN3 transitions to LIN reset mode by clearing RLN3nLCUC.OM0 to 0 when the timeout function is used (RLN3nLEDE.TERE = 1), users should take the procedure shown in **Figure 22.4, LIN Reset Sequence by Clearing RLN3nLCUC.OM0 to 0 When the Timeout Function is Used.**

### 22.3.3.11 RLN3nLTRC — LIN Transmission Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 10<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	LNRR	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 22.55 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LNRR	No LIN Response Request 0: Response for the reception ID 1: No response for the reception ID
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped. 1: Response transmission/reception is started.
0	FTS	LIN Communication Start 0: Header reception/wake-up transmission/reception is stopped. 1: Header reception/wake-up transmission/reception is started.

#### LNRR Bit (No LIN Response Request)

Set this bit to 1 if no response is to be transmitted/received after receiving the header and checking the received ID. Once set, this bit is automatically cleared to 0 upon detection of new sync field or transition to LIN reset mode. Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 04<sub>H</sub> using the store instruction.

Do not set this bit and the RTS bit to 1 simultaneously.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is stopped).

When response data of 9 bytes or more is to be transmitted or received, use this bit only after the completion of the header. (Do not use this bit for the second or later data group.)

**RTS Bit (Response Transmission/Reception Start)**

Set this bit to 1 to start response transmission or reception after receiving the header and checking the received ID. Once set, this bit is automatically cleared to 0 upon completion of response transmission or reception (including error detection) or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 02<sub>H</sub> to the RLN3nLTRC register using the store instruction.

Do not set this bit and the LNRR bit to 1 simultaneously

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is stopped).

When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group transmission/reception or transition to LIN reset mode.

**FTS Bit (LIN Communication Start)**

Set this bit to 1 to start header reception or wake-up transmission/reception.

Only 1 can be written to this bit; 0 cannot be written.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

### 22.3.3.12 RLN3nLMST — LIN Mode Status Register

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RLIN3n\_base> +11<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.56 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

#### OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

#### OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

### 22.3.3.13 RLN3nLST — LIN Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 12<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 22.57 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Reception Flag 0: Header reception has not been completed. 1: Header reception has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	FRC	Successful Response/Wake-up Reception Flag 0: Response or wake-up reception has not been completed. 1: Response or wake-up reception has been completed.
0	FTC	Successful Response/Wake-up Transmission Flag 0: Response or wake-up transmission has not been completed. 1: Response or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00<sub>H</sub> upon transition to LIN reset mode.

In LIN reset mode, writing a value to this register is disabled. In LIN reset mode, the register retains 00<sub>H</sub>.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### HTRC Flag (Successful Header Reception Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value before 1 is written.

The HTRC flag is set to 1 upon completion of header reception. Here, an interrupt request for RLIN3n successful reception is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if header reception is completed while this bit is 1, an interrupt is not generated. To clear this bit to 0, write 0 to the bit.

To detect a new header in the response field upon completion of header reception, clear this bit after it is set to 1.

**D1RC Flag (Successful Data 1 Reception Flag)**

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value it had before 1 is written.

The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. Write 0 to clear this bit.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

**ERR Flag (Error Detection Flag)**

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLIN3nLEST register is set to 1). Here, an interrupt request for RLIN3n status is generated if the ERRIE bit in the RLIN3nLIE register is 1 (interrupt is enabled). However, if an error is detected while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the RPER, IPER, CSER, SFER, FER, TER, and BER flags in the RLIN3nLEST register. This clears the ERR flag to 0.

**FRC Flag (Successful Response/Wake-up Reception Flag)**

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value it had before 1 is written.

The FRC flag is set to 1 upon completion of response or wake-up reception. Here, an interrupt request for RLIN3n successful reception is generated if the FRCIE bit in the RLIN3nLIE register is 1 (interrupt is enabled). However, if response reception or wake-up reception is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

**FTC Flag (Successful Response/Wake-up Transmission Flag)**

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value it had before 1 is written.

The FTC flag is set to 1 upon completion of response or wake-up transmission. Here, an interrupt request for RLIN3n transmission is generated if the FTCIE bit in the RLIN3nLIE register is 1 (interrupt is enabled). However, if response transmission or wake-up transmission is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.

When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

### 22.3.3.14 RLN3nLEST — LIN Error Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 13<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	RPER	IPER	CSER	SFER	FER	TER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 22.58 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	IPER	ID Parity Error Flag 0: ID parity error has not been detected. 1: ID parity error has been detected.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	SFER	Sync Field Error Flag 0: Sync field error has not been detected. 1: Sync field error has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	TER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00<sub>H</sub> upon transition to LIN reset mode.

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00<sub>H</sub>.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value it had before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. Write 0 to clear this bit.

#### IPER Flag (ID Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

When the IPERE bit of the RLN3nLEDE register is 1 (ID parity error detection enabled), this bit is set to 1 upon ID parity error detection. Write 0 to clear this bit.

**CSER Flag (Checksum Error Flag)**

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value it had before 1 is written. The CSER flag is set to 1 upon checksum error detection. Write 0 to clear this bit.

**SFER Flag (Sync Field Error Flag)**

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written. When the SFERE bit of the RLN3nLEDE register is 1 (sync field error detection enabled), this bit is set to 1 upon sync field error detection. Write 0 to clear this bit.

**FER Flag (Framing Error Flag)**

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value it had before 1 is written. When the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. Write 0 to clear this bit.

**TER Flag (Timeout Error Flag)**

Only 0 can be written to the TER flag; when 1 is written, the bit retains the value it had before 1 is written. When the TERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), this flag is set to 1 upon frame timeout error or response timeout error detection. Write 0 to clear this bit.

**BER Flag (Bit Error Flag)**

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written. When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. Write 0 to clear this bit.

### 22.3.3.15 RLIN3nLDFC — LIN Data Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 14<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LSS	—	LCS	RCDS	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.59 RLIN3nLDFC Register Contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Data transmission/reception continues without waiting for reception of the next header.)
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LCS	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RCDS	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

#### LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

When multi-byte response transmission/reception function is not used, set it to “0”.

Set this bit when the RTS bit is 0 (response transmission/reception stopped).

### LCS Bit (Checksum Select)

The LCS bit selects the checksum mode.

With 0 set, classic checksum mode is selected.

With 1 set, enhanced checksum mode is selected.

When the timeout error detection is enabled (the TERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see **Section 22.7.7, Error Statuses**.

When the length of the response field data is 0 bytes (the RFDL bit is 0), do not set this bit to "1" (enhanced).

When response data of 9 bytes or more is to be transmitted or received, do not change the LCS bit setting after the first data group through the last data group.

During transmission or reception of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

Set this bit when the RTS bit is 0 (response transmission/reception stopped).

### RCDS Bit (Response Field Communication Direction Select)

This bit selects the direction of the response field/wake-up signal communication.

With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).

With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

Set this bit when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped) in LIN operation mode or when the FTS bit is 0 (header reception or wake-up transmission/reception stopped) in LIN wake-up mode).

When response data of 9 bytes or more is to be transmitted or received, do not change this bit setting after the first data group through the last data group.

### RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.

The data length can be 0 to 8 bytes excluding the checksum size.

Set these bits when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped).

When response data of 9 bytes or more is to be transmitted or received, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit in the RLN3nLDFC register is 1) include the checksum.

### 22.3.3.16 RLN3nLIDB — LIN ID Buffer Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 15<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.60 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7, 6	IDP[1:0]	Parity Setting Stores the parity bits (P0 and P1) received in the ID field.
5 to 0	ID[5:0]	ID Setting Stores the 6-bit ID value received in the ID field.

The value in the RLN3nLIDB register is enabled after the completion of header reception. In LIN mode (LIN operation mode, LIN wake-up mode), writing to this register is disabled.

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

#### IDP[1:0] Bits (Parity Setting)

The IDP bits store the parity bits (P0 and P1) received in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.

When the IPERE bit in the RLN3nLEDE register is 1 (ID parity detection enabled), the received value and the value calculated internally are compared. If they do not match, IPER (ID parity error flag) is set.

#### ID[5:0] Bits (ID Setting)

The ID bits store the 6-bit ID value received in the ID field of the LIN frame.

### 22.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register

**Access:** This register is a read-only register that can be read in 8-bit units.  
However, in LIN self-test mode, this register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 16<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.61 RLN3nLCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Stores the checksum value transmitted or received.

In LIN operation mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):  
The value transmitted can be read from the register. Read the value after transmission is completed.  
Writing to this register is invalid.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):  
The value received can be read from the register. Read the value after reception is completed.  
Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):  
After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):  
Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

### 22.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN3nLDBR1: <RLIN3n\_base> + 18<sub>H</sub>  
 RLN3nLDBR2: <RLIN3n\_base> + 19<sub>H</sub>  
 RLN3nLDBR3: <RLIN3n\_base> + 1A<sub>H</sub>  
 RLN3nLDBR4: <RLIN3n\_base> + 1B<sub>H</sub>  
 RLN3nLDBR5: <RLIN3n\_base> + 1C<sub>H</sub>  
 RLN3nLDBR6: <RLIN3n\_base> + 1D<sub>H</sub>  
 RLN3nLDBR7: <RLIN3n\_base> + 1E<sub>H</sub>  
 RLN3nLDBR8: <RLIN3n\_base> + 1F<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.62 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or holds the received data. Setting range: 00 <sub>H</sub> to FF <sub>H</sub>

- For response transmission:

The RLN3nLDBRb registers set the data to be transmitted in the response field.

These registers should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stop).

- For response reception:

The RLN3nLDBRb registers store the data received in the response field.

The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.

Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

## 22.3.4 UART Related Registers

### 22.3.4.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 01<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 22.63 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 samplings 0 1 0 1: 6 samplings 0 1 1 0: 7 samplings 0 1 1 1: 8 samplings 1 0 0 0: 9 samplings 1 0 0 1: 10 samplings 1 0 1 0: 11 samplings 1 0 1 1: 12 samplings 1 1 0 0: 13 samplings 1 1 0 1: 14 samplings 1 1 1 0: 15 samplings 1 1 1 1: 16 samplings Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate). In UART mode, it is possible to set the NSPB bits from 6 samplings to 16 samplings.

#### LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler. The LIN communication clock source is divided by this prescaler.

### 22.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register

**Access:** RLN3nLBRP01 register can be read or written in 16-bit units.

RLN3nLBRP0 register can be read or written in 8-bit units.

RLN3nLBRP1 register can be read or written in 8-bit units.

**Address:** RLN3nLBRP01: <RLIN3n\_base> + 02<sub>H</sub>

RLN3nLBRP0: <RLIN3n\_base> + 02<sub>H</sub>

RLN3nLBRP1: <RLIN3n\_base> + 03<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.64 RLN3nLBRP01 Register Contents

Bit Position	Bit Name	Function
15 to 0	BRP[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000 <sub>H</sub> to FFFF <sub>H</sub>

Configure the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units using the registers RLN3nLBRP0 and RLN3nLBRP1.

### 22.3.4.3 RLN3nLMD — UART Mode Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 08<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	—	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R/W	R/W

Table 22.65 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LRDNFS	UART Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 1: UART mode

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### LRDNFS Bit (UART Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.

With 0 set, the noise filter is enabled when receiving data.

With 1 set, the noise filter is disabled when receiving data.

#### LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.

To use the LIN/UART interface as an UART, set these bits to 01<sub>B</sub>.

### 22.3.4.4 RLN3nLBFC — UART Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 09<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	UTPS	URPS	UPS[1:0]		USBLS	UBOS	UBLS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.66 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	UTPS	UART Output Polarity Switch 0: Transmission data normal output 1: Transmission data with inverted output
5	URPS	UART Input Polarity Switch 0: Reception data normal output 1: Reception data with inverted output
4, 3	UPS[1:0]	UART Parity Select 00: Parity disabled 01: Even parity 10: 0 Parity 11: Odd parity
2	USBLS	UART Stop Bit length Select 0: Stop bit: 1 bit 1: Stop bit: 2 bits
1	UBOS	UART Transfer Format Order Select 0: LSB First 1: MSB First
0	UBLS	UART Character Length Select 0: UART 8 bits communication 1: UART 7 bits communication

Configure the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### UTPS Bit (UART Output Polarity Switch)

Sets the output polarity for UART communication.

With 0 set, transmit data is output without inversion.

With 1 set, inverted transmit data is output.

The setting of this bit is valid in all the bits of the UART frame.

In half-duplex communication, this setting should match the setting of URPS bit.

#### URPS Bit (UART Input Polarity Switch)

This bit specifies the input polarity for UART communication.

With 0 set, received data is input without inversion.

With 1 set, received data is input with inversion.

The setting of this bit is valid in all the bits of the UART frame.

In half-duplex communication, this setting should match the setting of UTPS bit.

When setting this bit to “1” and expansion bit reception ((with expansion bit comparison) or (with data comparison)) is performed, set the inverse of the expected value to the UEBDL bit in the RLN3nLUOR1 register and RLN3nLIDB register to enable comparison of the inverted values of the received values.

### UPS[1:0] Bits (UART Parity Select)

Sets the UART parity.

- When these bits are set to “00<sub>B</sub>”, data is communicated without the parity.

[Transmission]

A parity bit is not added to transmit data.

[Reception]

Data is received without parity processing. Therefore, a parity error does not occur.

- When these bits are set to “01<sub>B</sub>”, data is communicated with the even parity.

[Transmission]

If the number of 1s in transmit data is odd, “1” is added to the parity bit. If the number of 1s in transmit data is even, “0” is added to the parity bit.

[Reception]

If the number of 1s in receive data including the parity bit is odd, a parity error occurs.

- When these bits are set to “10<sub>B</sub>”, data is communicated with 0 parity.

[Transmission]

Regardless of the number of 1s in transmit data, “0” is added to the parity bit.

[Reception]

The value of the parity bit is not evaluated. Therefore, no parity error occurs.

- When these bits are set to “11<sub>B</sub>”, data is communicated with the odd parity.

[Transmission]

If the number of 1s in transmit data is odd, “0” is added to the parity bit. If the number of 1s in transmit data is even, “1” is added to the parity bit.

[Reception]

If the number of 1s in receive data including the parity bit is even, a parity error occurs.

### USBLS Bit (UART Stop Bit Length Select)

Sets the stop bit length of data for UART communication.

With 0 set, stop bit length of 1 bit is selected.

With 1 set, stop bit length of 2 bits is selected.

### UBOS Bit (UART Transfer Format Select)

Sets the bit order of data for UART communication.

With 0 set, LSB first is selected.

With 1 set, MSB first is selected.

**UBLS Bit (UART Character Length Select)**

Sets the character length of one frame for UART communication.

With 0 set, the character length is 8 bits.

With 1 set, the character length is 7 bits.

When the character length of one frame is 9 bits (the UEBE bit in the RLN3nLUOR1 register is 1), the setting of this bit is ignored.

**22.3.4.5 RLN3nLSC — UART Space Configuration Register**

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0A<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 22.67 RLN3nLSC Register Contents

Bit Position	Bit Name	Function															
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															
5, 4	IBS[1:0]	Inter-Byte Space Select <table border="0" style="margin-left: 20px;"> <tr> <td>b5</td> <td>b4</td> <td></td> </tr> <tr> <td>0</td> <td>0</td> <td>0: 0 Tbit</td> </tr> <tr> <td>0</td> <td>1</td> <td>1: 1 Tbit</td> </tr> <tr> <td>1</td> <td>0</td> <td>0: 2 Tbits</td> </tr> <tr> <td>1</td> <td>1</td> <td>1: 3 Tbits</td> </tr> </table>	b5	b4		0	0	0: 0 Tbit	0	1	1: 1 Tbit	1	0	0: 2 Tbits	1	1	1: 3 Tbits
b5	b4																
0	0	0: 0 Tbit															
0	1	1: 1 Tbit															
1	0	0: 2 Tbits															
1	1	1: 3 Tbits															
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

**IBS[1:0] Bits (Inter-Byte Space Select)**

The IBS bits set the width of the space between the UART frames when transmitting data from the UART buffer. 0 to 3 Tbits can be set.

Set IBS[1:0] bits to “00<sub>B</sub>” when UART buffer is not used.

When data is transferred from the UART transmission data register (RLN3nLUTDR) and the UART wait transmission data register (RLN3nLUWTD), the setting of these bits is ignored. Set these bits to “00<sub>B</sub>”.

### 22.3.4.6 RLN3nLEDE —UART Error Detection Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0D<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FERE	OERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R/W

Table 22.68 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	OERE	Overrun Error Detection Enable 0: Disables overrun error detection. 1: Enables overrun error detection.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

#### FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

When this bit is set to 1, the detection result is reflected in the FER flag of the RLN3nLEST register.

For details on the framing error, see **Section 22.8.5, Error Statuses**.

#### OERE Bit (Overrun Error Detection Enable)

This bit enables or disables detection of the overrun error.

With 0 set, the overrun error is not detected.

With 1 set, the overrun error is detected.

When this bit is set to 1, the detection result is reflected in the OER flag of the RLN3nLEST register.

For details on the overrun error, see **Section 22.8.5, Error Statuses**.

**BERE Bit (Bit Error Detection Enable)**

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

When this bit is set to 1, the detection result is reflected in the BER flag of the RLN3nLEST register.

In full-duplex communication, do not set this bit to “1”.

Do not set this register when the NSPB bits in the RLN3nLWBR register are 0101<sub>B</sub> (6 samplings) and the LRDNFS bit in the RLN3nLMD register is 0 (noise filtering is enabled).

For details on the bit error, see **Section 22.8.5, Error Statuses**.

**22.3.4.7 RLN3nLCUC — UART Control Register**

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 0E<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.69 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	OM0	LIN Reset 0: LIN reset mode 1: LIN reset mode is canceled.

After a value is written to this register, confirm that the value written is reflected in the RLN3nLMST register before writing another value.

**OM0 Bit (LIN Reset)**

The OM0 bit selects whether to transition to or exit LIN reset mode.

With 0 set, LIN reset mode.

With 1 set, LIN reset mode is canceled.

### 22.3.4.8 RLN3nLTRC — UART Transmission Control Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 10<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R

Table 22.70 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTS	UART Buffer Transmission Start 0: UART Buffer transmission is stopped. 1: UART Buffer transmission is started.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### RTS Bit (UART Buffer Transmission Start)

When transmitting data from the UART buffer, set this bit to “1”.

Only 1 can be written to this bit; 0 cannot be written.

Write to this bit when the UTOE bit in the RLN3nLUOER register is 1 (transmission enable) and the UTS bit in the RLN3nLST register is 0 (transmission is not in progress).

Once set, regardless of errors, this bit is automatically cleared to 0 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDLFC register. This bit is also automatically cleared to 0 upon transition to LIN reset mode.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

When writing 1 to this bit while the UTSW bit in the RLN3nLDLFC register is 1 (when UART buffer transmission is requested, the start of transmission is delayed until the reception of stop bit is completed), write only during the reception of stop bit.

### 22.3.4.9 RLN3nLMST — UART Mode Status Register

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RLIN3n\_base> + 11<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.71 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

#### OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

### 22.3.4.10 RLN3nLST — UART Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 12<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	URS	UTS	ERR	—	—	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.72 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	URS	Reception Status Flag 0: Reception is stopped. 1: Reception is started.
4	UTS	Transmission Status Flag 0: Transmission is stopped. 1: Transmission is started.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	FTC	Successful UART Buffer Transmission Flag 0: UART buffer transmission has not been completed. 1: UART buffer transmission has been completed.

The RLN3nLST register is automatically cleared to “00<sub>H</sub>” upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains “00<sub>H</sub>”. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

#### URS Flag (Reception Status Flag)

At the start of the reception, this flag is set to 1.

The reception is started under the following condition.

- When the start bit is detected

At the end of reception, this flag is cleared to 0. While reception is stopped, this flag retains 0.

The reception is ended under the following conditions.

- Sampling point of the first bit of the stop bits

**UTS Flag (Transmission Status Flag)**

At the start of the transmission, this flag is set to 1. During the transmission, this flag retains 1. The transmission is started under the following conditions.

- When transmission data is specified in the RLN3nLUTDR or RLN3nLUWTDR register
- When the RTS bit in the RLN3nLTRC register is set to 1

This flag is cleared to 0 at the completion of transmission. The transmission is ended under the following conditions.

- When transmission of data specified in the RLN3nLUTDR or RLN3nLUWTDR register is completed and next data is not specified
- When transmission from UART buffer is completed (when the RTS bit in the RLN3nLTRC register is cleared to 0)

**ERR Flag (Error Detection Flag)**

This flag is set to 1 upon detection of an error, detection of an expansion bit, or when ID's match (when at least one of the flags of the RLN3nLEST register is 1). Here, an interrupt request for RLIN3n status is generated. However, if an error or expansion bit is detected or ID's match while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register.

**FTC Flag (Successful UART Buffer Transmission Flag)**

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that it was before 1 was written. Regardless of errors, this bit is set to 1 upon completion of transmission of the number of data specified by the MDL bit in the RLN3nLDFC register from the UART buffer. Here, an interrupt request for RLIN3n transmission is generated. Write 0 to clear this flag.

### 22.3.4.11 RLN3nLEST — UART Error Status Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 13<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	UPER	IDMT	EXBT	FER	OER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 22.73 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	UPER	Parity Error Flag 0: Parity error has not been detected. 1: Parity error has been detected.
5	IDMT	ID Match Flag 0: The received data does not match the ID value. 1: The received data matches the ID value.
4	EXBT	Expansion Bit Detection Flag 0: Expansion bit has not been detected. 1: Expansion bit has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	OER	Overrun Error Flag 0: Overrun error has not been detected. 1: Overrun error has been detected.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00<sub>H</sub> upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to, and the value of 00<sub>H</sub> is retained. To clear certain bits in this register, write 0 to those bits, and write 1 to the bits not to be cleared by using the store instruction.

#### UPER Flag (Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.

This flag is set to 1 upon parity error detection. Write 0 to clear this flag.

**IDMT Flag (ID Match Flag)**

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

The IDMT flag is set to 1 when all the following conditions are met:

- The UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enabled)
- The UECD bit in the RLN3nLUOR1 register is 0 (expansion bit comparison enabled)
- The UEBDCE bit in the RLN3nLUOR1 register is 1 (expansion bit/data comparison enabled)
  - The received expansion bit and the value of the UEBDL bit of the RLN3nLUOR1 register match.
  - The 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register match.

Write 0 to clear this flag.

**EXBT Flag (Expansion Bit Detection Flag)**

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

When the UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enable), if the received expansion bit matches with the UEBDL bit in the RLN3nLUOR1 register, this flag is set to 1.

Write 0 to clear this flag.

**FER Flag (Framing Error Flag)**

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

The FER flag is set to 1 upon framing error detection while the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled). Write 0 to clear this flag.

**OER Flag (Overrun Error Flag)**

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

The OER flag is set to 1 upon overrun error detection while the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). Write 0 to clear this flag.

**BER Flag (Bit Error Flag)**

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.

The BER flag is set to 1 when the transmitted data and the data monitored by the receive pin do not match while the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled).

Write 0 to clear this flag.

### 22.3.4.12 RLN3nLDFC — UART Data Field Configuration Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 14<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	UTSW	—	MDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 22.74 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function																																	
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.																																	
5	UTSW	Transmission Start Wait 0: When UART buffer transmission is requested, transmission is started immediately. 1: When UART buffer transmission is requested, transmission is not started until reception of the stop bit is completed.																																	
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

1 0 0 1		9 data																																	

#### UTSW Bit (Transmission Start Wait)

This bit controls the transmission start timing of UART buffer.

With 0 set, transmission is started as soon as the start of UART buffer transmission is requested.

With 1 set, transmission is started after the completion of the stop bit reception.

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

This bit is enabled when the RTS bit in the RLN3nLTRC register is set to 1. In addition, writing a value to this bit is disabled when the RTS bit is 1 (UART buffer transmission started).

Set this bit to 1 only to switch from reception to transmission in half-duplex communication.

#### MDL[3:0] Bits (UART Buffer Data Length Select)

These bits specify the data length of the UART buffer.

Writing a value to these bits is disabled when the RTS bit in the RLN3nLTRC register is 1 (UART buffer transmission started).

### 22.3.4.13 RLN3nLIDB — UART ID Buffer Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 15<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Table 22.75 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7 to 0	ID[7:0]	Specifies the ID value that is referred in expansion bit data comparison

#### ID Bit (ID Bit)

When the UEBE bit in the RLN3nLUOR1 register is set to 1 (expansion bit enabled), the UECD bit is set to 0 (expansion bit comparison enabled), and the UEBDCE bit is set to 1 (data comparison after expansion bit is detected), set the value to be compared with the received data. Write to the RLN3nLIDB register when the URS bit in the RLN3nLST register is 0 (reception is stopped).

### 22.3.4.14 RLN3nLUDB0 — UART Data Buffer 0 Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 17<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	UDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.76 RLN3nLUDB0 Register Contents

Bit Position	Bit Name	Function
7 to 0	UDB[7:0]	Sets the data to be transmitted. Setting range: 00 <sub>H</sub> to FF <sub>H</sub>

If the data length selection corresponds to 9 data bytes (RLN3nLDFC.MDL bit is “0<sub>H</sub>” or “9<sub>H</sub>”) for multi-byte UART transmission, then the first data value for UART communication is present in this buffer.

Write to the RLN3nLUDB0 register when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

**Table 22.77, Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format**, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 22.8.1.2, UART Buffer Transmission, 22.8.1.2(1), UART Buffer Transmission**.

Table 22.77 Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format

	RLN3nLUDB0							
	b7	b6	b5	b4	b3	b2	b1	b0
7-bit; LSB first	—*1	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

8-bit; LSB first	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
8-bit; MSB first	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7

Note 1. In the case of 7-bit data length, write the value after reset.

### 22.3.4.15 RLN3nLDBRb — UART Data Buffer b Register (b = 1 to 8)

**Access:** This register can be read or written in 8-bit units.

**Address:** RLN3nLDBR1: <RLIN3n\_base> + 18<sub>H</sub>  
 RLN3nLDBR2: <RLIN3n\_base> + 19<sub>H</sub>  
 RLN3nLDBR3: <RLIN3n\_base> + 1A<sub>H</sub>  
 RLN3nLDBR4: <RLIN3n\_base> + 1B<sub>H</sub>  
 RLN3nLDBR5: <RLIN3n\_base> + 1C<sub>H</sub>  
 RLN3nLDBR6: <RLIN3n\_base> + 1D<sub>H</sub>  
 RLN3nLDBR7: <RLIN3n\_base> + 1E<sub>H</sub>  
 RLN3nLDBR8: <RLIN3n\_base> + 1F<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.78 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Specifies the data to be transmitted. Setting range: 00 <sub>H</sub> to FF <sub>H</sub>

These registers specify the data transmitted from the UART buffer.

Write to these registers when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

**Table 22.79, Bit Arrangement of the RLN3nLDBRb Register According to Each Communication Format**, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 22.8.1.2, UART Buffer Transmission, 22.8.1.2(1), UART Buffer Transmission**.

Table 22.79 Bit Arrangement of the RLN3nLDBRb Register According to Each Communication Format

	RLN3nLDBRb							
	b7	b6	b5	b4	b3	b2	b1	b0
7-bit; LSB first	—*1	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
7-bit; MSB first	—*1	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6

8-bit; MSB first	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7

Note 1. In the case of 7-bit data length, write the value after reset.

### 22.3.4.16 RLN3nLUOER — UART Operation Enable Register

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	UROE	UTOE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 22.80 RLN3nLUOER Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	UROE	Reception Enable 0: Disables reception. 1: Enables reception.
0	UTOE	Transmission Enable 0: Disables transmission. 1: Enables transmission.

The RLN3nLUOER register is automatically cleared to 00<sub>H</sub> upon transition to LIN reset mode.

In LIN reset mode, this register cannot be written to.

In LIN reset mode, the register retains 00<sub>H</sub>.

#### UROE Bit (Reception Enable)

The UROE bit enables or disables reception.

With 0 set, reception is disabled.

With 1 set, reception is enabled.

Do not clear this bit during reception. If the communication is suspended during reception, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to transition to the LIN reset mode. Note that transmission is also aborted.

Do not set this bit to 1 when data transmission from the UART buffer is in progress.

#### UTOE Bit (Transmission Enable)

The UTOE bit enables or disables transmission.

With 0 set, transmission is disabled.

With 1 set, transmission is enabled.

Do not clear this bit during transmission. If the communication is suspended during transmission, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to transition to the LIN reset mode. Note that reception is also aborted.

### 22.3.4.17 RLN3nLUOR1 — UART Option Register 1

**Access:** This register can be read or written in 8-bit units.

**Address:** <RLIN3n\_base> + 21<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	UECD	UTIGTS	UEBDCE	UEBDL	UEBE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 22.81 RLN3nLUOR1 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UECD	Expansion Bit Comparison Disable 0: Enables expansion bit comparison. 1: Disables expansion bit comparison.
3	UTIGTS	Transmission Interrupt Generation Timing Select 0: Transmission interrupt is generated at the start of transmission. 1: Transmission interrupt is generated at the completion of transmission.
2	UEBDCE	Expansion Bit Data Comparison Enable 0: Disables data comparison after an expansion bit is detected. 1: Enables data comparison after an expansion bit is detected.
1	UEBDL	Expansion Bit Detection Level Select 0: Selects expansion bit value 0 as the expansion bit detection level. 1: Selects expansion bit value 1 as the expansion bit detection level.
0	UEBE	Expansion Bit Enable 0: Disables expansion bit operation. 1: Enables expansion bit operation.

#### UECD Bit (Expansion Bit Comparison Disable)

The UECD bit enables or disables comparison between the received expansion bit and the UEBDL bit value when the UEBE bit is 1 (expansion bit operation is enabled).

With 0 set, comparison between the received expansion bit and the UEBDL bit value is enabled when the expansion bit is received.

With 1 set, comparison between the received expansion bit and the UEBDL bit value is disabled when the expansion bit is received.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Do not set this bit to 1 when the UART buffer is used.

Do not set this bit to 1 when the UEBDCE bit is 1 (expansion bit/data comparison enable).

**UTIGTS Bit (Transmission Interrupt Generation Timing Select)**

The UTIGTS bit selects the generation timing of the transmission interrupt.

With 0 set, the transmission interrupt is generated at the start of transmission.

With 1 set, the transmission interrupt is generated at the completion of transmission.

When transmission from the UART buffer is performed with 0 set, the transmission interrupt is generated only at the start of the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register).

When transmission from the UART buffer is performed with 1 set, the transmission interrupt is generated only at the completion of the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register).

**UEBDCE Bit (Expansion Bit Data Comparison Enable)**

After an expansion bit is detected, this bit enables or disables the comparison between the 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register.

With 0 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is disabled.

With 1 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is enabled.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Do not set this bit to 1 when the UEBE bit is 0 (expansion bit operation disabled).

Do not set this bit to 1 when the UECD bit is 1 (expansion bit comparison disabled).

Do not set this bit to 1 when the UART buffer is used.

**UEBDL Bit (Expansion Bit Detection Level Select)**

The UEBDL bit selects the level to be detected as the expansion bit when the UEBE bit is 1 (expansion bit operation is enabled) and the UECD bit is 0 (expansion bit comparison enabled).

With 0 set, expansion bit value 0 is the level to be detected as the expansion bit.

With 1 set, expansion bit value 1 is the level to be detected as the expansion bit.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Do not set this bit to 1 when the UART buffer is used.

**UEBE Bit (Expansion Bit Enable Bit)**

The UEBE bit enables or disables expansion bit operation.

With 0 set, expansion bit operation is disabled.

With 1 set, expansion bit operation is enabled.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0<sub>B</sub> (LIN reset mode).

Do not set this bit to 1 when the UART buffer is used.

### 22.3.4.18 RLN3nLUTDR — UART Transmission Data Register

**Access:** RLN3nLUTDR register can be read or written in 16-bit units.  
 RLN3nLUTDRL register can be read or written in 8-bit units.  
 RLN3nLUTDRH register can be read or written in 8-bit units.

**Address:** RLN3nLUTDR: <RLIN3n\_base> + 24<sub>H</sub>  
 RLN3nLUTDRL: <RLIN3n\_base> + 24<sub>H</sub>  
 RLN3nLUTDRH: <RLIN3n\_base> + 25<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	UTD[8:0]

R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.82 RLN3nLUTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	UTD[8:0]	Specifies the data to be transmitted. Setting range: 000 <sub>H</sub> to 1FF <sub>H</sub>

The RLN3nLUTDR register specifies the data to be transmitted from the transmission data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

This register can be accessed in 8 bits.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

Also, do not write data to this register when a transmission request is being generated due to write access to the RLN3nLUWTDR register.

When transmitting data continuously, do not set another piece of transmission data in this register before the generation of transmission interrupt.

The table below shows the bit arrangement according to the set communication format.

Table 22.83 Bit Arrangement of the RLN3nLUTDR Register According to Each Communication Format

	RLN3nLUTDR									
	b8	b7	b6	b5	b4	b3	b2	b1	b0

### 22.3.4.19 RLN3nLURDR — UART Reception Data Register

**Access:** RLN3nLURDR register is a read-only register that can be read in 16-bit units.  
 RLN3nLURDRL register is a read-only register that can be read in 8-bit units.  
 RLN3nLURDRH register is a read-only register that can be read in 8-bit units.

**Address:** RLN3nLURDR: <RLIN3n\_base> + 26<sub>H</sub>  
 RLN3nLURDRL: <RLIN3n\_base> + 26<sub>H</sub>  
 RLN3nLURDRH: <RLIN3n\_base> + 27<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	URD [8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 22.84 RLN3nLURDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned.
8 to 0	URD [8:0]	Store the received data

The RLN3nLURDR allows the reception data to be read from the receive data register.

When the UROE bit in the RLN3nLUOER register is 1, the received data is stored in this register and can be read out.

This register is updated upon reception of stop bit in the received data.

This register is also updated even when an error is caused by the parity or stop bit.

However, the value of this register is not updated if an overrun error occurs when the OERE bit of the RLN3nLEDE register is 1 (overrun detection enabled). The value of this register is updated even if an overrun error occurs when the OERE bit is 0 (overrun detection disabled).

Read this register upon occurrence of a reception error (overrun error, framing error, parity error) when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). If the next data is received without reading this register, an overrun error occurs.

This register can be accessed in 8-bit units.

However, when expansion bit is used (UEBE bit of the RLN3nLUOR1 register is 1 (expansion bit operation enabled), do not attempt 8-bit access.

The table below shows the bit arrangement according to the set communication format.

Table 22.85 Bit Arrangement of the RLN3nLURDR Register According to Each Communication Format

	RLN3nLURDR									
	b8	b7	b6	b5	b4	b3	b2	b1	b0

### 22.3.4.20 RLN3nLUWTDR — UART Wait Transmission Data Register

**Access:** RLN3nLUWTDR register can be read or written in 16-bit units.  
 RLN3nLUWTDRL register can be read or written in 8-bit units.  
 RLN3nLUWTDRLH register can be read or written in 8-bit units.

**Address:** RLN3nLUWTDR: <RLIN3n\_base> + 28<sub>H</sub>  
 RLN3nLUWTDRL: <RLIN3n\_base> + 28<sub>H</sub>  
 RLN3nLUWTDRLH: <RLIN3n\_base> + 29<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	UWTD[8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.86 RLN3nLUWTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	UWTD[8:0]	Sets the data to be transmitted from the wait transmit data register after waiting for the stop bit reception to be completed. Setting range: 000 <sub>H</sub> to 1FF <sub>H</sub>

The RLN3nLUWTDR register sets the data to be transmitted from the UART wait transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

Use this register only to switch from reception to transmission in half-duplex communication.

Also, write to this register only while the stop bit is being received.

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

When this register is read, the value of the RLN3nLUWTDRL register is actually read.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

The table below shows the bit arrangement according to the set communication format.

Table 22.87 Bit Arrangement of the RLN3nLUWTDR Register According to Each Communication Format

	RLN3nLUWTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

## 22.4 Interrupt Sources

The LIN/UART interface generates four types of interrupt requests.

- RLIN3n transmission interrupt
- RLIN3n successful reception interrupt
- RLIN3n status interrupt
- RLIN3n interrupt

Setting the LIOS bit in the RLN3nLMD register to 0 allows to perform logical OR operation on all of the interrupt sources, outputting the interrupt request from the RLIN3n interrupt.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, or RLIN3n status interrupt depending on the interrupt request.

**Table 22.88, Interrupt Sources** lists the sources for each interrupt.

Table 22.88 Interrupt Sources

		LIOS Bit in RLN3nLMD Register is 0	LIOS Bit in RLN3nLMD Register is 1*1		
		RLIN3n Interrupt	RLIN3n Transmission Interrupt	RLIN3n Successful Reception Interrupt	RLIN3n Status Interrupt
LIN mode	LIN master mode	<ul style="list-style-type: none"> <li>• Successful frame transmission</li> <li>• Successful frame reception</li> <li>• Successful wake-up transmission</li> <li>• Successful wake-up reception</li> <li>• Successful header transmission</li> <li>• Bit error</li> <li>• Physical bus error</li> <li>• Frame/response timeout error</li> <li>• Framing error</li> <li>• Checksum error</li> <li>• Response preparation error</li> </ul>	<ul style="list-style-type: none"> <li>• Successful frame transmission</li> <li>• Successful wake-up transmission</li> <li>• Successful header transmission</li> </ul>	<ul style="list-style-type: none"> <li>• Successful frame reception</li> <li>• Successful wake-up reception</li> </ul>	<ul style="list-style-type: none"> <li>• Bit error</li> <li>• Physical bus error</li> <li>• Frame/response timeout error</li> <li>• Framing error</li> <li>• Checksum error</li> <li>• Response preparation error</li> </ul>
	LIN slave mode	<ul style="list-style-type: none"> <li>• Successful response transmission</li> <li>• Successful response reception</li> <li>• Successful wake-up transmission</li> <li>• Successful wake-up reception</li> <li>• Successful header reception</li> <li>• Bit error</li> <li>• Frame/response timeout error</li> <li>• Framing error</li> <li>• Sync field error</li> <li>• Checksum error</li> <li>• ID parity error</li> <li>• Response preparation error</li> </ul>	<ul style="list-style-type: none"> <li>• Successful response transmission</li> <li>• Successful wake-up transmission</li> </ul>	<ul style="list-style-type: none"> <li>• Successful response reception</li> <li>• Successful wake-up reception</li> <li>• Successful header reception</li> </ul>	<ul style="list-style-type: none"> <li>• Bit error</li> <li>• Frame/response timeout error</li> <li>• Framing error</li> <li>• Sync field error</li> <li>• Checksum error</li> <li>• ID parity error</li> <li>• Response preparation error</li> </ul>
UART mode		—	<ul style="list-style-type: none"> <li>• Transmission start/successful transmission</li> </ul>	<ul style="list-style-type: none"> <li>• Successful reception</li> <li>• Expansion bit mismatch</li> </ul>	<ul style="list-style-type: none"> <li>• Bit error</li> <li>• Overrun error</li> <li>• Framing error</li> <li>• Expansion bit match</li> <li>• ID match</li> <li>• Parity error</li> </ul>

Note 1. The LIOS bit setting is valid in LIN Mode. In UART mode, setting the LIOS bit is not required.

In LIN mode, each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is set to 1.

## 22.5 Modes

The LIN/UART interface provides the following four modes, depending on the specific function to be performed:

- LIN reset mode
- LIN mode
  - LIN master mode
  - LIN slave mode [auto baud rate]
  - LIN slave mode [fixed baud rate]
- UART mode
- LIN self-test mode

**Figure 22.2, Mode Transitions** shows mode transitions. **Table 22.89, Transition Condition of Each Mode** describes mode transition conditions. **Table 22.90, Operations Available in Each Mode** lists operations available in each mode.

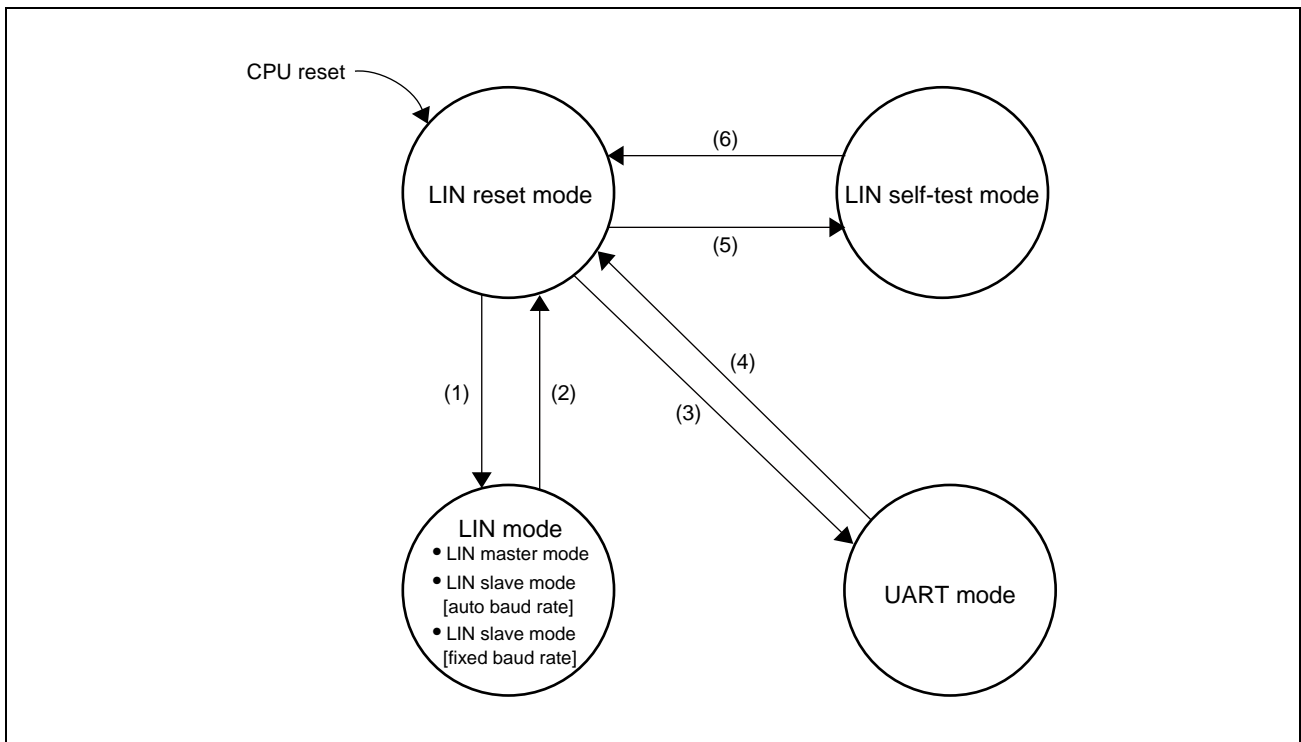

Figure 22.2 Mode Transitions

Table 22.89 Transition Condition of Each Mode

Mode Transition		Transition Condition
(1)	LIN reset mode → LIN mode	<ul style="list-style-type: none"> <li>• LIN master mode               <ul style="list-style-type: none"> <li>• LMD bits in RLN3nLMD register = 00<sub>B</sub> and OM1 and OM0 bits in RLN3nLCUC register = 01<sub>B</sub> or 11<sub>B</sub></li> </ul> </li> <li>• LIN slave mode [auto baud rate]               <ul style="list-style-type: none"> <li>• LMD bits in RLN3nLMD register = 10<sub>B</sub> and OM1 and OM0 bits in RLN3nLCUC register = 01<sub>B</sub> or 11<sub>B</sub></li> </ul> </li> <li>• LIN slave mode [fixed baud rate]               <ul style="list-style-type: none"> <li>• LMD bits in RLN3nLMD register = 11<sub>B</sub> and OM1 and OM0 bits of RLN3nLCUC register = 01<sub>B</sub> or 11<sub>B</sub></li> </ul> </li> </ul>
(2)	LIN mode → LIN reset mode	OM0 bit in RLN3nLCUC register = 0 <sub>B</sub>
(3)	LIN reset mode → UART mode	LMD bits in RLN3nLMD register = 01 <sub>B</sub> and OM0 bit in RLN3nLCUC register = 1 <sub>B</sub>
(4)	UART mode → LIN reset mode	OM0 bit in RLN3nLCUC register = 0 <sub>B</sub>
(5)	LIN reset mode → LIN self-test mode	See <b>Section 22.9, LIN Self-Test Mode.</b>
(6)	LIN self-test mode → LIN reset mode	See <b>Section 22.9, LIN Self-Test Mode.</b>

Table 22.90 Operations Available in Each Mode

LIN Mode		UART Mode	LIN Self-Test Mode
LIN Master Mode	LIN Slave Mode [auto baud rate] LIN Slave Mode [fixed baud rate]		
Header transmission Response transmission Response reception Wake-up transmission Wake-up reception Error detection	Header reception Response transmission Response reception Wake-up transmission Wake-up reception Error detection	UART transmission UART reception Error detection	Self-test

Whether mode has transitioned to LIN reset mode, the LIN mode, or the UART mode can be verified by reading the LMD bits in the RLN3nLMD register and the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode.**

## 22.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The transition to LIN reset mode can be verified by checking that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication and the UART communication functions are halted.

From LIN reset mode, transitions to LIN mode, UART mode, and LIN self-test mode can be made.

When the mode transitions to LIN reset mode, the following registers are initialized to their reset values and they retain their initial values while in LIN reset mode:

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRb register (b = 1 to 8)
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

## 22.7 LIN Mode

LIN mode can operate in the following submodes: LIN master mode, LIN slave mode [auto baud rate], and LIN slave mode [fixed baud rate].

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00<sub>B</sub> (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01<sub>B</sub> or 11<sub>B</sub> causes the transition to LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01<sub>B</sub> to 11<sub>B</sub>.

In LIN slave mode [auto baud rate] and LIN slave mode [fixed baud rate], header reception, response transmission, response reception, wake-up transmission, wake-up reception, and error detection can be performed.

The LIN slave mode [auto baud rate] allows automatic detection of the break field and the sync field, and sets a baud rate based on the results of measurement of a sync field. The baud rate can be set to 1 kbps to 20 kbps.

Set the LPRS[2:0] bits in the RLN3nLWBR register so that the prescaler clock (the clock obtained by dividing the frequency of the LIN communication clock source by the prescaler) is configured as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4 MHz* <sup>1</sup>
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

**Note 1.** Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to “0011<sub>B</sub>” (4 samplings).

LIN slave mode [fixed baud rate] allows automatic detection of the break field, the sync field, and the ID field at a baud rate that is preset by the baud rate generator.

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 10<sub>B</sub> (LIN slave mode [auto baud rate]) and setting the OM1 and OM0 bits in the RLN3nLCUC register to 01<sub>B</sub> or 11<sub>B</sub> causes the transition to LIN slave mode [auto baud rate]; and setting the LMD bits in the RLN3nLMD register to 11<sub>B</sub> (LIN slave mode [fixed baud rate]), and setting the OM1 and OM0 bits in the RLN3nLCUC register to 01<sub>B</sub> or 11<sub>B</sub> causes the transition to LIN slave mode [fixed baud rate], turning the OMM1 and OMM0 bits in the RLN3nLMST register to 01<sub>B</sub> or 11<sub>B</sub>.

When transitioning from one submode to another submode within LIN mode, transition to LIN reset mode first and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operating modes:

- LIN operation mode
- LIN wake-up mode

**Figure 22.3, Transition of Operating Modes** shows the transition of operating modes. **Table 22.91, Transition Conditions for Operating Modes** describes the transition conditions of operating modes.

Figure 22.3 Transition of Operating Modes

Table 22.91 Transition Conditions for Operating Modes

Operation Mode Transition	Transition Condition
(1) LIN reset mode → LIN mode • LIN operation mode	LMD bits in RLIN3nLMD register = 00 <sub>B</sub> or 10 <sub>B</sub> or 11 <sub>B</sub> and OM1 and OM0 bits in RLIN3nLCUC register = 11 <sub>B</sub>
(2) LIN reset mode → LIN mode • LIN wake-up mode	LMD bits in RLIN3nLMD register = 00 <sub>B</sub> or 10 <sub>B</sub> or 11 <sub>B</sub> and OM1 and OM0 bits in RLIN3nLCUC register = 01 <sub>B</sub>
(3)* <sup>2</sup> LIN mode → LIN reset mode • LIN operation mode • LIN wake-up mode	OM0 bit in RLIN3nLCUC register = 0 <sub>B</sub>
(4)* <sup>1</sup> LIN mode → LIN mode • LIN operation mode • LIN wake-up mode	OM1 and OM0 bits in RLIN3nLCUC register = 01 <sub>B</sub>
(5)* <sup>1</sup> LIN mode → LIN mode • LIN wake-up mode • LIN operation mode	OM1 and OM0 bits in RLIN3nLCUC register = 11 <sub>B</sub>

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is in progress (when the FTS bit in the RLIN3nLTRC register is 1).

Note 2. In LIN mode, if RLIN3 transitions to LIN reset mode by clearing RLIN3nLCUC.OM0 to 0 when the timeout function is used (RLIN3nLEDE.FTERE = 1 or RLIN3nLEDE.TERE = 1), users should take the procedure shown in **Figure 22.4, LIN Reset Sequence by Clearing RLIN3nLCUC.OM0 to 0 When the Timeout Function is Used**. The procedure is to protect a RLIN3 error interrupt and clear a RLIN3 error interrupt request.

Figure 22.4 LIN Reset Sequence by Clearing RLIN3nLCUC.OM0 to 0 When the Timeout Function is Used

**(1) LIN Operation Mode**

While in LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11<sub>B</sub> switches the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11<sub>B</sub>. Communication settings should be configured after the OMM1 and OMM0 bits have become 11<sub>B</sub>.

**(2) LIN Wake-up Mode**

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01<sub>B</sub> switches the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01<sub>B</sub>. Communication settings should be configured after the OMM1 and OMM0 bits have become 01<sub>B</sub>.

## 22.7.1 LIN Master Mode

### 22.7.1.1 Header Transmission

**Figure 22.5, Operation in Header Transmission** shows the operation of the LIN/UART interface (LIN master mode) in header transmission. **Table 22.92, Processing in Header Transmission** provides processing in header transmission.

Figure 22.5 Operation in Header Transmission

Table 22.92 Processing in Header Transmission

Software Processing	LIN/UART Interface Processing
(1) <ul style="list-style-type: none"> <li>• Sets a baud rate</li> <li>• Sets noise filter ON/OFF</li> <li>• Enables interrupt</li> <li>• Enables error detection</li> <li>• Sets frame configuration parameters</li> <li>• Transitions to LIN master mode: LIN operation mode</li> <li>• Configures frame information to be transmitted (ID, parity, data length, response direction, Checksum method, and transmission data)</li> </ul>	Waits for the FTS bit in the RLN3nLTRC register to be set by software (idle)
(2) Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3) Waits for an interrupt request	Transmits a break delimiter.
(4)	Transmits a sync field (55 <sub>H</sub> ).
(5)	Transmits an inter-byte space (header).
(6)	Transmits an ID field.
(7)	Sets the successful header transmission flag.

#### NOTE

For information about error detection conditions, see **Section 22.7.7, Error Statuses**.

### 22.7.1.2 Response Transmission

**Figure 22.6, Operation in Response Transmission** shows the operation of the LIN/UART interface (LIN master mode) in response transmission.

**Table 22.93, Processing in Response Transmission** provides processing in response transmission.

(6) <ul style="list-style-type: none"> <li>Processing after communication</li> <li>Reads the received data.</li> <li>Checks the RLN3nLST register, and clears flags.</li> </ul>	Idle

#### NOTE

For information about error detection, see **Section 22.7.7, Error Statuses**.

## 22.7.2 LIN Slave Mode

### 22.7.2.1 Header Reception

**Figure 22.8, Operation in Header Reception** shows the operation of the LIN/UART interface (LIN slave mode) in header reception. **Table 22.95, Processing in Header Reception** provides processing in header reception.

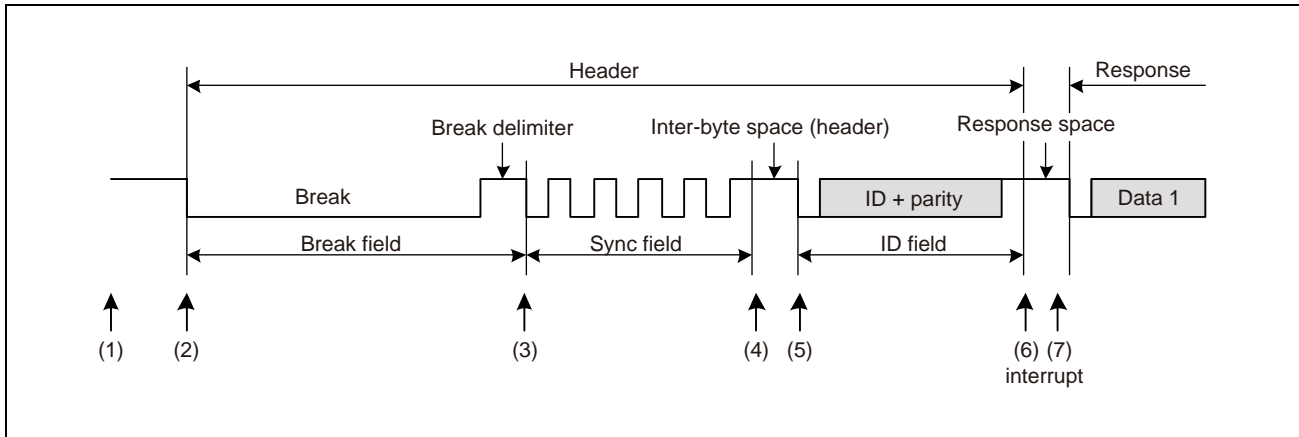

Figure 22.8 Operation in Header Reception

Table 22.95 Processing in Header Reception

Software Processing	LIN/UART Interface Processing
(1) <ul style="list-style-type: none"> <li>• Sets a baud rate</li> <li>• Sets noise filter ON/OFF</li> <li>• Enables interrupt</li> <li>• Enables error detection</li> <li>• Sets frame configuration parameters</li> <li>• Transitions to the LIN slave mode: LIN operation mode</li> <li>• Sets the FTS bit in the RLIN3nLTRC register to 1 (header reception or wake-up transmission/reception started)</li> </ul>	Waits for the FTS bit in the RLIN3nLTRC register to be set by software.
(2) Waits for an interrupt request.	Waits for detection of break field
(3)	Detects a break field (LIN slave mode [fixed baud rate]. For details about the break field detection timing in the case of LIN slave mode [auto baud rate], see [Auto Baud Rate Correction Function].)
(4)	<ul style="list-style-type: none"> <li>• Detects a sync field (55<sub>H</sub>)</li> <li>• Sets the baud rate generator (in the case of LIN slave mode [auto baud rate])</li> <li>• Clears the no-response request bit (LNRR bit).</li> </ul>
(5)	<ul style="list-style-type: none"> <li>• Receives an ID field.</li> <li>• Checks the ID parity bit</li> </ul>
(6)	Sets the header reception complete flag.
(7) <ul style="list-style-type: none"> <li>• Checks the RLIN3nLST register, and clears flags.</li> <li>• Checks the RLIN3nLIDB register, and prepares a response.</li> </ul>	<ul style="list-style-type: none"> <li>• Completes a header reception process.</li> <li>• Waits for a response request.</li> </ul>

**NOTE**

The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred. For information about error detection conditions, see **Section 22.7.7, Error Statuses**.

**[Auto Baud Rate Correction Function]**

In LIN slave mode [auto baud rate], the system always measures the low-level widths that are received. If the first “Low level” width is 10 times (if the BLT bit of the RLN3nLBFC register is “0”) or 11 times (if the BLT bit of the RLN3nLBFC register is “1”) or greater than the bit width calculated from the average of the starting 2 bits (the period of the consecutive falling edges from the beginning of the sync field) of the sync field, the system concludes that the detection of break field was successful and verifies that the data in the sync field is 55<sub>H</sub>. If the data in the sync field is indeed 55<sub>H</sub> and the system determines that sync field reception was successful, the system automatically sets the baud rate correction result to the RLN3nLBRP01 register.

If data is received up to the ID field without error, a successful header reception interrupt is generated at the stop bit position.

On the other hand, if the data in the sync field is not 55<sub>H</sub> and the system determines that sync field reception failed, the system sets the sync field error flag and an error interrupt is generated. In that case, baud rate correction is not performed and the LIN/UART interface waits for the detection of the next break field (low level).

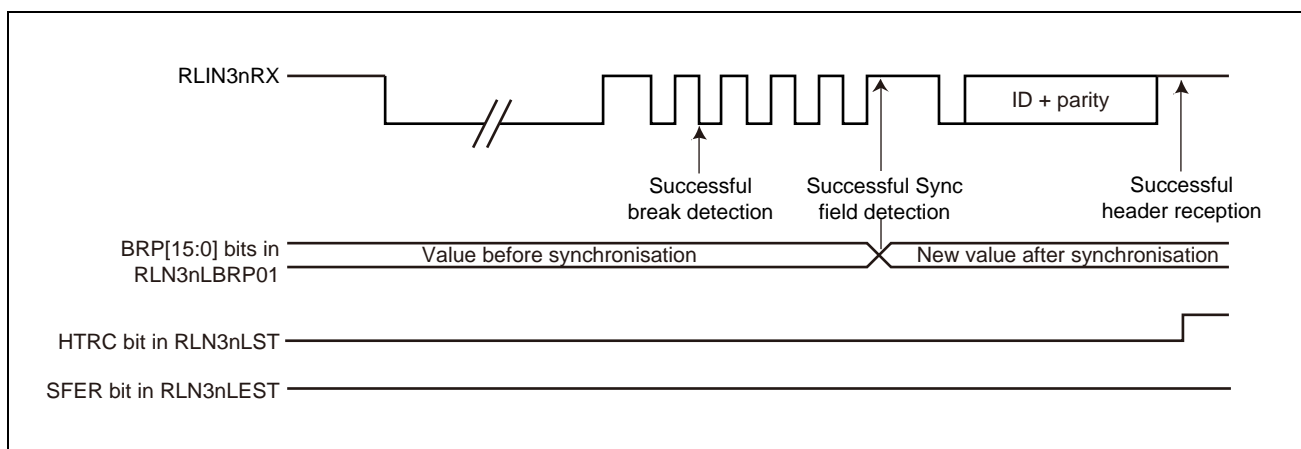

Figure 22.9 Header Reception in LIN Slave Mode [Auto Baud Rate] (in Normal Operation)

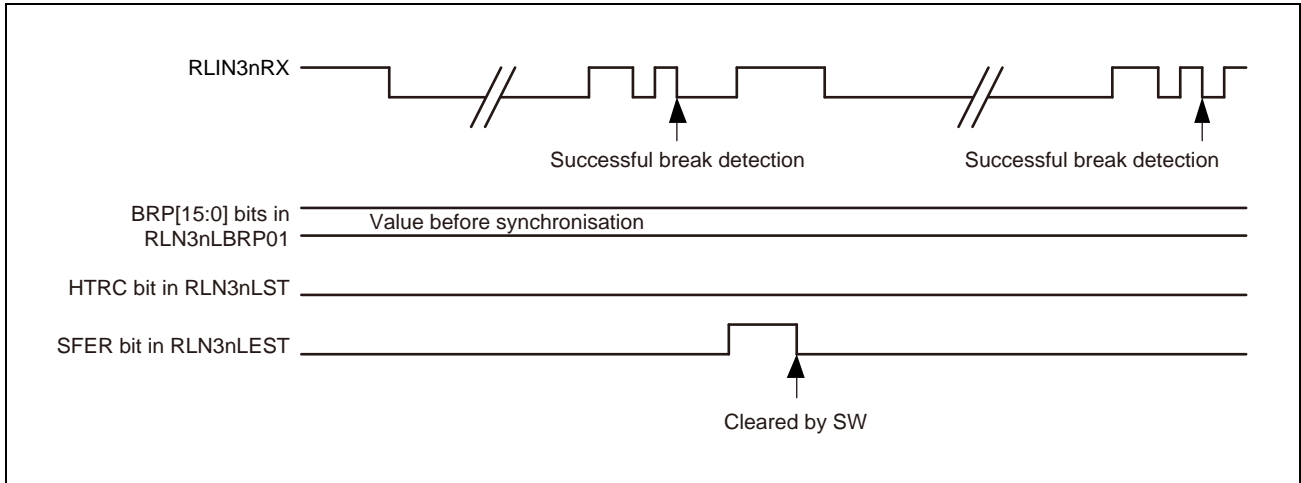

Figure 22.10 Header Reception in LIN Slave Mode [Auto Baud Rate] (Sync Field Error)

### 22.7.2.2 Response Transmission

**Figure 22.11, Operation in Response Transmission** shows the operation of the LIN/UART interface (LIN slave mode) in response transmission. **Table 22.96, Processing in Response Transmission** provides processing in response transmission.

Figure 22.11 Operation in Response Transmission

(5)	<ul style="list-style-type: none"> <li>• Determines the checksum.</li> <li>• Sets the successful response/wake-up reception flag or error flag.</li> <li>• Sets the RTS bit in the RL3nLTRC register to 0 (response transmission/reception stopped).</li> </ul>
(6) <ul style="list-style-type: none"> <li>• Processing after communication</li> <li>• Reads the received data.</li> <li>• Checks the RL3nLST register, and clears flags.</li> </ul>	<ul style="list-style-type: none"> <li>• Completes the response process.</li> <li>• Waits for a new break.</li> </ul>

#### NOTE

- For information about error detection conditions, see **Section 22.7.7, Error Statuses**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred.

### 22.7.2.4 No-response Request

**Figure 22.13, Operation when No Response is Requested** shows the operation of the LIN/UART interface (LIN slave mode) when no response is requested. **Table 22.98, Processing when No Response is Requested** shows the processing that occurs when no response is requested.

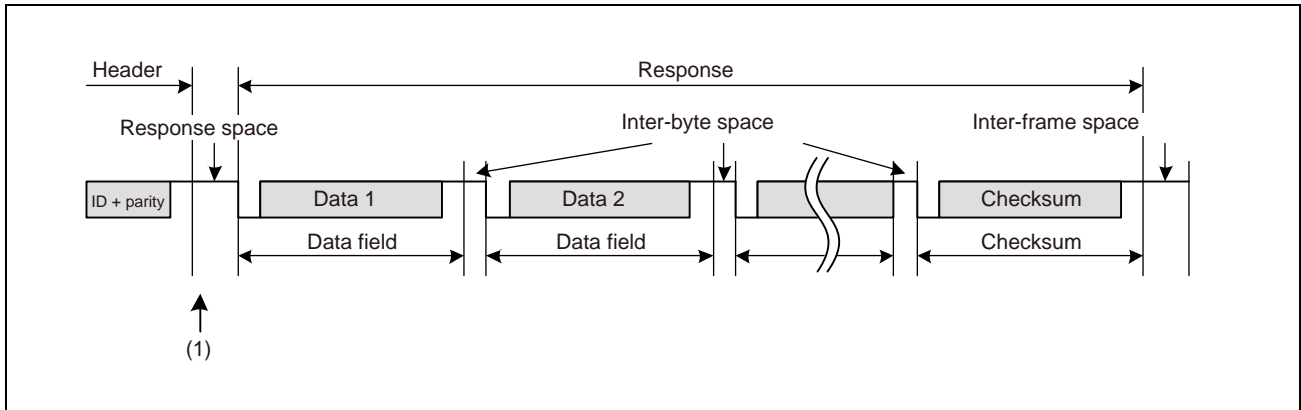

Figure 22.13 Operation when No Response is Requested

Table 22.98 Processing when No Response is Requested

Software Processing	LIN/UART Interface Processing
(1)	<ul style="list-style-type: none"> <li>• Waits for the LNRR (no-response request) bit to be set by software</li> <li>• Completes the frame reception process</li> </ul>
<ul style="list-style-type: none"> <li>• Sets the no-response request bit (LNRR bit) to 1.</li> </ul>	<ul style="list-style-type: none"> <li>• Waits for a new break</li> </ul>

### 22.7.3 Data Transmission/Reception

#### 22.7.3.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag of the RLIN3nLEST register (see **Section 22.7.7, Error Statuses**).

In LIN master mode and LIN slave mode [fixed baud rate], 1 Tbit is generated to be  $16f_{LIN}$ , and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

In LIN slave mode [auto baud rate], if 1 Tbit is generated to be  $4f_{LIN}$ , the sampling point for received data is at the third clock cycle (75% position). If 1 Tbit is generated to be  $8f_{LIN}$ , the sampling point for received data is at the 7th clock cycle (87.5% position).

**Figure 22.14, Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])** shows an example of data transmission timing.

Figure 22.14 Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

### 22.7.3.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN/UART interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLIN3nLMD register is 0, the LIN/UART interface uses a noise filter, and the value determined by a 3-sampling majority rule on prescaler clocks is used as the sampling value. If the LRDNFS bit in the RLIN3nLMD register is 1, the LIN/UART interface does not use a noise filter, and the value of the synchronized RLIN3nRX value at the sampling position is used as the sampling value.

**Figure 22.15, Example of Data Reception Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])** shows an example of data reception timing.

Figure 22.15 Example of Data Reception Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

## 22.7.4 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN/UART interface transmits or receives data continuously.

### 22.7.4.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data regions 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data regions 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

**Figure 22.16, LIN Transmission Processing and Corresponding Buffers** shows the LIN transmission processing and the corresponding buffers.

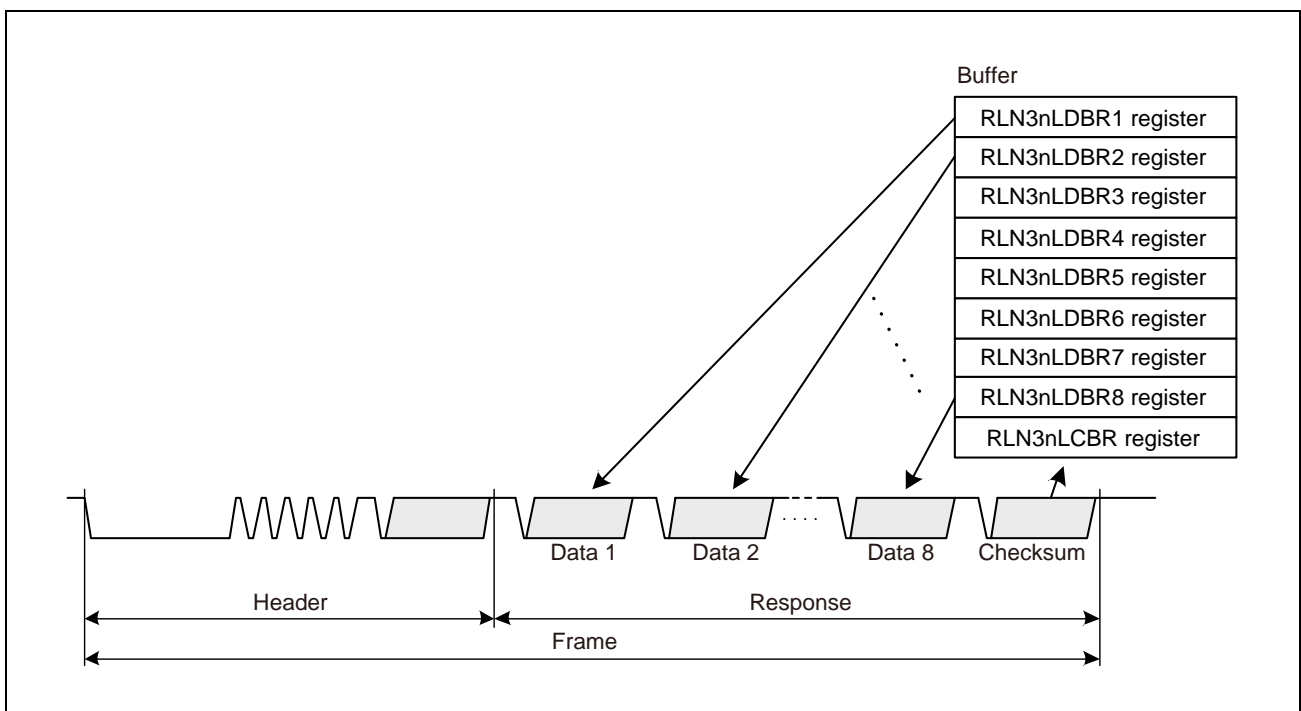

Figure 22.16 LIN Transmission Processing and Corresponding Buffers

#### [Frame Separate Mode]

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, the header and response are separately transmitted when prompted by respective transmission start requests.

When the transmission of the header is completed, the HTRC flag in the RLN3nLST register is set to 1 (successful header transmission).

Use frame separate mode when transmitting or receiving response data of 9 bytes or greater in LIN master mode.

### 22.7.4.2 Reception of LIN Frames

For an 8-byte reception, the contents of data regions 1 to 8 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data regions 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

**Figure 22.17, LIN Reception Processing and Corresponding Buffers** depicts the LIN reception processing and the corresponding buffers.

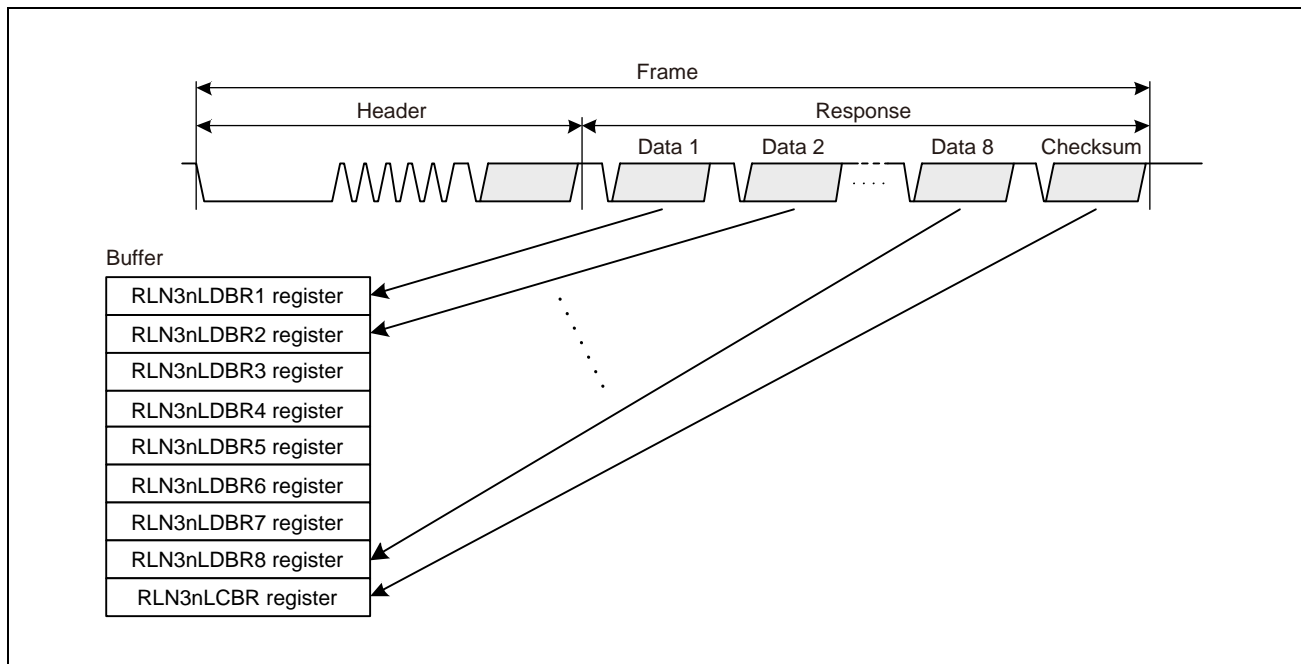

Figure 22.17 LIN Reception Processing and Corresponding Buffers

#### [Reception of Data 1]

When the reception of the first byte of data is completed, the D1RC flag in the RLN3nLST register is set to 1 (successful data 1 reception).

### 22.7.4.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses of 10 bytes or greater can also be transmitted and received.

In such case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be transmitted or received is not the final data group) in the first data group (variable from 0 to 8 bytes) before transmitting or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit in the RLN3nLDFC register should be set to 0 (indicating that the next data group to be transmitted or received is the final data group) before transmitting or receiving the data group, and a checksum should be appended to the final data group.

By changing the RFDL bit setting in RLN3nLDFC register when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register to 1 (frame separate mode).

#### NOTE

---

In LIN slave mode, the LIN/UART interface can detect a new break field during the transmission or reception of a response.

---

## 22.7.5 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

### 22.7.5.1 Wake-up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN3nLDFC register to 1 (LIN master mode: response transmission), or setting the RCDS bit in the RLN3nLDFC register to 1 (LIN slave mode: response transmission), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission, header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal is set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register in LIN master mode is 1 (LIN2.x), the LIN system clock ( $f_{LIN}$ ) becomes low level width at  $f_a$  regardless of the setting of the LCKS bit of the RLN3nLMD register. By setting the WUTL[3:0] bits of the RLN3nLWUP register to 0100<sub>B</sub> (5 Tbits), 260  $\mu$ s low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low-level width is output without any bit error, the FTC flag in the RLN3nLST register is set to 1 (successful frame response or wake-up transmission) and when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wake-up transmission interrupt enabled), an interrupt request for RLIN3n transmission is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is aborted and the BER flag of the RLN3nLEST register is set to 1 (bit error detected).

When RLN3nLEDE.PBERE is set in LIN master mode, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

**Figure 22.18, Wake-up Transmission Timing** shows the wake-up transmission timing.

Figure 22.18 Wake-up Transmission Timing

### 22.7.5.2 Wake-up Reception

To detect a wake-up signal, use the input signal low-level width count function. The input signal low level width count function measures the low level width of the input signal to the RLIN3nRX pin, using the same sampling point as data reception. This allows the 2.5-Tbit or longer low-level width of the input signal of  $f_{LIN}$  to be measured.

In LIN master mode, by setting the LWBR0 bit in the RLN3nLWBR register, operation is executed without changing the baud rate generator setting at a transition between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock ( $f_{LIN}$ ) to  $f_a$  regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200 bps while  $f_a$  is selected, an input signal with a low-level width of 130  $\mu$ s or longer regardless of the setting of the LCKS bit in the RLN3nLMD register.

To use the wake-up reception function, in LIN wake-up mode, set the RFT bit in the RLN3nLDFC register to 0 (LIN master mode: response reception) or the RCDS bit in the RLN3nLDFC register to 0 (LIN slave mode: response reception), and then set the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register is set to 1 (successful frame response/wake-up reception) and if the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wake-up reception interrupt enabled), an interrupt request for RLIN3n successful reception is generated.

Figure 22.19 Input Signal Low level Count Function

### 22.7.5.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, however the collision of wakeup signals is not detected in the LIN/UART interface.

## 22.7.6 Statuses

During LIN mode operation, the LIN/UART interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/reception, can generate interrupt requests.

**Table 22.99, Types of Statuses in LIN Master Mode** shows the types of statuses available in LIN master mode.

**Table 22.100, Types of Statuses in LIN Slave Mode** lists the types of statuses available in LIN slave mode [auto baud rate] and in LIN slave mode [fixed baud rate].

Table 22.99 Types of Statuses in LIN Master Mode

Status	Status Set Condition	Status Clear Condition	Operating Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if the LIN/UART interface actually enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if the LIN/UART interface actually enters LIN wake-up mode.	<ul style="list-style-type: none"> <li>• LIN operation mode</li> <li>• LIN wake-up mode</li> </ul>	OMM1 bit in RLN3nLMST register	—

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, or BER flag of the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000<sub>B</sub> (0-byte + checksum).

## 22.7.7 Error Statuses

### 22.7.7.1 LIN Master Mode

#### (1) Types of Error Statuses

The LIN/UART interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

**Table 22.101, Types of Error Statuses in LIN Master Mode** shows the types of error statuses.

Table 22.101 Types of Error Statuses in LIN Master Mode

Status	Error Detection Condition	Operating Mode Capable of Error Detection	Communication	Enable/Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match <sup>*1,*2</sup>	<ul style="list-style-type: none"> <li>LIN operation mode</li> <li>LIN wake-up mode</li> </ul>	Aborted	Enabled	BER flag in RLN3nLEST register
Physical bus error	<ul style="list-style-type: none"> <li>LIN bus is detected to be high level when transmitting a break</li> <li>LIN bus is detected to be low level when transmitting a break delimiter</li> <li>LIN bus is detected to be high level when transmitting a wake-up</li> </ul>	<ul style="list-style-type: none"> <li>LIN operation mode</li> <li>LIN wake-up mode</li> </ul>	Aborted	Enabled	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time <sup>*3,*4</sup>	LIN operation mode	Aborted	Enabled	FTER flag in RLN3nLEST register
Framing error	In response field reception, the stop bit of each data byte is low level	LIN operation mode	Aborted	Enabled	FER flag in RLN3nLEST register
Checksum error	In response field reception, checksum test results in an error	LIN operation mode	—	Disabled	CSER flag in RLN3nLEST register
Response preparation error	<p>One of the following conditions occurs in frame separate mode during a multi-byte response reception:</p> <ul style="list-style-type: none"> <li>The first reception data byte is received after completion of header transmission but before a response transmission/reception request is specified</li> <li>The first reception data byte is received after the completion of previous data group reception but before a transmission/reception request for the next data group is specified.</li> </ul>	LIN operation mode	Aborted	Disabled	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, processing is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately after the bit that caused the error is transmitted. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and can be calculated using the following formula. When the FSM bit in the RLN3nLDFC register is set to 1 (frame separate mode), the timeout time is that of the 8 data bytes until the RTS bit of the RLN3nLTRC register is set. Once the RTS bit is set, the timeout time is changed to the time based on the response field data length (the RFDL[3:0] bits in the RLN3nLDFC register).

**[Frame timeout]**

When classic checksum is selected (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

When enhanced checksum is selected (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data

bytes + 1) × 14 [Tbit]

The aforementioned timeout time is longer than the TFRAME\_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME\_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.

**[Response timeout]**

Timeout time = (number of data bytes + 1) × 14 [Tbit]

When an error is detected, time-out error detection function stops.

Note 4. If RLIN3 transitions to LIN reset mode by clearing RLN3nLCUC.OM0 to 0 when the timeout function is used (RLN3nLEDE.FTERE = 1), users should take the procedure shown in **Figure 22.4, LIN Reset Sequence by Clearing RLN3nLCUC.OM0 to 0 When the Timeout Function is Used.**

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), when it is cleared by software, or at a transition to LIN reset mode.

**(2) Target Time Domain for LIN Error Detection**

**Figure 22.20, Target Time Domain for LIN Error Detection (LIN Master Mode)** shows the time domain in which the LIN/UART interface in LIN master mode performs monitoring for error detection.

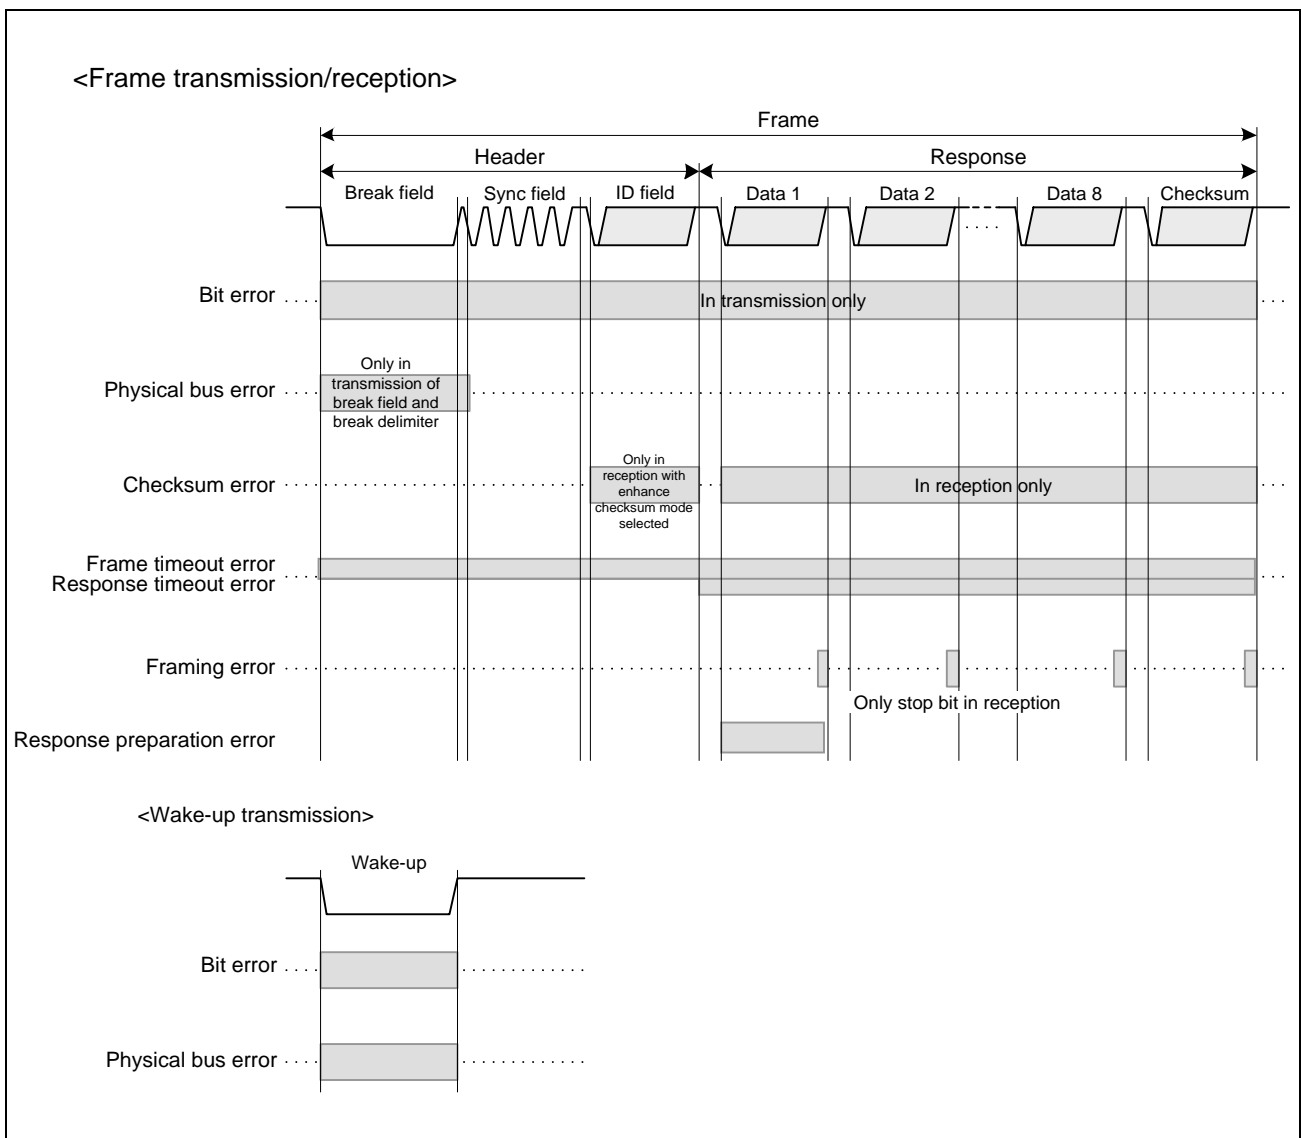

Figure 22.20 Target Time Domain for LIN Error Detection (LIN Master Mode)

## 22.7.7.2 LIN Slave Mode

### (1) Types of Error Statuses

The LIN/UART interface can detect seven types of error statuses in LIN slave mode [auto baud rate] or in LIN slave mode [fixed baud rate]. These error statuses can be verified by checking the corresponding bits in the RLIN3nLEST register.

**Table 22.102, Types of Error Statuses in LIN Slave Mode** shows the types of error statuses.

Table 22.102 Types of Error Statuses in LIN Slave Mode

Status	Error Detection Condition	Operating Mode Capable of Error Detection	Communication	Enable/Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match*1 *2	<ul style="list-style-type: none"> <li>• LIN operation mode</li> <li>• LIN wake-up mode</li> </ul>	Aborted	Enabled	BER flag in RLIN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3,*6	LIN operation mode	Aborted	Enabled	TER flag in RLIN3nLEST register
Framing error	In frame reception, the stop bit of each data byte is low level	LIN operation mode	Aborted	Enabled	FER flag in RLIN3nLEST register
Sync field error	If the width of the break low level is greater than the width set by the LBLT bit in the RLIN3nLBFC register and the sync field is not 55 <sub>H</sub>	LIN operation mode	Aborted	Enabled*4	SFER flag in RLIN3nLEST register
Checksum error	In response field reception, the checksum test results in an error	LIN operation mode	—*5	Disabled	CSER flag in RLIN3nLEST register
ID parity error	If the received ID parity bit does not match the value that is automatically calculated by the LIN/UART interface	LIN operation mode	Aborted	Enabled	IPER flag in RLIN3nLEST register
Response preparation error	<ul style="list-style-type: none"> <li>• After the reception of a header, if the response is not prepared before the first reception data byte is received</li> <li>• In a multi-byte response reception, if the preparation for the reception of next data group does not complete before the first reception data byte for the next data group is received</li> </ul>	LIN operation mode	Aborted	Disabled	RPER flag in RLIN3nLEST register

Note 1. If a bit error is detected, processing is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately after the bit that caused the error is transmitted. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLIN3nLDFC register) and the checksum selection (the LCS bit in the RLIN3nLDFC register), and this can be calculated according to the following formula. The timeout time is that of 8 data bytes until the RTS bit or the LNRR bit of the RLIN3nLTRC register is set. When the RTS bit is set, the timeout time is changed to the time based on the response field data length (RFDL[3:0] bit of the RLIN3nLDFC register). When the LNRR bit is set, the timeout function stops.

#### [Frame timeout]

When classic checksum is selected (when the CSM bit in RLIN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

When enhanced checksum is selected (when the CSM bit in RLIN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is longer than the TFRAME\_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME\_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.

#### [Response timeout]

Timeout time = (number of data bytes + 1) × 14 [Tbit]

When an error is detected, time-out error detection function stops.

Note 4. Only reflection of the result to the SFER flag can be enabled/disabled. Error detection cannot be enabled/disabled.

Note 5. Checksum determination is performed upon completion of response frame reception. In case of an error, the successful reception flag is not set to 1.

Note 6. If RLIN3 transitions to LIN reset mode by clearing RLN3nLCUC.OM0 to 0 when the timeout function is used (RLN3nLEDE.TERE = 1), users should take the procedure shown in **Figure 22.4, LIN Reset Sequence by Clearing RLN3nLCUC.OM0 to 0 When the Timeout Function is Used.**

The error status is cleared by software or at a transition to LIN reset mode.

**(2) Target Time Domain for LIN Error Detection**

**Figure 22.21, Target Time Domain for LIN Error Detection (LIN Slave Mode)** shows the time domain in which the LIN/UART interface in slave mode performs monitoring for error detection.

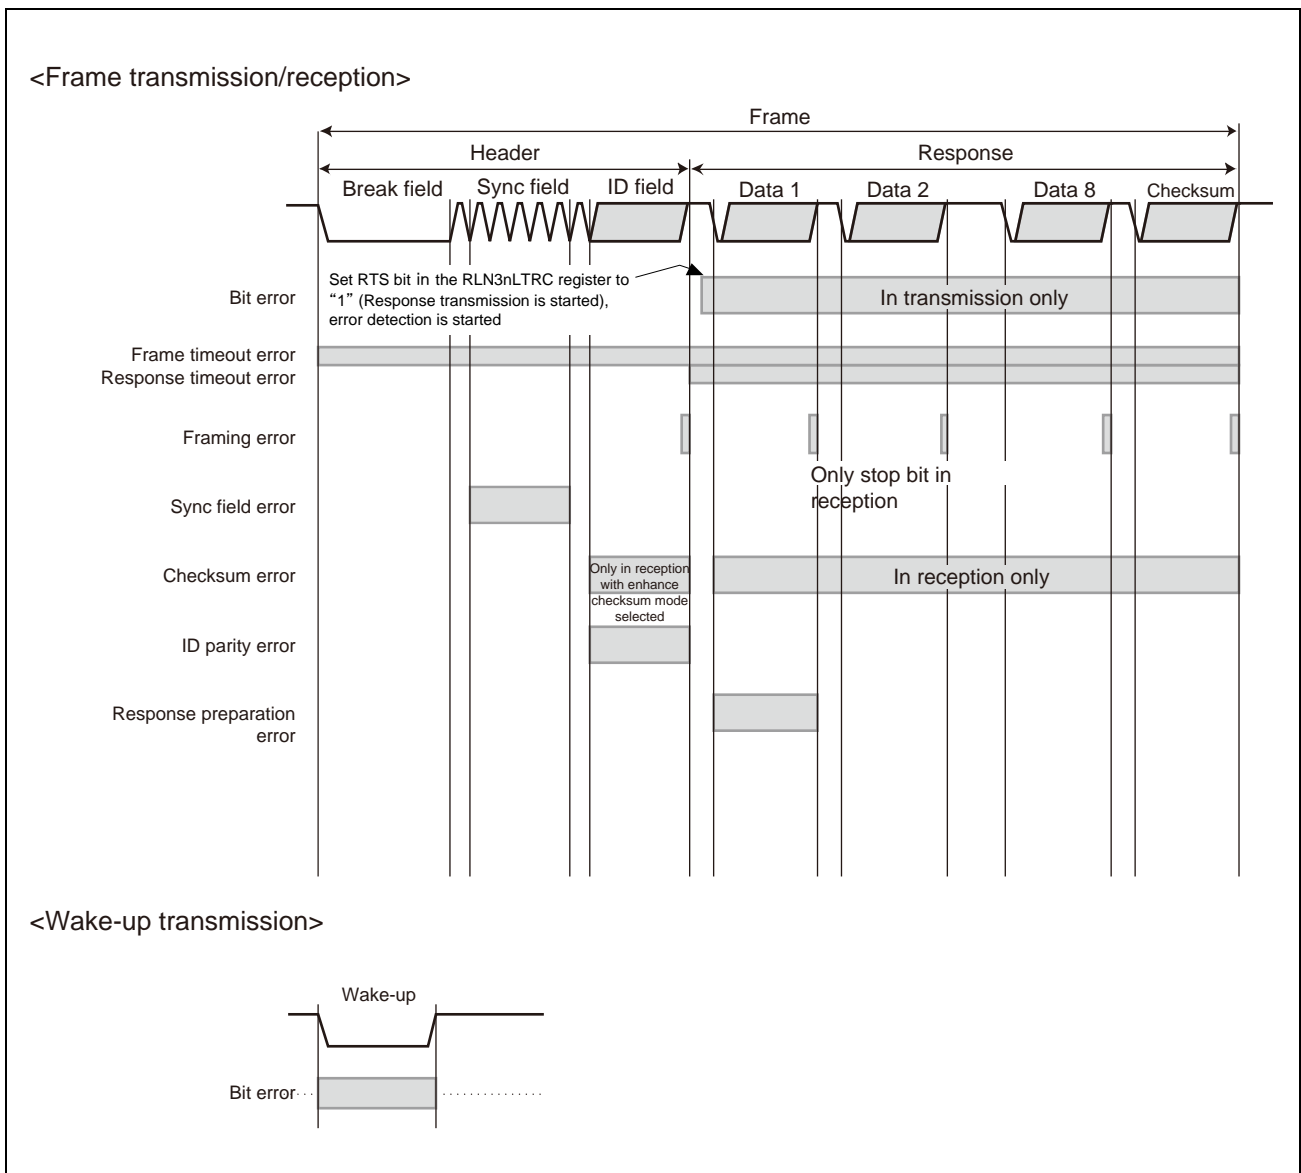

Figure 22.21 Target Time Domain for LIN Error Detection (LIN Slave Mode)

## 22.8 UART Mode

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 01<sub>B</sub> (UART mode) and the OM0 bit in the RLN3nLCUC register to 1 changes the mode to UART mode, turning the OMM0 bit in the RLN3nLMST register to 1.

### 22.8.1 Transmission

**Figure 22.22, LIN/UART Interface (in UART Mode) Transmission Operation** shows the operation of the LIN/UART interface (in UART mode) during transmission. **Table 22.103, LIN/UART Interface (UART Mode) Transmission Processing** provides processing of the LIN/UART interface (in UART mode) during transmission.

Figure 22.22 LIN/UART Interface (in UART Mode) Transmission Operation

Table 22.103 LIN/UART Interface (UART Mode) Transmission Processing

Software Processing	LIN/UART Interface Processing
(1) <ul style="list-style-type: none"> <li>• Sets a baud rate.</li> <li>• Sets noise filter ON/OFF.</li> <li>• Enables error detection.</li> <li>• Configures data format.</li> <li>• Sets an interrupt generation timing.</li> <li>• Exits from LIN reset mode.</li> <li>• Sets the transmission enable bit (UTOE bit) to 1.</li> </ul>	<ul style="list-style-type: none"> <li>• Waits for a transmission trigger (RLN3nLUTDR register) by software.</li> </ul>

(5) <ul style="list-style-type: none"> <li>• (RLN3nLUTDR) and waits for the generation of an interrupt request.</li> </ul>	Transmits a parity bit when parity is used.
(6)	Transmits 1 or 2 stop bits.

Table 22.103 LIN/UART Interface (UART Mode) Transmission Processing

Software Processing	LIN/UART Interface Processing
(7) [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] <ul style="list-style-type: none"> <li>• If another item of transmission data is set, goes to step (3).</li> </ul> [When the UTIGTS bit is 1 (a transmission interrupt is output upon completion of transmission)] <ul style="list-style-type: none"> <li>• When transmitting data continuously, goes to step (2).</li> </ul>	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] <ul style="list-style-type: none"> <li>• If another piece of transmission data is set, goes to step (3).</li> <li>• If the next data to be transmitted is not specified, clears the transmission status flag.</li> </ul> [When the UTIGTS bit is 1 (a transmission interrupt is output upon completion of transmission)] <ul style="list-style-type: none"> <li>• Generates RLIN3n transmission interrupt request.</li> <li>• Clears the transmission status flag.</li> </ul>

### 22.8.1.1 Continuous Transmission

The LIN/UART interface (in UART mode) can transmit multiple sets of data continuously by using the RLIN3nLUTDR register. **Figure 22.23, Operation Examples of LIN/UART Interface (UART Mode) Continuous Transmission** shows an operation example where the transmission interrupt generation timing is the start of transmission and an operation example where the transmission interrupt generation timing is the completion of transmission.

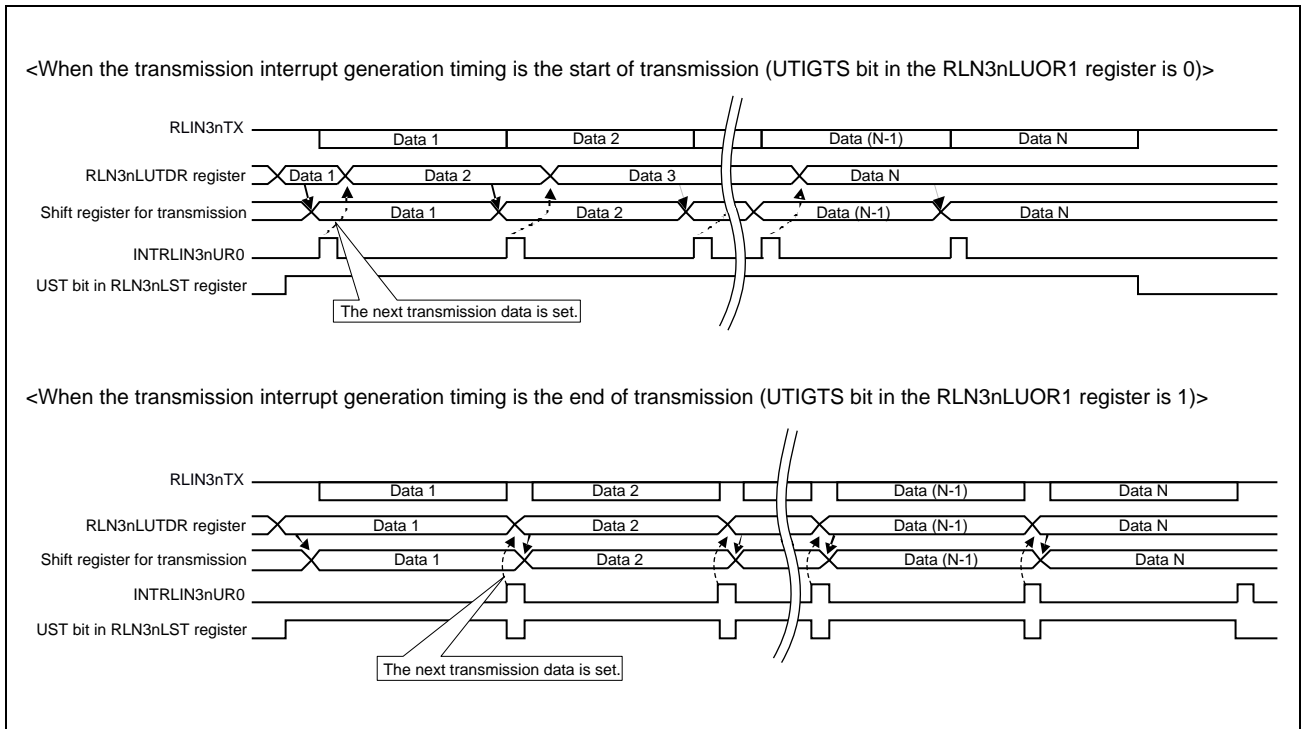

Figure 22.23 Operation Examples of LIN/UART Interface (UART Mode) Continuous Transmission

An interrupt can be generated at the completion of a transmission by changing the UTIGTS bit in the RLIN3nLUOR1 register from 0 to 1 after the start of transmission of final data, provided that the transmission interrupt generation timing is the start of transmission and the completion of transmission of final data needs to be known.

### 22.8.1.2 UART Buffer Transmission

The LIN/UART interface (in UART mode) has a maximum of nine bytes of UART buffers and it is capable of performing continuous transmissions through the use of UART buffers.

**Figure 22.24, UART Buffer Transmission in LIN/UART Interface (in UART Mode)** shows the UART buffer transmission operation of the LIN/UART interface (in UART mode).

**Table 22.104, UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode)** shows the UART buffer transmission processing.

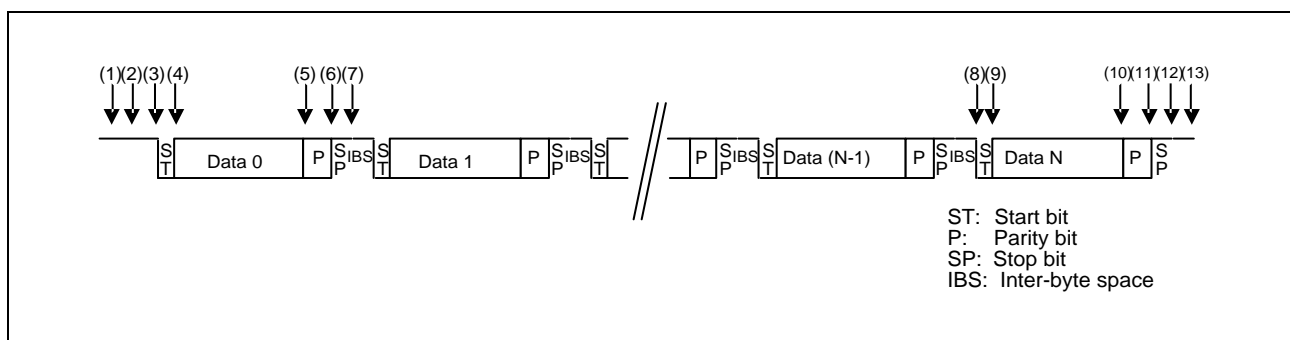

Figure 22.24 UART Buffer Transmission in LIN/UART Interface (in UART Mode)

Table 22.104 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode)

Software Processing	LIN/UART Interface Processing
(1) <ul style="list-style-type: none"> <li>• Sets a baud rate</li> <li>• Sets noise filter ON/OFF</li> <li>• Enables error detection</li> <li>• Configures data format</li> <li>• Sets the interrupt generation timing to the completion of transmission.</li> <li>• Exits from LIN reset mode.</li> <li>• Sets the transmission enable bit (UTOE bit) to 1</li> </ul>	<ul style="list-style-type: none"> <li>• Waits for a transmission trigger (RTS bit) by software</li> </ul>
(2) <ul style="list-style-type: none"> <li>• Sets the UART buffer data length and whether the start of transmission must be waited.</li> <li>• Specifies the data to be transmitted in the UART data 0 buffer register (RLN3nLUDb0) and the LIN data buffer b register (RLN3nLDBRb). (b =1 to 8)</li> <li>• Sets the UART buffer transmission start bit (RTS).</li> </ul>	<ul style="list-style-type: none"> <li>• Sets the transmission status flag.</li> </ul>
(3) Waits for an interrupt request.	Transmits a start bit. (For switching from reception to transmission in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see <b>Section 22.8.1.4, Transmission Start Wait Function.</b> )
(4)	Transmits the data specified in the UART data buffer 0 register (RLN3nLUDb0) or the LIN/UART data buffer b register (RLN3nLDBRb).
(5)	Transmits a parity bit when parity is used.
(6)	Transmits 1 or 2 stop bits (When the number of data set in UART buffer data length select bits is 1, proceeds to (12).)
(7)	Transmits an inter-byte space (idle).  Repeats steps (3) to (7) until the number of data set in the UART buffer data length select bits -1 is reached.

Table 22.105 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode)

Software Processing	LIN/UART Interface Processing
(8) Waits for an interrupt request.	Transmits a start bit.
(9)	Transmits the data specified in the LIN/UART data buffer b register (RLN3nLDBRb).
(10)	Transmits a parity bit when parity is used.
(11)	Transmits 1 or 2 stop bits.
(12)	<ul style="list-style-type: none"> <li>• Sets the successful buffer transmission flag.</li> <li>• Clears the UART buffer transmission start bit (RTS).</li> <li>• Generates a transmission interrupt request signal.</li> <li>• Clears the transmission status flag.</li> </ul>
(13) <ul style="list-style-type: none"> <li>• Checks the RLN3nLST register, and clears flags</li> <li>• When continuously transmitting data, goes to step (2).</li> </ul>	

### (1) UART Buffer Transmission

For a 9-byte transmission, the contents stored in the RLN3nLUDB0 and RLN3nLDBR1 to RLN3nLDBR8 registers are transmitted to data regions 0 to 8. The RLN3nLUDB0 register is used only if 9-byte transmission is specified. In other cases, the RLN3nLDBR1 to RLN3nLDBR8 registers are selected depending on the data length. For a 4-byte transmission, the contents stored in the RLN3nLDBR1 to RLN3nLDBR4 registers are transmitted to data regions 1 to 4, but the contents of the RLN3nLDBR5 to RLN3nLDBR8 registers are not transmitted. An RLIN3n transmission interrupt is generated after the number of data specified in the MDL [3:0] bits of the RLN3nLDFC register is transmitted. The spaces between each transmitted data can be specified in the IBS bit of the RLN3nLSC register.

**Figure 22.25, UART Buffer and Transmission Processing (for 9-Byte Transmission)** shows a 9-byte UART buffer and the transmission processing.

Figure 22.25 UART Buffer and Transmission Processing (for 9-Byte Transmission)

### 22.8.1.3 Data Transmission

One bit of data is transmitted per Tbit.

In half-duplex communication, if the BERE bit in the RLN3nLEDE register is 1 (bit error detection enabled), the transmission data and the input pin level are compared bit by bit during data transmission, and the results are stored in the BER flag of the RLN3nLEST register (see **Section 22.7.7, Error Statuses**). The timing at which the input pin is sampled during data transmission can vary depending on the settings of the LPRS[2:0] and NSPB[3:0] bits in the RLN3nLWBR register.

The bit error detection timing in UART mode is shown in **Table 22.106, Error Detection Timing in UART Mode**.

Table 22.106 Error Detection Timing in UART Mode

Sampling Count Per Bit	Bit Error Detection Timing
6 samples	3rd clock cycle + 1 prescaler clock
7 samples	4th clock cycle + 1 prescaler clock
8 samples	4th clock cycle + 1 prescaler clock
9 samples	5th clock cycle + 1 prescaler clock
10 samples	5th clock cycle + 1 prescaler clock
11 samples	6th clock cycle + 1 prescaler clock
12 samples	6th clock cycle + 1 prescaler clock
13 samples	7th clock cycle + 1 prescaler clock
14 samples	7th clock cycle + 1 prescaler clock
15 samples	8th clock cycle + 1 prescaler clock
16 samples	8th clock cycle + 1 prescaler clock

Example of Data Transmission Timing (when 1 Tbit = 16 samplings) is shown in **Figure 22.26, Example of Data Transmission Timing (When 1 Tbit = 16 samplings)**.

Figure 22.26 Example of Data Transmission Timing (When 1 Tbit = 16 samplings)

### 22.8.1.4 Transmission Start Wait Function

For performing half-duplex communication, the LIN/UART interface (in UART mode) has the function of securing the reception stop bit length when switching from reception to transmission.

If it is desired to delay the start of transmission until the stop bits for the reception are completed, specify the transmission data in the RLIN3nLUWTDR register, which is used only for the wait function, instead of specifying it in the RLIN3nLUTDR register as a transmission start request. When transmitting from the UART buffer, set the RTS bit in the RLIN3nLTRC register to 1 (UART buffer transmission start) while the UTSW bit in the RLIN3nLDFC register is set to 1.

In this case, the LIN/UART interface delays the start of transmission until the stop bits of reception data are completed.

It should be noted that even if the UART stop bit length select bit (USBLS) in RLIN3nLBFC register is 1 (stop bits = 2 bits), there is only a 1-bit delay.

**Figure 22.27, Transmission Wait Function (Case When Transmit Data Is Set While Stop Bits Are Being Received)** shows the operation of transmission wait function.

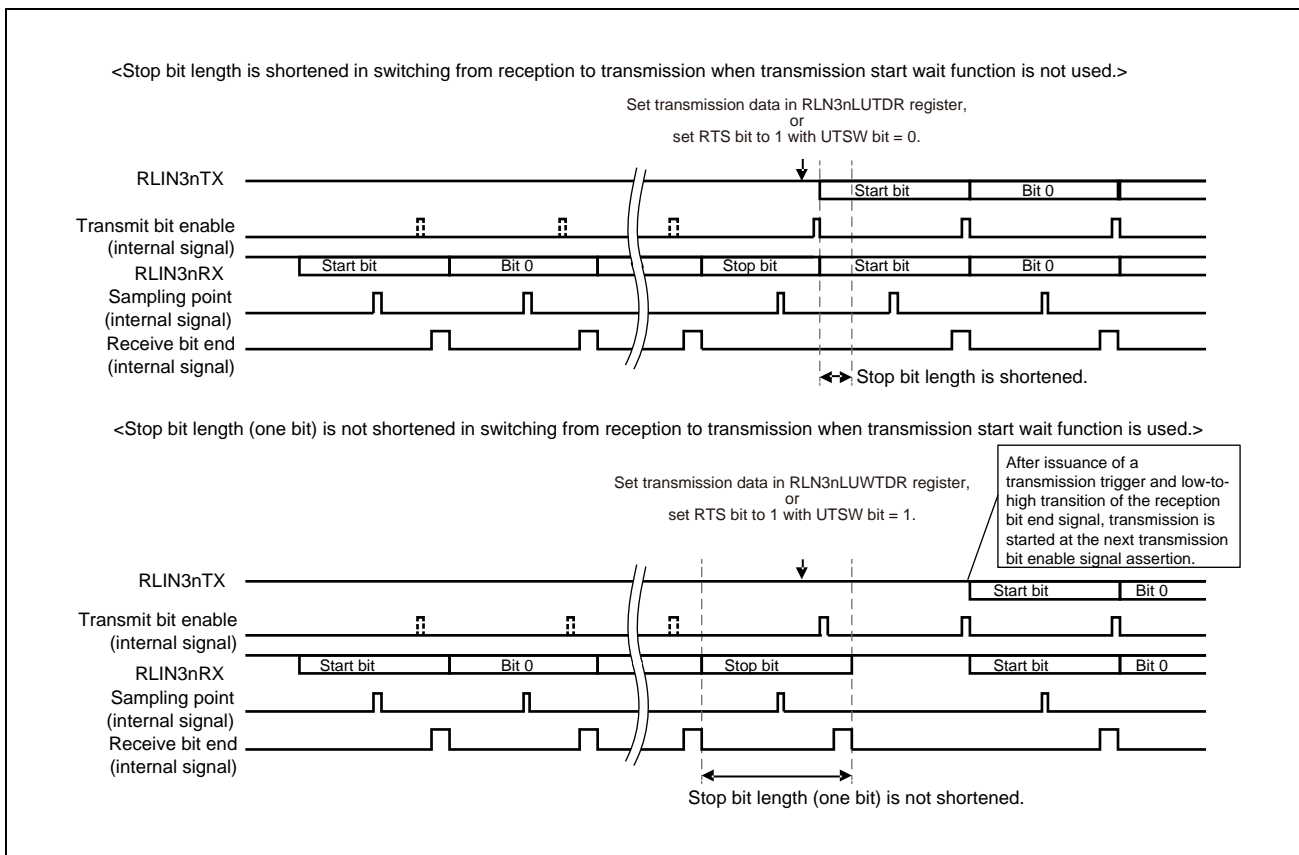

Figure 22.27 Transmission Wait Function (Case When Transmit Data Is Set While Stop Bits Are Being Received)

## 22.8.2 Reception

**Figure 22.28, LIN/UART Interface (in UART Mode) Reception Operation** shows the LIN/UART interface (in UART mode) reception operation. **Table 22.107, LIN/UART Interface (in UART Mode) Reception Processing** shows the LIN/UART interface (in UART mode) reception processing.

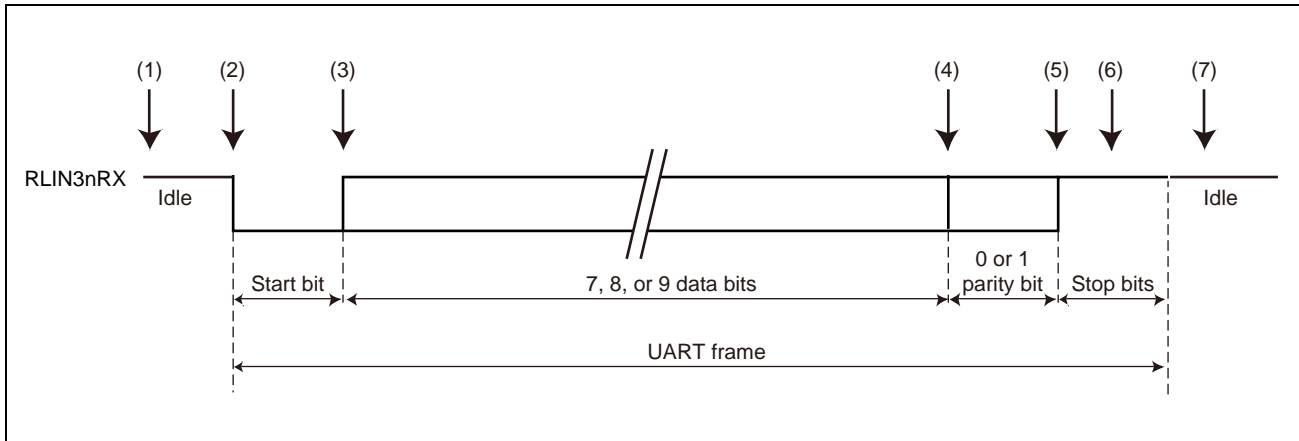

Figure 22.28 LIN/UART Interface (in UART Mode) Reception Operation

Table 22.107 LIN/UART Interface (in UART Mode) Reception Processing

Software Processing	LIN/UART Interface Processing
(1) <ul style="list-style-type: none"> <li>• Sets a baud rate.</li> <li>• Sets noise filter ON/OFF.</li> <li>• Enables error detection.</li> <li>• Configures data format.</li> <li>• Exits from LIN reset mode.</li> <li>• Sets the reception enable bit (UROE bit) to 1.</li> </ul>	<ul style="list-style-type: none"> <li>• Waits for the reception to be enabled by software.</li> </ul>
(2) Waits for an interrupt request.	<ul style="list-style-type: none"> <li>• Waits for detection of a start bit.</li> </ul>
(3)	Receives data.
(4)	Receives a parity bit when parity is used.
(5)	Receives only 1 stop bit.
(6)	<ul style="list-style-type: none"> <li>• Generates a RLIN3n successful reception interrupt request.</li> <li>• Clears the reception status flag.</li> </ul>
(7) Checks the RLIN3nLST register, and clears flags	Waits for a falling edge from the reception pin.

### 22.8.2.1 Data Reception

Data reception is performed by using the synchronized RLIN3nRX (an internal signal) that is the input from the RLIN3nRX pin synchronized with the prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, resampling is performed 0.5 Tbits later when the number of sampling per 1 Tbit is even and  $\{(the\ number\ of\ sampling + 1) / 2\} / (the\ number\ of\ sampling)$  Tbits later when the number is odd. If the synchronized RLIN3nRX signal is low level, the bit is recognized as a start bit. The bit is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected during the resampling.

After the start bit is detected, 1 bit is sampled per Tbit.

However, when the BERE bit in the RLN3nLEDE register is 1, the sampling point is the same as the bit error detection timing.

The LIN/UART interface has a noise filter function for received data. If the LRDNFS bit in the RLN3nLMD register is 0, the noise filter is used. For a sampling value, the value determined by a 3-sampling majority rule by the prescaler clock is used. If the LRDNFS bit in the RLN3nLMD register is 1, the noise filter is not used. In this case, for a sampling value, the synchronized RLIN3nRX value at the sampling position is used as is.

**Figure 22.29, Example of Data Reception Timing (When 1 Tbit = 16 samplings)** shows an example of data reception timing.

Figure 22.29 Example of Data Reception Timing (When 1 Tbit = 16 samplings)

### 22.8.3 Expansion Bits

The LIN/UART interface (in UART mode) can transmit and receive 9-bit long data by setting the UEBE bit in the RLN3nLUOR1 register to 1.

#### 22.8.3.1 Expansion Bit Transmission

The LIN/UART interface (in UART mode) can transmit 9-bit long data by writing the 9-bit data to either the UART transmission data register (RLN3nLUTDR) or the UART wait transmission data register (RLN3nLUWTD) when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1.

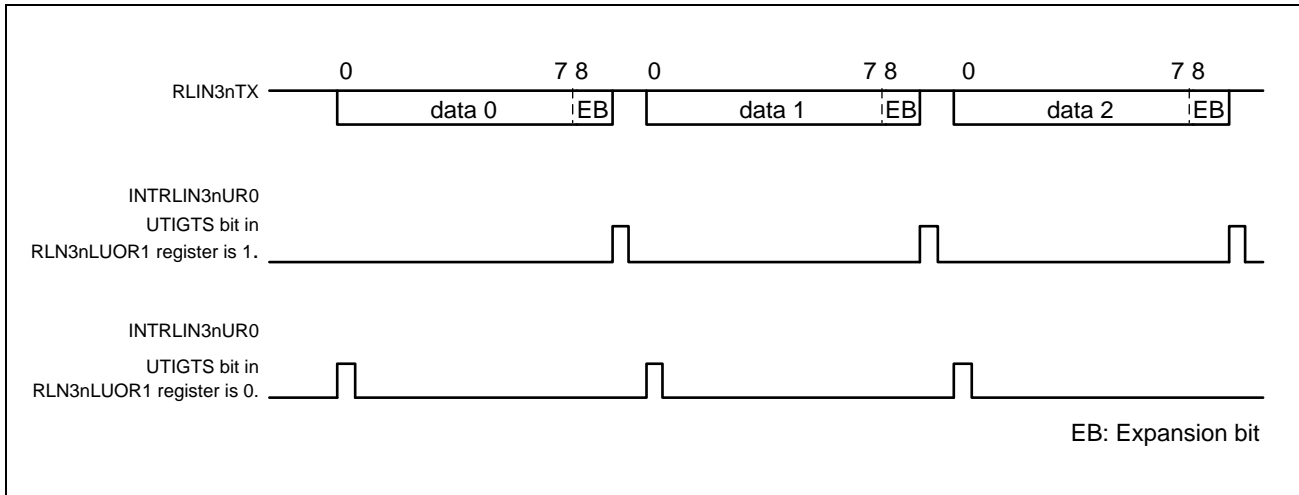

Figure 22.30 Transmission Example When Expansion Bit is Enabled (LSB First)

#### 22.8.3.2 Expansion Bit Reception

The LIN/UART interface (in UART mode) can always receive 9-bit data without comparing the expansion bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 1, and the expansion bit data comparison enable bit (UEBDCE) is 0. Regardless of the expansion bit detection level select bit (UEBDL) setting in the UART option register 1 (RLN3nLUOR1), a RLIN3n successful reception interrupt is generated when 9-bit data is received.

Figure 22.31 Expansion Bit Reception Example (LSB First)

### 22.8.3.3 Expansion Bit Reception (with Expansion Bit Comparison)

The LIN/UART interface (in UART mode) can compare received expansion bits and the UEBDL bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 0.

If the level that was set in the expansion bit detection level select bit (UEBDL) is detected, an RLIN3n status interrupt request is generated upon completion of data reception, and the expansion bit detection flag (EXBT) in the LIN error status register (RLN3nLEST) is set. If the reversed value of an expansion bit detection level is detected, RLIN3n successful reception interrupt request is generated. In either case, the received data is stored in the UART reception data register (RLN3nLURDR), unless there was an overrun error.

**Figure 22.32, Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL = 0)** shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

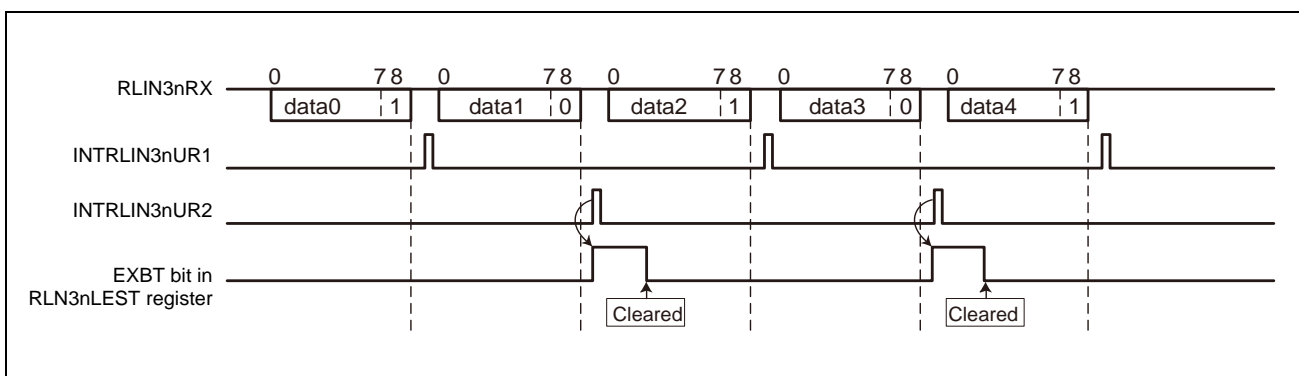

Figure 22.32 Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL = 0)

#### NOTE

- If a reception error (parity error, framing error, or overrun error) occurs in received data 0, 2, or 4 (if a reversed value of an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. In this case, a RLIN3n successful reception interrupt is not generated.
- If a reception error (parity error, framing error, or overrun error) occurs in received data 1 or 3 (if an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs, the expansion bit detection flag (EXBT) is also set.

### 22.8.3.4 Expansion Bit Reception (with Data Comparison)

If the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 1, when the level that was set by the expansion bit detection level select bit (UEBDL) is detected, the LIN/UART interface (in UART mode) compares the 8 bits of the received data excluding the expansion bit, with the a preset RLN3nLIDB register value.

If the result of the comparison is a match, the LIN/UART interface performs the following operations:

- Generates an RLIN3n status interrupt
- Sets the expansion bit detection flag (EXBT)
- Sets the ID match flag (IDMT)
- Stores the received data in the UART reception data register (RLN3nLURDR)

Even when the result of the comparison is a match, successful RLIN3n successful reception interrupt is not generated.

If the result of the comparison is not a match, no RLIN3n successful reception interrupt or RLIN3n status interrupt is generated, and the EXBT and IDMT flags are not set to 1. The received data is not stored in the UART reception data register (RLN3nLURDR).

When changing the UEBDCE bit to 0, make the change before the reception of the next data is completed.

**Figure 22.33, Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0)** shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

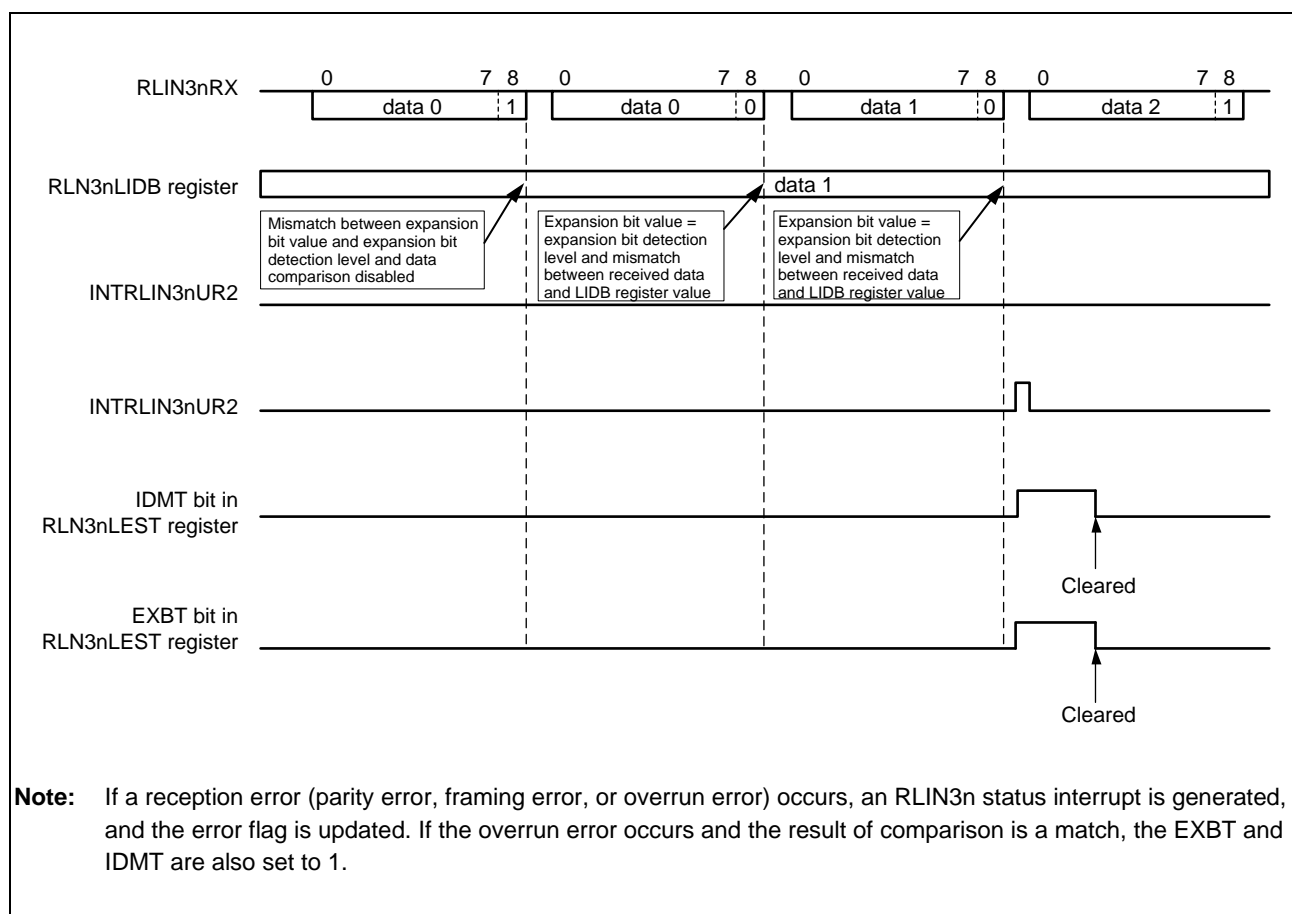

Figure 22.33 Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0)

## 22.8.4 Statuses

In UART mode, the LIN/UART interface can detect five types of statuses.

Two statuses, successful UART buffer transmission and error detection, can generate interrupt requests.

**Table 22.108, Types of Statuses in UART Mode** shows the types of statuses available in UART mode.

Table 22.108 Types of Statuses in UART Mode

Status	Status Set Condition	Status Clear Condition	Corresponding Bit	Interrupt
LIN reset mode	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode.	OMM0 bit in RLN3nLMST register	—
Successful UART buffer transmission	<ul style="list-style-type: none"> <li>When the UTIGTS bit in the RLN3nLUOR1 register is 0 (transmission interrupt request is generated upon start of transmission), if the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register) is started.</li> <li>When the UTIGTS bit in the RLN3nLUOR1 register is 1 (transmission interrupt request is generated upon completion of transmission), if the transmission of the data length specified by the MDL bit in the RLN3nLDFC register is completed.</li> </ul>	<ul style="list-style-type: none"> <li>When cleared by software</li> <li>After transition to LIN reset mode</li> </ul>	FTC flag in RLN3nLST register	✓
Error detection	If any of the UPER flag, IDMT flag, EXBT flag, FER flag, OER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected).	<ul style="list-style-type: none"> <li>When cleared by software*1</li> <li>After transition to LIN reset mode</li> </ul>	ERR flag in RLN3nLST register	✓
Transmission status	<ul style="list-style-type: none"> <li>When data is written to the RLN3nLUTDR or RLN3nLUWTDR register.</li> <li>When 1 is written to the RTS bit in the RLN3nLTRC register.</li> </ul>	<ul style="list-style-type: none"> <li>When the transmission of the data specified in the RLN3nLUTDR or RLN3nLUWTDR register is completed, but the next transmission data is not specified.</li> <li>When the transmission of the data in the UART buffer is completed and the RTS bit in the RLN3nLTRC register is cleared.</li> <li>After transition to LIN reset mode</li> </ul>	UTS flag in RLN3nLST register	—
Reception status	When a start bit is detected.	<ul style="list-style-type: none"> <li>When a sampling point for stop bits is detected</li> <li>After transition to LIN reset mode</li> </ul>	URS flag in RLN3nLST register	—

Note 1. Writing a 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register when not in the LIN reset mode sets the ERR flag in the RLN3nLST register to 0.

## 22.8.5 Error Statuses

### Types of Error Statuses

In UART mode, the LIN/UART interface can detect four types of errors and two types of statuses. The condition of these statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

**Table 22.109, Types of Statuses in UART Mode** lists applicable status types.

Table 22.109 Types of Statuses in UART Mode

Status	Error Detection Condition	Communication	Enable/Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data monitored on the reception pin do not match* <sup>1</sup>	Continues until the transmission of the specified transmission data is completed.	Enabled	BER flag in RLN3nLEST register
Overrun error	After received data is stored in the RLN3nLURDR register, the next data is received before the previous data is read. (In this case, no data is stored in the RLN3nLURDR register).	— (Reception is completed by the time this error is detected)	Enabled	OER flag in RLN3nLEST register
Framing error	When the first stop bit is low level in the reception processing.	— (Reception is completed by the time this error is detected)	Enabled	FER flag in RLN3nLEST register
Parity error	The received parity value fails to match the parity value calculated from the received data	Continues until the data reception is completed.	Disabled* <sup>2</sup>	UPER flag in RLN3nLEST register
Expansion bit detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register.	—	Enabled	EXBT flag in RLN3nLEST register
ID match detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register and the 8-bit received data excluding the expansion bit matches the value of the RLN3nLIDB register.	—	Enabled	IDMT flag in RLN3nLEST register

Note 1. In the case of transmission from the UART buffer, bit errors are detected even in the space between UART frames (inter-byte space).

Note 2. Setting the UPS[1:0] bits in the RLN3nLBFC register to 10<sub>B</sub> (0 parity) disables the checking of parity bit values. In this case, no parity error is generated.

The error status is cleared by software or at a transition to LIN reset mode.

## 22.9 LIN Self-Test Mode

The LIN/UART interface provides a LIN self-test mode. When the LIN/UART interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and they are internally connected within the LIN/UART interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX. The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following four modes:

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception
- LIN slave self-test mode (transmission): Header reception and response transmission
- LIN slave self-test mode (reception): Header reception and response reception

In LIN self-test mode, the operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator.

Regardless of the setting of the baud rate related registers, the baud rate setting is the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to 0000<sub>B</sub> or 1111<sub>B</sub>.) (The LPRS bits in the RLN3nLWBR register should be set to 000<sub>B</sub>.)

In addition, in LIN self-test mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- LIN slave mode (Auto baud rate)
- Frame/response timeout error

Do not use these functions.

Figure 22.34 Connection in LIN Reset Mode, LIN Mode, and UART Mode

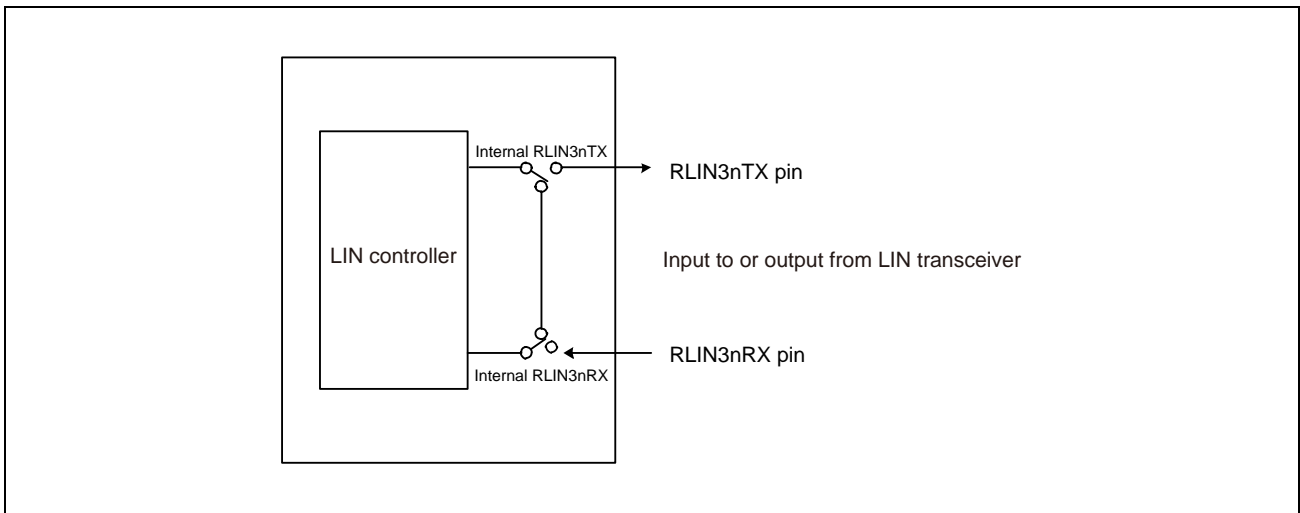

Figure 22.35 Connection in LIN Self-Test Mode

### 22.9.1 Transition to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.

The LSTM bit in the RLN3nLSTC register set to 1 indicates that the mode has transitioned to the LIN self-test mode.

When transitioning to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be consecutively written three times to the LIN self-test control register, as follows:

- Transition to LIN reset mode
  - Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
  - Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
  - LMD bits in RLN3nLMD = 00<sub>B</sub> (LIN master mode) or 11<sub>B</sub> (LIN slave mode [fixed baud rate])
- 1st write: RLN3nLSTC register = 1010 0111<sub>B</sub> (A7<sub>H</sub>)
- 2nd write: RLN3nLSTC register = 0101 1000<sub>B</sub> (58<sub>H</sub>)
- 3rd write: RLN3nLSTC register = 0000 0001<sub>B</sub> (01<sub>H</sub>)
- Verify the transition to LIN self-test mode
  - Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the 1st write (A7<sub>H</sub>) is written twice by mistake, the transition to LIN self-test mode is aborted. The above sequence should be retried from the 1st write step. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also aborted.

## 22.9.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  - RLN3nLWBR register = 0000 000x<sub>B</sub>\*<sup>1</sup>
  - RLN3nLBRP0 register = xxxx xxxx<sub>B</sub>\*<sup>1</sup>
  - RLN3nLBRP1 register = xxxx xxxx<sub>B</sub>\*<sup>1</sup>
  - RLN3nLMD register = 00xx xx00<sub>B</sub>\*<sup>1</sup>
- Configure the interrupt enable and error enable related registers.
  - RLN3nLIE register = 0000 xxxx<sub>B</sub>\*<sup>2</sup>
  - RLN3nLEDE register = x000 x0xx<sub>B</sub>
- Configure the break field and space related registers.
  - RLN3nLBFC register = 00xx xxxx<sub>B</sub>
  - RLN3nLSC register = 00xx 0xxx<sub>B</sub>
- Exit the LIN reset mode.
  - Write 11<sub>B</sub> to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11<sub>B</sub>.
- Configure the transmission frame related registers.
  - RLN3nLDFC register = 00x1 xxxx<sub>B</sub>
  - RLN3nLIDB register = xxxx xxxx<sub>B</sub>
  - RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx xxxx<sub>B</sub>
- Start header transmission → response transmission
  - Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN master self-test mode (transmission) is executed, interrupt is generated, and status and error status are also updated. The checksum is automatically calculated by the LIN/UART interface. To abort the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

**Note:** x: Arbitrary value can be specified.

- Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode: the RLN3nLBRP0 register, the RLN3nLBRP1 register and the LCKS bit in the RLN3nLMD register. Therefore, configuration of these registers is not necessary.
- Note 2.** If necessary, configure the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8, Section 7BC, Exception/Interrupts of RH850/F1KM.**
- Note 3.** When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled). The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1) [\text{Tbit}]$$

$$1 \text{ Tbit} = 1/\text{frequency of LIN communication clock source} \times 16$$

### 22.9.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  - RLN3nLWBR register = 0000 000<sub>x<sub>B</sub></sub><sup>\*1</sup>
  - RLN3nLBRP0 register = xxxx xxx<sub>x<sub>B</sub></sub><sup>\*1</sup>
  - RLN3nLBRP1 register = xxxx xxx<sub>x<sub>B</sub></sub><sup>\*1</sup>
  - RLN3nLMD register = 00xx xx00<sub>B</sub><sup>\*1</sup>
- Configure the interrupt enable and error enable related registers.
  - RLN3nLIE register = 0000 xxx<sub>x<sub>B</sub></sub><sup>\*2</sup>
  - RLN3nLEDE register = x000 x0xx<sub>B</sub>
- Configure the break field and space related registers.
  - RLN3nLBFC register = 00xx xxx<sub>x<sub>B</sub></sub>
  - RLN3nLSC register = 00xx 0xxx<sub>B</sub><sup>\*1</sup>
- Exit the LIN reset mode.
 

Write 11<sub>B</sub> to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11<sub>B</sub>.
- Configure the reception frame related registers.
  - RLN3nLDFC register = 00x0 xxx<sub>x<sub>B</sub></sub>
  - RLN3nLIDB register = xxxx xxx<sub>x<sub>B</sub></sub>
  - RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx xxx<sub>x<sub>B</sub></sub>
  - RLN3nLCBR register = xxxx xxx<sub>x<sub>B</sub></sub>

Since the checksum value to be transmitted is not automatically calculated, perform the calculation and specify the calculated value in the RLN3nLCBR register.
- Start header transmission → response reception
 

Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN master self-test mode (reception) is executed, interrupt is generated, and status and error status are also updated. To abort the LIN master self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the specified value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

**Note:** x: Arbitrary value can be specified.

- Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode: the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, configuration of these registers is not necessary.
- Note 2.** If necessary, configure the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**, **Section 7BC, Exception/Interrupts of RH850/F1KM**.
- Note 3.** When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE

register should not be set to 1 (successful header transmission interrupt enabled).

The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1) [\text{Tbit}]$$

$$1 \text{ Tbit} = 1/\text{frequency of LIN communication clock source} \times 16$$

## 22.9.4 Transmission in LIN Slave Self-Test Mode

To execute a self-test on LIN slave transmission, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  - RLN3nLWBR register = 0000 0000<sub>B</sub>\*<sup>1</sup>
  - RLN3nLBRP0 register = xxxx xxxx<sub>B</sub>\*<sup>1</sup>
  - RLN3nLBRP1 register = xxxx xxxx<sub>B</sub>\*<sup>1</sup>
  - RLN3nLMD register = 00x x0011<sub>B</sub>
- Configure the interrupt enable and error enable related registers.
  - RLN3nLIE register = 0000 xxxx<sub>B</sub>\*<sup>2</sup>
  - RLN3nLEDE register = xx0x x00x<sub>B</sub>
- Configure the break field and space related registers.
  - RLN3nLBFC register = 0000 000x<sub>B</sub>\*<sup>3</sup>
  - RLN3nLSC register = 00xx 0001<sub>B</sub>
- Exit the LIN reset mode.
 

Write 11<sub>B</sub> to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11<sub>B</sub>.
- Configure the transmission frame related registers.
  - RLN3nLDFC register = 00x1 xxxx<sub>B</sub>
  - RLN3nLIDB register = xxxx xxxx<sub>B</sub>
  - RLN3nLDBR1 to RLN3nLDBR8 registers = xxxx xxxx<sub>B</sub>
- Header reception → response transmission started
 

Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started). (The header reception and the response transmission are executed in this order, without manipulating the RTS bit in the RLN3nLTRC register.)

The LIN slave self-test mode (transmission) is executed, interrupt is generated, and status and error status are also updated.

The checksum is automatically calculated by the LIN/UART interface. To abort the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

**Note:** x: Arbitrary value can be specified.

**Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode: the RLN3nLBRP0 register, and the RLN3nLBRP1 register. Therefore, configuration of these registers is not necessary.

**Note 2.** If necessary, configure the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8, Section 7BC, Exception/Interrupts of RH850/F1KM.**

**Note 3.** According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

**Note 4.** When the successful header reception interrupt and the successful response transmission interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response transmission interrupt, the SHIE bit in the RLIN3nLIE register should not be set to 1 (successful header reception interrupt enabled).

The time from setting of the successful header reception flag to setting of the successful response/wake-up transmission flag is calculated by using the following formula.

$$10 \times (\text{number of data bytes} + 1) \text{ [Tbit]}$$

$$1 \text{ Tbit} = 1/\text{frequency of LIN communication clock source} \times 16$$

## 22.9.5 Reception in LIN Slave Self-Test Mode

To execute a self-test on LIN slave reception, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  - RLN3nLWBR register = 0000 0000<sub>B</sub>\*<sup>1</sup>
  - RLN3nLBRP0 register = xxxx xxxx<sub>B</sub>\*<sup>1</sup>
  - RLN3nLBRP1 register = xxxx xxxx<sub>B</sub>\*<sup>1</sup>
  - RLN3nLMD register = 00xx 0011<sub>B</sub>
- Configure the interrupt enable and error enable related registers.
  - RLN3nLIE register = 0000 xxxx<sub>B</sub>\*<sup>2</sup>
  - RLN3nLEDE register = xx0x x00x<sub>B</sub>
- Configure the break field and space related registers.
  - RLN3nLBFC register = 0000 000x<sub>B</sub>\*<sup>3</sup>
  - RLN3nLSC register = 00xx 0001<sub>B</sub>\*<sup>1</sup>
- Exit the LIN reset mode.
 

Write 11<sub>B</sub> to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11<sub>B</sub>.
- Configure the reception frame related registers.
  - RLN3nLDFC register = 00x0 xxxx<sub>B</sub>
  - RLN3nLIDB register = xxxx xxxx<sub>B</sub>
  - RLN3nLDBR1 to RLN3nLDBR8 registers = xxxx xxxx<sub>B</sub>
  - RLN3nLCBR register = xxxx xxxx<sub>B</sub>

Since the checksum value to be transmitted is not automatically calculated, users must calculate it and set it to the RLN3nLCBR register. A checksum test can be performed by setting an incorrect checksum value here.
- Header reception → response reception started
 

Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started). (Without any setting of the RTS bit in the RLN3nLTRC register, the header reception and the response reception are executed in this order.)

The LIN slave self-test mode (reception) is executed, interrupt is generated, and status and error status are also updated. To abort the LIN slave self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the specified value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

**Note:** x: Arbitrary value can be specified.

- Note 1.** The settings of the following registers are not reflected to the operation of the LIN self-test mode: the RLN3nLBRP0 register, and the RLN3nLBRP1 register.  
Therefore, configuration of these registers is not necessary.
- Note 2.** If necessary, configure the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8, Section 7BC, Exception/Interrupts of RH850/F1KM.**
- Note 3.** According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.
- Note 4.** When the successful header reception interrupt and the successful response reception interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not

completed before the generation of the successful response reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).

The time required from the set of the successful header reception flag to the set of the successful response/wake-up reception flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1) [\text{Tbit}]$$

$$1 \text{ Tbit} = 1/\text{frequency of LIN communication clock source} \times 16$$

### 22.9.6 Exiting LIN Self-Test Mode

To exit LIN self-test mode, perform the following procedure:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.  
If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11<sub>B</sub>, write 11<sub>B</sub> to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11<sub>B</sub>, transition to LIN reset mode.
- Verify that LIN/UART interface has exited LIN self-test mode.  
Read the LSTM bit in the RLN3nLSTC register; verify that it is 0 (not in LIN self-test mode)
- Verify the transition to LIN reset mode.  
Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

## 22.10 Baud Rate Generator

The prescaler clock is obtained by dividing the LIN communication clock source frequency by the prescaler, and the LIN system clock ( $f_{LIN}$ ) is obtained by dividing the prescaler clock frequency by the baud rate generator. The clock obtained by dividing the LIN system clock frequency ( $f_{LIN}$ ) by the number of samples is the baud rate. The inverse of this baud rate is called the bit time (Tbit).

The LIN/UART interface has two types of baud rate generators. The baud rate generators are switched according to the mode used.

### 22.10.1 LIN Master Mode

**Figure 22.36, Block Diagram of Baud Rate Generation in LIN Master Mode** shows a block diagram of baud rate generation in LIN master mode.

Figure 22.36 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that  $f_a$  is 307200 Hz (= 19200 × 16), the resulting bit rates are  $f_a = 19200 \times 16$ ,  $f_b = 9600 \times 16$ , and  $f_c = 2400 \times 16$ . These bit rates are frequency-divided by 16 in the bit timing generator, enabling baud rates of 19200 bps, 9600 bps and 2400 bps, to be generated. Also, by configuring the RLN3nLBRP1 register so that  $f_d$  is 166672 Hz (= 10417 × 16), the resulting bit rate is  $f_d = 10417 \times 16$ . This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

Baud rate of LIN master

$$= \{ \text{Frequency of LIN communication clock source} \} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selected clock})$$

$$\div (\text{RLN3nLBRP0} + 1) \div 16 [\text{bps}] \text{ (When } f_a \text{ is selected for } f_{LIN})$$

$$= \{ \text{Frequency of LIN communication clock source} \} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selected clock})$$

$$\begin{aligned} & \div (\text{RLN3nLBRP0} + 1) \div 2 \div 16 \text{ [bps]} \text{ (When fb is selected for } f_{\text{LIN}}) \\ = & \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selected clock}) \\ & \div (\text{RLN3nLBRP0} + 1) \div 8 \div 16 \text{ [bps]} \text{ (When fc is selected for } f_{\text{LIN}}) \\ = & \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selected clock}) \\ & \div (\text{RLN3nLBRP1} + 1) \div 2 \div 16 \text{ [bps]} \text{ (When fd is selected for } f_{\text{LIN}}) \end{aligned}$$

### 22.10.2 LIN Slave Mode

**Figure 22.37, Block Diagram of Baud Rate Generation in LIN Slave Mode** shows a block diagram of baud rate generation in LIN slave mode.

Figure 22.37 Block Diagram of Baud Rate Generation in LIN Slave Mode

In LIN slave mode (auto baud rate), the baud rate can be specified in the range of 1 kbps to 20 kbps. Configure the prescaler clock as follows according to the target baud rate:

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4 MHz* <sup>1</sup>
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

**Note 1.** Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to "0011<sub>B</sub>" (4 samplings).

The formula for baud rate is described below.

Baud rate of LIN slave

$$\begin{aligned} & = \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selected clock}) \\ & \div (\text{RLN3nLBRP0} + 1) \div 16 \text{ [bps]} \text{ ([Fixed baud rate])} \\ = & \{\text{Frequency of LIN communication clock source}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selected clock}) \\ & \div (\text{RLN3nLBRP0} + 1) \div 4 \text{ or } 8 \text{ [bps]} \text{ ([Auto baud rate])} \end{aligned}$$

## NOTE

For a LIN slave with fixed baud rate, set the NSPB[3:0] bit to "0000<sub>B</sub>" (16 samplings) or "1111<sub>B</sub>" (16 samplings). For a LIN slave with auto baud rate, set the NSPB[3:0] bits to "0011<sub>B</sub>" (4 samplings) or "0100<sub>B</sub>" (8 samplings).

### 22.10.3 UART Mode

**Figure 22.38, Block Diagram of Baud Rate Generation in UART Mode** shows a block diagram of baud rate generation in UART mode.

Figure 22.38 Block Diagram of Baud Rate Generation in UART Mode

UART baud rate is calculated with the following formula:

UART baud rate

$$= \{\text{LIN communication clock source frequency}\} \times (\text{RLN3nLWBR.LPRS}[2:0] \text{ selected clock}) \div (\text{RLN3nLBRP0} + 1) \div \{\text{RLN3nLWBR.NSPB}[3:0] \text{ selected count}\} \text{ [bps]}$$

## 22.11 Noise Filter

The LIN/UART interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLIN3nLMD register to 0 (use the noise filter), the noise filter is activated. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

**Figure 22.39, Configuration of Noise Filter** shows the configuration of the noise filter, **Figure 22.40, Example of Noise Filter Circuit** shows an example of a noise filter circuit, and **Figure 22.41, Determination of Received Data when Noise Filter is Used** shows the determination of the received data when the noise filter is used.

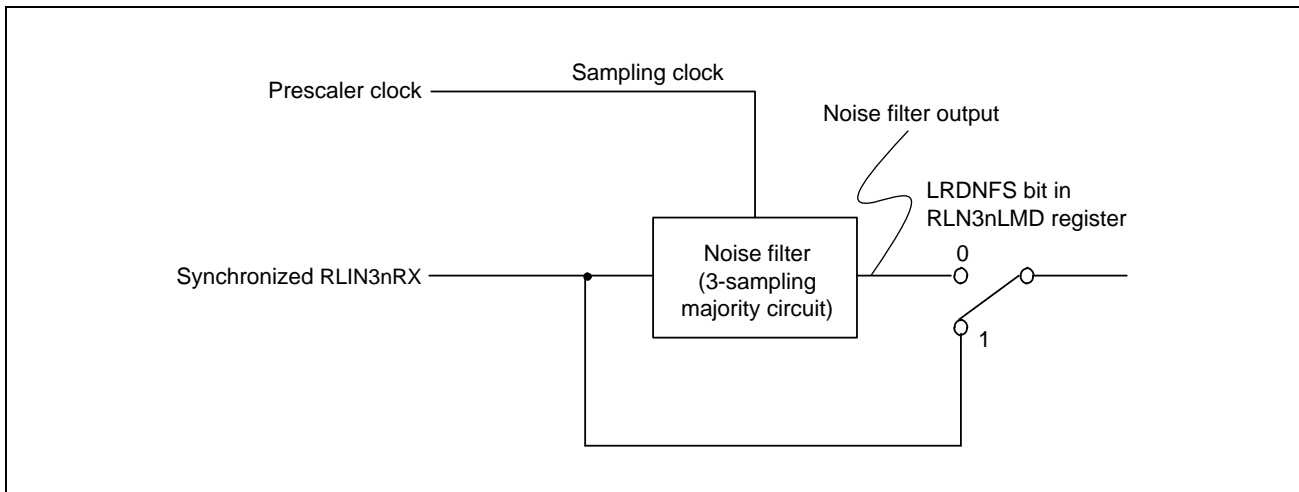

Figure 22.39 Configuration of Noise Filter

Figure 22.40 Example of Noise Filter Circuit

Figure 22.41 Determination of Received Data when Noise Filter is Used

## Section 23 I<sup>2</sup>C Bus Interface (RIIC)

This section contains a generic description of the I<sup>2</sup>C Bus Interface (RIIC).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RIIC.

### 23.1 Features of RH850/F1KH, RH850/F1KM RIIC

#### 23.1.1 Number of Units

This microcontroller has the following number of RIIC units.

Each RIIC unit has single channel interface.

Table 23.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	2	2	2
Name	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)

Table 23.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	2	2	2	2	2
Name	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)

Table 23.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	2	2	2
Name	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)

Table 23.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	2	2	2	2
Name	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)

Table 23.5 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RIIC units are identified by the index "n": for example, RIICnCR1 (n = 0, 1) is the I <sup>2</sup> C bus control register 1.

### 23.1.2 Register Base Addresses

RIIC base addresses are listed in the following table.

RIIC register addresses are given as offsets from the base addresses.

Table 23.6 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<RIIC0_base>	FFCA 0000 <sub>H</sub>
<RIIC1_base>	FFCA 0080 <sub>H</sub>

### 23.1.3 Clock Supply

The RIIC clock supply is shown in the following table.

Table 23.7 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RIICn	PCLK*1	CKSCLK_IIC	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_IIC	Bus clock

Note 1. Set the period of PCLK no greater than 1/2 of the width at high level of the SCL clock.

### 23.1.4 Interrupt Requests

RIIC interrupt requests are listed in the following table.

Table 23.8 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RIIC0			
INTRIICnEE	RIIC communication error / event generation interrupt	77	—
INTRIICnRI	RIIC receive end interrupt	78	20
INTRIICnTI	RIIC transmit data empty interrupt	76	19
INTRIICnTEI	RIIC transmit end interrupt	79	—
RIIC1			
INTRIICnEE	RIIC communication error / event generation interrupt	241	—
INTRIICnRI	RIIC receive end interrupt	242	114
INTRIICnTI	RIIC transmit data empty interrupt	240	113
INTRIICnTEI	RIIC transmit end interrupt	243	—

### 23.1.5 Reset Sources

RIIC reset sources are listed in the following table. RIIC is initialized by these reset sources.

Table 23.9 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
RIICn	All reset sources (ISORES)

### 23.1.6 External Input/Output Signals

External input/output signals of RIIC are listed below.

Table 23.10 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RIIC0		
RIICnSCL	Serial clock I/O pin	RIIC0SCL
RIICnSDA	Serial data I/O pin	RIIC0SDA
RIIC1		
RIICnSCL	Serial clock I/O pin	RIIC1SCL
RIICnSDA	Serial data I/O pin	RIIC1SDA

When using these ports, the PBDCn register for the corresponding port and the corresponding bit in the PODCn register must be set to 1.

## 23.2 Overview

### 23.2.1 Functional Overview

#### Communications format

- I<sup>2</sup>C bus format
- Master mode or slave mode selectable
- Automatic securing of the various set-up times, hold times, and bus-free times according to the specified transfer rate

#### Transfer rate

Up to 400 kbps

#### SCL clock

- For master operation, the duty cycle of the SCL clock is selectable in the following range:
  - $0\% < \text{Duty} < 100\%$

#### Issuing and detecting conditions

Start, restart, and stop conditions are automatically generated. Start conditions (including restart conditions) and stop conditions are detectable.

#### Slave address

- Up to three slave-address settings can be made.
- Seven- and ten-bit address formats are supported (along with the use of both at once).
- General call addresses and device ID addresses are detectable.

#### Acknowledgement

- For transmission, the acknowledge bit is automatically loaded
  - Transfer of the next data for transmission can be automatically suspended on detection of a not-acknowledge bit.
- For reception, the acknowledge bit is automatically transmitted
  - If a wait between the eighth and ninth clock cycles has been selected, software control of the value in the acknowledge field in response to the received value is possible.

#### Wait function

- In reception, the following periods of waiting can be obtained by holding the clock signal (SCL) at the low level:
  - Waiting between the eighth and ninth clock cycles
  - Waiting between the ninth clock cycle and the first clock cycle of the next transfer (WAIT function)

#### SDA output delay function

Timing of the output of transmitted data, including the acknowledge bit, can be delayed.

### Arbitration

- For multi-master operation
  - Operation to synchronize the SCL (clock) signal in cases of conflict with the SCL signal from another master is possible.
  - When issuing the start condition would create conflict on the bus, loss of arbitration is detected by testing for non-matching between the internal signal for the SDA line and the level on the SDA line.
  - In master operation, loss of arbitration is detected by testing for non-matching of internal and line levels for transmit data.
- Loss of arbitration due to detection of the start condition while the bus is busy can be detected (to prevent the issuing of double start conditions).
- Loss of arbitration in transfer of a not-acknowledge bit due to the internal signal for the SDA line and the level on the SDA line not matching can be detected.
- Loss of arbitration due to non-matching of internal and line levels for data can be detected in slave transmission.

### Timeout function

The internal time-out function is capable of detecting long-interval stop of the SCL (clock signal).

### Noise removal

The interface incorporates digital noise filters for both the SCL and SDA signals, and the width for noise cancellation by the filters is adjustable by software.

### Interrupt sources

- Four sources:
  - Error in transfer or occurrence of events (detection of arbitration loss, NACK, time-out, a start condition including a restart condition, or a stop condition)
  - Reception complete (including matching with a slave address)
  - Transmit-data-empty (including matching with a slave address)
  - Transmission complete

23.2.2 Block Diagram

Figure 23.1 Block Diagram of RIIC

Figure 23.2 Connections to the External Circuit by the I/O Pins (I<sup>2</sup>C Bus Configuration Example)

## 23.3 Registers

### 23.3.1 List of Registers

RIIC registers are listed in the table below.

For details about <RIICn\_base>, see **Section 23.1.2, Register Base Addresses**.

Table 23.11 List of Registers

Module Name	Register Name	Symbol	Address
RIICn	I <sup>2</sup> C bus control register 1	RIICnCR1	<RIICn_base> + 0000 <sub>H</sub>
	I <sup>2</sup> C bus control register 2	RIICnCR2	<RIICn_base> + 0004 <sub>H</sub>
	I <sup>2</sup> C bus mode register 1	RIICnMR1	<RIICn_base> + 0008 <sub>H</sub>
	I <sup>2</sup> C bus mode register 2	RIICnMR2	<RIICn_base> + 000C <sub>H</sub>
	I <sup>2</sup> C bus mode register 3	RIICnMR3	<RIICn_base> + 0010 <sub>H</sub>
	I <sup>2</sup> C bus function enable register	RIICnFER	<RIICn_base> + 0014 <sub>H</sub>
	I <sup>2</sup> C bus status enable register	RIICnSER	<RIICn_base> + 0018 <sub>H</sub>
	I <sup>2</sup> C bus interrupt enable register	RIICnIER	<RIICn_base> + 001C <sub>H</sub>
	I <sup>2</sup> C bus status register 1	RIICnSR1	<RIICn_base> + 0020 <sub>H</sub>
	I <sup>2</sup> C bus status register 2	RIICnSR2	<RIICn_base> + 0024 <sub>H</sub>
	I <sup>2</sup> C slave address register 0	RIICnSAR0	<RIICn_base> + 0028 <sub>H</sub>
	I <sup>2</sup> C slave address register 1	RIICnSAR1	<RIICn_base> + 002C <sub>H</sub>
	I <sup>2</sup> C slave address register 2	RIICnSAR2	<RIICn_base> + 0030 <sub>H</sub>
	I <sup>2</sup> C bus bit rate low-level register	RIICnBRL	<RIICn_base> + 0034 <sub>H</sub>
	I <sup>2</sup> C bus bit rate high-level register	RIICnBRH	<RIICn_base> + 0038 <sub>H</sub>
	I <sup>2</sup> C bus transmit data register	RIICnDRT	<RIICn_base> + 003C <sub>H</sub>
	I <sup>2</sup> C bus receive data register	RIICnDRR	<RIICn_base> + 0040 <sub>H</sub>
	I <sup>2</sup> C bus shift register	RIICnDRS	—

### 23.3.2 RIICnCR1 — I<sup>2</sup>C Bus Control Register 1

**Access:** RIICnCR1 register can be read or written in 32-bit units.  
 RIICnCR1L register can be read or written in 16-bit units.  
 RIICnCR1LL register can be read or written in 8-bit units.

**Address:** RIICnCR1: <RIICn\_base> + 0000<sub>H</sub>  
 RIICnCR1L: <RIICn\_base> + 0000<sub>H</sub>  
 RIICnCR1LL: <RIICn\_base> + 0000<sub>H</sub>

**Value after reset:** 0000 001F<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ICE	IICRST	CLO	SOWP	SCLO	SDAO	SCLI	SDAI
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	W	R/W	R/W	R	R

Table 23.12 RIICnCR1 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ICE	I <sup>2</sup> C Bus Interface Enable 0: Disabled (the RIICnSCL and RIICnSDA pins are not driven). 1: Enabled (the RIICnSCL and RIICnSDA pins are driven). (This bit selects an RIIC reset or internal reset in combination with the IICRST bit.)
6	IICRST	I <sup>2</sup> C Bus Internal Reset 0: Clears the RIIC reset or internal reset. 1: Initiates the RIIC reset or internal reset. (Clears the bit counter and the SCL/SDA output latch)
5	CLO	Extra SCL Clock Cycle Output 0: Does not output an extra SCL clock cycle (default). 1: Outputs an extra SCL clock cycle. (The CLO bit is cleared automatically after one clock cycle is output.)
4	SOWP	SCLO/SDAO Write Protect 0: Bits SCLO and SDAO can be written. 1: Bits SCLO and SDAO are protected. (This bit is read as 1.)
3	SCLO	SCL Output Control/Monitor <ul style="list-style-type: none"> <li>• Read:               <ul style="list-style-type: none"> <li>0: The RIIC has driven the RIICnSCL pin low.</li> <li>1: The RIIC has released the RIICnSCL pin.</li> </ul> </li> <li>• Write:               <ul style="list-style-type: none"> <li>0: The RIIC drives the RIICnSCL pin low.</li> <li>1: The RIIC releases the RIICnSCL pin.</li> </ul> </li> </ul>

Table 23.12 RIICnCR1 Register Contents

Bit Position	Bit Name	Function
2	SDAO	SDA Output Control/Monitor <ul style="list-style-type: none"> <li>• Read:               <ul style="list-style-type: none"> <li>0: The RIIC has driven the RIICnSDA pin low.</li> <li>1: The RIIC has released the RIICnSDA pin.</li> </ul> </li> <li>• Write:               <ul style="list-style-type: none"> <li>0: The RIIC drives the RIICnSDA pin low.</li> <li>1: The RIIC releases the RIICnSDA pin.</li> </ul> </li> </ul>
1	SCLI	SCL Line Monitor <ul style="list-style-type: none"> <li>0: RIICnSCL line is low.</li> <li>1: RIICnSCL line is high.</li> </ul>
0	SDAI	SDA Line Monitor <ul style="list-style-type: none"> <li>0: RIICnSDA line is low.</li> <li>1: RIICnSDA line is high.</li> </ul>

### SDAO Bit (SDA Output Control/Monitor) and SCLO Bit (SCL Output Control/Monitor)

These bits are used to directly control the RIICnSDA and RIICnSCL signals output from the RIIC.

When writing to these bits, also write 0 to the SOWP bit.

The result of setting these bits is input to the RIIC via the input buffer. When slave mode is selected, a START condition may be detected and the bus may be released depending on the bit settings.

Do not rewrite these bits during a START condition, STOP condition, repeated START condition, or during transmission or reception. Operation after rewriting under the above conditions is not guaranteed.

When reading these bits, the state of signals output from the RIIC can be read.

### CLO Bit (Extra SCL Clock Cycle Output)

This bit is used to output an extra SCL clock cycle for debugging or error processing.

Normally, set the bit to 0. Setting the bit to 1 in a normal communication state causes a communication error.

For details on this function, see **Section 23.13.2, Extra SCL Clock Cycle Output Function**.

### IICRST Bit (I<sup>2</sup>C Bus Internal Reset)

This bit is used to reset the internal states of the RIIC.

Setting this bit to 1 initiates an RIIC reset or internal reset.

Whether an RIIC reset or internal reset is initiated is determined according to the combination with the ICE bit.

**Table 23.13, RIIC Resets** lists the types of RIIC reset.

The RIIC reset resets all registers (except ICE and IICRST) including the RIICnCR2.BBSY flag and internal states of the RIIC, and the internal reset resets the bit counter (RIICnMR1.BC[2:0] bits), the I<sup>2</sup>C bus shift register (RIICnDRS), and the I<sup>2</sup>C bus status registers (RIICnSR1 and RIICnSR2) as well as the internal states of the RIIC. For the reset conditions for each register, see **Section 23.14, Reset Function of RIIC**.

An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the RIIC without initializing the port settings and the control and setting registers of the RIIC when the bus or RIIC hangs up due to a communication error, etc.

If the RIIC hangs up in a low level output state, resetting the internal states cancels the low level output state and releases the bus with the RIICnSCL pin and RIICnSDA pin at a high impedance.

**CAUTION**

If an internal reset is initiated using the IICRST bit for a bus hang-up occurred during communication with the master device in slave mode, the states may become different between the slave device and the master device (due to the difference in the bit counter information). For this reason, do not initiate an internal reset in slave mode, but initiate restoration processing from the master device. If an internal reset is necessary because the RIIC hangs up with the SCL line in a low level output state in slave mode, initiate an internal reset and then issue a restart condition from the master device or resume communication from the start condition issuance after issuing a stop condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start condition or restart condition from the master device, synchronization will be lost because the master and slave devices operate asynchronously.

Table 23.13 RIIC Resets

IICRST	ICE	State	Specifications
1	0	RIIC reset	Resets all registers (except ICE and IICRST) and internal states of the RIIC.
	1	Internal reset	Reset the RIICnMR1.BC[2:0] bits, and the RIICnSR1, RIICnSR2, RIICnDRS registers and the internal states of the RIIC.

**ICE Bit (I<sup>2</sup>C Bus Interface Enable)**

The ICE bit selects driving or non-driving of the RIICnSCL and RIICnSDA pins. Moreover, this bit can perform two types of reset in combination with the IICRST bit. For the types of reset, see **Table 23.13, RIIC Resets**.

Set the ICE bit to 1 when using RIIC. Setting the ICE bit to 1 selects driving of the RIICnSCL and RIICnSDA pins.

Set the ICE bit to 0 when RIIC is not to be used. Clearing the ICE bit to 0 stops driving of the RIICnSCL and RIICnSDA pins.

**CAUTION**

Though the output from RIICnSDA or RIICnSCL is disabled while the ICE bit is 0, the input to RIICnSDA or RIICnSCL is enabled. The RIICnSCL and RIICnSDA pin functions should not be assigned to the RIIC. If assigned, it causes the slave addresses to be compared.

### 23.3.3 RIICnCR2 — I<sup>2</sup>C Bus Control Register 2

**Access:** RIICnCR2 register can be read or written in 32-bit units.  
 RIICnCR2L register can be read or written in 16-bit units.  
 RIICnCR2LL register can be read or written in 8-bit units.

**Address:** RIICnCR2: <RIICn\_base> + 0004<sub>H</sub>  
 RIICnCR2L: <RIICn\_base> + 0004<sub>H</sub>  
 RIICnCR2LL: <RIICn\_base> + 0004<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	BBSY	MST	TRS	—	SP	RS	ST	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R

Table 23.14 RIICnCR2 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	BBSY	Bus Busy Detection Flag 0: The I <sup>2</sup> C bus is released (the bus is free). 1: The I <sup>2</sup> C bus is occupied (the bus is busy).
6	MST* <sup>1</sup>	Master/Slave Mode 0: Slave mode 1: Master mode
5	TRS* <sup>1</sup>	Transmit/Receive Mode 0: Receive mode 1: Transmit mode
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SP	Stop Condition Issuance Request 0: Does not request to issue a stop condition. 1: Requests to issue a stop condition.
2	RS	Restart Condition Issuance Request 0: Does not request to issue a restart condition. 1: Requests to issue a restart condition.
1	ST	Start Condition Issuance Request 0: Does not request to issue a start condition. 1: Requests to issue a start condition.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. When the RIICnMR1.MTWP bit is set to 1, the MST and TRS bits can be written to.

**ST Bit (Start Condition Issuance Request)**

This bit is used to request transition to master mode and issuance of a start condition.

When this bit is set to 1 to request to issue a start condition, a start condition is issued when the BBSY flag is set to 0 (bus free).

For details on the start condition issuance, see **Section 23.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the ST bit

[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition has been issued
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTION**

Set the ST bit to 1 (start condition issuance request) when the BBSY flag is set to 0 (bus free).

Note that arbitration may be lost as the start condition issuance error if the ST bit is set to 1 (start condition issuance request) when the BBSY flag is set to 1 (bus busy).

**RS Bit (Restart Condition Issuance Request)**

This bit is used to request that a restart condition be issued in master mode.

When this bit is set to 1 to request to issue a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the restart condition issuance, see **Section 23.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the RS bit with the RIICnCR2.BBSY flag set to 1

[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition has been issued or a start condition is detected
- When a stop condition is detected
- When the RIICnCR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTIONS**

1. Do not set the RS bit to 1 while issuing a stop condition.
2. It is commended to issue a restart condition in master transmit mode. If the RS bit is set to 1 (restart condition issuance request) in mode other than master mode, the restart condition is not issued in this mode but the RS bit remains set. If the operating mode changes to master mode with the bit not being cleared, the restart condition may be issued.

**SP Bit (Stop Condition Issuance Request)**

This bit is used to request that a stop condition be issued in master mode.

When this bit is set to 1 to request to issue a stop condition, a stop condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the stop condition issuance, see **Section 23.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the SP bit with both the RIICnCR2.BBSY flag and the RIICnCR2.MST bit set to 1

[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition has been issued or a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When a start condition and a restart condition are detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTIONS**

1. Writing to the SP bit is not possible while the setting of the BBSY flag is 0 (bus free).
2. Do not set the SP bit to 1 while a restart condition is being issued.

**TRS Bit (Transmit/Receive Mode)**

This bit indicates transmit or receive mode.

The RIIC is in receive mode when the TRS bit is set to 0 and is in transmit mode when the bit is set to 1. Combination of this bit and the MST bit indicates the operating mode of the RIIC.

The value of the TRS bit is automatically changed to the value for transmission mode or reception mode (1 or 0) by the following conditions.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When the address received in slave mode matches the address enabled in RIICnSER, with the R/W# bit set to 1
- When 1 is written to the TRS bit with the RIICnMR1.MTWP bit set to 1

[Clearing conditions]

- When a stop condition is detected
- The RIICnSR2.AL (arbitration-lost) flag being set to 1
- In master mode, reception of a slave address to which an R/W# bit with the value 1 is appended
- In slave transmit mode, a restart condition is detected (a restart condition is detected with RIICnCR2.BBSY = 1 and RIICnCR2.MST = 0)
- When 0 is written to the TRS bit with the RIICnMR1.MTWP bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**MST Bit (Master/Slave Mode)**

This bit indicates master or slave mode.

The RIIC is in slave mode when the MST bit is set to 0 and is in master mode when the bit is set to 1. Combination of this bit and the TRS bit indicates the operating mode of the RIIC.

The value of the MST bit is automatically changed to the value for master mode or slave mode (1 or 0) by the following conditions.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When 1 is written to the MST bit with the RIICnMR1.MTWP bit set to 1

[Clearing conditions]

- When a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 0 is written to the MST bit with the RIICnMR1.MTWP bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**BBSY Flag (Bus Busy Detection)**

The BBSY flag indicates whether the I<sup>2</sup>C bus is occupied (bus busy) or released (bus free).

This bit is set to 1 when the SDA line changes from high to low under the condition of SCL = high, assuming that a start condition has been issued.

When the SDA line changes from low to high under the condition of SCL = high, this bit is cleared to 0 after the bus free time (specified in RIICnBRL) start condition is not detected, assuming that a stop condition has been issued.

[Setting condition]

When a start condition is detected

[Clearing conditions]

- When the bus free time (specified in RIICnBRL) start condition is not detected after detecting a stop condition
- When 1 is written to the RIICnCR1.IICRST bit with the RIICnCR1.ICE bit set to 0 (RIIC reset)

**CAUTION**

- When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
- When an internal reset is applied while the bus is not free, the BBSY flag is not cleared.

### 23.3.4 RIICnMR1 — I<sup>2</sup>C Bus Mode Register 1

**Access:** RIICnMR1 register can be read or written in 32-bit units.  
 RIICnMR1L register can be read or written in 16-bit units.  
 RIICnMR1LL register can be read or written in 8-bit units.

**Address:** RIICnMR1: <RIICn\_base> + 0008<sub>H</sub>  
 RIICnMR1L: <RIICn\_base> + 0008<sub>H</sub>  
 RIICnMR1LL: <RIICn\_base> + 0008<sub>H</sub>

**Value after reset:** 0000 0008<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MTWP	CKS[2:0]			BCWP	BC[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	W	R/W	R/W	R/W

Table 23.15 RIICnMR1 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	MTWP	MST/TRS Write Protect 0: Disables writing to the RIICnCR2.MST and TRS bits. 1: Enables writing to the RIICnCR2.MST and TRS bits.
6 to 4	CKS[2:0]	Internal Reference Clock Selection (IIC $\phi$ ) b6 b4 0 0 0: PCLK/1 clock 0 0 1: PCLK/2 clock 0 1 0: PCLK/4 clock 0 1 1: PCLK/8 clock 1 0 0: PCLK/16 clock 1 0 1: PCLK/32 clock 1 1 0: PCLK/64 clock 1 1 1: PCLK/128 clock
3	BCWP*1	BC Write Protect 0: Enables a value to be written in the BC[2:0] bits. (This bit is read as 1.) 1: Protects the BC[2:0] bits.
2 to 0	BC[2:0]	Bit Counter b2 b0 0 0 0: 9 bits 0 0 1: 2 bits 0 1 0: 3 bits 0 1 1: 4 bits 1 0 0: 5 bits 1 0 1: 6 bits 1 1 0: 7 bits 1 1 1: 8 bits

Note 1. When rewriting the BC[2:0] bits, write 0 to the BCWP bit simultaneously.

**BC[2:0] Bits (Bit Counter)**

These bits function as a counter that indicates the number of bits remaining to be transferred at the detection of a rising edge on the SCL line. Although these bits are writable and readable, it is not necessary to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one (data is transferred with an additional acknowledge bit) between transferred frames. When setting any value other than 000<sub>B</sub>, set the value while the SCL line is at a low level.

[Clearing conditions]

- When 1 is written to the RIICnCR1.IICRST bit and a RIIC reset or internal reset is initiated.
- Data transfer including the acknowledge bit being completed.
- A start condition including a restart condition being detected.

### 23.3.5 RIICnMR2 — I<sup>2</sup>C Bus Mode Register 2

**Access:** RIICnMR2 register can be read or written in 32-bit units.  
 RIICnMR2L register can be read or written in 16-bit units.  
 RIICnMR2LL register can be read or written in 8-bit units.

**Address:** RIICnMR2: <RIICn\_base> + 000C<sub>H</sub>  
 RIICnMR2L: <RIICn\_base> + 000C<sub>H</sub>  
 RIICnMR2LL: <RIICn\_base> + 000C<sub>H</sub>

**Value after reset:** 0000 0006<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 23.16 RIICnMR2 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	DLCS	SDA Output Delay Clock Source Selection 0: The internal reference clock (IIC $\phi$ ) is selected as the clock source of the SDA output delay counter. 1: The internal reference clock divided by 2 (IIC $\phi$ /2) is selected as the clock source of the SDA output delay counter.*1
6 to 4	SDDL[2:0]	SDA Output Delay Counter <ul style="list-style-type: none"> <li>When RIICnMR2.DLCS = 0 (IIC<math>\phi</math>)               <ul style="list-style-type: none"> <li>b6 b4</li> <li>0 0 0: No output delay</li> <li>0 0 1: 1 IIC<math>\phi</math> cycle</li> <li>0 1 0: 2 IIC<math>\phi</math> cycles</li> <li>0 1 1: 3 IIC<math>\phi</math> cycles</li> <li>1 0 0: 4 IIC<math>\phi</math> cycles</li> <li>1 0 1: 5 IIC<math>\phi</math> cycles</li> <li>1 1 0: 6 IIC<math>\phi</math> cycles</li> <li>1 1 1: 7 IIC<math>\phi</math> cycles</li> </ul> </li> <li>When RIICnMR2.DLCS = 1 (IIC<math>\phi</math>/2)               <ul style="list-style-type: none"> <li>b6 b4</li> <li>0 0 0: No output delay</li> <li>0 0 1: 1 or 2 IIC<math>\phi</math> cycles</li> <li>0 1 0: 3 or 4 IIC<math>\phi</math> cycles</li> <li>0 1 1: 5 or 6 IIC<math>\phi</math> cycles</li> <li>1 0 0: 7 or 8 IIC<math>\phi</math> cycles</li> <li>1 0 1: 9 or 10 IIC<math>\phi</math> cycles</li> <li>1 1 0: 11 or 12 IIC<math>\phi</math> cycles</li> <li>1 1 1: 13 or 14 IIC<math>\phi</math> cycles</li> </ul> </li> </ul>

Table 23.16 RIICnMR2 Register Contents

Bit Position	Bit Name	Function
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TMOH	Timeout H Count Control 0: Disables counting while the SCL line is at a high level. 1: Enables counting while the SCL line is at a high level.
1	TMOL	Timeout L Count Control 0: Disables counting while the SCL line is at a low level. 1: Enables counting while the SCL line is at a low level.
0	TMOS	Timeout Detection Time Selection 0: Long mode is selected. 1: Short mode is selected.

Note 1. The setting DLCS = 1 (IIC $\phi$ /2) only becomes valid when SCL is at the low level. When SCL is at the high level, the setting DLCS = 1 becomes invalid and the clock source becomes the internal reference clock (IIC $\phi$ ).

### TMOS Bit (Timeout Detection Time Selection)

This bit is used to select long mode or short mode for the timeout detection time when the timeout function is enabled (RIICnFER.TMOE bit = 1). When this bit is set to 0, long mode is selected. When this bit is set to 1, short mode is selected. In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14 bit-counter. While the SCL line is in the state that enables this counter as specified by bits TMOH and TMOL, the counter counts up in synchronization with the internal reference clock (IIC $\phi$ ) as a count source.

For details on the timeout function, see **Section 23.13.1, Timeout Function**.

### TMOL Bit (Timeout L Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held low when the timeout function is enabled (RIICnFER.TMOE bit = 1).

### TMOH Bit (Timeout H Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held high when the timeout function is enabled (RIICnFER.TMOE bit = 1).

### SDDL[2:0] Bits (SDA Output Delay Setup Counter)

The SDA output can be delayed by the SDDL[2:0] setting. This counter works with the clock source selected by the DLCS bit. The setting of this function can be used for all types of SDA output, including the transmission of the acknowledge bit.

For details on this function, see **Section 23.7, Facility for Delaying SDA Output**.

### CAUTION

Set the SDA output delay time to meet the I<sup>2</sup>C bus standard (within the data enable time/acknowledge enable time\*<sup>1</sup>). Note that, if a value outside the standard is set, communication with communication devices may malfunction or it may seemingly become a start condition or stop condition depending on the bus state.

**Note 1.** Data enable time/acknowledge enable time  
3,450 ns (up to 100 kbps: standard mode [Sm])  
900 ns (up to 400 kbps: fast mode [Fm])

### 23.3.6 RIICnMR3 — I<sup>2</sup>C Bus Mode Register 3

**Access:** RIICnMR3 register can be read or written in 32-bit units.  
 RIICnMR3L register can be read or written in 16-bit units.  
 RIICnMR3LL register can be read or written in 8-bit units.

**Address:** RIICnMR3: <RIICn\_base> + 0010<sub>H</sub>  
 RIICnMR3L: <RIICn\_base> + 0010<sub>H</sub>  
 RIICnMR3LL: <RIICn\_base> + 0010<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	WAIT	RDRFS	ACKWP	ACKBT	ACKBR	NF[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W

Table 23.17 RIICnMR3 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	WAIT*2	WAIT 0: No WAIT (The period between ninth clock cycle and first clock cycle is not held low.) 1: WAIT (The period between ninth clock cycle and first clock cycle is held low.) Low-hold is released by reading RIICnDRR.
5	RDRFS*2	RDRF Flag Set Timing Selection 0: The RDRF flag is set at the rising edge of the ninth SCL clock cycle. (The SCL line is not held low at the falling edge of the eighth clock cycle.) 1: The RDRF flag is set at the rising edge of the eighth SCL clock cycle. (The SCL line is held low at the falling edge of the eighth clock cycle.) Low-hold is released by writing a value to the ACKBT bit.
4	ACKWP*1	ACKBT Write Protect 0: Modification of the ACKBT bit is disabled. 1: Modification of the ACKBT bit is enabled.
3	ACKBT*1	Transmit Acknowledge 0: A 0 is sent as the acknowledge bit (ACK transmission). 1: A 1 is sent as the acknowledge bit (NACK transmission).
2	ACKBR	Receive Acknowledge 0: A 0 is received as the acknowledge bit (ACK reception). 1: A 1 is received as the acknowledge bit (NACK reception).
1, 0	NF[1:0]	Digital noise Filter Stage Selection b1 b0 0 0: Noise of up to one IIC $\phi$ cycle is filtered out (single-stage filter). 0 1: Noise of up to two IIC $\phi$ cycles is filtered out (2-stage filter). 1 0: Noise of up to three IIC $\phi$ cycles is filtered out (3-stage filter). 1 1: Noise of up to four IIC $\phi$ cycles is filtered out (4-stage filter).

Note 1. If it is attempted to write 1 to both ACKWP and ACKBT bits, the ACKBT bit cannot be set to 1.

Note 2. The WAIT and RDRFS bits are valid only in receive mode (invalid in transmit mode).

**NF[1:0] Bits (Digital noise Filter Stage Selection)**

These bits are used to select the number of stages of the digital noise filter.

**CAUTION**

---

Set the noise range to be filtered out by the noise filter within a range less than the SCL line high-level period or low-level period. If the noise range is set to a value of (SCL clock width: high-level period or low-level period, whichever is shorter) - [1.5 internal reference clock synchronized (IIC $\phi$ ) cycles] or more, the SCL clock is regarded as noise by the noise filter function of the RIIC, which may prevent the RIIC from operating normally.

---

**ACKBR Bit (Receive Acknowledge)**

This bit is used to store the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

When 1 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When 0 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

**ACKBT Bit (Transmit Acknowledge)**

This bit is used to set the bit to be sent at the acknowledge timing in receive mode.

[Setting condition]

When 1 is written to this bit with the ACKWP bit set to 1

[Clearing conditions]

- When 0 is written to this bit after ACKBT reading while the ACKWP bit is set to 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

**CAUTION**

---

The ACKBT bit must be written to while the ACKWP bit is 1. If the ACKBT bit is written to with the ACKWP bit cleared to 0, writing to the ACKBT bit is disabled.

---

**ACKWP Bit (ACKBT Write Protect)**

This bit is used to control the modification of the ACKBT bit.

**RDRFS Bit (RDRF Flag Set Timing Selection)**

This bit is used to select the RDRF flag set timing in receive mode and also to select whether to hold the SCL line low at the falling edge of the eighth SCL clock cycle.

When the RDRFS bit is 0, the SCL line is not held low at the falling edge of the eighth SCL clock cycle, and the RDRF flag is set to 1 at the rising edge of the ninth SCL clock cycle.

When the RDRFS bit is 1, the RDRF flag is set to 1 at the rising edge of the eighth SCL clock cycle and the SCL line is held low at the falling edge of the eighth SCL clock cycle. The low-hold of the SCL line is released by writing a value to the ACKBT bit.

After data is received with this setting, the SCL line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1) according to receive data.

**WAIT Bit (WAIT)**

This bit is used to control whether to hold the period between the ninth SCL clock cycle and the first SCL clock cycle low until the receive data buffer (RIICnDRR) is completely read each time single-byte data is received in receive mode.

When the WAIT bit is 0, the receive operation is continued without holding the period between the ninth and the first SCL clock cycle low. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCL line is held low from the falling edge of the ninth clock cycle until the RIICnDRR value is read each time single-byte data is received. This enables receive operation in byte units.

**CAUTION**

---

When the value of the WAIT bit is cleared to 0, be sure to read the RIICnDRR beforehand.

---

### 23.3.7 RIICnFER — I<sup>2</sup>C Bus Function Enable Register

**Access:** RIICnFER register can be read or written in 32-bit units.  
 RIICnFERL register can be read or written in 16-bit units.  
 RIICnFERLL register can be read or written in 8-bit units.

**Address:** RIICnFER: <RIICn\_base> + 0014<sub>H</sub>  
 RIICnFERL: <RIICn\_base> + 0014<sub>H</sub>  
 RIICnFERLL: <RIICn\_base> + 0014<sub>H</sub>

**Value after reset:** 0000 0072<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.18 RIICnFER Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	SCLE	SCL Synchronous Circuit Enable 0: No SCL synchronous circuit is used. 1: An SCL synchronous circuit is used.
5	NFE	Digital Noise Filter Circuit Enable 0: No digital noise filter circuit is used. 1: A digital noise filter circuit is used.
4	NACKE	NACK Reception Transfer Suspension Enable 0: Transfer operation is not suspended during NACK reception (transfer suspension disabled). 1: Transfer operation is suspended during NACK reception (transfer suspension enabled).
3	SALE	Slave Arbitration-Lost Detection Enable 0: Slave arbitration-lost detection is disabled. 1: Slave arbitration-lost detection is enabled.
2	NALE	NACK Transmission Arbitration-Lost Detection Enable 0: NACK transmission arbitration-lost detection is disabled. 1: NACK transmission arbitration-lost detection is enabled.
1	MALE	Master Arbitration-Lost Detection Enable 0: Master arbitration-lost detection is disabled. (Disables the arbitration-lost detection function and does not clear the RIICnCR2.MST and TRS bits automatically when arbitration is lost.) 1: Master arbitration-lost detection is enabled. (Enables the arbitration-lost detection function and clears the RIICnCR2.MST and TRS bits automatically when arbitration is lost.)  If 1 is written to the ST bit while the BBSY flag is 1 in slave transmit mode, the TRS bit is not cleared.
0	TMOE	Timeout Function Enable 0: The timeout function is disabled. 1: The timeout function is enabled.

**TMOE Bit (Timeout Function Enable)**

This bit is used to enable or disable the timeout function.

For details on the timeout function, see **Section 23.13.1, Timeout Function**.

**MALE Bit (Master Arbitration-Lost Detection Enable)**

This bit is used to select enabling or disabling of the arbitration-lost detection function. Normally, set this bit to 1.

**NALE Bit (NACK Transmission Arbitration-Lost Detection Enable)**

This bit is used to specify whether the detection of ACK during transmission of NACK in reception (such as when slaves with the same address are present on the bus and each is transmitting different data, or when two or more masters select the same slave device simultaneously with different numbers of bytes for reception) is judged to represent a loss in arbitration.

**SALE Bit (Slave Arbitration-Lost Detection Enable)**

This bit is used to specify whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode (such as when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs due to noise).

**NACKE Bit (NACK Reception Transfer Suspension Enable)**

This bit is used to specify whether to continue or discontinue the transfer operation when NACK is received in transmit mode. Normally, set this bit to 1.

When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended.

When the NACKE bit is 0, the next transfer operation is continued regardless of the received acknowledge content.

**SCLE Bit (SCL Synchronous Circuit Enable)**

This bit is used to specify whether to synchronize the SCL clock with a rising or falling edge on the SCL line. Normally, set this bit to 1.

When the SCLE bit is cleared to 0 (SCL synchronous circuit not used), the RIIC does not synchronize the SCL clock with the SCL input clock. In this setting, the RIIC outputs the SCL clock with the transfer rate set in RIICnBRH and RIICnBRL regardless of the SCL line state. For this reason, if the bus load of the I<sup>2</sup>C bus line is much larger than the specification value or if the SCL clock output overlaps in multiple masters, the short-cycle SCL clock that does not meet the specification may be output. When no SCL synchronous circuit is used, it also affects the issuance of a start condition, restart condition, and stop condition, and the continuous output of extra SCL clock cycles.

This bit must not be cleared to 0 except for checking the output of the transfer rate.

### 23.3.8 RIICnSER — I<sup>2</sup>C Bus Status Enable Register

**Access:** RIICnSER register can be read or written in 32-bit units.  
 RIICnSERL register can be read or written in 16-bit units.  
 RIICnSERLL register can be read or written in 8-bit units.

**Address:** RIICnSER: <RIICn\_base> + 0018<sub>H</sub>  
 RIICnSERL: <RIICn\_base> + 0018<sub>H</sub>  
 RIICnSERLL: <RIICn\_base> + 0018<sub>H</sub>

**Value after reset:** 0000 0009<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 23.19 RIICnSER Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	DIDE	Device-ID Address Detection Enable 0: Device-ID address detection is disabled. 1: Device-ID address detection is enabled.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	GCE	General Call Address Enable 0: General call address detection is disabled. 1: General call address detection is enabled.
2	SAR2	Slave Address Register 2 Enable 0: Slave address in RIICnSAR2 is disabled. 1: Slave address in RIICnSAR2 is enabled.
1	SAR1	Slave Address Register 1 Enable 0: Slave address in RIICnSAR1 is disabled. 1: Slave address in RIICnSAR1 is enabled.
0	SAR0	Slave Address Register 0 Enable 0: Slave address in RIICnSAR0 is disabled. 1: Slave address in RIICnSAR0 is enabled.

#### SAR<sub>y</sub> Bit (Slave Address Register y Enable) (y = 0 to 2)

This bit is used to enable or disable the slave address set in RIICnSAR<sub>y</sub>.

When this bit is set to 1, the slave address set in RIICnSAR<sub>y</sub> is enabled and is compared with the received slave address.

When this bit is cleared to 0, the slave address set in RIICnSAR<sub>y</sub> is disabled and is ignored even if it matches the received slave address.

**GCAE Bit (General Call Address Enable)**

This bit is used to specify whether to ignore the general call address (0000 000<sub>B</sub> + 0 [W]: All 0) when it is received.

When this bit is set to 1, if the received slave address matches the general call address, the RIIC recognizes the received slave address as the general call address independently of the slave addresses set in RIICnSAR<sub>y</sub> (y = 0 to 2) and performs data receive operation.

When this bit is cleared to 0, the received slave address is ignored even if it matches the general call address.

**DIDE Bit (Device-ID Address Detection Enable)**

This bit is used to specify whether to recognize and execute the Device-ID address when a device ID (1111 100<sub>B</sub>) is received in the first frame after a start condition or restart condition is detected.

When this bit is set to 1, if the received first frame matches the device ID, the RIIC recognizes that the Device-ID address has been received. When the following R/W# bit is 0 [W], the RIIC recognizes the second and the following frames as slave addresses and continues the receive operation.

When this bit is cleared to 0, the RIIC ignores the received first frame even if it matches the device ID address and recognizes the first frame as a normal slave address.

For details on the device-ID address detection, see **Section 23.9.3, Device-ID Address Detection**.

### 23.3.9 RIICnIER — I<sup>2</sup>C Bus Interrupt Enable Register

**Access:** RIICnIER register can be read or written in 32-bit units.  
 RIICnIERL register can be read or written in 16-bit units.  
 RIICnIERLL register can be read or written in 8-bit units.

**Address:** RIICnIER: <RIICn\_base> + 001C<sub>H</sub>  
 RIICnIERL: <RIICn\_base> + 001C<sub>H</sub>  
 RIICnIERLL: <RIICn\_base> + 001C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.20 RIICnIER Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	TIE	Transmit Data Empty Interrupt Enable 0: Transmit data empty interrupt request (INTRIICnTI) is disabled. 1: Transmit data empty interrupt request (INTRIICnTI) is enabled.
6	TEIE	Transmit End Interrupt Enable 0: Transmit end interrupt request (INTRIICnTEI) is disabled. 1: Transmit end interrupt request (INTRIICnTEI) is enabled.
5	RIE	Receive Complete Interrupt Enable 0: Receive complete interrupt request (INTRIICnRI) is disabled. 1: Receive complete interrupt request (INTRIICnRI) is enabled.
4	NAKIE	NACK Reception Interrupt Enable 0: NACK reception interrupt request (NAKI) is disabled. 1: NACK reception interrupt request (NAKI) is enabled.
3	SPIE	Stop Condition Detection Interrupt Enable 0: Stop condition detection interrupt request (SPI) is disabled. 1: Stop condition detection interrupt request (SPI) is enabled.
2	STIE	Start Condition Detection Interrupt Enable 0: Start condition detection interrupt request (STI) is disabled. 1: Start condition detection interrupt request (STI) is enabled.
1	ALIE	Arbitration-Lost Interrupt Enable 0: Arbitration-lost interrupt request (ALI) is disabled. 1: Arbitration-lost interrupt request (ALI) is enabled.
0	TMOIE	Timeout Interrupt Enable 0: Timeout interrupt request (TMOI) is disabled. 1: Timeout interrupt request (TMOI) is enabled.

**TMOIE Bit (Timeout Interrupt Enable)**

This bit is used to enable or disable timeout interrupt requests (TMOI) when the RIICnSR2.TMOF flag is set to 1. A TMOI interrupt request is canceled by clearing the TMOF flag or the TMOIE bit to 0.

**ALIE Bit (Arbitration-Lost Interrupt Enable)**

This bit is used to enable or disable arbitration-lost interrupt requests (ALI) when the RIICnSR2.AL flag is set to 1. An ALI interrupt request is canceled by clearing the AL flag or the ALIE bit to 0.

**STIE Bit (Start Condition Detection Interrupt Enable)**

This bit is used to enable or disable start condition detection interrupt requests (STI) when the RIICnSR2.START flag is set to 1. An STI interrupt request is canceled by clearing the START flag or the STIE bit to 0.

**SPIE Bit (Stop Condition Detection Interrupt Enable)**

This bit is used to enable or disable stop condition detection interrupt requests (SPI) when the RIICnSR2.STOP flag is set to 1. An SPI interrupt request is canceled by clearing the STOP flag or the SPIE bit to 0.

**NAKIE Bit (NACK Reception Interrupt Enable)**

This bit is used to enable or disable NACK reception interrupt requests (NAKI) when the RIICnSR2.NACKF flag is set to 1. An NAKI interrupt request is canceled by clearing the NACKF flag or the NAKIE bit to 0.

**RIE Bit (Receive Complete Interrupt Enable)**

This bit is used to enable or disable receive complete interrupt requests (INTRIICnRI) when the RIICnSR2.RDRF flag is set to 1.

**TEIE Bit (Transmit End Interrupt Enable)**

This bit is used to enable or disable transmit end interrupts (INTRIICnTEI) when the RIICnSR2.TEND flag is set to 1. An INTRIICnTEI interrupt request is canceled by clearing the TEND flag or the TEIE bit to 0.

**TIE Bit (Transmit Data Empty Interrupt Enable)**

This bit is used to enable or disable transmit data empty interrupts (INTRIICnTI) when the RIICnSR2.TDRE flag is set to 1.

### 23.3.10 RIICnSR1 — I<sup>2</sup>C Bus Status Register 1

**Access:** RIICnSR1 register can be read or written in 32-bit units.  
 RIICnSR1L register can be read or written in 16-bit units.  
 RIICnSR1LL register can be read or written in 8-bit units.

**Address:** RIICnSR1: <RIICn\_base> + 0020<sub>H</sub>  
 RIICnSR1L: <RIICn\_base> + 0020<sub>H</sub>  
 RIICnSR1LL: <RIICn\_base> + 0020<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	DID	—	GCA	AAS2	AAS1	AAS0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R(W)*1	R	R(W)*1	R(W)*1	R(W)*1	R(W)*1

Note 1. Only 0 can be written to this bit.

Table 23.21 RIICnSR1 Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	DID	Device-ID Address Detection Flag 0: Device-ID address is not detected. 1: Device-ID address is detected.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	GCA	General Call Address Detection Flag 0: General call address is not detected. 1: General call address is detected.
2	AAS2	Slave Address 2 Detection Flag 0: Slave address 2 is not detected. 1: Slave address 2 is detected.
1	AAS1	Slave Address 1 Detection Flag 0: Slave address 1 is not detected. 1: Slave address 1 is detected.
0	AAS0	Slave Address 0 Detection Flag 0: Slave address 0 is not detected. 1: Slave address 0 is detected.

**AASy Flag (Slave Address y Detection) (y = 0 to 2)**

[Setting conditions]

&lt;For 7-bit address format: RIICnSARy.FSy = 0&gt;

When the received slave address matches the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

&lt;For 10-bit address format: RIICnSARy.FSy = 1&gt;

When the received slave address matches a value of (1111 0<sub>B</sub> + RIICnSARy.SVA[9:8]) and the following address matches the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy bit after reading AASy = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

&lt;For 7-bit address format: RIICnSARy.FSy = 0&gt;

- When the received slave address does not match the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

&lt;For 10-bit address format: RIICnSARy.FSy = 1&gt;

- When the received slave address does not match a value of (1111 0<sub>B</sub> + RIICnSARy.SVA[9:8]) with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
- When the received slave address matches a value of (1111 0<sub>B</sub> + RIICnSARy.SVA[9:8]) and the following address does not match the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)

This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

**GCA Flag (General Call Address Detection)**

[Setting condition]

- When the received slave address matches the general call address (0000 000<sub>B</sub> + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)

This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA bit after reading GCA = 1
  - When a stop condition is detected
  - When the received slave address does not match the general call address (0000 000<sub>B</sub> + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
- This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**DID Flag (Device-ID Address Detection)**

[Setting condition]

- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111 100<sub>B</sub>) + 0 [W]) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled). This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.
- When a restart condition is detected after a match with the device ID address and the device ID address (1111 100<sub>B</sub>) plus 1[R] has matched while the setting of the RIICnSER.DIDE bit is 1 (device ID address detection enabled). This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID bit after reading DID = 1
- When a stop condition is detected
- When the first frame received immediately after a start condition or restart condition is detected does not match a value of (device ID (1111 100<sub>B</sub>)) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)  
This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111 100<sub>B</sub>) + 0 [W]) and the second frame does not match any of slave addresses 0 to 2 with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)  
This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### 23.3.11 RIICnSR2 — I<sup>2</sup>C Bus Status Register 2

**Access:** RIICnSR2 register can be read or written in 32-bit units.  
 RIICnSR2L register can be read or written in 16-bit units.  
 RIICnSR2LL register can be read or written in 8-bit units.

**Address:** RIICnSR2: <RIICn\_base> + 0024<sub>H</sub>  
 RIICnSR2L: <RIICn\_base> + 0024<sub>H</sub>  
 RIICnSR2LL: <RIICn\_base> + 0024<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TDRE	TEND	RDRF	NACKF	STOP	START	AL	TMOF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R(W)*1	R(W)*1	R(W)*1	R(W)*1	R(W)*1	R(W)*1	R(W)*1

Note 1. Only 0 can be written to this bit.

Table 23.22 RIICnSR2 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	TDRE	Transmit Data Empty Flag 0: RIICnDRT contains transmit data. 1: RIICnDRT contains no transmit data.
6	TEND	Transmit End Flag 0: Data is being transmitted. 1: Data has been transmitted.
5	RDRF	Receive Complete Flag 0: RIICnDRR contains no receive data. 1: RIICnDRR contains receive data.
4	NACKF	NACK Detection Flag 0: NACK is not detected. 1: NACK is detected.
3	STOP	Stop Condition Detection Flag 0: Stop condition is not detected. 1: Stop condition is detected.
2	START	Start Condition Detection Flag 0: Start condition is not detected. 1: Start condition is detected.
1	AL	Arbitration-Lost Flag 0: Arbitration is not lost. 1: Arbitration is lost.
0	TMOF	Timeout Detection Flag 0: Timeout is not detected. 1: Timeout is detected.

**TMOF Flag (Timeout Detection)**

This flag is set to 1 when the RIIC recognizes timeout after the SCL line state remains unchanged for a certain period.

[Setting condition]

The timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is stuck low or high during the following conditions:

- The bus is busy (the RIICnCR2.BBSY flag is 1) in master mode (the RIICnCR2.MST bit is 1).
- The RIIC's own slave address matches (the RIICnSR1 register is not 00<sub>H</sub>) and the bus is busy (the RIICnCR2.BBSY bit is 1) in slave mode (the RIICnCR2.MST bit is 0).
- The bus is free (the RIICnCR2.BBSY flag is 0) while generation of a start condition is requested (the RIICnCR2.ST bit is 1).

[Clearing conditions]

- When 0 is written to the TMOF bit after reading TMOF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**AL Flag (Arbitration-Lost)**

This flag shows that bus mastership has been lost (loss in arbitration) due to a bus conflict or some other reason when a start condition is issued or an address and data are transmitted. The RIIC monitors the level on the SDA line during transmission and, if the level on the line does not match the value of the bit being output, sets the value of the AL bit to 1 to indicate that the bus is occupied by another device.

The RIIC can also set the flag to indicate the detection of loss of arbitration during NACK transmission in receive mode or during data transmission in slave mode.

[Setting conditions]

<When master arbitration-lost detection is enabled: RIICnFER.MALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data (including slave address) transmission in master transmit mode (when the SDA line is driven low while the internal SDA output is at a high level (the SDA pin is in the high-impedance state))
- When a start condition is detected while the RIICnCR2.ST bit is 1 (start condition issuance request) or the internal SDA output state does not match the SDA line level
- When the RIICnCR2.ST bit is set to 1 (start condition issuance request) with the RIICnCR2.BBSY flag set to 1.

<When NACK arbitration-lost detection is enabled: RIICnFER.NALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock in the ACK period during NACK transmission in receive mode

<When slave arbitration-lost detection is enabled: RIICnFER.SALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data transmission in slave transmit mode

[Clearing conditions]

- When 0 is written to the AL bit after reading AL = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Table 23.23 Relationship between Arbitration-Lost Generation Sources and Arbitration-Lost Enable Functions

RIICnFER			RIICnSR2	Error	Arbitration-Lost Generation Source
MALE	NALE	SALE	AL		
1	—	—	1	Start condition issuance error	When internal SDA output state does not match SDA line level when a start condition is detected while the RIICnCR2.ST bit is 1
			1		When RIICnCR2.ST is set to 1 with RIICnCR2.BBSY set to 1
—	1	—	1	Transmit data mismatch	When transmit data (including slave address) does not match the bus state in master transmit mode
—	—	1	1	NACK transmission mismatch	When ACK is detected during transmission of NACK in master receive mode or slave receive mode
—	—	1	1	Transmit data mismatch	When transmit data does not match the bus state in slave transmit mode

**Remark:** —: Don't care

### START Flag (Start Condition Detection)

[Setting condition]

When a start condition (or a restart condition) is detected

[Clearing conditions]

- When 0 is written to the START bit after reading START = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### STOP Flag (Stop Condition Detection)

[Setting condition]

When a stop condition is detected

[Clearing conditions]

- When 0 is written to the STOP bit after reading STOP = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### NACKF Flag (NACK Detection)

[Setting condition]

When acknowledge is not received (NACK is received) from the receive device in transmit mode with the RIICnFER.NACKE bit set to 1 (transfer suspension enabled)

[Clearing conditions]

- When 0 is written to the NACKF bit after reading NACKF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

### CAUTION

When the NACKF flag is set to 1, the RIIC suspends data transmission/reception. Writing to RIICnDRT in transmit mode or reading from RIICnDRR in receive mode with the NACKF flag set to 1 does not enable data transmit/receive operation. To restart data transmission/reception, clear the NACKF flag to 0.

**RDRF Flag (Receive Complete)**

[Setting conditions]

- When receive data has been transferred from RIICnDRS to RIICnDRR  
At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit)
- When the received slave address matches the address enabled in RIICnSER after a start condition (or a restart condition) is detected with the RIICnCR2.TRS bit cleared to 0
- In master mode, transition to master reception while the R/W# bit appended to the slave address is set to 1

[Clearing conditions]

- When 0 is written to the RDRF bit after reading RDRF = 1
- When data is read from RIICnDRR
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**TEND Flag (Transmit End)**

[Setting condition]

At the rising edge of the ninth SCL clock cycle while the TDRE flag is 1

[Clearing conditions]

- When 0 is written to the TEND bit after reading TEND = 1
- When data is written to RIICnDRT
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**TDRE Flag (Transmit Data Empty)**

[Setting conditions]

- When data has been transferred from RIICnDRT to RIICnDRS and RIICnDRT becomes empty
- When the RIICnCR2.TRS bit is set to 1
  - When the RIICnCR2.MST bit is set to 1 after a start condition is detected
  - When 1 is written to the RIICnCR2.TRS bit while the RIICnMR1.MTWP bit is 1
- When the received slave address matches the address enabled in RIICnSER after a start condition including a restart condition is detected with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When data is written to RIICnDRT
- When the RIICnCR2.TRS bit is cleared to 0
  - When a stop condition is detected
  - When the RIIC enters receive mode from transmit mode
  - When 0 is written to the RIICnCR2.TRS bit while the RIICnMR1.MTWP bit is 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

**CAUTION**

---

When the NACKF flag is set to 1 while the RIICnFER.NACKE bit is 1, the RIIC suspends data transmission/reception. Here, if the TDRE flag is 0 (next transmit data has been written), data is not transferred to the RIICnDRS register and the data of RIICnDRT register is retained, but the TDRE flag is not set to 1.

---

### 23.3.12 RIICnSARy — I<sup>2</sup>C Slave Address Register y (y = 0 to 2)

**Access:** RIICnSARy register can be read or written in 32-bit units.  
 RIICnSARyL register can be read or written in 16-bit units.  
 RIICnSARyLL and RIICnSARyLH registers can be read or written in 8-bit units.

**Address:** RIICnSAR0: <RIICn\_base> + 0028<sub>H</sub>  
 RIICnSAR0L: <RIICn\_base> + 0028<sub>H</sub>  
 RIICnSAR0LL: <RIICn\_base> + 0028<sub>H</sub>,  
 RIICnSAR0LH: <RIICn\_base> + 0029<sub>H</sub>  
 RIICnSAR1: <RIICn\_base> + 002C<sub>H</sub>  
 RIICnSAR1L: <RIICn\_base> + 002C<sub>H</sub>  
 RIICnSAR1LL: <RIICn\_base> + 002C<sub>H</sub>,  
 RIICnSAR1LH: <RIICn\_base> + 002D<sub>H</sub>  
 RIICnSAR2: <RIICn\_base> + 0030<sub>H</sub>  
 RIICnSAR2L: <RIICn\_base> + 0030<sub>H</sub>  
 RIICnSAR2LL: <RIICn\_base> + 0030<sub>H</sub>,  
 RIICnSAR2LH: <RIICn\_base> + 0031<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FSy	—	—	—	—	—	SVA[9:1]									SVA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.24 RIICnSARy Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	FSy	7-Bit/10-Bit Address Format Selection 0: The 7-bit address format is selected. 1: The 10-bit address format is selected.
14 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 1	SVA[9:1]	7-Bit Address/10-Bit Address Upper Bits A slave address is set. <ul style="list-style-type: none"> <li>When the FSy bit is 0 (7-bit address format), the SVA[7:1] bits are valid and form a 7-bit slave address.</li> <li>When the FSy bit is 1 (10-bit address format), SVA[9:1] bits form a 10-bit slave address (combined with the SVA0 bit).</li> </ul>
0	SVA0	10-Bit Address LSB The least significant bit (LSB) of a 10-bit slave address is set. <ul style="list-style-type: none"> <li>When the FSy bit is 0 (7-bit address format), this bit is invalid.</li> <li>When the FSy bit is 1 (10-bit address format), this bit is a 10-bit slave address (combined with the SVA[9:1] bits).</li> </ul>

**SVA0 Bit (10-Bit Address LSB)**

When the 10-bit address format is selected (RIICnSARy.FSy = 1), this bit functions as the LSB of a 10-bit address and forms a 10-bit address in combination with the SVA[9:1] bits.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, this bit is valid. While the RIICnSARy.FSy bit or SARy bit is 0, the setting of this bit is ignored.

**SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits)**

When the 7-bit address format is selected (RIICnSARy.FSy = 0), these bits function as a 7-bit address. When the 10-bit address format is selected (RIICnSARy.FSy = 1), these bits function as a 10-bit address in combination with the SVA0 bit.

While the RIICnSER.SARy bit is 0, the setting of these bits is ignored.

**FSy Bit (7-Bit/10-Bit Address Format Selection)**

This bit is used to select 7-bit address or 10-bit address for slave address y (in RIICnSARy).

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 0, the 7-bit address format is selected for slave address y, the RIICnSARy.SVA[7:1] setting is valid, and the settings of the SVA[9:8] bits and the RIICnSARy.SVA0 bit are ignored.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, the 10-bit address format is selected for slave address y and the settings of the SVA[9:1] bits and the SVA0 bit are valid.

While the RIICnSER.SARy bit is 0 (RIICnSARy disabled), the setting of the RIICnSARy.FSy bit is invalid.

### 23.3.13 RIICnBRL — I<sup>2</sup>C Bus Bit Rate Low-Level Register

**Access:** RIICnBRL register can be read or written in 32-bit units.  
 RIICnBRL register can be read or written in 16-bit units.  
 RIICnBRL register can be read or written in 8-bit units.

**Address:** RIICnBRL: <RIICn\_base> + 0034<sub>H</sub>  
 RIICnBRL: <RIICn\_base> + 0034<sub>H</sub>  
 RIICnBRL: <RIICn\_base> + 0034<sub>H</sub>

**Value after reset:** 0000 00FF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.25 RIICnBRL Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	BRL[4:0]	Bit Rate Low-Level Period Low-level period of SCL clock

The RIICnBRL register is a 5-bit register that is used to set the width at low level for the SCL clock.

It also works to generate the data setup time for automatic SCL low-hold operation (see **Section 23.10, Automatic Low-Hold Function for SCL**); when the RIIC is used only in slave mode, this register needs to be set to a value longer than the data setup time\*<sup>1</sup>.

RIICnBRL counts the low-level period with the internal reference clock source (IIC $\phi$ ) specified by the RIICnMR1.CKS[2:0] bits.

**Note 1.** Data setup time ( $t_{su}$ : DAT)  
 250 ns (up to 100 kbps: standard mode [Sm])  
 100 ns (up to 400 kbps: fast mode [Fm])

### 23.3.14 RIICnBRH — I<sup>2</sup>C Bus Bit Rate High-Level Register

**Access:** RIICnBRH register can be read or written in 32-bit units.  
 RIICnBRHL register can be read or written in 16-bit units.  
 RIICnBRHLL register can be read or written in 8-bit units.

**Address:** RIICnBRH: <RIICn\_base> + 0038<sub>H</sub>  
 RIICnBRHL: <RIICn\_base> + 0038<sub>H</sub>  
 RIICnBRHLL: <RIICn\_base> + 0038<sub>H</sub>

**Value after reset:** 0000 00FF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	BRH[4:0]				
Value after reset	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 23.26 RIICnBRH Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	BRH[4:0]	Bit Rate High-Level Period High-level period of SCL clock

RIICnBRH is a 5-bit register to set the high-level period of SCL clock. RIICnBRH is valid in master mode. If the RIIC is used only in slave mode, this register need not to set the high-level period.

RIICnBRH counts the high-level period with the internal reference clock source (IIC $\phi$ ) specified by the RIICnMR1.CKS[2:0] bits.

The I<sup>2</sup>C transfer rate and the SCL clock duty are calculated using the following expression.

- When RIICnFER.SCLE = 0  
 Transfer rate =  $1 / \{ [(RIICnBRH + 1) + (RIICnBRL + 1)] / IIC\phi^{*1} + tr + tf \}$   
 Duty cycle =  $\{ tr + [(RIICnBRH + 1) / IIC\phi] \} / \{ tr + tf + [(RIICnBRH + 1) + (RIICnBRL + 1)] / IIC\phi \}$
- When RIICnFER.SCLE = 1, RIICnFER.NFE = 0, IIC $\phi$  = PCLK  
 Transfer rate =  $1 / \{ [(RIICnBRH + 3) + (RIICnBRL + 3)] / IIC\phi^{*1} + tr + tf \}$   
 Duty cycle =  $\{ tr + [(RIICnBRH + 3) / IIC\phi] \} / \{ tr + tf + [(RIICnBRH + 3) + (RIICnBRL + 3)] / IIC\phi \}$
- When RIICnFER.SCLE = 1, RIICnFER.NFE = 1, IIC $\phi$  = PCLK  
 Transfer rate =  $1 / \{ [(RIICnBRH + 3 + nf) + (RIICnBRL + 3 + nf)] / IIC\phi^{*1} + tr + tf \}$   
 Duty cycle =  $\{ tr + [(RIICnBRH + 3 + nf) / IIC\phi] \} / \{ tr + tf + [(RIICnBRH + 3 + nf) + (RIICnBRL + 3 + nf)] / IIC\phi \}$
- RIICnFER.SCLE = 1, RIICnFER.NFE = 0, IIC $\phi$  < PCLK  
 Transfer rate =  $1 / \{ [(RIICnBRH + 2) + (RIICnBRL + 2)] / IIC\phi^{*1} + tr + tf \}$   
 Duty cycle =  $\{ tr + [(RIICnBRH + 2) / IIC\phi] \} / \{ tr + tf + [(RIICnBRH + 2) + (RIICnBRL + 2)] / IIC\phi \}$

- (5) When RIICnFER.SCLE = 1, RIICnFER.NFE = 1, IICφ < PCLK

$$\text{Transfer rate} = 1 / \{ [(RIICnBRH + 2 + nf) + (RIICnBRL + 2 + nf)] / IIC\phi^{*1} + tr + tf \}$$

$$\text{Duty cycle} = \{ tr + [(RIICnBRH + 2 + nf) / IIC\phi] \} / \{ tr + tf + [(RIICnBRH + 2 + nf) + (RIICnBRL + 2 + nf)] / IIC\phi \}$$

tf: SCL line falling time [ns]\*2

tr: SCL line rising time [ns]\*2

nf: Digital noise filter stage

Duty cycle: 0% &lt; Duty &lt; 100%

**Note 1.** As for IICφ, see CKS[2:0] in **Section 23.3.4, RIICnMR1 — I<sup>2</sup>C Bus Mode Register 1**.**Note 2.** The SCL line rising time [tr] and SCL line falling time [tf] depend on the total bus line capacitance [Cb] and the pull-up resistor [Rp]. For details, see the I<sup>2</sup>C bus standard from NXP Semiconductors.**Table 23.27, Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate** lists examples of the RIICnBRH and RIICnBRL register settings when the SCL synchronization circuit is not used.

Table 23.27 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate

**CAUTION**

CBRH/ICBRL settings in these tables are calculated using the following values:

SCL line rising time (tr): 100 kbps or less, [Sm]: 1000 ns, 400 kbps or less, [Fm]: 300 ns

SCL line falling time (tf): 400 kbps or less, [Sm/Fm]: 300 ns

For the specified values of SCL line rising time (tr) and SCL line falling time (tf), see the I<sup>2</sup>C bus standard from NXP Semiconductors.

### 23.3.15 RIICnDRT — I<sup>2</sup>C Bus Transmit Data Register

**Access:** RIICnDRT register can be read or written in 32-bit units.  
 RIICnDRTL register can be read or written in 16-bit units.  
 RIICnDRTLL register can be read or written in 8-bit units.

**Address:** RIICnDRT: <RIICn\_base> + 003C<sub>H</sub>  
 RIICnDRTL: <RIICn\_base> + 003C<sub>H</sub>  
 RIICnDRTLL: <RIICn\_base> + 003C<sub>H</sub>

**Value after reset:** 0000 00FF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DRT[7:0]							
Value after reset	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When RIICnDRT detects a space in the I<sup>2</sup>C bus shift register (RIICnDRS), it transfers the transmit data that has been written to RIICnDRT to RIICnDRS and starts transmitting data in transmit mode.

The double-buffer structure of RIICnDRT and RIICnDRS allows continuous transmit operation if the next transmit data has been written to RIICnDRT while the RIICnDRS data is being transmitted.

RIICnDRT can always be read and written. Write transmit data to RIICnDRT once when a transmit data empty interrupt (INTRIICnTI) request is generated. When writing to bit 31 to 8, write the value after reset.

### 23.3.16 RIICnDRR — I<sup>2</sup>C Bus Receive Data Register

**Access:** RIICnDRR register is a read-only register that can be read in 32-bit units.  
 RIICnDRRL register is a read-only register that can be read in 16-bit units.  
 RIICnDRRLL register is a read-only register that can be read in 8-bit units.

**Address:** RIICnDRR: <RIICn\_base> + 0040<sub>H</sub>  
 RIICnDRRL: <RIICn\_base> + 0040<sub>H</sub>  
 RIICnDRRLL: <RIICn\_base> + 0040<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DRR[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

When 1 byte of data has been received, the received data is transferred from the I<sup>2</sup>C bus shift register (RIICnDRS) to RIICnDRR to enable the next data to be received.

The double-buffer structure of RIICnDRS and RIICnDRR allows continuous receive operation if the received data has been read from RIICnDRR while RIICnDRS is receiving data.

RIICnDRR cannot be written. Read data from RIICnDRR once when a receive complete interrupt (INTRIICnRI) request is generated.

If RIIC receives the next receive data before the current data is read from RIICnDRR (while the RIICnSR2.RDRF flag is 1), the RIIC automatically holds the SCL clock low one cycle before the RDRF flag is set to 1 next.

### 23.3.17 RIICnDRS — I<sup>2</sup>C Bus Shift Register

**Access:** This register is not accessible.

**Address:** —

**Value after reset:** 0000 00FF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DRS[7:0]							
Value after reset	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

RIICnDRS is a shift register to transmit and receive data.

During transmission, transmit data is transferred from RIICnDRT to RIICnDRS and is sent from the SDA pin. During reception, data is transferred from RIICnDRS to RIICnDRR after 1 byte of data has been received.

RIICnDRS cannot be accessed directly.

## 23.4 Interrupt Sources

The RIIC issues four types of interrupt request: transfer error or event generation (arbitration-lost detection, NACK detection, timeout detection, start condition detection, and stop condition detection), receive complete, transmit data empty, and transmit end.

**Table 23.28, Interrupt Sources** lists details of the several interrupt requests. The receive complete and transmit data empty interrupt request are both capable of launching data transfer by the DMA.

Table 23.28 Interrupt Sources

Symbol	Interrupt Source	Interrupt Flag	DMA Launching	Interrupt Condition
INTRIICnTI	Transmit Data Empty	TDRE	Possible	TDRE = 1 and TIE = 1
INTRIICnTEI	Transmit End	TEND	Not possible	TEND = 1 and TEIE = 1
INTRIICnRI	Receive Complete	RDRF	Possible	RDRF = 1 and RIE = 1
INTRIICnEE	Transfer Error/Event Generation	AL	Not possible	AL = 1 and ALIE = 1
		NACKF		NACKF = 1 and NAKIE = 1
		TMOF		TMOF = 1 and TMOIE = 1
		START		START = 1 and STIE = 1
		STOP		STOP = 1 and SPIE = 1

Clear or mask the each flag during interrupt handling.

### CAUTIONS

1. There is a latency (delay) between the execution of a write instruction for a peripheral module by the CPU and actual writing to the module. Thus, when an interrupt flag has been cleared or masked, read the relevant flag again to check whether clearing or masking has been completed, and then return from interrupt processing. Returning from interrupt processing without checking that writing to the module has been completed creates a possibility of repeated processing of the same interrupt.
2. Since INTRIICnTI is an edge-detected interrupt, it does not require clearing. Furthermore, the RIICnSR2.TDRE flag (a condition for INTRIICnTI) is automatically cleared to 0 when data for transmission are written to RIICnDRT or a stop condition is detected (RIICnSR2.STOP flag = 1).
3. Since INTRIICnRI is an edge-detected interrupt, it does not require clearing. Furthermore, the RIICnSR2.RDRF flag (a condition for INTRIICnRI) is automatically cleared to 0 when data are read from RIICnDRR.
4. When using the INTRIICnTEI interrupt, clear the RIICnSR2.TEND flag in the INTRIICnTEI interrupt processing. Note that the RIICnSR2.TEND flag is automatically cleared to 0 when data for transmission are written to RIICnDRT or a stop condition is detected (RIICnSR2.STOP flag = 1).
5. Even when using the INTRIICnEE interrupt, clear the RIICnSR2.NACKF flag after detecting the stop condition (RIICnSR2.STOP flag = 1) as shown in **Figure 23.6, Example of Master Transmission Flowchart**, **Figure 23.10, Example of Master Reception Flowchart (7-Bit Address Format, 1 or 2 Bytes)**, **Figure 23.11, Example of Master Reception Flowchart (7-Bit Address Format, 3 Bytes or More)**, and **Figure 23.15, Example of Slave Transmission Flowchart**. If the RIICnSR2.NACKF flag is cleared before detecting the STOP condition, the automatic low-hold function for SCL (**Section 23.10.1, Function to Prevent Wrong Transmission of Transmit Data**) may be enabled.

## 23.5 Operation

### 23.5.1 Communication Data Format

The I<sup>2</sup>C bus format consists of 8-bit data and 1-bit acknowledge. The frame following a start condition or restart condition is an address frame used to specify a slave device with which the master device communicates. The specified slave is valid until a new slave is specified or a stop condition is issued.

**Figure 23.3, I<sup>2</sup>C Bus Format** shows the I<sup>2</sup>C bus format, and **Figure 23.4, I<sup>2</sup>C Bus Timing (SLA = 7 Bits)** shows the I<sup>2</sup>C bus timing.

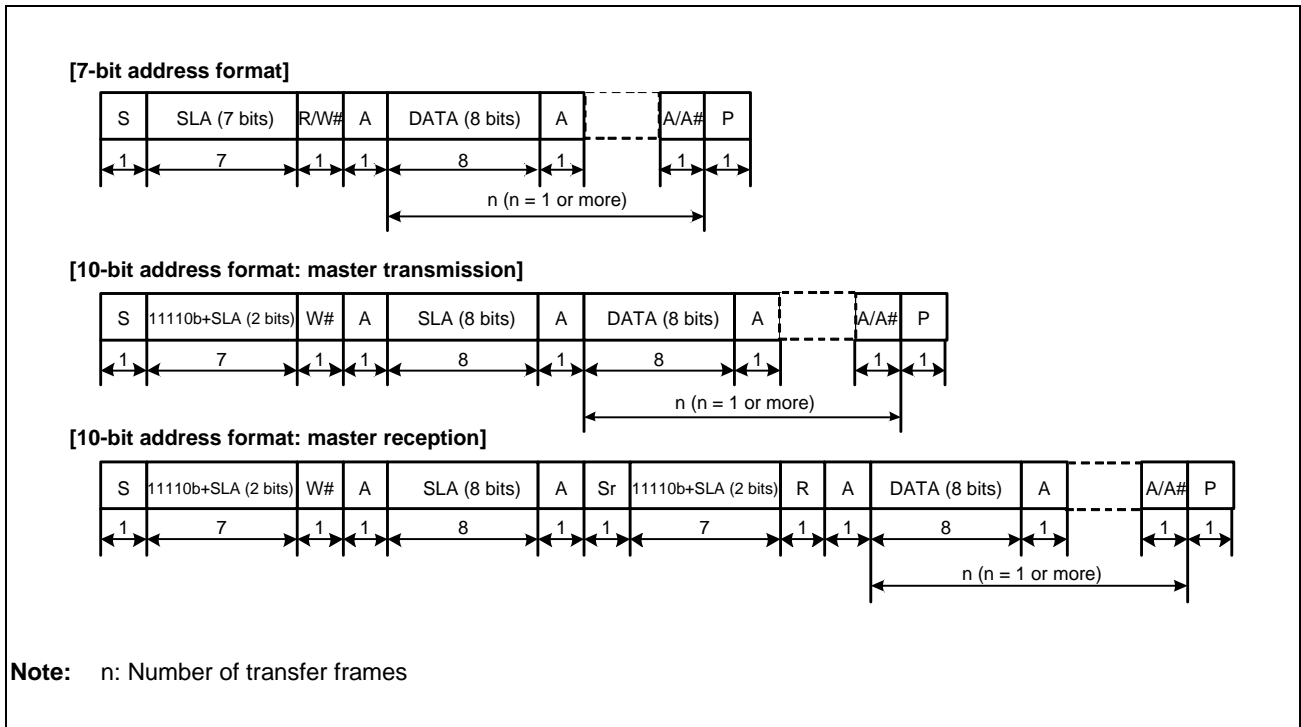

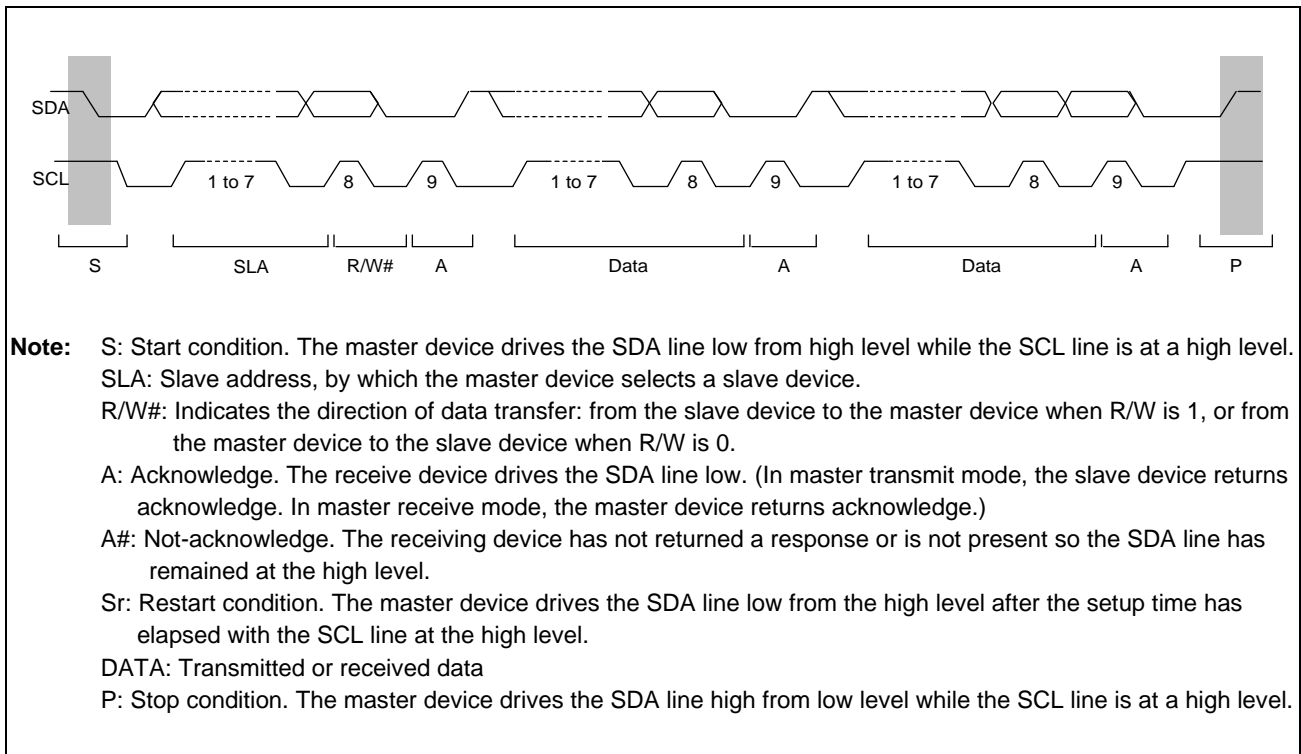

Figure 23.3 I<sup>2</sup>C Bus Format

Figure 23.4 I<sup>2</sup>C Bus Timing (SLA = 7 Bits)

### 23.5.2 Initial Settings

Before starting data transmission and reception, initialize the RIIC according to the procedure in **Figure 23.5, Example of RIIC Initialization Flowchart**. Make initial settings for the RIIC once when starting the RIIC.

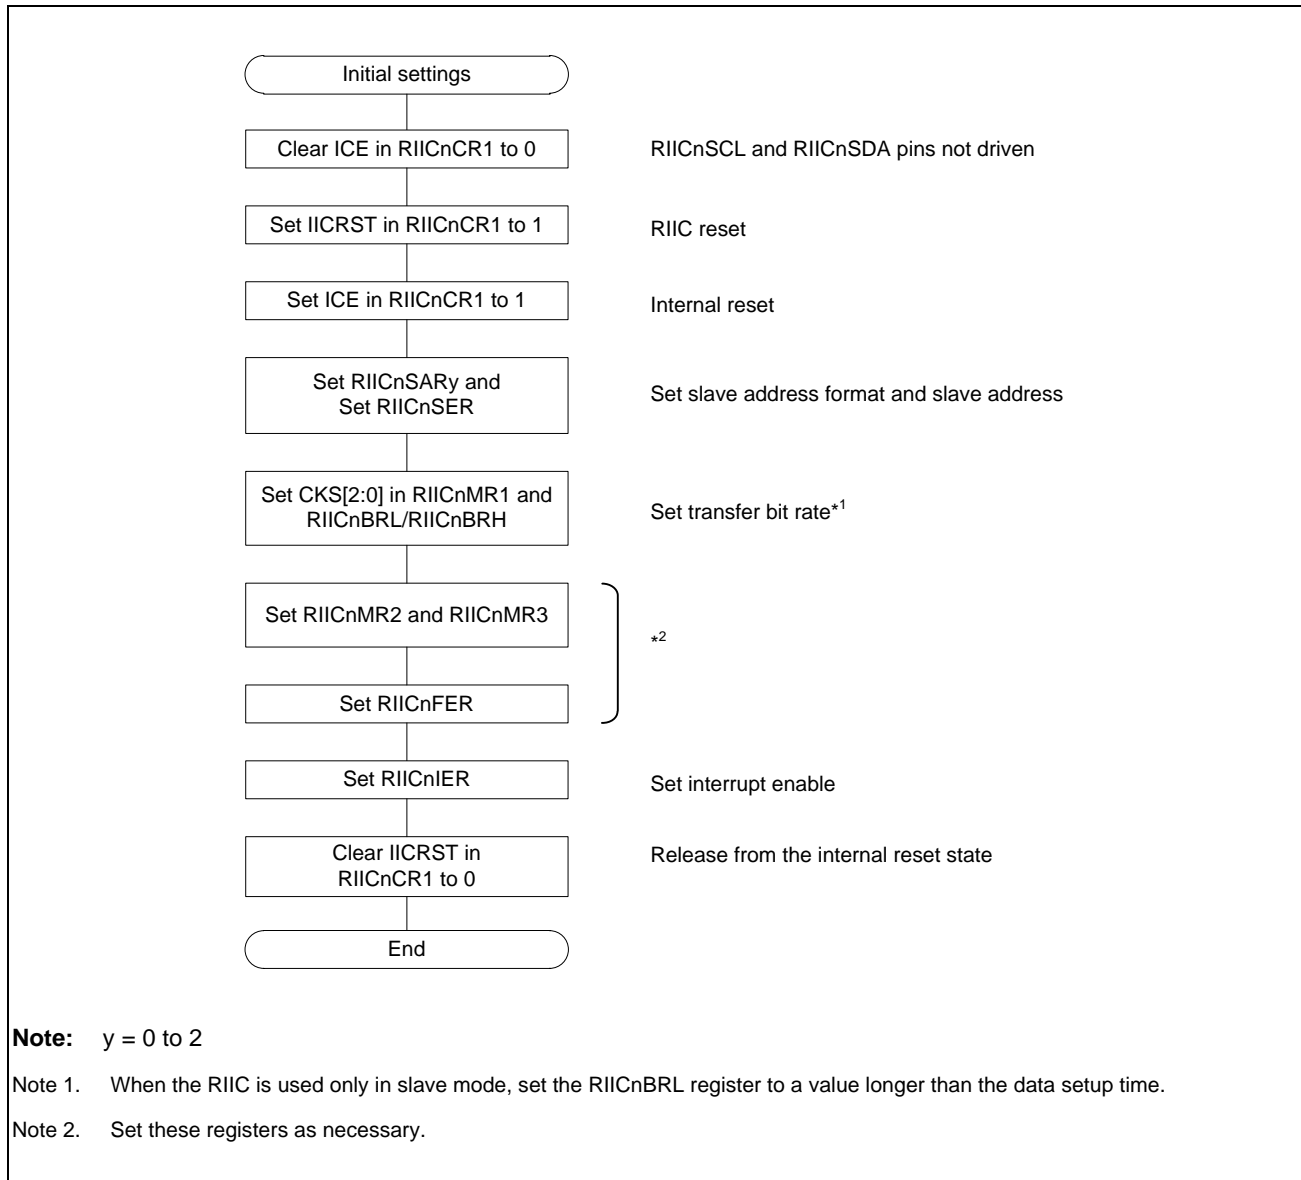

Figure 23.5 Example of RIIC Initialization Flowchart

### 23.5.3 Master Transmit Operation

In master transmit operation, the RIIC outputs the SCL (clock) and transmitted data signals as the master device, and the slave device returns acknowledgements. **Figure 23.6, Example of Master Transmission Flowchart** shows an example of usage of master transmission and **Figure 23.7, Master Transmit Operation Timing (1) (7-Bit Address Format)** to **Figure 23.9, Master Transmit Operation Timing (3)** show the timing of operations in master transmission.

The following describes the procedure and operations for master transmission.

- (1) Set the RIICnCR1.IICRST bit 1 to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARY, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 23.5, Example of RIIC Initialization Flowchart**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.
- (2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. At the same time, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS and MST bits to 1.
- (3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the slave address including the R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the RIIC continues in master transmit mode.  
 Since the RIICnSR2.NACKF flag being 1 at this time indicates that the slave address has not been recognized or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.  
 For data transmission with an address in the 10-bit format, start by writing 1111 0<sub>B</sub>, the two higher-order bits of the slave address, and W# to RIICnDRT as the first address transmission. Then, as the second address transmission, write the eight lower-order bits of the slave address to RIICnDRT.
- (4) After confirming that the RIICnSR2.TDRE flag is 1, write the data for transmission to the RIICnDRT register. The RIIC automatically holds the SCL line low until the data for transmission are ready or a stop condition is issued.
- (5) After all bytes of data for transmission have been written to the RIICnDRT register, wait until the value of the RIICnSR2.TEND flag returns to 1, and then set the RIICnCR2.SP bit to 1 (stop condition issuance request). Upon receiving a stop condition issuance request, the RIIC issues the stop condition.
- (6) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00<sub>B</sub> and enters slave receive mode. Furthermore, it automatically clears the RIICnSR2.TDRE and TEND flags to 0, and sets the RIICnSR2.STOP flag in to 1.
- (7) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

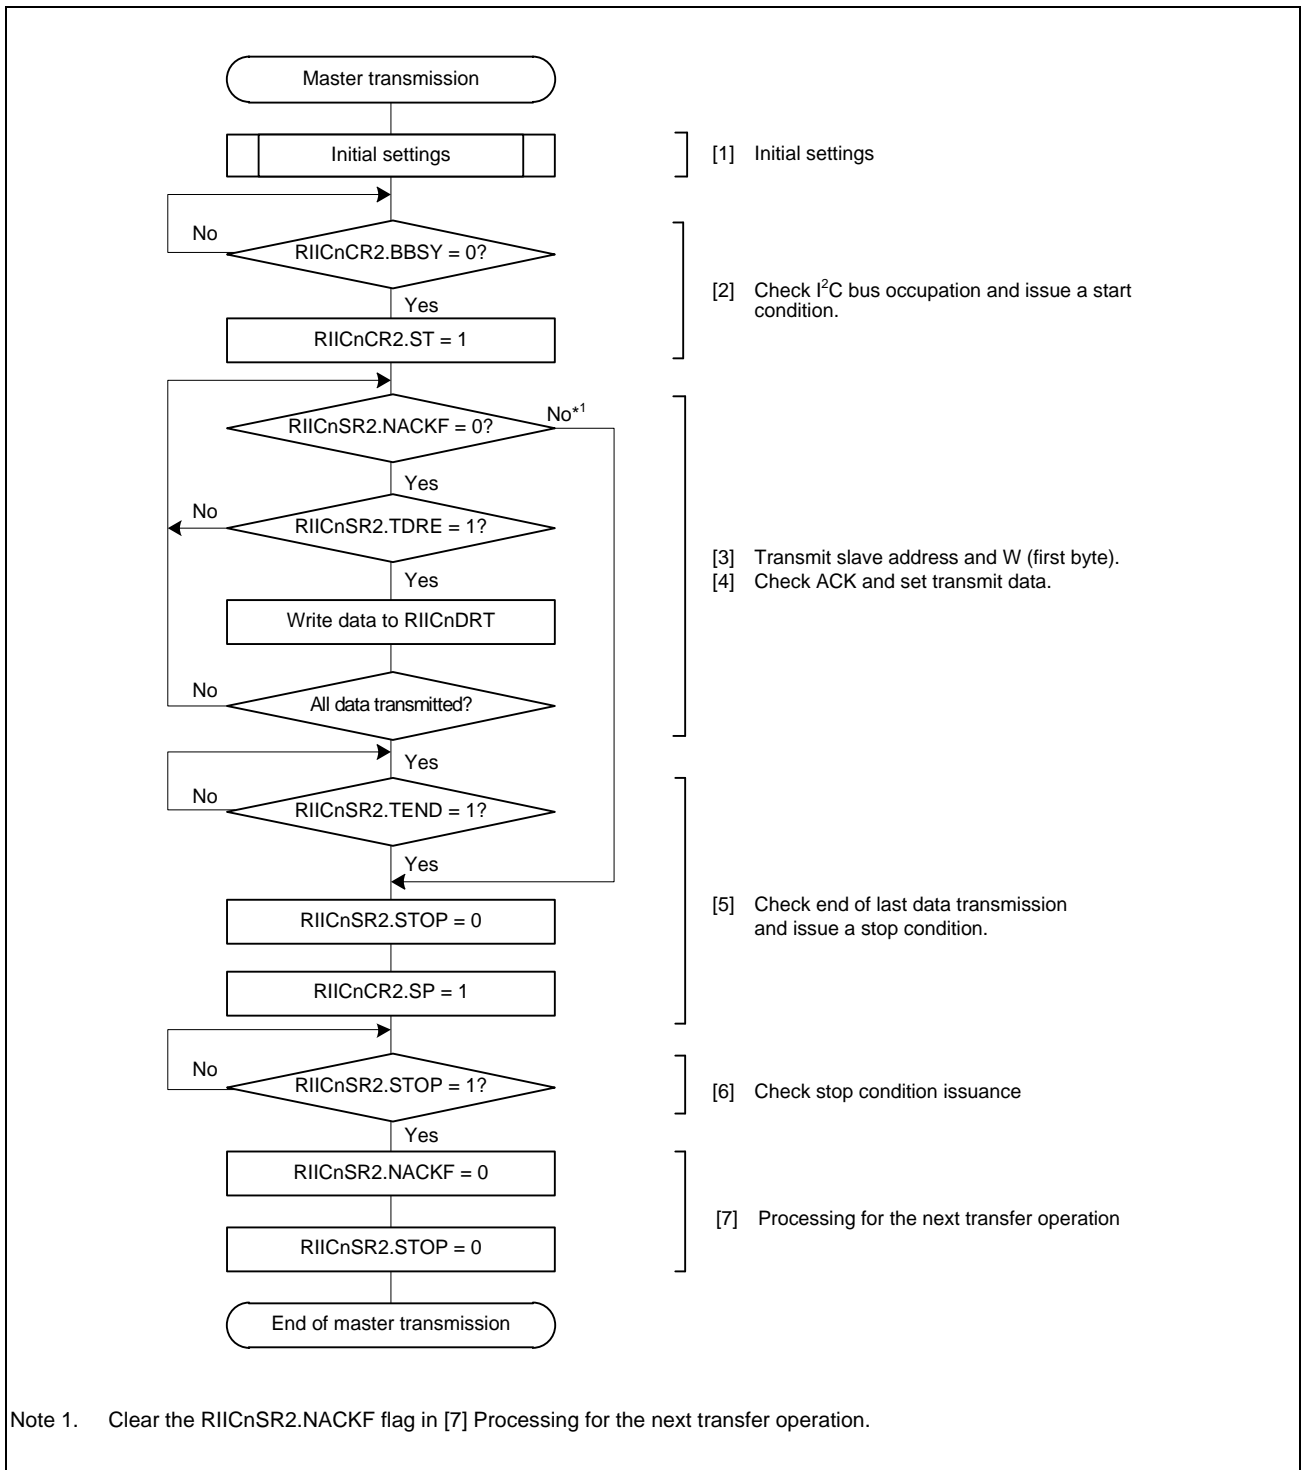

Figure 23.6 Example of Master Transmission Flowchart

Figure 23.7 Master Transmit Operation Timing (1) (7-Bit Address Format)

Figure 23.8 Master Transmit Operation Timing (2) (10-Bit Address Format)

Figure 23.9 Master Transmit Operation Timing (3)

### 23.5.4 Master Receive Operation

In master receive operation, the RIIC as a master device outputs the SCL (clock) signal, receives data from the slave device, and returns acknowledgements. Since the RIIC must start by sending a slave address to the corresponding slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

**Figure 23.10, Example of Master Reception Flowchart (7-Bit Address Format, 1 or 2 Bytes)** shows an example of master reception flowchart (7-bit address format, 1 or 2 bytes), **Figure 23.11, Example of Master Reception Flowchart (7-Bit Address Format, 3 Bytes or More)** shows an example of master reception flowchart (7-bit address format, 3 bytes or more), and **Figure 23.12, Master Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)** to **Figure 23.14, Master Receive Operation Timing (3) (when RDRFS = 0)** show the timing of operations in master reception.

The following describes the procedure and operations for master reception.

- (1) Set the RIICnCR1.IICRST bit to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 23.5, Example of RIIC Initialization Flowchart**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.
- (2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. When the RIIC detects the start condition, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the levels for the SDA output and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.
- (3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and value of the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the slave address including the R/W# bit has been transmitted, the value of the RIICnCR2.TRS bit is automatically updated to select transmit or receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 1, the RIICnCR2.TRS bit is cleared to 0 on the rising edge of the ninth cycle of SCL (the clock signal), placing the RIIC in master receive mode. At this time, the TDRE flag is automatically cleared to 0 and the RIICnSR2.RDRF flag is automatically set to 1.  
 Since the RIICnSR2.NACKF flag being 1 at this time indicates that the slave address has not been recognized or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.  
 For master reception from a device with a 10-bit address, start by using master transmission to transmit the two higher-order bits of the slave address and then the eight lower-order bits of the slave address, and issue a restart condition following generation of the transmission end interrupt (or after TEND = 1) (see **Figure 23.13, Master Receive Operation Timing (2) (10-Bit Address Format, when RDRFS = 0)** for operation timing). After that, transmitting 1111 0<sub>B</sub> plus the two higher-order bits of the slave address, and the R bit places the RIIC in master receive mode.
- (4) Dummy read RIICnDRR after confirming that the RIICnSR2.RDRF flag is 1; this makes the RIIC start output of the SCL (clock) signal and start data reception.

- (5) After 1 byte of data has been received, the RIICnSR2.RDRF flag is set to 1 on the rising edge of the eighth or ninth cycle of SCL clock (the clock signal) as selected by the RIICnMR3.RDRFS bit. Reading out RIICnDRR at this time will produce the received data, and the RDRF flag is automatically cleared to 0 at the same time. Furthermore, the value of the acknowledgement field received during the ninth cycle of SCL clock is returned as the value set in the RIICnMR3.ACKBT bit. Furthermore, if the next byte to be received is the next to last byte, set the RIICnMR3.WAIT bit to 1 (for wait insertion) before reading the RIICnDRR (containing the second byte from last). As well as enabling NACK output even in the case of delays in processing to set the RIICnMR3.ACKBT bit to 1 (NACK) in step (6), due to other interrupts, etc., this fixes the SCL line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, so the state is such that issuing a stop condition is possible.
- (6) When the RIICnMR3.RDRFS bit is 0 and the slave device must be notified that it is to end transfer for data reception after transfer of the next (final) byte, set the RIICnMR3.ACKBT bit to 1 (NACK).
- (7) After reading out the byte before last from the RIICnDRR register, if the value of the RIICnSR2.RDRF flag is confirmed to be 1, write 1 to the RIICnCR2.SP bit (stop condition issuance request) and then read the last byte from RIICnDRR. When RIICnDRR is read, the RIIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is completed or the SCL line is released from the low-hold state.
- (8) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00<sub>B</sub> and enters slave receive mode. Furthermore, detection of the stop condition leads to setting of the RIICnSR2.STOP flag to 1.
- (9) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

Figure 23.14 Master Receive Operation Timing (3) (when RDRFS = 0)

### 23.5.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL (clock) signal, the RIIC transmits data as a slave device, and the master device returns acknowledgements.

**Figure 23.15, Example of Slave Transmission Flowchart** shows an example of usage of slave transmission and **Figure 23.16, Slave Transmit Operation Timing (1) (7-Bit Address Format)** and **Figure 23.17, Slave Transmit Operation Timing (2)** show the timing of operations in slave transmission.

The following describes the procedure and operations for slave transmission.

- (1) Follow the procedure in **Figure 23.5, Example of RIIC Initialization Flowchart** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC automatically sets the BBSY and RIICnSR2.START flags to 1 and automatically clears the ST bit to 0 on detection of a start condition.
- (2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 1, the RIIC automatically places itself in slave transmit mode by setting both the RIICnCR2.TRS bit and the RIICnSR2.TDRE flag to 1.
- (3) After the RIICnSR2.TDRE flag is confirmed to be 1, write the data for transmission to the RIICnDRT register. At this time, if the RIIC receives no acknowledge from the master device (receives a NACK signal) while the RIICnFER.NACKE bit is 1, the RIIC suspends transfer of the next data.
- (4) Wait until the RIICnSR2.TEND flag is set to 1 while the RIICnSR2.TDRE flag is 1, after the RIICnSR2.NACKF flag is set to 1 or the last byte for transmission is written to the RIICnDRT register. When the RIICnSR2.NACKF flag or the TEND flag is 1, the RIIC drives the SCL line low on the ninth falling edge of SCL clock.
- (5) When the RIICnSR2.NACKF flag or the RIICnSR2.TEND flag is 1, dummy read RIICnDRR to complete the processing. This releases the SCL line.
- (6) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.GCA, and AASy (y = 0 to 2), flags RIICnSR2.TDRE and TEND, and the RIICnCR2.TRS bit to 0, and enters slave receive mode. Furthermore, it automatically sets the RIICnSR2.STOP flag to 1.
- (7) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

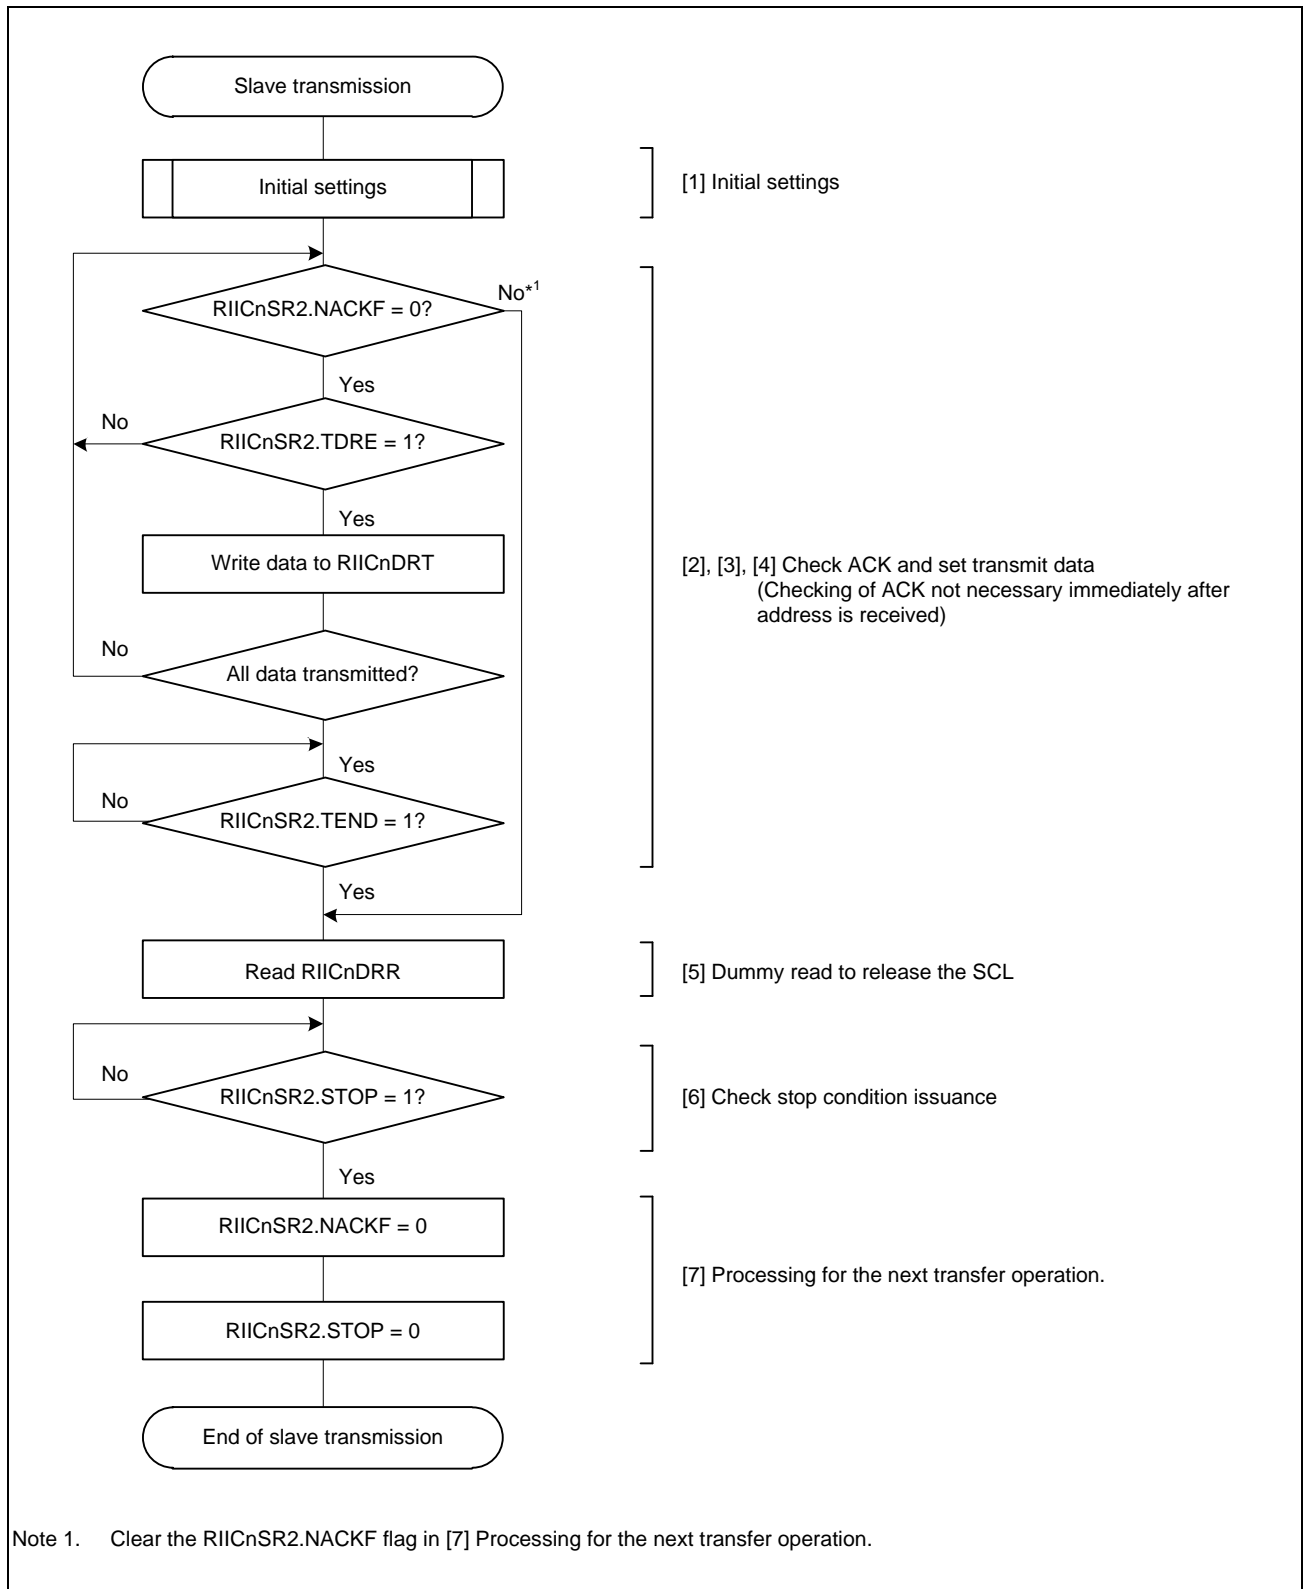

Figure 23.15 Example of Slave Transmission Flowchart

Figure 23.16 Slave Transmit Operation Timing (1) (7-Bit Address Format)

Figure 23.17 Slave Transmit Operation Timing (2)

### 23.5.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the RIIC returns acknowledgements as a slave device.

**Figure 23.18, Example of Slave Reception Flowchart** shows an example of usage of slave reception and **Figure 23.19, Slave Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)** and **Figure 23.20, Slave Receive Operation Timing (2) (when RDRFS = 0)** show the timing of operations in slave reception.

The following describes the procedure and operations for slave reception.

- (1) Follow the procedure in **Figure 23.5, Example of RIIC Initialization Flowchart** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC automatically sets the BBSY and RIICnSR2.START flags to 1 and automatically clears the ST bit to 0 on detection of a start condition.
- (2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 0, the RIIC continues to place itself in slave receive mode and sets the RIICnSR2.RDRF flag to 1.
- (3) After the RIICnSR2.STOP flag is confirmed to be 0 and the RIICnSR2.RDRF flag to be 1, dummy read RIICnDRR as the first read operation (the dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower eight bits when the 10-bit address format is selected).
- (4) When RIICnDRR is read, the RIIC automatically clears the RIICnSR2.RDRF flag to 0. If reading of RIICnDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the RIIC holds the SCL line low from one SCL cycle before the timing with which RDRF should be set. In this case, reading RIICnDRR releases the SCL line from being held at the low level.  
When the RIICnSR2.STOP flag is 1 and the RIICnSR2.RDRF flag is also 1, read RIICnDRR until all the data is completely received.
- (5) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 0. Furthermore, it automatically sets the RIICnSR2.STOP flag to 1.
- (6) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.STOP flag to 0 for the next transfer operation.

Figure 23.18 Example of Slave Reception Flowchart

Figure 23.19 Slave Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)

Figure 23.20 Slave Receive Operation Timing (2) (when RDRFS = 0)

## 23.6 SCL Synchronization Circuit

In generation of the SCL (clock) signal, the RIIC starts counting out the value for width at high level specified in RIICnBRH when it detects a rising edge on the SCL line and drives the SCL line low once counting of the width at high level is complete. When the RIIC detects the falling edge of the SCL line, it starts counting out the width at low level period specified in RIICnBRL, and then stops driving the SCL line (releases the line) once counting of the width at low level is complete. The SCL (clock) signal is thus generated.

If multiple master devices are connected to the I<sup>2</sup>C bus, a collision of SCL signals may arise due to contention with another master device. In such cases, the master devices have to synchronize their SCL signals. Since this synchronization of SCL signals must be bit by bit, the RIIC is equipped with a facility (the SCL synchronization circuit) to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCL line during communication.

When the RIIC has detected a rising edge on the SCL line and thus started counting out the width at high level specified in RIICnBRH, and the level on the SCL line falls because an SCL signal is being generated by another master device, the RIIC stops counting when it detects the falling edge, drives the level on the SCL line low, and starts counting out the width at low level specified in RIICnBRL. When the RIIC finishes counting out the width at low level, it stops driving the SCL line to the low level (i.e. releases the line). At this time, if the width at low level of the SCL clock signal from the other master device is longer than the width at low level set in the RIIC, the width at low level of the SCL signal will be extended. Once the width at low level for the other master device has ended, the SCL signal rises because the SCL line has been released. That is, in cases of contention of SCL signals from more than one master, the width at high level of the SCL signal is synchronized with that of the clock having the narrower width, and the width at low level of the SCL signal is synchronized with that of the clock having the broader width. However, such synchronization of the SCL signal is only enabled when the RIICnFER.SCLE bit is set to 1.

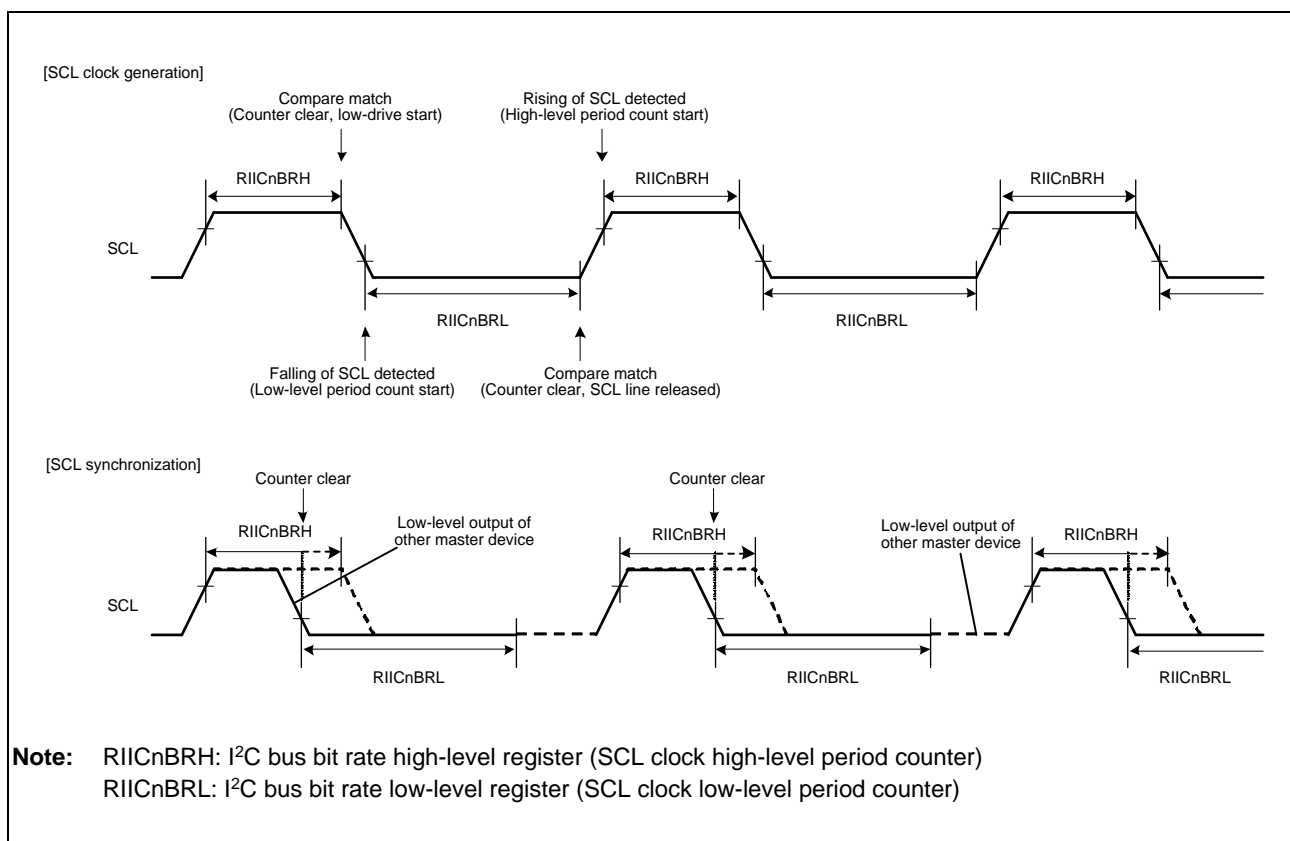

Figure 23.21 Generation and Synchronization of the SCL Signal from the RIIC

### 23.7 Facility for Delaying SDA Output

The RIIC module incorporates a facility for delaying output on the SDA line. The delay can be applied to all output (issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals) on the SDA line.

With the SDA output delay facility, SDA output is delayed from detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval over which the SCL (clock) signal is at the low level. Doing this leads to usage with the aim of preventing erroneous operation of communications devices.

The output delay facility is enabled by setting the RIICnMR2.SDDL[2:0] bits to any value other than 000<sub>B</sub>, and disabled by setting the same bits to 000<sub>B</sub>.

While the SDA output delay facility is enabled (i.e. while the SDDL[2:0] bits are set to any value other than 000<sub>B</sub>), the RIICnMR2.DLCS bit selects the clock source for counting by the SDA output delay counter as the internal base clock (IICφ) for the RIIC module or as a clock signal derived by dividing the frequency of the internal base clock by two (IICφ/2). The counter counts the number of cycles set in the SDDL[2:0] bits. After counting of the set number of cycles of delay is completed, the RIIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.

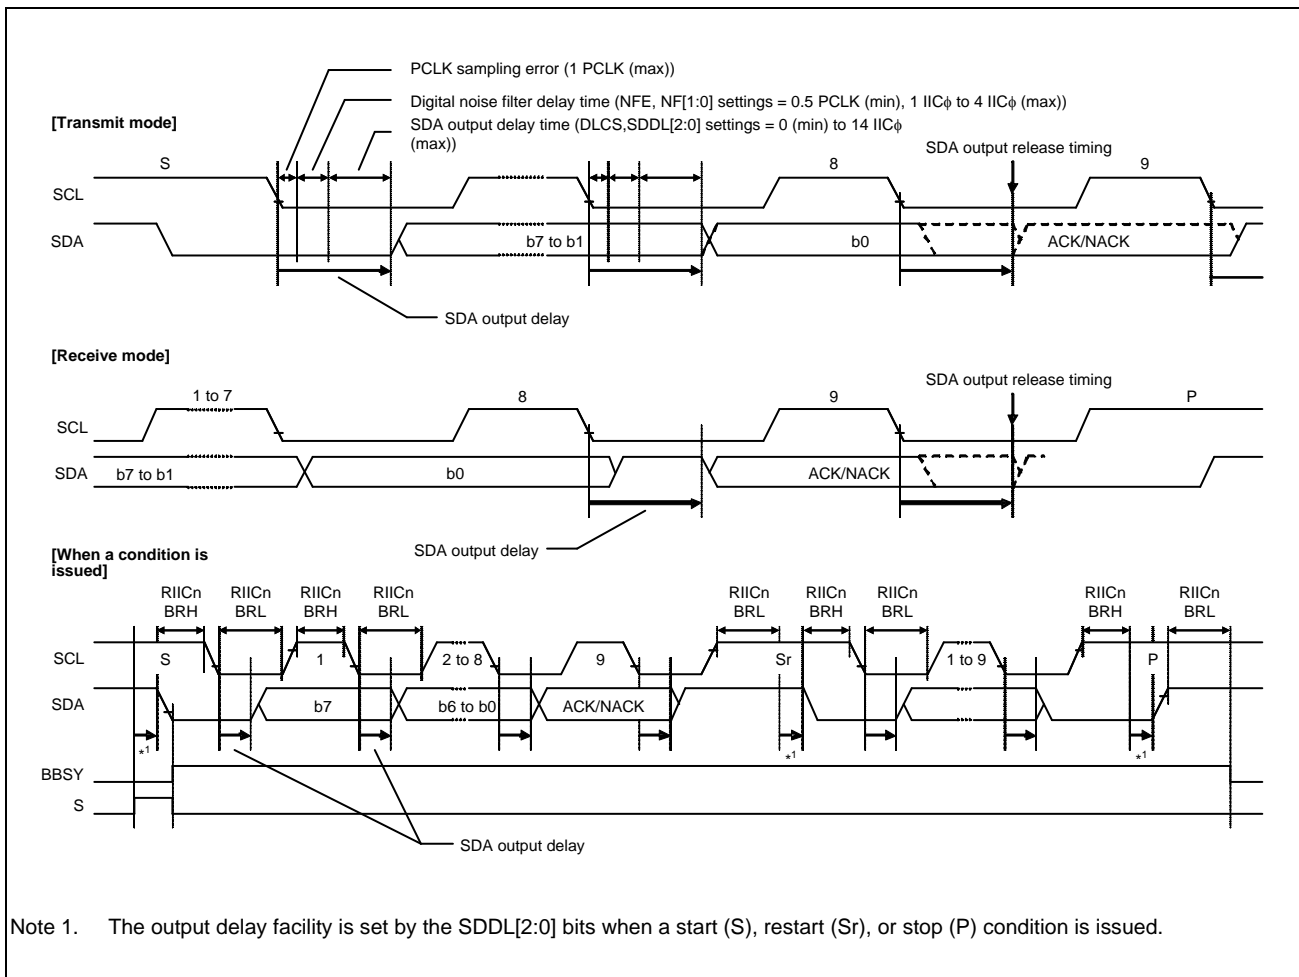

Figure 23.22 SDA Output Delay Facility

## 23.8 Digital Noise-Filter Circuits

The states of the RIICnSCL and RIICnSDA pins are conveyed to the internal circuitry through the digital noise-filter circuit. **Figure 23.23, Block Diagram of Digital Noise Filter Circuit** is a block diagram of the digital noise-filter circuit.

The on-chip digital noise-filter circuit of the RIIC consists of four flip-flop circuit stages connected in series and a match-detection circuit.

The number of effective stages in the digital noise filter is selected by the RIICnMR3.NF[1:0] bits. The selected number of effective stages determines the noise-filtering capability as a period from one to four IIC $\phi$  cycles.

The input signal to the RIICnSCL pin (or RIICnSDA pin) is sampled on falling edges of the IIC $\phi$  signal. When the input signal level matches the output level of the number of effective flip-flop circuit stages as selected by the RIICnMR3.NF[1:0] bits, the signal level is conveyed as an internal signal. If the signal levels do not match, the previous value is retained.

If the ratio between the frequency of the internal operating clock (PCLK) and the transfer rate is small, the characteristics of the digital noise filter may lead to the elimination of needed signals as noise. In such cases, it is possible to disable the digital noise-filter circuit (by clearing the RIICnFER.NFE bit to 0).

Figure 23.23 Block Diagram of Digital Noise Filter Circuit

## 23.9 Address Match Detection

The RIIC can set three unique slave addresses in addition to the general call address and device ID address, and also can set 7-bit or 10-bit slave addresses.

### 23.9.1 Slave-Address Match Detection

The RIIC can set three unique slave addresses, and has a slave address detection function for each unique slave address. When the RIICnSER.SARy bit (y = 0 to 2) is set to 1, the slave addresses set in RIICnSARy (y = 0 to 2) can be detected.

When the RIIC detects a match of the set slave address, the corresponding RIICnSR1.AASy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. The RIICnSR2.RDRF flag or the RIICnSR2.TDRE flag is set to 1 by the following R/W# bit. This causes a receive complete interrupt (INTRIICnRI) or transmit data empty interrupt (INTRIICnTI) to be generated. The AASy flag is used to identify which slave address has been specified.

**Figure 23.24, AASy Flag Set Timing with 7-Bit Address Format Selected to Figure 23.26, AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed** show the AASy flag set timing in three cases.

Figure 23.24 AASy Flag Set Timing with 7-Bit Address Format Selected

Figure 23.26 AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed

### 23.9.2 Detection of the General Call Address

The RIIC has a facility for detecting the general call address ( $0000\ 000_B + 0 [W]$ ). This is enabled by setting the RIICnSER.GCAE bit to 1.

If the address received after a start or restart condition is issued is  $0000\ 000_B + 1[R]$  (start byte), the RIIC recognizes this as the address of a slave device with an “all-zero” address but not as the general call address.

When the RIIC detects the general call address, both the RIICnSR1.GCA flag and the RIICnSR2.RDRF flag are set to 1 on the rising edge of the ninth cycle of SCL clock. This leads to the generation of a receive complete interrupt (INTRIICnRI). The value of the GCA flag can be confirmed to recognize that the general call address has been transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

Figure 23.27 Timing of GCA Flag Setting during Reception of General Call Address

### 23.9.3 Device-ID Address Detection

The RIIC module has a facility for detecting device-ID addresses conforming with the I<sup>2</sup>C bus specification (Rev. 03). When the RIIC receives 1111 100<sub>B</sub> as the first byte after a start condition or restart condition was issued with the RIICnSER.DIDE bit set to 1, the RIIC recognizes the address as a device ID, sets the RIICnSR1.DID flag to 1 on the rising edge of the ninth SCL clock cycle when the following R/W# bit is 0, and then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the RIIC sets the corresponding RIICnSR1.AASy flag (y = 0 to 2) to 1.

After that, when the first byte received after a start or restart condition is issued matches the device ID address (1111 100<sub>B</sub>) again and the following R/W# bit is 1, the RIIC does not compare the second and subsequent bytes and sets the RIICnSR2.TDRE flag to 1.

In the device-ID address detection function, the RIIC clears the DID flag to 0 if a match with the RIIC's own slave address is not obtained or a match with the device ID address is not obtained after a match with the RIIC's own slave address and the detection of a restart condition. If the first byte after detection of a start or restart condition matches the device ID address (1111 100<sub>B</sub>) and the R/W# bit is 0, the RIIC sets the DID flag to 1 and compares the second and subsequent bytes with the RIIC's slave address. If the R/W# bit is 1, the DID flag holds the previous value and the RIIC does not compare the second and subsequent bytes. Therefore, the reception of a device-ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Furthermore, prepare the device-ID fields (three bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal data for transmission. For details, see I<sup>2</sup>C Bus Standard from NXP Semiconductors.

Figure 23.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID

## 23.10 Automatic Low-Hold Function for SCL

### 23.10.1 Function to Prevent Wrong Transmission of Transmit Data

To prevent the unintended transmission of erroneous data, this low-hold period is extended until data for transmission have been written. In addition, the RIIC holds the SCL line low over the period until a stop condition is issued and also over the period until the RIICnDRR register is dummy read.

#### <Master transmit mode>

- Low-level interval after a start condition or restart condition is issued
- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next
- Low-level interval from the ninth clock cycle until a stop condition is issued

#### <Slave transmit mode>

- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next
- Low-level interval from the ninth clock cycle and the RIICnDRR register is dummy read

Figure 23.29 Automatic Low-Hold Operation in Transmit Mode

### 23.10.2 NACK Reception Transfer Suspension Function

The RIIC has a function to suspend transfer operation when NACK is received in transmit mode (RIICnCR2.TRS bit = 1). This function is enabled when the RIICnFER.NACKE bit is set to 1 (transfer suspension enabled). If the next transmit data has already been written (RIICnSR2.TDRE flag = 0) when NACK is received, next data transmission at the falling edge of the ninth SCL clock cycle is automatically suspended. This prevents the SDA line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (RIICnSR2.NACKF flag = 1), transmit operation and receive operation are discontinued. To restore transmit/receive operation, be sure to clear the NACKF flag to 0. In master transmit mode, clear the NACKF flag to 0 after issue a restart condition or NACKF flag to 0 after issue a stop condition, and then issue a start condition again.

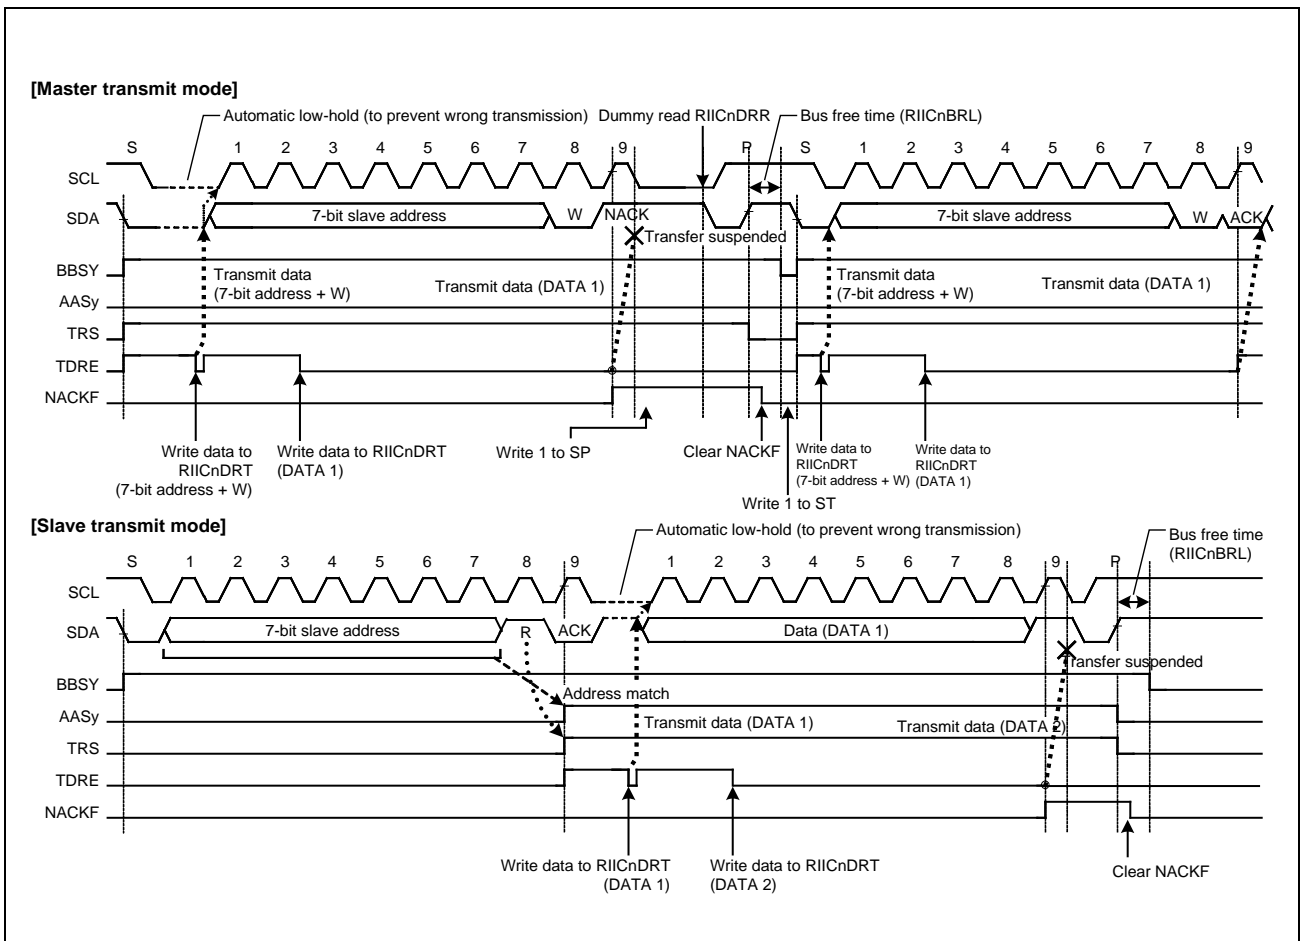

Figure 23.30 Suspension of Data Transfer when NACK is Received (NACKE = 1)

### 23.10.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (RIICnDRR) read is delayed for a period of one transfer frame or more with receive complete (RIICnSR2.RDRF flag = 1) in receive mode (RIICnCR2.TRS = 0), the RIIC holds the SCL line low automatically immediately before the next data is received to prevent failure to receive data.

This function to prevent failure to receive data using the automatic low-hold function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, the RIIC's own slave address is designated after a stop condition is issued. This function does not disturb other communication because the RIIC does not hold the SCL line low when a mismatch with its own slave address occurs after a stop condition is issued.

Sections in which the SCL line is held low can be selected with a combination of the RIICnMR3.WAIT and RDRFS bits.

#### (1) One-Byte Receive Operation and Automatic Low-Hold Function Using the WAIT Bit

When the RIICnMR3.WAIT bit is set to 1, the RIIC performs one-byte receive operation using the WAIT bit function.

Furthermore, when the RIICnMR3.RDRFS bit is 0, the RIIC automatically sends the RIICnMR3.ACKBT bit value for the acknowledge bit in the period from the falling edge of the eighth SCL clock cycle to the falling edge of the ninth SCL clock cycle, and automatically holds the SCL line low at the falling edge of the ninth SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from RIICnDRR, which enables bitwise receive operation.

The WAIT bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and device ID address) is obtained in master receive mode or slave receive mode.

#### (2) One-Byte Receive Operation (ACK/NACK Transmission Control) and Automatic Low-Hold Function Using the RDRFS Bit

When the RIICnMR3.RDRFS bit is set to 1, the RIIC performs one-byte receive operation using the RDRFS bit function.

When the RIICnSR2.RDRFS bit is set to 1, the RDRF flag (receive complete) in RIICnSR2 is set to 1 at the rising edge of the eighth SCL clock cycle, and the SCL line is automatically held low at the falling edge of the eighth SCL clock cycle. This lowhold is released by writing a value to the RIICnMR3.ACKBT bit, but cannot be released by reading data from RIICnDRR, which enables receive operation by the ACK/NACK transmission control according to the data received in byte units.

The RDRFS bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and device ID address) is obtained in master receive mode or slave receive mode.

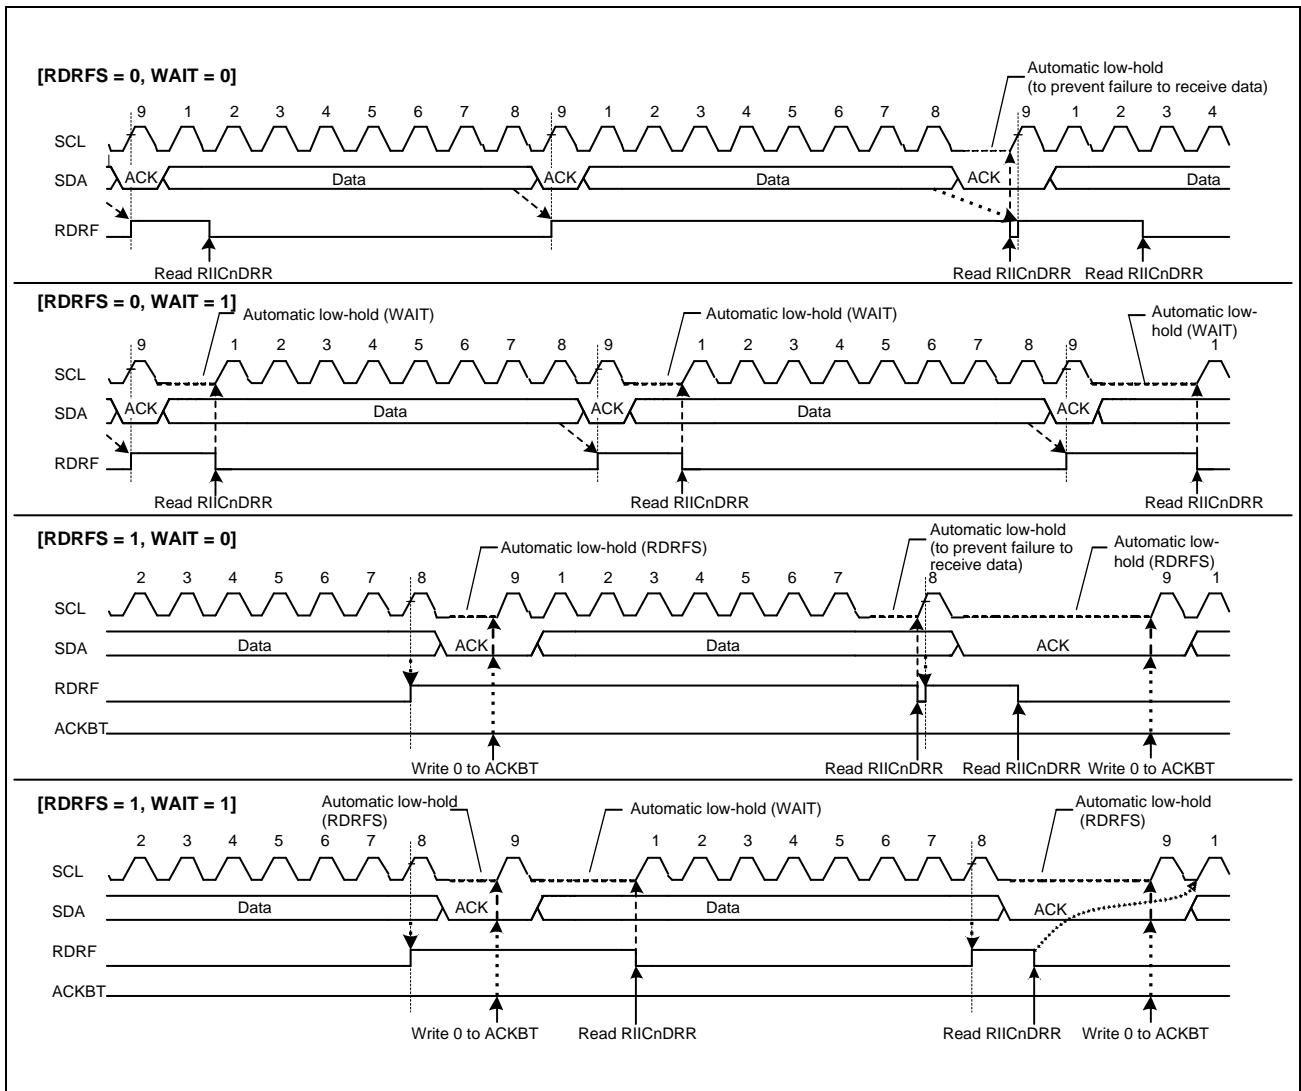

Figure 23.31 Automatic Low-Hold Operation in Receive Mode (Using RDRFS and WAIT Bits)

## 23.11 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I<sup>2</sup>C bus standard, the RIIC has functions to prevent double-issue of a start condition, to detect arbitration-lost during transmission of NACK, and to detect arbitration-lost in slave transmit mode.

### 23.11.1 Master Arbitration-Lost Detection (MALE Bit)

The RIIC drives the SDA line low to issue a start condition. However, if the SDA line has already been driven low by another master device issuing a start condition, the RIIC considers this a loss in arbitration, so priority is given to transfer by the other master device. Similarly, if the RIICnCR2.ST bit is set to 1 while the bus is busy (RIICnCR2.BBSY flag = 1), the RIIC considers itself to have lost in arbitration, so priority is given to transfer by the other master device and no start condition is generated.

When a start condition is issued successfully, if the data for transmission including the address bits (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state, and the low level is detected on the SDA line), the RIIC loses in arbitration.

After a loss in arbitration of mastership, the RIIC immediately enters slave receive mode. If a slave address (including the general call address) matches its own address at this time, the RIIC continues in slave operation.

A loss in arbitration of mastership is detected when the following conditions are met while the RIICnFER.MALE bit is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Non-matching of the internal level for output on SDA and the level on the SDA line after a start condition was issued by setting the RIICnCR2.ST bit to 1 while the RIICnCR2.BBSY flag was cleared to 0 (erroneous issuing of a start condition)
- Setting of the RIICnCR2.ST bit to 1 (start condition double-issue error) while the RIICnCR2.BBSY flag is set to 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDA line in master transmit mode (RIICnCR2.MST and TRS bits = 11<sub>B</sub>)

Figure 23.32 Examples of Master Arbitration-Lost Detection (MALE = 1)

Figure 23.33 Arbitration-Lost when a Start Condition is Issued (MALE = 1)

The TRS bit is not cleared if 1 is written to the ST bit while the BBSY flag is 1 in slave transmit mode.

### 23.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

The RIIC has a function to cause arbitration to be lost if the internal SDA output level does not match the level on the SDA line (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state, and the low level is detected on the SDA line) during transmission of NACK in receive mode. Arbitration is lost due to a conflict of NACK transmission and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send/receive the same information through a single slave device. **Figure 23.34, Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)** shows an example of arbitration-lost detection during transmission of NACK.

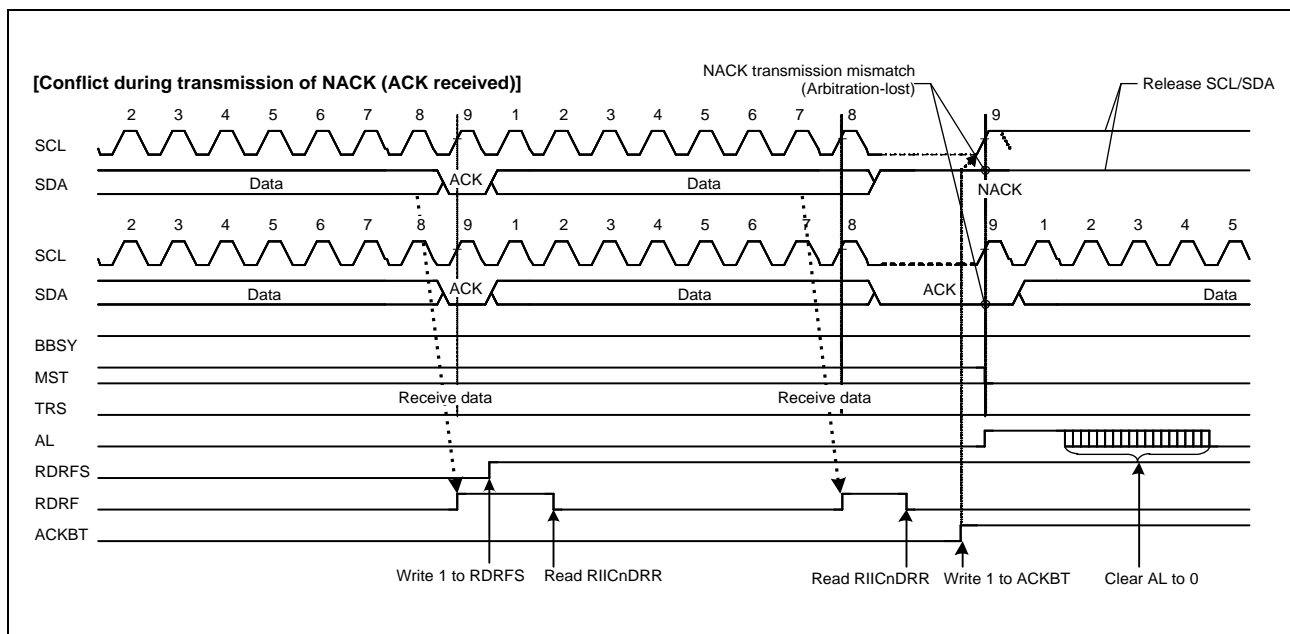

Figure 23.34 Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)

The following explains arbitration-lost detection using an example where two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives two bytes of data from the slave device, and master B receives four bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in both master A and master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Here, master A sends NACK when it has received two final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received necessary four bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect ACK transmitted by master B and issues a stop condition.

Therefore, the issuance of the stop condition conflicts with the SCL clock output of master B, which disturbs communication.

When the RIIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost.

If arbitration is lost during transmission of NACK, the RIIC enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

The RIIC detects arbitration-lost during transmission of NACK when the following condition is met with the RIICnFER.NALE bit set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

When the internal SDA output level does not match the SDA line (ACK is received) during transmission of NACK (RIICnMR3.ACKBT bit = 1)

### 23.11.3 Slave Arbitration-Lost Detection (SALE Bit)

The RIIC has a function to cause arbitration to be lost if the data for transmission (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the highimpedance state, and the low level is detected on the SDA line) in slave transmit mode.

When it loses slave arbitration, the RIIC enters slave receive mode.

The RIIC detects slave arbitration-lost when the following condition is met with the RIICnFER.SALE bit set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

When transmit data excluding acknowledge (internal SDA output level) does not match the SDA line in slave transmit mode (RIICnCR2.MST and TRS bits = 01<sub>B</sub>)

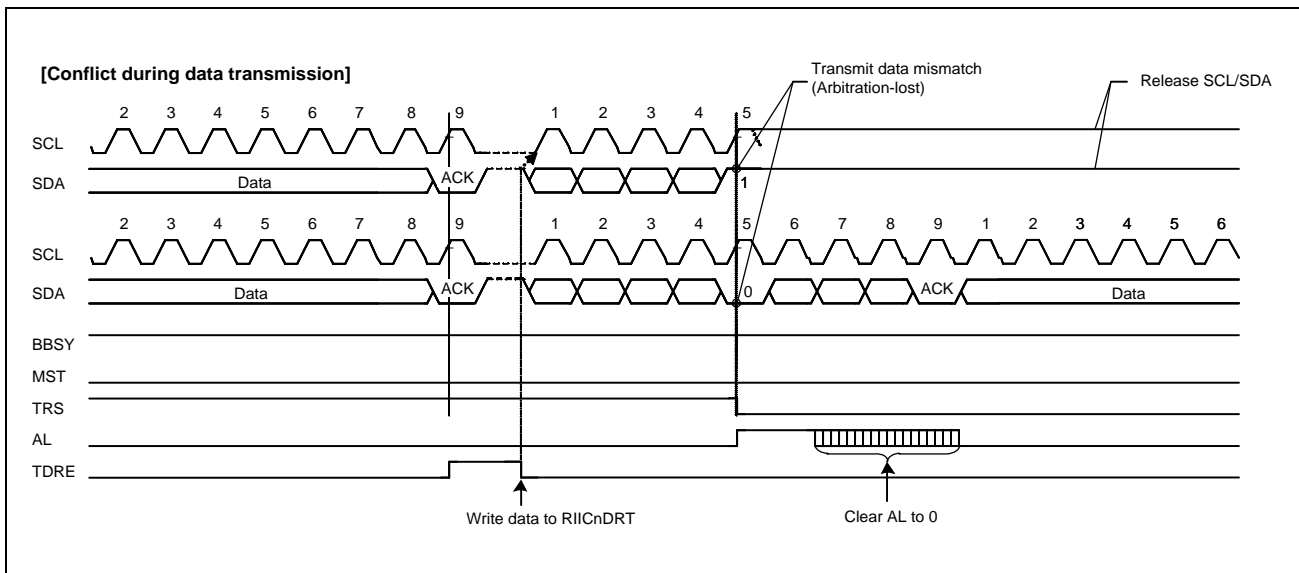

Figure 23.35 Example of Slave Arbitration-Lost Detection (SALE = 1)

## 23.12 Start Condition/Restart Condition/Stop Condition Issuing Function

### 23.12.1 Issuing a Start Condition

The RIIC issues a start condition when the RIICnCR2.ST bit is set to 1.

When the ST bit is set to 1, a start condition issuance request is made and the RIIC issues a start condition when the RIICnCR2.BBSY flag is 0 (bus free). When a start condition is issued normally, the RIIC automatically shifts to the master transmit mode.

A start condition is issued in the following sequence.

[Start condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the start condition hold time.
- Drive the SCL line low (high level to low level).
- Detect low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

### 23.12.2 Issuing a Restart Condition

The RIIC issues a restart condition when the RIICnCR2.RS bit is set to 1.

When the RS bit is set to 1, a restart condition issuance request is made even during communication and the RIIC issues a restart condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

(To detect the issuance of a restart condition, clear the RIICnSR2.START flag before a restart condition is issued.)

A restart condition is issued in the following sequence.

[Restart condition issuance]

- Release the SDA line.
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRL and the restart condition setup time.
- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the restart condition hold time.
- Drive the SCL line low (high level to low level).
- Detect a low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

Figure 23.36 Start Condition/Restart Condition Issue Timing (ST and RS Bits)

### 23.12.3 Issuing a Stop Condition

The RIIC issues a stop condition when the RIICnCR2.SP bit is set to 1.

When the SP bit is set to 1, a stop condition issuance request is made and the RIIC issues a stop condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A stop condition is issued in the following sequence.

[Stop condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRH and the stop condition setup time.
- Release the SDA line (low level to high level).
- Ensure the time set in RIICnBRL and the bus free time.
- Clear the BBSY flag to 0 (to release the bus mastership).

Figure 23.37 Stop Condition Issue Timing (SP Bit)

## 23.13 Bus Hanging

If the clock signals from the master and slave devices go out of synchronization due to noise or other factors, the I<sup>2</sup>C bus might hang with a fixed level on the SCL line and/or SDA line.

As measures against the bus hanging, the RIIC has a timeout function to detect hanging by monitoring the SCL line, a function for the output of an extra SCL clock cycle to release the bus from a hung state due to clock signals being out of synchronization, and the RIIC/internal reset function.

By checking the RIICnCR1.SCLO, SDAO, SCLI, and SDAI bits, it is possible to see whether the RIIC or its partner in communications is placing the low level on the SCL or SDA lines.

### 23.13.1 Timeout Function

The RIIC has the timeout function to detect an abnormality that the SCL line is held for a certain period of time. The RIIC can detect an abnormal bus state by monitoring that the SCL line is held low or high for a predetermined time.

The timeout function monitors the SCL line state and counts the low-level period or high-level period using the internal counter. The timeout function resets the internal counter each time the SCL line changes (rising or falling), but continues to count unless the SCL line changes. If the internal counter overflows due to no SCL line change, the RIIC can detect the timeout and report the bus abnormality.

The internal counter is cleared when one of the conditions is met.

- (1) When RIICnMR2.TMOH=0, and RIICnMR2.TMOL=1:  
The internal counter is cleared by SCL rising
- (2) When RIICnMR2.TMOH=1, and RIICnMR2.TMOL=0:  
The internal counter is cleared by SCL falling
- (3) When RIICnMR2.TMOH=RIICnMR2.TMOL=1:  
The internal counter is cleared by SCL rising or falling

This timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is stuck low or high during the following conditions:

- The bus is busy (RIICnCR2.BBSY flag is 1) in master mode (RIICnCR2.MST bit is 1).
- The RIIC's own slave address matches (RIICnSR1 register is not 00<sub>H</sub>) and the bus is busy (RIICnCR2.BBSY flag is 1) in slave mode (RIICnCR2.MST bit is 0).
- The bus is free (RIICnCR2.BBSY flag is 0) while generation of a START condition is requested (RIICnCR2.ST bit is 1).

The internal counter of the timeout function works using the internal reference clock (IIC $\phi$ ) set by the RIICnMR1.CKS[2:0] bits as a count source. It functions as a 16-bit counter when long mode is selected (RIICnMR2.TMOS bit = 0) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCL line level (low/high or both levels) during which this counter is activated can be selected by the setting of the RIICnMR2.TMOH and TMOL bits. If both TMOL and TMOH bits are cleared to 0, the internal counter does not work.

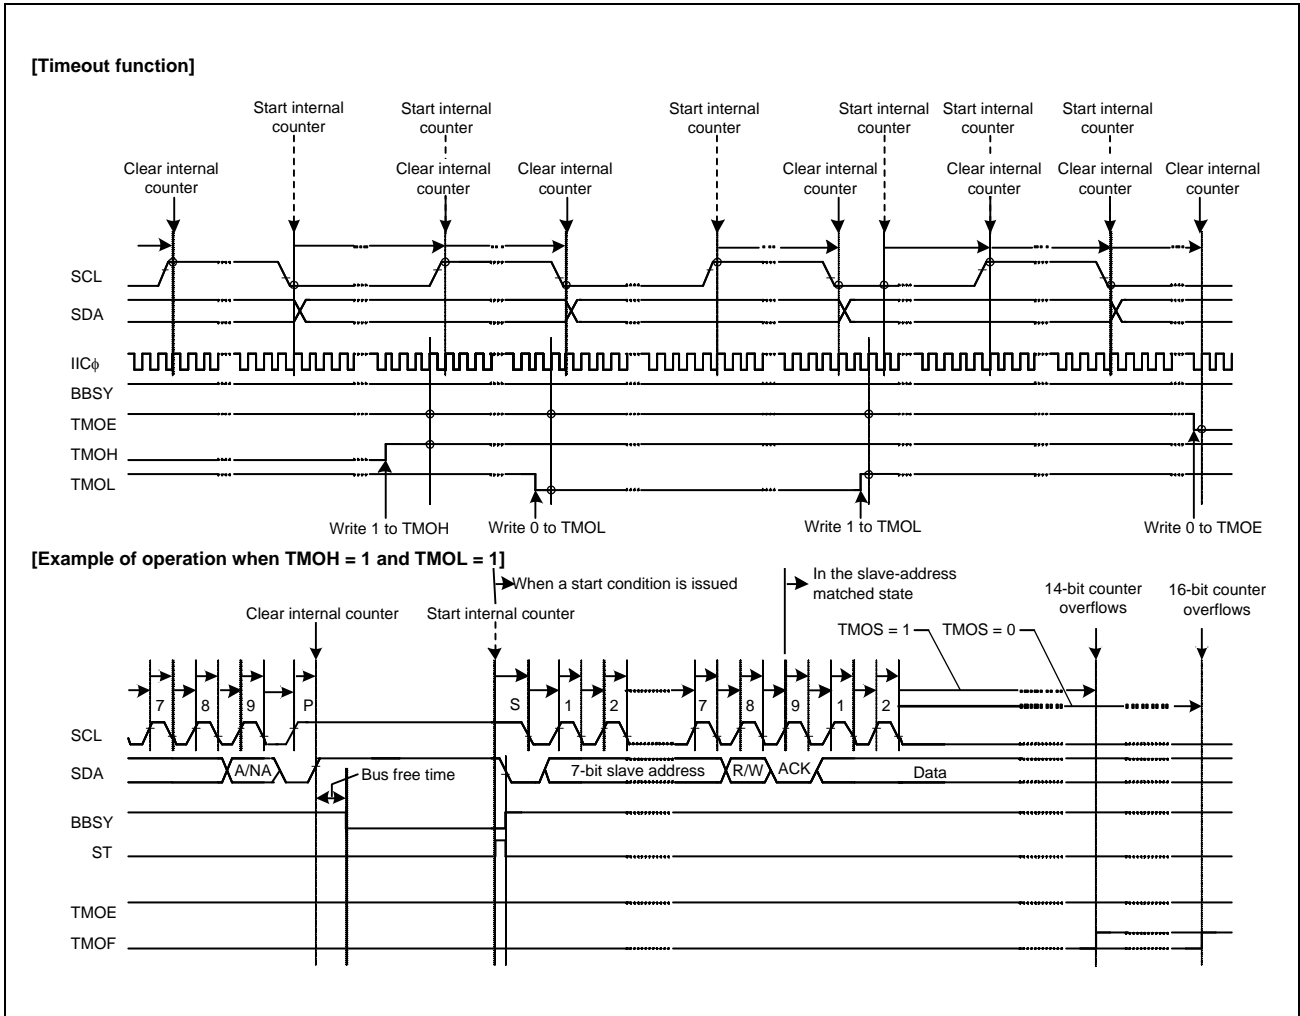

Figure 23.38 Timeout Function (TMOE, TMOS, TMOH, and TMOL Bits)

### 23.13.2 Extra SCL Clock Cycle Output Function

In master mode, the RIIC module has a facility for the output of extra SCL (clock) cycles to release the SDA line of the slave device from being held at the low level due to the master being out of synchronization with the slave device.

This function is mainly used in master mode to release the SDA line of the slave device from the state of being fixed to the low level by including extra cycles of SCL output from the RIIC with single cycles of the SCL (clock) signal as the unit in the case of a bus error where the RIIC cannot issue a stop condition because the slave device is holding the SDA line at the low level. Do not use this facility in normal situations. Using it when communications are proceeding correctly will lead to malfunctions.

When the RIICnCR1.CLO bit is set to 1 in master mode, a single cycle of the SCL clock at the frequency corresponding to the transfer rate settings (settings of the RIICnMR1.CKS[2:0] bits, and of the RIICnBRH and RIICnBRL registers) is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit is automatically cleared to 0. Therefore, further extra clock cycles can be output consecutively by the software program writing 1 to the CLO bit after having read CLO = 0.

When the RIIC module is in master mode and the slave device is holding the SDA line at the low level because synchronization with the slave device has been lost due to the effects of noise, etc., the output of a stop condition is not possible. The facility for output of an extra cycle of the SCL (clock) signal can be used to output extra cycles of SCL one by one to make the slave device release the SDA line from being held at the low level, thus recovering the bus from an unusable state. Release of the SDA line by the slave device can be monitored by reading the RIICnCR1.SDAI bit. After confirming release of the SDA line by the slave device, complete communications by reissuing the stop condition.

Use this facility with the RIICnFER.MALE bit (master arbitration-lost detection disabled) cleared to 0. If the MALE bit is set to 1 (master arbitration-lost detection enabled), arbitration can be lost when the value of the RIICnCR1.SDAO bit does not match the state of the SDA line, so do not use this function.

[Additional output conditions for the SCL clock]

- In master mode and when the bus is free
- In master mode and the SCL line is not held low (the bus is busy)

**Figure 23.39, Extra SCL Clock Cycle Output Function (CLO Bit)** shows the operation timing of the extra SCL clock cycle output function (CLO bit).

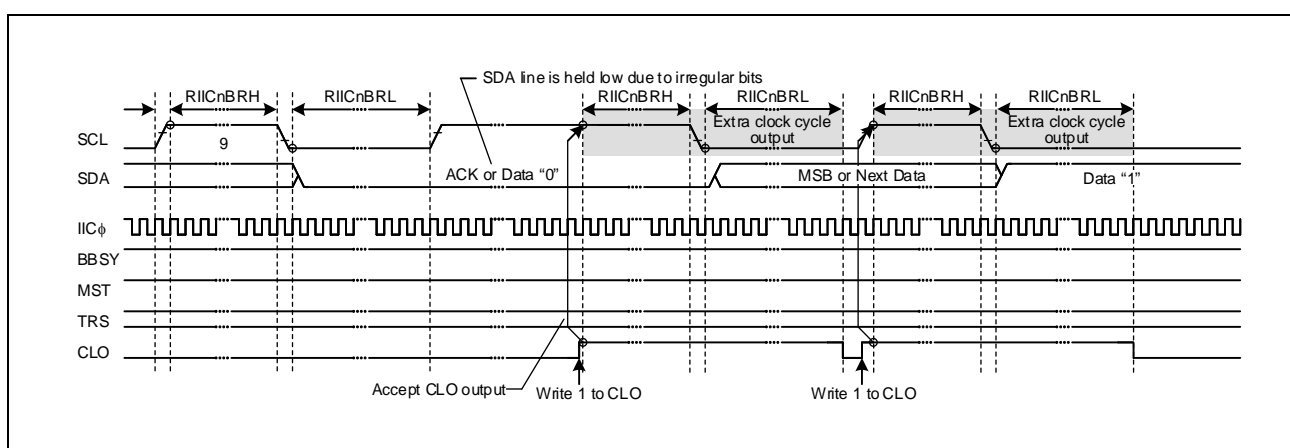

Figure 23.39 Extra SCL Clock Cycle Output Function (CLO Bit)

### 23.13.3 RIIC Reset and Internal Reset

The RIIC module incorporates a function for resetting itself. There are two types of reset. One is referred to as an RIIC reset; this initializes all registers including the RIICnCR2.BBSY flag. The other is referred to as an internal reset; this releases the RIIC from the slave-address matched state and initializes the internal counter while retaining other settings.

After issuing a reset, be sure to clear the RIICnCR1.IICRST bit to 0.

Both types of reset are effective for release from bus-hung states since both restore the output state of the SCL and SDA pins to the high impedance state.

Issuing a reset during slave operation may lead to a loss of synchronization between the master device clock and the slave device clock, so avoid this where possible. Note that monitoring of the bus state, such as for the presence of a start condition, is not possible during an RIIC reset (RIICnCR1.IICE and IICRST bits = 01<sub>B</sub>).

For a detailed description of the RIIC and internal resets, see **Section 23.14, Reset Function of RIIC**.

## 23.14 Reset Function of RIIC

The RIIC has RIIC reset, and internal reset functions. In addition RIIC is cleared by ISORES.

**Table 23.29, RIIC Reset Functions** lists the scope of each reset and reset conditions.

Table 23.29 RIIC Reset Functions

Note 1. When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.  
When an internal reset is applied while the bus is not free, the BBSY flag is not cleared to 0.

## Section 24 CANFD Interface (RS-CANFD)

This section contains a generic description of the CAN Interface (RS-CANFD).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RS-CANFD.

### 24.1 Features of RH850/F1KH, RH850/F1KM RS-CANFD

#### 24.1.1 Number of Units and Channels

This microcontroller has the following number of RS-CANFD units and channels.

Table 24.1 Number of Units (RH850/F1KH-D8)

	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	2
Name	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0, 1)

Table 24.2 Number of Units (RH850/F1KM-S4)

	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0)

Table 24.3 Number of Units (RH850/F1KM-S2)

	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	1	1	1
Name	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0)

Table 24.9 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index "n"; for example, RCFDCnCFDGCCTR is the global control register of the RCFDCn unit (n = 0, 1).
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index "m"; for example, RCFDCnCFDCmSTS is the channel m status register (m = 0 to 7 with n = 0, or m = 0 to 3 with n = 1).
z	Throughout this section, the total number of channels of RS-CANFD units is generically indicated by the index "z" (z = 0 to 11).
j	The individual registers associated with receive rule table are generically indicated by the index "j"; for example, RCFDCnCFDGAFLIDj (j = 0 to 15 with both value of index "n" (n = 0, 1)) is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index "k"; for example, RCFDCnCFDCFCKk (k = 0 to [channel m × 3 + 2] with both value of index "n" (n = 0, 1)) is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index "x"; for example, RCFDCnCFDRFSTsx (x = 0 to 7 with both value of index "n" (n = 0, 1)) is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by "d"; for example, the transmit/receive FIFO buffer data field register is described as RCFDCnCFDFDf_d_k (d = 0 to 15).
q	The individual receive buffers are generically indicated by the index "q"; for example, RCFDCnCFDRMIDq (q = 0 to [channel m × 16 + 15] with both value of index "n" (n = 0, 1)) is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index "p"; for example, RCFDCnCFDTMCp (p = 0 to [channel m × 32 + 31] with both value of index "n" (n = 0, 1)) is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by "b"; for example, the receive buffer data field register is described as RCFDCnCFDRMDFb_q (b = 0 to 15 with both value of index "n" (n = 0, 1)).
r	The individual RAM tests for CAN are generically indicated by the index "r"; for example, RCFDCnCFDRPGACCr (r = 0 to 63 with both value of index "n" (n = 0, 1)) is the RAM test page access register.
y	The registers not covered above are indicated by the index "y"; for example, RCFDCnCFDRMNDy (y = 0 to 3 with n = 0 or (y = 0, 1) with n = 1) is a receive buffer new data register.

**Note:** The functions and descriptions of registers in this section are for the RS-CANFDn that has 8 channels (m = 0 to 7) for unit 0 (n = 0) and 4 channels (m = 0 to 3) for unit 1 (n = 1). When referring to information with indices, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

Table 24.10 Indices (RH850/F1KM-S4, RH850/F1KM-S2)

Index	Description
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index "n"; for example, RCFDCnCFDGCTR is the global control register of the RCFDCn unit (n = 0).
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index "m"; for example, RCFDCnCFDCmSTS is the channel m status register (m = 0 to 7).
z	Throughout this section, the total number of channels of RS-CANFD units is generically indicated by the index "z" (z = 0 to 7).
j	The individual registers associated with receive rule table are generically indicated by the index "j"; for example, RCFDCnCFDGAFLIDj (j = 0 to 15) is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index "k"; for example, RCFDCnCFDCFCCK (k = 0 to [channel m × 3 + 2]) is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index "x"; for example, RCFDCnCFDRFSTsx (x = 0 to 7) is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by "d"; for example, the transmit/receive FIFO buffer data field register is described as RCFDCnCFDCFDf_d_k (d = 0 to 15).
q	The individual receive buffers are generically indicated by the index "q"; for example, RCFDCnCFDRMIDq (q = 0 to [channel m × 16 + 15]) is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index "p"; for example, RCFDCnCFDTMCp (p = 0 to [channel m × 32 + 31]) is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by "b"; for example, the receive buffer data field register is described as RCFDCnCFDRMDFb_q (b = 0 to 15).
r	The individual RAM tests for CAN are generically indicated by the index "r"; for example, RCFDCnCFDRPGACCr (r = 0 to 63) is the RAM test page access register.
y	The registers not covered above are indicated by the index "y"; for example, RCFDCnCFDRMNDy (y = 0 to 3 with n = 0, or y = 0, 1 with n = 1) is a receive buffer new data register.

**Note:** The functions and descriptions of registers in this section are for the RS-CANFD that has 8 channels (m = 0 to 7). When referring to information with indices, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

Table 24.11 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index "n"; for example, RCFDCnCFDGCTR is the global control register of the RCFDCn unit (n = 0).
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index "m"; for example, RCFDCnCFDCmSTS is the channel m status register (m = 0 to 5).
z	Throughout this section, the total number of channels of RS-CANFD units is generically indicated by the index "z" (z = 0 to 5).
j	The individual registers associated with receive rule table are generically indicated by the index "j"; for example, RCFDCnCFDGAFLIDj (j = 0 to 15) is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index "k"; for example, RCFDCnCFDCFCCK (k = 0 to [channel m × 3 + 2]) is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index "x"; for example, RCFDCnCFDRFSTX (x = 0 to 7)*1 is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by "d"; for example, the transmit/receive FIFO buffer data field register is described as RCFDCnCFDCDFD_k (d = 0 to 15).
q	The individual receive buffers are generically indicated by the index "q"; for example, RCFDCnCFDRMIDq (q = 0 to [channel m × 16 + 15]) is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index "p"; for example, RCFDCnCFDTMCp (p = 0 to [channel m × 32 + 31]) is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by "b"; for example, the receive buffer data field register is described as RCFDCnCFDRMDFb_q (b = 0 to 15).
r	The individual RAM tests for CAN are generically indicated by the index "r"; for example, RCFDCnCFDRPGACCr (r = 0 to 63) is the RAM test page access register.
y	The registers not covered above are indicated by the index "y"; for example, RCFDCnCFDRMNDy (y = 0 to 2 with n = 0, or y = 0, 1 with n = 1) is a receive buffer new data register.

**Note:** The functions and descriptions of registers in this section are for the RS-CANFD that has 6 channels (m = 0 to 5). When referring to information with indices, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

Note 1. Only the index "x" of RCFDCnCFDCDTCT register and RCFDCnCFDCDTSTS register for RH850/F1KM-S1 are x = 0 to 5.

The following table lists the values of indices for individual products.

Table 24.12 Indices for Individual Products (RH850/F1KH-D8)

Unit Name	Indices for Individual Products		
	176 Pins	233 Pins	324 Pins

	k = 0 to 2	k = 0 to 8	k = 0 to 8	k = 0 to 17
	x = 0 to 7*1	x = 0 to 7*1	x = 0 to 7*1	x = 0 to 7*1
	d = 0 to 15	d = 0 to 15	d = 0 to 15	d = 0 to 15
	q = 0 to 15	q = 0 to 47	q = 0 to 47	q = 0 to 95
	p = 0 to 31	p = 0 to 95	p = 0 to 95	p = 0 to 191
	b = 0 to 15	b = 0 to 15	b = 0 to 15	b = 0 to 15
	r = 0 to 63	r = 0 to 63	r = 0 to 63	r = 0 to 63
y = 0	y = 0, 1	y = 0, 1	y = 0 to 2	

Note 1. Only the index "x" of RCFDCnCFDCDTCT register and RCFDCnCFDCDTSTS register for RH850/F1KM-S1 are x = 0 to 5.

### 24.1.2 Register Base Addresses

RCFDCn base addresses are listed in the following table.

RCFDCn register addresses are given as offsets from the base addresses.

Table 24.16 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<RCFDC0_base>	FFD0 0000 <sub>H</sub>
<RCFDC1_base>	FFD2 0000 <sub>H</sub>

Table 24.17 Register Base Address (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<RCFDC0_base>	FFD0 0000 <sub>H</sub>

### 24.1.3 Clock Supply

The RCFDCn clock supply is shown in the following table.

Table 24.18 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RCFDCn	clk_xincan	CKSCLK_ICANOSC	Communication clock from OSC clock
	clk	CKSCLK_IPERI2	Communication clock
	pclk	CKSCLK_ICAN	Module clock
	Register access clock	CPUCLK_M, CKSCLK_ICAN	Bus clock

The operating frequency of the RCFDCn depends on the transfer rate and the number of channels in use. **Table 24.19, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM** shows the range of the frequency.

Table 24.19 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM

Condition			Range of Operating Frequency		
Nominal Bit Rate	Data Bit Rate	No. of Channels in Use (max.)	pclk	clk_xincan*1	clk*1
500 kbps	5 Mbps	8 ch	pclk = 80 MHz	Not applicable	clk = 40 MHz
1 Mbps	2 Mbps	8 ch	pclk = 80 MHz	Not applicable	clk = 40 MHz
500 kbps	2 Mbps	2 ch	pclk = 24 MHz	clk_xincan = 12 MHz	Not applicable
500 kbps	2 Mbps	8 ch	pclk = 80 MHz	Not applicable	clk = 40 MHz

Note 1. Setting the DCS bit in the RCFDCnCFDGCFCFG register enables to select either clk\_xincan or clk. Set clocks less than or equal to pclk/2.

#### CAUTION

When the RS-CANFD module is used in stop mode, set the MainOSC as the clock source of the RS-CANFD module. For details about how to set the clock source, see **Section 12AB.4.3.10, RS-CANFD Clock Domains C\_ISO\_CAN and C\_ISO\_CANOSC** and **Section 12C.4.3.9, RS-CANFD Clock Domains C\_ISO\_CAN and C\_ISO\_CANOSC**.

## 24.1.4 Interrupt Requests

RCFDCn interrupt requests are listed in the following table.

Table 24.20 Interrupt Requests (RH850/F1KH-D8)

Unit	Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RCFDC0				
Global	INTRCANGERR0	CAN global error interrupt	22	—
	INTRCANGRECC0	CAN receive FIFO interrupt	23	—
	RSCANFDRF0	Reception FIFO access message buffers0	—	60
	RSCANFDRF1	Reception FIFO access message buffers1	—	61
	RSCANFDRF2	Reception FIFO access message buffers2	—	62
	RSCANFDRF3	Reception FIFO access message buffers3	—	63
	RSCANFDRF4	Reception FIFO access message buffers4	—	68
	RSCANFDRF5	Reception FIFO access message buffers5	—	69
	RSCANFDRF6	Reception FIFO access message buffers6	—	82
RSCANFDRF7	Reception FIFO access message buffers7	—	83	
CAN0	INTRCAN0ERR	CAN0 error interrupt	24	—
	INTRCAN0REC	CAN0 transmit/receive FIFO receive completion interrupt	25	—
	INTRCAN0TRX	CAN0 transmit interrupt	26	—
	RSCANFDCF0	CAN0 common FIFO access message buffers	—	23
CAN1	INTRCAN1ERR	CAN1 error interrupt	113	—
	INTRCAN1REC	CAN1 transmit/receive FIFO receive completion interrupt	114	—
	INTRCAN1TRX	CAN1 transmit interrupt	115	—
	RSCANFDCF1	CAN1 common FIFO access message buffers	—	24
CAN2	INTRCAN2ERR	CAN2 error interrupt	217	—
	INTRCAN2REC	CAN2 transmit/receive FIFO receive completion interrupt	218	—
	INTRCAN2TRX	CAN2 transmit interrupt	219	—
	RSCANFDCF2	CAN2 common FIFO access message buffers	—	26
CAN3	INTRCAN3ERR	CAN3 error interrupt	220	—
	INTRCAN3REC	CAN3 transmit/receive FIFO receive completion interrupt	221	—
	INTRCAN3TRX	CAN3 transmit interrupt	222	—
	RSCANFDCF3	CAN3 common FIFO access message buffers	—	27
CAN4	INTRCAN4ERR	CAN4 error interrupt	272	—
	INTRCAN4REC	CAN4 transmit/receive FIFO receive completion interrupt	273	—
	INTRCAN4TRX	CAN4 transmit interrupt	274	—
	RSCANFDCF4	CAN4 common FIFO access message buffers	—	48
CAN5	INTRCAN5ERR	CAN5 error interrupt	287	—
	INTRCAN5REC	CAN5 transmit/receive FIFO receive completion interrupt	288	—
	INTRCAN5TRX	CAN5 transmit interrupt	289	—
	RSCANFDCF5	CAN5 common FIFO access message buffers	—	49
CAN6	INTRCAN6ERR	CAN6 error interrupt	321	—
	INTRCAN6REC	CAN6 transmit/receive FIFO receive completion interrupt	322	—
	INTRCAN6TRX	CAN6 transmit interrupt	323	—
	RSCANFDCF6	CAN6 common FIFO access message buffers	—	64

Table 24.20 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal		Description	Interrupt Number	DMA Trigger Number
CAN7	INTRCAN7ERR	CAN7 error interrupt	332	—
	INTRCAN7REC	CAN7 transmit/receive FIFO receive completion interrupt	333	—
	INTRCAN7TRX	CAN7 transmit interrupt	334	—
	RSCANFDCF7	CAN7 common FIFO access message buffers	—	65
RCFDC1				
Global	INTRCANGERR1	CAN global error interrupt	319	—
	INTRCANGRECC1	CAN receive FIFO interrupt	320	—
	RSCANFDRF8	Reception FIFO access message buffers8	—	96
	RSCANFDRF9	Reception FIFO access message buffers9	—	97
	RSCANFDRF10	Reception FIFO access message buffers10	—	98

## NOTE

For the wake-up factors from standby mode, see **Section 14.1.2.1, Wake-Up Factors for Stand-By Modes.**

### 24.1.5 Reset Sources

RCFDCn reset sources are listed in the following table. RCFDCn is initialized by these reset sources.

Table 24.23 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
RCFDCn	All reset sources (ISORES)

### 24.1.6 External Input/Output Signals

External input/output signals of RCFDCn are listed below.

Table 24.24 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
RCFDC0		
CANzRX (z = 0 to 7)	CANm receive data input	CANzRX (z = 0 to 7)
CANzTX (z = 0 to 7)	CANm transmit data output	CANzTX (z = 0 to 7)
RCFDC1		
CANzRX (z = 8 to 11)	CANm receive data input	CANzRX (z = 8 to 11)
CANzTX (z = 8 to 11)	CANm transmit data output	CANzTX (z = 8 to 11)

Table 24.25 External Input/Output Signals (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Signal Name	Description	Alternative Port Pin Signal
RCFDC0		
CANzRX (z = 0 to 7)	CANm receive data input	CANzRX (z = 0 to 7)
CANzTX (z = 0 to 7)	CANm transmit data output	CANzTX (z = 0 to 7)

Table 24.26 External Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RCFDC0		
CANzRX (z = 0 to 5)	CANm receive data input	CANzRX (z = 0 to 5)
CANzTX (z = 0 to 5)	CANm transmit data output	CANzTX (z = 0 to 5)

## 24.2 Overview

### 24.2.1 Functional Overview

**Table 24.27, RS-CANFD Module Specifications** shows the RS-CANFD module specifications that has 8 channels (m = 0 to 7) for unit 0 (n = 0) and 4 channels (m = 0 to 3) for unit 1 (n = 1). **Figure 24.1, RS-CANFD Module Block Diagram** shows the RS-CANFD module block diagram.

Table 24.27 RS-CANFD Module Specifications

Item	Specification
Number of channels	8 (n = 0), 4 (n = 1)
Protocol	ISO11898-1 compliant Using CAN FD frames is selectable by switching interface modes.
Communication speed	Classical CAN only mode : <ul style="list-style-type: none"> <li>• Maximum 1 Mbps</li> </ul> $\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$ $\text{CANm bit time} = \text{CANmTq} \times \text{Tq count per bit}$ $\text{CANmTq} = \frac{(\text{NBRP}[9: 0] \text{ bits in the RCFDCnCFDCmNCFG register} + 1)}{\text{fCAN}}$ <p>fCAN: Frequency of CAN clock (selected by the DCS bit in the RCFDCnCFDGCFCFG register)</p> CAN FD mode and CAN FD only mode: <ul style="list-style-type: none"> <li>• Data bit rate: max.5 Mbps ( Nominal bit rate ≤ 500 Kbps )</li> <li>• Data bit rate: max.2 Mbps ( 1Mbps ≥ Nominal bit rate &gt; 500 Kbps )</li> </ul> Note : fCAN = 40 MHz $\text{Transmission rate (CANm nominal bit time clock)} = \frac{1}{\text{CANm nominal bit time}}$ $\text{Transmission rate (CANm data bit time clock)} = \frac{1}{\text{CANm data bit time}}$ $\text{CANm nominal bit time} = \text{CANmTq(N)} \times \text{Tq count per nominal bit}$ $\text{CANm data bit time} = \text{CANmTq(D)} \times \text{Tq count per data bit}$ $\text{CANmTq(N)} = \frac{(\text{NBRP}[9: 0] \text{ bits in the RCFDCnCFDCmNCFG register} + 1)}{\text{fCAN}}$ $\text{CANmTq(D)} = \frac{(\text{DBRP}[7: 0] \text{ bits in the RCFDCnCFDCmDCFCFG register} + 1)}{\text{fCAN}}$ <p>fCAN: Frequency of CAN clock (selected by the DCS bit in the RCFDCnCFDGCFCFG register)            m = 0 to 7 (n = 0), m = 0 to 3 with (n = 1)            Tq: Time quantum</p>

Table 24.27 RS-CANFD Module Specifications

Item	Specification
Buffer	<p>RCFDC0: 1280 buffers in total</p> <ul style="list-style-type: none"> <li>Individual buffers: 256 buffers (32 buffers × 8 channels) Transmit buffer: 32 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 32 buffers allocatable)</li> <li>Shared buffers: 1024 buffers for all channels Receive buffer: 0 to 128 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each)</li> <li>ECC included</li> </ul> <p>RCFDC1: 640 buffers in total</p> <ul style="list-style-type: none"> <li>Individual buffers: 128 buffers (32 buffers × 4 channels) Transmit buffer: 32 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 32 buffers allocatable)</li> <li>Shared buffers: 512 buffers for all channels Receive buffer: 0 to 64 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each)</li> <li>ECC included</li> </ul>
Reception function	<ul style="list-style-type: none"> <li>Receives data frames and remote frames.</li> <li>Selects ID format (standard ID, extended ID, or both IDs) to be received.</li> <li>Sets interrupt enable/disable for each FIFO.</li> <li>Mirror function (reception of messages transmitted from the own CAN node)</li> <li>Timestamp function (to record message reception time as a 16-bit timer value)</li> </ul>
Reception filter function	<ul style="list-style-type: none"> <li>Selects receive messages according to 1024 receive rules.</li> <li>Sets the number of receive rules (0 to 255) for each channel.</li> <li>Acceptance filter processing: Sets ID and mask for each receive rule.</li> <li>DLC filter processing: Enables DLC filter check for each acceptance rule.</li> </ul>
Receive message transfer function	<ul style="list-style-type: none"> <li>Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer</li> <li>Label addition function Stores label information together with a message in a receive buffer and FIFO buffer.</li> </ul>
Transmission function	<ul style="list-style-type: none"> <li>Transmits data frames and remote frames.</li> <li>Selects ID format (standard ID, extended ID, or both IDs) to be transmitted.</li> <li>Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer.</li> <li>Selects ID priority transmission or transmit buffer number priority transmission.</li> <li>Transmit request can be aborted (possible to confirm with a flag)</li> <li>One-shot transmission function</li> </ul>
Interval transmission function	Transmits messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers)
Transmit queue function	Transmits all stored messages according to the ID priority.
Transmit history function	Stores the history information of transmission-completed messages
Gateway function	Transmits a received message automatically.
Bus off recovery mode selection	<p>Selects the method for returning from bus off state.</p> <ul style="list-style-type: none"> <li>ISO11898-1 compliant</li> <li>Automatic entry to channel halt mode at bus-off entry</li> <li>Automatic entry to channel halt mode at bus-off end</li> <li>Transition to channel halt mode by program request</li> <li>Transition to the error-active state by program request (forcible return from the bus off state)</li> </ul>

Table 24.27 RS-CANFD Module Specifications

Item	Specification
Error status monitoring	<ul style="list-style-type: none"> <li>• Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus lock).</li> <li>• Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery)</li> <li>• Reads the error counter.</li> <li>• Monitors DLC errors.</li> </ul>
Interrupt source	RCFDC0: 26 sources, RCFDC1: 14 sources <ul style="list-style-type: none"> <li>• Global interrupts (2 sources/unit) (n = 0, 1)               <ul style="list-style-type: none"> <li>Receive FIFO interrupt (1 source/unit) (n = 0, 1)</li> <li>Global error interrupt (1 source/unit) (n = 0, 1)</li> </ul> </li> <li>• Channel interrupts (3 sources/channel) CANm transmit interrupt (m = 0 to 7 (n = 0), m = 0 to 3 (n = 1))               <ol style="list-style-type: none"> <li>1. CANm transmit interrupt                   <ul style="list-style-type: none"> <li>– CANm transmit complete interrupt</li> <li>– CANm transmit abort interrupt</li> <li>– CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)</li> <li>– CANm transmit history interrupt</li> <li>– CANm transmit queue interrupt</li> </ul> </li> <li>2. CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)</li> <li>3. CANm error interrupt</li> </ol> </li> </ul>
CAN stop mode	Reduces power consumption by stopping clock supply to the RS-CANFD module.
CAN clock source	Selects the clk or the clk_xincan. As for the range of operating frequency, see <b>Table 24.19, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM.</b>
Test function	Test function for user evaluation <ul style="list-style-type: none"> <li>• Listen-only mode</li> <li>• Self-test mode 0 (external loopback)</li> <li>• Self-test mode 1 (internal loopback)</li> <li>• Restricted operation mode</li> <li>• RAM test (read/write test)</li> <li>• Inter-channel communication test [CRC error test enabled]</li> </ul>

## 24.2.2 Interface Modes

The RS-CANFD has three interface modes.

- Classical CAN only mode: Handles only classical CAN frames.
- CAN FD mode: Handles classical CAN frames and CAN FD frames.
- CAN FD only mode: Handles only CAN FD frames.

Interface modes are switched by the CLOE bit and the FDOE in the RCFDCnCFDCmFDCFG register.

Set interface modes for each channel.

Table 24.28 Description and Configuration of Interface Mode

Interface Mode	Description	Configuration
CAN-FD mode	Classical and CAN-FD frames can be transmitted and received	RCFDCnCFDCmFDCFG.CLOE = 0 RCFDCnCFDCmFDCFG.FDOE = 0
CAN-FD only mode	Only CAN-FD frames can be transmitted and received. Classical frames will cause the detection of an error	RCFDCnCFDCmFDCFG.CLOE = 0 RCFDCnCFDCmFDCFG.FDOE = 1
Classical CAN only mode	Only Classical Frame can be transmitted and received. FD frames will cause the detection of an error	RCFDCnCFDCmFDCFG.CLOE = 1 RCFDCnCFDCmFDCFG.FDOE = 0

## 24.2.3 CAN FD Protocol

This product supports CAN FD according to the ISO/DIS 11898-1 protocol that specifies the new CRC field including stuff counters.

24.2.4 Block Diagram

Figure 24.1 RS-CANFD Module Block Diagram

## 24.3 Registers

This section describes all registers to be used when the RS-CANFD is used.

### 24.3.1 List of Registers

The following tables list RS-CANFD registers to be used.

For details about <RCFDCn\_base>, see **Section 24.1.2, Register Base Addresses**.

For details about registers initialized in Global reset mode or Channel reset mode, see following.

- **Table 24.121, Registers Initialized in Global Reset Mode or Channel Reset Mode**
- **Table 24.122, Registers Initialized Only in Global Reset Mode**

Table 24.29 List of Registers

Module Name	Register Name	Symbol	Address	Guard Group
Channel-related registers				
RCFDCn	Channel nominal bit rate configuration register	RCFDCnCFDCmNCFG	<RCFDCn_base> + 0000 <sub>H</sub> + (10 <sub>H</sub> × m)	RCFDCn Chm
RCFDCn	Channel control register	RCFDCnCFDCmCTR	<RCFDCn_base> + 0004 <sub>H</sub> + (10 <sub>H</sub> × m)	RCFDCn Chm
RCFDCn	Channel status register	RCFDCnCFDCmSTS	<RCFDCn_base> + 0008 <sub>H</sub> + (10 <sub>H</sub> × m)	RCFDCn Chm
RCFDCn	Channel error flag register	RCFDCnCFDCmERFL	<RCFDCn_base> + 000C <sub>H</sub> + (10 <sub>H</sub> × m)	RCFDCn Chm
RCFDCn	Channel data bit rate configuration register	RCFDCnCFDCmDCFG	<RCFDCn_base> + 0700 <sub>H</sub> + (20 <sub>H</sub> × m)	RCFDCn Chm
RCFDCn	Channel CAN FD configuration register	RCFDCnCFDCmFDCFG	<RCFDCn_base> + 0704 <sub>H</sub> + (20 <sub>H</sub> × m)	RCFDCn Chm
RCFDCn	Channel CAN FD control register	RCFDCnCFDCmFDCTR	<RCFDCn_base> + 0708 <sub>H</sub> + (20 <sub>H</sub> × m)	RCFDCn Chm
RCFDCn	Channel CAN FD status register	RCFDCnCFDCmFDSTS	<RCFDCn_base> + 070C <sub>H</sub> + (20 <sub>H</sub> × m)	RCFDCn Chm
RCFDCn	Channel CAN FD CRC register	RCFDCnCFDCmFDCRC	<RCFDCn_base> + 0710 <sub>H</sub> + (20 <sub>H</sub> × m)	RCFDCn Chm
Global-related registers				
RCFDCn	Global configuration register	RCFDCnCFDGCFCG	<RCFDCn_base> + 0084 <sub>H</sub>	RCFDCn global
RCFDCn	Global control register	RCFDCnCFDGCCTR	<RCFDCn_base> + 0088 <sub>H</sub>	RCFDCn global
RCFDCn	Global status register	RCFDCnCFDGSTS	<RCFDCn_base> + 008C <sub>H</sub>	RCFDCn global
RCFDCn	Global error flag register	RCFDCnCFDGERFL	<RCFDCn_base> + 0090 <sub>H</sub>	RCFDCn global
RCFDCn	Global timestamp counter register	RCFDCnCFDGTSC	<RCFDCn_base> + 0094 <sub>H</sub>	RCFDCn global
RCFDCn	Global TX interrupt status register 0	RCFDCnCFDGTINTSTS0	<RCFDCn_base> + 0610 <sub>H</sub>	RCFDCn global
RCFDCn	Global TX interrupt status register 1	RCFDCnCFDGTINTSTS1	<RCFDCn_base> + 0614 <sub>H</sub>	RCFDCn global
RCFDCn	Global FD configuration register	RCFDCnCFDGFDCFG	<RCFDCn_base> + 0624 <sub>H</sub>	RCFDCn global
Receive rule-related registers				
RCFDCn	Receive rule entry control register	RCFDCnCFDGAFLLECTR	<RCFDCn_base> + 0098 <sub>H</sub>	RCFDCn global
RCFDCn	Receive rule configuration register 0	RCFDCnCFDGAFLCFG0	<RCFDCn_base> + 009C <sub>H</sub>	RCFDCn global
RCFDCn	Receive rule configuration register 1	RCFDCnCFDGAFLCFG1	<RCFDCn_base> + 00A0 <sub>H</sub>	RCFDCn global
RCFDCn	Receive rule ID register	RCFDCnCFDGAFLIDj	<RCFDCn_base> + 1000 <sub>H</sub> + (10 <sub>H</sub> × j)	RCFDCn global
RCFDCn	Receive rule mask register	RCFDCnCFDGAFLMj	<RCFDCn_base> + 1004 <sub>H</sub> + (10 <sub>H</sub> × j)	RCFDCn global
RCFDCn	Receive rule pointer 0 register	RCFDCnCFDGAFLP0_j	<RCFDCn_base> + 1008 <sub>H</sub> + (10 <sub>H</sub> × j)	RCFDCn global
RCFDCn	Receive rule pointer 1 register	RCFDCnCFDGAFLP1_j	<RCFDCn_base> + 100C <sub>H</sub> + (10 <sub>H</sub> × j)	RCFDCn global
Receive buffer-related registers				
RCFDCn	Receive buffer number register	RCFDCnCFDRMNB	<RCFDCn_base> + 00A4 <sub>H</sub>	RCFDCn global
RCFDCn	Receive buffer new data register	RCFDCnCFDRMNDy	<RCFDCn_base> + 00A8 <sub>H</sub> + (04 <sub>H</sub> × y)	RCFDCn global
RCFDCn	Receive buffer ID register	RCFDCnCFDRMIDq	<RCFDCn_base> + 2000 <sub>H</sub> + (80 <sub>H</sub> × q)	RCFDCn global
RCFDCn	Receive buffer pointer register	RCFDCnCFDRMPTRq	<RCFDCn_base> + 2004 <sub>H</sub> + (80 <sub>H</sub> × q)	RCFDCn global
RCFDCn	Receive buffer CAN FD status register	RCFDCnCFDRMFDSTSq	<RCFDCn_base> + 2008 <sub>H</sub> + (80 <sub>H</sub> × q)	RCFDCn global
RCFDCn	Receive buffer data field register	RCFDCnCFDRMDFb_q	<RCFDCn_base> + 200C <sub>H</sub> + (04 <sub>H</sub> × b) + (80 <sub>H</sub> × q)	RCFDCn global

Table 24.29 List of Registers

Module Name	Register Name	Symbol	Address	Guard Group
Receive FIFO buffer-related registers				
RCFDCn	Receive FIFO buffer configuration and control register	RCFDCnCFDRFCCx	<RCFDCn_base> + 00B8 <sub>H</sub> + (04 <sub>H</sub> × x)	RCFDCn global
RCFDCn	Receive FIFO buffer status register	RCFDCnCFDRFSTx	<RCFDCn_base> + 00D8 <sub>H</sub> + (04 <sub>H</sub> × x)	RCFDCn global
RCFDCn	Receive FIFO buffer pointer control register	RCFDCnCFDRFPCTR <sub>x</sub>	<RCFDCn_base> + 00F8 <sub>H</sub> + (04 <sub>H</sub> × x)	RCFDCn global
RCFDCn	Receive FIFO buffer access id register	RCFDCnCFDRFID <sub>x</sub>	<RCFDCn_base> + 6000 <sub>H</sub> + (80 <sub>H</sub> × x)	RCFDCn global
RCFDCn	Receive FIFO buffer access pointer register	RCFDCnCFDRFPTR <sub>x</sub>	<RCFDCn_base> + 6004 <sub>H</sub> + (80 <sub>H</sub> × x)	RCFDCn global
RCFDCn	Receive FIFO CAN FD status register	RCFDCnCFDRFFDSTS <sub>x</sub>	<RCFDCn_base> + 6008 <sub>H</sub> + (80 <sub>H</sub> × x)	RCFDCn global
RCFDCn	Receive FIFO buffer access data field register	RCFDCnCFDRFDF <sub>d_x</sub>	<RCFDCn_base> + 600C <sub>H</sub> + (04 <sub>H</sub> × d) + (80 <sub>H</sub> × x)	RCFDCn global
Transmit/receive FIFO buffer-related registers				
RCFDCn	Transmit/receive FIFO buffer configuration and control register	RCFDCnCFDCFCCK	<RCFDCn_base> + 0118 <sub>H</sub> + (04 <sub>H</sub> × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer status register	RCFDCnCFDCFST <sub>sk</sub>	<RCFDCn_base> + 0178 <sub>H</sub> + (04 <sub>H</sub> × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer pointer control register	RCFDCnCFDCFPCTR <sub>sk</sub>	<RCFDCn_base> + 01D8 <sub>H</sub> + (04 <sub>H</sub> × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer access id register	RCFDCnCFDCFID <sub>sk</sub>	<RCFDCn_base> + 6400 <sub>H</sub> + (80 <sub>H</sub> × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer access pointer register	RCFDCnCFDCFPTR <sub>sk</sub>	<RCFDCn_base> + 6404 <sub>H</sub> + (80 <sub>H</sub> × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO CAN FD configuration/status register	RCFDCnCFDCFFDST <sub>SK</sub>	<RCFDCn_base> + 6408 <sub>H</sub> + (80 <sub>H</sub> × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer access data field register	RCFDCnCFDCFD <sub>Fd_k</sub>	<RCFDCn_base> + 640C <sub>H</sub> + (04 <sub>H</sub> × d) + (80 <sub>H</sub> × k)	RCFDCn global
FIFO status-related registers				
RCFDCn	FIFO empty status register	RCFDCnCFDFESTS	<RCFDCn_base> + 0238 <sub>H</sub>	RCFDCn global
RCFDCn	FIFO full status register	RCFDCnCFDFESTS	<RCFDCn_base> + 023C <sub>H</sub>	RCFDCn global
RCFDCn	FIFO message lost status register	RCFDCnCFDFMSTS	<RCFDCn_base> + 0240 <sub>H</sub>	RCFDCn global
RCFDCn	Receive FIFO buffer interrupt flag status register	RCFDCnCFDRFISTS	<RCFDCn_base> + 0244 <sub>H</sub>	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer receive interrupt flag status register	RCFDCnCFDCFRISTS	<RCFDCn_base> + 0248 <sub>H</sub>	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer transmit interrupt flag status register	RCFDCnCFDCFTISTS	<RCFDCn_base> + 024C <sub>H</sub>	RCFDCn global
FIFO DMA-related registers				
RCFDCn	DMA enable register	RCFDCnCFDCDTCT	<RCFDCn_base> + 0640 <sub>H</sub>	RCFDCn global
RCFDCn	DMA status register	RCFDCnCFDCDTSTS	<RCFDCn_base> + 0644 <sub>H</sub>	RCFDCn global

## 24.3.2 Details of Channel-related Registers

### 24.3.2.1 RCFDCnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0 to 7)

**Access:** RCFDCnCFDCmNCFG register can be read or written in 32-bit units

RCFDCnCFDCmNCFG, RCFDCnCFDCmNCFGH registers can be read or written in 16-bit units

RCFDCnCFDCmNCFG, RCFDCnCFDCmNCFGH, RCFDCnCFDCmNCFGH, RCFDCnCFDCmNCFGH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDCmNCFG: <RCFDCn\_base> + 0000<sub>H</sub> + (10<sub>H</sub> × m)

RCFDCnCFDCmNCFG: <RCFDCn\_base> + 0000<sub>H</sub> + (10<sub>H</sub> × m),

RCFDCnCFDCmNCFGH: <RCFDCn\_base> + 0002<sub>H</sub> + (10<sub>H</sub> × m)

RCFDCnCFDCmNCFG: <RCFDCn\_base> + 0000<sub>H</sub> + (10<sub>H</sub> × m),

RCFDCnCFDCmNCFGH: <RCFDCn\_base> + 0001<sub>H</sub> + (10<sub>H</sub> × m),

RCFDCnCFDCmNCFGH: <RCFDCn\_base> + 0002<sub>H</sub> + (10<sub>H</sub> × m),

RCFDCnCFDCmNCFGH: <RCFDCn\_base> + 0003<sub>H</sub> + (10<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.34 RCFDCnCFDCmNCFG Register Contents

Bit Position	Bit Name	Function
15 to 11	NSJW[4:0]	Nominal Bit Rate Resynchronization Jump Width Control b15 b14 b13 b12 b11 0 0 0 0 0: 1 Tq 0 0 0 0 1: 2 Tq 0 0 0 1 0: 3 Tq : : 1 1 1 1 0: 31 Tq 1 1 1 1 1: 32 Tq
10	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
9 to 0	NBRP[9:0]	Nominal Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1).

Modify the RCFDCnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings for bit timing parameters, see **Section 24.10.1, Initial Settings**.

#### NTSEG2[4:0] Bits

These bits specify a Tq value for the length of phase segment 2 (PHASE\_SEG2) of nominal bit rate.

Possible values are 2 Tq to 32 Tq, inclusive.

Set a value smaller than the value of the NTSEG1[6:0] bits.

#### NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP\_SEG) and phase segment 1 (PHASE\_SEG1) of nominal bit rate as a Tq value.

Possible values are 4 to 128 Tq.

#### NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. Possible values are 1 to 32 Tq. Specify a value equal to or smaller than the NTSEG2[4:0] value.

#### NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

The NBRP[9:0] value and the DBRP[7:0] value should be equal and the two corresponding bit rate values are different according to the respective segment values.

### 24.3.2.2 RCFDCnCFDCmCTR — Channel Control Register (m = 0 to 7)

**Access:** RCFDCnCFDCmCTR register can be read or written in 32-bit units

RCFDCnCFDCmCTRL, RCFDCnCFDCmCTRH registers can be read or written in 16-bit units

RCFDCnCFDCmCTRLL, RCFDCnCFDCmCTRLLH, RCFDCnCFDCmCTRHL, RCFDCnCFDCmCTRHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDCmCTR: <RCFDCn\_base> + 0004<sub>H</sub> + (10<sub>H</sub> × m)

RCFDCnCFDCmCTRL: <RCFDCn\_base> + 0004<sub>H</sub> + (10<sub>H</sub> × m),

RCFDCnCFDCmCTRH: <RCFDCn\_base> + 0006<sub>H</sub> + (10<sub>H</sub> × m)

RCFDCnCFDCmCTRLL: <RCFDCn\_base> + 0004<sub>H</sub> + (10<sub>H</sub> × m),

RCFDCnCFDCmCTRLLH: <RCFDCn\_base> + 0005<sub>H</sub> + (10<sub>H</sub> × m),

RCFDCnCFDCmCTRHL: <RCFDCn\_base> + 0006<sub>H</sub> + (10<sub>H</sub> × m),

RCFDCnCFDCmCTRHH: <RCFDCn\_base> + 0007<sub>H</sub> + (10<sub>H</sub> × m)

**Value after reset:** 0000 0005<sub>H</sub>

Table 24.35 RCFDCnCFDCmCTR Register Contents

Bit Position	Bit Name	Function
31	ROM	Restricted Operation Mode Enable 0: Restricted operation mode is disabled. 1: Restricted operation mode is enabled.
30	CRCT	CRC Error Test Enable 0: The first bit of the reception ID field is not inverted. 1: The first bit of the reception ID field is inverted.
29 to 27	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
26, 25	CTMS[1:0]	Communication Test Mode Select b26 b25 0 0: Standard test mode 0 1: Listen-only mode 1 0: Self-test mode 0 (external loopback mode) 1 1: Self-test mode 1 (internal loopback mode)
24	CTME	Communication Test Mode Enable 0: Communication test mode is disabled. 1: Communication test mode is enabled.
23	ERRD	Error Display Mode Select 0: Error flags are displayed only for the first error information after bits 14 to 8 in the RCFDCnCFDCmERFL register are all cleared. 1: Error flags for all error information are displayed.

Table 24.35 RCFDCnCFDCmCTR Register Contents

Bit Position	Bit Name	Function
22, 21	BOM[1:0]	Bus Off Recovery Mode Select b22 b21 0 0: ISO11898-1 compliant 0 1: Entry to channel halt mode automatically at bus-off entry 1 0: Entry to channel halt mode automatically at bus-off end 1 1: Entry to channel halt mode (in bus-off state) by program request
20	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
19	TDCVFIE	Transmitter Delay Compensation Violation Interrupt Enable 0: A transmitter delay compensation violation interrupt is disabled. 1: A transmitter delay compensation violation interrupt is enabled.
18	SOCOIE	Successful Occurrence Counter Overflow Interrupt Enable 0: A successful occurrence counter overflow interrupt is disabled. 1: A successful occurrence counter overflow interrupt is enabled.
17	EOCOIE	Error Occurrence Counter Overflow Interrupt Enable 0: An error occurrence counter overflow interrupt is disabled. 1: An error occurrence counter overflow interrupt is enabled.
16	TAIE	Transmit Abort Interrupt Enable 0: Transmit abort interrupt is disabled. 1: Transmit abort interrupt is enabled.
15	ALIE	Arbitration Lost Interrupt Enable 0: Arbitration lost interrupt is disabled. 1: Arbitration lost interrupt is enabled.
14	BLIE	Bus Lock Interrupt Enable 0: Bus lock interrupt is disabled. 1: Bus lock interrupt is enabled.
13	OLIE	Overload Frame Transmit Interrupt Enable 0: Overload frame transmit interrupt is disabled. 1: Overload frame transmit interrupt is enabled.
12	BORIE	Bus Off Recovery Interrupt Enable 0: Bus off recovery interrupt is disabled. 1: Bus off recovery interrupt is enabled.
11	BOEIE	Bus Off Entry Interrupt Enable 0: Bus off entry interrupt is disabled. 1: Bus off entry interrupt is enabled.
10	EPIE	Error Passive Interrupt Enable 0: Error passive interrupt is disabled. 1: Error passive interrupt is enabled.
9	EWIE	Error Warning Interrupt Enable 0: Error warning interrupt is disabled. 1: Error warning interrupt is enabled.
8	BEIE	Bus Error Interrupt Enable 0: Bus error interrupt is disabled. 1: Bus error interrupt is enabled.
7 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
3	RTBO	Forcible Return from Bus-off When this bit is set to 1, forcible return from the bus off state is made. This bit is always read as 0.

Table 24.35 RCFDCnCFDCmCTR Register Contents

Bit Position	Bit Name	Function
2	CSLPR	Channel Stop Mode 0: Other than channel stop mode 1: Channel stop mode
1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

**ROM Bit**

When the ROM bit and the CTME bit in the RCFDCnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RCFDCnCFDCmCTR register is 00<sub>B</sub> (standard test mode). Modify this bit only in channel halt mode.

This bit is always 0 in channel reset mode.

**CRCT Bit**

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RCFDCnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RCFDCnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RCFDCnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is set to 0 in channel reset mode.

**CTMS[1:0] Bits**

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

**CTME Bit**

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

**ERRD Bit**

This bit is used to control the display mode of bits 14 to 8 in the RCFDCnCFDCmERFL register. When this bit is clear to 0, if any error is detected while the flags of bits 14 to 8 in the RCFDCnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

**BOM[1:0] Bits**

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00<sub>B</sub>, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10<sub>B</sub> (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01<sub>B</sub>, the CHMDC[1:0] bits in the RCFDCnCFDCmCTR register (m = 0 to 7) are set to 10<sub>B</sub> and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RCFDCnCFDCmSTS register are cleared to 00<sub>H</sub>.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10<sub>B</sub>, the CHMDC[1:0] bits are set to 10<sub>B</sub> and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00<sub>H</sub>.

When the BOM[1:0] bits are set to 11<sub>B</sub> and the CHMDC[1:0] bits are set to 10<sub>B</sub> while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00<sub>H</sub>. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10<sub>B</sub>, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01<sub>B</sub> or at bus off end when the BOM[1:0] bits are 10<sub>B</sub>), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

**TDCVFIE Bit**

When the TDCVF flag in the RCFDCnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

**SOCOIE Bit**

When the SOCO flag in the RCFDCnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

**EOCOIE Bit**

When the EOCO flag in the RCFDCnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

**TAIE Bit**

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

**ALIE Bit**

When the ALF flag in the RCFDCnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**BLIE Bit**

When the BLF flag in the RCFDCnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**OLIE Bit**

When the OVLV flag in the RCFDCnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**BORIE Bit**

When the BORF flag in the RCFDCnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**BOEIE Bit**

When the BOEF flag in the RCFDCnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**EPIE Bit**

When the EPF flag in the RCFDCnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**EWIE Bit**

When the EWF flag in the RCFDCnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**BEIE Bit**

When the BEF flag in the RCFDCnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

**RTBO Bit**

Setting this bit to 1 in the bus off state forcibly returns from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RCFDCnCFDCmSTS register to 00<sub>H</sub> and also clears the BOSTS flag in the RCFDCnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RCFDCnCFDCmCTR register are 00<sub>B</sub> (ISO11898-1 compliant). A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

**CSLPR Bit**

Setting this bit to 1 places the channel into channel stop mode. Clearing this bit to 0 makes the channel exit channel stop mode.

This bit should not be modified in channel communication mode or channel halt mode.

**CHMDC[1:0] Bits**

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 24.5.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11<sub>B</sub>.

When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits are automatically set to 10<sub>B</sub>.

### 24.3.2.3 RCFDCnCFDCmSTS — Channel Status Register (m = 0 to 7)

**Access:** RCFDCnCFDCmSTS register can be read or written in 32-bit units  
 RCFDCnCFDCmSTSL register can be read or written in 16-bit units  
 RCFDCnCFDCmSTSH register is a read-only register that can be read in 16-bit units  
 RCFDCnCFDCmSTSLL register is a read-only register that can be read in 8-bit units  
 RCFDCnCFDCmSTSLH register can be read or written in 8-bit units  
 RCFDCnCFDCmSTSHL, RCFDCnCFDCmSTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDCmSTS: <RCFDCn\_base> + 0008<sub>H</sub> + (10<sub>H</sub> × m)  
 RCFDCnCFDCmSTSL: <RCFDCn\_base> + 0008<sub>H</sub> + (10<sub>H</sub> × m),  
 RCFDCnCFDCmSTSH: <RCFDCn\_base> + 000A<sub>H</sub> + (10<sub>H</sub> × m)  
 RCFDCnCFDCmSTSLL: <RCFDCn\_base> + 0008<sub>H</sub> + (10<sub>H</sub> × m),  
 RCFDCnCFDCmSTSLH: <RCFDCn\_base> + 0009<sub>H</sub> + (10<sub>H</sub> × m),  
 RCFDCnCFDCmSTSHL: <RCFDCn\_base> + 000A<sub>H</sub> + (10<sub>H</sub> × m),  
 RCFDCnCFDCmSTSHH: <RCFDCn\_base> + 000B<sub>H</sub> + (10<sub>H</sub> × m)

**Value after reset:** 0000 0005<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TEC[7:0]								REC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ESIF	COMSTS	RECSTS	TRMSTS	BOSTS	EPSTS	CSLPTS	CHLPTS	CRSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W	R	R	R	R	R	R	R	R/W*	R	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.36 RCFDCnCFDCmSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	ESIF	Error State Indication Flag 0: No CAN FD message whose ESI bit is recessive has been received. 1: At least one CAN FD message whose ESI bit is recessive has been received.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state

Table 24.36 RCFDCnCFDCmSTS Register Contents

Bit Position	Bit Name	Function
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

**TEC[7:0] Bits**

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

**REC[7:0] Bits**

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

**ESIF Flag**

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is set to 0 in channel reset mode.

**COMSTS Flag**

This bit indicates that communication is ready.

This flag is set to 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

**RECSTS Flag**

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

**TRMSTS Flag**

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

**BOSTS Flag**

This flag is set to 1 when the bus off state ( $TEC[7:0] > 255$ ) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

**EPSTS Flag**

This flag is set to 1 when the RS-CANFD module has entered the error passive state ( $(128 \leq TEC[7:0] \leq 255)$  or  $(128 \leq REC[7:0])$ ), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

**CSLPSTS Flag**

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

**CHLTSTS Flag**

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

**CRSTSTS Flag**

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

### 24.3.2.4 RCFDCnCFDCmERFL — Channel Error Flag Register (m = 0 to 7)

**Access:** RCFDCnCFDCmERFL register can be read or written in 32-bit units  
 RCFDCnCFDCmERFL register can be read or written in 16-bit units  
 RCFDCnCFDCmERFLH register is a read-only register that can be read in 16-bit units  
 RCFDCnCFDCmERFLLL, RCFDCnCFDCmERFLH registers can be read or written in 8-bit units  
 RCFDCnCFDCmERFLHL, RCFDCnCFDCmERFLHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDCmERFL: <RCFDCn\_base> + 000C<sub>H</sub> + (10<sub>H</sub> × m)  
 RCFDCnCFDCmERFL: <RCFDCn\_base> + 000C<sub>H</sub> + (10<sub>H</sub> × m),  
 RCFDCnCFDCmERFLH: <RCFDCn\_base> + 000E<sub>H</sub> + (10<sub>H</sub> × m)  
 RCFDCnCFDCmERFLLL: <RCFDCn\_base> + 000C<sub>H</sub> + (10<sub>H</sub> × m),  
 RCFDCnCFDCmERFLH: <RCFDCn\_base> + 000D<sub>H</sub> + (10<sub>H</sub> × m),  
 RCFDCnCFDCmERFLHL: <RCFDCn\_base> + 000E<sub>H</sub> + (10<sub>H</sub> × m),  
 RCFDCnCFDCmERFLHH: <RCFDCn\_base> + 000F<sub>H</sub> + (10<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	CRCREG[14:0]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	ADERR	B0ERR	B1ERR	CERR	AERR	FERR	SERR	ALF	BLF	OVLFF	BORF	BOEF	EPF	EWFF	BEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.37 RCFDCnCFDCmERFL Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data (CRC length:15 bits) A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.

Table 24.37 RCFDCnCFDCmERFL Register Contents

Bit Position	Bit Name	Function
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected.
5	OVLf	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWf	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is set to 1. Transition to channel reset mode resets these flags to 0.

If the ERRD bit in the RCFDCnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RCFDCnCFDCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

### CRCREG[14:0] Flag

When the CTME bit in the RCFDCnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CAN FD frame is sent or received, the value of CRCREG[20:0] bits in the RCFDCnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

This bit is always 0 in channel reset mode.

**ADERR Flag**

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

**B0ERR Flag**

This flag is set to 1 when a recessive bit has been detected even though a dominant bit was transmitted.

**B1ERR Flag**

This flag is set to 1 when a dominant bit has been detected even though a recessive bit was transmitted.

**CERR Flag**

This flag is set to 1 when a CRC error has been detected.

**AERR Flag**

This flag is set to 1 when an ACK error has been detected.

**FERR Flag**

This flag is set to 1 when a form error has been detected.

**SERR Flag**

This flag is set to 1 when a stuff error has been detected.

**ALF Flag**

This flag is set to 1 when an arbitration-lost has been detected.

**BLF Flag**

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of bus lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

**OVLFFlag**

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

**BORF Flag**

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 01<sub>B</sub> (channel reset mode).
- The RTBO bit in the RCFDCnCFDCmCTR register is set to 1 (forcible return from the bus off state).
- The BOM[1:0] bits in the RCFDCnCFDCmCTR register are set to 01<sub>B</sub> (transition to channel halt mode at bus off entry).

- The CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 10<sub>B</sub> (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11<sub>B</sub> (transition to channel halt mode upon a request from the program during bus off).

**BOEF Flag**

This flag is set to 1 when the bus off state is entered (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RCFDCnCFDCmCTR register (m = 0 to 7) are set to 01<sub>B</sub> (transition to channel halt mode at bus off entry).

**EPF Flag**

This flag is set to 1 when the error passive state is entered ( $(128 \leq \text{TEC}[7:0] \leq 255)$  or  $(128 \leq \text{REC}[7:0])$ ). This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

**EWF Flag**

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

**BEF Flag**

This flag is set to 1 when any one of the ADERR, BOERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RCFDCnCFDCmERFL register is set to 1.

**NOTE**

---

To clear the flag of this register to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

---

### 24.3.2.5 RCFDCnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0 to 7)

**Access:** RCFDCnCFDCmDCFG register can be read or written in 32-bit units

RCFDCnCFDCmDCFGL, RCFDCnCFDCmDCFGH registers can be read or written in 16-bit units

RCFDCnCFDCmDCFGLL, RCFDCnCFDCmDCFGLH, RCFDCnCFDCmDCFGLHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDCmDCFG: <RCFDCn\_base> + 0700<sub>H</sub> + (20<sub>H</sub> × m)

RCFDCnCFDCmDCFGL: <RCFDCn\_base> + 0700<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmDCFGH: <RCFDCn\_base> + 0702<sub>H</sub> + (20<sub>H</sub> × m)

RCFDCnCFDCmDCFGLL: <RCFDCn\_base> + 0700<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmDCFGLH: <RCFDCn\_base> + 0702<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmDCFGLHH: <RCFDCn\_base> + 0703<sub>H</sub> + (20<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.38 RCFDCnCFDCmDCFG Register Contents

Bit Position	Bit Name	Function
19 to 16	DTSEG1[3:0]	Data Bit Rate Time Segment 1 Control b19 b18 b17 b16 0 0 0 0: Setting prohibited 0 0 0 1: 2 Tq 0 0 1 0: 3 Tq 0 0 1 1: 4 Tq 0 1 0 0: 5 Tq 0 1 0 1: 6 Tq 0 1 1 0: 7 Tq 0 1 1 1: 8 Tq 1 0 0 0: 9 Tq 1 0 0 1: 10 Tq 1 0 1 0: 11 Tq 1 0 1 1: 12 Tq 1 1 0 0: 13 Tq 1 1 0 1: 14 Tq 1 1 1 0: 15 Tq 1 1 1 1: 16 Tq
15 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	DBRP[7:0]	Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1).

Modify the RCFDCnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CAN FD mode, set the RCFDCnCFDCmDCFG register to the value equal to the set RCFDCnCFDCmNCFG register value. For the description and settings of bit timing parameters, see **Section 24.10.1, Initial Settings**.

The channel of Classical only mode does not have to perform the configuration of this register.

#### DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. Possible values are 1 to 8 Tq. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

#### DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE\_SEG2) of nominal bit rate.

Possible values are 2 to 8 Tq.

Set a value less than or equal to the value of the DTSEG1[3:0] bits.

#### DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP\_SEG) and phase segment 1 (PHASE\_SEG1) of data bit rate as a Tq value.

Possible values are 2 to 16 Tq.

**DBRP[7:0] Bits**

The clock obtained by dividing the CAN clock ( $f_{CAN}$ ) by the data bit rate prescaler ( $(DBRP[7:0] + 1)$ ) becomes  $CANmTq(D)$  clock ( $f_{CANTQ(D)m}$ ). One clock of the  $CANmTq(D)$  clock becomes one Time Quantum ( $Tq$ ).

Be sure to specify the same value for both  $NBRP[9:0]$  and  $DBRP[7:0]$ .

To specify different values for the nominal bit rate and the data bit rate, change the values of the  $RCFDCnCFDCmNCFG.NTSEG1$  and  $NTSEG2$  bits and  $RCFDCnCFDCmDCFG.DTSEG1$  and  $DTSEG2$  bits, respectively.

When the  $TDCE$  bit is set to 1 (Transmitter delay compensation is enabled) in the  $RCFDCnCFDCmFDCFG$  register, set the equal value of 1 or less to the bits  $NBRP[9:0]$  and  $DBRP[7:0]$ .

### 24.3.2.6 RCFDCnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 to 7)

**Access:** RCFDCnCFDCmFDCFG register can be read or written in 32-bit units

RCFDCnCFDCmFDCFGL, RCFDCnCFDCmFDCFGH registers can be read or written in 16-bit units

RCFDCnCFDCmFDCFGLL, RCFDCnCFDCmFDCFGLH, RCFDCnCFDCmFDCFGHL, RCFDCnCFDCmFDCFGHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDCmFDCFG: <RCFDCn\_base> + 0704<sub>H</sub> + (20<sub>H</sub> × m)

RCFDCnCFDCmFDCFGL: <RCFDCn\_base> + 0704<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmFDCFGH: <RCFDCn\_base> + 0706<sub>H</sub> + (20<sub>H</sub> × m)

RCFDCnCFDCmFDCFGLL: <RCFDCn\_base> + 0704<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmFDCFGLH: <RCFDCn\_base> + 0705<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmFDCFGHL: <RCFDCn\_base> + 0706<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmFDCFGHH: <RCFDCn\_base> + 0707<sub>H</sub> + (20<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit Position	Bit Name	Function
31	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
30	CLOE	Classical CAN only mode enable bit 0: Classical CAN only mode is disabled 1: Classical CAN only mode is enabled
29	REFE	Reception data edge filter enable bit 0: Reception data edge filter is disabled 1: Reception data edge filter is enabled
28	FDOE	FD-only mode enable bit 0: FD-only mode is disabled 1: FD-only mode is enabled
27	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
26	GWBR S	Gateway BRS 0: A frame is transmitted with the BRS bit in the received frame set to 0. 1: A frame is transmitted with the BRS bit in the received frame set to 1.
25	GWDFD	Gateway FDF 0: A frame is transmitted regarding the received frame as a classical CAN frame. 1: A frame is transmitted regarding the received frame as a CAN FD frame.
24	GWEN	CAN-CAN FD Gateway Enable 0: The CAN-CAN FD gateway is disabled. 1: The CAN-CAN FD gateway is enabled.
23	Reserved	This bit is read as the value after reset. The write value should be the value after reset.

Table 24.39 RCFDCnCFDCmFDCFG Register Contents

Bit Position	Bit Name	Function
22 to 16	TDCO[6:0]	Transmitter Delay Compensation Offset These bits are set to the transmitter delay compensation offset value.
15 to 11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10	ESIC	Error State Display Mode Select 0: Always displays the node error state. 1: When the node is not in the error passive state: Displays the message buffer error state. When the node is in the error passive state: Displays the node error state.
9	TDCE	Transmitter Delay Compensation Enable 0: Transmitter delay compensation is disabled. 1: Transmitter delay compensation is enabled.
8	TDCOC	Transmitter Delay Compensation Measurement Select 0: Measurement and offset 1: Only offset
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2 to 0	EOCCFG[2:0]	Error Occurrence Counting Method Select b2 b1 b0 0 0 0: All transmit messages and receive messages 0 0 1: All transmit messages 0 1 0: All receive messages 0 1 1: Setting prohibited 1 0 0: Only data phase of transmitted or received CAN FD message 1 0 1: Only data phase of transmitted CAN FD message 1 1 0: Only data phase of received CAN FD message 1 1 1: Setting prohibited

**CLOE Bit**

Setting this bit to 1 enables Classical CAN only mode. When data is transmitted, a classical CAN frame will be sent. When a CAN FD frame is received, a form error or a CRC error is detected.

Modify this bit only in channel reset mode.

Do not set RCFDCnCFDCmFDCFG.CLOE and RCFDCnCFDCmFDCFG.FDOE simultaneously.

CLOE Bit	FDOE Bit	Interface Mode
0	0	CAN-FD mode
0	1	FD only mode
1	0	Classical CAN only mode
1	1	Reserved

**REFE Bit**

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge.

Modify this bit only in channel reset mode.

Setting this bit to 0 when using in Classical CAN only mode.

**FDOE Bit**

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CAN FD frame will be sent regardless of the settings to the CFFDF bit in the RCFDCnCFDCFFDCSTSk register or the TMFDF bit in the RCFDCnCFDCTMDCTRp register. When a classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

In case a Classical frame is configured for transmitting, the FDF bit is sent as recessive, so a FD frame is sent.

If the DLC is configured bigger than 8, the remaining data bytes are padded with CCh.

Do not set RCFDCnCFDCmFDCFG.CLOE and RCFDCnCFDCmFDCFG.FDOE simultaneously.

**GWBRs Bit**

When the GWEN bit is 1, the BRS bit in a CAN FD frame to be transmitted by the gateway function is set.

When the GWFDF bit is set to 0, write 0 to this bit. Modify this bit only in channel reset mode.

**GWDF Bit**

When the GWEN bit is 1, the FDF bit in a CAN FD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

**GWEN Bit**

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RCFDCnCFDCFCCK register set to 10<sub>B</sub> (gateway mode).

Setting this bit to 1 enables the CAN-CAN FD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWDF bit and the GWBRs bit. When the DLC value in the received classical CAN frame is 1001<sub>B</sub> or more and the GWDF bit is set to 1 (CAN FD frame), the DLC value is replaced with 1000<sub>B</sub>. When the received CAN-FD frame is more than 1001<sub>B</sub>, and GWDF bit is set to 0(classical CAN frame), the payload size is cut down to 8 byte. Only 8 bytes of top data performs GW transmission, and the remaining byte cancels it.

While this bit is set to 1, do not perform routing the following frames by using the gateway function.

- Remote frames

Modify this bit only in channel reset mode.

**Table 24.40, Operation when the CAN-CAN FD Gateway is Enabled** shows the settings and formats of transmit frame and receive frame while the CAN- CAN FD gateway is enabled.

Table 24.40 Operation when the CAN-CAN FD Gateway is Enabled

Receive Frame			GWDF Bit	Transmit Frame					
Format	BRS Bit	Received DLC Value		Format	BRS Bit	DLC Value to be Transmitted			
Classical CAN	None	DLC ≤ 1000 <sub>B</sub>	0	Classical CAN	None	Not replaced			
		DLC > 1000 <sub>B</sub>							
CAN FD	Arbitrary	DLC ≤ 1000 <sub>B</sub>				1	CAN FD	According to GWBRs bit setting	Replaced with 1000 <sub>B</sub>
		DLC > 1000 <sub>B</sub>							
Classical CAN	None	DLC ≤ 1000 <sub>B</sub>	1	CAN FD	According to GWBRs bit setting				Not replaced
		DLC > 1000 <sub>B</sub>							Replaced with 1000 <sub>B</sub>
CAN FD	Arbitrary	DLC ≤ 1000 <sub>B</sub>				1	CAN FD	According to GWBRs bit setting	Not replaced
		DLC > 1000 <sub>B</sub>							

**TDCO[6:0] Bits**

These bits set the SSP offset value. How to use this value depends on the TDCOC bit in the RCFDCnCFDCmFDCFG register.

These bits are based on CAN clock frequency( $f_{CAN}$ ).

When the TDCOC bit is set to 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded down to the nearest integer  $T_q$ ).

When the TDCOC bit is set to 1, the transmitter delay compensation result equals to the TDCO[6:0] value.

The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

**ESIC Bit**

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RCFDCnCFDCFFDCSTSk register or TMESI bit in the RCFDCnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is set to 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode

Table 24.41 ESI Value to Be Transmitted

ESIC Bit	Channel Status	ESI Value to be Transmitted
0	Error active	0 (error active node)
	Error passive	1 (error passive node)
1	Error active	ESI value set in the transmit/receive FIFO buffer or transmit buffer (CFESI bit in the RCFDCnCFDCFFDCSTSk register or TMESI bit in the RCFDCnCFDTMFDCTRp register)
	Error passive	1 (error passive node)

**TDCE Bit**

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

**TDCOC Bit**

When this bit is set to 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is set to 1, the SSP position is defined only by the SSP offset value. Modify this bit only in channel reset mode or channel halt mode.

**EOCCFG[2:0] Bits**

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

### 24.3.2.7 RCFDCnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 7)

**Access:** RCFDCnCFDCmFDCTR register can be read or written in 32-bit units  
 RCFDCnCFDCmFDCTRL register can be read or written in 16-bit units  
 RCFDCnCFDCmFDCTRLL register can be read or written in 8-bit units

**Address:** RCFDCnCFDCmFDCTR: <RCFDCn\_base> + 0708<sub>H</sub> + (20<sub>H</sub> × m)  
 RCFDCnCFDCmFDCTRL: <RCFDCn\_base> + 0708<sub>H</sub> + (20<sub>H</sub> × m)  
 RCFDCnCFDCmFDCTRLL: <RCFDCn\_base> + 0708<sub>H</sub> + (20<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 24.42 RCFDCnCFDCmFDCTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	SOCCLR	Successful Occurrence Counter Clear Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read as 0.
0	EOCCLR	Error Occurrence Counter Clear Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0.

#### SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RCFDCnCFDCmFDSTS register). This bit is automatically cleared to 0.

#### EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RCFDCnCFDCmFDSTS register). This bit is automatically cleared to 0.

### 24.3.2.8 RCFDCnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 7)

**Access:** RCFDCnCFDCmFDSTS register can be read or written in 32-bit units  
 RCFDCnCFDCmFDSTSL register can be read or written in 16-bit units  
 RCFDCnCFDCmFDSTSH register is a read-only register that can be read in 16-bit units  
 RCFDCnCFDCmFDSTSLL, RCFDCnCFDCmFDSTSLH registers can be read or written in 8-bit units  
 RCFDCnCFDCmFDSTSHL, RCFDCnCFDCmFDSTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDCmFDSTS: <RCFDCn\_base> + 070C<sub>H</sub> + (20<sub>H</sub> × m)  
 RCFDCnCFDCmFDSTSL: <RCFDCn\_base> + 070C<sub>H</sub> + (20<sub>H</sub> × m),  
 RCFDCnCFDCmFDSTSH: <RCFDCn\_base> + 070E<sub>H</sub> + (20<sub>H</sub> × m)  
 RCFDCnCFDCmFDSTSLL: <RCFDCn\_base> + 070C<sub>H</sub> + (20<sub>H</sub> × m),  
 RCFDCnCFDCmFDSTSLH: <RCFDCn\_base> + 070D<sub>H</sub> + (20<sub>H</sub> × m),  
 RCFDCnCFDCmFDSTSHL: <RCFDCn\_base> + 070E<sub>H</sub> + (20<sub>H</sub> × m),  
 RCFDCnCFDCmFDSTSHH: <RCFDCn\_base> + 070F<sub>H</sub> + (20<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SOC[7:0]								EOC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.43 RCFDCnCFDCmFDSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	SOC[7:0]	Successful Occurrence Counter The successful occurrence counter value can be read.
23 to 16	EOC[7:0]	Error Occurrence Counter The error occurrence counter value can be read.
15 to 10	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
9	SOCO	Successful Occurrence Counter Overflow Flag 0: The successful occurrence counter does not overflow. 1: The successful occurrence counter has overflowed.
8	EOCO	Error Occurrence Counter Overflow Flag 0: The error occurrence counter does not overflow. 1: The error occurrence counter has overflowed.
7	TDCVF	Transmitter Delay Compensation Violation Flag 0: No transmitter delay compensation violation is present. 1: A transmitter delay compensation violation is present.
6 to 0	TDCR[6:0]	Transmitter Delay Compensation Result Status The transmitter delay compensation result can be read.

**SOC[7:0] Bits**

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches FF<sub>H</sub>. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RCFDCnCFDCmFDCTR register. These bits are set to 0 in channel reset mode.

**EOC[7:0] Bits**

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RCFDCnCFDCmFDCFG register. This counter stops counting when it reaches FF<sub>H</sub>.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RCFDCnCFDCmFDCTR register. These bits are set to 0 in channel reset mode.

**SOCO Flag**

This bit indicates that successful occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached FF<sub>H</sub>. This flag is set to 0 in channel reset mode.

**EOCO Flag**

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RCFDCnCFDCmFDCFG register when the EOC[7:0] value has reached FF<sub>H</sub>. This flag is set to 0 in channel reset mode.

**TDCVF Flag**

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CAN<sub>m</sub> bit times - 2 fCAN (CAN<sub>m</sub> bit time is the value of data bit rate). This flag is set to 0 in channel reset mode.

**TDCR[6:0] Flags**

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RCFDCnCFDCmFDCFG register.

These flags are updated at a falling edge between the FDF bit and res bit when the TDCE bit in the RCFDCnCFDCmFDCFG register is set to 1 (transmitter delay compensation enable) and also the TDCOC bit in the RCFDCnCFDCmFDCFG register is set to 0 (measurement and offset).

This flag is set to 0 in channel reset mode.

### 24.3.2.9 RCFDCnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 to 7)

**Access:** RCFDCnCFDCmFDCRC register is a read-only register that can be read in 32-bit units

RCFDCnCFDCmFDCRCL, RCFDCnCFDCmFDCRCH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDCmFDCRCLL, RCFDCnCFDCmFDCRCLH, RCFDCnCFDCmFDCRCHL, RCFDCnCFDCmFDCRCHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDCmFDCRC: <RCFDCn\_base> + 0710<sub>H</sub> + (20<sub>H</sub> × m)

RCFDCnCFDCmFDCRCL: <RCFDCn\_base> + 0710<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmFDCRCH: <RCFDCn\_base> + 0712<sub>H</sub> + (20<sub>H</sub> × m)

RCFDCnCFDCmFDCRCLL: <RCFDCn\_base> + 0710<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmFDCRCLH: <RCFDCn\_base> + 0711<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmFDCRCHL: <RCFDCn\_base> + 0712<sub>H</sub> + (20<sub>H</sub> × m),

RCFDCnCFDCmFDCRCHH: <RCFDCn\_base> + 0713<sub>H</sub> + (20<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.44 RCFDCnCFDCmFDCRC Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	These bits are read as the value after reset.
27 to 24	SCNT[3:0]	Stuff count bit Indicate a value of the stuff count in a CAN FD frame. Bits 25 to 27 indicates the Gray-coded value of the stuff bit count modulo 8 in the transmitted/received frames. Bit 24 indicates an even parity value of bits 25 to 27.
23 to 21	Reserved	These bits are read as the value after reset.
20 to 0	CRCREG[20:0]	CRC Calculation Data (CRC Length:17 Bit or 21 Bit) These bits show the CRC value calculated based on the transmit message or receive message. When the CRC length is 17 bits, bits b20 to b17 are read as 0.

#### SCNT[3:0] Flags

When the CTME bit in the RCFDCnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CAN FD frame can be read if a message transmitted/received is a CAN FD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. These flags are updated at the first bit in the CRC field of the CAN FD frame. These bits are cleared to 0 in channel reset mode.

**CRCREG[20:0] Flags**

When the CTME bit in the RCFDCnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CAN FD frame (CRC length = 17 or 21 bits), these flags are updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received the CRCREG[14:0] value in the RCFDCnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0. These bits are cleared to 0 in channel reset mode.

## 24.3.3 Details of Global-related Registers

### 24.3.3.1 RCFDCnCFDGCFCG — Global Configuration Register

**Access:** RCFDCnCFDGCFCG register can be read or written in 32-bit units

RCFDCnCFDGCFCGL, RCFDCnCFDGCFCGH registers can be read or written in 16-bit units

RCFDCnCFDGCFCGLL, RCFDCnCFDGCFCGLH, RCFDCnCFDGCFCGHL, RCFDCnCFDGCFCGHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGCFCG: <RCFDCn\_base> + 0084<sub>H</sub>

RCFDCnCFDGCFCGL: <RCFDCn\_base> + 0084<sub>H</sub>,

RCFDCnCFDGCFCGH: <RCFDCn\_base> + 0086<sub>H</sub>

RCFDCnCFDGCFCGLL: <RCFDCn\_base> + 0084<sub>H</sub>,

RCFDCnCFDGCFCGLH: <RCFDCn\_base> + 0085<sub>H</sub>,

RCFDCnCFDGCFCGHL: <RCFDCn\_base> + 0086<sub>H</sub>,

RCFDCnCFDGCFCGHH: <RCFDCn\_base> + 0087<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	CMPOC	Payload Overflow Mode Select 0: No message is stored. 1: Messages are stored and payloads exceeding the buffer size are discarded.
4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000<sub>B</sub>.

Note 2. For the CAN clock frequency settings, see **Table 24.19, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM.**

Modify the RCFDCnCFDGCFCFG register only in global reset mode.

### ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 24.7.3.1, Interval Transmission Function.**

### TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CAN FD frames.

**TSSS Bit**

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

**TSP[3:0] Bits**

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

**CMPOC Bit**

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer, and depending on the DRE bit the received DLC value or the DLC value of the receive rule is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer's payload storage size is set by the following bits.

- Receive buffer: RMPLS[2:0] bits in the RCFDCnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RCFDCnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RCFDCnCFDCFCCK register

**DCS Bit**

When this bit is set to 0, clk is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk\_xincan is used as the clock source of the CAN clock (fCAN). For the CAN clock frequency settings, see **Table 24.19, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM.**

**MME Bit**

Setting this bit to 1 makes the mirror function available.

**DRE Bit**

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00<sub>H</sub> is stored in each data byte that exceeds the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

**DCE Bit**

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RCFDCnCFDGAFLP0\_j register to 0000<sub>B</sub> before clearing the DCE bit in the RCFDCnCFDGCFCFG register to 0.

**TPRI Bit**

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the transmit buffer with the smallest number has the highest priority.

When using the transmit queue, this bit should be set to 0.

### 24.3.3.2 RCFDCnCFDGCTR — Global Control Register

**Access:** RCFDCnCFDGCTR register can be read or written in 32-bit units

RCFDCnCFDGCTRL, RCFDCnCFDGCTRH registers can be read or written in 16-bit units

RCFDCnCFDGCTRLL, RCFDCnCFDGCTRLH, RCFDCnCFDGCTRHL registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGCTR: <RCFDCn\_base> + 0088<sub>H</sub>

RCFDCnCFDGCTRL: <RCFDCn\_base> + 0088<sub>H</sub>,

RCFDCnCFDGCTRH: <RCFDCn\_base> + 008A<sub>H</sub>

RCFDCnCFDGCTRLL: <RCFDCn\_base> + 0088<sub>H</sub>,

RCFDCnCFDGCTRLH: <RCFDCn\_base> + 0089<sub>H</sub>,

RCFDCnCFDGCTRHL: <RCFDCn\_base> + 008A<sub>H</sub>

**Value after reset:** 0000 0005<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 24.46 RCFDCnCFDGCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 12	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
11	CMPOFIE	Payload Overflow Interrupt Enable 0: A payload overflow interrupt is disabled. 1: A payload overflow interrupt is enabled.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode

Table 24.46 RCFDCnCFDGCTR Register Contents

Bit Position	Bit Name	Function
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

**TSRST Bit**

This bit is used to reset the timestamp counter. When this bit is set to 1, the RCFDCnCFDGTSC register is cleared to 0000<sub>H</sub>.

**CMPOFIE Bit**

When the CMPOF flag in the RCFDCnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request occurs. Modify this bit only in global reset mode.

**THLEIE Bit**

When the THLEIE bit is set to 1 and the THLES flag in the RCFDCnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

**MEIE Bit**

When the MEIE bit is set to 1 and the MES flag in the RCFDCnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

**DEIE Bit**

When the DEIE bit is set to 1 and the DEF flag in the RCFDCnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

**GSLPR Bit**

Setting this bit to 1 places the RS-CANFD module into global stop mode.

Clearing this bit to 0 makes the RS-CANFD module leave from global stop mode. This bit should not be modified in global operating mode or global test mode.

**GMDC[1:0] Bits**

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 24.5.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module in global stop mode.

### 24.3.3.3 RCFDCnCFDGSTS — Global Status Register

**Access:** RCFDCnCFDGSTS register is a read-only register that can be read in 32-bit units  
 RCFDCnCFDGSTSL register is a read-only register that can be read in 16-bit units  
 RCFDCnCFDGSTSLL register is a read-only register that can be read in 8-bit units

**Address:** RCFDCnCFDGSTS: <RCFDCn\_base> + 008C<sub>H</sub>  
 RCFDCnCFDGSTSL: <RCFDCn\_base> + 008C<sub>H</sub>  
 RCFDCnCFDGSTSLL: <RCFDCn\_base> + 008C<sub>H</sub>

**Value after reset:** 0000 000D<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	GRAM INIT	GSLPS TS	GHLT TS	GRST TS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.47 RCFDCnCFDGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

#### GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

#### GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

**GHLTSTS Flag**

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

**GRSTSTS Flag**

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

### 24.3.3.4 RCFDCnCFDGERFL — Global Error Flag Register

**Access:** RCFDCnCFDGERFL register can be read or written in 32-bit units  
 RCFDCnCFDGERFLL, RCFDCnCFDGERFLH registers can be read or written in 16-bit units  
 RCFDCnCFDGERFLLL, RCFDCnCFDGERFLHL registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGERFL: <RCFDCn\_base> + 0090<sub>H</sub>  
 RCFDCnCFDGERFLL: <RCFDCn\_base> + 0090<sub>H</sub>,  
 RCFDCnCFDGERFLH: <RCFDCn\_base> + 0092<sub>H</sub>  
 RCFDCnCFDGERFLLL: <RCFDCn\_base> + 0090<sub>H</sub>,  
 RCFDCnCFDGERFLHL: <RCFDCn\_base> + 0092<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	EEF7	EEF6	EEF5	EEF4	EEF3	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CMPOF	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.48 RCFDCnCFDGERFL Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
23	EEF7	ECC Error Flag for Channel 7 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
22	EEF6	ECC Error Flag for Channel 6 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
21	EEF5	ECC Error Flag for Channel 5 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
20	EEF4	ECC Error Flag for Channel 4 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
19	EEF3	ECC Error Flag for Channel 3 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority

Table 24.48 RCFDCnCFDGERFL Register Contents

Bit Position	Bit Name	Function
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
15 to 4	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
3	CMPOF	Payload Overflow Flag 0: No payload overflow has occurred. 1: A payload overflow has occurred.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RCFDCnCFDGERFL register are cleared to 0 in global reset mode.

#### EEFm Flag

When a 2-bit ECC error is detected during the transmission priority determination of channel  $m$  ( $m = 0$  to  $7$ ), the EEF $m$  flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

#### CMPOF Flag

When a payload overflow occurs in any of channel  $m$  ( $m = 0$  to  $7$ ), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

#### THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RCFDCnCFDTHLSTSm register ( $m = 0$  to  $7$ ) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

#### MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RCFDCnCFDRFSTStx register ( $x = 0$  to  $7$ ) or the CFMLT flags in the RCFDCnCFDCFSTSk register ( $k = 0$  to  $17$ ) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

**DEF Flag**

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

**NOTE**

---

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

---

### 24.3.3.5 RCFDCnCFDGTSC — Global Timestamp Counter Register

**Access:** RCFDCnCFDGTSC register is a read-only register that can be read in 32-bit units.  
RCFDCnCFDGTSC register is a read-only register that can be read in 16-bit units.

**Address:** RCFDCnCFDGTSC: <RCFDCn\_base> + 0094<sub>H</sub>  
RCFDCnCFDGTSC: <RCFDCn\_base> + 0094<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.49 RCFDCnCFDGTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000 <sub>H</sub> to FFFF <sub>H</sub>

#### TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RCFDCnCFDGCFCG register is 0 (pclk):

The timestamp counter starts counting when the RS-CANFD module has transitioned to global operating mode.

This counter stops counting when the RS-CANFD module has transitioned to global stop mode or global test mode.

- When the TSSS bit is 1 (CANm nominal bit time clock):

The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.

This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

### 24.3.3.6 RCFDCnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

**Access:** RCFDCnCFDGTINTSTS0 register is a read-only register that can be read in 32-bit units  
RCFDCnCFDGTINTSTS0L, RCFDCnCFDGTINTSTS0H registers are read-only registers that can be read in 16-bit units

RCFDCnCFDGTINTSTS0LL, RCFDCnCFDGTINTSTS0LH, RCFDCnCFDGTINTSTS0HL,  
RCFDCnCFDGTINTSTS0HH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDGTINTSTS0: <RCFDCn\_base> + 0610<sub>H</sub>  
RCFDCnCFDGTINTSTS0L: <RCFDCn\_base> + 0610<sub>H</sub>,  
RCFDCnCFDGTINTSTS0H: <RCFDCn\_base> + 0612<sub>H</sub>  
RCFDCnCFDGTINTSTS0LL: <RCFDCn\_base> + 0610<sub>H</sub>,  
RCFDCnCFDGTINTSTS0LH: <RCFDCn\_base> + 0611<sub>H</sub>,

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 24.50 RCFDCnCFDGTINTSTS0 Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are read as the value after reset.
28	THIF3	Channel 3 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
27	CFTIF3	Channel 3 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
26	TQIF3	Channel 3 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
25	TAIF3	Channel 3 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
24	TSIF3	Channel 3 Transmit Buffer Transmit Complete Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
23 to 21	Reserved	These bits are read as the value after reset.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.

Table 24.50 RCFDCnCFDGTINTSTS0 Register Contents

Bit Position	Bit Name	Function
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	These bits are read as the value after reset.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

**TSIFm Bits**

The TSIFm bit is set to 1 when the TMIEp bit in the RCFDCnCFDTMIECm register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the corresponding RCFDCnCFDTMSTSp register are set to 10<sub>B</sub> (transmit completed without abort request) or 11<sub>B</sub> (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00<sub>B</sub> under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

**TAIFm Bits**

The TAIFm bit is set to 1 when the TAIE bit in the RCFDCnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RCFDCnCFDTMSTSp register are set to 01<sub>B</sub> (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00<sub>B</sub> after the transmit abort is completed.

**TQIFm Bits**

When the TXQTXIE bit in the RCFDCnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQTXIF bit in the RCFDCnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQTXIF bit (transmit queue interrupt request) in the RCFDCnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQTXIE bit is cleared to 0.

**CFTIFm Bits**

When the CFTXIE bit in the RCFDCnCFDFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RCFDCnCFDFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

**THIFm Bits**

When the THLIE bit in the RCFDCnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RCFDCnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RCFDCnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

### 24.3.3.7 RCFDCnCFDGTINTSTS1 — Global TX Interrupt Status Register 1

**Access:** RCFDCnCFDGTINTSTS1 register is a read-only register that can be read in 32-bit units  
RCFDCnCFDGTINTSTS1L, RCFDCnCFDGTINTSTS1H registers are read-only registers that can be read in 16-bit units

RCFDCnCFDGTINTSTS1LL, RCFDCnCFDGTINTSTS1LH, RCFDCnCFDGTINTSTS1HL,  
RCFDCnCFDGTINTSTS1HH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDGTINTSTS1: <RCFDCn\_base> + 0614<sub>H</sub>  
RCFDCnCFDGTINTSTS1L: <RCFDCn\_base> + 0614<sub>H</sub>,  
RCFDCnCFDGTINTSTS1H: <RCFDCn\_base> + 0616<sub>H</sub>  
RCFDCnCFDGTINTSTS1LL: <RCFDCn\_base> + 0614<sub>H</sub>,  
RCFDCnCFDGTINTSTS1LH: <RCFDCn\_base> + 0615<sub>H</sub>,  
RCFDCnCFDGTINTSTS1HL: <RCFDCn\_base> + 0616<sub>H</sub>,  
RCFDCnCFDGTINTSTS1HH: <RCFDCn\_base> + 0617<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	THIF7	CFTIF7	TQIF7	TAIF7	TSIF7	—	—	—	THIF6	CFTIF6	TQIF6	TAIF6	TSIF6

R/W	R	R	R	R*	R*	R*	R*	R*	R	R	R	R*	R*	R*	R*	R*

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 24.51 RCFDCnCFDGTINTSTS1 Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are read as the value after reset.
28	THIF7	Channel 7 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
27	CFTIF7	Channel 7 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
26	TQIF7	Channel 7 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
25	TAIF7	Channel 7 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
24	TSIF7	Channel 7 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
23 to 21	Reserved	These bits are read as the value after reset.
20	THIF6	Channel 6 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.

Table 24.51 RCFDCnCFDGTINTSTS1 Register Contents

Bit Position	Bit Name	Function
19	CFTIF6	Channel 6 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF6	Channel 6 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF6	Channel 6 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF6	Channel 6 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested
15 to 13	Reserved	These bits are read as the value after reset.
12	THIF5	Channel 5 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF5	Channel 5 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF5	Channel 5 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF5	Channel 5 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF5	Channel 5 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF4	Channel 4 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF4	Channel 4 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF4	Channel 4 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF4	Channel 4 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF4	Channel 4 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

**TSIFm Bits**

The TSIFm bit is set to 1 when the TMIEp bit in the RCFDCnCFDTMIECm register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the corresponding RCFDCnCFDTMSTSp register are set to 10<sub>B</sub> (transmit completed without abort request) or 11<sub>B</sub> (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00<sub>B</sub> under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

**TAIFm Bits**

The TAIFm bit is set to 1 when the TAIE bit in the RCFDCnCFDCmCTR register is set to 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RCFDCnCFDTMSTSp register are set to 01<sub>B</sub> (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00<sub>B</sub> after the transmit abort is completed.

**TQIFm Bits**

When the TXQTXIE bit in the RCFDCnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQTXIF bit in the RCFDCnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQTXIF bit (transmit queue interrupt request) in the RCFDCnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. Clearing the TXQTXIE bit to 0 also clears this flag to 0.

**CFTIFm Bits**

When the CFTXIE bit in the RCFDCnCFDFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RCFDCnCFDFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

**THIFm Bits**

When the THLIE bit in the RCFDCnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RCFDCnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RCFDCnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

### 24.3.3.8 RCFDCnCFDGFDCFG — Global FD Configuration Register

**Access:** RCFDCnCFDGFDCFG register can be read or written in 32-bit units  
 RCFDCnCFDGFDCFGL register can be read or written in 16-bit units  
 RCFDCnCFDGFDCFGLL, RCFDCnCFDGFDCFGLH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGFDCFG: <RCFDCn\_base> + 0624<sub>H</sub>  
 RCFDCnCFDGFDCFGL: <RCFDCn\_base> + 0624<sub>H</sub>  
 RCFDCnCFDGFDCFGLL: <RCFDCn\_base> + 0624<sub>H</sub>,  
 RCFDCnCFDGFDCFGLH: <RCFDCn\_base> + 0625<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSCCFG[1:0]		—	—	—	—	—	—	—	RPED
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Table 24.52 RCFDCnCFDGFDCFG register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	TSCCFG[1:0]	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Captured at a sample point of the res bit.*1 1 1: Setting prohibited.
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RPED	Protocol exception event detection disabled bit 0: Protocol exception event detection is enabled 1: Protocol exception event detection is disabled

Note 1. When a classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

#### TSCCFG bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

#### RPED bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame will be output. Modify this bit only in global reset mode.

## 24.3.4 Details of Receive Rule-related Registers

### 24.3.4.1 RCFDCnCFDGAFLECTR — Receive Rule Entry Control Register

**Access:** RCFDCnCFDGAFLECTR register can be read or written in 32-bit units  
 RCFDCnCFDGAFLECTRL register can be read or written in 16-bit units  
 RCFDCnCFDGAFLECTRLL, RCFDCnCFDGAFLECTRLH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGAFLECTR: <RCFDCn\_base> + 0098<sub>H</sub>  
 RCFDCnCFDGAFLECTRL: <RCFDCn\_base> + 0098<sub>H</sub>  
 RCFDCnCFDGAFLECTRLL: <RCFDCn\_base> + 0098<sub>H</sub>,  
 RCFDCnCFDGAFLECTRLH: <RCFDCn\_base> + 0099<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AFLDA E	—	—	AFLPN[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.53 RCFDCnCFDGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7, 6	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
5 to 0	AFLPN[5:0]	Receive Rule Table Page Number Configuration A page number can be selected in the range of page 0 (000000 <sub>B</sub> ) to page 63 (111111 <sub>B</sub> ).

#### AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

#### AFLPN[5:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 000000<sub>B</sub> to 111111<sub>B</sub>.

For details about the receive rule table, see **Section 24.6.1, Data Processing Using the Receive Rule Table**.

### 24.3.4.2 RCFDCnCFDGAFLCFG0 — Receive Rule Configuration Register 0

**Access:** RCFDCnCFDGAFLCFG0 register can be read or written in 32-bit units

RCFDCnCFDGAFLCFG0L, RCFDCnCFDGAFLCFG0H registers can be read or written in 16-bit units

RCFDCnCFDGAFLCFG0LL, RCFDCnCFDGAFLCFG0LH, RCFDCnCFDGAFLCFG0HL, RCFDCnCFDGAFLCFG0HH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGAFLCFG0: <RCFDCn\_base> + 009C<sub>H</sub>

RCFDCnCFDGAFLCFG0L: <RCFDCn\_base> + 009C<sub>H</sub>,

RCFDCnCFDGAFLCFG0H: <RCFDCn\_base> + 009E<sub>H</sub>

RCFDCnCFDGAFLCFG0LL: <RCFDCn\_base> + 009C<sub>H</sub>,

RCFDCnCFDGAFLCFG0LH: <RCFDCn\_base> + 009D<sub>H</sub>,

RCFDCnCFDGAFLCFG0HL: <RCFDCn\_base> + 009E<sub>H</sub>,

RCFDCnCFDGAFLCFG0HH: <RCFDCn\_base> + 009F<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RNC0[7:0]								RNC1[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RNC2[7:0]								RNC3[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.54 RCFDCnCFDGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules exclusively used for channel 2.
7 to 0	RNC3[7:0]	Number of Rules for Channel 3 Set the number of receive rules exclusively used for channel 3.

Modify the RCFDCnCFDGAFLCFG0 register only in global reset mode.

Up to 128 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 255.
- The total number of rules allocated to each channel does not exceed the number of rules that can be registered for the entire unit.

#### RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table. Set these bits to a value within the range of 00<sub>H</sub> to FF<sub>H</sub>.

**RNC1[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 1 receive rule table. Set these bits to a value within the range of 00<sub>H</sub> to FF<sub>H</sub>.

**RNC2[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 2 receive rule table. Set these bits to a value within the range of 00<sub>H</sub> to FF<sub>H</sub>.

**RNC3[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 3 receive rule table. Set these bits to a value within the range of 00<sub>H</sub> to FF<sub>H</sub>.

### 24.3.4.3 RCFDCnCFDGAFLCFG1 — Receive Rule Configuration Register 1

**Access:** RCFDCnCFDGAFLCFG1 register can be read or written in 32-bit units

RCFDCnCFDGAFLCFG1L, RCFDCnCFDGAFLCFG1H registers can be read or written in 16-bit units

RCFDCnCFDGAFLCFG1LL, RCFDCnCFDGAFLCFG1LH, RCFDCnCFDGAFLCFG1HL, RCFDCnCFDGAFLCFG1HH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGAFLCFG1: <RCFDCn\_base> + 00A0<sub>H</sub>

RCFDCnCFDGAFLCFG1L: <RCFDCn\_base> + 00A0<sub>H</sub>,

RCFDCnCFDGAFLCFG1H: <RCFDCn\_base> + 00A2<sub>H</sub>

RCFDCnCFDGAFLCFG1LL: <RCFDCn\_base> + 00A0<sub>H</sub>,

RCFDCnCFDGAFLCFG1LH: <RCFDCn\_base> + 00A1<sub>H</sub>,

RCFDCnCFDGAFLCFG1HL: <RCFDCn\_base> + 00A2<sub>H</sub>,

RCFDCnCFDGAFLCFG1HH: <RCFDCn\_base> + 00A3<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.55 RCFDCnCFDGAFLCFG1 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC4[7:0]	Number of Rules for Channel 4 Set the number of receive rules exclusively used for channel 4.
23 to 16	RNC5[7:0]	Number of Rules for Channel 5 Set the number of receive rules exclusively used for channel 5.
15 to 8	RNC6[7:0]	Number of Rules for Channel 6 Set the number of receive rules exclusively used for channel 6.
7 to 0	RNC7[7:0]	Number of Rules for Channel 7 Set the number of receive rules exclusively used for channel 7.

Modify the RCFDCnCFDGAFLCFG1 register only in global reset mode.

Up to 128 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 255.
- The total number of rules allocated to each channel does not exceed the number of rules that can be registered for the entire unit.

#### RNC4[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 4 receive rule table. Set these bits to a value within the range of 00<sub>H</sub> to FF<sub>H</sub>.

**RNC5[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 5 receive rule table. Set these bits to a value within the range of 00<sub>H</sub> to FF<sub>H</sub>.

**RNC6[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 6 receive rule table. Set these bits to a value within the range of 00<sub>H</sub> to FF<sub>H</sub>.

**RNC7[7:0] Bits**

These bits are used to set the number of rules to be registered in the channel 7 receive rule table. Set these bits to a value within the range of 00<sub>H</sub> to FF<sub>H</sub>.

### 24.3.4.4 RCFDCnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)

**Access:** RCFDCnCFDGAFLIDj register can be read or written in 32-bit units  
 RCFDCnCFDGAFLIDjL, RCFDCnCFDGAFLIDjH registers can be read or written in 16-bit units  
 RCFDCnCFDGAFLIDjLL, RCFDCnCFDGAFLIDjLH, RCFDCnCFDGAFLIDjHL, RCFDCnCFDGAFLIDjHH registers  
 can be read or written in 8-bit units

**Address:** RCFDCnCFDGAFLIDj: <RCFDCn\_base> + 1000<sub>H</sub> + (10<sub>H</sub> × j)  
 RCFDCnCFDGAFLIDjL: <RCFDCn\_base> + 1000<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLIDjH: <RCFDCn\_base> + 1002<sub>H</sub> + (10<sub>H</sub> × j)  
 RCFDCnCFDGAFLIDjLL: <RCFDCn\_base> + 1000<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLIDjLH: <RCFDCn\_base> + 1001<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLIDjHL: <RCFDCn\_base> + 1002<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLIDjHH: <RCFDCn\_base> + 1003<sub>H</sub> + (10<sub>H</sub> × j)

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.56 RCFDCnCFDGAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RCFDCnCFDGAFLIDj register when the AFLDAE bit in the RCFDCnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

**GAFLRTR Bit**

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

**GAFLLB Bit**

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

**GAFLID[28:0] Bits**

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

### 24.3.4.5 RCFDCnCFDGAFMLj — Receive Rule Mask Register (j = 0 to 15)

**Access:** RCFDCnCFDGAFMLj register can be read or written in 32-bit units

RCFDCnCFDGAFMLjL, RCFDCnCFDGAFMLjH registers can be read or written in 16-bit units

RCFDCnCFDGAFMLjLL, RCFDCnCFDGAFMLjLH, RCFDCnCFDGAFMLjHL, RCFDCnCFDGAFMLjHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGAFMLj:  $\langle \text{RCFDCn\_base} \rangle + 1004_{\text{H}} + (10_{\text{H}} \times j)$   
 RCFDCnCFDGAFMLjL:  $\langle \text{RCFDCn\_base} \rangle + 1004_{\text{H}} + (10_{\text{H}} \times j)$ ,  
 RCFDCnCFDGAFMLjH:  $\langle \text{RCFDCn\_base} \rangle + 1006_{\text{H}} + (10_{\text{H}} \times j)$   
 RCFDCnCFDGAFMLjLL:  $\langle \text{RCFDCn\_base} \rangle + 1004_{\text{H}} + (10_{\text{H}} \times j)$ ,  
 RCFDCnCFDGAFMLjLH:  $\langle \text{RCFDCn\_base} \rangle + 1005_{\text{H}} + (10_{\text{H}} \times j)$ ,  
 RCFDCnCFDGAFMLjHL:  $\langle \text{RCFDCn\_base} \rangle + 1006_{\text{H}} + (10_{\text{H}} \times j)$ ,  
 RCFDCnCFDGAFMLjHH:  $\langle \text{RCFDCn\_base} \rangle + 1007_{\text{H}} + (10_{\text{H}} \times j)$

**Value after reset:** 0000 0000<sub>H</sub>

	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.57 RCFDCnCFDGAFMLj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared.
29	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RCFDCnCFDGAFMLj register when the AFLDAE bit in the RCFDCnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RCFDCnCFDGAFMLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set all the GAFLIDM[28:0] bits to 0 at the same time.

**GAFLRTRM Bit**

This bit is used to mask the RTR bit of the receive rule.

**GAFLIDM[28:0] Bits**

These bits are used to mask the corresponding ID bit of the receive rule.

### 24.3.4.6 RCFDCnCFDGAFLP0\_j — Receive Rule Pointer 0 Register (j = 0 to 15)

**Access:** RCFDCnCFDGAFLP0\_j register can be read or written in 32-bit units  
 RCFDCnCFDGAFLP0\_jL, RCFDCnCFDGAFLP0\_jH registers can be read or written in 16-bit units  
 RCFDCnCFDGAFLP0\_jLL, RCFDCnCFDGAFLP0\_jLH, RCFDCnCFDGAFLP0\_jHL, RCFDCnCFDGAFLP0\_jHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGAFLP0\_j: <RCFDCn\_base> + 1008<sub>H</sub> + (10<sub>H</sub> × j)  
 RCFDCnCFDGAFLP0\_jL: <RCFDCn\_base> + 1008<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLP0\_jH: <RCFDCn\_base> + 100A<sub>H</sub> + (10<sub>H</sub> × j)  
 RCFDCnCFDGAFLP0\_jLL: <RCFDCn\_base> + 1008<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLP0\_jLH: <RCFDCn\_base> + 1009<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLP0\_jHL: <RCFDCn\_base> + 100A<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLP0\_jHH: <RCFDCn\_base> + 100B<sub>H</sub> + (10<sub>H</sub> × j)

**Value after reset:** 0000 0000<sub>H</sub>

15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Table 24.58 RCFDCnCFDGAFLP0\_j Register Contents

Bit Position	Bit Name	Function
3 to 0	GAFLDLC[3:0]	Receive Rule DLC
		<b>b3</b> <b>b2</b> <b>b1</b> <b>b0</b> <b>Classical CAN Frame</b> <b>CAN FD Frame</b>
		0 0 0 0 DLC check is disabled
		0 0 0 1 1 data byte
		0 0 1 0 2 data bytes
		0 0 1 1 3 data bytes
		0 1 0 0 4 data bytes
		0 1 0 1 5 data bytes
		0 1 1 0 6 data bytes
		0 1 1 1 7 data bytes
		1 0 0 0 8 data bytes
		1 0 0 1 8 data bytes 12 data bytes
		1 0 1 0 16 data bytes
		1 0 1 1 20 data bytes
		1 1 0 0 24 data bytes
		1 1 0 1 32 data bytes
1 1 1 0 48 data bytes		
1 1 1 1 64 data bytes		

Modify the RCFDCnCFDGAFLP0\_j register when the AFLDAE bit in the RCFDCnCFDGAFLLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

### GAFLPTR[15:0] Bits

These bits are used to set a 16-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

### GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

### GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the setting value by the NRXMB[7:0] bits in the RCFDCnCFDRMNB register.

### GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000<sub>B</sub> disables the DLC check function allowing messages with any data length to pass the DLC check.

### 24.3.4.7 RCFDCnCFDGAFLP1\_j — Receive Rule Pointer 1 Register (j = 0 to 15)

**Access:** RCFDCnCFDGAFLP1\_j register can be read or written in 32-bit units  
 RCFDCnCFDGAFLP1\_jL, RCFDCnCFDGAFLP1\_jH registers can be read or written in 16-bit units  
 RCFDCnCFDGAFLP1\_jLL, RCFDCnCFDGAFLP1\_jLH, RCFDCnCFDGAFLP1\_jHL, RCFDCnCFDGAFLP1\_jHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGAFLP1\_j: <RCFDCn\_base> + 100C<sub>H</sub> + (10<sub>H</sub> × j)  
 RCFDCnCFDGAFLP1\_jL: <RCFDCn\_base> + 100C<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLP1\_jH: <RCFDCn\_base> + 100E<sub>H</sub> + (10<sub>H</sub> × j)  
 RCFDCnCFDGAFLP1\_jLL: <RCFDCn\_base> + 100C<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLP1\_jLH: <RCFDCn\_base> + 100D<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLP1\_jHL: <RCFDCn\_base> + 100E<sub>H</sub> + (10<sub>H</sub> × j),  
 RCFDCnCFDGAFLP1\_jHH: <RCFDCn\_base> + 100F<sub>H</sub> + (10<sub>H</sub> × j)

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.59 RCFDCnCFDGAFLP1\_j Register Contents

Bit Position	Bit Name	Function
31 to 8	GAFLFDP[31:8]	Transmit/Receive FIFO Buffer k Select (Bit position – 8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RCFDCnCFDGAFLP1\_j register when the AFLDAE bit in the RCFDCnCFDGAFLLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

#### GAFLFDP[31:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RCFDCnCFDGAFLP0\_j register is set to 1 (messages are stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RCFDCnCFDGFCCk register are set to 00<sub>B</sub> (receive mode) or 10<sub>B</sub> (gateway mode) can be selected.

## 24.3.5 Details of Receive Buffer-related Registers

### 24.3.5.1 RCFDCnCFDRMNB — Receive Buffer Number Register

**Access:** RCFDCnCFDRMNB register can be read or written in 32-bit units  
 RCFDCnCFDRMNBL register can be read or written in 16-bit units  
 RCFDCnCFDRMNBL, RCFDCnCFDRMNBLH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDRMNB: <RCFDCn\_base> + 00A4<sub>H</sub>  
 RCFDCnCFDRMNBL: <RCFDCn\_base> + 00A4<sub>H</sub>  
 RCFDCnCFDRMNBL: <RCFDCn\_base> + 00A4<sub>H</sub>,  
 RCFDCnCFDRMNBLH: <RCFDCn\_base> + 00A5<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.60 RCFDCnCFDRMNB Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	RMPLS[2:0]	Receive Buffer Payload Storage Size Select b10 b9 b8 0 0 0: 8byte 0 0 1: 12byte 0 1 0: 16byte 0 1 1: 20byte 1 0 0: 24byte 1 0 1: 32byte 1 1 0: 48byte 1 1 1: 64byte
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 128.

Modify the RCFDCnCFDRMNB register only in global reset mode.

#### RMPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

#### NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

### 24.3.5.2 RCFDCnCFDRMNDy — Receive Buffer New Data Register (y = 0 to 3)

**Access:** RCFDCnCFDRMNDy register can be read or written in 32-bit units  
 RCFDCnCFDRMNDyL, RCFDCnCFDRMNDyH registers can be read or written in 16-bit units  
 RCFDCnCFDRMNDyLL, RCFDCnCFDRMNDyLH, RCFDCnCFDRMNDyHL, RCFDCnCFDRMNDyHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDRMNDy: <RCFDCn\_base> + 00A8<sub>H</sub> + (04<sub>H</sub> × y)  
 RCFDCnCFDRMNDyL: <RCFDCn\_base> + 00A8<sub>H</sub> + (04<sub>H</sub> × y),  
 RCFDCnCFDRMNDyH: <RCFDCn\_base> + 00AA<sub>H</sub> + (04<sub>H</sub> × y)  
 RCFDCnCFDRMNDyLL: <RCFDCn\_base> + 00A8<sub>H</sub> + (04<sub>H</sub> × y),  
 RCFDCnCFDRMNDyLH: <RCFDCn\_base> + 00A9<sub>H</sub> + (04<sub>H</sub> × y),  
 RCFDCnCFDRMNDyHL: <RCFDCn\_base> + 00AA<sub>H</sub> + (04<sub>H</sub> × y),  
 RCFDCnCFDRMNDyHH: <RCFDCn\_base> + 00AB<sub>H</sub> + (04<sub>H</sub> × y)

**Value after reset:** 0000 0000<sub>H</sub>

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RCFDCnCFDRMNDy register in global operating mode or global test mode.

#### RMNSq Flags (q = 0 to 127)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[2:0] value in the RCFDCnCFDRMNB register is 000<sub>B</sub> (8 bytes), the message storing time is 12 pclk clock cycles.

When the RMPLS[2:0] value is 111<sub>B</sub> (64 bytes), the message storing time is 40 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size). These flags are cleared to 0 in global reset mode.

### 24.3.5.3 RCFDCnCFDRMIDq — Receive Buffer ID Register (q = 0 to 127)

**Access:** RCFDCnCFDRMIDq register is a read-only register that can be read in 32-bit units

RCFDCnCFDRMIDqL, RCFDCnCFDRMIDqH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRMIDqLL, RCFDCnCFDRMIDqLH, RCFDCnCFDRMIDqHL, RCFDCnCFDRMIDqHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDRMIDq: <RCFDCn\_base> + 2000<sub>H</sub> + (80<sub>H</sub> × q)  
 RCFDCnCFDRMIDqL: <RCFDCn\_base> + 2000<sub>H</sub> + (80<sub>H</sub> × q),  
 RCFDCnCFDRMIDqH: <RCFDCn\_base> + 2002<sub>H</sub> + (80<sub>H</sub> × q)  
 RCFDCnCFDRMIDqLL: <RCFDCn\_base> + 2000<sub>H</sub> + (80<sub>H</sub> × q),  
 RCFDCnCFDRMIDqLH: <RCFDCn\_base> + 2001<sub>H</sub> + (80<sub>H</sub> × q),  
 RCFDCnCFDRMIDqHL: <RCFDCn\_base> + 2002<sub>H</sub> + (80<sub>H</sub> × q),  
 RCFDCnCFDRMIDqHH: <RCFDCn\_base> + 2003<sub>H</sub> + (80<sub>H</sub> × q)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.62 RCFDCnCFDRMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR/RRS <ul style="list-style-type: none"> <li>When the received message is a classical CAN frame 0: Data frame 1: Remote frame</li> <li>When the received message is a CAN FD frame The RRS bit value of the received message can be read.</li> </ul>
29	Reserved	This bit is read as the value after reset.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

#### RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

#### RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

**RMID[28:0] Bits**

These bits contain the ID of the message stored in the receive buffer.

### 24.3.5.4 RCFDCnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 127)

**Access:** RCFDCnCFDRMPTRq register is a read-only register that can be read in 32-bit units

RCFDCnCFDRMPTRqL, RCFDCnCFDRMPTRqH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRMPTRqLL, RCFDCnCFDRMPTRqLH, RCFDCnCFDRMPTRqHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDRMPTRq: <RCFDCn\_base> + 2004<sub>H</sub> + (80<sub>H</sub> × q)

RCFDCnCFDRMPTRqL: <RCFDCn\_base> + 2004<sub>H</sub> + (80<sub>H</sub> × q),

RCFDCnCFDRMPTRqH: <RCFDCn\_base> + 2006<sub>H</sub> + (80<sub>H</sub> × q)

RCFDCnCFDRMPTRqLL: <RCFDCn\_base> + 2004<sub>H</sub> + (80<sub>H</sub> × q),

RCFDCnCFDRMPTRqLH: <RCFDCn\_base> + 2005<sub>H</sub> + (80<sub>H</sub> × q),

RCFDCnCFDRMPTRqHH: <RCFDCn\_base> + 2007<sub>H</sub> + (80<sub>H</sub> × q)

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.63 RCFDCnCFDRMPTRq Register Contents

Bit Position	Bit Name	Function
31 to 28	RMDLC[3:0]	Receive Buffer DLC Data
		b31 b30 b29 b28 Classical CAN Frame CAN FD Frame
		0 0 0 0 0 data bytes
		0 0 0 1 1 data byte
		0 0 1 0 2 data bytes
		0 0 1 1 3 data bytes
		0 1 0 0 4 data bytes
		0 1 0 1 5 data bytes
		0 1 1 0 6 data bytes
		0 1 1 1 7 data bytes
		1 0 0 0 8 data bytes
		1 0 0 1 8 data bytes 12 data bytes
		1 0 1 0 16 data bytes
		1 0 1 1 20 data bytes
		1 1 0 0 24 data bytes
		1 1 0 1 32 data bytes
1 1 1 0 48 data bytes		
1 1 1 1 64 data bytes		
27 to 16	Reserved	These bits are read as the value after reset.
15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

**RMDLC[3:0] Bits**

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[2:0] bits in the RCFDCnCFDRMNB register.

**RMTS[15:0] Bits**

These bits indicate the timestamp value of the message stored in the receive buffer.

### 24.3.5.5 RCFDCnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 127)

**Access:** RCFDCnCFDRMFDSTSq register is a read-only register that can be read in 32-bit units  
 RCFDCnCFDRMFDSTSqL, RCFDCnCFDRMFDSTSqH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRMFDSTSqLL, RCFDCnCFDRMFDSTSqHL, RCFDCnCFDRMFDSTSqHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDRMFDSTSq: <RCFDCn\_base> + 2008<sub>H</sub> + (80<sub>H</sub> × q)  
 RCFDCnCFDRMFDSTSqL: <RCFDCn\_base> + 2008<sub>H</sub> + (80<sub>H</sub> × q),  
 RCFDCnCFDRMFDSTSqH: <RCFDCn\_base> + 200A<sub>H</sub> + (80<sub>H</sub> × q)  
 RCFDCnCFDRMFDSTSqLL: <RCFDCn\_base> + 2008<sub>H</sub> + (80<sub>H</sub> × q),  
 RCFDCnCFDRMFDSTSqHL: <RCFDCn\_base> + 200A<sub>H</sub> + (80<sub>H</sub> × q),  
 RCFDCnCFDRMFDSTSqHH: <RCFDCn\_base> + 200B<sub>H</sub> + (80<sub>H</sub> × q)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.64 RCFDCnCFDRMFDSTSq Register Contents

Bit Position	Bit Name	Function
31 to 16	RMPTR[15:0]	Receive Buffer Label Data Label information of the received message.
15 to 3	Reserved	These bits are read as the value after reset.
2	RMFDF	FD 0: Classical CAN frame 1: CAN FD frame
1	RMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RMESI	ESI 0: Error active node 1: Error passive node

#### RMPTR[15:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

#### RMFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive buffer.

#### RMBRS Bit

When the RMFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0, this bit is always read as 0.

**RMESI Bit**

When the RMFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0, this bit is always read as 0.

### 24.3.5.6 RCFDCnCFDRMDFb\_q — Receive Buffer Data Field Register (b = 0 to 15, q = 0 to 127)

**Access:** RCFDCnCFDRMDFb\_q register is a read-only register that can be read in 32-bit units

RCFDCnCFDRMDFb\_qL, RCFDCnCFDRMDFb\_qH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRMDFb\_qLL, RCFDCnCFDRMDFb\_qLH, RCFDCnCFDRMDFb\_qHL, RCFDCnCFDRMDFb\_qHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDRMDFb\_q:  $\langle \text{RCFDCn\_base} \rangle + 200\text{C}_\text{H} + (04_\text{H} \times b) + (80_\text{H} \times q)$

RCFDCnCFDRMDFb\_qL:  $\langle \text{RCFDCn\_base} \rangle + 200\text{C}_\text{H} + (04_\text{H} \times b) + (80_\text{H} \times q)$ ,

RCFDCnCFDRMDFb\_qH:  $\langle \text{RCFDCn\_base} \rangle + 200\text{E}_\text{H} + (04_\text{H} \times b) + (80_\text{H} \times q)$

RCFDCnCFDRMDFb\_qLL:  $\langle \text{RCFDCn\_base} \rangle + 200\text{C}_\text{H} + (04_\text{H} \times b) + (80_\text{H} \times q)$ ,

RCFDCnCFDRMDFb\_qLH:  $\langle \text{RCFDCn\_base} \rangle + 200\text{D}_\text{H} + (04_\text{H} \times b) + (80_\text{H} \times q)$ ,

RCFDCnCFDRMDFb\_qHL:  $\langle \text{RCFDCn\_base} \rangle + 200\text{E}_\text{H} + (04_\text{H} \times b) + (80_\text{H} \times q)$ ,

RCFDCnCFDRMDFb\_qHH:  $\langle \text{RCFDCn\_base} \rangle + 200\text{F}_\text{H} + (04_\text{H} \times b) + (80_\text{H} \times q)$

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.65 RCFDCnCFDRMDFb\_q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB4 × b + 3 [7:0]	Receive Buffer Data Byte 4 × b + 3
		Receive Buffer Data Byte 4 × b + 2
23 to 16	RMDB4 × b + 2 [7:0]	Receive Buffer Data Byte 4 × b + 1
		Receive Buffer Data Byte 4 × b + 0
15 to 8	RMDB4 × b + 1 [7:0]	Data for a message stored in the receive buffer can be read.
7 to 0	RMDB4 × b + 0 [7:0]	

When the RMDLC[3:0] value in the RCFDCnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as 00<sub>H</sub>.

Specify the payload storage size of the receive buffer by the RMPLS[2:0] bits in the RCFDCnCFDRMNB register. Do not read or write the RCFDCnCFDRMDFb\_q register corresponding to an area that exceeds the specified size.

## 24.3.6 Details of Receive FIFO Buffer-related Registers

### 24.3.6.1 RCFDCnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

**Access:** RCFDCnCFDRFCCx register can be read or written in 32-bit units  
 RCFDCnCFDRFCCxL register can be read or written in 16-bit units  
 RCFDCnCFDRFCCxLL, RCFDCnCFDRFCCxLH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDRFCCx: <RCFDCn\_base> + 00B8<sub>H</sub> + (04<sub>H</sub> × x)  
 RCFDCnCFDRFCCxL: <RCFDCn\_base> + 00B8<sub>H</sub> + (04<sub>H</sub> × x)  
 RCFDCnCFDRFCCxLL: <RCFDCn\_base> + 00B8<sub>H</sub> + (04<sub>H</sub> × x),  
 RCFDCnCFDRFCCxLH: <RCFDCn\_base> + 00B9<sub>H</sub> + (04<sub>H</sub> × x)

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.66 RCFDCnCFDRFCCx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	This bit is read as the value after reset. The write value should be the value after reset.

Table 24.66 RCFDCnCFDRFCCx Register Contents

Bit Position	Bit Name	Function
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
6 to 4	RFPLS[2:0]	Receive FIFO Buffer Payload Storage Size Select b6 b5 b4 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes
3, 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

**RFIGCV[2:0] Bits**

These bits are used to specify the number of received messages required to generate a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001<sub>B</sub> (4 messages), set the RFIGCV[2:0] bits to 001<sub>B</sub>, 011<sub>B</sub>, 101<sub>B</sub>, or 111<sub>B</sub>. Modify these bits only in global reset mode.

**RFIM Bit**

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

**RFDC[2:0] Bits**

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000<sub>B</sub>, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

**RFPLS[2:0] Bits**

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

**RFIE Bit**

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit is set to 0 (no receive FIFO buffer is used).

**RFE Bit**

Setting the RFE bit to 1 enables the use of FIFO buffers. Clearing this bit to 0 sets the RFEMP flag in the RCFDCnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RCFDCnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

### 24.3.6.2 RCFDCnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

**Access:** RCFDCnCFDRFSTSx register can be read or written in 32-bit units  
 RCFDCnCFDRFSTSxL register can be read or written in 16-bit units  
 RCFDCnCFDRFSTSxLL register can be read or written in 8-bit units  
 RCFDCnCFDRFSTSxLH register is a read-only register that can be read in 8-bit units

**Address:** RCFDCnCFDRFSTSx: <RCFDCn\_base> + 00D8<sub>H</sub> + (04<sub>H</sub> × x)  
 RCFDCnCFDRFSTSxL: <RCFDCn\_base> + 00D8<sub>H</sub> + (04<sub>H</sub> × x)  
 RCFDCnCFDRFSTSxLL: <RCFDCn\_base> + 00D8<sub>H</sub> + (04<sub>H</sub> × x),  
 RCFDCnCFDRFSTSxLH: <RCFDCn\_base> + 00D9<sub>H</sub> + (04<sub>H</sub> × x)

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.67 RCFDCnCFDRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

#### RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00<sub>H</sub> when the RFE bit in the RCFDCnCFDRFCCx register is set to 0. This flag is 00<sub>H</sub> in global reset mode.

**RFIF Flag**

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RCFDCnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

**RFMLT Flag**

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

**RFLL Flag**

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RCFDCnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RCFDCnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

**RFEMP Flag**

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RCFDCnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when a received message is in the receive FIFO buffer.

**NOTE**

---

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

---

### 24.3.6.3 RCFDCnCFDRFPCTR<sub>x</sub> — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

**Access:** RCFDCnCFDRFPCTR<sub>x</sub> register is a write-only register that can be written in 32-bit units  
 RCFDCnCFDRFPCTR<sub>xL</sub> register is a write-only register that can be written in 16-bit units  
 RCFDCnCFDRFPCTR<sub>xLL</sub> register is a write-only register that can be written in 8-bit units

**Address:** RCFDCnCFDRFPCTR<sub>x</sub>: <RCFDCn\_base> + 00F8<sub>H</sub> + (04<sub>H</sub> × x)  
 RCFDCnCFDRFPCTR<sub>xL</sub>: <RCFDCn\_base> + 00F8<sub>H</sub> + (04<sub>H</sub> × x)  
 RCFDCnCFDRFPCTR<sub>xLL</sub>: <RCFDCn\_base> + 00F8<sub>H</sub> + (04<sub>H</sub> × x)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 24.68 RCFDCnCFDRFPCTR<sub>x</sub> Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF <sub>H</sub> , the read pointer moves to the next unread message in the receive FIFO buffer.

When the RFDMAEx value in the RCFDCnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

#### RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF<sub>H</sub>, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RCFDCnCFDRFSTS<sub>x</sub> register is decremented by 1. Read the RCFDCnCFDRFID<sub>x</sub>, RCFDCnCFDRFPTR<sub>x</sub>, RCFDCnCFDRFFDSTS<sub>x</sub>, and RCFDCnCFDRFDFd\_x registers to read messages in the receive FIFO buffer, and then write FF<sub>H</sub> to the RFPC[7:0] bits.

When writing FF<sub>H</sub> to these bits, make sure that the RFE bit in the RCFDCnCFDRFCC<sub>x</sub> register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RCFDCnCFDRFSTS<sub>x</sub> register is 0 (the receive FIFO buffer contains unread messages).

### 24.3.6.4 RCFDCnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

**Access:** RCFDCnCFDRFIDx register is a read-only register that can be read in 32-bit units

RCFDCnCFDRFIDxL, RCFDCnCFDRFIDxH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRFIDxLL, RCFDCnCFDRFIDxLH, RCFDCnCFDRFIDxHL, RCFDCnCFDRFIDxHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDRFIDx: <RCFDCn\_base> + 6000<sub>H</sub> + (80<sub>H</sub> × x)

RCFDCnCFDRFIDxL: <RCFDCn\_base> + 6000<sub>H</sub> + (80<sub>H</sub> × x),

RCFDCnCFDRFIDxH: <RCFDCn\_base> + 6002<sub>H</sub> + (80<sub>H</sub> × x)

RCFDCnCFDRFIDxLL: <RCFDCn\_base> + 6000<sub>H</sub> + (80<sub>H</sub> × x),

RCFDCnCFDRFIDxLH: <RCFDCn\_base> + 6001<sub>H</sub> + (80<sub>H</sub> × x),

RCFDCnCFDRFIDxHL: <RCFDCn\_base> + 6002<sub>H</sub> + (80<sub>H</sub> × x),

29	Reserved	This bit is read as the value after reset.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

#### RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

#### RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

**RFID[28:0] Bits**

These bits indicate the ID of the message stored in the receive FIFO buffer.

### 24.3.6.5 RCFDCnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

**Access:** RCFDCnCFDRFPTRx register is a read-only register that can be read in 32-bit units

RCFDCnCFDRFPTRxL, RCFDCnCFDRFPTRxH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRFPTRxLL, RCFDCnCFDRFPTRxLH, RCFDCnCFDRFPTRxHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDRFPTRx: <RCFDCn\_base> + 6004<sub>H</sub> + (80<sub>H</sub> × x)

RCFDCnCFDRFPTRxL: <RCFDCn\_base> + 6004<sub>H</sub> + (80<sub>H</sub> × x),

RCFDCnCFDRFPTRxH: <RCFDCn\_base> + 6006<sub>H</sub> + (80<sub>H</sub> × x)

15 to 0	RFTS[15:0]	Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read.

**RFDLC[3:0] Bits**

These bits contain the data length of the message stored in the receive FIFO buffer.

**RFTS[15:0] Bits**

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

### 24.3.6.6 RCFDCnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7)

**Access:** RCFDCnCFDRFFDSTSx register is a read-only register that can be read in 32-bit units

RCFDCnCFDRFFDSTSxL, RCFDCnCFDRFFDSTSxH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRFFDSTSxLL, RCFDCnCFDRFFDSTSxHL, RCFDCnCFDRFFDSTSxHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDRFFDSTSx: <RCFDCn\_base> + 6008<sub>H</sub> + (80<sub>H</sub> × x)

RCFDCnCFDRFFDSTSxL: <RCFDCn\_base> + 6008<sub>H</sub> + (80<sub>H</sub> × x),

RCFDCnCFDRFFDSTSxH: <RCFDCn\_base> + 600A<sub>H</sub> + (80<sub>H</sub> × x)

RCFDCnCFDRFFDSTSxLL: <RCFDCn\_base> + 6008<sub>H</sub> + (80<sub>H</sub> × x),

RCFDCnCFDRFFDSTSxHL: <RCFDCn\_base> + 600A<sub>H</sub> + (80<sub>H</sub> × x),

RCFDCnCFDRFFDSTSxHH: <RCFDCn\_base> + 600B<sub>H</sub> + (80<sub>H</sub> × x)

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.71 RCFDCnCFDRFFDSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	RFPTR[15:0]	Receive FIFO Buffer Label Data Label information of the received message can be read.
15 to 3	Reserved	These bits are read as the value after reset.
2	RFFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	RFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RFESI	ESI 0: Error active node 1: Error passive node

#### RFPTR[15:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

#### RFFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive FIFO buffer.

**RFBRs Bit**

When the RFFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer.  
When the RFFDF bit is set to 0, this bit is always read as 0.

**RFESI Bit**

When the RFFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer.  
When the RFFDF bit is set to 0, this bit is always read as 0.

### 24.3.6.7 RCFDCnCFDRFDFd\_x — Receive FIFO Buffer Access Data Field Register (d = 0 to 15, x = 0 to 7)

**Access:** RCFDCnCFDRFDFd\_x register is a read-only register that can be read in 32-bit units

RCFDCnCFDRFDFd\_xL, RCFDCnCFDRFDFd\_xH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRFDFd\_xLL, RCFDCnCFDRFDFd\_xLH, RCFDCnCFDRFDFd\_xHL, RCFDCnCFDRFDFd\_xHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDRFDFd\_x: <RCFDCn\_base> + 600C<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × x)

RCFDCnCFDRFDFd\_xL: <RCFDCn\_base> + 600C<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × x),

RCFDCnCFDRFDFd\_xLL: <RCFDCn\_base> + 600C<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × x),

RCFDCnCFDRFDFd\_xLH: <RCFDCn\_base> + 600D<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × x),

RCFDCnCFDRFDFd\_xHL: <RCFDCn\_base> + 600E<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × x),

RCFDCnCFDRFDFd\_xHH: <RCFDCn\_base> + 600F<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × x)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFDB4 × d + 3 [7:0]								RFDB4 × d + 2 [7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFDB4 × d + 1 [7:0]								RFDB4 × d + 0 [7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.72 RCFDCnCFDRFDFd\_x Register Contents

Bit Position	Bit Name	Function
31 to 24	RFDB4 × d + 3 [7:0]	Receive Buffer Data Byte 4 × d + 3 Receive Buffer Data Byte 4 × d + 2
23 to 16	RFDB4 × d + 2 [7:0]	Receive Buffer Data Byte 4 × d + 1 Receive Buffer Data Byte 4 × d + 0
15 to 8	RFDB4 × d + 1 [7:0]	Data for a message stored in the receive buffer can be read.
7 to 0	RFDB4 × d + 0 [7:0]	

When the RFDLC[3:0] value in the RCFDCnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as 00<sub>H</sub>.

Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RCFDCnCFDRFCCx register. Do not read or write the RCFDCnCFDRFDFd\_x register corresponding to an area that exceeds the specified size.

## 24.3.7 Transmit/Receive FIFO Buffer-related Registers

### 24.3.7.1 RCFDCnCFDCFCCK — Transmit/receive FIFO Buffer Configuration and Control Register (k = 0 to 23)

**Access:** RCFDCnCFDCFCCK register can be read or written in 32-bit units

RCFDCnCFDCFCCKL, RCFDCnCFDCFCCKH registers can be read or written in 16-bit units

RCFDCnCFDCFCCKLL, RCFDCnCFDCFCCKLH, RCFDCnCFDCFCCKHL, RCFDCnCFDCFCCKHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDCFCCK: <RCFDCn\_base> + 0118<sub>H</sub> + (04<sub>H</sub> × k)  
 RCFDCnCFDCFCCKL: <RCFDCn\_base> + 0118<sub>H</sub> + (04<sub>H</sub> × k),  
 RCFDCnCFDCFCCKH: <RCFDCn\_base> + 011A<sub>H</sub> + (04<sub>H</sub> × k)  
 RCFDCnCFDCFCCKLL: <RCFDCn\_base> + 0118<sub>H</sub> + (04<sub>H</sub> × k),

2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.

Table 24.73 RCFDCnCFDFCCK Register Contents

Bit Position	Bit Name	Function
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

**CFITT[7:0] Bits**

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01<sub>B</sub> (transmit mode) or 10<sub>B</sub> (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

**CFDC[2:0] Bits**

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000<sub>B</sub>, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

**CFTML[4:0] Bits**

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/ receive FIFO buffer k when the CFM[1:0] bits are set to 01<sub>B</sub> (transmit mode) or 10<sub>B</sub> (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as  $m = k/3$  (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be  $((32 \times m) + CFTML[4:0])$  (See **Table 24.32, Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer by the Setting of Bits CFTML[4:0]**).

See **Table 24.30, Transmit Buffer p Allocated to Each Channel** and **Table 24.31, Transmit/Receive FIFO Buffer k Allocated to Each Channel**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001<sub>B</sub> or more enables the setting of the CFTML[4:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the same channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

**CFIGCV[2:0] Bits**

These bits are used to specify the number of received messages required to generate a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00<sub>B</sub> (receive mode) or 10<sub>B</sub> (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001<sub>B</sub> (4 messages), set the CFIGCV[2:0] bits to 001<sub>B</sub>, 011<sub>B</sub>, 101<sub>B</sub>, or 111<sub>B</sub>.

Modify these bits only in global reset mode.

**CFIM Bit**

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

**CFITR Bit**

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RCFDCnCFDGCFCFG register.

When this bit is 1, the interval timer clock source is the  $pclk/2$  clock divided by (the value of the ITRCP[15:0] bits in the RCFDCnCFDGCFG register  $\times 10$ ).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### **CFITSS Bit**

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer. When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel which does not handle the CAN FD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

#### **CFM[1:0] Bits**

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

#### **CFPLS[2:0] Bits**

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

#### **CFTXIE Bit**

When this bit is set to 1 and the CFTXIF flag in the RCFDCnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

#### **CFRXIE Bit**

When this bit is set to 1 and the CFRXIF flag in the RCFDCnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

#### **CFE Bit**

Setting this bit to 1 enables the transmit/receive FIFO buffers.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration- lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RCFDCnCFDCFCCk register have been set, set this bit to 1 by using another instruction.

### 24.3.7.2 RCFDCnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 23)

**Access:** RCFDCnCFDCFSTSk register can be read or written in 32-bit units  
 RCFDCnCFDCFSTSkL register can be read or written in 16-bit units  
 RCFDCnCFDCFSTSkLL register can be read or written in 8-bit units  
 RCFDCnCFDCFSTSkLH register is a read-only register that can be read in 8-bit units

**Address:** RCFDCnCFDCFSTSk: <RCFDCn\_base> + 0178<sub>H</sub> + (04<sub>H</sub> × k)  
 RCFDCnCFDCFSTSkL: <RCFDCn\_base> + 0178<sub>H</sub> + (04<sub>H</sub> × k)  
 RCFDCnCFDCFSTSkLL: <RCFDCn\_base> + 0178<sub>H</sub> + (04<sub>H</sub> × k),  
 RCFDCnCFDCFSTSkLH: <RCFDCn\_base> + 0179<sub>H</sub> + (04<sub>H</sub> × k)

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFMC[7:0]							—	—	—	CFTXIF	CFRXIF	CFMLT	CFLL	CFEMP	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.74 RCFDCnCFDCFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

**CFMC[7:0] Bits**

The CFMC[7:0] bits indicate the following values according to the setting of the CFM[1:0] bits in the RCFDCnCFDCFCCK register.

- When CFM[1:0] value is 01<sub>B</sub> (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00<sub>B</sub> (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10<sub>B</sub> (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00<sub>B</sub>: In global reset mode
- When CFM[1:0] value is 01<sub>B</sub> or 10<sub>B</sub>: In channel reset mode
- When the CFE bit in the RCFDCnCFDCFCCK register is cleared to 0.

**CFTXIF Flag**

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01<sub>B</sub> or 10<sub>B</sub>, and the interrupt source selected by the CFIM bit in the RCFDCnCFDCFCCK register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00<sub>B</sub>: In global reset mode
- When the CFM[1:0] bits are set to 01<sub>B</sub> or 10<sub>B</sub>: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

**CFRXIF Flag**

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00<sub>B</sub> or 10<sub>B</sub>, and the factor selected by the CFIM bit in the RCFDCnCFDCFCCK register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00<sub>B</sub>: In global reset mode
- When the CFM[1:0] bits are set to 01<sub>B</sub> or 10<sub>B</sub>: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

**CFMLT Flag**

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00<sub>B</sub>: In global reset mode
- When the CFM[1:0] bits are set to 01<sub>B</sub> or 10<sub>B</sub>: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

**CFLL Flag**

The CFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RCFDCnCFDCFCCK register.

The CFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RCFDCnCFDCFCCK register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00<sub>B</sub>: In global reset mode
- When the CFM[1:0] bits are set to 01<sub>B</sub> or 10<sub>B</sub>: In channel reset mode

**CFEMP Flag**

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00<sub>B</sub>: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01<sub>B</sub> or 10<sub>B</sub>: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00<sub>B</sub> or 10<sub>B</sub>: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01<sub>B</sub>: A value of FF<sub>H</sub> has been written to the RCFDCnCFDCFPCTRk register after data was written to the RCFDCnCFDCFDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDfD\_k register

**NOTE**

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

### 24.3.7.3 RCFDCnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 23)

**Access:** RCFDCnCFDCFPCTRk register is a write-only register that can be written in 32-bit units  
 RCFDCnCFDCFPCTRkL register is a write-only register that can be written in 16-bit units  
 RCFDCnCFDCFPCTRkLL register is a write-only register that can be written in 8-bit units

**Address:** RCFDCnCFDCFPCTRk: <RCFDCn\_base> + 01D8<sub>H</sub> + (04<sub>H</sub> × k)  
 RCFDCnCFDCFPCTRkL: <RCFDCn\_base> + 01D8<sub>H</sub> + (04<sub>H</sub> × k)  
 RCFDCnCFDCFPCTRkLL: <RCFDCn\_base> + 01D8<sub>H</sub> + (04<sub>H</sub> × k)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CFPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 24.75 RCFDCnCFDCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control <ul style="list-style-type: none"> <li>• Receive mode: Writing FF<sub>H</sub> to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer.</li> <li>• Transmit mode: Writing FF<sub>H</sub> to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer.</li> <li>• Gateway mode: Setting prohibited</li> </ul>

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer ( $k = 3 \times m$ ) allocated to channel  $m$  and when the CFDMAEm bit in the RCFDCnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

#### CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RCFDCnCFDCFCCK register is 00<sub>B</sub>):

Writing FF<sub>H</sub> to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RCFDCnCFDCFSTSk register is decremented by 1. Read the RCFDCnCFDCFDIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDfD\_k registers to read messages from the transmit/receive FIFO buffer, and then write FF<sub>H</sub> to the CFPC[7:0] bits.

When writing FF<sub>H</sub> to these bits, make sure that the CFE bit in the RCFDCnCFDCFCCK register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RCFDCnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RCFDCnCFDCFCCK register is 01<sub>B</sub>):

Writing FF<sub>H</sub> to the CFPC[7:0] bits stores the data written to the RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDf\_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1. Write transmit messages to the RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDf\_k registers before writing FF<sub>H</sub> to the CFPC[7:0] bits.

When writing FF<sub>H</sub> to these bits, make sure that the CFE bit in the RCFDCnCFDCFCCK register is set to 1 and the CFFLL flag in the RCFDCnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).

- Gateway mode (CFM[1:0] value in the RCFDCnCFDCFCCK register is 10<sub>B</sub>): Setting prohibited

### 24.3.7.4 RCFDCnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 23)

**Access:** RCFDCnCFDCFIDk register can be read or written in 32-bit units

RCFDCnCFDCFIDkL, RCFDCnCFDCFIDkH registers can be read or written in 16-bit units

RCFDCnCFDCFIDkLL, RCFDCnCFDCFIDkLH, RCFDCnCFDCFIDkHL, RCFDCnCFDCFIDkHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDCFIDk: <RCFDCn\_base> + 6400<sub>H</sub> + (80<sub>H</sub> × k)

RCFDCnCFDCFIDkL: <RCFDCn\_base> + 6400<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFIDkH: <RCFDCn\_base> + 6402<sub>H</sub> + (80<sub>H</sub> × k)

RCFDCnCFDCFIDkLL: <RCFDCn\_base> + 6400<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFIDkLH: <RCFDCn\_base> + 6401<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFIDkHL: <RCFDCn\_base> + 6402<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFIDkHH: <RCFDCn\_base> + 6403<sub>H</sub> + (80<sub>H</sub> × k)

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.76 RCFDCnCFDCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR/RRS <ul style="list-style-type: none"> <li>When the CFM[1:0] value is 01<sub>B</sub> (transmit mode) <ul style="list-style-type: none"> <li>When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame</li> <li>When the transmit message is a CAN FD frame Write 0 to this bit.</li> </ul> </li> <li>When the CFM[1:0] value is 00<sub>B</sub> (receive mode) <ul style="list-style-type: none"> <li>When the received message is a classical CAN frame 0: Data frame 1: Remote frame</li> <li>When the received message is a CAN FD frame The RRS bit value of the received message can be read.</li> </ul> </li> </ul>
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01 <sub>B</sub> (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.

Table 24.76 RCFDCnCFDCFDk Register Contents

Bit Position	Bit Name	Function
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data <ul style="list-style-type: none"> <li>• When CFM[1:0] value is 01<sub>B</sub> (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.</li> <li>• When CFM[1:0] value is 00<sub>B</sub> (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.</li> </ul>

This register can be read or written when the CFM[1:0] value in the RCFDCnCFDCFCCK register is 01<sub>B</sub> (transmit mode). This register can be read when the CFM[1:0] value is 00<sub>B</sub> (receive mode). This RCFDCnCFDCFDk register should not be read or written when the CFM[1:0] value is 10<sub>B</sub> (gateway mode).

#### CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00<sub>B</sub>. When the CFM[1:0] value is 01<sub>B</sub>, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

#### CFRTR Bit

If the received message is a classical CAN frame, this bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00<sub>B</sub>. If the received message is a CAN FD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is 01<sub>B</sub>, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFFDF bit in the RCFDCnCFDCFFDCSTSk register is 1 (CAN FD frame), set this bit to 0.

#### THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01<sub>B</sub> (transmit mode).

#### CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00<sub>B</sub>.

When the CFM[1:0] value is 01<sub>B</sub>, these bits are used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

### 24.3.7.5 RCFDCnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 23)

**Access:** RCFDCnCFDCFPTRk register can be read or written in 32-bit units

RCFDCnCFDCFPTRkL, RCFDCnCFDCFPTRkH registers can be read or written in 16-bit units

RCFDCnCFDCFPTRkLL, RCFDCnCFDCFPTRkLH, RCFDCnCFDCFPTRkHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDCFPTRk: <RCFDCn\_base> + 6404<sub>H</sub> + (80<sub>H</sub> × k)

RCFDCnCFDCFPTRkL: <RCFDCn\_base> + 6404<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFPTRkH: <RCFDCn\_base> + 6406<sub>H</sub> + (80<sub>H</sub> × k)

RCFDCnCFDCFPTRkLL: <RCFDCn\_base> + 6404<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFPTRkLH: <RCFDCn\_base> + 6405<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFPTRkHH: <RCFDCn\_base> + 6407<sub>H</sub> + (80<sub>H</sub> × k)

**Value after reset:** 0000 0000<sub>H</sub>

		1 0 0 1 8 data bytes 12 data bytes
		1 0 1 0 16 data bytes
		1 0 1 1 20 data bytes
		1 1 0 0 24 data bytes
		1 1 0 1 32 data bytes
1 1 1 0 48 data bytes		
1 1 1 1 64 data bytes		
27 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00 <sub>B</sub> (receive mode). The timestamp value of the received message can be read.

This register can be read or written when the CFM[1:0] value in the RCFDCnCFDCFCCK register is 01<sub>B</sub> (transmit mode). This register can be read when the CFM[1:0] value is 00<sub>B</sub> (receive mode). This register should not be read or written when the CFM[1:0] value is 10<sub>B</sub> (gateway mode).

### **CFDLC[3:0] Bits**

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00<sub>B</sub>.

When the CFM[1:0] value is 01<sub>B</sub>, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to 1001<sub>B</sub> or more while the CFFDF bit in the RCFDCnCFDCFFDCSTSk register is 0 (classical CAN frame), 8-byte data is transmitted actually.

A value of 0000<sub>B</sub> to 1111<sub>B</sub> is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by CC<sub>H</sub>.

### **CFTS[15:0] Bits**

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer. These bits are valid when the CFM[1:0] value is 00<sub>B</sub>.

### 24.3.7.6 RCFDCnCFDCFFDCSTSk — Transmit/receive FIFO CAN FD Configuration/status Register (k = 0 to 23)

**Access:** RCFDCnCFDCFFDCSTSk register can be read or written in 32-bit units

RCFDCnCFDCFFDCSTSkL register can be read or written in 16-bit units

RCFDCnCFDCFFDCSTSkH register is a read-only register that can be read in 16-bit units

RCFDCnCFDCFFDCSTSkLL register can be read or written in 8-bit units

RCFDCnCFDCFFDCSTSkHL, RCFDCnCFDCFFDCSTSkHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDCFFDCSTSk: <RCFDCn\_base> + 6408<sub>H</sub> + (80<sub>H</sub> × k)

RCFDCnCFDCFFDCSTSkL: <RCFDCn\_base> + 6408<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFFDCSTSkH: <RCFDCn\_base> + 640A<sub>H</sub> + (80<sub>H</sub> × k)

RCFDCnCFDCFFDCSTSkLL: <RCFDCn\_base> + 6408<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFFDCSTSkHL: <RCFDCn\_base> + 640A<sub>H</sub> + (80<sub>H</sub> × k),

RCFDCnCFDCFFDCSTSkHH: <RCFDCn\_base> + 640B<sub>H</sub> + (80<sub>H</sub> × k)

**Value after reset:** 0000 0000<sub>H</sub>

Table 24.78 RCFDCnCFDCFFDCSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	CFPTR[15:0]	Transmit/Receive FIFO Buffer Label Data <ul style="list-style-type: none"> <li>When CFM[1:0] value is 01<sub>B</sub> (transmit mode): <ul style="list-style-type: none"> <li>Set the label information to be stored in the transmit history buffer.</li> <li>Only bits CFPTR[15:0] are valid.</li> </ul> </li> <li>When CFM[1:0] value is 00<sub>B</sub> (receive mode): <ul style="list-style-type: none"> <li>The label information of the received message can be read.</li> </ul> </li> </ul>
15 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFDF	FDF <ul style="list-style-type: none"> <li>0: Classical CAN frame</li> <li>1: CAN FD frame</li> </ul>
1	CFBRS	BRS <ul style="list-style-type: none"> <li>0: The bit rate in the data area does not change.</li> <li>1: The bit rate in the data area changes.</li> </ul>
0	CFESI	ESI <ul style="list-style-type: none"> <li>0: Error active node</li> <li>1: Error passive node</li> </ul>

This register can be read or written when the CFM[1:0] value in the RCFDCnCFDCFCCK register is 01<sub>B</sub> (transmit mode). This register can be read when the CFM[1:0] value is 00<sub>B</sub> (receive mode). Do not read or write this register when the CFM[1:0] value is 10<sub>B</sub> (gateway mode).

**CFPTR[15:0] Bits**

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00<sub>B</sub>. When the CFM[1:0] value is 01<sub>B</sub>, the CFPTR[15:0] value is stored in the transmit history buffer when message transmission has been completed.

**CFFDF Bit**

When the CFM[1:0] value is 00<sub>B</sub>, this bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is 01<sub>B</sub>, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

**CFBRS Bit**

When the CFM[1:0] value is 00<sub>B</sub>, if the CFFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is set to 0, this bit is always read as 0.

When the CFM[1:0] value is 01<sub>B</sub>, if the CFFDF bit is set to 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is set to 0, write 0 to this bit.

**CFESI Bit**

When the CFM[1:0] value is 00<sub>B</sub>, if the CFFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is set to 0, this bit is always read as 0.

When the CFM[1:0] value is 01<sub>B</sub>, if the CFFDF bit is set to 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RCFDCnCFDCmFDCFG register is set to 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is set to 0, write 0 to this bit.

### 24.3.7.7 RCFDCnCFDCFDf\_k — Transmit/receive FIFO Buffer Access Data Field Register (d = 0 to 15, k = 0 to 23)

**Access:** RCFDCnCFDCFDf\_k register can be read or written in 32-bit units

RCFDCnCFDCFDf\_kL, RCFDCnCFDCFDf\_kH registers can be read or written in 16-bit units

RCFDCnCFDCFDf\_kLL, RCFDCnCFDCFDf\_kLH, RCFDCnCFDCFDf\_kHL, RCFDCnCFDCFDf\_kHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDCFDf\_k: <RCFDCn\_base> + 640C<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × k)  
 RCFDCnCFDCFDf\_kL: <RCFDCn\_base> + 640C<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × k),  
 RCFDCnCFDCFDf\_kH: <RCFDCn\_base> + 640E<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × k)  
 RCFDCnCFDCFDf\_kLL: <RCFDCn\_base> + 640C<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × k),  
 RCFDCnCFDCFDf\_kLH: <RCFDCn\_base> + 640D<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × k),  
 RCFDCnCFDCFDf\_kHL: <RCFDCn\_base> + 640E<sub>H</sub> + (04<sub>H</sub> × d) + (80<sub>H</sub> × k),

Table 24.79 RCFDCnCFDCFDf\_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB4 × d + 3 [7:0]	Transmit/Receive FIFO Buffer Data Byte 4 × d + 3 Transmit/Receive FIFO Buffer Data Byte 4 × d + 2
23 to 16	CFDB4 × d + 2 [7:0]	Transmit/Receive FIFO Buffer Data Byte 4 × d + 1 Transmit/Receive FIFO Buffer Data Byte 4 × d + 0
15 to 8	CFDB4 × d + 1 [7:0]	<ul style="list-style-type: none"> <li>When CFM[1:0] value is 01<sub>B</sub> (transmit mode): Set the transmit/receive FIFO buffer data.</li> </ul>
7 to 0	CFDB4 × d + 0 [7:0]	<ul style="list-style-type: none"> <li>When CFM[1:0] value is 00<sub>B</sub> (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.</li> </ul>

This register can be read or written when the CFM[1:0] value in the RCFDCnCFDCFCCK register is 01<sub>B</sub> (transmit mode).

This register can be read when the CFM[1:0] value is 00<sub>B</sub> (receive mode). When the CFDL[3:0] value in the RCFDCnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as 00<sub>H</sub>.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RCFDCnCFDCFCCK register. Do not read or write the RCFDCnCFDCFDf\_k register corresponding to an area that exceeds the specified size.

This register should not be read or written when the CFM[1:0] value is 10<sub>B</sub> (gateway mode).

## 24.3.8 Details of FIFO Status-related Registers

### 24.3.8.1 RCFDCnCFDFESTS — FIFO Empty Status Register

**Access:** RCFDCnCFDFESTS register is a read-only register that can be read in 32-bit units

RCFDCnCFDFESTSL, RCFDCnCFDFESTSH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDFESTSLL, RCFDCnCFDFESTSLH, RCFDCnCFDFESTSHL, RCFDCnCFDFESTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDFESTS: <RCFDCn\_base> + 0238<sub>H</sub>

RCFDCnCFDFESTSL: <RCFDCn\_base> + 0238<sub>H</sub>,

RCFDCnCFDFESTSH: <RCFDCn\_base> + 023A<sub>H</sub>

RCFDCnCFDFESTSLL: <RCFDCn\_base> + 0238<sub>H</sub>,

RCFDCnCFDFESTSLH: <RCFDCn\_base> + 0239<sub>H</sub>,

RCFDCnCFDFESTSHL: <RCFDCn\_base> + 023A<sub>H</sub>,

RCFDCnCFDFESTSHH: <RCFDCn\_base> + 023B<sub>H</sub>

**Value after reset:** FFFF FFFF<sub>H</sub>

6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RCFDCnCFDFESTS register is set to FFFF FFFF<sub>H</sub> in global reset mode.

#### CFkEMP Flag (k = 0 to 23)

The CFkEMP flag is set to 1 when the CFEMP flag in the RCFDCnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

#### RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RCFDCnCFDRFSTSt register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

### 24.3.8.2 RCFDCnCFDFFSTS — FIFO Full Status Register

**Access:** RCFDCnCFDFFSTS register is a read-only register that can be read in 32-bit units

RCFDCnCFDFFSTSL, RCFDCnCFDFFSTSH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDFFSTSLL, RCFDCnCFDFFSTSLH, RCFDCnCFDFFSTSHL, RCFDCnCFDFFSTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDFFSTS: <RCFDCn\_base> + 023C<sub>H</sub>  
 RCFDCnCFDFFSTSL: <RCFDCn\_base> + 023C<sub>H</sub>,  
 RCFDCnCFDFFSTSH: <RCFDCn\_base> + 023E<sub>H</sub>  
 RCFDCnCFDFFSTSLL: <RCFDCn\_base> + 023C<sub>H</sub>,  
 RCFDCnCFDFFSTSLH: <RCFDCn\_base> + 023D<sub>H</sub>,  
 RCFDCnCFDFFSTSHL: <RCFDCn\_base> + 023E<sub>H</sub>,  
 RCFDCnCFDFFSTSHH: <RCFDCn\_base> + 023F<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RCFDCnCFDFSTSTS register is cleared to 0000 0000<sub>H</sub> in global reset mode.

#### CFkFLL Flag (k = 0 to 23)

The CFkFLL flag is set to 1 when the CFFLL flag in the RCFDCnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

#### RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RCFDCnCFDRFSTSTx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

### 24.3.8.3 RCFDCnCFDFMSTS — FIFO Message Lost Status Register

**Access:** RCFDCnCFDFMSTS register is a read-only register that can be read in 32-bit units

RCFDCnCFDFMSTSL, RCFDCnCFDFMSTSH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDFMSTSLL, RCFDCnCFDFMSTSLH, RCFDCnCFDFMSTSHL, RCFDCnCFDFMSTSHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDFMSTS: <RCFDCn\_base> + 0240<sub>H</sub>

RCFDCnCFDFMSTSL: <RCFDCn\_base> + 0240<sub>H</sub>,

RCFDCnCFDFMSTSH: <RCFDCn\_base> + 0242<sub>H</sub>

RCFDCnCFDFMSTSLL: <RCFDCn\_base> + 0240<sub>H</sub>,

5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RCFDCnCFDFMSTS register is cleared to 0000 0000<sub>H</sub> in global reset mode.

#### CFkMLT Flag (k = 0 to 23)

The CFkMLT flag is set to 1 when the CFMLT flag in the RCFDCnCFDFMSTS<sub>k</sub> register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

#### RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RCFDCnCFDFMSTS<sub>x</sub> register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

### 24.3.8.4 RCFDCnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

**Access:** RCFDCnCFDRFISTS register is a read-only register that can be read in 32-bit units  
 RCFDCnCFDRFISTSLSL register is a read-only register that can be read in 16-bit units  
 RCFDCnCFDRFISTSLLSLL register is a read-only register that can be read in 8-bit units

**Address:** RCFDCnCFDRFISTS: <RCFDCn\_base> + 0244<sub>H</sub>  
 RCFDCnCFDRFISTSLSL: <RCFDCn\_base> + 0244<sub>H</sub>  
 RCFDCnCFDRFISTSLLSLL: <RCFDCn\_base> + 0244<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RF7IF	RF6IF	RF5IF	RF4IF	RF3IF	RF2IF	RF1IF	RF0IF

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.83 RCFDCnCFDRFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag
6	RF6IF	0: No receive FIFO buffer x interrupt request is present.
5	RF5IF	1: A receive FIFO buffer x interrupt request is present.
4	RF4IF	(x = 0 to 7)
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RCFDCnCFDRFISTS register is cleared to 0000 0000<sub>H</sub> in global reset mode.

#### RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RCFDCnCFDRFISTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

### 24.3.8.5 RCFDCnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

**Access:** RCFDCnCFDCFRISTS register is a read-only register that can be read in 32-bit units

RCFDCnCFDCFRISTS<sub>SL</sub>, RCFDCnCFDCFRISTS<sub>SH</sub> registers are read-only registers that can be read in 16-bit units

RCFDCnCFDCFRISTS<sub>SLL</sub>, RCFDCnCFDCFRISTS<sub>SLH</sub>, RCFDCnCFDCFRISTS<sub>SHL</sub> registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDCFRISTS: <RCFDCn\_base> + 0248<sub>H</sub>  
 RCFDCnCFDCFRISTS<sub>SL</sub>: <RCFDCn\_base> + 0248<sub>H</sub>,  
 RCFDCnCFDCFRISTS<sub>SH</sub>: <RCFDCn\_base> + 024A<sub>H</sub>  
 RCFDCnCFDCFRISTS<sub>SLL</sub>: <RCFDCn\_base> + 0248<sub>H</sub>,  
 RCFDCnCFDCFRISTS<sub>SLH</sub>: <RCFDCn\_base> + 0249<sub>H</sub>,  
 RCFDCnCFDCFRISTS<sub>SHL</sub>: <RCFDCn\_base> + 024A<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

5	CF5RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag
4	CF4RXIF	0: No transmit/receive FIFO buffer k receive interrupt request is present.
3	CF3RXIF	1: A transmit/receive FIFO buffer k receive interrupt request is present.
2	CF2RXIF	(k = 0 to 23)
1	CF1RXIF	
0	CF0RXIF	

The RCFDCnCFDCFRISTS register is cleared to 0000 0000<sub>H</sub> in global reset mode.

#### CFkRXIF Flag (k = 0 to 23)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RCFDCnCFDCFRISTS<sub>k</sub> register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

### 24.3.8.6 RCFDCnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

**Access:** RCFDCnCFDCFTISTS register is a read-only register that can be read in 32-bit units

RCFDCnCFDCFTISTS<sub>SL</sub>, RCFDCnCFDCFTISTS<sub>SH</sub> registers are read-only registers that can be read in 16-bit units

RCFDCnCFDCFTISTS<sub>SLL</sub>, RCFDCnCFDCFTISTS<sub>SLH</sub>, RCFDCnCFDCFTISTS<sub>SHL</sub> registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDCFTISTS: <RCFDCn\_base> + 024C<sub>H</sub>  
 RCFDCnCFDCFTISTS<sub>SL</sub>: <RCFDCn\_base> + 024C<sub>H</sub>,

Table 24.85 RCFDCnCFDCFTISTS Register Contents

Bit Position	Bit Name	Function
3	CF3TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag
2	CF2TXIF	0: No transmit/receive FIFO buffer k transmit interrupt request is present.
1	CF1TXIF	1: A transmit/receive FIFO buffer k transmit interrupt request is present.
0	CF0TXIF	(k = 0 to 23)

The RCFDCnCFDCFTISTS register is cleared to 0000 0000<sub>H</sub> in global reset mode.

### CFkTXIF Flag (k = 0 to 23)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RCFDCnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

## 24.3.9 Details of FIFO DMA-related Registers

### 24.3.9.1 RCFDCnCFDCDTCT — DMA Enable Register

**Access:** RCFDCnCFDCDTCT register can be read or written in 32-bit units  
 RCFDCnCFDCDTCTL register can be read or written in 16-bit units  
 RCFDCnCFDCDTCTL, RCFDCnCFDCDTCTLH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDCDTCT: <RCFDCn\_base> + 0640<sub>H</sub>  
 RCFDCnCFDCDTCTL: <RCFDCn\_base> + 0640<sub>H</sub>  
 RCFDCnCFDCDTCTL: <RCFDCn\_base> + 0640<sub>H</sub>,  
 RCFDCnCFDCDTCTLH: <RCFDCn\_base> + 0641<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

13	CFDMAE5	Transmit/Receive FIFO Buffer 15 DMA Enable 0: A DMA transfer request of transmit/receive FIFO buffer 15 is disabled. 1: A DMA transfer request of transmit/receive FIFO buffer 15 is enabled.
12	CFDMAE4	Transmit/Receive FIFO Buffer 12 DMA Enable 0: A DMA transfer request of transmit/receive FIFO buffer 12 is disabled. 1: A DMA transfer request of transmit/receive FIFO buffer 12 is enabled.
11	CFDMAE3	Transmit/Receive FIFO Buffer 9 DMA Enable 0: A DMA transfer request of transmit/receive FIFO buffer 9 is disabled. 1: A DMA transfer request of transmit/receive FIFO buffer 9 is enabled.
10	CFDMAE2	Transmit/Receive FIFO Buffer 6 DMA Enable 0: A DMA transfer request of transmit/receive FIFO buffer 6 is disabled. 1: A DMA transfer request of transmit/receive FIFO buffer 6 is enabled.

Table 24.86 RCFDCnCFDCDTCT Register Contents

Bit Position	Bit Name	Function
9	CFDMAE1	Transmit/Receive FIFO Buffer 3 DMA Enable 0: A DMA transfer request of transmit/receive FIFO buffer 3 is disabled. 1: A DMA transfer request of transmit/receive FIFO buffer 3 is enabled.
8	CFDMAE0	Transmit/Receive FIFO Buffer 0 DMA Enable 0: A DMA transfer request of transmit/receive FIFO buffer 0 is disabled. 1: A DMA transfer request of transmit/receive FIFO buffer 0 is enabled.
7	RFDMAE7	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2:
6	RFDMAE6	Receive FIFO Buffer x DMA Enable
5	RFDMAE5	0: A DMA transfer request of receive FIFO buffer x is disabled. 1: A DMA transfer request of receive FIFO buffer x is enabled.
4	RFDMAE4	(x = 0 to 7)
3	RFDMAE3	RH850/F1KM-S1:
2	RFDMAE2	Receive FIFO Buffer x DMA Enable
1	RFDMAE1	0: A DMA transfer request of receive FIFO buffer x is disabled. 1: A DMA transfer request of receive FIFO buffer x is enabled.
0	RFDMAE0	(x = 0 to 5)

Modify the RCFDCnCFDCDTCT register in global operating mode or global test mode.

#### CFDMAEm Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer  $3 \times m$  (the first transmit/ receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RCFDCnCFDCFCCK register is set to 00<sub>B</sub> (receive mode).

Set this bit to 0 when the CFM[1:0] value is 01<sub>B</sub> (transmit mode) or 10<sub>B</sub> (gateway mode).

#### RFDMAEx Bit

This bit is used to enable DMA transfer for receive FIFO buffer x.

### 24.3.9.2 RCFDCnCFDCDTSTS — DMA Status Register

**Access:** RCFDCnCFDCDTSTS register is a read-only register that can be read in 32-bit units  
 RCFDCnCFDCDTSTSL register is a read-only register that can be read in 16-bit units  
 RCFDCnCFDCDTSTSLL, RCFDCnCFDCDTSTSLH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDCDTSTS: <RCFDCn\_base> + 0644<sub>H</sub>  
 RCFDCnCFDCDTSTSL: <RCFDCn\_base> + 0644<sub>H</sub>  
 RCFDCnCFDCDTSTSLL: <RCFDCn\_base> + 0644<sub>H</sub>,  
 RCFDCnCFDCDTSTSLH: <RCFDCn\_base> + 0645<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 16	Reserved	These bits are read as the value after reset.
15	CFDMASTS7	Transmit/Receive FIFO Buffer 21 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 21 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 21 is in progress.
14	CFDMASTS6	Transmit/Receive FIFO Buffer 18 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 18 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 18 is in progress.
13	CFDMASTS5	Transmit/Receive FIFO Buffer 15 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 15 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 15 is in progress.
12	CFDMASTS4	Transmit/Receive FIFO Buffer 12 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 12 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 12 is in progress.
11	CFDMASTS3	Transmit/Receive FIFO Buffer 9 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 9 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 9 is in progress.
10	CFDMASTS2	Transmit/Receive FIFO Buffer 6 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 6 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 6 is in progress.
9	CFDMASTS1	Transmit/Receive FIFO Buffer 3 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 3 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 3 is in progress.

Table 24.87 RCFDCnCFDCDTSTS Register Contents

Bit Position	Bit Name	Function
8	CFDMASTS0	Transmit/Receive FIFO Buffer 0 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 0 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 0 is in progress.
7	RFDMASTS7	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2:
6	RFDMASTS6	Receive FIFO Buffer x DMA Status
5	RFDMASTS5	0: DMA transfer of receive FIFO buffer x is not in progress. 1: DMA transfer of receive FIFO buffer x is in progress.
4	RFDMASTS4	(x = 0 to 7)
3	RFDMASTS3	RH850/F1KM-S1:
2	RFDMASTS2	Receive FIFO Buffer x DMA Status
1	RFDMASTS1	0: DMA transfer of receive FIFO buffer x is not in progress. 1: DMA transfer of receive FIFO buffer x is in progress.
0	RFDMASTS0	(x = 0 to 5)

### CFDMASTS<sub>m</sub> Bit

When DMA transfer is enabled (CFDMAEm bit in the RCFDCnCFDCDTCT register is 1) for the transmit/receive FIFO buffer  $3 \times m$  (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTS<sub>m</sub> bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0), the CFDMASTS<sub>m</sub> bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTS<sub>m</sub> bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

### RFDMASTS<sub>x</sub> Bit

When DMA transfer is enabled (corresponding RFDMAEx bit in the RCFDCnCFDCDTCT register is 1) for the receive FIFO buffer x and the receive FIFO buffer contains one of more messages, the RFDMASTS<sub>x</sub> bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the receive FIFO buffer x have been transferred or DMA transfer is disabled (RFDMAEx bit = 0), the RFDMASTS<sub>x</sub> bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTS<sub>x</sub> bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area) These bits are cleared to 0 in global reset mode.

## 24.3.10 Details of Transmit Buffer-related Registers

### 24.3.10.1 RCFDCnCFDTMCp — Transmit Buffer Control Register (p = 0 to 255)

**Access:** RCFDCnCFDTMCp register can be read or written in 8-bit units

**Address:** RCFDCnCFDTMCp: <RCFDCn\_base> + 0250<sub>H</sub> + (01<sub>H</sub> × p)

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W <sup>*1</sup>	R/W <sup>*1</sup>

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 24.88 RCFDCnCFDTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RCFDCnCFDTMCp register meets any of the following conditions, set it to 00<sub>H</sub>.

- The RCFDCnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[4:0] bits in the RCFDCnCFDFCCK register (p = m × 32 + the value of CFTML[4:0] bits).
- The RCFDCnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[4:0] bits in the RCFDCnCFDTXQCCm (m = 0 to 7) register (p = (m × 32 + 31) to (m × 32 + 31 – the value of TXQDC[4:0] bits)).

All of the bits in the RCFDCnCFDTMCp register are cleared to 0 in channel reset mode. Modify the RCFDCnCFDTMCp register in channel communication mode or channel halt mode.

#### TMOM Bit

Setting this bit to 1 enables one-shot transmission. If transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RCFDCnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

**TMTAR Bit**

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

**TMTR Bit**

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RCFDCnCFDTMSTSp register is 00<sub>B</sub>.

### 24.3.10.2 RCFDCnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 255)

**Access:** RCFDCnCFDTMSTSp register can be read or written in 8-bit units

**Address:** RCFDCnCFDTMSTSp: <RCFDCn\_base> + 0350<sub>H</sub> + (01<sub>H</sub> × p)

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 24.89 RCFDCnCFDTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

All of the bits in the RCFDCnCFDTMSTSp register are cleared to 0 in channel reset mode.

#### TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RCFDCnCFDTMCp register is set to 1. The TMTARM flag is set to 0 when the TMTAR bit in the RCFDCnCFDTMCp register is set to 0.

#### TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RCFDCnCFDTMCp register is set to 1. The TMTRM flag is set to 0 when the TMTR bit in the RCFDCnCFDTMCp register is set to 0.

#### TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00<sub>B</sub>: Transmission is in progress or no transmit request is present.

01<sub>B</sub>: Transmission from the transmit buffer was aborted.

10<sub>B</sub>: Transmission has been completed with the TMTAR bit in the RCFDCnCFDTMCp register set to 0 (transmit abort is not requested).

11<sub>B</sub>: Transmission has been completed with the TMTAR bit in the RCFDCnCFDTMCp register set to 1 (transmit abort is requested).

Write 00<sub>B</sub> to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00<sub>B</sub> to this flag.

**TMTSTS Flag**

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

### 24.3.10.3 RCFDCnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 255)

**Access:** RCFDCnCFDTMIDp register can be read or written in 32-bit units  
 RCFDCnCFDTMIDpL, RCFDCnCFDTMIDpH registers can be read or written in 16-bit units  
 RCFDCnCFDTMIDpLL, RCFDCnCFDTMIDpLH, RCFDCnCFDTMIDpHL, RCFDCnCFDTMIDpHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDTMIDp: <RCFDCn\_base> + 8000<sub>H</sub> + (80<sub>H</sub> × p)  
 RCFDCnCFDTMIDpL: <RCFDCn\_base> + 8000<sub>H</sub> + (80<sub>H</sub> × p),  
 RCFDCnCFDTMIDpH: <RCFDCn\_base> + 8002<sub>H</sub> + (80<sub>H</sub> × p)  
 RCFDCnCFDTMIDpLL: <RCFDCn\_base> + 8000<sub>H</sub> + (80<sub>H</sub> × p),  
 RCFDCnCFDTMIDpLH: <RCFDCn\_base> + 8001<sub>H</sub> + (80<sub>H</sub> × p),  
 RCFDCnCFDTMIDpHL: <RCFDCn\_base> + 8002<sub>H</sub> + (80<sub>H</sub> × p),  
 RCFDCnCFDTMIDpHH: <RCFDCn\_base> + 8003<sub>H</sub> + (80<sub>H</sub> × p)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.90 RCFDCnCFDTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR/RRS <ul style="list-style-type: none"> <li>When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame</li> <li>When the transmit message is a CAN FD frame Write 0 to this bit.</li> </ul>
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RCFDCnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 32 + 31) for the corresponding channel.

#### TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

**TMRTR Bit**

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

Set this bit to 0 when the TMFDF bit in the RCFDCnCFDTMFDCTRp register is 1 (CAN FD frame).

**THLEN Bit**

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

**TMID[28:0] Bits**

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

### 24.3.10.4 RCFDCnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 255)

**Access:** RCFDCnCFDTMPTRp register can be read or written in 32-bit units  
 RCFDCnCFDTMPTRpH register can be read or written in 16-bit units  
 RCFDCnCFDTMPTRpHH register can be read or written in 8-bit units

**Address:** RCFDCnCFDTMPTRp: <RCFDCn\_base> + 8004<sub>H</sub> + (80<sub>H</sub> × p)  
 RCFDCnCFDTMPTRpH: <RCFDCn\_base> + 8006<sub>H</sub> + (80<sub>H</sub> × p)  
 RCFDCnCFDTMPTRpHH: <RCFDCn\_base> + 8007<sub>H</sub> + (80<sub>H</sub> × p)

**Value after reset:** 0000 0000<sub>H</sub>

1	1	1	1		64 data bytes																																																																																											
27 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.																																																																																														

Modify this register when the TMTRM bit in the corresponding RCFDCnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 32 + 31) for the corresponding channel.

**TMDLC[3:0] Bits**

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RCFDCnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to 1001<sub>B</sub> or more while the TMFDF bit in the RCFDCnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the TMRTR bit is 1 (remote frame), these bits set the length of the message to be requested.

### 24.3.10.5 RCFDCnCFDTMFDCTR<sub>p</sub> — Transmit Buffer CAN FD Configuration Register ( $p = 0$ to 255)

**Access:** RCFDCnCFDTMFDCTR<sub>p</sub> register can be read or written in 32-bit units

RCFDCnCFDTMFDCTR<sub>pL</sub>, RCFDCnCFDTMFDCTR<sub>pH</sub> registers can be read or written in 16-bit units

RCFDCnCFDTMFDCTR<sub>pLL</sub>, RCFDCnCFDTMFDCTR<sub>pHL</sub>, RCFDCnCFDTMFDCTR<sub>pHH</sub> registers can be read or written in 8-bit units

**Address:** RCFDCnCFDTMFDCTR<sub>p</sub>: <RCFDCn\_base> + 8008<sub>H</sub> + (80<sub>H</sub> ×  $p$ )

RCFDCnCFDTMFDCTR<sub>pL</sub>: <RCFDCn\_base> + 8008<sub>H</sub> + (80<sub>H</sub> ×  $p$ ),

RCFDCnCFDTMFDCTR<sub>pH</sub>: <RCFDCn\_base> + 800A<sub>H</sub> + (80<sub>H</sub> ×  $p$ )

RCFDCnCFDTMFDCTR<sub>pLL</sub>: <RCFDCn\_base> + 8008<sub>H</sub> + (80<sub>H</sub> ×  $p$ ),

RCFDCnCFDTMFDCTR<sub>pHL</sub>: <RCFDCn\_base> + 800A<sub>H</sub> + (80<sub>H</sub> ×  $p$ ),

RCFDCnCFDTMFDCTR<sub>pHH</sub>: <RCFDCn\_base> + 800B<sub>H</sub> + (80<sub>H</sub> ×  $p$ )

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 24.92 RCFDCnCFDTMFDCTR<sub>p</sub> Register Contents

Bit Position	Bit Name	Function
31 to 16	TMPTR[15:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	TMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	TMESI	ESI 0: Error active node 1: Error passive node

Modify this register when the TMTRM bit in the corresponding RCFDCnCFDTMSTSp register is set to 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer  $p$  ( $p = m \times 32 + 31$ ) of the corresponding channel.

#### TMPTR[15:0] Bits

When message transmission has been completed, the TMPTR[15:0] value is stored in the transmit history buffer.

**TMFDF Bit**

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

**TMBRS Bit**

When this bit is set to 1 while the TMFDF bit is set to 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is set to 0, write 0 to this bit.

**TMESI Bit**

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is set to 1. The set value is transmitted when the ESIC bit in the RCFDCnCFDCmFDCFG register is set to 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is set to 0, write 0 to this bit.

### 24.3.10.6 RCFDCnCFDTMDFb\_p — Transmit Buffer Data Field Register (b = 0 to 15, p = 0 to 255)

**Access:** RCFDCnCFDTMDFb\_p register can be read or written in 32-bit units

RCFDCnCFDTMDFb\_pL, RCFDCnCFDTMDFb\_pH registers can be read or written in 16-bit units

RCFDCnCFDTMDFb\_pLL, RCFDCnCFDTMDFb\_pLH, RCFDCnCFDTMDFb\_pHL, RCFDCnCFDTMDFb\_pHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDTMDFb\_p: <RCFDCn\_base> + 800C<sub>H</sub> + (04<sub>H</sub> × b) + (80<sub>H</sub> × p)

RCFDCnCFDTMDFb\_pL: <RCFDCn\_base> + 800C<sub>H</sub> + (04<sub>H</sub> × b) + (80<sub>H</sub> × p),

RCFDCnCFDTMDFb\_pH: <RCFDCn\_base> + 800E<sub>H</sub> + (04<sub>H</sub> × b) + (80<sub>H</sub> × p)

RCFDCnCFDTMDFb\_pLL: <RCFDCn\_base> + 800C<sub>H</sub> + (04<sub>H</sub> × b) + (80<sub>H</sub> × p),

RCFDCnCFDTMDFb\_pLH: <RCFDCn\_base> + 800D<sub>H</sub> + (04<sub>H</sub> × b) + (80<sub>H</sub> × p),

RCFDCnCFDTMDFb\_pHL: <RCFDCn\_base> + 800E<sub>H</sub> + (04<sub>H</sub> × b) + (80<sub>H</sub> × p),

RCFDCnCFDTMDFb\_pHH: <RCFDCn\_base> + 800F<sub>H</sub> + (04<sub>H</sub> × b) + (80<sub>H</sub> × p)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMDB4 × b + 3 [7:0]								TMDB4 × b + 2 [7:0]

Table 24.93 RCFDCnCFDTMDFb\_p Register Contents

Bit Position	Bit Name	Function
31 to 24	TMDB4 × b + 3 [7:0]	Transmit Buffer Data Byte 4 × b + 3 Transmit Buffer Data Byte 4 × b + 2
23 to 16	TMDB4 × b + 2 [7:0]	Transmit Buffer Data Byte 4 × b + 1 Transmit Buffer Data Byte 4 × b + 0
15 to 8	TMDB4 × b + 1 [7:0]	Set the transmit buffer data.
7 to 0	TMDB4 × b + 0 [7:0]	

Modify this register when the TMTRM bit in the corresponding RCFDCnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 32 + 31) for the corresponding channel.

### 24.3.10.7 RCFDCnCFDTMIECm — Transmit Buffer Interrupt Enable Configuration Register (m = 0 to 7)

**Access:** RCFDCnCFDTMIECm register can be read or written in 32-bit units

RCFDCnCFDTMIECmL, RCFDCnCFDTMIECmH registers can be read or written in 16-bit units

RCFDCnCFDTMIECmLL, RCFDCnCFDTMIECmLH, RCFDCnCFDTMIECmHL, RCFDCnCFDTMIECmHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDTMIECm: <RCFDCn\_base> + 04D0<sub>H</sub> + (04<sub>H</sub> × m)

RCFDCnCFDTMIECmL: <RCFDCn\_base> + 04D0<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDTMIECmH: <RCFDCn\_base> + 04D2<sub>H</sub> + (04<sub>H</sub> × m)

RCFDCnCFDTMIECmLL: <RCFDCn\_base> + 04D0<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDTMIECmLH: <RCFDCn\_base> + 04D1<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDTMIECmHL: <RCFDCn\_base> + 04D2<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDTMIECmHH: <RCFDCn\_base> + 04D3<sub>H</sub> + (04<sub>H</sub> × m)

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = m × 32 + 31 to m × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = m × 32 + 15 to m × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

#### TMIEp Bits (p = 0 to 255)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RCFDCnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

**Table 24.95, TMIEp Bit Assignment** shows the bit assignment.

## 24.3.11 Details of Transmit Buffer Status-related Registers

### 24.3.11.1 RCFDCnCFDTMTRSTSm — Transmit Buffer Transmit Request Status Register (m = 0 to 7)

**Access:** RCFDCnCFDTMTRSTSm register is a read-only register that can be read in 32-bit units

RCFDCnCFDTMTRSTSmL, RCFDCnCFDTMTRSTSmH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDTMTRSTSmLL, RCFDCnCFDTMTRSTSmLH, RCFDCnCFDTMTRSTSmHL, RCFDCnCFDTMTRSTSmHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDTMTRSTSm: <RCFDCn\_base> + 0450<sub>H</sub> + (04<sub>H</sub> × m)

RCFDCnCFDTMTRSTSmL: <RCFDCn\_base> + 0450<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDTMTRSTSmH: <RCFDCn\_base> + 0452<sub>H</sub> + (04<sub>H</sub> × m)

RCFDCnCFDTMTRSTSmLL: <RCFDCn\_base> + 0450<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDTMTRSTSmLH: <RCFDCn\_base> + 0451<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDTMTRSTSmHL: <RCFDCn\_base> + 0452<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDTMTRSTSmHH: <RCFDCn\_base> + 0453<sub>H</sub> + (04<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.96 RCFDCnCFDTMTRSTSm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = m × 32 + 31 to m × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = m × 32 + 15 to m × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

#### TMTRSTSp Flags (p = 0 to 255)

These flags indicate the status of the TMTR bit in the RCFDCnCFDTMCP register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

**Table 24.97, TMTRSTSp Bit Assignment** shows the bit assignment.

### 24.3.11.2 RCFDCnCFDTMTARSTSm — Transmit Buffer Transmit Abort Request Status Register (m = 0 to 7)

**Access:** RCFDCnCFDTMTARSTSm register is a read-only register that can be read in 32-bit units  
RCFDCnCFDTMTARSTSmL, RCFDCnCFDTMTARSTSmH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDTMTARSTSmLL, RCFDCnCFDTMTARSTSmLH, RCFDCnCFDTMTARSTSmHL,  
RCFDCnCFDTMTARSTSmHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDTMTARSTSm:  $\langle \text{RCFDCn\_base} \rangle + 0470_{\text{H}} + (04_{\text{H}} \times m)$   
RCFDCnCFDTMTARSTSmL:  $\langle \text{RCFDCn\_base} \rangle + 0470_{\text{H}} + (04_{\text{H}} \times m)$ ,  
RCFDCnCFDTMTARSTSmH:  $\langle \text{RCFDCn\_base} \rangle + 0472_{\text{H}} + (04_{\text{H}} \times m)$   
RCFDCnCFDTMTARSTSmLL:  $\langle \text{RCFDCn\_base} \rangle + 0470_{\text{H}} + (04_{\text{H}} \times m)$ ,  
RCFDCnCFDTMTARSTSmLH:  $\langle \text{RCFDCn\_base} \rangle + 0471_{\text{H}} + (04_{\text{H}} \times m)$ ,  
RCFDCnCFDTMTARSTSmHL:  $\langle \text{RCFDCn\_base} \rangle + 0472_{\text{H}} + (04_{\text{H}} \times m)$ ,  
RCFDCnCFDTMTARSTSmHH:  $\langle \text{RCFDCn\_base} \rangle + 0473_{\text{H}} + (04_{\text{H}} \times m)$

15 to 0	TMTARSTSp	Transmit Buffer Transmit Abort Request Status Flag p ( $p = m \times 32 + 15$ to $m \times 32 + 0$ ) 0: No transmit abort request is present. 1: A transmit abort request is present.

#### TMTARSTSp Flags (p = 0 to 255)

These flags indicate the status of the TMTAR bit in the RCFDCnCFDTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

**Table 24.99, TMTARSTSp Bit Assignment** shows the bit assignment.

15 to 0	TMTTCSTSp	Transmit Buffer Transmit Complete Status Flag p (p = m × 32 + 15 to m × 32 + 0) 0: Transmission has not been completed. 1: Transmission has been completed.

#### TMTTCSTSp Flags (p = 0 to 255)

When the TMTRF[1:0] flag in the RCFDCnCFDTMSTSp register is set to 10<sub>B</sub> (transmission has been completed (without transmit abort request)) or 11<sub>B</sub> (transmission has been completed (with transmit abort request)), the corresponding TMTTCSTSp flag is set to 1.

To clear the TMTTCSTSp flag to 0, set the corresponding TMTRF[1:0] flag to 00<sub>B</sub>. This flag is cleared to 0 in channel reset mode.

**Table 24.101, TMTTCSTSp Bit Assignment** shows the bit assignment.

## 24.3.12 Details of Transmit Queue-related Registers

### 24.3.12.1 RCFDCnCFDXTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 7)

**Access:** RCFDCnCFDXTXQCCm register can be read or written in 32-bit units

RCFDCnCFDXTXQCCmL register can be read or written in 16-bit units

RCFDCnCFDXTXQCCmLL, RCFDCnCFDXTXQCCmLH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDXTXQCCm: <RCFDCn\_base> + 0550<sub>H</sub> + (04<sub>H</sub> × m)

RCFDCnCFDXTXQCCmL: <RCFDCn\_base> + 0550<sub>H</sub> + (04<sub>H</sub> × m)

RCFDCnCFDXTXQCCmLL: <RCFDCn\_base> + 0550<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDXTXQCCmLH: <RCFDCn\_base> + 0551<sub>H</sub> + (04<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.104 RCFDCnCFDXTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	TXQDC[4:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 31) makes the (g + 1) transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	TXQTXIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
4 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

**TXQDC[4:0] Bits**

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from  $(m \times 32 + 31)$  to  $(m \times 32 + 0)$  (See **Table 24.33, Transmit Buffer p Allocated to the Transmit Queue of Each Channel**). For examples of how buffer allocation is done, see **Figure 24.9, Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links**.

Modify these bits only in channel reset mode.

**TXQIM Bit**

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

**TXQTXIE Bit**

When the TXQTXIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQTXIE bit.

**TXQE Bit**

Setting this bit to 1 enables the transmit queue. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[4:0] bits to 00010<sub>B</sub> or more.

### 24.3.12.2 RCFDCnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 7)

**Access:** RCFDCnCFDTXQSTSm register can be read or written in 32-bit units  
 RCFDCnCFDTXQSTSmL register can be read or written in 16-bit units  
 RCFDCnCFDTXQSTSmLL register can be read or written in 8-bit units

**Address:** RCFDCnCFDTXQSTSm: <RCFDCn\_base> + 0570<sub>H</sub> + (04<sub>H</sub> × m)  
 RCFDCnCFDTXQSTSmL: <RCFDCn\_base> + 0570<sub>H</sub> + (04<sub>H</sub> × m)  
 RCFDCnCFDTXQSTSmLL: <RCFDCn\_base> + 0570<sub>H</sub> + (04<sub>H</sub> × m)

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.105 RCFDCnCFDTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13 to 8	Reserved	When read, the undefined value is returned. When writing to these bits, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TXQTXIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

#### TXQTXIF Flag

The TXQTXIF flag is set to 1 when the interrupt source specified by the TXQIM bit in the RCFDCnCFDTXQCCm register has occurred.

The TXQTXIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RCFDCnCFDTXQCCm register to 0 (the transmit queue is not used).

**TXQFLL Flag**

The TXQFLL flag is set to 1 when the number of messages stored in the transmit queue matches the transmit queue depth set by the TXQDC[4:0] bits in the RCFDCnCFDCTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[4:0] bits.
- In channel reset mode

**TXQEMP Flag**

The TXQEMP flag is cleared to 0 when even a single message is stored in the transmit queue. This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

### 24.3.12.3 RCFDCnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 7)

**Access:** RCFDCnCFDTXQPCTRm register is a write-only register that can be written in 32-bit units  
 RCFDCnCFDTXQPCTRmL register is a write-only register that can be written in 16-bit units  
 RCFDCnCFDTXQPCTRmLL register is a write-only register that can be written in 8-bit units

**Address:** RCFDCnCFDTXQPCTRm: <RCFDCn\_base> + 0590<sub>H</sub> + (04<sub>H</sub> × m)  
 RCFDCnCFDTXQPCTRmL: <RCFDCn\_base> + 0590<sub>H</sub> + (04<sub>H</sub> × m)  
 RCFDCnCFDTXQPCTRmLL: <RCFDCn\_base> + 0590<sub>H</sub> + (04<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 24.106 RCFDCnCFDTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF <sub>H</sub> to these bits moves the write pointer of the transmit queue to the next queue buffer.

#### TXQPC[7:0] Bits

Writing FF<sub>H</sub> to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request for the message. Write transmit messages to the RCFDCnCFDTMID<sub>p</sub>, RCFDCnCFDTMPTR<sub>p</sub>, RCFDCnCFDTMFDCTR<sub>p</sub>, and RCFDCnCFDTMDFb<sub>p</sub> registers (p = 31, 63, 95, 127, 159, 191, 223 and 255) before writing FF<sub>H</sub> to the TXQPC[7:0] bits.

When writing FF<sub>H</sub> to these bits, make sure that the TXQE bit in the RCFDCnCFDTXQCC<sub>m</sub> register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RCFDCnCFDTXQST<sub>Sm</sub> register is 0 (the transmit queue is not full).

### 24.3.13 Details of Transmit History-related Registers

#### 24.3.13.1 RCFDCnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 7)

**Access:** RCFDCnCFDTHLCCm register can be read or written in 32-bit units

RCFDCnCFDTHLCCmL register can be read or written in 16-bit units

RCFDCnCFDTHLCCmLL, RCFDCnCFDTHLCCmLH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDTHLCCm: <RCFDCn\_base> + 05B0<sub>H</sub> + (04<sub>H</sub> × m)

RCFDCnCFDTHLCCmL: <RCFDCn\_base> + 05B0<sub>H</sub> + (04<sub>H</sub> × m)

RCFDCnCFDTHLCCmLL: <RCFDCn\_base> + 05B0<sub>H</sub> + (04<sub>H</sub> × m),

RCFDCnCFDTHLCCmLH: <RCFDCn\_base> + 05B1<sub>H</sub> + (04<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	THLDT E	THLIM	THLIE	—	—	—	—	—	—	—	THLE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Table 24.107 RCFDCnCFDTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entries from transmit/receive FIFO buffers and transmit queue 1: Entries from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 24 items of data have been stored in the transmit history buffer 1: Each time transmit history data is stored in the transmit history buffer
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

#### THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

**THLIM Bit**

This bit is used to select a transmit history interrupt source. Modify this bit only in channel reset mode.

**THLIE Bit**

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit is set to 0.

**THLE Bit**

Setting this bit to 1 enables the transmit history buffer. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

### 24.3.13.2 RCFDCnCFDTHLSTSm — Transmit History Status Register (m = 0 to 7)

**Access:** RCFDCnCFDTHLSTSm register can be read or written in 32-bit units  
 RCFDCnCFDTHLSTSmL register can be read or written in 16-bit units  
 RCFDCnCFDTHLSTSmLL register can be read or written in 8-bit units  
 RCFDCnCFDTHLSTSmLH register is a read-only register that can be read in 8-bit units

**Address:** RCFDCnCFDTHLSTSm: <RCFDCn\_base> + 05D0<sub>H</sub> + (04<sub>H</sub> × m)  
 RCFDCnCFDTHLSTSmL: <RCFDCn\_base> + 05D0<sub>H</sub> + (04<sub>H</sub> × m)  
 RCFDCnCFDTHLSTSmLL: <RCFDCn\_base> + 05D0<sub>H</sub> + (04<sub>H</sub> × m),  
 RCFDCnCFDTHLSTSmLH: <RCFDCn\_base> + 05D1<sub>H</sub> + (04<sub>H</sub> × m)

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	THLMC[5:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.108 RCFDCnCFDTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13 to 8	THLMC[5:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

#### THLMC[5:0] Bits

These bits indicate the number of unread data stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

**THLIF Flag**

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RCFDCnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

**THLELT Flag**

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

**THLFLL Flag**

The THLFLL flag is set to 1 when 32 items of data have been stored in the transmit history buffer, and is cleared to 0 when the number of data stored in the transmit history buffer has decreased to less than 32. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RCFDCnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

**THLEMP Flag**

The THLEMP flag is cleared to 0 when even a single item of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RCFDCnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

**NOTE**

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

### 24.3.13.3 RCFDCnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 7)

**Access:** RCFDCnCFDTHLPCTRm register is a write-only register that can be written in 32-bit units  
 RCFDCnCFDTHLPCTRmL register is a write-only register that can be written in 16-bit units  
 RCFDCnCFDTHLPCTRmLL register is a write-only register that can be written in 8-bit units

**Address:** RCFDCnCFDTHLPCTRm: <RCFDCn\_base> + 05F0<sub>H</sub> + (04<sub>H</sub> × m)  
 RCFDCnCFDTHLPCTRmL: <RCFDCn\_base> + 05F0<sub>H</sub> + (04<sub>H</sub> × m)  
 RCFDCnCFDTHLPCTRmLL: <RCFDCn\_base> + 05F0<sub>H</sub> + (04<sub>H</sub> × m)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	THLPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 24.109 RCFDCnCFDTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF <sub>H</sub> to these bits moves the read pointer to the next unread data in the transmit history buffer.

#### THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF<sub>H</sub>, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[5:0] (transmit history buffer unread data counter) value in the RCFDCnCFDTHLSTSm register is decremented by 1. Write FF<sub>H</sub> to the THLPC[7:0] bits after reading from the RCFDCnCFDTHLACC0m register and the RCFDCnCFDTHLACC1m register.

When writing FF<sub>H</sub> to these bits, make sure that the THLE bit in the RCFDCnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RCFDCnCFDTHLSTSm register is 0.

### 24.3.13.4 RCFDCnCFDTHLACC0m — Transmit History Access Register 0 (m = 0 to 7)

**Access:** RCFDCnCFDTHLACC0m register is a read-only register that can be read in 32-bit units  
RCFDCnCFDTHLACC0mL, RCFDCnCFDTHLACC0mH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDTHLACC0mLL, RCFDCnCFDTHLACC0mHL, RCFDCnCFDTHLACC0mHH registers are read-only registers that can be read in 8-bit units

**Address:** RCFDCnCFDTHLACC0m:  $\langle \text{RCFDCn\_base} \rangle + 10000_{\text{H}} + (08_{\text{H}} \times m)$   
RCFDCnCFDTHLACC0mL:  $\langle \text{RCFDCn\_base} \rangle + 10000_{\text{H}} + (08_{\text{H}} \times m)$ ,  
RCFDCnCFDTHLACC0mH:  $\langle \text{RCFDCn\_base} \rangle + 10002_{\text{H}} + (08_{\text{H}} \times m)$   
RCFDCnCFDTHLACC0mLL:  $\langle \text{RCFDCn\_base} \rangle + 10000_{\text{H}} + (08_{\text{H}} \times m)$ ,  
RCFDCnCFDTHLACC0mHL:  $\langle \text{RCFDCn\_base} \rangle + 10002_{\text{H}} + (08_{\text{H}} \times m)$ ,  
RCFDCnCFDTHLACC0mHH:  $\langle \text{RCFDCn\_base} \rangle + 10003_{\text{H}} + (08_{\text{H}} \times m)$

**Value after reset:** 0000 0000<sub>H</sub>

#### TID[15:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

## 24.3.14 Details of Test-related Registers

### 24.3.14.1 RCFDCnCFDGTSTCFG — Global Test Configuration Register

**Access:** RCFDCnCFDGTSTCFG register can be read or written in 32-bit units

RCFDCnCFDGTSTCFGL, RCFDCnCFDGTSTCFGH registers can be read or written in 16-bit units

RCFDCnCFDGTSTCFGLL, RCFDCnCFDGTSTCFGHL, RCFDCnCFDGTSTCFGHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDGTSTCFG: <RCFDCn\_base> + 0618<sub>H</sub>

RCFDCnCFDGTSTCFGL: <RCFDCn\_base> + 0618<sub>H</sub>,

RCFDCnCFDGTSTCFGH: <RCFDCn\_base> + 061A<sub>H</sub>

RCFDCnCFDGTSTCFGLL: <RCFDCn\_base> + 0618<sub>H</sub>,

RCFDCnCFDGTSTCFGHL: <RCFDCn\_base> + 061A<sub>H</sub>,

RCFDCnCFDGTSTCFGHH: <RCFDCn\_base> + 061B<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit Position	Bit Name	Function
3	C3ICBCE	CAN3 Inter-channel Communication Test Enable 0: CAN3 inter-channel communication test is disabled. 1: CAN3 inter-channel communication test is enabled.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled. 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RCFDCnCFDGTSTCFG register only in global test mode.

### RTMPS[8:0] Bits

- RCFDC0 with 8 channels

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00<sub>H</sub> to 108<sub>H</sub>, inclusive.

- RCFDC0 with 6 channels

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00<sub>H</sub> to C6<sub>H</sub>, inclusive. Should not access more than 192 Bytes in the last page.

- RCFDC1 with 4 channels

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00<sub>H</sub> to 84<sub>H</sub>, inclusive. Should not access more than 128 Bytes in the last page.

### C7ICBCE Bit

Setting this bit to 1 enables the channel 7 inter-channel communication test. This bit is cleared to 0 in global reset mode.

### C6ICBCE Bit

Setting this bit to 1 enables the channel 6 inter-channel communication test. This bit is cleared to 0 in global reset mode.

### C5ICBCE Bit

Setting this bit to 1 enables the channel 5 inter-channel communication test. This bit is cleared to 0 in global reset mode.

### C4ICBCE Bit

Setting this bit to 1 enables the channel 4 inter-channel communication test. This bit is cleared to 0 in global reset mode.

### C3ICBCE Bit

Setting this bit to 1 enables the channel 3 inter-channel communication test. This bit is cleared to 0 in global reset mode.

### C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test. This bit is cleared to 0 in global reset mode.

**C1ICBCE Bit**

Setting this bit to 1 enables the channel 1 inter-channel communication test. This bit is cleared to 0 in global reset mode.

**C0ICBCE Bit**

Setting this bit to 1 enables the channel 0 inter-channel communication test. This bit is cleared to 0 in global reset mode.

### 24.3.14.2 RCFDCnCFDGTSTCTR — Global Test Control Register

**Access:** RCFDCnCFDGTSTCTR register can be read or written in 32-bit units  
 RCFDCnCFDGTSTCTRL register can be read or written in 16-bit units  
 RCFDCnCFDGTSTCTRLL register can be read or written in 8-bit units

**Address:** RCFDCnCFDGTSTCTR: <RCFDCn\_base> + 061C<sub>H</sub>  
 RCFDCnCFDGTSTCTRL: <RCFDCn\_base> + 061C<sub>H</sub>  
 RCFDCnCFDGTSTCTRLL: <RCFDCn\_base> + 061C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RTME	—	ICBCTME
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 24.113 RCFDCnCFDGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	ICBCTME	Inter-channel Communication Test Enable 0: Inter-channel communication test is disabled 1: Inter-channel communication test is enabled

#### RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode (See **Figure 24.37, RAM Test Setting Procedure**).

1. Set the GMDC[1:0] bits in the RCFDCnCFDGTSTCTR register to 10<sub>B</sub> (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

#### ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 7) in the RCFDCnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

### 24.3.14.3 RCFDCnCFDGLOCKK — Global Lock Key Register

**Access:** RCFDCnCFDGLOCKK register is a write-only register that can be written in 32-bit units.  
RCFDCnCFDGLOCKKL register is a write-only register that can be written in 16-bit units.

**Address:** RCFDCnCFDGLOCKK: <RCFDCn\_base> + 062C<sub>H</sub>  
RCFDCnCFDGLOCKKL: <RCFDCn\_base> + 062C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCK[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W*	W*	W*	W*	W*	W*	W*	W*	W*	W*	W*	W*	W*	W*	W*	W*

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 24.114 RCFDCnCFDGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RCFDCnCFDGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 24.10.4.2, Procedure for Releasing the Protection.**

#### LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RCFDCnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RCFDCn\_base> + 0000<sub>H</sub> to <RCFDCn\_base> + 07FF<sub>H</sub>) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

### 24.3.14.4 RCFDCnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63)

**Access:** RCFDCnCFDRPGACCr register can be read or written in 32-bit units  
 RCFDCnCFDRPGACCrL, RCFDCnCFDRPGACCrH registers can be read or written in 16-bit units  
 RCFDCnCFDRPGACCrLL, RCFDCnCFDRPGACCrLH, RCFDCnCFDRPGACCrHL, RCFDCnCFDRPGACCrHH registers can be read or written in 8-bit units

**Address:** RCFDCnCFDRPGACCr: <RCFDCn\_base> + 10400<sub>H</sub> + (04<sub>H</sub> × r)  
 RCFDCnCFDRPGACCrL: <RCFDCn\_base> + 10400<sub>H</sub> + (04<sub>H</sub> × r),  
 RCFDCnCFDRPGACCrH: <RCFDCn\_base> + 10402<sub>H</sub> + (04<sub>H</sub> × r)  
 RCFDCnCFDRPGACCrLL: <RCFDCn\_base> + 10400<sub>H</sub> + (04<sub>H</sub> × r),  
 RCFDCnCFDRPGACCrLH: <RCFDCn\_base> + 10401<sub>H</sub> + (04<sub>H</sub> × r),  
 RCFDCnCFDRPGACCrHL: <RCFDCn\_base> + 10402<sub>H</sub> + (04<sub>H</sub> × r),  
 RCFDCnCFDRPGACCrHH: <RCFDCn\_base> + 10403<sub>H</sub> + (04<sub>H</sub> × r)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDTA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDTA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.115 RCFDCnCFDRPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA[31:0]	RAM Data Test Access RAM data for CAN can be read and written.

Modify the RCFDCnCFDRPGACCr register in global test mode with the RTME bit in the RCFDCnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RCFDCnCFDRPGACCr register can be read and written when the RTME bit is set to 1.

## 24.4 Interrupt Sources and DMA Trigger

### 24.4.1 Interrupt Sources

The RS-CANFD module has 26 interrupts for unit 0 and 14 interrupts for unit 1 are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources/unit): Receive FIFO interrupt Global error interrupt
- Channel interrupts (3 sources/channel): (m = 0 to 7 (n = 0), m = 0 to 3 (n = 1))

#### 1. CANm transmit interrupt

- CANm transmit complete interrupt
- CANm transmit abort interrupt
- CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
- CANm transmit history interrupt
- CANm transmit queue Interrupt

#### 2. CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)

#### 3. CANm error interrupt

CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In this case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

**Table 24.116, List of CAN Interrupt Sources** lists the CAN interrupt sources. **Figure 24.2, CAN Global Interrupt Block Diagram** shows the CAN global interrupt block diagram. **Figure 24.3, CAN Channel Interrupt Block Diagram** shows the CAN channel interrupt block diagram.

Table 24.116 List of CAN Interrupt Sources

	Interrupt Source		Corresponding Interrupt Request Flag	Corresponding Interrupt Enable Bit
Global interrupts	Receive FIFO	Receive FIFO 0	RFIF in the RCFDCnCFDRFSTS0 register	RFIE in the RCFDCnCFDRFCC0 register
		Receive FIFO 1	RFIF in the RCFDCnCFDRFSTS1 register	RFIE in the RCFDCnCFDRFCC1 register
		Receive FIFO 2	RFIF in the RCFDCnCFDRFSTS2 register	RFIE in the RCFDCnCFDRFCC2 register
		Receive FIFO 3	RFIF in the RCFDCnCFDRFSTS3 register	RFIE in the RCFDCnCFDRFCC3 register
		Receive FIFO 4	RFIF in the RCFDCnCFDRFSTS4 register	RFIE in the RCFDCnCFDRFCC4 register
		Receive FIFO 5	RFIF in the RCFDCnCFDRFSTS5 register	RFIE in the RCFDCnCFDRFCC5 register
		Receive FIFO 6	RFIF in the RCFDCnCFDRFSTS6 register	RFIE in the RCFDCnCFDRFCC6 register
		Receive FIFO 7	RFIF in the RCFDCnCFDRFSTS7 register	RFIE in the RCFDCnCFDRFCC7 register
	Global error		DEF in the RCFDCnCFDGERFL register	DEIE in the RCFDCnCFDGCTR register
			MES in the RCFDCnCFDGERFL register	MEIE in the RCFDCnCFDGCTR register
			THLES in the RCFDCnCFDGERFL register	THLEIE in the RCFDCnCFDGCTR register
			CMPOF in the RCFDCnCFDGERFL register	CMPOFIE in the RCFDCnCFDGCTR register
	Channel interrupts (m = 0 to 7 (n = 0), m = 0 to 3 (n = 1))	CANm transmit	CANm transmit complete	TMTRF[1:0] in the RCFDCnCFDTMSTSp register
CANm transmit abort			TMTRF[1:0] in the RCFDCnCFDTMSTSp register	TAIE in the RCFDCnCFDCmCTR register
CANm transmit/ receive FIFO transmit complete			CFTXIF in the RCFDCnCFDCFSTSk register	CFTXIE in the RCFDCnCFDCFCCK register
CANm transmit queue			TXQTXIF in the RCFDCnCFDTXQSTSm register	TXQTXIE in the RCFDCnCFDTXQCCm register
CANm transmit history			THLIF in the RCFDCnCFDTHLSTSm register	THLIE in the RCFDCnCFDTHLCCm register
CANm transmit/receive FIFO receive complete		CFRXIF in the RCFDCnCFDCFSTSk register	CFRXIE in the RCFDCnCFDCFCCK register	
CANm error		BEF in the RCFDCnCFDCmERFL register	BEIE in the RCFDCnCFDCmCTR register	
		ALF in the RCFDCnCFDCmERFL register	ALIE in the RCFDCnCFDCmCTR register	
		BLF in the RCFDCnCFDCmERFL register	BLIE in the RCFDCnCFDCmCTR register	
		OVLf in the RCFDCnCFDCmERFL register	OLIE in the RCFDCnCFDCmCTR register	
		BORF in the RCFDCnCFDCmERFL register	BORIE in the RCFDCnCFDCmCTR register	
		BOEF in the RCFDCnCFDCmERFL register	BOEIE in the RCFDCnCFDCmCTR register	
		EPF in the RCFDCnCFDCmERFL register	EPIE in the RCFDCnCFDCmCTR register	
		EWf in the RCFDCnCFDCmERFL register	EWIE in the RCFDCnCFDCmCTR register	
		SOCO in the RCFDCnCFDCmFDSTS register	SOCOIE in the RCFDCnCFDCmCTR register	
		EOCO in the RCFDCnCFDCmFDSTS register	EOCOIE in the RCFDCnCFDCmCTR register	
		TDCVF in the RCFDCnCFDCmFDSTS register	TDCVFIE in the RCFDCnCFDCmCTR register	

Figure 24.2 CAN Global Interrupt Block Diagram

Figure 24.3 CAN Channel Interrupt Block Diagram

### 24.4.2 DMA Trigger

FIFO buffers used for reception can be related to DMA channels. The following 16 FIFO buffers can be related.

- All receive FIFO buffers  $x$  ( $x = 0$  to  $7$ )
- The first transmit/receive FIFO buffer  $k$  ( $k = 3 \times m$ ,  $m = 0$  to  $7$ ) allocated to channel  $m$

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RCFDCnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

## 24.5 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in **Section 24.5.1, Global Modes**, and details of channel modes are described in **Section 24.5.2, Channel Modes**.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

### 24.5.1 Global Modes

**Figure 24.4, Transitions of Global Modes** shows the transitions of global modes.

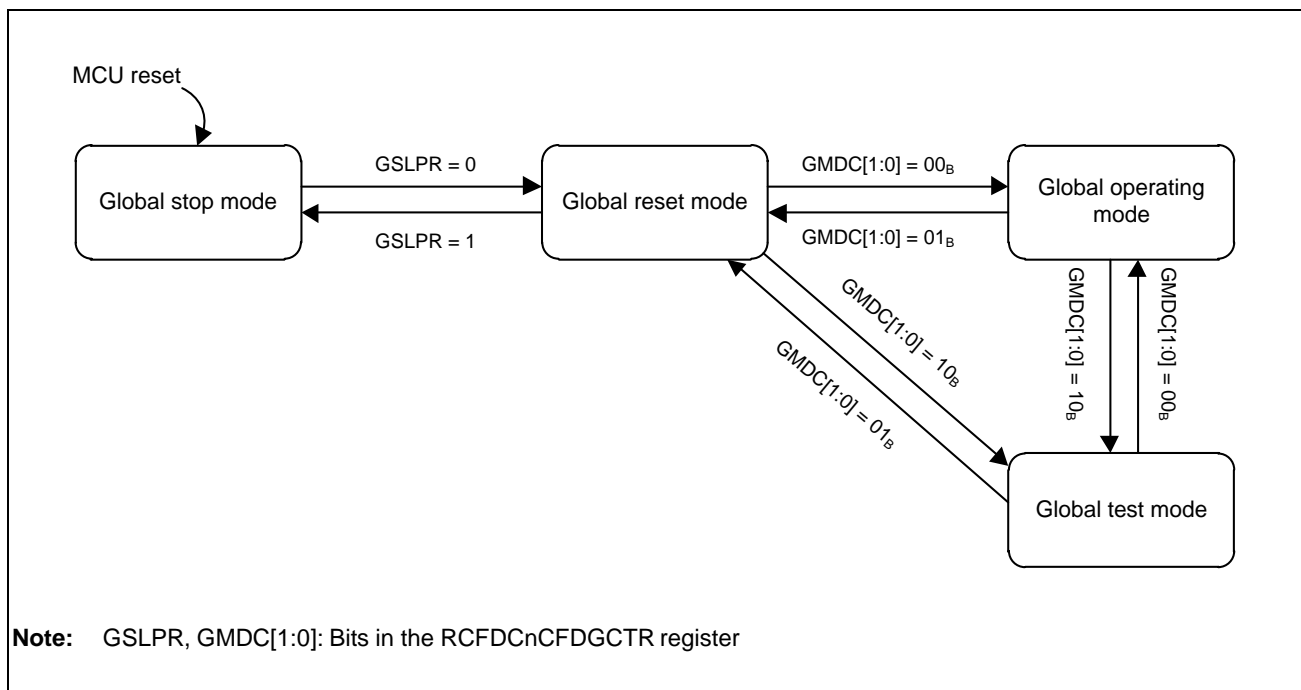

Figure 24.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 24.117, Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 24.117 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

Channel Mode before Setting	Channel Mode after Setting			
	GMDC[1:0] = 00 <sub>B</sub> GSLPR = 0 (Global Operation)	GMDC[1:0] = 10 <sub>B</sub> GSLPR = 0 (Global Test)	GMDC[1:0] = 01 <sub>B</sub> GSLPR = 0 (Global Reset)	GMDC[1:0] = 01 <sub>B</sub> GSLPR = 1 (Global Stop)
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

**Note:** GMDC[1:0], GSLPR: Bits in the RCFDCnCFDGCTR register

**Table 24.118, Global Mode Transition Time** shows the global mode transition time.

Table 24.118 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Two CAN bit times <sup>*1,*2</sup>
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Two CAN bit times <sup>*1,*2</sup>
Global operating	Global test	Three CAN frames <sup>*1</sup>

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use

Note 2. This time value is the CAN bit time of the nominal bit rate.

### 24.5.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RCFDCnCFDGCmCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each RCFDCnCFDGCmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

### 24.5.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see **Table 24.121, Registers Initialized in Global Reset Mode or Channel Reset Mode** and **Table 24.122, Registers Initialized Only in Global Reset Mode**.

Setting the GMDC[1:0] bits in the RCFDCnCFDGCmCTR register to 01<sub>B</sub> sets the CHMDC[1:0] bits in each RCFDCnCFDGCmCTR registers (m = 0 to 7) to 01<sub>B</sub> (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode.

Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01<sub>B</sub>).

### 24.5.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RCFDCnCFDGCmCTR register to 10<sub>B</sub> sets the CHMDC[1:0] bits in each RCFDCnCFDGCmCTR register to 10<sub>B</sub> (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

### 24.5.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RCFDCnCFDGCmCTR register are set to 00<sub>B</sub>, the RS-CANFD module transitions to global operating mode.

## 24.5.2 Channel Modes

Figure 24.5, Channel Mode State Transition Chart shows a channel mode state transition chart. Table 24.119, Channel Mode Transition Time shows the channel mode transition time.

Figure 24.5 Channel Mode State Transition Chart

Table 24.119 Channel Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times* <sup>1</sup>
Channel reset	Channel communication	Four CANm bit times* <sup>1</sup>
Channel halt	Channel reset	Two CANm bit times* <sup>1</sup>
Channel halt	Channel communication	Four CANm bit times* <sup>1</sup>
Channel communication	Channel reset	Two CANm bit times* <sup>1</sup>
Channel communication	Channel halt	Two CANm frames

Note 1. This time value is the CANm bit time of the nominal bit rate.

### 24.5.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. Channel-related registers can be read, but writing data to them is prohibited (except write to CSLPR bit). Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RCFDCnCFDCmCTR register (m = 0 to 7) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

### 24.5.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. For registers to be initialized, see **Table 24.121, Registers Initialized in Global Reset Mode or Channel Reset Mode**.

When the CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 01<sub>B</sub> (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode.

**Table 24.120, Operation when a Channel Transitions to Channel Reset Mode/Channel Halt Mode** shows the operation when the CHMDC[1:0] bits are set to 01<sub>B</sub> (channel reset mode) during CAN communication.

### 24.5.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

**Table 24.120, Operation when a Channel Transitions to Channel Reset Mode/Channel Halt Mode** shows operation when the CHMDC[1:0] bits are set to 10<sub>B</sub> (channel halt mode) during CAN communication.

Table 24.120 Operation when a Channel Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01 <sub>B</sub> )	Transitions to channel reset mode before reception is completed.*1	Transitions to channel reset mode before transmission is completed.*1	Transitions to channel reset mode before bus off recovery.
Channel halt*3 (CHMDC[1:0] = 10 <sub>B</sub> )	Transitions to channel halt mode after reception is completed.*2	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00 <sub>B</sub> ] Transitions to channel halt mode (CHMDC[1:0] = 10 <sub>B</sub> ) only after bus off recovery. [When BOM[1:0] = 01 <sub>B</sub> ] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10 <sub>B</sub> ] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11 <sub>B</sub> ] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10 <sub>B</sub> before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10<sub>B</sub> and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01<sub>B</sub>.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RCFDCnCFDCmERFL register that becomes 1 when dominant lock is detected.

Note 3. When the transition from channel reset mode to channel halt mode is to be made, set the RCFDCnCFDCmNCFG register and the RCFDCnCFDCmDCFG register, and then make a transition.

### 24.5.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 00<sub>B</sub>, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RCFDCnCFDCmSTS register (m = 0 to 7) is set to 1

(communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

### 24.5.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RCFDCnCFDCmCTR register.

- When BOM[1:0] = 00<sub>B</sub>:

Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RCFDCnCFDCmSTS register are initialized to 00<sub>H</sub>, the BORF flag in the RCFDCnCFDCmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 10<sub>B</sub> (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).

- When BOM[1:0] = 01<sub>B</sub>:

When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10<sub>B</sub> and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00<sub>H</sub>. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.

- When BOM[1:0] = 10<sub>B</sub>:

When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10<sub>B</sub>. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00<sub>H</sub>, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.

- When BOM[1:0] = 11<sub>B</sub>:

When the CHMDC[1:0] bits are set to 10<sub>B</sub> in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00<sub>H</sub>, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.

However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 11 consecutive recessive bits 128 times ) before CHMDC[1:0] bits are set to 10<sub>B</sub>.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01<sub>B</sub> or 10<sub>B</sub> is made only when the CHMDC[1:0] bits are 00<sub>B</sub> (channel communication mode).

Furthermore, setting the RTBO bit in the RCFDCnCFDCmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to 00<sub>H</sub>. Write 1 to the RTBO bit only when the BOM[1:0] value is 00<sub>B</sub>. Writing 1 to the RTBO bit in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

### 24.5.3 Initializing Registers by Transition to CAN Mode

**Table 24.121, Registers Initialized in Global Reset Mode or Channel Reset Mode** lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, **Table 24.122, Registers Initialized Only in Global Reset Mode** lists bits and flags to be initialized only by a transition to global reset mode.

Table 24.121 Registers Initialized in Global Reset Mode or Channel Reset Mode

Register	Bit / Flag
RCFDCnCFDCmCTR register	ROM, CRCT, CTMS[1:0], CTME, CHMDC[1:0]
RCFDCnCFDCmSTS register	CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, ESIF, REC[7:0], TEC[7:0]
RCFDCnCFDCmERFL register	CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF
RCFDCnCFDCmFDCTR register	EOCCLR, SOCCLR
RCFDCnCFDCmFDSTS register	SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0]
RCFDCnCFDCmFDCRC register	CRCREG[20:0], SCNT[3:0]
RCFDCnCFDCFCCK register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE
RCFDCnCFDCFSTSk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF
RCFDCnCFDCFTISTS register	CFkTXIF
RCFDCnCFDTMCP register	TMOM, TMTAR, TMTR
RCFDCnCFDTMSTSp register	TMTARM, TMTRM, TMTRF[1:0], TMTSTS
RCFDCnCFDTMTRSTSm register	TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RCFDCnCFDTMTARSTSm register	TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RCFDCnCFDTMTCSTSm register	TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RCFDCnCFDTMTASTSm register	TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.)
RCFDCnCFDCTXQCCm register	TXQE
RCFDCnCFDCTXQSTSm register	TXQTXIF, TXQFLL, TXQEMP
RCFDCnCFDTHLCCm register	THLE
RCFDCnCFDTHLSTSm register	THLMC[5:0], THLIF, THLELT, THLFLL, THLEMP
RCFDCnCFDGTINTSTS0 register	TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 0 to 3)
RCFDCnCFDGTINTSTS1 register	TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 4 to 7)

Table 24.122 Registers Initialized Only in Global Reset Mode

Register	Bit / Flag
RCFDCnCFDGGSTS register	GHLTSTS
RCFDCnCFDGERFL register	EEF0, EEF1, EEF2, EEF3, EEF4, EEF5, CMPOF, THLES, MES, DEF
RCFDCnCFDGTSC register	TS[15:0]
RCFDCnCFDRMNDy register	RMNSq
RCFDCnCFDRFCCx register	RFE
RCFDCnCFDRFSTx register	RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP
RCFDCnCFDCFCCk register	When transmit/receive FIFO buffer is in receive mode: CFE
RCFDCnCFDCFSTSk register	When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT
RCFDCnCFDFESTS register	CFkEMP, RFxEMP
RCFDCnCFDFFFSTS register	CFkFLL, RFxFLL
RCFDCnCFDFMSTS register	CFkMLT, RFxMLT
RCFDCnCFDRFISTS register	RFxIF
RCFDCnCFDCFRISTS register	CFkRXIF
RCFDCnCFDCDTCT register	CFDMAEm, RFDMAEx
RCFDCnCFDCDTSTS register	CFDMASTSm, RFDMASTx
RCFDCnCFDGTSTCFG register	RTMPS[8:0], C0ICBCE, C1ICBCE, C2ICBCE, C3ICBCE, C4ICBCE, C5ICBCE, C6ICBCE, C7ICBCE
RCFDCnCFDGTSTCTR register	RTME, ICBCTME

## 24.6 Reception Functions

There are two reception types.

- Reception by receive buffers:

Zero to 128 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.

- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):

Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

### 24.6.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 255 receive rules can be registered per channel and up to (128 × number of channels) total receive rules can be registered in the entire module. (Up to 1024 receive rules can be registered in this module that has eight channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 24.6, Registration of Receive Rules (for Setting Channel 0 and 1)** illustrates how receive rules are registered.

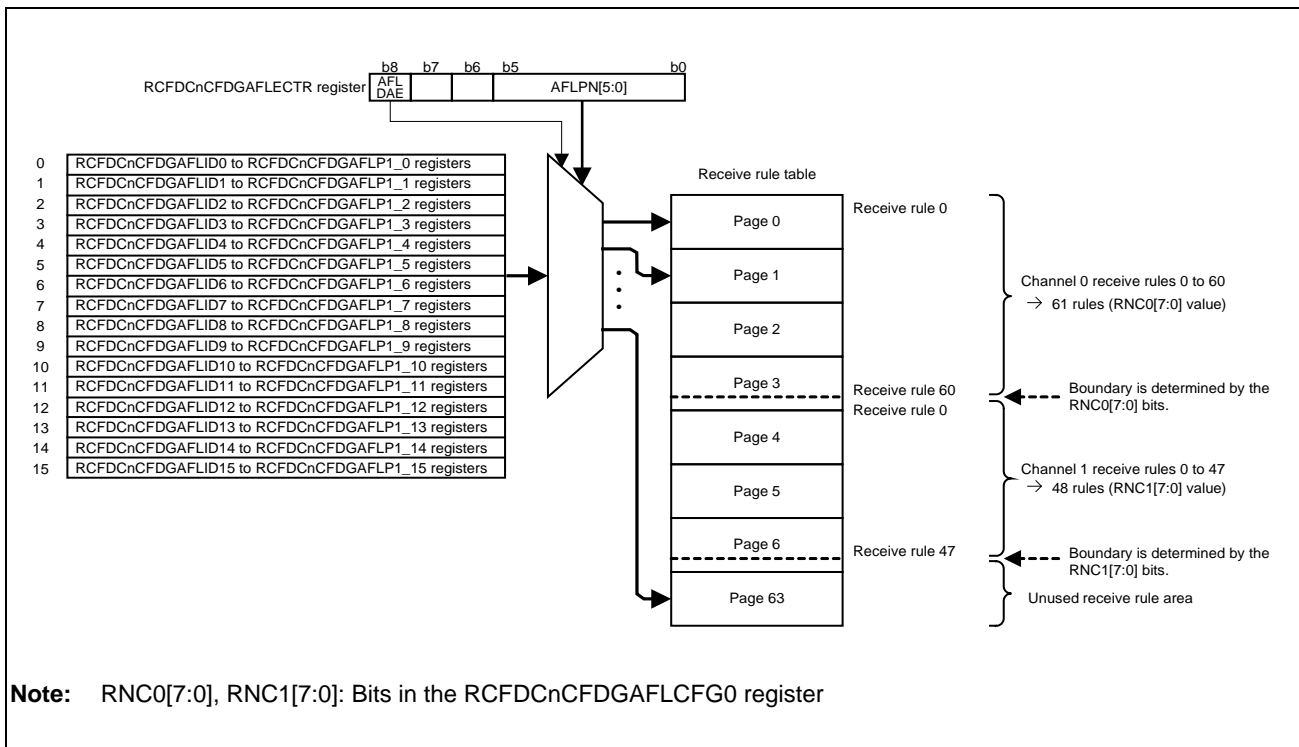

Figure 24.6 Registration of Receive Rules (for Setting Channel 0 and 1)

#### CAUTION

Receive rules for each channel must be set in contiguous blocks. Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RCFDCnCFDGAFLIDj, RCFDCnCFDGAFLMj, RCFDCnCFDGAFLP0\_j, and RCFDCnCFDGAFLP1\_j registers (j = 0 to 15). The RCFDCnCFDGAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RCFDCnCFDGAFLMj register is used to set mask, the RCFDCnCFDGAFLP0\_j register is used to set label information to be added, DLC value, and storage receive buffer, and the RCFDCnCFDGAFLP1\_j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

### 24.6.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RCFDCnCFDGAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule with the smallest number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

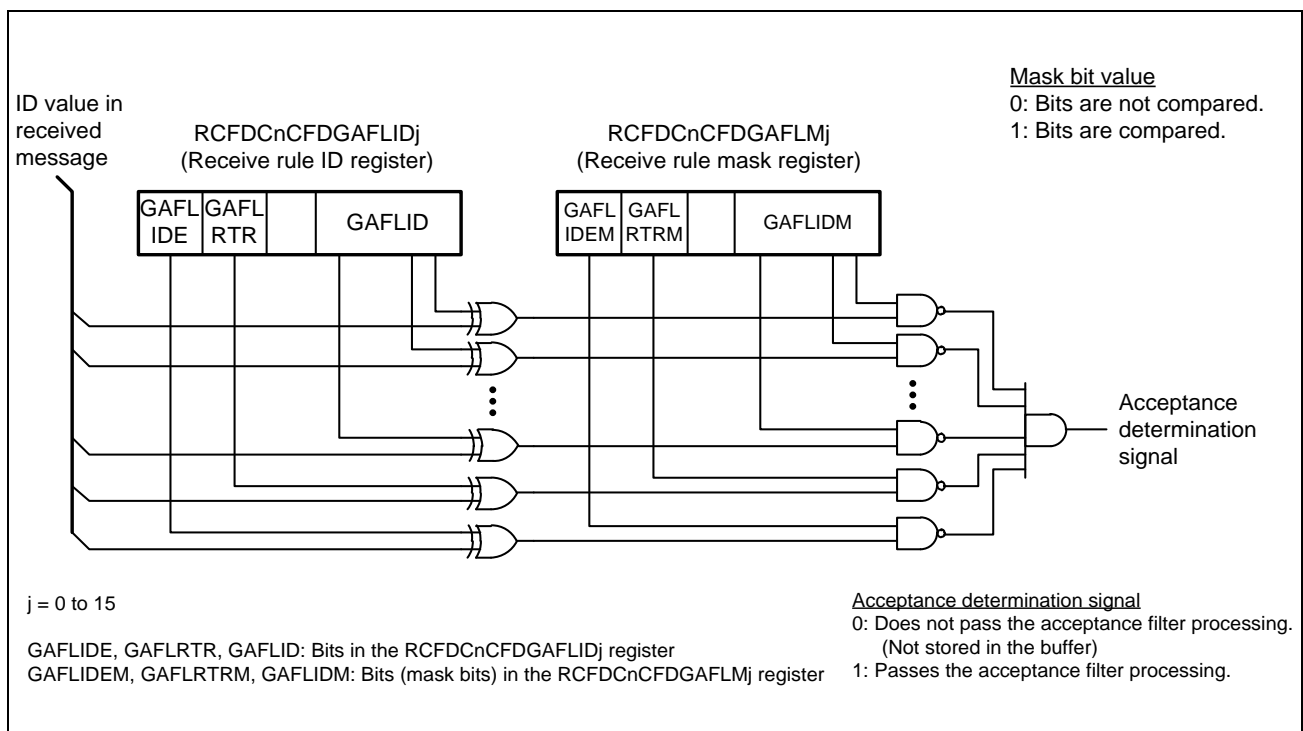

Figure 24.7 Acceptance Filter Function

### 24.6.1.2 DLC Filter Processing

When the DCE bit in the RCFDCnCFDGCFCFG register is set to 1 (DLC check is enabled), DLC filter processing is performed for messages that pass through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RCFDCnCFDGCFCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RCFDCnCFDGCFCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of 00<sub>H</sub> is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RCFDCnCFDGERFL register is set to 1 (a DLC error is present).

### 24.6.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, and/or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RCFDCnCFDGAFLP0\_j register (j = 0 to 15) and by the RCFDCnCFDGAFLP1\_j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

If the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RCFDCnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RCFDCnCFDGCFCFG register. When the CMPOC bit is 0, the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1, the received message is stored in the buffer with payloads exceeding the storage size being discarded, and depending on the DRE bit in the RCFDCnCFDGCFCFG register the received DLC value or the DLC value of the receive rule is stored in the buffer.

### 24.6.1.4 Label Addition Processing

It is possible to add 16-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[15:0] bits in the RCFDCnCFDGAFLP0\_j register.

### 24.6.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is enabled by setting the MME bit in the RCFDCnCFDGCFCFG register to 1 (mirror function is enabled).

When the mirror function is in use, receive rules for which the GAFLLB bit in the RCFDCnCFDGAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

### 24.6.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time and transmission time. The timestamp counter value is fetched at the timing set with the TSCCFG[1:0] bits in the RCFDCnCFDGCFCFG register and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RCFDCnCFDGCFCFG register. The clock source is selectable from pclk/2 or nominal CANm bit time clock (m = 0 to 7). However, do not select the nominal CANm bit time clock of channels that handle CAN FD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RCFDCnCFDGCFCFG register.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to 0000<sub>H</sub> by setting the TSRST bit in the RCFDCnCFDGCCTR register to 1.

Figure 24.8 Timestamp Function Block Diagram

## 24.7 Transmission Functions

There are three types of transmission. The transmittable payload length is 64 bytes in every transmission types.

- Transmission using transmit buffers:  
Each channel has 32 buffers.
- Transmission using transmit/receive FIFO buffers (transmit mode):  
Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first- out basis.
- Transmission using transmit queues:  
Up to 32 transmit buffers per channel can be allocated to the transmit queues. Transmit buffer ((32 × m) + 31) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

**Figure 24.9, Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links** shows the allocation of transmit queues and transmit/receive FIFO buffer link.

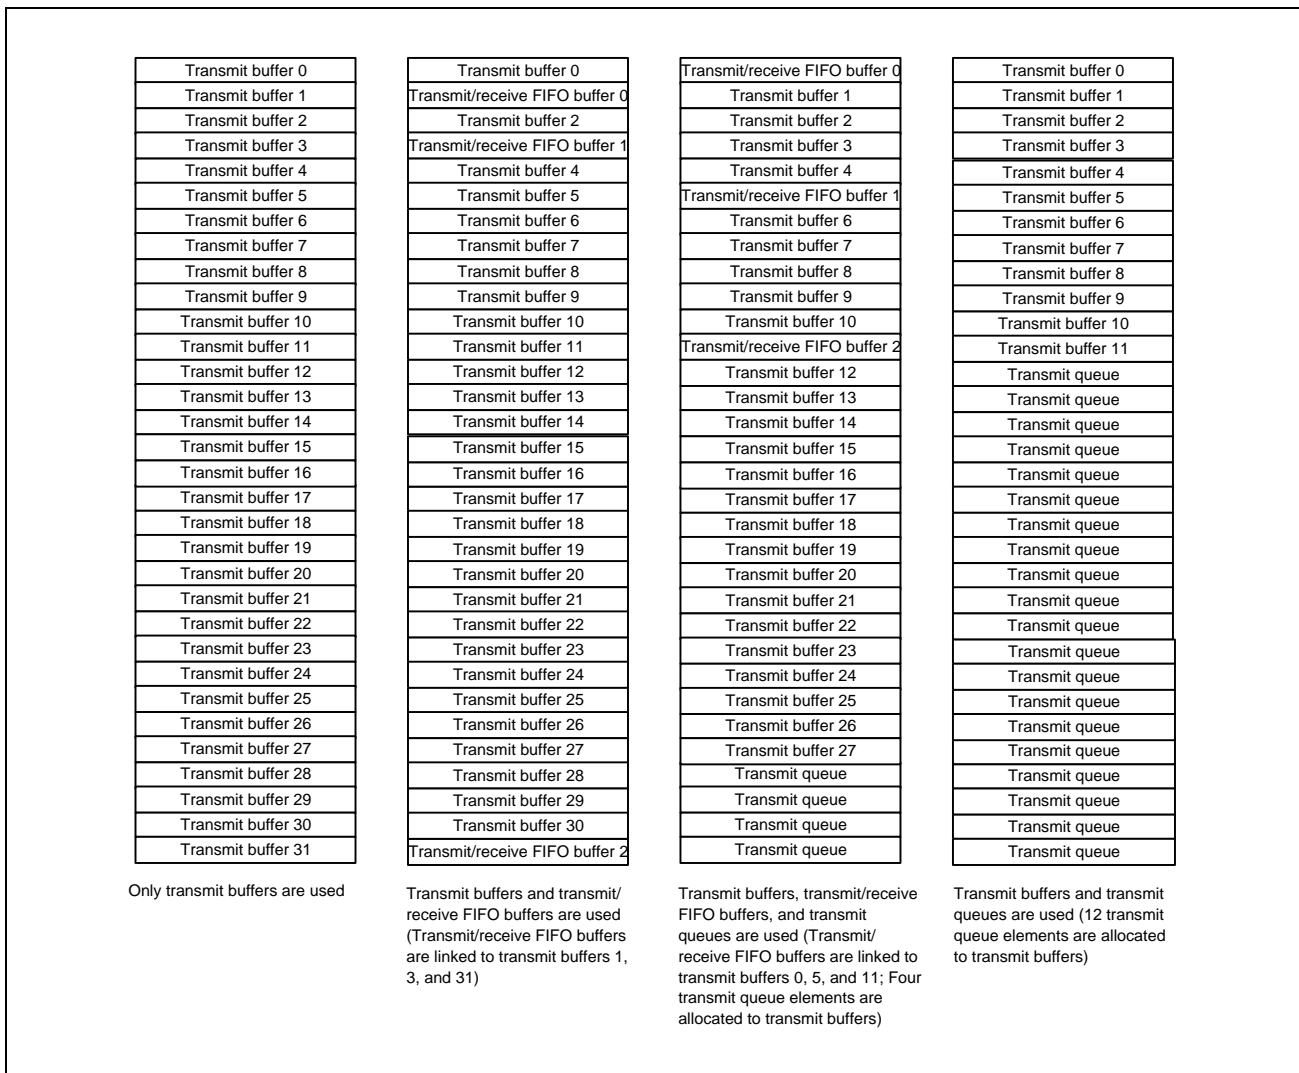

Figure 24.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

### 24.7.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RCFDCnCFDGCFCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the smallest buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit setting. When a 2-bit ECC error is detected in the priority determination processing, no message is transmitted.

## 24.7.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RCFDCnCFDTMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RCFDCnCFDTMSTSp register (p = 0 to 255). When transmit completes successfully, the TMTRF[1:0] flag is set to 10<sub>B</sub> (transmission has been completed (without transmit abort request)) or 11<sub>B</sub> (transmission has been completed (with transmit abort request)).

### 24.7.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RCFDCnCFDTMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RCFDCnCFDTMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RCFDCnCFDTMSTSp register is set to 01<sub>B</sub> (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

### 24.7.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RCFDCnCFDTMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RCFDCnCFDTMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10<sub>B</sub> or 11<sub>B</sub>. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01<sub>B</sub> (transmit abort has been completed).

### 24.7.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffer, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RCFDCnCFDCFCCK register ( $k = 0$  to 23). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[4:0] bits in the RCFDCnCFDCFCCK register. When the CFE bit in the RCFDCnCFDCFCCK register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

#### 24.7.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RCFDCnCFDCFCCK register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RCFDCnCFDCFCCK register. When the interval timer is not used, set the CFITT[7:0] bits to 00<sub>H</sub>.

Select an interval timer count source using the CFITR and CFITSS bits in the RCFDCnCFDCFCCK register. When the CFITR and CFITSS bits are set to 00<sub>B</sub>, the count source is obtained by dividing  $pclk/2$  by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10<sub>B</sub>, the count source is obtained by dividing  $pclk/2$  by (the value of the ITRCP[15:0] bits  $\times 10$ ). When the CFITR and CFITSS bits are set to  $x1$ <sub>B</sub>, the CANm bit time clock becomes a count source in Classical CAN only mode and the nominal CANm bit time clock becomes a count source in CAN FD mode. (Use this count source only for the channel which does not handle the CAN FD frames in CAN FD mode.)

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00<sub>B</sub>

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = 10<sub>B</sub>:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = x1<sub>B</sub>:

Classical CAN only mode:

$$\frac{1}{\text{CANm bit time clock frequency}} \times N$$

CAN FD mode and CAN FD only mode:

$$\frac{1}{\text{Nominal CANm bit time clock frequency}} \times N$$

**Figure 24.10, Interval Timer Block Diagram** shows the interval timer block diagram.

Figure 24.10 Interval Timer Block Diagram

**Figure 24.11, Interval Timer Timing Chart** shows the interval timer timing diagram.

Figure 24.11 Interval Timer Timing Chart

- (1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.
- (2) The interval timer is decremented by 1 upon the next count enable signal.
- (3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.
- (4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 1164 pclk cycles may be generated.

### 24.7.4 Transmission Using Transmit Queues

3 to 32 buffers are allocated to a transmit queue for each channel, and transmit buffer  $((32 \times m) + 31)$  is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RCFDCnCFDTXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RCFDCnCFDTXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, arbitration-lost, or the transition to channel halt mode when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

### 24.7.5 Transmit Data Padding (in CAN FD Mode and in CAN FD only Mode)

When the payload length indicated by the set DLC value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by CC<sub>H</sub>.

This processing is performed in the following cases.

- Transmit/receive FIFO set to transmission or gateway mode:

When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RCFDCnCFDFCFCk register.

This processing is also performed in FD only mode, if a Classical Frame is configured with a DLC bigger than 8.

### 24.7.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 32 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RCFDCnCFDTHLCCm register. The THLEN bit in the RCFDCnCFDFIDk register (k = 0 to 23) and the RCFDCnCFDTMIDp register (p = 0 to 255) determines whether transmit history data is stored for each message.

A timestamp value is always included in the transmit history data..

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 448 pelk cycles.

- Buffer type

001<sub>B</sub>: Transmit buffer

010<sub>B</sub>: Transmit/receive FIFO buffer

100<sub>B</sub>: Transmit queue

- Buffer number:

Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 24.123, Transmit History Data Buffer Numbers**.

- Label data: Label information of the transmit message
- Timestamp: Timestamp value of the transmit message

Table 24.123 Transmit History Data Buffer Numbers

Buffer No. / Buffer Type	001 <sub>B</sub>	010 <sub>B</sub>	100 <sub>B</sub>
00000 <sub>B</sub>	Transmit buffer 32 × m + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[4:0] bits in the RCFDCnCFDCFCCK register (k = 0 to 23)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
00001 <sub>B</sub>	Transmit buffer 32 × m + 1		
00010 <sub>B</sub>	Transmit buffer 32 × m + 2		
00011 <sub>B</sub>	Transmit buffer 32 × m + 3		
00100 <sub>B</sub>	Transmit buffer 32 × m + 4		
00101 <sub>B</sub>	Transmit buffer 32 × m + 5		
00110 <sub>B</sub>	Transmit buffer 32 × m + 6		
00111 <sub>B</sub>	Transmit buffer 32 × m + 7		
01000 <sub>B</sub>	Transmit buffer 32 × m + 8		
01001 <sub>B</sub>	Transmit buffer 32 × m + 9		
01010 <sub>B</sub>	Transmit buffer 32 × m + 10		
01011 <sub>B</sub>	Transmit buffer 32 × m + 11		
01100 <sub>B</sub>	Transmit buffer 32 × m + 12		
01101 <sub>B</sub>	Transmit buffer 32 × m + 13		
01110 <sub>B</sub>	Transmit buffer 32 × m + 14		
01111 <sub>B</sub>	Transmit buffer 32 × m + 15		
10000 <sub>B</sub>	Transmit buffer 32 × m + 16		
10001 <sub>B</sub>	Transmit buffer 32 × m + 17		
10010 <sub>B</sub>	Transmit buffer 32 × m + 18		
10011 <sub>B</sub>	Transmit buffer 32 × m + 19		
10100 <sub>B</sub>	Transmit buffer 32 × m + 20		
10101 <sub>B</sub>	Transmit buffer 32 × m + 21		
10110 <sub>B</sub>	Transmit buffer 32 × m + 22		
10111 <sub>B</sub>	Transmit buffer 32 × m + 23		
11000 <sub>B</sub>	Transmit buffer 32 × m + 24		
11001 <sub>B</sub>	Transmit buffer 32 × m + 25		
11010 <sub>B</sub>	Transmit buffer 32 × m + 26		
11011 <sub>B</sub>	Transmit buffer 32 × m + 27		
11100 <sub>B</sub>	Transmit buffer 32 × m + 28		
11101 <sub>B</sub>	Transmit buffer 32 × m + 29		
11110 <sub>B</sub>	Transmit buffer 32 × m + 30		
11111 <sub>B</sub>	Transmit buffer 32 × m + 31		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see **Section 24.6.1.6, Timestamp**.

Transmit history data can be read from the RCFDCnCFDTHLACC0m register and the RCFDCnCFDTHLACC1m register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

## 24.8 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, receive messages can be transmitted from an arbitrary channel without CPU intervention.

When the CFM[1:0] bits in the RCFDCnCFDCFCCK register are set to 10<sub>B</sub> (gateway mode) for the transmit/receive FIFO buffer selected by the RCFDCnCFDGAFLP1\_j register of a channel being used for transmission, messages that pass through filter processing according to the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RCFDCnCFDCFCCK register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

### 24.8.1 CAN-CAN FD Gateway

When the gateway function is used, a frame to be transmitted can be replaced with a classical CAN frame or a CAN FD frame.

Setting the GWEN bit in the RCFDCnCFDCmFDCFG register to 1 enables the CAN-CAN FD gateway. The FDF and BRS bits in the transmit frame can be selected by the GWFDF and GWBRS bits in the RCFDCnCFDCmFDCFG register. When the DLC value of the received CAN frame is 1001<sub>B</sub> or more and the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with 1000<sub>B</sub>.

When the CAN-CAN FD gateway is enabled, do not perform routing for the following frames.

- Remote frames

## 24.9 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

### 24.9.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RCFDCnCFDCmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RCFDCnCFDCmFDCRC register when the message is a CAN FD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see **Section 24.9.6.1, CRC Error Test**.

### 24.9.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

**Figure 24.12, Connection when Listen-Only Mode is Selected** shows the connection when listen-only mode is selected.

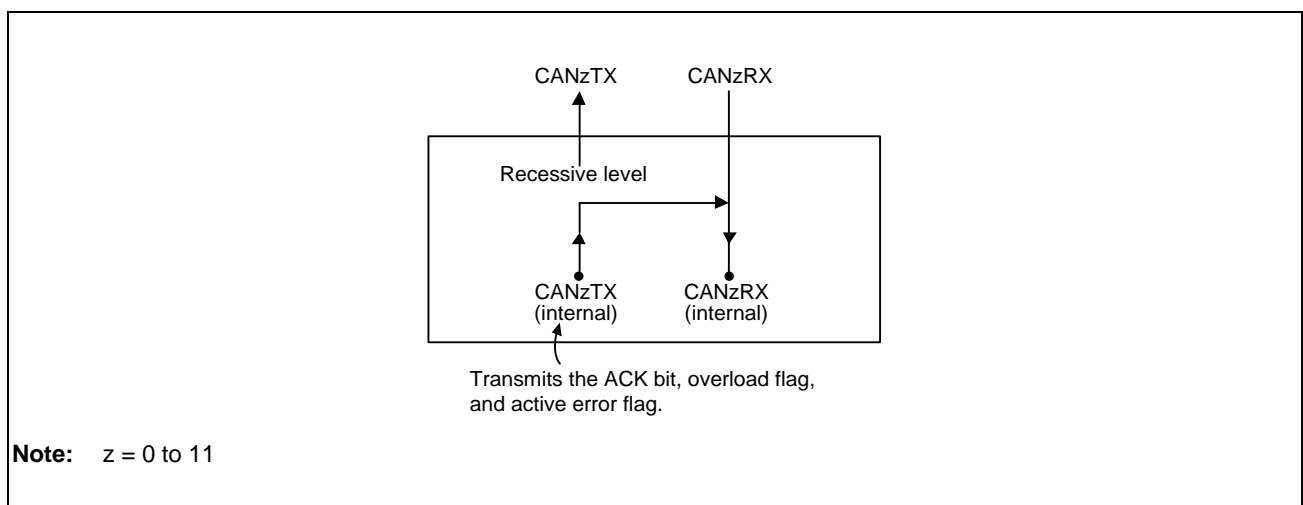

Figure 24.12 Connection when Listen-Only Mode is Selected

### 24.9.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RCFDCnCFDGAFLIDj register ( $j = 0$  to 15) is set to 0 (when a message transmitted from another CAN node is received).

If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

#### 24.9.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver. In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

**Figure 24.13, Connection when Self-Test Mode 0 is Selected** shows the connection when self-test mode 0 is selected.

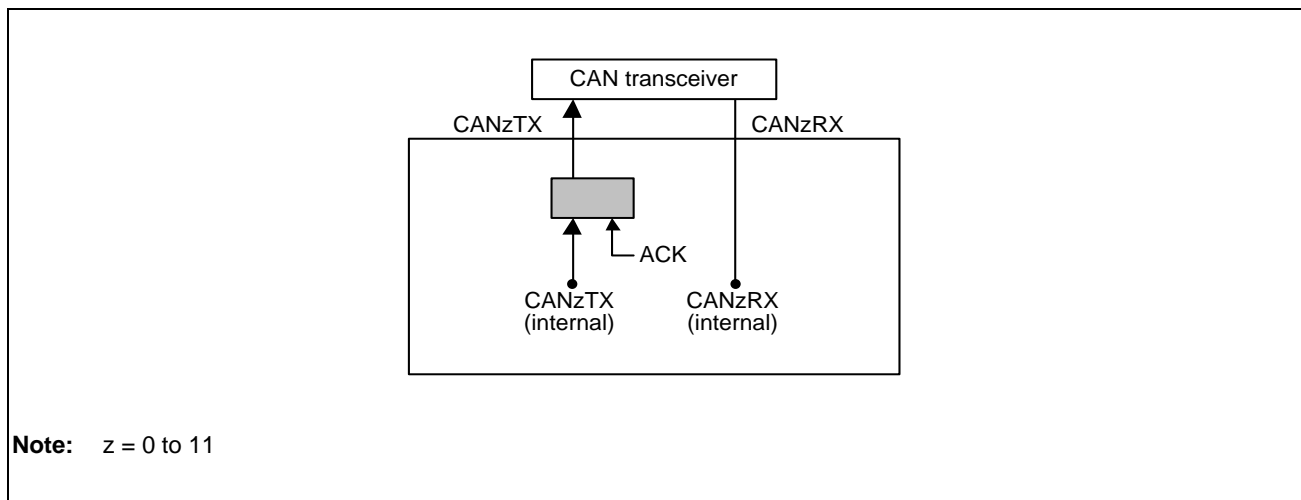

Figure 24.13 Connection when Self-Test Mode 0 is Selected

### 24.9.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANzTX pin ( $z = 0$  to 11) to the internal CANzRX pin is performed. The external CANzRX pin input is isolated. The external CANzTX pin outputs only recessive bits.

**Figure 24.14, Connection when Self-Test Mode 1 is Selected** shows the connection when self-test mode 1 is selected.

Figure 24.14 Connection when Self-Test Mode 1 is Selected

### 24.9.4 Restricted Operation Mode (CAN FD Mode and CAN FD Only Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the bus idle state comes for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error.

A desired transmission request can be made for transmission without restrictions.

### 24.9.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page are set by the RTMPS[8:0] bits in the RCFDCnCFDGTSTCFG register. Data in the set page can be read from and written to the RCFDCnCFDRPGACC<sub>r</sub> register ( $r = 0$  to 63).

The available total RAM size:

- RCFDC0 with 8 channels: 67840 bytes (10900<sub>H</sub>).
- RCFDC0 with 6 channels: 50880 bytes (C6C0<sub>H</sub>).
- RCFDC1 with 4 channels: 33920 bytes (8480<sub>H</sub>).

### 24.9.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

Set the channels not participating in test to Channel halt mode.

**Figure 24.15, Connection for Inter-Channel Communication Test** shows the connection for inter-channel communication test.

Figure 24.15 Connection for Inter-Channel Communication Test

### 24.9.6.1 CRC Error Test

A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

#### Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

#### Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RCFDCnCFDC0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RCFDCnCFDTMCP register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RCFDCnCFDCmERFL register or the CRCREG[20:0] bits in the RCFDCnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RCFDCnCFDC0ERFL is 1 (CRC error detected).

The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID's upper 5-bit value is 10000<sub>B</sub> or ID's upper 6-bit value is 011111<sub>B</sub> is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

## 24.10 RS-CANFD Setting Procedure

### 24.10.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset.

The RAM initialization time:

- RCFDC0 with 8 channels: 25730 pclk cycles.
- RCFDC0 with 6 channels: 19298 pclk cycles.
- RCFDC1 with 4 channels: 12866 pclk cycles.

The GRAMINIT flag in the RCFDCnCFDGSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 24.16, CAN Setting Procedure after the MCU is Reset** shows the CAN setting procedure after the MCU is reset.

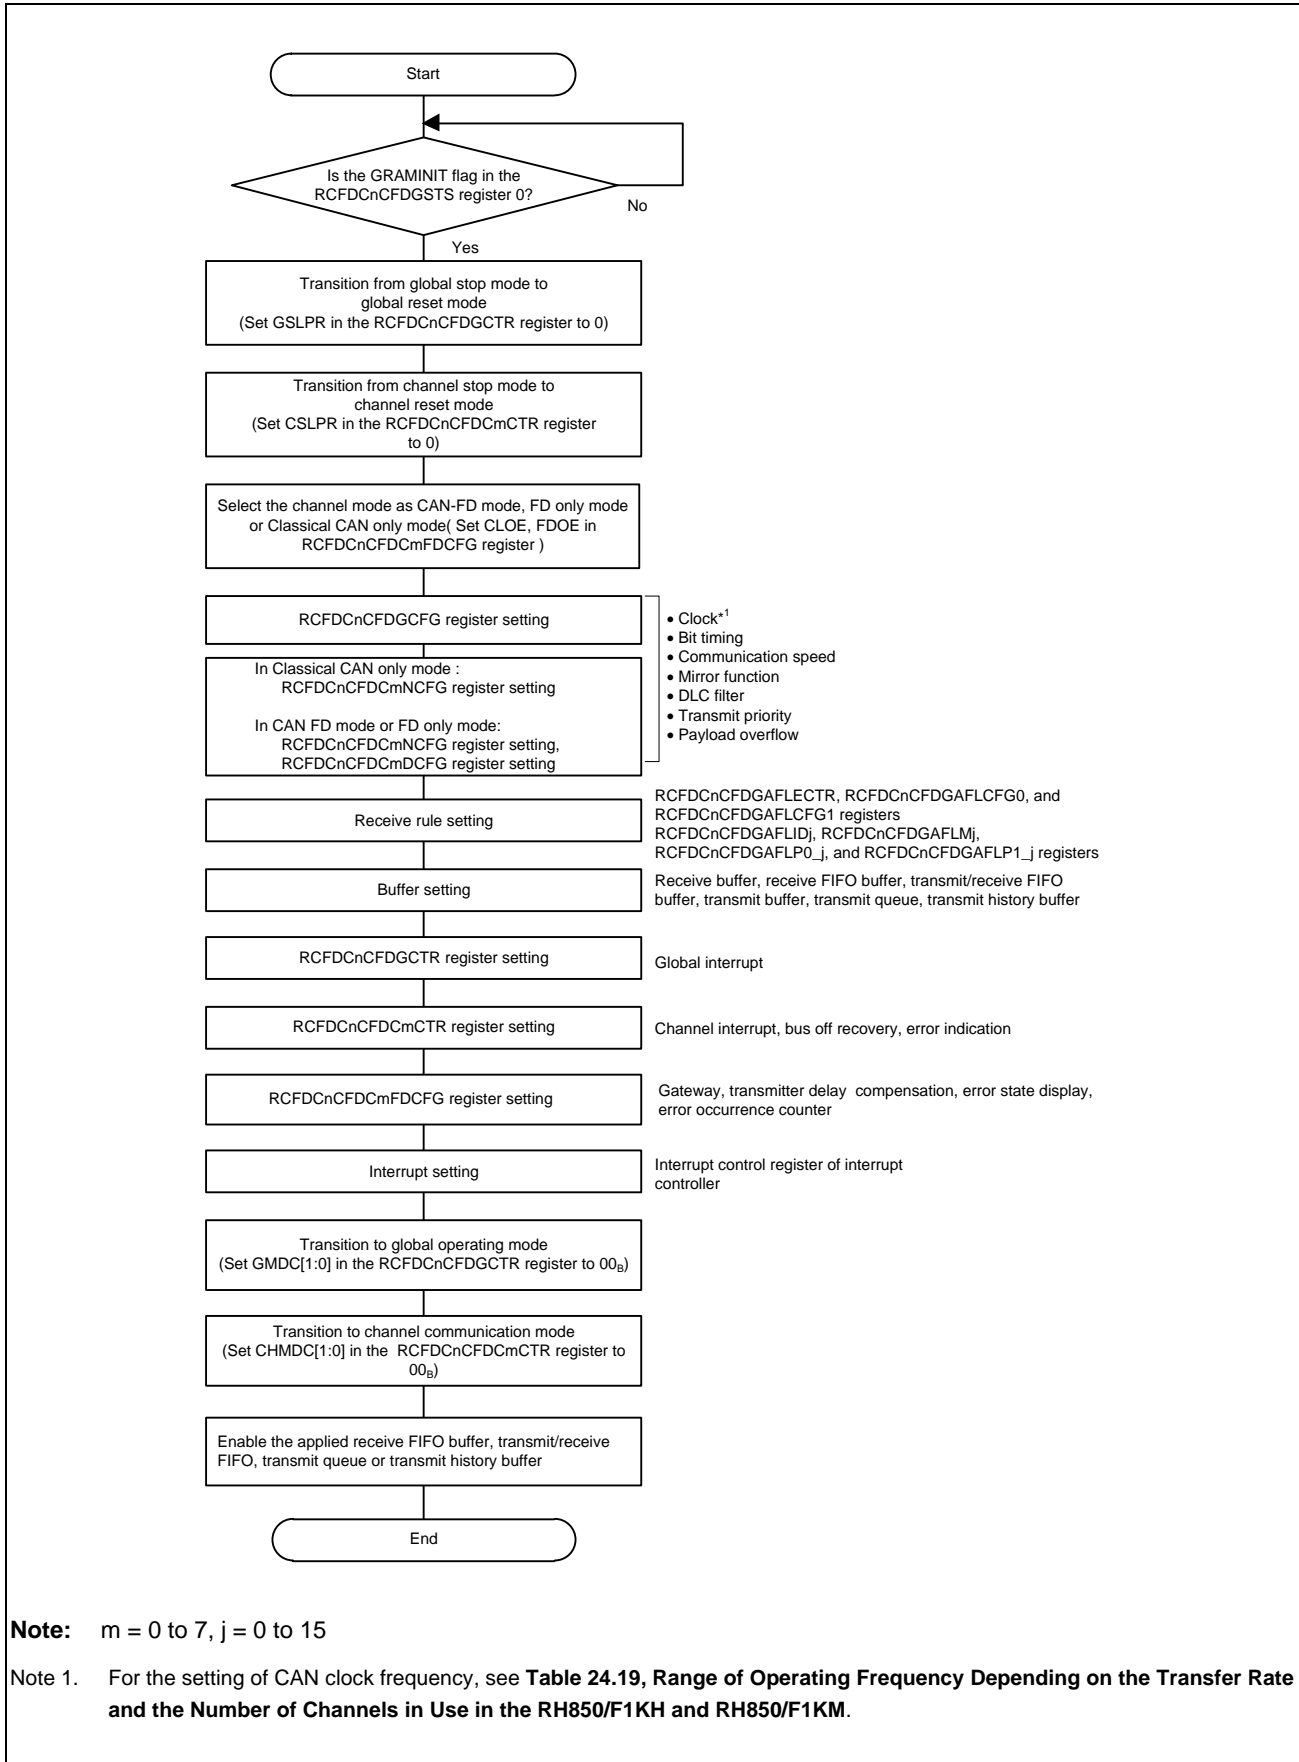

Figure 24.16 CAN Setting Procedure after the MCU is Reset

### 24.10.1.1 Clock Setting

Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk\_xincan or clk\_c using the DCS bit in the RCFDCnCFDGCFCFG register.

### 24.10.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. Two bit rates (nominal bit rate and data bit rate) are provided. Set the nominal bit rate in the RCFDCnCFDCmNCFG register and set the data bit rate in the RCFDCnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RCFDCnCFDGCFCFG register. Set a division ratio by the NBRP[9:0] bits in the RCFDCnCFDCmNCFG register and the DBRP[7:0] bits in the RCFDCnCFDCmDCFG register (CANmTq(N) clock and CANmTq(D) clock).

Be sure to specify the same values for both NBRP[9:0] and DBRP[7:0].

To specify different values for the nominal bit rate and the data bit rate, change the values of the RCFDCnCFDCmNCFG.NTSEG1 and NTSEG2 bits and RCFDCnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RCFDCnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

**Figure 24.17, Bit Timing Chart** shows the bit timing chart. **Table 24.124, Example of Bit Timing Settings** shows an example of bit timing setting.

Figure 24.17 Bit Timing Chart

Table 24.124 Example of Bit Timing Settings

1 Bit	Set Value (Tq)				Sample Point (%)
	SS	TSEG1	TSEG2	SJW	Note: See <b>Table 24.27, RS-CANFD Module Specifications.</b>
8 Tq	1	4	3	1	62.50
	1	5	2	1	75.00
10 Tq	1	6	3	1	70.00
	1	7	2	1	80.00
16 Tq	1	10	5	1	68.75
	1	11	4	1	75.00
20 Tq	1	12	7	1	65.00
	1	13	6	1	70.00
50 Tq	1	39	10	4	80.00

### 24.10.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. Set two types of transmission rate (arbitration phase and data phase) for each channel.

**Figure 24.18, CAN Clock Control Block Diagram** shows the CAN clock control block diagram, and **Table 24.125, Example of Communication Speed Setting (Classical CAN only mode)** shows an example of the communication speed setting.

Figure 24.18 CAN Clock Control Block Diagram

Table 24.125 Example of Communication Speed Setting (Classical CAN only mode)

Communication Speed	fCAN					
	40 MHz	32 MHz	24 MHz	20 MHz	16 MHz	8 MHz
1 Mbps	8 Tq (5) 20 Tq (2)	8 Tq (4) 16 Tq (2)	8 Tq (3) 12 Tq (2) 24 Tq (1)	10 Tq (2) 20 Tq (1)	8 Tq (2) 16 Tq (1)	8 Tq (1)
500 Kbps	8 Tq (10) 20 Tq (4)	8 Tq (8) 16 Tq (4)	8 Tq (6) 12 Tq (4) 24 Tq (2)	10 Tq (4) 20 Tq (2)	8 Tq (4) 16 Tq (2)	8 Tq (2) 16 Tq (1)
250 Kbps	8 Tq (20) 20 Tq (8)	8 Tq (16) 16 Tq (8)	8 Tq (12) 12 Tq (8) 24 Tq (4)	10 Tq (8) 20 Tq (4)	8 Tq (8) 16 Tq (4)	8 Tq (4) 16 Tq (2)
125 Kbps	8 Tq (40) 20 Tq (16)	8 Tq (32) 16 Tq (16)	8 Tq (24) 12 Tq (16) 24 Tq (8)	10 Tq (16) 20 Tq (8)	8 Tq (16) 16 Tq (8)	8 Tq (8) 16 Tq (4)

Table 24.126 Example of Transmission Rate Setting (Nominal Bit Rate and Data Bit Rate in CAN FD mode and CAN FD only mode)

Communication Rate	fCAN	
	40 MHz	20 MHz
Nominal bit rate 500 kbps Data bit rate 5 Mbps	Nominal bit rate 80 Tq (1) Data bit rate 8Tq (1)	None
Nominal bit rate 1M bps Data bit rate 2 Mbps	Nominal bit rate 40 Tq (1) Data bit rate 20Tq (1)	Nominal bit rate 20 Tq (1) Data bit rate 10 Tq (1)

**Note:** Values in ( ) are baud rate prescaler division values.

### 24.10.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 63 (for 8-channel unit) by the AFLPN[5:0] bits in the RCFDCnCFDGAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

**Figure 24.19, Receive Rule Setting Procedure** shows the receive rule setting procedure.

Figure 24.19 Receive Rule Setting Procedure

### 24.10.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. And also set the payload storage size. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

Up to 28672 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the buffers so that the following conditions are met.

Number of receive buffers  $\times$  (12 + payload storage size) + total of (number of depth  $\times$  (12 + payload storage size)) of receive FIFO buffers  $\times$  + total of (number of depth  $\times$  (12 + payload storage size)) of transmit/receive FIFO buffers  $k \leq$  28672 bytes

**NOTE**

The size of the RAM is for the RS-CANFDs that has 8 channels ( $m = 0$  to  $7$ ) of IP design logic. Regard the size of the RAM as the ones corresponding to your target product (3584  $\times$  ( $m+1$ ) bytes).

**Figure 24.20, Buffer Configuration** shows the buffer configuration. **Figure 24.21, Buffer Setting Procedure** shows the buffer setting procedure.

Figure 24.20 Buffer Configuration

**CAUTION**

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.

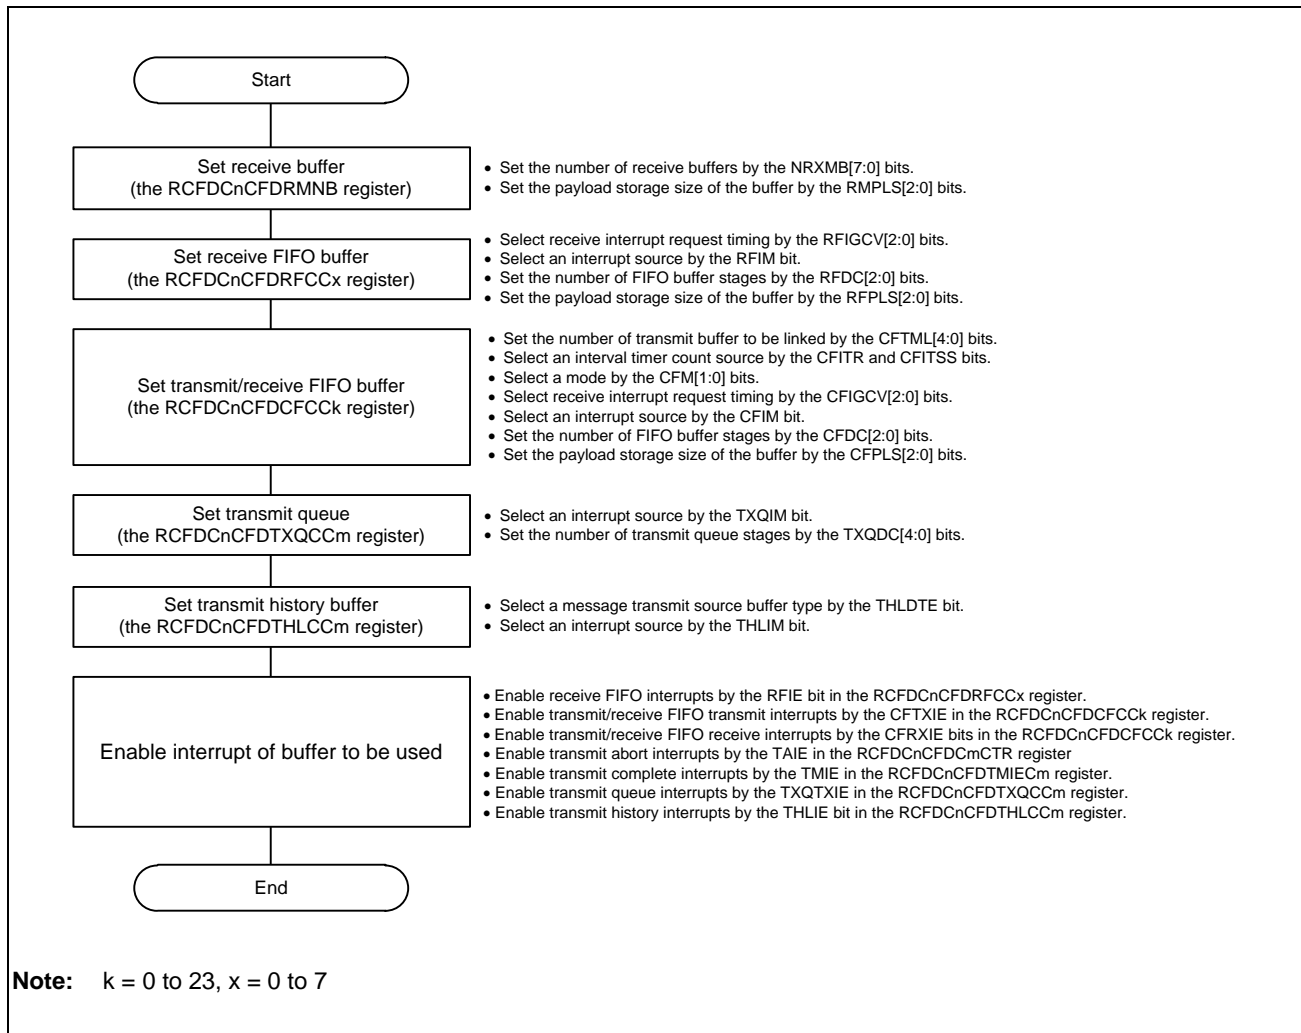

Figure 24.21 Buffer Setting Procedure

### 24.10.1.6 Transmitter Delay Compensation

A high baud rate is used in the data phase in CAN FD mode and CAN FD only mode. Transmitter delay compensation is provided as a function to accept propagation delay in data phase.

To use this function, set the TDCE bit in the RCFDCnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RCFDCnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS- CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of  $T_q$ .)

Usually, the TDCO[6:0] value must be equal to  $SS + TSEG1$ , the sample point timing

Figure 24.22 SSP timing

When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RCFDCnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of  $T_q$ .)

The RS-CANFD module compensates a delay up to  $(3 \text{ CANm bit time} - 2 f_{\text{CAN}})$ . (CANm bit time is data bit rate value.)

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RCFDCnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

## 24.10.2 Reception Procedure

### 24.10.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RCFDCnCFDRMNDy register ( $y = 0$  to  $3$ ,  $q = 0$  to  $127$ ) is set to 1 (receive buffer  $q$  contains a new message). Messages can be read from registers RCFDCnCFDRMIDq, RCFDCnCFDRMPTRq, RCFDCnCFDRMFDSTSq, and RCFDCnCFDRMDFb\_q ( $b = 0$  to  $15$ ). If the next message is received before reading the message out of buffer, the message will be overwritten. **Figure 24.23, Receive Buffer Reading Procedure** shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RCFDCnCFDRMIDq, RCFDCnCFDRMPTRq, RCFDCnCFDRMFDSTSq, and RCFDCnCFDRMDFb\_q.

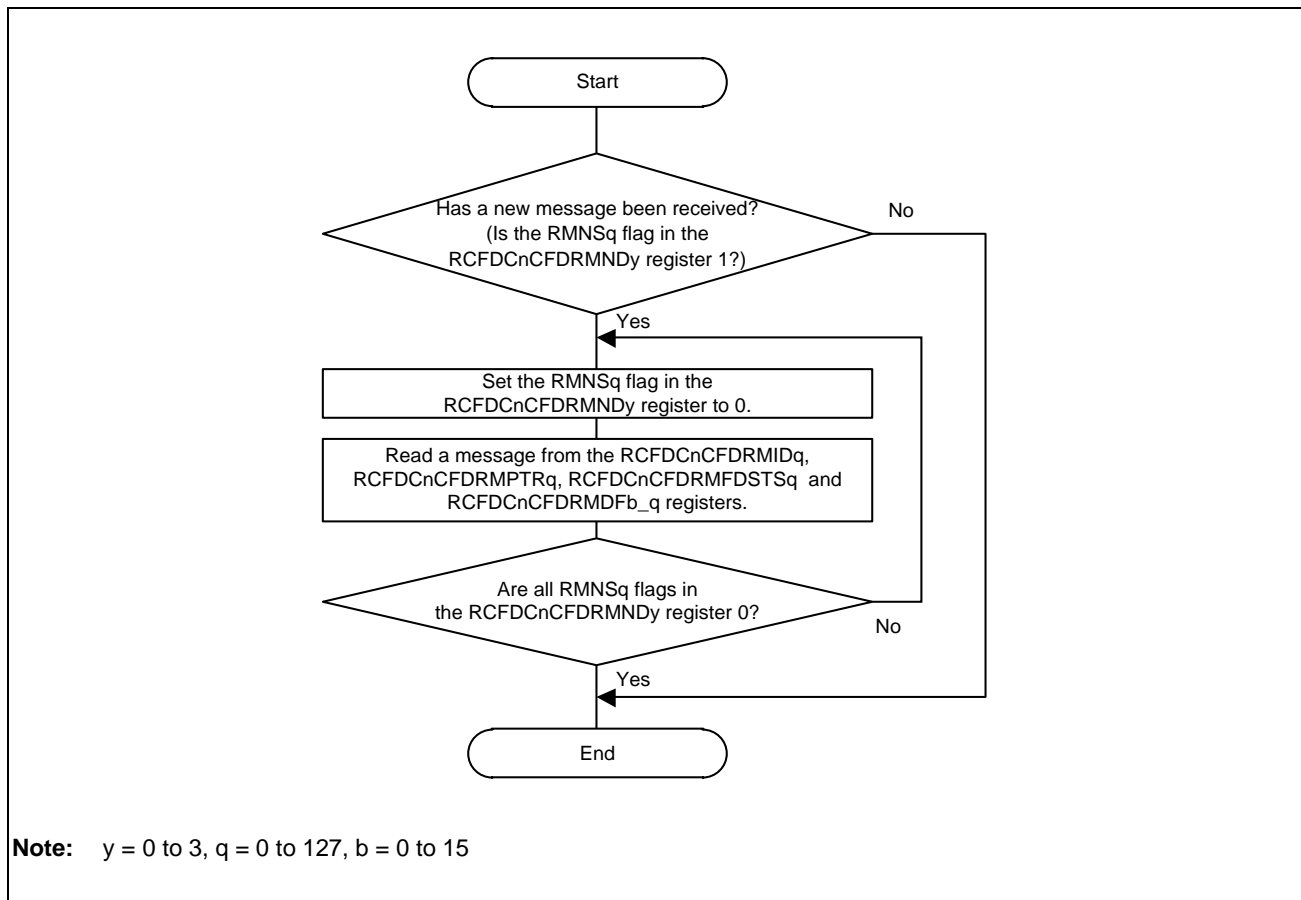

Figure 24.23 Receive Buffer Reading Procedure

Figure 24.24 Receive Buffer Reception Timing Chart

- (1) When the ID field in a message has been received, the acceptance filter processing starts.
- (2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RCFDCnCFDGCFCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
- (3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.  
When the message storage processing starts, the RMNSq flag in the corresponding RCFDCnCFDRMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.
- (4) When the ID field of the next message has been received, the acceptance filter processing starts.
- (5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RCFDCnCFDGCFCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
- (6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag can not be cleared to 0 during storage of messages.

### 24.10.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message counter (RFMC[7:0] bits in the RCFDCnCFDRFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RCFDCnCFDCFSTSk register (k = 0 to 23)) is incremented by 1. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RCFDCnCFDRFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RCFDCnCFDCFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RCFDCnCFDRFIDx, RCFDCnCFDRFPTRx, RCFDCnCFDRFFDSTSx, and RCFDCnCFDRFDFd\_x (d = 0 to 15) registers for receive FIFO buffers, or from the RCFDCnCFDCFIDk, RCFDCnCFDCFPtrk, RCFDCnCFDCFDCSTSk and RCFDCnCFDCFDFd\_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RCFDCnCFDRFCCx register or the CFDC[2:0] bits in the RCFDCnCFDCFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RCFDCnCFDRFSTSx register or the CFEMP flag in the RCFDCnCFDCFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RCFDCnCFDRFSTSx register or CFRXIF flag in the RCFDCnCFDCFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.

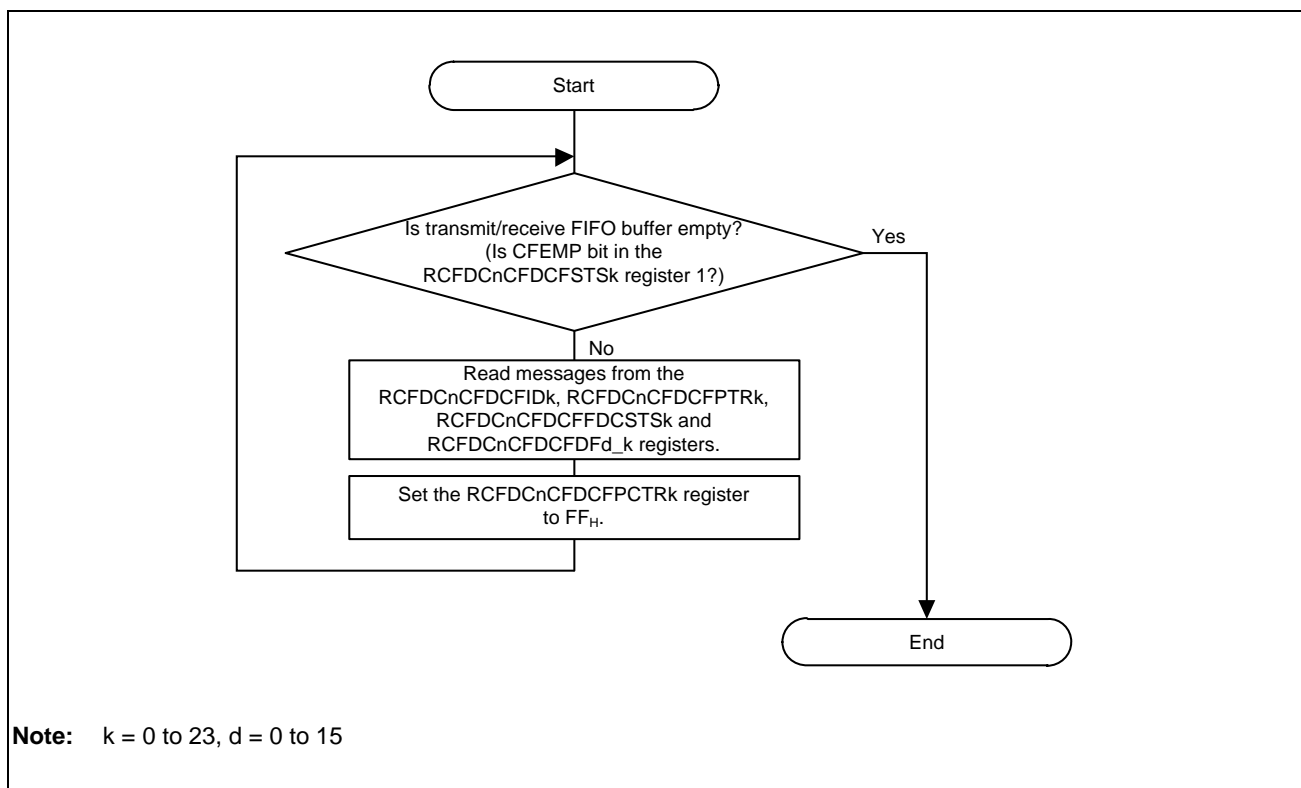

Figure 24.25 Transmit/Receive FIFO Buffer Reading Procedure

When reading a message, do not read the RCFDCnCFDRFDFd\_x or RCFDCnCFDCFDf\_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RCFDCnCFDRFCCx register or the CFPLS[2:0] bits in the RCFDCnCFDCFCCK register.

Table 24.127 Payload Storage Area of Receive FIFO Buffer

Set RFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000 <sub>B</sub>	8 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF1_x
001 <sub>B</sub>	12 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF2_x
010 <sub>B</sub>	16 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF3_x
011 <sub>B</sub>	20 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF4_x
100 <sub>B</sub>	24 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF5_x
101 <sub>B</sub>	32 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF7_x
110 <sub>B</sub>	48 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF11_x
111 <sub>B</sub>	64 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF15_x

Table 24.128 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000 <sub>B</sub>	8 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf1_k
001 <sub>B</sub>	12 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf2_k
010 <sub>B</sub>	16 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf3_k
011 <sub>B</sub>	20 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf4_k
100 <sub>B</sub>	24 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf5_k
101 <sub>B</sub>	32 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf7_k
110 <sub>B</sub>	48 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf11_k
111 <sub>B</sub>	64 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf15_k

Figure 24.26 FIFO Buffer Reception Timing Chart

- (1) When the ID field in a message has been received, the acceptance filter processing starts.
- (2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RCFDCnCFDGCFCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
- (3) When the message has passed through the DLC filter processing and the CFE bit in the RCFDCnCFDCFCCK register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RCFDCnCFDCFCCK register is 001<sub>B</sub> or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RCFDCnCFDCFSTSk register is incremented and becomes 01<sub>H</sub>. When the CFIM bit in the RCFDCnCFDCFCCK register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RCFDCnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.
- (4) When the ID field of the next message has been received, the acceptance filter processing starts.
- (5) Read received messages from the RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, and RCFDCnCFDCFDf\_k registers and write FF<sub>H</sub> to the RCFDCnCFDCFPCTRk register. This causes the CFMC[7:0] bits in the

RCFDCnCFDCFSTSk register to be decremented. When CFMC[7:0] becomes 00<sub>H</sub>, the CFEMP flag in the RCFDCnCFDCFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

- (6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RCFDCnCFDGCFCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
- (7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001<sub>B</sub> or more. The CFMC[7:0] bit value is incremented by 1 to be 01<sub>H</sub>. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).

The message is stored in the receive FIFO buffer if the RFE bit in the RCFDCnCFDRFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RCFDCnCFDRFCCx register are set to 001<sub>B</sub> or more. The RFMC[7:0] bits in the RCFDCnCFDRFSTsx register are set to 01<sub>H</sub> by being incremented by 1. When the RFIM bit in the RCFDCnCFDRFCCx register is set to 1 (an interrupt request occurs each time a message has been received), the RFIF flag in the RCFDCnCFDRFSTsx register is set to 1 (a receive FIFO interrupt request is present).

### 24.10.2.3 FIFO Buffer Reading Procedure by DMA Transfer

The following FIFO buffers can be read by DMA transfer.

- RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2:  
All receive FIFO buffers  $x$  ( $x = 0$  to  $7$ )  
RH850/F1KM-S1:  
The receive FIFO buffers  $x$  except for the following ( $x = 0$  to  $7$ )  
The receive FIFO buffer  $x$  DMA enable (RCFDCnCFDCDTCT) and the receive FIFO buffer  $x$  DMA status (RCFDCnCFDCDTSTS) ( $x = 0$  to  $5$ )
- The first transmit/receive FIFO buffer  $k$  allocated to channel  $m$  ( $k = 3 \times m$ ,  $m = 0$  to  $7$ )

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RCFDCnCFDCDTCT register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RCFDCnCFDRFCCx register or CFRXIE bit in the RCFDCnCFDCFCCK register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RCFDCnCFDRFCCx register or RCFDCnCFDCFCCK register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the address of the FIFO access register address\*<sup>1</sup> for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RCFDCnCFDRFCCx register or the CFPLS[2:0] bits in the RCFDCnCFDCFCCK register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RCFDCnCFDRFSTSx register or the CFMC[7:0] value in the RCFDCnCFDCFSTSx register is automatically decremented by 1. After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSx bit in the RCFDCnCFDCDTSTS register) is cleared to 0 (DMA transfer disabled), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.

- Note 1.**
- Receive FIFO buffer  
RCFDCnCFDRFIDx, RCFDCnCFDRFPTRx, RCFDCnCFDRFFDSTSx, RCFDCnCFDRFDFd\_x
  - Transmit/Receive FIFO buffer  
RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSx, RCFDCnCFDCFDFd\_k

## 24.10.3 Transmission Procedure

### 24.10.3.1 Procedure for Transmission from Transmit Buffers

**Figure 24.27, Procedure for Transmission from Transmit Buffers** shows the procedure for transmission from transmit buffers.

**Figure 24.28, Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 24.29, Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.

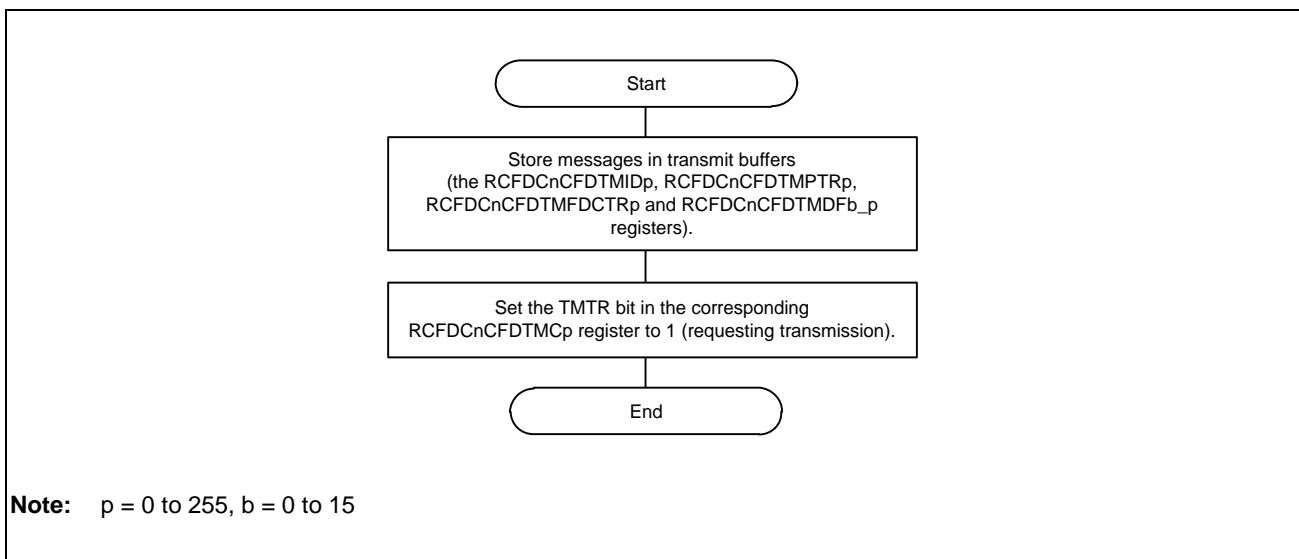

Figure 24.27 Procedure for Transmission from Transmit Buffers

Figure 24.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

- (1) When the TMTR bit in the RCFDCnCFDTMC $\alpha$  register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer  $\alpha$  is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RCFDCnCFDTMSTSp register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.
- (2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur between transmissions because the determination processing is completed by the third bit of the intermission.
- (3) When transmission completes successfully, the TMTRF[1:0] flag in the RCFDCnCFDTMSTSp register is set to 10<sub>B</sub> (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RCFDCnCFDTMC $\alpha$  register are cleared to 0. When the TMIE $\alpha$  bit in the RCFDCnCFDTMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00<sub>B</sub> (transmission is in progress or no transmit request is present).
- (4) Before starting the next transmission, set the TMTRF[1:0] flag to 00<sub>B</sub>. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00<sub>B</sub>.

If an arbitration-lost occurs after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest- priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted.

Figure 24.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

- (1) When the TMTR bit in the RCFDCnCFDTMC $\alpha$  register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer  $\alpha$  is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RCFDCnCFDTMSTSp register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.
- (2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

- (3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer  $\beta$  is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.
- (4) When transmission completes successfully, the TMTRF[1:0] flag in the RCFDCnCFDTMSTSA register is set to 11<sub>B</sub> (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RCFDCnCFDTMCA register are cleared to 0. When the TMIEA value in the RCFDCnCFDTMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00<sub>B</sub> (transmission is in progress or no transmit request is present).
- (5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.
- (6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01<sub>B</sub>. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01<sub>B</sub>. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RCFDCnCFDCMCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00<sub>B</sub>.

If an arbitration loss occurs after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted.

### 24.10.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

**Figure 24.30, Procedure for Transmission from Transmit/Receive FIFO Buffers** shows the procedure for transmission from transmit/receive FIFO buffers.

**Figure 24.31, Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 24.32, Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.

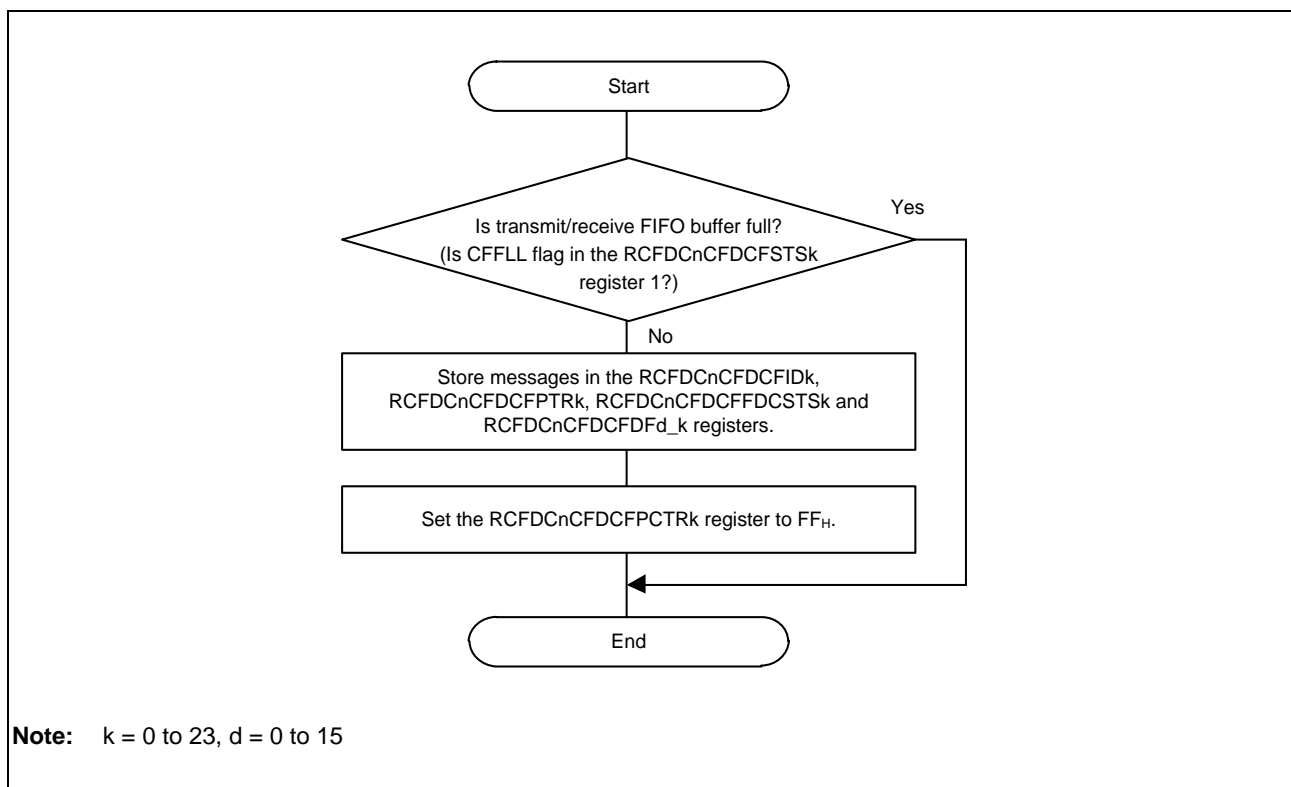

Figure 24.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When storing a message, do not write a value to the RCFDCnCFDCFDf\_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RCFDCnCFDCFCCK register.

Table 24.129 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000 <sub>B</sub>	8 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf1_k
001 <sub>B</sub>	12 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf2_k
010 <sub>B</sub>	16 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf3_k
011 <sub>B</sub>	20 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf4_k
100 <sub>B</sub>	24 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf5_k
101 <sub>B</sub>	32 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf7_k
110 <sub>B</sub>	48 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf11_k
111 <sub>B</sub>	64 bytes	RCFDCnCFDCFDf0_k to RCFDCnCFDCFDf15_k

Figure 24.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

- (1) While the CAN bus is idle, when the CFE bit in the RCFDCnCFDCFCC $\alpha$  register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RCFDCnCFDCFCC $\alpha$  register is 001<sub>B</sub> (4 messages) or more and the CFMC[7:0] value in the RCFDCnCFDCFSTSc register is 01<sub>H</sub> or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer  $\alpha$  of channel 0.
- (2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

- (3) When transmission completes successfully, the CFMC[7:0] value in the RCFDCnCFDCFSTSa register is decremented by 1. Setting the CFIM bit in the RCFDCnCFDCFCCa register to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RCFDCnCFDCFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present).
- (4) The program can clear the CFTXIF flag.
- (5) Message transmission from transmit/receive FIFO buffer  $\beta$  of channel 0 completes and the CFMC[7:0] value in the RCFDCnCFDCFSTSB register is decremented by 1. The CFMC[7:0] bits are cleared to 00H and therefore the CFEMP flag in the RCFDCnCFDCFSTSB register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RCFDCnCFDCFSTSa and RCFDCnCFDCFSTSB registers is set to 1 (the transmit/receive FIFO buffer is full).

Figure 24.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

- (1) While the CAN bus is idle, when the CFE bit in the RCFDCnCFDCFCC $\alpha$  register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RCFDCnCFDCFCC $\alpha$  register is 001<sub>B</sub> (4 messages) or more and the CFMC[7:0] value in the RCFDCnCFDCFSTS $\alpha$  register is 01<sub>H</sub> or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer  $\alpha$  of channel 0.
- (2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).
- (3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer  $\beta$  is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.
- (4) When transmit completes successfully, the CFMC[7:0] value is cleared to 00<sub>H</sub>. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RCFDCnCFDCFSTS $\alpha$  register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.
- (5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer  $\beta$ ), transmit/receive FIFO buffers  $\beta$  cannot be disabled immediately even if the CFE bit in the RCFDCnCFDCFCC $\beta$  register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RCFDCnCFDCFSTS $\beta$  register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)
- (6) After the internal processing time has passed, transmit/receive FIFO buffers  $\beta$  are disabled and the CFMC[7:0] bits in the RCFDCnCFDCFSTS $\beta$  register are cleared to 00<sub>H</sub> and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer  $\beta$  is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer  $\beta$  is immediately disabled. (The CFMC[7:0] bits are cleared to 00<sub>H</sub> and the CFEMP flag is set to 1.)

### 24.10.3.3 Procedure for Transmission from the Transmit Queue

Figure 24.33, Procedure for Transmission from the Transmit Queue shows the procedure for transmission from the transmit queue.

Figure 24.33 Procedure for Transmission from the Transmit Queue

### 24.10.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RCFDCnCFDTHLACC0m register and the RCFDCnCFDTHLACC1m register.

The next data can be accessed by writing FF<sub>H</sub> to the corresponding RCFDCnCFDTHLPCTRm register (m = 0 to 7) after reading a set of data. **Figure 24.34, Transmit History Buffer Reading Procedure** shows the transmit history buffer reading procedure.

Figure 24.34 Transmit History Buffer Reading Procedure

## 24.10.4 Test Settings

### 24.10.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

**Figure 24.35, Self-Test Mode Setting Procedure** shows the self-test mode setting procedure.

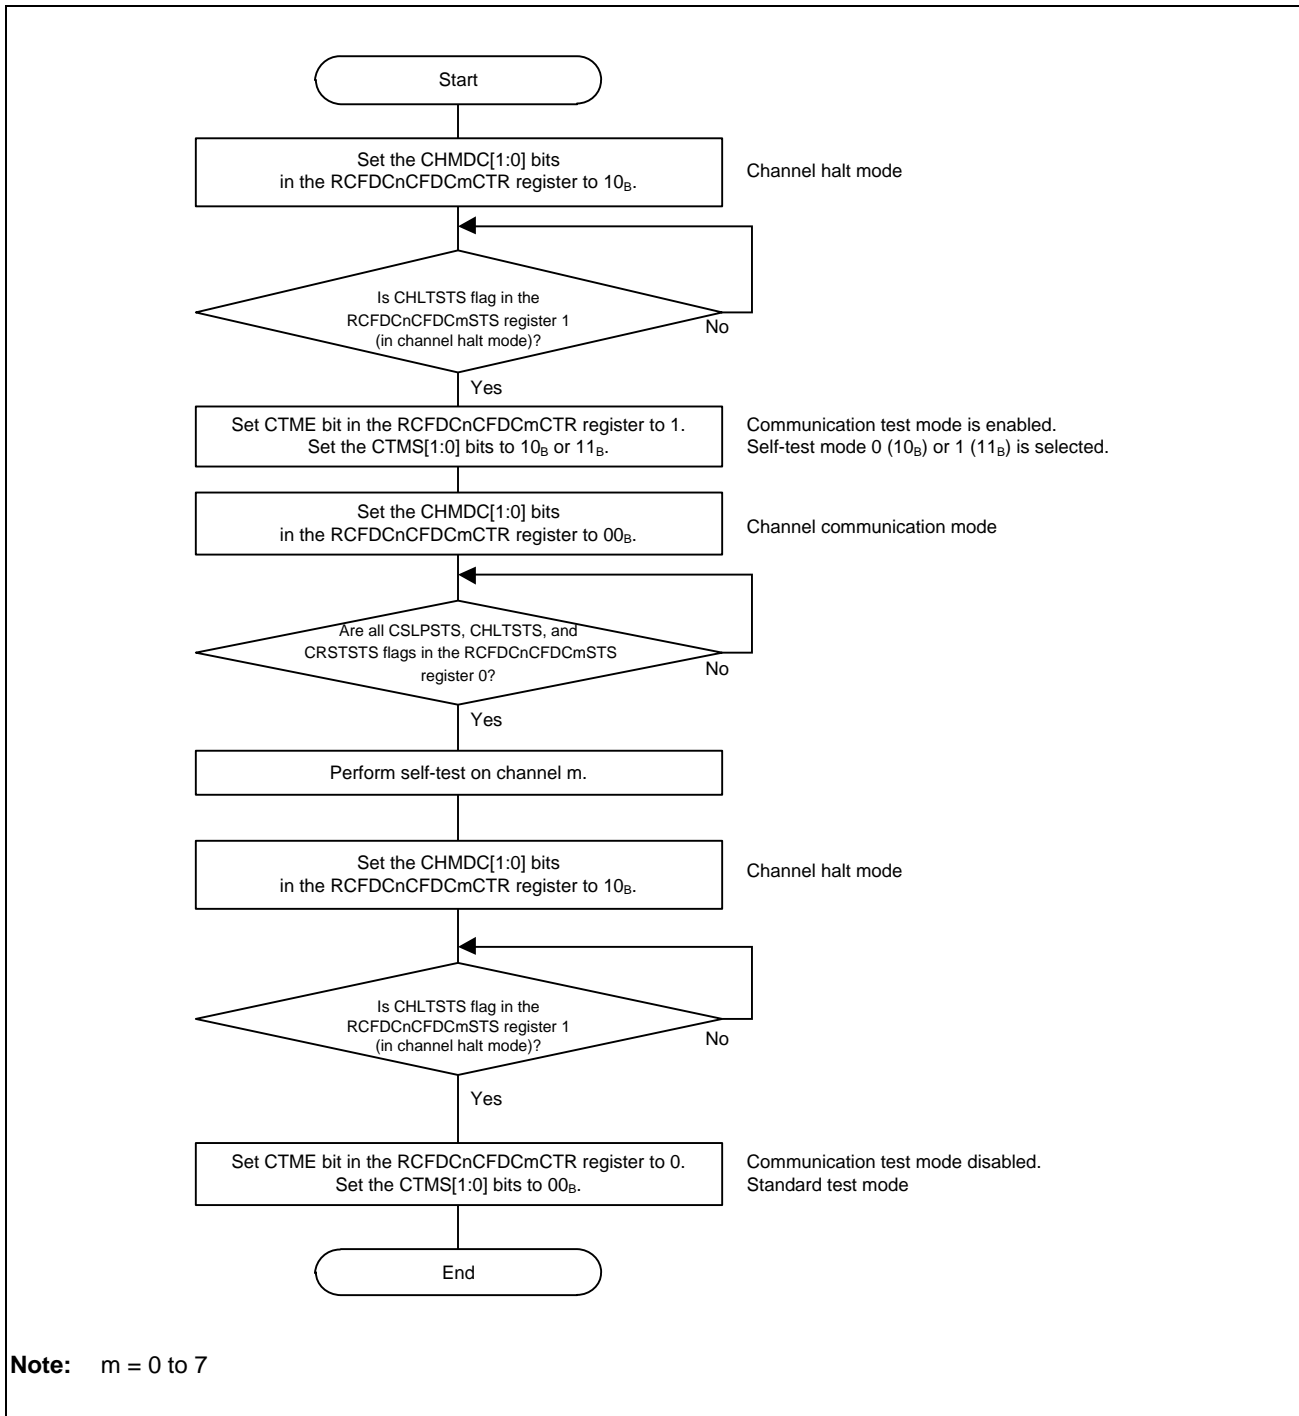

Figure 24.35 Self-Test Mode Setting Procedure

### 24.10.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 24.130, Protection Release Data for Test Function** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RCFDCnCFDGLCKK register, then set the target test bit to 1.

Table 24.130 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	7575 <sub>H</sub>	8A8A <sub>H</sub>	RTME bit in the RCFDCnCFDGTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data1.

**Figure 24.36, Protection Release Procedure** shows the procedure for releasing the protection.

Figure 24.36 Protection Release Procedure

### 24.10.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before ending the RAM test, write 0000 0000<sub>H</sub> to all pages of the CAN RAM.

Figure 24.37, RAM Test Setting Procedure shows the RAM test setting procedure.

Figure 24.37 RAM Test Setting Procedure

### 24.10.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

**Figure 24.38, Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)** shows the inter-channel communication test setting procedure.

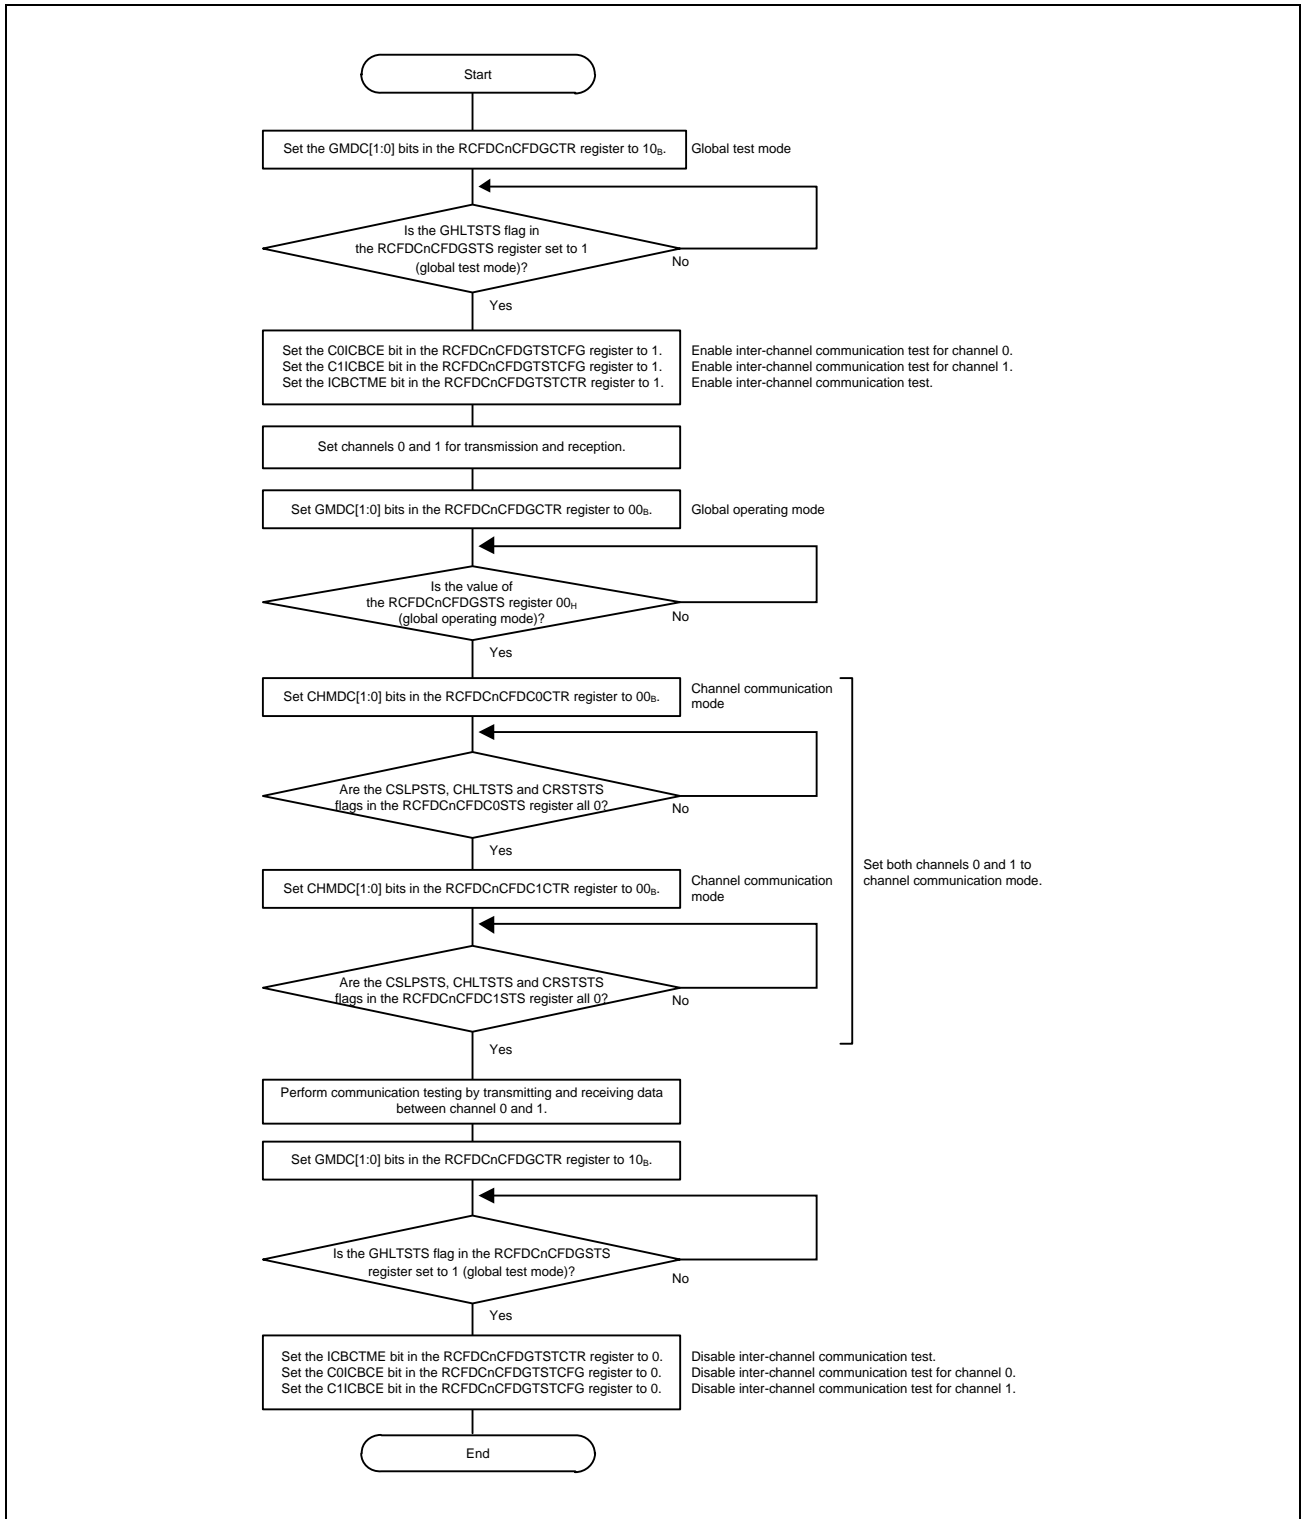

Figure 24.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

## 24.11 Notes on the RS-CANFD Module

- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RCFDCnCFDGGSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RCFDCnCFDCmSTS register (m = 0 to 7) for transitions.
- When only classical CAN frames are used in CAN FD mode, set the RCFDCnCFDCmDCFG register to the value equal to the set RCFDCnCFDCmNCFG register value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the smallest rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the smallest number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RCFDCnCFDTMCp) of the corresponding transmit buffer to 00<sub>H</sub>. The status register (RCFDCnCFDTMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RCFDCnCFDTMTRSTS0 to RCFDCnCFDTMTRSTS7, RCFDCnCFDTMTARSTS0 to RCFDCnCFDTMTARSTS7, RCFDCnCFDTMTCSTS0 to RCFDCnCFDTMTCSTS7, and RCFDCnCFDTMTASTS0 to RCFDCnCFDTMTASTS7), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RCFDCnCFDTMIEC0 to RCFDCnCFDTMIEC7) to 0 (transmit buffer interrupt is disabled).
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a newly received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- In the case of registers that access the RAM, the value after reset shown in **Section 24.3, Registers** indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The following registers apply.
  - Receive rule (RCFDCnCFDGAFLIDj, RCFDCnCFDGAFLMj, RCFDCnCFDGAFLP0\_j, RCFDCnCFDGAFLP1\_j registers)
  - Receive buffers (RCFDCnCFDRMIDq, RCFDCnCFDRMPTRq, RCFDCnCFDRMFDSTSq, RCFDCnCFDRMDFb\_q registers)
  - Receive FIFO buffer access registers (RCFDCnCFDRFIDx, RCFDCnCFDRFPTRx, RCFDCnCFDRFFDSTsx, and RCFDCnCFDRFDFd\_x registers)
  - Transmit/receive FIFO buffer access registers (RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDf\_d\_k registers)
  - Transmit buffers (RCFDCnCFDTMIDp, RCFDCnCFDTMPTRp, RCFDCnCFDTMFDCTRp, and RCFDCnCFDTMDFb\_p registers)
  - Transmit history access registers (RCFDCnCFDTHLACC0m, RCFDCnCFDTHLACC1m registers)
  - RAM test page access register (RCFDCnCFDRPGACCr register)

- The values of unused receive buffers (RCFDCnCFDRMIDq, RCFDCnCFDRMPTRq, RCFDCnCFDRMFDSTSq, and RCFDCnCFDRMDFb\_q registers), receive FIFO buffer access registers (RCFDCnCFDRFIDx, RCFDCnCFDRFPTRx, RCFDCnCFDRFFDSTSx, and RCFDCnCFDRFDFd\_x registers) and transmit/receive FIFO buffer access registers (RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDFd\_k registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

## 24.12 Detection and Correction of Errors in RS-CANFD RAM

For details of ECC, see **Section 40A.2.6, ECC for Peripheral RAM, Section 40B.2.6, ECC for Peripheral RAM, Section 40C.2.5, ECC for Peripheral RAM.**

## Section 25 FlexRay (FLXA)

This section contains a generic description of the FlexRay (FLXA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of FLXA.

### CAUTION

Please read “global RAM” described in this section as “global RAM/retention RAM”.

### NOTE

The POC described in this section is an abbreviated form of Protocol Operation Control and differs from the POC (power-on clear) described in **Section 10A, Power Supply Circuit of RH850/F1KH-D8**, **Section 10B, Power Supply Circuit of RH850/F1KM-S4, RH850/F1KM-S2** and **Section 10C, Power Supply Circuit of RH850/F1KM-S1**.

## 25.1 Features of RH850/F1KH, RH850/F1KM FLXA

### 25.1.1 Number of Units and Channels

This microcontroller has the following number of FLXA units and channels.

Table 25.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	FLXAn (n = 0)	FLXAn (n = 0)	FLXAn (n = 0)

Table 25.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	FLXAn (n = 0)	FLXAn (n = 0)	FLXAn (n = 0)	FLXAn (n = 0)	FLXAn (n = 0)

Table 25.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	—	—	—
Name	—	—	—

Table 25.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	—	—
Name	—	—	—	—

Table 25.5 FLXA Unit Configurations and Channels (RH850/F1KH-D8)

Unit Name	Number of Channels per Unit	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
FLXA0	2 (A ch, B ch)	✓	✓	✓

Table 25.6 FLXA Unit Configurations and Channels (RH850/F1KM-S4)

Unit Name	Number of Channels per Unit	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
FLXA0	2 (A ch, B ch)	✓	✓	✓	✓	✓

Table 25.7 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual FLXA units are identified by the index “n”; for example, FLXAnFROC is the FlexRay control register.

Table 25.8 Index (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual FLXA units are identified by the index “n”; for example, FLXAnFROC is the FlexRay control register.

### 25.1.2 Register Base Address

FLXAn base address is listed in the following table.

FLXAn register addresses are given as an offset from the base address in general.

Table 25.9 Register Base Address (RH850/F1KH-D8)

Base Address Name	Base Address
<FLXA0_base>	1002 0000 <sub>H</sub>

Table 25.10 Register Base Address (RH850/F1KM-S4)

Base Address Name	Base Address
<FLXA0_base>	1002 0000 <sub>H</sub>

### 25.1.3 Clock Supply

The FLXAn clock supply is shown in the following table.

Table 25.11 Clock Supply (RH850/F1KH-D8)

Unit Name	Clock Name for the Unit	Supply Clock Name
FLXAn	hclk	CPUCLK_L
	clkc	CKSCLK_PPLLCLK*1
	Register access clock	CPUCLK_L

Note 1. FLXA0 clock can stop by OPBT0. FLXA0EN, refer to **Section 44.9.2, OPBT0 — Option Byte 0**.

Table 25.12 Clock Supply (RH850/F1KM-S4)

Unit Name	Clock Name for the Unit	Supply Clock Name
FLXAn	hclk	CPUCLK_L
	clkc	CKSCLK_PPLLCLK*1
	Register access clock	CPUCLK_L

Note 1. FLXA0 clock can stop by OPBT0. FLXA0EN, refer to **Section 44.9.2, OPBT0 — Option Byte 0**.

Table 25.13 Range of Operating Frequency Depending on the Transfer Rate

Data Transfer Rate	Range of Operating Frequency	
	hclk	clkc
10 Mbps	45 ≤ hclk ≤ 60 MHz	80 MHz
5 Mbps	27 ≤ hclk ≤ 60 MHz	80 MHz
2.5 Mbps	27 ≤ hclk ≤ 60 MHz	80 MHz

### 25.1.4 Interrupt Requests

The FLXAn interrupt requests are listed in the following table.

Table 25.14 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
FLXA0			
INTFLXA0LINE0	FlexRay0 interrupt	179	—
INTFLXA0LINE1	FlexRay1 interrupt	180	—
INTFLXA0TIM0	Timer 0 interrupt	181	—
INTFLXA0TIM1	Timer 1 interrupt	182	—
INTFLXA0TIM2	Timer 2 interrupt	183	—
INTFLXA0FDA	FIFO transfer interrupt	173	—
INTFLXA0FW	FIFO transfer warning interrupt	174	—
INTFLXA0OW	Output transfer warning interrupt	178	—
INTFLXA0OT	Output transfer end interrupt	177	—
INTFLXA0IQF	Input queue full interrupt	176	—
INTFLXA0IQE	Input queue empty interrupt	175	—

Table 25.15 Interrupt Requests (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
FLXA0			
INTFLXA0LINE0	FlexRay0 interrupt	179	—
INTFLXA0LINE1	FlexRay1 interrupt	180	—
INTFLXA0TIM0	Timer 0 interrupt	181	—
INTFLXA0TIM1	Timer 1 interrupt	182	—
INTFLXA0TIM2	Timer 2 interrupt	183	—
INTFLXA0FDA	FIFO transfer interrupt	173	—
INTFLXA0FW	FIFO transfer warning interrupt	174	—
INTFLXA0OW	Output transfer warning interrupt	178	—
INTFLXA0OT	Output transfer end interrupt	177	—
INTFLXA0IQF	Input queue full interrupt	176	—
INTFLXA0IQE	Input queue empty interrupt	175	—

### 25.1.5 Reset Sources

FLXAn reset sources are listed in the following table. FLXAn is initialized by the following reset signal:

Table 25.16 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
FLXAn	All reset sources (ISORES)

Table 25.17 Reset Sources (RH850/F1KM-S4)

Unit Name	Reset Source
FLXAn	All reset sources (ISORES)

### 25.1.6 External Input/Output Signals

External input/output signals of FLXAn are listed below.

Table 25.18 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal Name
FLXA0		
rxda_extfxr	Channel A receive data input	FLXA0RXDA
fxr_txda	Channel A transmit data output	FLXA0TXDA
fxr_txena_n	Channel A transmit data enable	FLXA0TXENA
rxdb_extfxr	Channel B receive data input	FLXA0RXDB
fxr_txdb	Channel B transmit data output	FLXA0TXDB
fxr_txeb_n	Channel B transmit data enable	FLXA0TXENB
stpwt_extfxr	Stop watch trigger input	FLXA0STPWT

Table 25.19 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal Name
FLXA0		
rxda_extfxr	Channel A receive data input	FLXA0RXDA
fxr_txda	Channel A transmit data output	FLXA0TXDA
fxr_txena_n	Channel A transmit data enable	FLXA0TXENA
rxdb_extfxr	Channel B receive data input	FLXA0RXDB
fxr_txdb	Channel B transmit data output	FLXA0TXDB
fxr_txeb_n	Channel B transmit data enable	FLXA0TXENB
stpwt_extfxr	Stop watch trigger input	FLXA0STPWT

### 25.1.7 Functions

For communication on a FlexRay network, individual message buffers that can hold up to 254 bytes of data can be configured. Up to 128 message buffers can be configured in the message RAM. All functions concerning the handling of messages are implemented in the Message Handler. These functions include acceptance filtering, the transfer of messages between the two FlexRay Channel Protocol Controllers and the Message RAM, maintaining the transmission schedule, and providing message status information.

The register set of the FlexRay IP-module can be accessed directly by an external Host via the module's Host interface. These registers are used to control/configure/monitor the FlexRay Channel Protocol Controllers, Message Handler, Global Time Unit, System Universal Control, Frame and Symbol Processing, Network Management, Interrupt Control, to access the Message RAM via Input/Output Buffer; and to control the data transfer between the Message RAM and the local RAM/global RAM.

The FlexRay IP-module supports the following features:

Item	Specification
Communication	Conformance with FlexRay protocol specification v2.1
Data transfer rate	Up to 10 Mbit/s on each channel
Input/Output pins per channel	TxD, RxD, TxEN
FlexRay channels	2 (channels A and B)
Message buffers	Up to 128 message buffers configurable Configuration of message buffers with different payload lengths possible Each message buffer can be configured as a receive buffer, transmit buffer, part of a receive FIFO buffer. Filtering for slot counter, cycle counter, and channel
Message RAM	8 Kbyte of Message RAM for storage can be configured 128 message buffers with a data section of up to 48 bytes or up to 30 message buffers with a data section of 254 bytes
FIFO	One configurable receive FIFO
Message buffer access	By host CPU via input and output buffers Input Buffer: Holds message to be transferred to the Message RAM Output Buffer: Holds message read from the Message RAM  By data transfer function Input transfer: Message buffer content is transferred from local RAM/global RAM to Message RAM on CPU request Output transfer: Message buffer content is transferred from Message RAM to local RAM/global RAM automatically
Network management	Supported
Interrupts	Maskable module interrupts
Timer	Two absolute timers One relative timer One stop watch timer

### 25.1.8 Block Diagram

Figure 25.1 FlexRay IP Block Diagram

#### Input Buffer (IBF)

For write access to the message buffers configured in the Message RAM, the Host can write the header and data section for a specific message buffer to the Input Buffer. The Message Handler then transfers the data from the Input Buffer to the selected message buffer in the Message RAM.

#### Output Buffer (OBF)

For read access to a message buffer configured in the Message RAM the Message Handler transfers the selected message buffer to the Output Buffer. After the transfer has completed, the Host can read the header and data section of the transferred message buffer from the Output Buffer.

#### Message Handler (MHD)

The FlexRay Message Handler controls data transfers between the following components:

- Input/Output Buffer and Message RAM

- Temporary buffer RAMs of the two FlexRay Protocol Controllers and Message RAM

### **Message RAM (MRAM)**

The Message RAM consists of a single-ported RAM that stores up to 128 FlexRay message buffers together with the related configuration data (header and data partition).

### **Temporary buffer RAM (TBF A/B)**

Stores the data section of two complete messages.

### **FlexRay Channel Protocol Controller (PRT A/B)**

The FlexRay Channel Protocol Controllers consist of shift register and FlexRay protocol FSM. They are connected to the Temporary buffer RAMs for intermediate message storage and to the physical layer via bus driver (BD).

This controller has the following functionality:

- Control and check of bit timing
- Reception/transmission of FlexRay frames and symbols
- Check of header CRC
- Generation/check of frame CRC
- Interfacing with bus driver

### **Global Time Unit (GTU)**

The Global Time Unit performs the following functions:

- Generation of microtick ( $\mu T$ )
- Generation of macrotick (MT)
- Fault tolerant clock synchronization, by FTM algorithm, for:
  - rate correction
  - offset correction
- Cycle counter
- Timing control of static segment
- Timing control of dynamic segment (minislottling)
- Support of external clock correction

### **System Universal Control (SUC)**

The System Universal Controller has the following functions:

- Configuration
- Wakeup
- Startup
- Normal Operation
- Passive Operation

### Frame and Symbol Processing (FSP)

The Frame and Symbol Processing has the following functions:

- Checks whether the timing of frames and symbols is correct or not
- Checks whether the syntax and semantics of the received frame are correct or not
- Sets the slot status flags

### Network Management (NEM)

Handles the network management vector.

### Interrupt Control (INT)

The Interrupt Controller has the following functions:

- Provides error and status interrupt flags
- Enables and disables interrupt sources
- Assignment of interrupt sources to one of the two general module interrupt lines
- Enables and disables module interrupt lines

### Timer (TIM)

The Timer module includes the following macrotick timer:

- Two absolute timers
- One relative timer
- One stop watch timer

### Transfer Handler (TRH)

Handles the data transfer between local RAM/global RAM and FlexRay module. The Transfer Handler supports the following transfer types:

- Transfer of buffer configuration data from the local RAM/global RAM to the Message RAM
- Transfer of payload data for temporary buffers from the local RAM/global RAM to the Message RAM
- Transfer of buffer configuration data and payload data for temporary buffer from the local RAM/global RAM to the Message RAM
- Automatic transfer of payload data from receive buffer to the local RAM/global RAM upon frame reception
- Automatic transfer of payload data, buffer configuration data and message buffer status data from receive buffer to the local RAM/global RAM upon frame reception
- Automatic transfer of buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the local RAM/global RAM in response to slot status update
- Manual transfer of payload data, buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the local RAM/global RAM

## 25.2 Registers

### 25.2.1 List of Registers

The FLXAn registers are listed in the following table.

For details on <FLXAn\_base>, see **Section 25.1.2, Register Base Address**.

Table 25.20 List of Registers

Module Name	Register Name	Symbol	Address
FLXAn	FlexRay operation control register	FLXAnFROC	<FLXAn_base> + 0004 <sub>H</sub>
	FlexRay operation status register	FLXAnFROS	<FLXAn_base> + 000C <sub>H</sub>
	FlexRay test register 1	FLXAnFRTEST1	<FLXAn_base> + 0010 <sub>H</sub>
	FlexRay test register 2	FLXAnFRTEST2	<FLXAn_base> + 0014 <sub>H</sub>
	FlexRay lock register	FLXAnFRLCK	<FLXAn_base> + 001C <sub>H</sub>
	FlexRay error interrupt register	FLXAnFREIR	<FLXAn_base> + 0020 <sub>H</sub>
	FlexRay status interrupt register	FLXAnFRSIR	<FLXAn_base> + 0024 <sub>H</sub>
	FlexRay error interrupt line select register	FLXAnFREILS	<FLXAn_base> + 0028 <sub>H</sub>
	FlexRay status interrupt line select register	FLXAnFRSILS	<FLXAn_base> + 002C <sub>H</sub>
	FlexRay error interrupt enable set register	FLXAnFREIES	<FLXAn_base> + 0030 <sub>H</sub>
	FlexRay error interrupt enable reset register	FLXAnFREIER	<FLXAn_base> + 0034 <sub>H</sub>
	FlexRay status interrupt enable set register	FLXAnFRSIES	<FLXAn_base> + 0038 <sub>H</sub>
	FlexRay status interrupt disable register	FLXAnFRSIER	<FLXAn_base> + 003C <sub>H</sub>
	FlexRay interrupt line enable register	FLXAnFRILE	<FLXAn_base> + 0040 <sub>H</sub>
	FlexRay timer 0 configuration register	FLXAnFRTOC	<FLXAn_base> + 0044 <sub>H</sub>
	FlexRay timer 1 configuration register	FLXAnFRT1C	<FLXAn_base> + 0048 <sub>H</sub>
	FlexRay stop watch register 1	FLXAnFRSTPW1	<FLXAn_base> + 004C <sub>H</sub>
	FlexRay stop watch register 2	FLXAnFRSTPW2	<FLXAn_base> + 0050 <sub>H</sub>
	FlexRay SUC configuration register 1	FLXAnFRSUCC1	<FLXAn_base> + 0080 <sub>H</sub>
	FlexRay SUC configuration register 2	FLXAnFRSUCC2	<FLXAn_base> + 0084 <sub>H</sub>
	FlexRay SUC configuration register 3	FLXAnFRSUCC3	<FLXAn_base> + 0088 <sub>H</sub>
	FlexRay NEM configuration register	FLXAnFRNEMC	<FLXAn_base> + 008C <sub>H</sub>
	FlexRay PRT configuration register 1	FLXAnFRPRTC1	<FLXAn_base> + 0090 <sub>H</sub>
	FlexRay PRT configuration register 2	FLXAnFRPRTC2	<FLXAn_base> + 0094 <sub>H</sub>
	FlexRay MHD configuration register	FLXAnFRMHDC	<FLXAn_base> + 0098 <sub>H</sub>
	FlexRay GTU configuration register 1	FLXAnFRGTUC1	<FLXAn_base> + 00A0 <sub>H</sub>
	FlexRay GTU configuration register 2	FLXAnFRGTUC2	<FLXAn_base> + 00A4 <sub>H</sub>
	FlexRay GTU configuration register 3	FLXAnFRGTUC3	<FLXAn_base> + 00A8 <sub>H</sub>
	FlexRay GTU configuration register 4	FLXAnFRGTUC4	<FLXAn_base> + 00AC <sub>H</sub>
	FlexRay GTU configuration register 5	FLXAnFRGTUC5	<FLXAn_base> + 00B0 <sub>H</sub>
	FlexRay GTU configuration register 6	FLXAnFRGTUC6	<FLXAn_base> + 00B4 <sub>H</sub>
	FlexRay GTU configuration register 7	FLXAnFRGTUC7	<FLXAn_base> + 00B8 <sub>H</sub>
	FlexRay GTU configuration register 8	FLXAnFRGTUC8	<FLXAn_base> + 00BC <sub>H</sub>
	FlexRay GTU configuration register 9	FLXAnFRGTUC9	<FLXAn_base> + 00C0 <sub>H</sub>
	FlexRay GTU configuration register 10	FLXAnFRGTUC10	<FLXAn_base> + 00C4 <sub>H</sub>
	FlexRay GTU configuration register 11	FLXAnFRGTUC11	<FLXAn_base> + 00C8 <sub>H</sub>
	FlexRay CC status vector register	FLXAnFRCCSV	<FLXAn_base> + 0100 <sub>H</sub>
	FlexRay CC error vector register	FLXAnFRCCEV	<FLXAn_base> + 0104 <sub>H</sub>

Table 25.20 List of Registers

Module Name	Register Name	Symbol	Address
FLXAn	FlexRay slot counter value register	FLXAnFRSCV	<FLXAn_base> + 0110 <sub>H</sub>
	FlexRay macrotick and cycle counter value register	FLXAnFRMTCCV	<FLXAn_base> + 0114 <sub>H</sub>
	FlexRay rate correction value register	FLXAnFRRCV	<FLXAn_base> + 0118 <sub>H</sub>
	FlexRay offset correction value register	FLXAnFROCV	<FLXAn_base> + 011C <sub>H</sub>
	FlexRay sync frame status register	FLXAnFRSFS	<FLXAn_base> + 0120 <sub>H</sub>
	FlexRay symbol window and NIT status register	FLXAnFRSWNIT	<FLXAn_base> + 0124 <sub>H</sub>
	FlexRay aggregated channel status register	FLXAnFRACS	<FLXAn_base> + 0128 <sub>H</sub>
	FlexRay even sync ID register m (m = 1 to 15)	FLXAnFRESIDm (m = 1 to 15)	<FLXAn_base> + 0130 <sub>H</sub> to <FLXAn_base> + 0168 <sub>H</sub> (<FLXAn_base> + 0130 <sub>H</sub> + (m - 1) × 4 <sub>H</sub> )
	FlexRay odd sync ID register m (m = 1 to 15)	FLXAnFROSIDm (m = 1 to 15)	<FLXAn_base> + 0170 <sub>H</sub> to <FLXAn_base> + 01A8 <sub>H</sub> (<FLXAn_base> + 0170 <sub>H</sub> + (m - 1) × 4 <sub>H</sub> )
	FlexRay network management vector register m (m = 1 to 3)	FLXAnFRNMVm (m = 1 to 3)	<FLXAn_base> + 01B0 <sub>H</sub> to <FLXAn_base> + 01B8 <sub>H</sub> (<FLXAn_base> + 01B0 <sub>H</sub> + (m - 1) × 4 <sub>H</sub> )
	FlexRay message RAM configuration register	FLXAnFRMRC	<FLXAn_base> + 0300 <sub>H</sub>
	FlexRay FIFO rejection filter register	FLXAnFRFRF	<FLXAn_base> + 0304 <sub>H</sub>
	FlexRay FIFO rejection filter mask register	FLXAnFRFRFM	<FLXAn_base> + 0308 <sub>H</sub>
	FlexRay FIFO critical level register	FLXAnFRFCL	<FLXAn_base> + 030C <sub>H</sub>
	FlexRay message handler status register	FLXAnFRMHDS	<FLXAn_base> + 0310 <sub>H</sub>
	FlexRay last dynamic transmit slot register	FLXAnFRLDTS	<FLXAn_base> + 0314 <sub>H</sub>
	FlexRay FIFO status register	FLXAnFRFSR	<FLXAn_base> + 0318 <sub>H</sub>
	FlexRay message handler constraints flags register	FLXAnFRMHDF	<FLXAn_base> + 031C <sub>H</sub>
	FlexRay transmission request register i (i = 1 to 4)	FLXAnFRTRQi (i = 1 to 4)	<FLXAn_base> + 0320 <sub>H</sub> to <FLXAn_base> + 032C <sub>H</sub> (<FLXAn_base> + 0320 <sub>H</sub> + (i - 1) × 4 <sub>H</sub> )
	FlexRay new data register i (i = 1 to 4)	FLXAnFRNDATi (i = 1 to 4)	<FLXAn_base> + 0330 <sub>H</sub> to <FLXAn_base> + 033C <sub>H</sub> (<FLXAn_base> + 0330 <sub>H</sub> + (i - 1) × 4 <sub>H</sub> )
	FlexRay message buffer status changed register i (i = 1 to 4)	FLXAnFRMBSCi (i = 1 to 4)	<FLXAn_base> + 0340 <sub>H</sub> to <FLXAn_base> + 034C <sub>H</sub> (<FLXAn_base> + 0340 <sub>H</sub> + (i - 1) × 4 <sub>H</sub> )
	FlexRay write data section register x (x = 1 to 64)	FLXAnFRWRDSx (x = 1 to 64)	<FLXAn_base> + 0400 <sub>H</sub> to <FLXAn_base> + 04FC <sub>H</sub> (<FLXAn_base> + 0400 <sub>H</sub> + (x - 1) × 4 <sub>H</sub> )
	FlexRay write header section register 1	FLXAnFRWRHS1	<FLXAn_base> + 0500 <sub>H</sub>
	FlexRay write header section register 2	FLXAnFRWRHS2	<FLXAn_base> + 0504 <sub>H</sub>
	FlexRay write header section register 3	FLXAnFRWRHS3	<FLXAn_base> + 0508 <sub>H</sub>
	FlexRay input buffer command mask register	FLXAnFRIBCM	<FLXAn_base> + 0510 <sub>H</sub>
	FlexRay input buffer command request register	FLXAnFRIBCR	<FLXAn_base> + 0514 <sub>H</sub>
	FlexRay read data section register x (x = 1 to 64)	FLXAnFRRDDs (x = 1 to 64)	<FLXAn_base> + 0600 <sub>H</sub> to <FLXAn_base> + 06FC <sub>H</sub> (<FLXAn_base> + 0600 <sub>H</sub> + (x - 1) × 4 <sub>H</sub> )
	FlexRay read header section register 1	FLXAnFRRDHS1	<FLXAn_base> + 0700 <sub>H</sub>
	FlexRay read header section register 2	FLXAnFRRDHS2	<FLXAn_base> + 0704 <sub>H</sub>
	FlexRay read header section register 3	FLXAnFRRDHS3	<FLXAn_base> + 0708 <sub>H</sub>
	FlexRay message buffer status register	FLXAnFRMBS	<FLXAn_base> + 070C <sub>H</sub>
	FlexRay output buffer command mask register	FLXAnFROBCM	<FLXAn_base> + 0710 <sub>H</sub>

Table 25.20 List of Registers

Module Name	Register Name	Symbol	Address
FLXAn	FlexRay output buffer command request register	FLXAnFROBCR	<FLXAn_base> + 0714 <sub>H</sub>
	FlexRay input transfer configuration register	FLXAnFRITC	<FLXAn_base> + 0800 <sub>H</sub>
	FlexRay output transfer configuration register	FLXAnFROTC	<FLXAn_base> + 0804 <sub>H</sub>
	FlexRay input pointer table base address register	FLXAnFRIBA	<FLXAn_base> + 0808 <sub>H</sub>
	FlexRay FIFO pointer table base address register	FLXAnFRFBA	<FLXAn_base> + 080C <sub>H</sub>
	FlexRay output pointer table base address register	FLXAnFROBA	<FLXAn_base> + 0810 <sub>H</sub>
	FlexRay input queue control register	FLXAnFRIQC	<FLXAn_base> + 0814 <sub>H</sub>
	FlexRay user input transfer request register	FLXAnFRUIR	<FLXAn_base> + 0818 <sub>H</sub>
	FlexRay user output transfer request register	FLXAnFRUOR	<FLXAn_base> + 081C <sub>H</sub>
	FlexRay Input Transfer Status Register	FLXAnFRITS	<FLXAn_base> + 0820 <sub>H</sub>
	FlexRay output transfer status register	FLXAnFROTS	<FLXAn_base> + 0824 <sub>H</sub>
	FlexRay access error status register	FLXAnFRAES	<FLXAn_base> + 0828 <sub>H</sub>
	FlexRay access error address register	FLXAnFRAEA	<FLXAn_base> + 082C <sub>H</sub>
	FlexRay message data available register i (i = 0 to 3)	FLXAnFRDAi (i = 0 to 3)	<FLXAn_base> + 0830 <sub>H</sub> to <FLXAn_base> + 083C <sub>H</sub> (<FLXAn_base> + 0830 <sub>H</sub> + i × 4 <sub>H</sub> )
	FlexRay H-Bus configuration register	FLXAnFRAHBC	<FLXAn_base> + 0840 <sub>H</sub>
	FlexRay timer 2 configuration register	FLXAnFRT2C	<FLXAn_base> + 0844 <sub>H</sub>

## 25.2.2 FlexRay Operation Register

### 25.2.2.1 FLXAnFROC — FlexRay Operation Control Register

**Access:** FLXAnFROC can be read or written in 32-bit units.

FLXAnFROCL and FLXAnFROCH can be read or written in 16-bit units.

FLXAnFROCLL and FLXAnFROCHL can be read or written in 8-bit units.

**Address:** FLXAnFROC: <FLXAn\_base> + 0004<sub>H</sub>

FLXAnFROCL: <FLXAn\_base> + 0004<sub>H</sub>, FLXAnFROCH: <FLXAn\_base> + 0006<sub>H</sub>

FLXAnFROCLL: <FLXAn\_base> + 0004<sub>H</sub>, FLXAnFROCHL: <FLXAn\_base> + 0006<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	T2IE	T1IE	T0IE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W

Table 25.21 FLXAnFROC Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	T2IE	Timer 2 interrupt enable Bit 0: Disabled 1: Enabled
17	T1IE	Timer 1 interrupt enable Bit 0: Disabled 1: Enabled
16	T0IE	Timer 0 interrupt enable Bit 0: Disabled 1: Enabled
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	OEP	Operation Enable bit Protection Bit 0: OE is unprotected 1: OE is protected
6 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	BEC	Byte Endian Control Bit 0: Little endian 1: Big endian
0	OE	Operation Enable Bit 0: Operation disabled, SW reset 1: Operation Enabled

**(1) FLXAnFROC.T2IE**

Timer 2 interrupt enable bit

This bit controls the timer 2 interrupt.

0: Disabled

No interrupt will be requested and the timer 2 interrupt line will be released if pending.

1: Enabled

Timer 2 interrupt will be asserted when FLXAnFROTS.T2IS is 1.

**(2) FLXAnFROC.T1IE**

Timer 1 interrupt enable bit

The user can only set this bit to 1 when timer 1 interrupt is not enabled in the FlexRay Status interrupt enable register (FLXAnFRSIES.T1IE is 0).

This bit controls the timer 1 interrupt.

0: Disabled

No interrupt will be requested and the timer 1 interrupt line will be released if pending.

1: Enabled

Timer 1 interrupt will be asserted when FLXAnFROTS.T1IS is 1.

**(3) FLXAnFROC.T0IE**

Timer 0 interrupt enable bit

The user can only set this bit to 1 when timer 0 interrupt is not enabled in the FlexRay Status interrupt enable register (FLXAnFRSIES.T0IE is 0).

This bit controls the timer 0 interrupt.

0: Disabled

No interrupt will be requested and the timer 0 interrupt line will be released if pending.

1: Enabled

Timer 0 interrupt will be asserted when FLXAnFROTS.T0IS is 1.

**(4) FLXAnFROC.OEP**

Operation Enable bit Protection bit

This bit protects against unintended write access to the OE bit.

0: OE is unprotected

Write access to the OE bit is enabled

1: OE is protected

Write access to the OE bit is disabled

**(5) FLXAnFROC.BEC**

Byte Endian Control bit

The user can only change this bit when FLXAnFROS.OS is 1.

This bit controls the byte order on reading and writing the FlexRay Network Management Vector register (FLXAnFRNMVm), FlexRay Write Data Section (FLXAnFRWRDSx) and FlexRay Read Data Section (FLXAnFRRDDSx). This bit also controls the byte order when reading or writing FlexRay payload data using the data transfer function.

For details about the byte alignment please refer to **Section 25.3.17, Byte Alignment**.

0: Little endian

Byte alignment in FLXAnFRNMVm, FLXAnFRWRDSx and FLXAnFRRDDSx is in little endian style.

1: Big endian

Byte alignment in FLXAnFRNMVm, FLXAnFRWRDSx and FLXAnFRRDDSx is in big endian style.

**(6) FLXAnFROC.OE**

Operation Enable bit

The user can only write to this bit when FLXAnFROC.OEP is 0.

The user should only write this bit with 0 when FLXAnFROS.OS is 1.

The user should only write this bit with 1 when FLXAnFROS.OS is 0 and the FlexRay sample clock is enabled.

This bit controls the operation state and executes the software reset of the FlexRay module. The operation status bit (FLXAnFROS.OS) indicates whether the FlexRay module is in reset state or not.

0: Operation disabled, SW reset

Forcibly moves the FlexRay module to its reset state, whatever the state of the FlexRay module is.

1: Operation Enabled

Reset state of the FlexRay module is released.

### 25.2.2.2 FLXAnFROS — FlexRay Operation Status Register

**Access:** FLXAnFROS can be read or written in 32-bit units.  
 FLXAnFROSL is a read-only register that can be read in 16-bit units.  
 FLXAnFROSH can be read or written in 16-bit units.  
 FLXAnFROSLL is a read-only register that can be read in 8-bit units.  
 FLXAnFROSHL can be read or written in 8-bit units.

**Address:** FLXAnFROS: <FLXAn\_base> + 000C<sub>H</sub>  
 FLXAnFROSL: <FLXAn\_base> + 000C<sub>H</sub>, FLXAnFROSH: <FLXAn\_base> + 000E<sub>H</sub>,  
 FLXAnFROSLL: <FLXAn\_base> + 000C<sub>H</sub>, FLXAnFROSHL: <FLXAn\_base> + 000E<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 25.22 FLXAnFROS Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	T2IS	Timer 2 Interrupt Status Bit 0: Timer 2 has not matched the conditions configured in the FLXAnFRT2C register 1: Timer 2 matched the conditions configured in the FLXAnFRT2C register
17	T1IS	Timer 1 Interrupt Status Bit 0: Timer 1 has not matched the conditions configured in the FLXAnFRT1C register 1: Timer 1 matched the conditions configured in the FLXAnFRT1C register
16	T0IS	Timer 0 Interrupt Status Bit 0: Timer 0 has not matched the conditions configured in the FLXAnFRT0C register 1: Timer 0 matched the conditions configured in the FLXAnFRT0C register
15 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	OS	Operation Status Bit 0: Operation disabled, reset state 1: Operation enabled

#### (1) FLXAnFROS.T2IS

##### Timer 2 Interrupt Status Bit

Writing 0 has no effect on the bit value.

This bit indicates that the expiration criteria configured in FLXAnFRT2C register has matched the FlexRay local time. If enabled in FLXAnFROC.T2IE the timer 2 interrupt is generated when FLXAnFROS.T2IS is 1.

[Clearing condition]

This bit is cleared by writing 1 to FLXAnFROS.T2IS.

This bit is cleared when FLXAnFROS.OS changes from 1 to 0.

[Setting condition]

This bit is set when the expiration criteria configured in FLXAnFRT2C matches the FlexRay local time.

## (2) FLXAnFROS.T1IS

Timer 1 Interrupt Status Bit

Writing 0 has no effect on the bit value.

This bit indicates that the expiration criteria configured in FLXAnFRT1C register has matched the FlexRay local time.

If enabled in FLXAnFROC.T1IE the timer 1 interrupt is generated when FLXAnFROS.T1IS is 1.

[Clearing condition]

This bit is cleared by writing 1 to FLXAnFROS.T1IS.

This bit is cleared when FLXAnFROS.OS changes from 1 to 0.

[Setting condition]

This bit is set when the expiration criteria configured in FLXAnFRT1C matches the FlexRay local time.

## (3) FLXAnFROS.T0IS

Timer 0 Interrupt Status Bit

Writing 0 has no effect on the bit value.

This bit indicates that the expiration criteria configured in FLXAnFRT0C register has matched the FlexRay local time.

If enabled in FLXAnFROC.T0IE the timer 0 interrupt is generated when FLXAnFROS.T0IS is 1.

[Clearing condition]

This bit is cleared by writing 1 to FLXAnFROS.T0IS.

This bit is cleared when FLXAnFROS.OS changes from 1 to 0.

[Setting condition]

This bit is set when the expiration criteria configured in FLXAnFRT0C matches the FlexRay local time.

## (4) FLXAnFROS.OS

Operation Status Bit

This bit indicates if the FlexRay module is in the reset or the operation state.

When FLXAnFROS.OS is 0 the FlexRay module gets initialized and registers mapped to the address area  $\langle \text{FLXAn\_base} \rangle + 0010_{\text{H}}$  to  $\langle \text{FLXAn\_base} \rangle + 0FFF_{\text{H}}$  cannot be accessed; read access from these registers will return undefined data.

When FLXAnFROS.OS is 1 it is possible to access to the address area  $\langle \text{FLXAn\_base} \rangle + 0010_{\text{H}}$  to  $\langle \text{FLXAn\_base} \rangle + 0FFF_{\text{H}}$  and to perform FlexRay communication.

When FLXAnFROS.OS changes from 0 to 1 all registers in the address range  $\langle \text{FLXAn\_base} \rangle + 0010_{\text{H}}$  to  $\langle \text{FLXAn\_base} \rangle + 0FFF_{\text{H}}$  are set to the “Values after reset”.

[Clearing condition]

When FLXAnFROC.OE is set to 0. It takes up to two peripheral bus clock cycles until FLXAnFROS.OS is set to 0.

[Setting condition]

When FLXAnFROC.OE is set to 1 it takes up to four peripheral clock cycles of the clock with the lower frequency out of the FlexRay sample clock and peripheral bus clock until FLXAnFROS.OS is set to 1.

## 25.2.3 Special Registers

### 25.2.3.1 FLXAnFRTEST1 — FlexRay Test Register 1

The FlexRay Test Register 1 holds the control bits to configure the test modes of the FlexRay module.

When the FlexRay is operated in one of its test modes that requires FLXAnFRTEST1.WRTEN to be set (RAM Test Mode, I/O Test Mode, Asynchronous Transmit Mode, and Loop Back Mode) only the selected test mode functionality is available.

To return from test mode operation to regular FlexRay operation we strongly recommend to apply a reset using FLXAnFROC.OE to reset all FlexRay internal state machines to their initial state.

The test functions are not available in addition to the normal operational mode functions, they change the functions of parts of the FlexRay module. Therefore normal operation as specified outside this chapter and as required by the FlexRay protocol specification and the FlexRay conformance test is not possible. Test mode functions may not be combined with each other or with FlexRay protocol functions.

The test mode features are intended for hardware testing or for FlexRay bus analyzer tools. They are not intended to be used in FlexRay applications.

**Access:** FLXAnFRTEST1 can be read or written in 32-bit units.

**Address:** FLXAnFRTEST1: <FLXAn\_base> + 0010<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

**(1) FLXAnFRTEST1.CERB**

Coding Error Report Channel B

Set when a coding error is detected on channel B.

Reset to zero when register FLXAnFRTEST1 is read or written. Once the FLXAnFRTEST1.CERB is set it will remain unchanged until FLXAnFRTEST1 register is accessed.

**NOTES**

---

1. Coding errors are signalled in all states where frame decoding is possible. FLXAnFRTEST1.CERB should be ignored in all other states.
  2. The error codes regarding CAS/MTS symbols concern only the monitored bit pattern, irrelevant whether those bit patterns are seen in the symbol window or elsewhere.
- 

**(2) FLXAnFRTEST1.CERA**

Coding Error Report Channel A

Set when a coding error is detected on channel A.

Reset to zero when register FLXAnFRTEST1 is read or written. Once the FLXAnFRTEST1.CERA is set it will remain unchanged until FLXAnFRTEST1 register is accessed.

**NOTES**

---

1. Coding errors are signalled in all states where frame decoding is possible. FLXAnFRTEST1.CERA should be ignored in all other states.
  2. The error codes regarding CAS/MTS symbols concern only the monitored bit pattern, irrelevant whether those bit patterns are seen in the symbol window or elsewhere.
- 

**(3) FLXAnFRTEST1.TXENB**

Control of Channel B Transmit Enable Pin

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.

This bit is used to test the interface to the physical layer (connectivity test) by driving the FLXAnTENB pin.

**(4) FLXAnFRTEST1.TXENA**

Control of Channel A Transmit Enable Pin

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.

This bit is used to test the interface to the physical layer (connectivity test) by driving the FLXAnTENA pin.

**(5) FLXAnFRTEST1.TXB**

Control of Channel B Transmit Pin

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.

This bit is used to test the interface to the physical layer (connectivity test) by driving the FLXAnTXDB pin.

**(6) FLXAnFRTEST1.TXA**

Control of Channel A Transmit Pin

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.

This bit is used to test the interface to the physical layer (connectivity test) by driving the FLXAnTXDA pin.

**(7) FLXAnFRTEST1.RXB**

Monitor Channel B Receive Pin

This bit is used to test the interface to the physical layer (connectivity test) by reading the FLXAnRXDB pin.

**(8) FLXAnFRTEST1.RXA**

Monitor Channel A Receive Pin

This bit is used to test the interface to the physical layer (connectivity test) by reading the FLXAnRXDA pin.

**(9) FLXAnFRTEST1.AOB**

Activity on B

FLXAnFRTEST1.AOB is set when there is activity on channel B or if the POC state is in DEFAULT\_CONFIG or CONFIG state.

During STARTUP, NORMAL\_ACTIVE or NORMAL\_PASSIVE the function of FLXAnFRTEST1.AOB is inverse of zChannelIdle as specified in *the FlexRay protocol specification V2.1, Section 3, BITSTRB process*.

FLXAnFRTEST1.AOB should be ignored in all other POC states.

**(10) FLXAnFRTEST1.AOA**

Activity on A

FLXAnFRTEST1.AOA is set when there is activity on channel A or if the POC state is in DEFAULT\_CONFIG or CONFIG state.

During STARTUP, NORMAL\_ACTIVE or NORMAL\_PASSIVE the function of FLXAnFRTEST1.AOA is inverse of zChannelIdle as specified in *the FlexRay protocol specification V2.1, Section 3, BITSTRB process*.

FLXAnFRTEST1.AOA should be ignored in all other POC states.

**(11) FLXAnFRTEST1.TMC**

Test Multiplexer Control

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.

00<sub>B</sub> = Normal signal path

01<sub>B</sub> = RAM Test Mode

Internal busses are multiplexed to make the Message RAM, Transient buffer RAM A and Transient buffer RAM B of the FlexRay module directly accessible by the Host. This mode is intended to enable testing of the FlexRay RAM during product testing.

10<sub>B</sub> = I/O Test Mode

Output pins FLXAnTXDA, FLXAnTXDB, FLXAnTENA, FLXAnTENB, are driven to the values defined by bits FLXAnFRTEST1.TXA, FLXAnFRTEST1.TXB, FLXAnFRTEST1.TXENA, FLXAnFRTEST1.TXENB. The values applied to the input pins FLXAnRXDA, FLXAnRXDB can be read from register bits FLXAnFRTEST1.RXA, FLXAnFRTEST1.RXB.

11<sub>B</sub> = Normal signal path

**(12) FLXAnFRTEST1.ELBE**

External Loop Back Enable

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.

There are two possibilities to perform a Loop Back test. External Loop Back via physical layer or internal Loop Back for in-system self-test.

In case of an internal Loop Back the FlexRay IP module pins FLXAnTENA, FLXAnTENB are in their inactive state, pins FLXAnTXDA, FLXAnTXDB are set to HIGH, pins FLXAnRXDA, FLXAnRXDB are not evaluated. Bit FLXAnFRTEST1.ELBE is evaluated only when POC is in Loop Back Mode and test multiplexer control is in non-multiplexing mode FLXAnFRTEST1.TMC = 00<sub>B</sub>.

**(13) FLXAnFRTEST1.WRTEN**

Write Test Register Enable

To set the bit from 0 to 1 the test mode key has to be written as defined in **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**. Enables write access to the test registers. The unlock sequence is not required when FLXAnFRTEST1.WRTEN is kept at 1 while other bits of the register are changed.

The bit can be reset to 0 at any time.

### 25.2.3.2 FLXAnFRTEST2 — FlexRay Test Register 2

The FlexRay Test Register 2 holds all bits required for the RAM test of the Message RAM, Transient buffer RAM A and Transient buffer RAM B of the FlexRay module.

**Access:** FLXAnFRTEST2 can be read or written in 32-bit units.

**Address:** FLXAnFRTEST2: <FLXAn\_base> + 0014<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

#### (1) FLXAnFRTEST2.SSEL

Segment Select

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to “1”.

To enable access to the complete Message RAM (8192 byte addresses) the Message RAM is segmented into portions of 1024 bytes.

**(2) FLXAnFRTEST2.RS**

RAM Select

Write access to this register is only possible when FLXAnFRTEST1.WRTEN is set to “1”.

In RAM Test mode the RAM blocks selected by FLXAnFRTEST2.RS are mapped to module address <FLXAn\_base> + 0400<sub>H</sub> to ERAY + 07FF<sub>H</sub> (1024 byte addresses).

**25.2.3.3 FLXAnFRLCK — FlexRay Lock Register**

**Access:** FLXAnFRLCK can be read or written in 32-bit units.  
FLXAnFRLCKL can be read or written in 16-bit units.  
FLXAnFRLCKLL can be read or written in 8-bit units.

**Address:** FLXAnFRLCK: <FLXAn\_base> + 001C<sub>H</sub>,  
FLXAnFRLCKL: <FLXAn\_base> + 001C<sub>H</sub>,  
FLXAnFRLCKLL: <FLXAn\_base> + 001C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.25 FLXAnFRLCK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	TMK[7:0]	Test Mode Key Bit
7 to 0	CLK[7:0]	Configuration Lock Key Bit

**(1) FLXAnFRLCK.TMK**

Test Mode Key Bit

The Lock Register is write-only. Reading the register will return 0000 0000<sub>H</sub>.

To write bit FLXAnFRTEST1.WRTEN, the write operation has to be directly preceded by two consecutive write accesses to the Test Mode Key (unlock sequence). If the write sequence below is interrupted by other write accesses between the second write to the Test Mode Key and the write access to the FLXAnFRTEST1 register, FLXAnFRTEST1.WRTEN is not set to 1 and the sequence has to be repeated.

First write: FLXAnFRLCK.TMK = “0111 0101” (75<sub>H</sub>)

Second write: FLXAnFRLCK.TMK = “1000 1010” (8A<sub>H</sub>)

Third write: FLXAnFRTEST1.WRTEN = “1”

**CAUTION**

---

If the Host uses 16-bit accesses to write the listed bit fields, the user has to ensure that no dummy accesses to the remaining register bytes/words are inserted by the compiler.

---

**(2) FLXAnFRLCK.CLK**

Configuration Lock Key Bit

The Lock Register is write-only. Reading the register will return 0000 0000<sub>H</sub>.

To leave CONFIG state by writing FLXAnFRSUCC1.CMD (command READY), the write operation has to be directly preceded by two write accesses to the Configuration Lock Key (unlock sequence). If the write sequence below is interrupted by other write accesses between the second write to the Configuration Lock Key and the write access to the FLXAnFRSUCC1 register, the CC remains in CONFIG state and the sequence has to be repeated.

First write: FLXAnFRLCK.CLK = "1100 1110<sub>B</sub>" (CE<sub>H</sub>)

Second write: FLXAnFRLCK.CLK = "0011 0001<sub>B</sub>" (31<sub>H</sub>)

Third write: FLXAnFRSUCC1.CMD

**CAUTION**

---

If the Host uses 8/16-bit accesses to write the listed bit fields, the user has to ensure that no dummy accesses to the remaining register bytes/words are inserted by the compiler.

---

## 25.2.4 Interrupt Registers

### 25.2.4.1 FLXAnFREIR — FlexRay Error Interrupt Register

The flags are set when the CC detects one of the listed error conditions. The flags remain set until cleared.

**Access:** FLXAnFREIR can be read or written in 32-bit units.

FLXAnFREIRL and FLXAnFREIRH can be read or written in 16-bit units.

FLXAnFREIRLL, FLXAnFREIRLH, FLXAnFREIRHL, and FLXAnFREIRHH can be read or written in 8-bit units.

**Address:** FLXAnFREIR: <FLXAn\_base> + 0020<sub>H</sub>,

FLXAnFREIRL: <FLXAn\_base> + 0020<sub>H</sub>, FLXAnFREIRH: <FLXAn\_base> + 0022<sub>H</sub>,

FLXAnFREIRLL: <FLXAn\_base> + 0020<sub>H</sub>, FLXAnFREIRLH: <FLXAn\_base> + 0021<sub>H</sub>,

FLXAnFREIRHL: <FLXAn\_base> + 0022<sub>H</sub>, FLXAnFREIRHH: <FLXAn\_base> + 0023<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	TABB	Transmission Across Boundary Channel B Flag 0: No transmission across slot boundary detected on channel B 1: Transmission across slot boundary detected on channel B
25	LTVB	Latest Transmit Violation Channel B Flag 0: No latest transmit violation detected on channel B 1: Latest transmit violation detected on channel B
24	EDB	Error Detected on Channel B Flag 0: No error detected on channel B 1: Error detected on channel B
23 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	TABA	Transmission Across Boundary Channel A Flag 0: No transmission across slot boundary detected on channel A 1: Transmission across slot boundary detected on channel A
17	LTVA	Latest Transmit Violation Channel A Flag 0: No latest transmit violation detected on channel A 1: Latest transmit violation detected on channel A
16	EDA	Error Detected on Channel A Flag 0: No error detected on channel A 1: Error detected on channel A
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 25.26 FLXAnFREIR Register Contents

Bit Position	Bit Name	Function
11	MHF	Message Handler Constraints Flag 0: No message handler constraint violation detected 1: Message handler constraint violation detected
10	IOBA	Illegal Output buffer Access Flag 0: No illegal Host access to Output Buffer occurred 1: Illegal Host access to Output Buffer occurred
9	IIBA	Illegal Input Buffer Access Flag 0: No illegal Host access to Input Buffer occurred 1: Illegal Host access to Input Buffer occurred
8	EFA	Empty FIFO Access Flag 0: No access to empty FIFO occurred 1: Access to empty FIFO occurred
7	RFO	Receive FIFO Overrun Flag 0: No receive FIFO overrun detected 1: A receive FIFO overrun has been detected
6	AERR	Access error Flag 0: Access error is not detected. 1: Access error is detected.
5	CCL	CHI Command Locked Flag 0: CHI command not accepted 1: CHI command accepted
4	CCF	Clock Correction Failure Flag 0: No clock correction error 1: Clock correction failed
3	SFO	Sync Frame Overflow Flag 0: Number of received sync frames $\leq$ FLXAnFRGTUC2 1: More sync frames received than configured by FLXAnFRGTUC2
2	SFBM	Sync Frames Below Minimum Flag 0: Sync node: 1 or more sync frames received, non-sync node: 2 or more sync frames received 1: Less than the required minimum of sync frames received
1	CNA	Command Not Accepted Flag 0: CHI command accepted 1: CHI command not accepted
0	PEMC	POC Error Mode Changed Flag 0: Error mode has not changed 1: Error mode has changed

**(1) FLXAnFREIR.TABB**

Transmission Across Boundary Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

The flag indicates that a transmission across a slot boundary occurred for channel B.

**(2) FLXAnFREIR.LTVB**

Latest Transmit Violation Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

The flag indicates to the CPU that a latest transmission violation occurred on channel B.

**(3) FLXAnFREIR.EDB**

Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This bit is set whenever one of the flags FLXAnFRACS.SEDB, FLXAnFRACS.CEDB, FLXAnFRACS.CIB, FLXAnFRACS.SBVB changes from 0 to 1.

**(4) FLXAnFREIR.TABA**

Transmission Across Boundary Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

The flag indicates that a transmission across a slot boundary occurred for channel A.

**(5) FLXAnFREIR.LTVA**

Latest Transmit Violation Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

The flag indicates to the CPU that a latest transmit violation occurred on channel A.

**(6) FLXAnFREIR.EDA**

Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This bit is set whenever one of the flags FLXAnFRACS.SEDA, FLXAnFRACS.CEDA, FLXAnFRACS.CIA, FLXAnFRACS.SBVA changes from 0 to 1.

**(7) FLXAnFREIR.MHF**

Message Handler Constraints Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

The flag indicates a Message Handler constraint violation condition. It is set whenever one of the flags FLXAnFRMHDF.SNUA, FLXAnFRMHDF.SNUB, FLXAnFRMHDF.FNFA, FLXAnFRMHDF.FNFB, FLXAnFRMHDF.TBFA, FLXAnFRMHDF.TBFB, FLXAnFRMHDF.WAHP changes from 0 to 1.

**(8) FLXAnFREIR.IOBA**

Illegal Output buffer Access Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC when the Host requests the transfer of a message buffer from the Message RAM to the Output Buffer while FLXAnFROBCR.OBSYS is set to 1.

**(9) FLXAnFREIR.IIBA**

Illegal Input Buffer Access Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC when the Host wants to modify a message buffer via Input Buffer and one of the following conditions applies:

1. The CC is not in CONFIG or DEFAULT\_CONFIG state and the Host writes to the Input Buffer Command Request register to modify the
  - Header section of message buffer 0 or 1 configured as a key slot
  - Header section of static message buffers with buffer number < FLXAnFRMRC.FDB while FLXAnFRMRC.SEC = "01<sub>B</sub>"
  - Header section of any static or dynamic message buffer while FLXAnFRMRC.SEC = "1<sub>B</sub>"
  - Header and/or data section of any message buffer belonging to the receive FIFO
2. The Host writes to any register of the Input Buffer while FLXAnFRIBCR.IBSYH is set to 1.

**(10) FLXAnFREIR.EFA**

Empty FIFO Access Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set when the Host requests the transfer of a message from the receive FIFO via Output Buffer while the receive FIFO is empty.

**(11) FLXAnFREIR.RFO**

Receive FIFO Overrun Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

The flag is set by the CC when a receive FIFO overrun is detected. When a receive FIFO overrun occurs, the oldest message is overwritten with a new message. The current state of the FIFO is monitored in register FLXAnFRFSR.

**(12) FLXAnFREIR.AERR**

Access error flag Flag

Writing 0 in this bit has no effect.

This bit is cleared when writing 1 to it.

Notifies of an access error.

When the AMR, ATBF1, or ATBF2 bit in the FLXAnFRMHDS register changes from 0 to 1, this bit is set to 1.

**(13) FLXAnFREIR.CCL**

CHI Command Locked Flag

Writing 0 has no effect on the bit value. This bit is cleared by writing 1 to it.

The flag indicates that the write access to the CHI command vector FLXAnFRSUCC1.CMD was not successful because the execution of the previous CHI command has not yet completed. In this case bit FLXAnFREIR.CNA is also set to 1.

**(14) FLXAnFREIR.CCF**

Clock Correction Failure Flag

Writing 0 has no effect on the bit value. This bit is cleared by writing 1 to it.

This flag is set at the end of the communication cycle whenever one of the following errors occurs:

- Offset and/or rate correction incomplete
- Clock correction limit exceeded

The clock correction status is monitored in registers FLXAnFRCCEV and FLXAnFRSFS. A failure may occur during startup, therefore bit FLXAnFREIR.CCF should be set to 0 after the CC entered NORMAL\_ACTIVE state.

**(15) FLXAnFREIR.SFO**

Sync Frame Overflow Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

It is set to 1 when either the number of sync frames received during the last communication cycle or the total number of different sync frame IDs received during the last two cycles exceeds the maximum number of sync frames as defined by FLXAnFRGTUC2.SNM.

**(16) FLXAnFREIR.SFBM**

Sync Frames Below Minimum Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 at the end of a cycle if the number of sync frames received during the last communication cycle was below the limit required for rate or offset correction term calculation (i.e. offset and/or rate correction incomplete). The clock correction status is monitored in FLXAnFRCCEV and FLXAnFRSFS.

This flag may be set to 1 during startup. Therefore this flag should be set to 0 by the Host after the CC entered NORMAL\_ACTIVE state.

**(17) FLXAnFREIR.CNA**

Command Not Accepted Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

The flag indicates that the write access to the CHI command vector FLXAnFRSUCC1.CMD was not successful because the requested command was not valid in the actual POC state, or because the CHI command was locked (FLXAnFREIR.CCL = 1).

**(18) FLXAnFREIR.PEMC**

POC Error Mode Changed Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 whenever the error mode signaled by FLXAnFRCCEV.ERRM changes.

### 25.2.4.2 FLXAnFRSIR — FlexRay Status Interrupt Register

The flags are set when the CC detects one of the listed events. The flags remain set until cleared.

**Access:** FLXAnFRSIR can be read or written in 32-bit units.

FLXAnFRSIRL and FLXAnFRSIRH can be read or written in 16-bit units.

FLXAnFRSIRLL, FLXAnFRSIRLH, FLXAnFRSIRHL, and FLXAnFRSIRHH can be read or written in 8-bit units.

**Address:** FLXAnFRSIR: <FLXAn\_base> + 0024<sub>H</sub>,

FLXAnFRSIRL: <FLXAn\_base> + 0024<sub>H</sub>, FLXAnFRSIRH: <FLXAn\_base> + 0026<sub>H</sub>,

FLXAnFRSIRLL: <FLXAn\_base> + 0024<sub>H</sub>, FLXAnFRSIRLH: <FLXAn\_base> + 0025<sub>H</sub>,

FLXAnFRSIRHL: <FLXAn\_base> + 0026<sub>H</sub>, FLXAnFRSIRHH: <FLXAn\_base> + 0027<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	MTSB	WUPB	—	—	—	—	—	—	MTSA	WUPA

Table 25.27 FLXAnFRSIR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	MTSB	MTS Received on Channel B Flag (vSS!ValidMTSB) 0: No MTS symbol received on channel B 1: MTS symbol received on channel B
24	WUPB	Wakeup Pattern Channel B Flag 0: No wakeup pattern received on channel B 1: Wakeup pattern received on channel B
23 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	MTSA	MTS Received on Channel A Flag (vSS!ValidMTSA) 0: No MTS symbol received on channel A 1: MTS symbol received on channel A
16	WUPA	Wakeup Pattern Channel A Flag 0: No wakeup pattern received on channel A 1: Wakeup pattern received on channel A
15	SDS	Start of Dynamic Segment Flag 0: Dynamic segment not yet started 1: Dynamic segment started
14	MBSI	Message Buffer Status Interrupt Flag 0: No message buffer status change of message buffer with MBI = 1 1: Message buffer status of at least one message buffer with MBI = 1 has changed
13	SUCS	Startup Completed Successfully Flag 0: No startup completed successfully 1: Startup completed successfully
12	SWE	Stop Watch Event Flag 0: No Stop Watch Event 1: Stop Watch Event occurred

Table 25.27 FLXAnFRSIR Register Contents

Bit Position	Bit Name	Function
11	TOBC	OBF Transfer Complete Flag 0: No transfer completed 1: Transfer between Message RAM and Output Buffer completed
10	TIBC	IBF Transfer Complete Flag 0: No transfer completed 1: Transfer between Input Buffer and Message RAM completed
9	TI1	Timer Interrupt 1 Flag 0: No timer interrupt 1 1: Timer interrupt 1 occurred
8	TI0	Timer Interrupt 0 Flag 0: No timer interrupt 0 1: Timer interrupt 0 occurred
7	NMVC	Network Management Vector Changed Flag 0: No change in the network management vector 1: Network management vector changed
6	RFCL	Receive FIFO Critical Level Flag 0: Receive FIFO below critical level 1: Receive FIFO critical level reached
5	RFNE	Receive FIFO Not Empty Flag 0: Receive FIFO is empty 1: Receive FIFO is not empty
4	RXI	Receive Interrupt Flag 0: No ND flag of a receive buffer with MBI = 1 has been set to 1 1: At least one ND flag of a receive buffer with MBI = 1 has been set to 1
3	TXI	Transmit Interrupt Flag 0: No frame transmitted from a transmit buffer with MBI = 1 1: At least one frame was transmitted from a transmit buffer with MBI = 1
2	CYCS	Cycle Start Interrupt Flag 0: No communication cycle started 1: Communication cycle started
1	CAS	Collision Avoidance Symbol Flag 0: No bit pattern matching the CAS symbol received 1: Bit pattern matching the CAS symbol received
0	WST	Wakeup Status Flag 0: Wakeup status unchanged 1: Wakeup status changed

**(1) FLXAnFRSIR.MTSB**

MTS Received on Channel B Flag (vSS!ValidMTSB)

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

Indicates that a Media Access Test Symbol was received on channel B during the preceding symbol window.

Updated by the CC for each channel at the end of the symbol window.

**(2) FLXAnFRSIR.WUPB**

Wakeup Pattern Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 when a wakeup pattern was received on channel B in either of the following states:

- WAKEUP
- READY
- STARTUP state

**(3) FLXAnFRSIR.MTSA**

MTS Received on Channel A Flag (vSS!ValidMTSA)

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

Indicates that a Media Access Test Symbol was received on channel A during the preceding symbol window.

Updated by the CC for each channel at the end of the symbol window.

**(4) FLXAnFRSIR.WUPA**

Wakeup Pattern Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 when a wakeup pattern was received on channel A in either of the following states:

- WAKEUP
- READY
- STARTUP state

**(5) FLXAnFRSIR.SDS**

Start of Dynamic Segment Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC when the dynamic segment starts.

**(6) FLXAnFRSIR.MBSI**

Message Buffer Status Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC when the message buffer status FLXAnFRMBS has changed and if bit MBI of that message buffer is 1 (see **Table 25.120, Header Section of a Message Buffer in the Message RAM**).

**(7) FLXAnFRSIR.SUCS**

Startup Completed Successfully Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set whenever a startup completed successfully and the CC entered NORMAL\_ACTIVE state.

**(8) FLXAnFRSIR.SWE**

Stop Watch Event Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set after a stop watch activation when the current cycle counter and macrotick value are stored in the Stop Watch register (see **Section 25.2.5.4, FLXAnFRSTPW1 — FlexRay Stop Watch Register 1**).

**(9) FLXAnFRSIR.TOBC**

Transfer Output Buffer Completed Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set whenever a transfer from the Message RAM to the Output Buffer has completed and FLXAnFROBCR.OBSYS has been cleared by the Message Handler.

**(10) FLXAnFRSIR.TIBC**

Transfer Input Buffer Completed Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set whenever a transfer from the message RAM to the input buffer has completed and FLXAnFRIBCR.IBSYS has been cleared by the Message Handler.

**(11) FLXAnFRSIR.TI1**

Timer 1 Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set whenever timer 1 matches the conditions configured in register FLXAnFRT1C. FlexRay timer 1 interrupt is generated when the T1IE bit in the FLXAnFROC register is effective.

**(12) FLXAnFRSIR.TI0**

Timer 0 Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set whenever timer 0 matches the conditions configured in register FLXAnFRT0C. FlexRay timer 0 interrupt is generated when the T0IE bit in the FLXAnFROC register is effective.

**(13) FLXAnFRSIR.NMVC**

Network Management Vector Changed Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This is set when a change in the Network Management Vector occurs.

**(14) FLXAnFRSIR.RFCL**

Receive FIFO Critical Level Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set when the receive FIFO fill level FLXAnFRFSR.RFFL is equal to or greater than the critical level as configured by FLXAnFRFCL.CL.

**(15) FLXAnFRSIR.RFNE**

Receive FIFO Not Empty Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC when a received valid frame was stored into the empty receive FIFO. The current state of the receive FIFO is monitored in register FLXAnFRFSR.

**(16) FLXAnFRSIR.RXI**

Receive Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC whenever the set condition of a message buffers ND flag is fulfilled (see **Section 25.2.9.6, FLXAnFRNDAT<sub>i</sub> — FlexRay New Data Register i (i = 1 to 4)**), and if bit MBI of that message buffer is set to 1 (see **Table 25.120, Header Section of a Message Buffer in the Message RAM**)

**(17) FLXAnFRSIR.TXI**

Transmit Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC at the end of frame transmission if bit MBI in the respective message buffer is set to 1 (see **Table 25.120, Header Section of a Message Buffer in the Message RAM**).

**(18) FLXAnFRSIR.CYCS**

Cycle Start Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC when a communication cycle starts.

**(19) FLXAnFRSIR.CAS**

Collision Avoidance Symbol Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC during STARTUP state when a CAS or a potential CAS was received.

**(20) FLXAnFRSIR.WST**

Wakeup Status Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set when FLXAnFRCCSV.WSV changes to a value other than UNDEFINED.

### 25.2.4.3 FLXAnFREILS — FlexRay Error Interrupt Line Select Register

The FlexRay Error Interrupt Line Select register assigns an interrupt generated by a specific error interrupt flag from register FLXAnFREIR to one of the two modules interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt).

**Access:** FLXAnFREILS can be read or written in 32-bit units.  
 FLXAnFREILSL and FLXAnFREILSH can be read or written in 16-bit units.  
 FLXAnFREILSLL, FLXAnFREILSLH, FLXAnFREILSHL, and FLXAnFREILSHH can be read or written in 8-bit units.

**Address:** FLXAnFREILS: <FLXAn\_base> + 0028<sub>H</sub>,  
 FLXAnFREILSL: <FLXAn\_base> + 0028<sub>H</sub>, FLXAnFREILSH: <FLXAn\_base> + 002A<sub>H</sub>,  
 FLXAnFREILSLL: <FLXAn\_base> + 0028<sub>H</sub>, FLXAnFREILSLH: <FLXAn\_base> + 0029<sub>H</sub>,  
 FLXAnFREILSHL: <FLXAn\_base> + 002A<sub>H</sub>, FLXAnFREILSHH: <FLXAn\_base> + 002B<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

### 25.2.4.4 FLXAnFRSILS — FlexRay Status Interrupt Line Select Register

The FlexRay Status Interrupt Line Select register assign an interrupt generated by a specific status interrupt flag from register FLXAnFRSIR to one of the two module interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt).

**Access:** FLXAnFRSILS can be read or written in 32-bit units.  
 FLXAnFRSILSL and FLXAnFRSILSH can be read or written in 16-bit units.  
 FLXAnFRSILSLL, FLXAnFRSILSLH, FLXAnFRSILSHL, and FLXAnFRSILSHH can be read or written in 8-bit units.

**Address:** FLXAnFRSILS: <FLXAn\_base> + 002C<sub>H</sub>,  
 FLXAnFRSILSL: <FLXAn\_base> + 002C<sub>H</sub>, FLXAnFRSILSH: <FLXAn\_base> + 002E<sub>H</sub>,  
 FLXAnFRSILSLL: <FLXAn\_base> + 002C<sub>H</sub>, FLXAnFRSILSLH: <FLXAn\_base> + 002D<sub>H</sub>,  
 FLXAnFRSILSHL: <FLXAn\_base> + 002E<sub>H</sub>, FLXAnFRSILSHH: <FLXAn\_base> + 002F<sub>H</sub>

**Value after reset:** 0303 FFFF<sub>H</sub>

### 25.2.4.5 FLXAnFREIES — FlexRay Error Interrupt Enable Set Register

The settings in the FlexRay Error Interrupt Enable Set register (FLXAnFREIES) and FlexRay Error Interrupt Enable Reset (FLXAnFREIER) register determine which status changes in the FlexRay Error Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value. Writing a 1 sets the interrupt enable bit.

**Access:** FLXAnFREIES can be read or written in 32-bit units.  
 FLXAnFREIESL and FLXAnFREIESH can be read or written in 16-bit units.  
 FLXAnFREIESLL, FLXAnFREIESLH, FLXAnFREIESHL, and FLXAnFREIESHH can be read or written in 8-bit units.

**Address:** FLXAnFREIES: <FLXAn\_base> + 0030<sub>H</sub>,  
 FLXAnFREIESL: <FLXAn\_base> + 0030<sub>H</sub>, FLXAnFREIESH: <FLXAn\_base> + 0032<sub>H</sub>,  
 FLXAnFREIESLL: <FLXAn\_base> + 0030<sub>H</sub>, FLXAnFREIESLH: <FLXAn\_base> + 0031<sub>H</sub>,

### 25.2.4.6 FLXAnFREIER — FlexRay Error Interrupt Enable Reset Register

The settings in the FlexRay Error Interrupt Enable Set register (FLXAnFREIES) and FlexRay Error Interrupt Enable Reset (FLXAnFREIER) register determine which status changes in the FlexRay Error Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value. Writing a 1 clears the interrupt enable bit.

**Access:** FLXAnFREIER can be read or written in 32-bit units.  
 FLXAnFREIERL and FLXAnFREIERH can be read or written in 16-bit units.  
 FLXAnFREIERLL, FLXAnFREIERLH, FLXAnFREIERHL, and FLXAnFREIERHH can be read or written in 8-bit units.

**Address:** FLXAnFREIER: <FLXAn\_base> + 0034<sub>H</sub>,

### 25.2.4.7 FLXAnFRSIES — FlexRay Status Interrupt Enable Set Register

The settings in the FlexRay Status Interrupt Enable Set register (FLXAnFRSIES) and FlexRay Status Interrupt Enable Reset (FLXAnFRSIER) register determine which status changes in the FlexRay Status Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value. Writing a 1 sets the interrupt enable bit.

**Access:** FLXAnFRSIES can be read or written in 32-bit units.  
FLXAnFRSIESL and FLXAnFRSIESH and can be read or written in 16-bit units.  
FLXAnFRSIESLL, FLXAnFRSIESLH, FLXAnFRSIESHL, and FLXAnFRSIESHH can be read or written in 8-bit units.

**Address:** FLXAnFRSIES: <FLXAn\_base> + 0038<sub>H</sub>,

### 25.2.4.8 FLXAnFRSIER — FlexRay Status Interrupt Disable Register

The settings in the FlexRay Status Interrupt Enable Set register (FLXAnFRSIES) and FlexRay Status Interrupt Disable (FLXAnFRSIER) register determine which status changes in the FlexRay Status Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value. Writing a 1 clears the interrupt enable bit.

**Access:** FLXAnFRSIER can be read or written in 32-bit units.  
 FLXAnFRSIERL and FLXAnFRSIERH can be read or written in 16-bit units.  
 FLXAnFRSIERLL, FLXAnFRSIERLH, FLXAnFRSIERHL, and FLXAnFRSIERHH can be read or written in 8-bit units.

**Address:** FLXAnFRSIER: <FLXAn\_base> + 003C<sub>H</sub>,

### 25.2.4.9 FLXAnFRILE — FlexRay Interrupt Line Enable Register

Each of the two module interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt) can be enabled/disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

**Access:** FLXAnFRILE can be read or written in 32-bit units.  
 FLXAnFRILEL can be read or written in 16-bit units.  
 FLXAnFRILELL can be read or written in 8-bit units.

**Address:** FLXAnFRILE: <FLXAn\_base> + 0040<sub>H</sub>,  
 FLXAnFRILEL: <FLXAn\_base> + 0040<sub>H</sub>,

## 25.2.5 FlexRay Timer Registers

### 25.2.5.1 FLXAnFRT0C — FlexRay Timer 0 Configuration Register

This register is an absolute timer. It specifies the point in time when a FlexRay timer 0 interrupt occurs as the values of cycle count and macrotick (MT). When the FlexRay timer 0 passes, FLXAnFRSIR.TI0 and FLXAnFROS.TOIS are set to 1. A timer 0 interrupt then occurs while the FLXAnFROC.TOIE bit is effective.

#### CAUTION

The configuration of timer 0 is compared against the macrotick counter value, there is no separate counter for timer 0.

**Access:** FLXAnFRT0C can be read or written in 32-bit units.  
 FLXAnFRT0CL and FLXAnFRT0CH can be read or written in 16-bit units.  
 FLXAnFRT0CLL, FLXAnFRT0CLH, FLXAnFRT0CHL, and FLXAnFRT0CHH can be read or written in 8-bit units.

**Address:** FLXAnFRT0C: <FLXAn\_base> + 0044<sub>H</sub>,  
 FLXAnFRT0CL: <FLXAn\_base> + 0044<sub>H</sub>, FLXAnFRT0CH: <FLXAn\_base> + 0046<sub>H</sub>,  
 FLXAnFRT0CLL: <FLXAn\_base> + 0044<sub>H</sub>, FLXAnFRT0CLH: <FLXAn\_base> + 0045<sub>H</sub>,  
 FLXAnFRT0CHL: <FLXAn\_base> + 0046<sub>H</sub>, FLXAnFRT0CHH: <FLXAn\_base> + 0047<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 25.35 FLXAnFRT0C Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 16	T0MO[13:0]	Timer 0 Macrotick Offset Bit Timer 0 Macrotick Offset
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 8	T0CC[6:0]	Timer 0 Cycle Code Bit Timer 0 Cycle Code
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	T0MS	Timer 0 Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	T0RC	Timer 0 Run Control Bit 0: Timer 0 halted 1: Timer 0 running

**(1) FLXAnFRT0C.TOMO**

Timer 0 Macrotick Offset Bit

Before reconfiguration of the timer, the timer has to be halted first by clearing FLXAnFRT0C.T0RC to 0. Configures the macrotick offset from the beginning of the communication cycle where the interrupt is to occur. The FlexRay timer 0 interrupt occurs at this offset for each cycle of the cycle set.

**(2) FLXAnFRT0C.T0CC**

Timer 0 Cycle Code Bit

Before reconfiguration of the timer, the timer has to be halted first by clearing FLXAnFRT0C.T0RC to 0. The 7-bit timer 0 cycle code determines the cycle set used for generation of the FlexRay timer 0 interrupt. For details about the configuration of the cycle code see **Section 25.3.8.2, Cycle Counter Filtering**.

**(3) FLXAnFRT0C.T0MS**

Timer 0 Mode Select Bit

Before reconfiguration of the timer, the timer has to be halted first by clearing FLXAnFRT0C.T0RC to 0. Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

**(4) FLXAnFRT0C.T0RC**

Timer 0 Run Control Bit

Timer 0 can be activated (set FLXAnFRT0C.T0RC to 1) when the POC is either in NORMAL\_ACTIVE state or in NORMAL\_PASSIVE state.

Timer 0 is deactivated when leaving NORMAL\_ACTIVE state or NORMAL\_PASSIVE state except for transitions between the two states.

### 25.2.5.2 FLXAnFRT1C — FlexRay Timer 1 Configuration Register

This register is a relative timer. After the specified number of macroticks (MT) has expired, a FlexRay timer 1 interrupt is asserted. When the FlexRay timer 1 passes, FLXAnFRSIR.TI1 and FLXAnFROS.TI1S are set to 1. A timer 1 interrupt then occurs while the FLXAnFROC.TI1E bit is effective.

**Access:** FLXAnFRT1C can be read or written in 32-bit units.  
 FLXAnFRT1CL and FLXAnFRT1CH can be read or written in 16-bit units.  
 FLXAnFRT1CLL, FLXAnFRT1CHL, and FLXAnFRT1CHH can be read or written in 8-bit units.

**Address:** FLXAnFRT1C: <FLXAn\_base> + 0048<sub>H</sub>,  
 FLXAnFRT1CL: <FLXAn\_base> + 0048<sub>H</sub>, FLXAnFRT1CH: <FLXAn\_base> + 004A<sub>H</sub>,  
 FLXAnFRT1CLL: <FLXAn\_base> + 0048<sub>H</sub>, FLXAnFRT1CHL: <FLXAn\_base> + 004A<sub>H</sub>,  
 FLXAnFRT1CHH: <FLXAn\_base> + 004B<sub>H</sub>

**Value after reset:** 0002 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 25.36 FLXAnFRT1C Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 16	T1MC[13:0]	Timer 1 Macrotick Count Bit
15 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	T1MS	Timer 1 Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	T1RC	Timer 1 Run Control Bit 0: Timer 1 halted 1: Timer 1 running

**(1) FLXAnFRT1C.T1MC**

Timer 1 Macrotick Count Bit

Before reconfiguration of the timer, the timer has to be halted first by writing 0 to FLXAnFRT1C.T1RC.

- Valid values are 2 to 16383 MT in continuous mode
- Valid values are 1 to 16383 MT in single-shot mode

When the configured macrotick count is reached the FlexRay timer 1 interrupt is generated.

**(2) FLXAnFRT1C.T1MS**

Timer 1 Mode Select Bit

Before reconfiguration of the timer, the timer has to be halted first by writing 0 to FLXAnFRT1C.T1RC.

Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

**(3) FLXAnFRT1C.T1RC**

Timer 1 Run Control Bit

Timer 1 can be activated (set FLXAnFRT1C.T1RC to 1) as long as the POC is either in NORMAL\_ACTIVE state or in NORMAL\_PASSIVE state.

Timer 1 is deactivated when leaving NORMAL\_ACTIVE state or NORMAL\_PASSIVE state except for transitions between the two states.

### 25.2.5.3 FLXAnFRT2C — FlexRay Timer 2 Configuration Register

This register is an absolute timer. Timer 2 has the same absolute timer features as timer 0.

**Access:** FLXAnFRT2C can be read or written in 32-bit units.

FLXAnFRT2CL and FLXAnFRT2CH can be read or written in 16-bit units.

FLXAnFRT2CLL, FLXAnFRT2CLH, FLXAnFRT2CHL, and FLXAnFRT2CHH can be read or written in 8-bit units.

**Address:** FLXAnFRT2C: <FLXAn\_base> + 0844<sub>H</sub>

FLXAnFRT2CL: <FLXAn\_base> + 0844<sub>H</sub>, FLXAnFRT2CH: <FLXAn\_base> + 0846<sub>H</sub>,

FLXAnFRT2CLL: <FLXAn\_base> + 0844<sub>H</sub>, FLXAnFRT2CLH: <FLXAn\_base> + 0845<sub>H</sub>,

FLXAnFRT2CHL: <FLXAn\_base> + 0846<sub>H</sub>, FLXAnFRT2CHH: <FLXAn\_base> + 0847<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	T2MO[13:0]

Table 25.37 FLXAnFRT2C Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 16	T2MO[13:0]	Timer 2 Macrotick Offset Bit Timer 2 Macrotick Offset
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 8	T2CC[6:0]	Timer 2 Cycle Code Bit Timer 2 Cycle Code
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	T2MS	Timer 2 Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	T2RC	Timer 2 Run Control Bit 0: Timer 2 halted 1: Timer 2 running

**(1) FLXAnFRT2C.T2MO**

Timer 2 Macrotick Offset Bit

The user can only write to these bits when FLXAnFRT2C.T2RC is 0.

Allowed range is 0 to FLXAnFRGTUC2.MPC.

These bits indicate the timer macrotick value defining the timer expiration condition.

**(2) FLXAnFRT2C.T2CC**

Timer 2 Cycle Code Bit

The user can only write to these bits when FLXAnFRT2C.T2RC is 0.

This bit indicates the cycle counter filter code defining the timer expiration condition.

See **Section 25.3.8.2, Cycle Counter Filtering**.

**(3) FLXAnFRT2C.T2MS**

Timer 2 Mode Select Bit

The user can only write to these bits when FLXAnFRT2C.T2RC is 0.

This bit indicates the operation mode of the Timer 2.

0: Single-shot mode

The timer is operating in the non-repetitive (single shot) mode. Once the configured expiration criteria are matching the timer will be automatically halted.

1: Continuous mode

The timer is operating in the repetitive (continuous) mode. The timer will expire every time the configured expiration criteria are matching. The timer is not halted.

**(4) FLXAnFRT2C.T2RC**

Timer 2 Run Control Bit

The user can only set this bit to 1 when the POC is in NORMAL\_ACTIVE or NORMAL\_PASSIVE state.

This bit indicates the activation state of the Timer 2.

When the expiration criteria are matching for a single shot timer, then this bit is cleared automatically and the Timer 2 is halted.

[Setting condition]

This bit is set by writing 1 to it when the POC is in NORMAL\_ACTIVE or NORMAL\_PASSIVE state.

[Clearing condition]

This bit is cleared when the POC state leaves the NORMAL\_ACTIVE or NORMAL\_PASSIVE state except for transitions between the two states.

This bit is cleared when the timer is operating in the non-repetitive (single shot) mode (FLXAnFRT2C.T2MS is 0) and the expiration criteria are matching.

This bit is cleared by writing 0 to it.

### 25.2.5.4 FLXAnFRSTPW1 — FlexRay Stop Watch Register 1

The stop watch is activated by the following trigger events.

- FlexRay 0 interrupt or FlexRay 1 interrupt
- Writing bit FLXAnFRSTPW1.SSWT to 1

At the first MT counter increment after the stop watch starts, the actual cycle counter and macrotick values are captured in register FLXAnFRSTPW1 while the slot counter values for channel A and B are captured in register FLXAnFRSTPW2.

**Access:** FLXAnFRSTPW1 can be read or written in 32-bit units.  
 FLXAnFRSTPW1L can be read or written in 16-bit units.  
 FLXAnFRSTPW1H is a read-only register that can be read in 16-bit units.  
 FLXAnFRSTPW1LL can be read or written in 8-bit units.  
 FLXAnFRSTPW1LH, FLXAnFRSTPW1HL, and FLXAnFRSTPW1HH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRSTPW1: <FLXAn\_base> + 004C<sub>H</sub>,  
 FLXAnFRSTPW1L: <FLXAn\_base> + 004C<sub>H</sub>, FLXAnFRSTPW1H: <FLXAn\_base> + 004E<sub>H</sub>,  
 FLXAnFRSTPW1LL: <FLXAn\_base> + 004C<sub>H</sub>, FLXAnFRSTPW1LH: <FLXAn\_base> + 004D<sub>H</sub>,  
 FLXAnFRSTPW1HL: <FLXAn\_base> + 004E<sub>H</sub>, FLXAnFRSTPW1HH: <FLXAn\_base> + 004F<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.38 FLXAnFRSTPW1 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 16	SMTV[13:0]	Stop Watch Captured Macrotick Value
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	SCCV[5:0]	Stop Watch Captured Cycle Counter Value
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	EINT1	Enable FlexRay Interrupt 1 Trigger Bit 0: Stop watch trigger by FlexRay 1 interrupt disabled 1: FlexRay 1 interrupt event triggers stop watch
5	EINT0	Enable FlexRay 0 Interrupt Trigger Bit 0: Stop watch trigger by FlexRay 0 interrupt disabled 1: FlexRay interrupt 0 event triggers stop watch
4	EETP	Enable External Trigger Pin 0: Stop watch trigger via MCU input pin (FLXA0STPWT) disabled 1: A rising or falling edge on MCU input pin (FLXA0STPWT) trigger stop watch

Table 25.38 FLXAnFRSTPW1 Register Contents

Bit Position	Bit Name	Function
3	SSWT	Software Stop Watch Trigger Bit 0: Software trigger reset 1: Stop watch activated by software trigger
2	EDGE	Stop Watch Trigger Edge Select Bit 0: Falling edge 1: Rising edge
1	SWMS	Stop Watch Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	ESWT	Enable Hardware Stop Watch Trigger Bit 0: Stop watch trigger disabled 1: Stop watch trigger enabled

**(1) FLXAnFRSTPW1.SMTV**

Stop Watch Captured Macrotick Value

Indicates the state of the macrotick counter when the stop watch event occurred.

**(2) FLXAnFRSTPW1.SCCV**

Stop Watch Captured Cycle Counter Value

Indicates the state of the cycle counter when the stop watch event occurred.

**(3) FLXAnFRSTPW1.EINT1**

Enable FlexRay 1 Interrupt Trigger Bit

Enables stop watch trigger by FlexRay 1 interrupt when FLXAnFRSTPW1.ESWT = 1.

**(4) FLXAnFRSTPW1.EINT0**

Enable FlexRay 0 Interrupt Trigger Bit

Enables stop watch trigger by FlexRay 0 interrupt when FLXAnFRSTPW1.ESWT = 1.

**(5) FLXAnFRSTPW1.EETP**

Enable External Trigger Pin

Enables stop watch trigger event via MCU pin FLXAnSTPWT if FLXAnFRSTPW1.ESWT = '1'.

**(6) FLXAnFRSTPW1.SSWT**

Software Stop Watch Trigger Bit

Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to 1 simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.

Writing 1 in this bit activates the stop watch. This bit is reset to 0 after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

**(7) FLXAnFRSTPW1.EDGE**

Stop Watch Trigger Edge Select Bit

**(8) FLXAnFRSTPW1.SWMS**

Stop Watch Mode Select Bit

**(9) FLXAnFRSTPW1.ESWT**

Enable Stop Watch Trigger Bit

Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to 1 simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.

If enabled, a FlexRay 0 interrupt event or a FlexRay 1 interrupt event activates the stop watch.

In single-shot mode, this bit is reset to 0 after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

### 25.2.5.5 FLXAnFRSTPW2 — FlexRay Stop Watch Register 2

**Access:** FLXAnFRSTPW2 is a read-only register that can be read in 32-bit units.

FLXAnFRSTPW2L and FLXAnFRSTPW2H are the read-only registers that can be read in 16-bit units.

FLXAnFRSTPW2LL, FLXAnFRSTPW2LH, FLXAnFRSTPW2HL, and FLXAnFRSTPW2HH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRSTPW2: <FLXAn\_base> + 0050<sub>H</sub>,

FLXAnFRSTPW2L: <FLXAn\_base> + 0050<sub>H</sub>, FLXAnFRSTPW2H: <FLXAn\_base> + 0052<sub>H</sub>,

FLXAnFRSTPW2LL: <FLXAn\_base> + 0050<sub>H</sub>, FLXAnFRSTPW2LH: <FLXAn\_base> + 0051<sub>H</sub>,

FLXAnFRSTPW2HL: <FLXAn\_base> + 0052<sub>H</sub>, FLXAnFRSTPW2HH: <FLXAn\_base> + 0053<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.39 FLXAnFRSTPW2 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned.
26 to 16	SSCVB[10:0]	Stop Watch Captured Slot Counter Value Channel B
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	SSCVA[10:0]	Stop Watch Captured Slot Counter Value Channel A

#### (1) FLXAnFRSTPW2.SSCVB

Stop Watch Captured Slot Counter Value Channel B

Indicates the state of the slot counter value for channel B when the stop watch event occurred.

#### (2) FLXAnFRSTPW2.SSCVA

Stop Watch Captured Slot Counter Value Channel A

Indicates the state of the slot counter value for channel A when the stop watch event occurred.

## 25.2.6 CC Control Registers

This section describes the registers provided by the CC (Communication Controller) to allow the Host to control the operation of the CC. The FlexRay protocol specification requires the Host to write application configuration data in CONFIG state only. Please consider that the configuration registers are not locked for writing in DEFAULT\_CONFIG state.

The configuration data is reset when DEFAULT\_CONFIG state is entered after reset. To change POC state from DEFAULT\_CONFIG to CONFIG state the Host has to apply CHI command CONFIG. If the Host wants the CC to leave CONFIG state, the Host has to execute the lock release sequence as described in

**Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register.**

### 25.2.6.1 FLXAnFRSUCC1 — FlexRay SUC Configuration Register 1

**Access:** FLXAnFRSUCC1 can be read or written in 32-bit units.

FLXAnFRSUCC1L and FLXAnFRSUCC1H can be read or written in 16-bit units.

FLXAnFRSUCC1LL, FLXAnFRSUCC1LH, FLXAnFRSUCC1HL, and FLXAnFRSUCC1HH can be read or written in 8-bit units.

**Address:** FLXAnFRSUCC1: <FLXAn\_base> + 0080<sub>H</sub>,

FLXAnFRSUCC1L: <FLXAn\_base> + 0080<sub>H</sub>, FLXAnFRSUCC1H: <FLXAn\_base> + 0082<sub>H</sub>,

FLXAnFRSUCC1LL: <FLXAn\_base> + 0080<sub>H</sub>, FLXAnFRSUCC1LH: <FLXAn\_base> + 0081<sub>H</sub>,

FLXAnFRSUCC1HL: <FLXAn\_base> + 0082<sub>H</sub>, FLXAnFRSUCC1HH: <FLXAn\_base> + 0083<sub>H</sub>

**Value after reset:** 0C40 1080<sub>H</sub>

Table 25.40 FLXAnFRSUCC1 Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27	CCHB	Connected to Channel B Bit Configures pChannels 0: Not connected to channel B 1: Node connected to channel B (default after reset)
26	CCHA	Connected to Channel A Bit Configures pChannels 0: Not connected to channel A 1: Node connected to channel A (default after reset)
25	MTSB	Select Channel B for MTS Transmission Bit 0: Channel B disabled for MTS transmission 1: Channel B selected for MTS transmission
24	MTSA	Select Channel A for MTS Transmission Bit 0: Channel A disabled for MTS transmission 1: Channel A selected for MTS transmission

Table 25.40 FLXAnFRSUCC1 Register Contents

Bit Position	Bit Name	Function
23	HCSE	Halt due to Clock Sync Error Bit Configures pAllowHaltDueToClock 0: CC will enter/remain in NORMAL_PASSIVE 1: CC will enter HALT state
22	TSM	Transmission Slot Mode Bit Configures pSingleSlotEnabled 0: ALL Slot Mode 1: SINGLE Slot Mode (value after hard reset)
21	WUCS	Wakeup Channel Select Bit Configures pWakeupChannel 0: Send wakeup pattern on channel A 1: Send wakeup pattern on channel B
20 to 16	PTA[4:0]	Passive to Active Bit Configures pAllowPassiveToActive
15 to 11	CSA[4:0]	Cold Start Attempts Bit Configures gColdStartAttempts
10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	TXSY	Transmit Sync Frame in Key Slot Bit Configures pKeySlotUsedForSync 0: No sync frame transmission in key slot, node is neither sync nor coldstart node 1: Key slot used to transmit sync frame, node is sync node
8	TXST	Transmit Startup Frame in Key Slot Bit Configures pKeySlotUsedForStartup 0: No startup frame transmission in key slot, node is non-coldstarter 1: Key slot used to transmit startup frame, node is leading or following coldstarter
7	PBSY	POC Busy Flag 0: POC not busy, FLXAnFRSUCC1.CMD writeable 1: POC is busy, FLXAnFRSUCC1.CMD locked
6 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	CMD[3:0]	CHI Command Vector Bit 0000 <sub>B</sub> : command_not_accepted 0001 <sub>B</sub> : CONFIG 0010 <sub>B</sub> : READY 0011 <sub>B</sub> : WAKEUP 0100 <sub>B</sub> : RUN 0101 <sub>B</sub> : ALL_SLOTS 0110 <sub>B</sub> : HALT 0111 <sub>B</sub> : FREEZE 1000 <sub>B</sub> : SEND_MTS 1001 <sub>B</sub> : ALLOW_COLDSTART 1010 <sub>B</sub> : RESET_STATUS_INDICATORS 1011 <sub>B</sub> : MONITOR_MODE 1100 <sub>B</sub> : CLEAR_RAMs others: reserved

**(1) FLXAnFRSUCC1.CCHB**

Connected to Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. Configures whether the node is connected to channel B (pChannels).

**(2) FLXAnFRSUCC1.CCHA**

Connected to Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. Configures whether the node is connected to channel A (pChannels).

**(3) FLXAnFRSUCC1.MTSB**

Select Channel B for MTS Transmission Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. FLXAnFRSUCC1.MTSB may also be changed outside DEFAULT\_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**. This may be combined with CHI command SEND\_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to 1, an MTS symbol will be transmitted on both channels when requested by writing FLXAnFRSUCC1.CMD = “1000<sub>B</sub>”. The bit selects channel B for MTS symbol transmission.

**(4) FLXAnFRSUCC1.MTSA**

Select Channel A for MTS Transmission Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. FLXAnFRSUCC1.MTSA may also be changed outside DEFAULT\_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**. This may be combined with CHI command SEND\_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to 1, an MTS symbol will be transmitted on both channels when requested by writing FLXAnFRSUCC1.CMD = “1000<sub>B</sub>”. The bit selects channel A for MTS symbol transmission.

**(5) FLXAnFRSUCC1.HCSE**

Halt due to Clock Sync Error Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. Controls the transition to HALT state due to a clock synchronization error (pAllowHaltDueToClock).

**(6) FLXAnFRSUCC1.TSM**

Transmission Slot Mode Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. Sets the value after transmission slot mode reset (pSingleSlotEnabled).

In SINGLE slot mode the CC may only transmit in the preconfigured key slot. The key slot ID is configured in the header section of message buffer 0 or message buffers 0 and 1 depending on bit FLXAnFRMRC.SPLM.

If FLXAnFRSUCC1.TSM = 1, message buffer 0 or message buffers 0 and 1 can be (re)configured in DEFAULT\_CONFIG or CONFIG state only. In ALL slot mode the CC may transmit in all slots.

FLXAnFRSUCC1.TSM is a configuration bit which can only be set/reset by the Host.

The CC changes to ALL slot mode when the Host successfully applied the ALL\_SLOTS command by writing FLXAnFRSUCC1.CMD = “0101<sub>B</sub>” in POC states NORMAL\_ACTIVE or NORMAL\_PASSIVE. The actual slot mode is monitored by FLXAnFRCCSV.SLM.

### (7) FLXAnFRSUCC1.WUCS

Wakeup Channel Select Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. With this bit the Host selects the channel on which the CC sends the Wakeup pattern (pWakeupChannel).

### (8) FLXAnFRSUCC1.PTA

Passive to Active Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 31 even/odd cycle pairs.

Defines the number of consecutive even/odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL\_PASSIVE to NORMAL\_ACTIVE state (pAllowPassiveToActive).

If set to “0000<sub>B</sub>” the CC is not allowed to transit from NORMAL\_PASSIVE to NORMAL\_ACTIVE state.

### (9) FLXAnFRSUCC1.CSA

Cold Start Attempts Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Must be identical in all nodes of a cluster. Valid values are 2 to 31.

Configures the maximum number of attempts that a cold starting node is permitted to try to start up the network without receiving any valid response from another node (gColdStartAttempts).

### (10) FLXAnFRSUCC1.TXSY

Transmit Sync Frame in Key Slot Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Defines whether the key slot is used to transmit sync frames (pKeySlotUsedForSync).

#### CAUTION

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set for coldstart nodes.

### (11) FLXAnFRSUCC1.TXST

Transmit Startup Frame in Key Slot Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Defines whether the key slot is used to transmit startup frames (pKeySlotUsedForStartup).

#### CAUTION

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set for coldstart nodes.

**(12) FLXAnFRSUCC1.PBSY**

POC Busy Flag

Signals that the POC is busy and cannot accept a command from the Host. FLXAnFRSUCC1.CMD is locked against write accesses.

Set to 1 after reset during initialization of internal RAM blocks.

**(13) FLXAnFRSUCC1.CMD**

CHI Command Vector Bit

The Host may write any CHI command at any time, but certain commands are enabled only in certain POC states. If a command is not enabled, it will not be executed, the CHI command vector FLXAnFRSUCC1.CMD will be reset to “0000<sub>B</sub>” = command\_not\_accepted, and flag FLXAnFREIR.CNA will be set to 1.

In general the Host must check FLXAnFRSUCC1.PBSY before writing a new CHI command.

In case the previous CHI command has not yet completed, FLXAnFREIR.CCL is set to 1 together with FLXAnFREIR.CNA; the CHI command needs to be repeated.

Except for HALT state, a POC state change command applied while the CC is already in the requested POC state neither causes a state change nor will FLXAnFREIR.CNA be set.
