

# RH850/F1KH, RH850/F1KM

User's Manual: Hardware

Renesas microcontroller  
RH850 Family

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
  2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
  3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
  4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
  5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
  6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
    - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
    - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
- Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
  8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
  9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
  10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
  11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
  12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
  13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
  14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

(Rev.5.0-1 October 2020)

## General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

### 1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

### 2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

### 3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

### 4. Handling of unused pins

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

### 5. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.).

### 6. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

### 7. Power ON/OFF sequence

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

# How to Use This Manual

## 1. Purpose and Target Readers

This manual is designed to provide the user with an understanding of the hardware functions and electrical characteristics of the MCU. It is intended for users designing application systems incorporating the MCU. A basic knowledge of electric circuits, logical circuits, and MCUs is necessary in order to use this manual.

The manual comprises an overview of the product; descriptions of the CPU, system control functions, peripheral functions, and electrical characteristics; and usage notes.

Particular attention should be paid to the precautionary notes when using the manual. These notes occur within the body of the text, at the end of each section, and in the Usage Notes section.

The following documents apply to the RH850/F1KH, RH850/F1KM. Make sure to refer to the latest versions of these documents. The newest versions of the documents listed may be obtained from the Renesas Electronics Web site.

Document Type	Description	Document Title	Document No.
User's manual for Hardware	Hardware specifications (pin assignments, memory maps, peripheral function specifications, electrical characteristics, timing charts) and operation description  Note: Refer to the application notes for details on using peripheral functions.	xxx/xx Group User's Manual: Hardware	This User's manual
User's manual for Hardware	Hardware specifications of flash memory programming and erasure	RH850/F1KH, RH850/F1KM, RH850/F1K Flash Memory User's Manual: Hardware Interface	R01UH0622EJxxxx
User's manual for Hardware	Hardware specifications of intelligent cryptographic unit/master D(ICUMD)	RH850/F1KH, RH850/F1KM ICUMD User's Manual: Hardware	R01UH0705EJxxxx
User's manual for Software	Description of CPU instruction set	RH850G3KH User's Manual: Software	R01US0165EJxxxx
Application Note	Information on using peripheral functions and application examples  Sample programs  Information on writing programs in assembly language and C	Available from Renesas Electronics Web site.	
Renesas Technical Update	Product specifications, updates on documents, etc.		

**How to read this manual**

This RH850/F1KH, RH850/F1KM Hardware User's Manual corresponds to Rev.1.30.

The RH850/F1KM-S2 description relates to a revision level of Rev.1.00.

The xxA section describes the functionality of RH850/F1KH-D8.

The xxB section describes the functionality of RH850/F1KM-S4 and RH850/F1KM-S2.

The xxC section describes the functionality of RH850/F1KM-S1.

The xxAB section describes the functionality of RH850/F1KH-D8, RH850/F1KM-S4 and RH850/F1KM-S2.

The xxBC section describes the functionality of RH850/F1KM-S4, RH850/F1KM-S2 and RH850/F1KM-S1.

The xxx section describes the functionality of all related products.

**Conventions**

Data significance: Higher digits on the left and lower digits on the right

Active low representation: xxx (overscore over pin or signal name)

Note: Footnote for item marked with Note in the text

Caution: Information requiring particular attention

Remark: Supplementary information

Numeric representation: Binary ... xxxx or xxxxB

Decimal ... xxxx

Hexadecimal ... xxxxH

Prefix indicating power of 2 (address space, memory capacity):

K (kilo):  $2^{10} = 1,024$

M (mega):  $2^{20} = 1,024^2$

G (giga):  $2^{30} = 1,024^3$

# Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.

(1) Access: This register can be read/written in 32-bit units.

(2) Address: <CSIGN base> + 1010.

(3) Value after reset: 0000 0000.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CSIGNPS[1:0]		CSIGNDLS[3:0]			—	—	—	—	—	—	CSIGNDIR	—	CSIGNDAP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

(4) (5) (6) (7) (8)

**Table 14.19 CSIGNCFG0 Register Contents (1/2)**

Bit Position	Bit Name	Function																				
31, 30	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.																				
29, 28	CSIGNPS[1:0]	Specifies parity. <table border="1"> <thead> <tr> <th>CSIGNPS1</th> <th>CSIGNPS0</th> <th>Transmission</th> <th>Reception</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>No parity transmitted</td> <td>No parity is waited for.</td> </tr> <tr> <td>0</td> <td>1</td> <td>Add parity bit fixed at 0</td> <td>Parity bit is waited for but not judged.</td> </tr> <tr> <td>1</td> <td>0</td> <td>Add odd parity</td> <td>Odd parity bit is waited for.</td> </tr> <tr> <td>1</td> <td>1</td> <td>Add even parity</td> <td>Even parity bit is waited for.</td> </tr> </tbody> </table>	CSIGNPS1	CSIGNPS0	Transmission	Reception	0	0	No parity transmitted	No parity is waited for.	0	1	Add parity bit fixed at 0	Parity bit is waited for but not judged.	1	0	Add odd parity	Odd parity bit is waited for.	1	1	Add even parity	Even parity bit is waited for.
CSIGNPS1	CSIGNPS0	Transmission	Reception																			
0	0	No parity transmitted	No parity is waited for.																			
0	1	Add parity bit fixed at 0	Parity bit is waited for but not judged.																			
1	0	Add odd parity	Odd parity bit is waited for.																			
1	1	Add even parity	Even parity bit is waited for.																			
27 to 24	CSIGNDLS [3:0]	Specifies data length. 0: Data length is 16 bits 1: Data length is 1 bit 2: Data length is 2 bits ... 15: Data length is 15 bits <b>CAUTION</b> Do not set bits CSIGNCFG0.CSIGNDLS[3:0] for a value 1 to 6 when the extended data length function is disabled with bit CSIGNCTL1.CSIGNEDLE set to 0. It is forbidden to transmit two consecutive data with a data length of less than 7 bits.																				
23 to 19	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.																				

## (1) Access

The register can be accessed in the bit unit indicated here.

## (2) Address

This is the register address.

For base address, see description of base address in each section.

(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from A to F or as X where they are undefined.

(4) Bit position

This is the bit number.

The bits are numbered from 31 to 0 for 32-bit registers, 15 to 0 for 16-bit registers, and 7 to 0 for 8-bit registers.

(5) Bit name

Bit name or field name is indicated.

When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGNDLS[3:0] above.

Indicate reserved bits by using a dash (—).

(6) Value after a reset (in binary notation)

This is the bit values after a reset.

0 : The value after a reset is 0.

1 : The value after a reset is 1.

— : The value after a reset is undefined.

(7) R/W

This is the bit attribute of all bits of the register.

R/W : The bit or field is readable and writable.

R : The bit or field is readable.

Note that all reserved bits are indicated as R. When written, the value specified in the bit chart or the value after a reset should be written.

In case of writing to writable registers that also include non-reserved bits with the R-attribute, writing to the R-attribute bits will be ignored unless otherwise specified.

W : This bit or field is writable. When read, the value is undefined. If a value is indicated in the bit chart, the value is returned.

(8) Function

This is function of the bit.

Section 5	Write-Protected Registers .....	760
5.1	Overview .....	760
5.1.1	Functional Overview .....	760
5.1.2	Writing Procedure to Write-Protected Registers .....	760
5.1.3	Interrupt during Write Protection Unlock .....	761
5.1.4	Emulation Break during Write Protection Unlock Sequence .....	762
5.1.5	Write-Protection Target Registers .....	762
5.2	Registers .....	772
5.2.1	List of Registers .....	772
5.2.2	Details of Control Protection Cluster Registers .....	779
5.2.2.1	PROTCMDn — Protection Command Register .....	779
5.2.2.2	PROTSn — Protection Status Register .....	780
5.2.3	Details of Clock Monitor Control and Test Protection Cluster Registers .....	781
5.2.3.1	CLMAnPCMD — CLMAn Protection Command Register .....	781
5.2.3.2	CLMAnPS — CLMAn Protection Status Register .....	782
5.2.3.3	PROTCMDCLMA — Clock Monitor Test Protection Command Register .....	783
5.2.3.4	PROTSCCLMA — Clock Monitor Test Protection Status Register .....	784
5.2.4	Details of Core Voltage Monitor Protection Cluster Registers .....	785
5.2.4.1	PROTCMDCVM — Core Voltage Monitor Protection Command Register .....	785
5.2.4.2	PROTSCVM — Core Voltage Monitor Protection Status Register .....	786
5.2.5	Details of Port Protection Cluster Registers .....	787
5.2.5.1	PPCMDn — Port Protection Command Register .....	787
5.2.5.2	PPROTSn — Port Protection Status Register .....	788
5.2.6	Details of Self-Programming Protection Cluster Registers .....	789
5.2.6.1	FLMDPCMD — FLMD Protection Command Register .....	789
5.2.6.2	FLMDPS — FLMD Protection Error Status Register .....	790
Section 6	Operating Mode .....	791
Section 7A	Exception/Interrupts of RH850/F1KH-D8 .....	792
7A.1	Features of RH850/F1KH Exception/Interrupts .....	792
7A.2	Interrupt Sources .....	795
7A.2.1	Interrupt Sources .....	795
7A.2.1.1	FE Level Non-Maskable Interrupts .....	795
7A.2.1.2	FE Level Maskable Interrupts .....	795
7A.2.1.3	EI Level Maskable Interrupts .....	797
7A.2.2	FE Level Non-Maskable Interrupt Sources .....	809
7A.2.2.1	List of Registers .....	809
7A.2.2.2	WDTNMIF — FENMI Factor Register .....	809
7A.2.2.3	WDTNMIFC — WDTNMI Factor Clear Register .....	810
7A.2.3	FE Level Maskable Interrupt Sources .....	811
7A.2.3.1	List of Registers .....	811
7A.2.3.2	FEINTF — FEINT Factor Register .....	811
7A.2.3.3	FEINTFMSK — FEINT Factor Mask Register .....	814
7A.2.3.4	FEINTFC — FEINT Factor Clear Register .....	817
7A.3	Edge/Level Detection .....	820
7A.4	Interrupt Controller Control Registers .....	821

7A.4.1	List of Registers .....	821
7A.4.2	ICxxx — EI Level Interrupt Control Registers .....	822
7A.4.3	IMRm — EI Level Interrupt Mask Registers (m = 0 to 11).....	824
7A.4.4	IBDxxx — EI Level Interrupt Binding Registers .....	825
7A.4.5	FNC — FE Level NMI Status Register.....	835
7A.4.6	FIC — FE Level Maskable Interrupt Status Register.....	836
7A.5	EI Level Maskable Interrupt Select Register .....	837
7A.5.1	List of Registers .....	837
7A.5.2	SELB_INTC1 — INTC1 Interrupt Select Register .....	838
7A.6	Interrupt Function System Registers .....	840
7A.6.1	FPIPR — FPI Exception Interrupt Priority.....	840
7A.6.2	ISPR — Priority of Interrupt being Serviced .....	840
7A.6.3	PMR — Interrupt Priority Masking .....	840
7A.6.4	ICSR — Interrupt Control Status.....	840
7A.6.5	INTCFG — Interrupt Function Setting .....	840
7A.7	Operation when Acknowledging an Interrupt .....	841
7A.7.1	Exception Source Codes for Different Types of SYSERR Exceptions .....	843
7A.8	Return from Interrupts.....	844
7A.9	Interrupt Operation.....	845
7A.9.1	Interrupt Mask Function of EI Level Maskable Interrupt (EIINT) .....	845
7A.9.2	Interrupt Priority Level Judgment.....	845
7A.9.2.1	Comparison with the Priority Level of the Interrupt Currently being Handled.....	846
7A.9.2.2	Masking through Priority Mask Register (PMR) .....	846
7A.9.2.3	The Requested Interrupt Source with the Highest Priority Level is Selected .....	846
7A.9.2.4	Interrupt Suspended by CPU.....	846
7A.9.3	Interrupt Request Acknowledgement Conditions and the Priority .....	850
7A.9.4	Exception Priority of Interrupts and the Priority Mask.....	850
7A.9.5	Interrupt Priority Mask .....	850
7A.9.6	Priority Mask Function .....	850
7A.9.7	Exception Management .....	850
7A.9.8	Inter-Processor Interrupts .....	851
7A.9.9	Broadcast Function (Broadcast Communication Function) .....	851
7A.9.9.1	Example of Operation .....	852
7A.9.9.2	Inter-Processor Interrupt Flow .....	853
7A.10	Exception Handler Address .....	854
7A.10.1	Direct Vector Method .....	855
7A.10.2	Table Reference Method .....	857
<b>Section 7BC Exception/Interrupts of RH850/F1KM .....</b>		<b>859</b>
7BC.1	Features of RH850/F1KM Exception/Interrupts .....	859
7BC.2	Interrupt Sources .....	861
7BC.2.1	Interrupt Sources.....	861
7BC.2.1.1	FE Level Non-Maskable Interrupts .....	861
7BC.2.1.2	FE Level Maskable Interrupts .....	861

7BC.2.1.3	EI Level Maskable Interrupts .....	865
7BC.2.2	FE Level Non-Maskable Interrupt Sources .....	896
7BC.2.2.1	List of Registers .....	896
7BC.2.2.2	WDTNMIF — FENMI Factor Register .....	896
7BC.2.2.3	WDTNMIFC — WDTNMI Factor Clear Register .....	897
7BC.2.3	FE Level Maskable Interrupt Sources .....	898
7BC.2.3.1	List of Registers .....	898
7BC.2.3.2	FEINTF — FEINT Factor Register .....	899
7BC.2.3.3	FEINTFMSK — FEINT Factor Mask Register .....	902
7BC.2.3.4	FEINTFC — FEINT Factor Clear Register .....	905
7BC.3	Edge/Level Detection .....	908
7BC.4	Interrupt Controller Control Registers .....	910
7BC.4.1	List of Registers .....	910
7BC.4.2	ICxxx — EI Level Interrupt Control Registers .....	911
7BC.4.3	IMRm — EI Level Interrupt Mask Registers (m = 0 to 11) .....	913
7BC.4.4	FNC — FE Level NMI Status Register .....	914
7BC.4.5	FIC — FE Level Maskable Interrupt Status Register .....	915
7BC.5	EI Level Maskable Interrupt Select Register .....	916
7BC.5.1	List of Registers .....	916
7BC.5.2	SELB_INTC1 — INTC1 Interrupt Select Register .....	917
7BC.6	Interrupt Function System Registers .....	919
7BC.6.1	FPIPR — FPI Exception Interrupt Priority .....	919
7BC.6.2	ISPR — Priority of Interrupt being Serviced .....	919
7BC.6.3	PMR — Interrupt Priority Masking .....	919
7BC.6.4	ICSR — Interrupt Control Status .....	919
7BC.6.5	INTCFG — Interrupt Function Setting .....	919
7BC.7	Operation when Acknowledging an Interrupt .....	920
7BC.7.1	Exception Source Codes for Different Types of SYSERR Exceptions .....	922
7BC.8	Return from Interrupts .....	923
7BC.9	Interrupt Operation .....	924
7BC.9.1	Interrupt Mask Function of EI Level Maskable Interrupt (EIINT) .....	924
7BC.9.2	Interrupt Priority Level Judgment .....	924
7BC.9.2.1	Comparison with the Priority Level of the Interrupt Currently being Handled .....	925
7BC.9.2.2	Masking through Priority Mask Register (PMR) .....	925
7BC.9.2.3	The Requested Interrupt Source with the Highest Priority Level is Selected .....	925
7BC.9.2.4	Interrupt Suspended by CPU .....	925
7BC.9.3	Interrupt Request Acknowledgement Conditions and the Priority .....	929
7BC.9.4	Exception Priority of Interrupts and the Priority Mask .....	929
7BC.9.5	Interrupt Priority Mask .....	929
7BC.9.6	Priority Mask Function .....	929
7BC.9.7	Exception Management .....	929
7BC.10	Exception Handler Address .....	930
7BC.10.1	Direct Vector Method .....	931
7BC.10.2	Table Reference Method .....	933

Section 8 DMA Controller .....	935
8.1 Features of RH850/F1KH, RH850/F1KM DMA Controller .....	935
8.1.1 Number of Channels .....	935
8.1.2 Register Base Addresses .....	936
8.1.3 Interrupt Requests.....	937
8.1.4 DMA Trigger Factors.....	941
8.2 Overview.....	954
8.2.1 Overview .....	954
8.2.2 Term Definition.....	955
8.3 DMA Function.....	956
8.3.1 Basic Operation of DMA Transfer.....	956
8.3.1.1 Transfer Mode.....	956
8.3.1.2 Executing a DMA Cycle.....	956
8.3.1.3 Updating Transfer Information.....	956
8.3.1.4 Last Transfer and Address Reload Transfer .....	957
8.3.1.5 Transfer Completion Interrupt Output.....	957
8.3.1.6 Continuous Transfer .....	958
8.3.2 Channel Priority Order .....	960
8.3.2.1 DMAC Channel Arbitration .....	960
8.3.2.2 Interface Arbitration.....	961
8.3.3 Reload Function.....	961
8.3.3.1 Overview of the Reload Function.....	961
8.3.3.2 Operation of Reload Function 1.....	962
8.3.3.3 Reload Function 2.....	963
8.3.3.4 Timing of Setting DMAC Reload Registers .....	964
8.3.4 Chain Function.....	965
8.3.4.1 Overview .....	965
8.3.4.2 Setting Up the Chain Function.....	966
8.3.4.3 Caution for Using the Chain Function.....	966
8.3.5 DMAC Operation.....	967
8.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests.....	967
8.3.5.2 Generating and Accepting a Software DMA Transfer Request.....	967
8.3.5.3 Executing DMA Transfer.....	967
8.4 Suspension, Resume, Transfer Abort, and Clearing of a DMA Transfer Request.....	968
8.4.1 DMA Suspension and Resume by Software Control.....	968
8.4.2 Suspension, Resume, and Transfer Abort of a DMAC Channel .....	968
8.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR.....	970
8.4.4 List of Suspend, Resume, and Transfer Abort Functions .....	970
8.5 Error Control .....	971
8.5.1 Type of Error .....	971
8.5.2 DMA Transfer Error.....	971
8.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs.....	971
8.6 Reliability Functions.....	972
8.6.1 Overview .....	972
8.6.2 Register Access Protection Function.....	972
8.6.2.1 Identifying the Accessing Master .....	972

8.6.2.2	Master Access .....	972
8.6.2.3	Channel Assignment.....	972
8.6.2.4	Illegal Access .....	973
8.6.3	Master Information Inherit Function .....	973
8.6.4	Other Reliability Functions .....	974
8.6.4.1	Restriction on the Next Channel in the Chain.....	974
8.7	Setting Up DMA Transfer .....	975
8.7.1	Overview of Setting Up DMA .....	975
8.7.2	Setting Up the Overall DMA Operation .....	975
8.7.3	Setting Up the DMA Channel Setting .....	976
8.7.3.1	Setting Up the DMAC Channel Setting.....	976
8.8	Global Registers .....	978
8.8.1	List of Global Register Address .....	978
8.8.2	Details of Global Registers .....	981
8.8.2.1	PDMAAnDMACTL — DMA Control Register .....	981
8.8.2.2	PDMAAnDMACER — DMAC Error Register .....	982
8.8.2.3	PDMAAnDM0CMV — DMAC0 Register Access Protection Violation Register.....	983
8.8.2.4	PDMAAnDM1CMV — DMAC1 Register Access Protection Violation Register.....	984
8.8.2.5	PDMAAnDM2CMV — DMAC2 Register Access Protection Violation Register.....	985
8.8.2.6	PDMAAnDM3CMV — DMAC3 Register Access Protection Violation Register.....	986
8.8.2.7	PDMAAnCMVC — Register Access Protection Violation Clear Register.....	987
8.8.2.8	PDMAAnDMyiCM — DMAC Channel Master Setting (yi = 00 to 07, 10 to 17, 20 to 27, and 30 to 37 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, yi = 00 to 07 and 10 to 17 in RH850/F1KM-S1) .....	988
8.9	DMAC Channel Registers .....	989
8.9.1	DMAC Channel Register Addresses.....	989
8.9.2	Details of DMAC Channel Registers.....	991
8.9.2.1	PDMAAnDSAm — DMAC Source Address Register.....	991
8.9.2.2	PDMAAnDDAm — DMAC Destination Address Register.....	992
8.9.2.3	PDMAAnDTCm — DMAC Transfer Count Register .....	993
8.9.2.4	PDMAAnDTCTm — DMAC Transfer Control Register .....	994
8.9.2.5	PDMAAnDRSAm — DMAC Reload Source Address Register.....	997
8.9.2.6	PDMAAnDRDAm — DMAC Reload Destination Address Register.....	998
8.9.2.7	PDMAAnDRTCm — DMAC Reload Transfer Count Register .....	999
8.9.2.8	PDMAAnDCENm — DMAC Channel Operation Enable Setting Register.....	1000
8.9.2.9	PDMAAnDCSTm — DMAC Transfer Status Register .....	1001
8.9.2.10	PDMAAnDCSTSm — DMAC Transfer Status Set Register .....	1003
8.9.2.11	PDMAAnDCSTCm — DMAC Transfer Status Clear Register .....	1004
8.9.2.12	PDMAAnDTFRm — DTFR Setting Register .....	1005
8.9.2.13	PDMAAnDTFRRQm — DTFR Transfer Request Status Register .....	1006
8.9.2.14	PDMAAnDTFRRQCm — DTFR Transfer Request Clear Register .....	1007
8.10	DMA Trigger Factor Select Registers.....	1008
8.10.1	List of DMA Trigger Factor Select Register Address .....	1008
8.10.2	DTFSEL_TAUD0/DTFSEL_TAUB0/DTFSEL_TAUB1 — DMA Trigger Factor Select Register.....	1009

Section 9A	Reset Controller of RH850/F1KH-D8 .....	1014
9A.1	Overview .....	1014
9A.1.1	Reset Sources .....	1015
9A.1.2	Reset Controller Redundancy .....	1016
9A.1.3	Reset Output ( $\overline{\text{RESETOUT}}$ ) .....	1017
9A.1.4	Reset Flag .....	1017
9A.1.5	Clock Supply .....	1017
9A.2	Configuration .....	1018
9A.2.1	Block Diagram .....	1018
9A.3	Registers .....	1021
9A.3.1	Reset Controller Registers Overview .....	1021
9A.3.2	Details of Reset Flag Registers .....	1022
9A.3.2.1	RESF — Reset Factor Register .....	1022
9A.3.2.2	RESFC — Reset Factor Clear Register .....	1024
9A.3.2.3	RESFR — Redundant Reset Factor Register .....	1026
9A.3.2.4	RESFCR — Redundant Reset Factor Clear Register .....	1028
9A.3.3	Details of Software Reset Control Register .....	1030
9A.3.3.1	SWRESA — Software Reset Register .....	1030
9A.4	Functional Description .....	1031
9A.4.1	Reset Flags .....	1031
9A.4.2	Power-On Clear (POC) Reset .....	1031
9A.4.3	Low-Voltage Indicator (LVI) Reset .....	1034
9A.4.4	Core Voltage Monitor (CVM) Reset .....	1035
9A.4.5	External Reset ( $\overline{\text{RESET}}$ ) .....	1036
9A.4.6	Watchdog Timer (WDTA) Reset .....	1037
9A.4.7	Software Reset .....	1037
9A.4.8	Clock Monitor (CLMA) Reset .....	1038
9A.4.9	Debugger Reset .....	1038
Section 9BC	Reset Controller of RH850/F1KM .....	1039
9BC.1	Overview .....	1039
9BC.1.1	Reset Sources .....	1040
9BC.1.2	Reset Controller Redundancy .....	1041
9BC.1.3	Reset Output ( $\overline{\text{RESETOUT}}$ ) .....	1042
9BC.1.4	Reset Flag .....	1042
9BC.1.5	Clock Supply .....	1042
9BC.2	Configuration .....	1043
9BC.2.1	Block Diagram .....	1043
9BC.3	Registers .....	1047
9BC.3.1	Reset Controller Registers Overview .....	1047
9BC.3.2	Details of Reset Flag Registers .....	1048
9BC.3.2.1	RESF — Reset Factor Register .....	1048
9BC.3.2.2	RESFC — Reset Factor Clear Register .....	1050
9BC.3.2.3	RESFR — Redundant Reset Factor Register .....	1052

9BC.3.2.4	RESFCR — Redundant Reset Factor Clear Register .....	1054
9BC.3.3	Details of Software Reset Control Register .....	1056
9BC.3.3.1	SWRESA — Software Reset Register .....	1056
9BC.3.4	Details of Cyclic RUN Mode Reset Vector Address Register .....	1057
9BC.3.4.1	CYCRBASE — Cyclic RUN Mode RBASE Register .....	1057
9BC.4	Functional Description .....	1058
9BC.4.1	Reset Flags .....	1058
9BC.4.2	Power-On Clear (POC) Reset .....	1058
9BC.4.3	Low-Voltage Indicator (LVI) Reset .....	1061
9BC.4.4	Core Voltage Monitor (CVM) Reset .....	1062
9BC.4.5	External Reset ( $\overline{\text{RESET}}$ ) .....	1063
9BC.4.6	Watchdog Timer (WDTA) Reset .....	1064
9BC.4.7	Software Reset .....	1064
9BC.4.8	Clock Monitor (CLMA) Reset .....	1065
9BC.4.9	Debugger Reset .....	1065
9BC.4.10	Reset Vector Address of CPU .....	1066
<b>Section 10A</b>	<b>Power Supply Circuit of RH850/F1KH-D8 .....</b>	<b>1067</b>

24.3	Registers.....	2025
24.3.1	List of Registers .....	2025
24.3.2	Details of Channel-related Registers .....	2031
24.3.2.1	RCFDCnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0 to 7).....	2031
24.3.2.2	RCFDCnCFDCmCTR — Channel Control Register (m = 0 to 7).....	2033
24.3.2.3	RCFDCnCFDCmSTS — Channel Status Register (m = 0 to 7).....	2039
24.3.2.4	RCFDCnCFDCmERFL — Channel Error Flag Register (m = 0 to 7).....	2042
24.3.2.5	RCFDCnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0 to 7).....	2046
24.3.2.6	RCFDCnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 to 7).....	2049
24.3.2.7	RCFDCnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 7).....	2053
24.3.2.8	RCFDCnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 7) .....	2054
24.3.2.9	RCFDCnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 to 7).....	2056
24.3.3	Details of Global-related Registers .....	2058
24.3.3.1	RCFDCnCFDGCFCFG — Global Configuration Register .....	2058
24.3.3.2	RCFDCnCFDGCCTR — Global Control Register .....	2062
24.3.3.3	RCFDCnCFDGSTS — Global Status Register .....	2064
24.3.3.4	RCFDCnCFDGERFL — Global Error Flag Register .....	2066
24.3.3.5	RCFDCnCFDGTSC — Global Timestamp Counter Register.....	2069
24.3.3.6	RCFDCnCFDGTINTSTS0 — Global TX Interrupt Status Register 0 .....	2070
24.3.3.7	RCFDCnCFDGTINTSTS1 — Global TX Interrupt Status Register 1 .....	2073
24.3.3.8	RCFDCnCFDGFDCFG — Global FD Configuration Register.....	2076
24.3.4	Details of Receive Rule-related Registers .....	2077
24.3.4.1	RCFDCnCFDGAFLCTR — Receive Rule Entry Control Register.....	2077
24.3.4.2	RCFDCnCFDGAFLCFG0 — Receive Rule Configuration Register 0.....	2078
24.3.4.3	RCFDCnCFDGAFLCFG1 — Receive Rule Configuration Register 1.....	2080
24.3.4.4	RCFDCnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15) .....	2082
24.3.4.5	RCFDCnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15).....	2084
24.3.4.6	RCFDCnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15).....	2086
24.3.4.7	RCFDCnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15).....	2088

24.3.5	Details of Receive Buffer-related Registers.....	2089
24.3.5.1	RCFDCnCFDRMNB — Receive Buffer Number Register.....	2089
24.3.5.2	RCFDCnCFDRMNDy — Receive Buffer New Data Register (y = 0 to 3).....	2090
24.3.5.3	RCFDCnCFDRMIDq — Receive Buffer ID Register (q = 0 to 127).....	2091
24.3.5.4	RCFDCnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 127).....	2093
24.3.5.5	RCFDCnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 127) .....	2095
24.3.5.6	RCFDCnCFDRMDFb_q — Receive Buffer Data Field Register (b = 0 to 15, q = 0 to 127) .....	2097
24.3.6	Details of Receive FIFO Buffer-related Registers.....	2098
24.3.6.1	RCFDCnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) .....	2098
24.3.6.2	RCFDCnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) .....	2101
24.3.6.3	RCFDCnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7).....	2103
24.3.6.4	RCFDCnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7).....	2104
24.3.6.5	RCFDCnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7).....	2106
24.3.6.6	RCFDCnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7).....	2108
24.3.6.7	RCFDCnCFDRFDFd_x — Receive FIFO Buffer Access Data Field Register (d = 0 to 15, x = 0 to 7) .....	2110
24.3.7	Transmit/Receive FIFO Buffer-related Registers.....	2111
24.3.7.1	RCFDCnCFDCFCCK — Transmit/receive FIFO Buffer Configuration and Control Register (k = 0 to 23).....	2111
24.3.7.2	RCFDCnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 23).....	2115
24.3.7.3	RCFDCnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 23) .....	2118
24.3.7.4	RCFDCnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 23).....	2120
24.3.7.5	RCFDCnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 23) .....	2122
24.3.7.6	RCFDCnCFDCFFDCSTSk — Transmit/receive FIFO CAN FD Configuration/ status Register (k = 0 to 23).....	2124
24.3.7.7	RCFDCnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field Register (d = 0 to 15, k = 0 to 23) .....	2126
24.3.8	Details of FIFO Status-related Registers .....	2127
24.3.8.1	RCFDCnCFDFESTS — FIFO Empty Status Register .....	2127
24.3.8.2	RCFDCnCFDFFSTS — FIFO Full Status Register .....	2129
24.3.8.3	RCFDCnCFDFMSTS — FIFO Message Lost Status Register.....	2131
24.3.8.4	RCFDCnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register ...	2133
24.3.8.5	RCFDCnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register .....	2134
24.3.8.6	RCFDCnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register .....	2136
24.3.9	Details of FIFO DMA-related Registers .....	2138
24.3.9.1	RCFDCnCFDCDTCT — DMA Enable Register .....	2138
24.3.9.2	RCFDCnCFDCDTSTS — DMA Status Register .....	2140
24.3.10	Details of Transmit Buffer-related Registers.....	2142
24.3.10.1	RCFDCnCFDTMCp — Transmit Buffer Control Register (p = 0 to 255).....	2142
24.3.10.2	RCFDCnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 255).....	2144

24.3.10.3	RCFDCnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 255)	2146
24.3.10.4	RCFDCnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 255)	2148
24.3.10.5	RCFDCnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 255)	2150
24.3.10.6	RCFDCnCFDTMDFb_p — Transmit Buffer Data Field Register (b = 0 to 15, p = 0 to 255)	2152
24.3.10.7	RCFDCnCFDTMIECm — Transmit Buffer Interrupt Enable Configuration Register (m = 0 to 7)	2153
24.3.11	Details of Transmit Buffer Status-related Registers	2155
24.3.11.1	RCFDCnCFDTMTRSTSm — Transmit Buffer Transmit Request Status Register (m = 0 to 7)	2155
24.3.11.2	RCFDCnCFDTMTARSTSm — Transmit Buffer Transmit Abort Request Status Register (m = 0 to 7)	2157
24.3.11.3	RCFDCnCFDTMTCSTSm — Transmit Buffer Transmit Complete Status Register (m = 0 to 7)	2159
24.3.11.4	RCFDCnCFDTMTASTSm — Transmit Buffer Transmit Abort Status Register (m = 0 to 7)	2161
24.3.12	Details of Transmit Queue-related Registers	2163
24.3.12.1	RCFDCnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 7)	2163
24.3.12.2	RCFDCnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 7)	2165
24.3.12.3	RCFDCnCFDTXQPCTrm — Transmit Queue Pointer Control Register (m = 0 to 7)	2167
24.3.13	Details of Transmit History-related Registers	2168
24.3.13.1	RCFDCnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 7)	2168
24.3.13.2	RCFDCnCFDTHLSTSm — Transmit History Status Register (m = 0 to 7)	2170
24.3.13.3	RCFDCnCFDTHLPCTrm — Transmit History Pointer Control Register (m = 0 to 7)	2172
24.3.13.4	RCFDCnCFDTHLACC0m — Transmit History Access Register 0 (m = 0 to 7)	2173
24.3.13.5	RCFDCnCFDTHLACC1m — Transmit History Access Register 1 (m = 0 to 7)	2174
24.3.14	Details of Test-related Registers	2175
24.3.14.1	RCFDCnCFDGTSTCFG — Global Test Configuration Register	2175
24.3.14.2	RCFDCnCFDGTSTCTR — Global Test Control Register	2178
24.3.14.3	RCFDCnCFDGLOCKK — Global Lock Key Register	2179
24.3.14.4	RCFDCnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63)	2180

25.2.8.4	FLXAnFRFCL — FlexRay FIFO Critical Level Register .....	2371
25.2.9	Message Buffer Status Registers .....	2372
25.2.9.1	FLXAnFRMHDS — FlexRay Message Handler Status Register .....	2372
25.2.9.2	FLXAnFRLDTS — FlexRay Last Dynamic Transmit Slot Register .....	2375
25.2.9.3	FLXAnFRFSR — FlexRay FIFO Status Register .....	2376
25.2.9.4	FLXAnFRMHDF — FlexRay Message Handler Constraints Flags Register.....	2378
25.2.9.5	FLXAnFRTXRQi — FlexRay Transmission Request i (i = 1 to 4) .....	2382
25.2.9.6	FLXAnFRNDATi — FlexRay New Data Register i (i = 1 to 4) .....	2383
25.2.9.7	FLXAnFRMBSCi — FlexRay Message Buffer Status Changed Register i (i = 1 to 4).....	2384
25.2.10	Input Buffer.....	2385
25.2.10.1	FLXAnFRWRDSx — FlexRay Write Data Section Register x (x = 1 to 64) .....	2386
25.2.10.2	FLXAnFRWRHS1 — FlexRay Write Header Section Register 1 .....	2387
25.2.10.3	FLXAnFRWRHS2 — FlexRay Write Header Section Register 2 .....	2390
25.2.10.4	FLXAnFRWRHS3 — FlexRay Write Header Section Register 3 .....	2391
25.2.10.5	FLXAnFRIBCM — FlexRay Input Buffer Command Mask Register.....	2392
25.2.10.6	FLXAnFRIBCR — FlexRay Input Buffer Command Request Register .....	2394
25.2.11	Output Buffer.....	2396

25.2.11.1	FLXAnFRRDDsx — FlexRay Read Data Section Register x (x = 1 to 64)	2396
25.2.11.2	FLXAnFRRDHS1 — FlexRay Read Header Section Register 1	2398
25.2.11.3	FLXAnFRRDHS2 — FlexRay Read Header Section Register 2	2400
25.2.11.4	FLXAnFRRDHS3 — FlexRay Read Header Section Register 3	2402
25.2.11.5	FLXAnFRMBS — FlexRay Message Buffer Status Register	2404
25.2.11.6	FLXAnFROBCM — FlexRay Output Buffer Command Mask Register	2410
25.2.11.7	FLXAnFROBCR — FlexRay Output Buffer Command Request Register	2412
25.2.12	Data Transfer Control Register	2414
25.2.12.1	FLXAnFRITC — FlexRay Input Transfer Configuration Register	2414
25.2.12.2	FLXAnFROTC — FlexRay Output Transfer Configuration Register	2417
25.2.12.3	FLXAnFRIBA — FlexRay Input Pointer Table Base Address Register	2420
25.2.12.4	FLXAnFRFBA — FlexRay FIFO Pointer Table Base Address Register	2421
25.2.12.5	FLXAnFROBA — FlexRay Output Pointer Table Base Address Register	2422
25.2.12.6	FLXAnFRIQC — FlexRay Input Queue Control Register	2423
25.2.12.7	FLXAnFRUIR — FlexRay User Input Transfer Request Register	2424
25.2.12.8	FLXAnFRUOR — FlexRay User Output Transfer Request Register	2425
25.2.12.9	FLXAnFRAHBC — FlexRay H-Bus Configuration Register	2427
25.2.13	Data Transfer Status Register	2428
25.2.13.1	FLXAnFRITS — FlexRay Input Transfer Status Register	2428
25.2.13.2	FLXAnFROTS — FlexRay Output Transfer Status Register	2432
25.2.13.3	FLXAnFRAES — FlexRay Access Error Status Register	2437
25.2.13.4	FLXAnFRAEA — FlexRay Access Error Address Register	2440
25.2.13.5	FLXAnFRDAi — FlexRay Message Data Available Register i (i = 0 to 3)	2441

31.14.3.4	Register Settings for the Master Channel.....	3041
31.14.3.5	Register Settings for Slave Channel 1.....	3043
31.14.3.6	Register Settings For Slave Channel 2.....	3045
31.14.3.7	Register Settings for Slave Channel 3.....	3047
31.14.3.8	Operating Procedure for Delay Pulse Output Function .....	3048
31.14.3.9	Specific Timing Diagrams .....	3050
31.14.4	AD Conversion Trigger Output Function Type 1.....	3052
31.14.4.1	Overview .....	3052
31.14.4.2	Block Diagram and General Timing Diagram .....	3052
31.14.5	Triangle PWM Output Function.....	3054
31.14.5.1	Overview .....	3054
31.14.5.2	Equations .....	3055
31.14.5.3	Block Diagram and General Timing Diagram .....	3056
31.14.5.4	Register Settings for the Master Channel.....	3058
31.14.5.5	Register Settings for the Slave Channel(s) .....	3060
31.14.5.6	Operating Procedure for Triangle PWM Output Function.....	3062
31.14.5.7	Specific Timing Diagrams .....	3063
31.14.6	Triangle PWM Output Function with Dead Time .....	3065
31.14.6.1	Overview .....	3065
31.14.6.2	Equations .....	3067
31.14.6.3	Block Diagram and General Timing Diagram .....	3068
31.14.6.4	Register Settings for the Master Channel.....	3071
31.14.6.5	Register Settings for Slave Channel 2.....	3073
31.14.6.6	Register Settings for Slave Channel 3.....	3075
31.14.6.7	Operating Procedure for Triangle PWM Output Function with Dead Time .....	3077
31.14.6.8	Specific Timing Diagrams .....	3078
31.14.7	A/D Conversion Trigger Output Function Type 2.....	3088
31.14.7.1	Overview .....	3088
31.14.7.2	Block Diagram and General Timing Diagram .....	3088

**Section 32 Timer Array Unit D (TAUD) .....** 3090

32.1	Features of RH850/F1KH, RH850/F1KM TAUD .....	3090
32.1.1	Number of Units and Channels.....	3090
32.1.2	Register Base Address .....	3091
32.1.3	Clock Supply .....	3091

32.1.4	Interrupt Requests.....	3092
32.1.5	Reset Sources.....	3092
32.1.6	External Input/Output Signals.....	3093
32.1.7	Internal Input/Output Signals.....	3094
32.1.8	TAUD0 Input Selection.....	3094
32.1.8.1	List of Registers.....	3095
32.1.8.2	SELB_TAUD0I — TAUDTTINm Input Signal Selection Register.....	3095
32.2	Overview.....	3096
32.2.1	Functional Overview.....	3096
32.2.2	Terms.....	3097
32.2.3	Functional List of Timer Operations.....	3098
32.2.4	TAUD I/O and Interrupt Request Signals.....	3099
32.2.5	Block Diagram.....	3100
32.2.6	Description of Blocks.....	3101
32.3	Registers.....	3102
32.3.1	List of Registers.....	3102
32.3.2	Details of TAUDn Prescaler Registers.....	3103
32.3.2.1	TAUDnTPS — TAUDn Prescaler Clock Select Register.....	3103
32.3.2.2	TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register.....	3106
32.3.3	Details of TAUDn Control Registers.....	3107
32.3.3.1	TAUDnCDRm — TAUDn Channel Data Register.....	3107
32.3.3.2	TAUDnCNTm — TAUDn Channel Counter Register.....	3108
32.3.3.3	TAUDnCMORM — TAUDn Channel Mode OS Register.....	3109
32.3.3.4	TAUDnCMURm — TAUDn Channel Mode User Register.....	3112
32.3.3.5	TAUDnCSRm — TAUDn Channel Status Register.....	3113
32.3.3.6	TAUDnCSCm — TAUDn Channel Status Clear Trigger Register.....	3114
32.3.3.7	TAUDnTS — TAUDn Channel Start Trigger Register.....	3114
32.3.3.8	TAUDnTE — TAUDn Channel Enable Status Register.....	3115
32.3.3.9	TAUDnTT — TAUDn Channel Stop Trigger Register.....	3115
32.3.4	Details of TAUDn Simultaneous Rewrite Registers.....	3116
32.3.4.1	TAUDnRDE — TAUDn Channel Reload Data Enable Register.....	3116
32.3.4.2	TAUDnRDS — TAUDn Channel Reload Data Control Channel Select Register.....	3116
32.3.4.3	TAUDnRDM — TAUDn Channel Reload Data Mode Register.....	3117
32.3.4.4	TAUDnRDC — TAUDn Channel Reload Data Control Register.....	3117
32.3.4.5	TAUDnRDT — TAUDn Channel Reload Data Trigger Register.....	3118
32.3.4.6	TAUDnRSF — TAUDn Channel Reload Status Register.....	3118
32.3.5	Details of TAUDn Output Registers.....	3119
32.3.5.1	TAUDnTOE — TAUDn Channel Output Enable Register.....	3119
32.3.5.2	TAUDnTO — TAUDn Channel Output Register.....	3119
32.3.5.3	TAUDnTOM — TAUDn Channel Output Mode Register.....	3120
32.3.5.4	TAUDnTOC — TAUDn Channel Output Configuration Register.....	3120
32.3.5.5	TAUDnTOL — TAUDn Channel Output Active Level Register.....	3121
32.3.6	Details of TAUDn Dead Time Output Registers.....	3122
32.3.6.1	TAUDnTDE — TAUDn Channel Dead Time Output Enable Register.....	3122
32.3.6.2	TAUDnTDM — TAUDn Channel Dead Time Output Mode Register.....	3122
32.3.6.3	TAUDnTDL — TAUDn Channel Dead Time Output Level Register.....	3123
32.3.7	Details of TAUDn Real-time/Modulation Output Registers.....	3124
32.3.7.1	TAUDnTRE — TAUDn Channel Real-time Output Enable Register.....	3124

32.3.7.2	TAUDnTRC — TAUDn Channel Real-time Output Control Register .....	3124
32.3.7.3	TAUDnTRO — TAUDn Channel Real-time Output Register .....	3125
32.3.7.4	TAUDnTME — TAUDn Channel Modulation Output Enable Register .....	3125
32.3.8	TAUDn Emulation Register .....	3126
32.3.8.1	TAUDnEMU — TAUDn Emulation Register .....	3126
32.4	Operating Procedure .....	3127
32.5	Concepts of Synchronous Channel Operation .....	3128
32.5.1	Rules of Synchronous Channel Operation .....	3128
32.5.2	Simultaneous Start and Stop of Synchronous Channel Counters .....	3130
32.5.2.1	Simultaneous Start and Stop within the Same Unit .....	3130
32.5.2.2	Simultaneous Start between the Units .....	3130
32.6	Simultaneous Rewrite .....	3131
32.6.1	Overview of Operations .....	3131
32.6.2	How to Control Simultaneous Rewrite .....	3133
32.6.2.1	Initial Settings .....	3134
32.6.2.2	Start Counter and Count Operation .....	3134
32.6.2.3	Simultaneous Rewrite .....	3134
32.6.3	Other General Rules of Simultaneous Rewrite .....	3135
32.6.4	Types of Simultaneous Rewrite .....	3136
32.6.4.1	Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A) .....	3136
32.6.4.2	Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel (Method B) .....	3138
32.6.4.3	Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1) .....	3139
32.6.4.4	Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2) .....	3141
32.7	Channel Output Modes .....	3143
32.7.1	General Procedures for Specifying a Channel Output Mode .....	3145
32.7.2	Channel Output Modes Controlled Independently by TAUDn Signals .....	3146
32.7.2.1	Independent Channel Output Mode 1 .....	3146
32.7.2.2	Independent Channel Output Mode 1 with Real-Time Output .....	3146
32.7.2.3	Independent Channel Output Mode 2 .....	3147
32.7.3	Channel Output Modes Controlled Synchronously by TAUDn Signals .....	3148
32.7.3.1	Synchronous Channel Output Mode 1 .....	3148
32.7.3.2	Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output .....	3148
32.7.3.3	Synchronous Channel Output Mode 2 .....	3148
32.7.3.4	Synchronous Channel Output Mode 2 with Dead Time Output .....	3149
32.7.3.5	Synchronous Channel Output Mode 2 with One-Phase PWM Output .....	3150
32.7.3.6	Synchronous Channel Output Mode 2 with Complementary Modulation Output .....	3151
32.7.3.7	Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output .....	3151
32.8	Start Timing in Each Operating Modes .....	3152
32.8.1	Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode .....	3152
32.8.2	Event Count Mode .....	3153

32.8.3	Other Operating Modes .....	3153
32.9	TAUDDTOUTm Output and INTTAUDNm Generation when Counter Starts or Restarts.....	3154
32.10	Interrupt Generation upon Overflow .....	3155
32.10.1	Combination of the TAUDDTTINm Input Pulse Interval Measurement Function and the TAUDDTTINm Input Interval Timer Function .....	3156
32.10.2	Combination of the TAUDDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDDTTINm Width).....	3157
32.10.3	Combination of the TAUDDTTINm Input Position Detection Function and the Interval Timer Function .....	3158
32.10.4	Combination of the TAUDDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDDTTINm Input Period Count) .....	3159
32.11	TAUDDTTINm Edge Detection .....	3160
32.12	Independent Channel Operation Functions.....	3161
32.12.1	Interval Timer Function .....	3161
32.12.1.1	Overview .....	3161
32.12.1.2	Equations .....	3161
32.12.1.3	Block Diagram and General Timing Diagram .....	3162
32.12.1.4	Register Settings.....	3163
32.12.1.5	Operating Procedure for Interval Timer Function .....	3165
32.12.1.6	Specific Timing Diagrams .....	3166
32.12.2	TAUDDTTINm Input Interval Timer Function .....	3170
32.12.2.1	Overview .....	3170
32.12.2.2	Equations.....	3170
32.12.2.3	Block Diagram and General Timing Diagram .....	3171
32.12.2.4	Register Settings.....	3172
32.12.2.5	Operating Procedure for TAUDDTTINm Input Interval Timer Function .....	3174
32.12.2.6	Specific Timing Diagrams .....	3175
32.12.3	Clock Divide Function .....	3176
32.12.3.1	Overview .....	3176
32.12.3.2	Equations.....	3177
32.12.3.3	Block Diagram and General Timing Diagram .....	3177
32.12.3.4	Register Settings.....	3178
32.12.3.5	Operating Procedure for Clock Divide Function .....	3180
32.12.3.6	Specific Timing Diagrams .....	3181
32.12.4	External Event Count Function .....	3183
32.12.4.1	Overview .....	3183
32.12.4.2	Equations.....	3183
32.12.4.3	Block Diagram and General Timing Diagram .....	3184
32.12.4.4	Register Settings.....	3185
32.12.4.5	Operating Procedure for External Event Count Function .....	3186
32.12.4.6	Specific Timing Diagrams .....	3187
32.12.5	Delay Count Function .....	3189
32.12.5.1	Overview .....	3189
32.12.5.2	Equations.....	3189
32.12.5.3	Block Diagram and General Timing Diagram .....	3190
32.12.5.4	Register Settings.....	3191
32.12.5.5	Operating Procedure for Delay Count Function .....	3192

32.12.6	One-Pulse Output Function .....	3193
32.12.6.1	Overview .....	3193
32.12.6.2	Equations .....	3193
32.12.6.3	Block Diagram and General Timing Diagram .....	3194
32.12.6.4	Register Settings.....	3195
32.12.6.5	Operating Procedure for One-Pulse Output Function .....	3197
32.12.7	TAUDDTTINm Input Pulse Interval Measurement Function .....	3198
32.12.7.1	Overview .....	3198
32.12.7.2	Equations .....	3199
32.12.7.3	Block Diagram and General Timing Diagram .....	3200
32.12.7.4	Register Settings.....	3201
32.12.7.5	Operating Procedure for TAUDDTTINm Input Pulse Interval Measurement Function .....	3202
32.12.7.6	Specific Timing Diagrams: Overflow Operation.....	3203
32.12.8	TAUDDTTINm Input Signal Width Measurement Function .....	3206
32.12.8.1	Overview .....	3206
32.12.8.2	Equations .....	3207
32.12.8.3	Block Diagram and General Timing Diagram .....	3207
32.12.8.4	Register Settings.....	3208
32.12.8.5	Operating Procedure for TAUDDTTINm Input Signal Width Measurement Function .....	3209
32.12.8.6	Specific Timing Diagrams: Overflow Operation.....	3210
32.12.9	TAUDDTTINm Input Position Detection Function .....	3214
32.12.9.1	Overview .....	3214
32.12.9.2	Equations .....	3214
32.12.9.3	Block Diagram and General Timing Diagram .....	3215
32.12.9.4	Register Settings.....	3216
32.12.9.5	Operating Procedure for TAUDDTTINm Input Position Detection Function .....	3217
32.12.9.6	Specific Timing Diagrams .....	3218
32.12.10	TAUDDTTINm Input Period Count Detection Function .....	3219
32.12.10.1	Overview .....	3219
32.12.10.2	Equations .....	3219
32.12.10.3	Block Diagram and General Timing Diagram .....	3220
32.12.10.4	Register Settings.....	3221

32.12.10.6	Specific Timing Diagrams .....	3223
32.12.11	TAUDDTTINm Input Pulse Interval Judgment Function.....	3224
32.12.11.1	Overview .....	3224
32.12.11.2	Block Diagram and General Timing Diagram .....	3225
32.12.11.3	Register Settings.....	3226
32.12.11.4	Operating Procedure for TAUDDTTINm Input Pulse Interval Judgment Function .....	3227
32.12.12	TAUDDTTINm Input Signal Width Judgment Function .....	3228
32.12.12.1	Overview .....	3228
32.12.12.2	Block Diagram and General Timing Diagram .....	3229
32.12.12.3	Register Settings.....	3230
32.12.12.4	Operating Procedure for TAUDDTTINm Input Signal Width Judgment Function .....	3231
32.12.13	Overflow Interrupt Output Function (during TAUDDTTINm Width Measurement).....	3232
32.12.13.1	Overview .....	3232
32.12.13.2	Block Diagram and General Timing Diagram .....	3233
32.12.13.3	Register Settings.....	3234

32.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement) .....	3235
32.12.14 Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection) .....	3236
32.12.14.1 Overview .....	3236
32.12.14.2 Block Diagram and General Timing Diagram .....	3237
32.12.14.3 Register Settings.....	3238
32.12.14.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection) .....	3239
32.12.15 One-Phase PWM Output Function .....	3240
32.12.15.1 Overview .....	3240
32.12.15.2 Block Diagram and General Timing Diagram .....	3241
32.12.15.3 Register Settings for Lower Channels .....	3243
32.12.15.4 Register Settings for Upper Channels .....	3245
32.12.15.5 Operating Procedure for One-phase PWM Output Function.....	3246
32.13 Independent Channel Real-Time Functions.....	3247
32.13.1 Real-Time Output Function Type 1.....	3247
32.13.1.1 Overview .....	3247
32.13.1.2 Equations .....	3248
32.13.1.3 Block Diagram and General Timing Diagram .....	3248
32.13.1.4 Register Settings for Upper Channels .....	3250
32.13.1.5 Register Settings for Lower Channels .....	3252
32.13.1.6 Operating Procedure for Real-Time Output Function Type 1.....	3253
32.13.1.7 Specific Timing Diagrams .....	3254
32.13.2 Real-Time Output Function Type 2.....	3255
32.13.2.1 Overview .....	3255
32.13.2.2 Block Diagram and General Timing Diagram .....	3256
32.13.2.3 Register Settings for Upper Channels .....	3258
32.13.2.4 Register Settings for Lower Channels .....	3260
32.13.2.5 Operating Procedure for Real-Time Output Function Type 2.....	3261
32.13.2.6 Specific Timing Diagrams .....	3262
32.14 Independent Channel Simultaneous Rewrite Functions .....	3263
32.14.1 Simultaneous Rewrite Trigger Generation Function Type 1.....	3263
32.14.1.1 Overview .....	3263
32.14.1.2 Equations .....	3264
32.14.1.3 Block Diagram and General Timing Diagram .....	3265
32.14.1.4 Register Settings for Upper Channels .....	3267
32.14.1.5 Register Settings for Lower Channels .....	3268
32.14.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1 .....	3269
32.14.2 Simultaneous Rewrite Trigger Generation Function Type 2.....	3270
32.14.2.1 Overview .....	3270
32.14.2.2 Block Diagram and General Timing Diagram .....	3271
32.14.2.3 Register Settings for Upper Channels .....	3273
32.14.2.4 Register Settings for Lower Channels .....	3275
32.14.2.5 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 2 .....	3277
32.15 Synchronous Channel Operation Functions.....	3278
32.15.1 PWM Output Function.....	3278
32.15.1.1 Overview .....	3278

32.15.1.2	Equations .....	3279
32.15.1.3	Block Diagram and General Timing Diagram .....	3279
32.15.1.4	Register Settings for the Master Channel.....	3281
32.15.1.5	Register Settings for Slave Channels.....	3283
32.15.1.6	Operating Procedure for PWM Output Function.....	3285
32.15.1.7	Specific Timing Diagrams .....	3286
32.15.2	One-Shot Pulse Output Function .....	3289
32.15.2.1	Overview .....	3289
32.15.2.2	Equations .....	3290
32.15.2.3	Block Diagram and General Timing Diagram .....	3290
32.15.2.4	Register Settings for the Master Channel.....	3292
32.15.2.5	Register Settings for Slave Channels.....	3294
32.15.2.6	Operating Procedure for One-Shot Pulse Output Function.....	3296
32.15.2.7	Specific Timing Diagrams .....	3297
32.15.3	Trigger Start PWM Output Function.....	3301
32.15.3.1	Overview .....	3301
32.15.3.2	Equations .....	3302
32.15.3.3	Block Diagram and General Timing Diagram .....	3302
32.15.3.4	Register Settings for the Master Channel.....	3304
32.15.3.5	Register Settings for Slave Channels.....	3306
32.15.3.6	Operating Procedure for Trigger Start PWM Output Function .....	3308
32.15.3.7	Specific Timing Diagrams .....	3309
32.15.4	Delay Pulse Output Function .....	3312
32.15.4.1	Overview .....	3312
32.15.4.2	Equations .....	3313
32.15.4.3	Block Diagram and General Timing Diagram .....	3314
32.15.4.4	Register Settings for the Master Channel.....	3316
32.15.4.5	Register Settings for Slave Channel 1.....	3318
32.15.4.6	Register Settings for Slave Channel 2.....	3320
32.15.4.7	Register Settings for Slave Channel 3.....	3322
32.15.4.8	Operating Procedure for Delay Pulse Output Function .....	3324
32.15.4.9	Specific Timing Diagrams .....	3326
32.15.5	Offset Trigger Output Function .....	3328
32.15.5.1	Overview .....	3328
32.15.5.2	Equations .....	3329
32.15.5.3	Block Diagram and General Timing Diagram .....	3329
32.15.5.4	Register Settings for the Master Channel.....	3331
32.15.5.5	Register Settings for Slave Channels.....	3333
32.15.5.6	Operating Procedure for Offset Trigger Output Function .....	3335
32.15.5.7	Specific Timing Diagrams .....	3336
32.15.6	A/D Conversion Trigger Output Function Type 1.....	3338
32.15.6.1	Overview .....	3338
32.15.6.2	Block Diagram and General Timing Diagram .....	3338
32.15.7	Triangle PWM Output Function.....	3340
32.15.7.1	Overview .....	3340
32.15.7.2	Equations .....	3341
32.15.7.3	Block Diagram and General Timing Diagram .....	3342
32.15.7.4	Register Settings for the Master Channel.....	3344
32.15.7.5	Register Settings for Slave Channels.....	3346
32.15.7.6	Operating Procedure for Triangle PWM Output Function.....	3348
32.15.7.7	Specific Timing Diagrams .....	3349

32.15.8	Triangle PWM Output Function with Dead Time .....	3351
32.15.8.1	Overview .....	3351
32.15.8.2	Equations .....	3353
32.15.8.3	Block Diagram and General Timing Diagram .....	3354
32.15.8.4	Register Settings for the Master Channel.....	3356
32.15.8.5	Register Settings for Slave Channel 2.....	3358
32.15.8.6	Register Settings for Slave Channel 3.....	3360
32.15.8.7	Operating Procedure for Triangle PWM Output Function with Dead Time .....	3362
32.15.8.8	Specific Timing Diagrams .....	3363
32.15.9	A/D Conversion Trigger Output Function Type 2.....	3365
32.15.9.1	Overview .....	3365
32.15.9.2	Block Diagram and General Timing Diagram .....	3365
32.15.10	Interrupt Request Signals Culling Function .....	3367
32.15.10.1	Overview .....	3367
32.15.10.2	Equations .....	3368
32.15.10.3	Block Diagram and General Timing Diagram .....	3368
32.15.10.4	Register Settings for the Master Channel.....	3370
32.15.10.5	Register Settings for the Slave Channel.....	3372
32.15.10.6	Operating Procedure for Interrupt Request Signals Culling Function .....	3373
32.15.10.7	Specific Timing Diagrams .....	3374
32.16	Synchronous Non-Complementary and Complementary Modulation Output Functions .....	3375
32.16.1	Non-Complementary Modulation Output Function Type 1 .....	3375
32.16.1.1	Overview .....	3375
32.16.1.2	Equations .....	3376
32.16.1.3	Block Diagram and General Timing Diagram .....	3377
32.16.1.4	Register Settings for the Master Channel.....	3379
32.16.1.5	Register Settings for Slave Channel 1.....	3381
32.16.1.6	Register Settings for Slave Channels 2 to 7.....	3383
32.16.1.7	Operating Procedure for Non-Complementary Modulation Output Function Type 1 .....	3385
32.16.1.8	Specific Timing Diagrams .....	3387
32.16.2	Non-Complementary Modulation Output Function Type 2 .....	3388
32.16.2.1	Overview .....	3388
32.16.2.2	Equations .....	3390
32.16.2.3	Block Diagram and General Timing Diagram .....	3391
32.16.2.4	Register Settings for the Master Channel.....	3393
32.16.2.5	Register Settings for Slave Channel 1.....	3395
32.16.2.6	Register settings for slave channels 2 to 7.....	3397
32.16.2.7	Operating Procedure for Non-Complementary Modulation Output Function Type 2 .....	3399
32.16.2.8	Specific Timing Diagrams .....	3401
32.16.3	Complementary Modulation Output Function .....	3402
32.16.3.1	Overview .....	3402
32.16.3.2	Equations .....	3405
32.16.3.3	Block Diagram and General Timing Diagram .....	3406
32.16.3.4	Register Settings for the Master Channel.....	3408
32.16.3.5	Register Settings for Slave Channel 1.....	3410
32.16.3.6	Register settings for slave channels 2, 4, and 6.....	3412
32.16.3.7	Register settings for slave channels 3, 5, and 7.....	3414
32.16.3.8	Operating Procedure for Complementary Modulation Output Function .....	3416
32.16.3.9	Specific Timing Diagrams .....	3418

Section 33	Timer Array Unit J (TAUJ)	3420
33.1	Features of RH850/F1KH, RH850/F1KM TAUJ	3420
33.1.1	Number of Units and Channels	3420
33.1.2	Register Base Addresses	3422
33.1.3	Clock Supply	3423
33.1.4	Interrupt Requests	3424
33.1.5	Reset Sources	3424
33.1.6	External Input/Output Signals	3425
33.1.7	Internal Input/Output Signals	3425
33.1.8	TAUJ0 / TAUJ2 Input Selection	3426
33.1.8.1	List of Registers	3428
33.1.8.2	SELB_TAUJ0I — TAUJTTINm Input Signal Selection Register	3428
33.1.8.3	SELB_TAUJ2I — TAUJTTINm Input Signal Selection Register	3429
33.2	Overview	3430
33.2.1	Functional Overview	3430
33.2.2	Terms	3430
33.2.3	Functional List of Timer Operations	3431
33.2.4	TAUJ I/O and Interrupt Request Signals	3431
33.2.5	Block Diagram	3432
33.2.6	Description of Block Diagram	3433
33.3	Registers	3434
33.3.1	List of Registers	3434
33.3.2	Details of TAUJn Prescaler Registers	3435
33.3.2.1	TAUJnTPS — TAUJn Prescaler Clock Select Register	3435
33.3.2.2	TAUJnBRS — TAUJn Prescaler Baud Rate Setting Register	3438
33.3.3	Details of TAUJn Control Registers	3439
33.3.3.1	TAUJnCDRm — TAUJn Channel Data Register	3439
33.3.3.2	TAUJnCNTm — TAUJn Channel Counter Register	3440
33.3.3.3	TAUJnCMORM — TAUJn Channel Mode OS Register	3441
33.3.3.4	TAUJnCMURm — TAUJn Channel Mode User Register	3444
33.3.3.5	TAUJnCSRm — TAUJn Channel Status Register	3445
33.3.3.6	TAUJnCSCm — TAUJn Channel Status Clear Trigger Register	3445
33.3.3.7	TAUJnTS — TAUJn Channel Start Trigger Register	3446
33.3.3.8	TAUJnTE — TAUJn Channel Enable Status Register	3446
33.3.3.9	TAUJnTT — TAUJn Channel Stop Trigger Register	3447
33.3.4	Details of TAUJn Simultaneous Rewrite Register	3448
33.3.4.1	TAUJnRDE — TAUJn Channel Reload Data Enable Register	3448
33.3.4.2	TAUJnRDM — TAUJn Channel Reload Data Mode Register	3448
33.3.4.3	TAUJnRDT — TAUJn Channel Reload Data Trigger Register	3449
33.3.4.4	TAUJnRSF — TAUJn Channel Reload Status Register	3449
33.3.5	Details of TAUJn Output Registers	3450
33.3.5.1	TAUJnTOE — TAUJn Channel Output Enable Register	3450
33.3.5.2	TAUJnTO — TAUJn Channel Output Register	3450
33.3.5.3	TAUJnTOM — TAUJn Channel Output Mode Register	3451
33.3.5.4	TAUJnTOC — TAUJn Channel Output Configuration Register	3452
33.3.5.5	TAUJnTOL — TAUJn Channel Output Active Level Register	3453
33.3.6	TAUJn Emulation Register	3453

33.3.6.1	TAUJnEMU — TAUJn Emulation Register .....	3453
33.4	Operating Procedure .....	3454
33.5	Concepts of Synchronous Channel Operation Function .....	3455
33.5.1	Rules of Synchronous Channel Operation Function.....	3455
33.5.2	Simultaneous Start and Stop of Synchronous Channel Counters.....	3457
33.5.2.1	Simultaneous Start and Stop within a TAUJ Unit .....	3457
33.5.2.2	Simultaneous Start between TAUJ Units .....	3457
33.6	Simultaneous Rewrite.....	3458
33.6.1	How to Control Simultaneous Rewrite .....	3458
33.6.1.1	Initial Settings.....	3459
33.6.1.2	Start Counter and Count Operation .....	3459
33.6.1.3	Simultaneous Rewrite .....	3459
33.6.2	Other General Rules for Simultaneous Rewrite.....	3459
33.6.3	Simultaneous Rewrite Procedure .....	3460
33.7	Channel Output Modes.....	3462
33.7.1	General Procedures for Specifying a Channel Output Mode .....	3464
33.7.2	Channel Output Modes Controlled Independently by TAUJn Signals .....	3465
33.7.2.1	Independent Channel Output Mode 1.....	3465
33.7.3	Channel Output Modes Controlled Synchronously by TAUJn Signals.....	3465
33.7.3.1	Synchronous Channel Output Mode 1.....	3465
33.8	Start Timing in Each Operating Modes.....	3466
33.8.1	Interval Timer Mode, Capture Mode, and Count Capture Mode .....	3466
33.8.2	Other Operating Modes .....	3467
33.9	TAUJTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts .....	3468
33.10	Interrupt Generation upon Overflow .....	3469
33.10.1	Combination of the TAUJTINm Input Position Detection Function and the Interval Timer Function .....	3470
33.11	TAUJTINm Edge Detection .....	3471
33.12	Independent Channel Operation Functions.....	3472
33.12.1	Interval Timer Function .....	3472
33.12.1.1	Overview .....	3472
33.12.1.2	Equations.....	3472
33.12.1.3	Block Diagram and General Timing Diagram .....	3473
33.12.1.4	Register Settings.....	3474
33.12.1.5	Operating Procedure for Interval Timer Function .....	3476
33.12.1.6	Specific Timing Diagrams .....	3477
33.12.2	TAUJTINm Input Interval Timer Function .....	3480
33.12.2.1	Overview .....	3480
33.12.2.2	Equations.....	3480
33.12.2.3	Block Diagram and General Timing Diagram .....	3481
33.12.2.4	Register Settings.....	3482
33.12.2.5	Operating Procedure for TAUJTINm Input Interval Timer Function .....	3484
33.12.2.6	Specific Timing Diagrams .....	3485
33.12.3	TAUJTINm Input Pulse Interval Measurement Function .....	3486
33.12.3.1	Overview .....	3486
33.12.3.2	Equations .....	3487

33.12.3.3	Block Diagram and General Timing Diagram .....	3487
33.12.3.4	Register Settings.....	3488
33.12.3.5	Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function .....	3489
33.12.3.6	Specific Timing Diagrams: Overflow Behavior .....	3490
33.12.4	TAUJTTINm Input Signal Width Measurement Function.....	3493
33.12.4.1	Overview .....	3493
33.12.4.2	Equations .....	3493
33.12.4.3	Block Diagram and General Timing Diagram .....	3494
33.12.4.4	Register Settings.....	3495
33.12.4.5	Operating Procedure for TAUJTTINm Input Signal Width Measurement Function .....	3496
33.12.4.6	Specific Timing Diagrams: Overflow Behavior .....	3497
33.12.5	TAUJTTINm Input Position Detection Function .....	3500
33.12.5.1	Overview .....	3500
33.12.5.2	Equations .....	3500
33.12.5.3	Block Diagram and General Timing Diagram .....	3501
33.12.5.4	Register Settings.....	3502
33.12.5.5	Operating Procedure for TAUJTTINm Input Position Detection Function .....	3503
33.12.5.6	Specific Timing Diagrams .....	3504
33.12.6	TAUJTTINm Input Period Count Detection Function.....	3505
33.12.6.1	Overview .....	3505
33.12.6.2	Equations.....	3505
33.12.6.3	Block Diagram and General Timing Diagram .....	3506
33.12.6.4	Register Settings.....	3507
33.12.6.5	Operating Procedure for TAUJTTINm Input Period Count Detection Function....	3508
33.12.6.6	Specific Timing Diagrams .....	3509
33.12.7	Overflow Interrupt Output Function (during TAUJTTINm Width Measurement).....	3510
33.12.7.1	Overview .....	3510
33.12.7.2	Block Diagram and General Timing Diagram .....	3511
33.12.7.3	Register Settings.....	3512
33.12.7.4	Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement) .....	3513
33.12.8	Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)	3514
33.12.8.1	Overview .....	3514
33.12.8.2	Block Diagram and General Timing Diagram .....	3515
33.12.8.3	Register Settings.....	3516
33.12.8.4	Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection) .....	3517
33.13	Synchronous Channel Operation Functions.....	3518
33.13.1	PWM Output Function.....	3518
33.13.1.1	Overview .....	3518
33.13.1.2	Equations .....	3519
33.13.1.3	Block Diagram and General Timing Diagram .....	3519
33.13.1.4	Register Settings for the Master Channel.....	3521
33.13.1.5	Register Settings for the Slave Channel(s) .....	3523
33.13.1.6	Operating Procedure for PWM Output Function.....	3525
33.13.1.7	Specific Timing Diagrams .....	3526
<b>Section 34</b>	<b>Real-Time Clock (RTCA) .....</b>	<b>3529</b>
34.1	Features of RH850/F1KH, RH850/F1KM RTCA .....	3529

34.1.1	Number of Units .....	3529
34.1.2	Register Base Address .....	3530
34.1.3	Clock Supply .....	3530
34.1.4	Interrupt Requests.....	3530
34.1.5	Reset Sources.....	3530
34.1.6	External Input/Output Signals .....	3530
34.2	Overview.....	3532
34.2.1	Functional Overview .....	3532
34.2.2	Block Diagram.....	3532
34.2.3	Description of Blocks .....	3533
34.3	Registers.....	3534
34.3.1	List of Registers .....	3534
34.3.2	Details of RTCA Control Registers .....	3535
34.3.2.1	RTCA <sub>n</sub> CTL0 — RTCA Control Register 0.....	3535
34.3.2.2	RTCA <sub>n</sub> CTL1 — RTCA Control Register 1.....	3536
34.3.2.3	RTCA <sub>n</sub> CTL2 — RTCA Control Register 2.....	3537
34.3.3	Details of RTCA Sub-Counter Registers .....	3539
34.3.3.1	RTCA <sub>n</sub> SUBC — RTCA Sub-Count Register.....	3539
34.3.3.2	RTCA <sub>n</sub> SRBU — RTCA Sub-Count Register Read Buffer.....	3540
34.3.3.3	RTCA <sub>n</sub> SUBU — RTCA Clock Error Correction Register .....	3541
34.3.3.4	RTCA <sub>n</sub> SCMP — RTCA Sub-Counter Compare Register .....	3542
34.3.4	Details of RTCA Clock Counter and Buffer Registers .....	3543
34.3.4.1	RTCA <sub>n</sub> SECC — RTCA Seconds Count Register .....	3543
34.3.4.2	RTCA <sub>n</sub> SEC — RTCA Seconds Count Buffer Register .....	3544
34.3.4.3	RTCA <sub>n</sub> MINC — RTCA Minutes Count Register.....	3545
34.3.4.4	RTCA <sub>n</sub> MIN — RTCA Minutes Count Buffer Register.....	3546
34.3.4.5	RTCA <sub>n</sub> HOUREC — RTCA Hours Count Register.....	3547
34.3.4.6	RTCA <sub>n</sub> HOUR — RTCA Hours Count Buffer Register.....	3549
34.3.4.7	RTCA <sub>n</sub> WEEKC — RTCA Day of the Week Count Register.....	3550
34.3.4.8	RTCA <sub>n</sub> WEEK — RTCA Day of the Week Count Buffer Register .....	3551
34.3.4.9	RTCA <sub>n</sub> DAYC — RTCA Day of the Month Count Register .....	3552
34.3.4.10	RTCA <sub>n</sub> DAY — RTCA Day of the Month Count Buffer Register .....	3553
34.3.4.11	RTCA <sub>n</sub> MONC — RTCA Month Count Register .....	3554
34.3.4.12	RTCA <sub>n</sub> MONTH — RTCA Month Count Buffer Register.....	3555
34.3.4.13	RTCA <sub>n</sub> YEAREC — RTCA Year Count Register .....	3556
34.3.4.14	RTCA <sub>n</sub> YEAR — RTCA Year Count Buffer Register .....	3557
34.3.5	Details of RTCA Special Counter and Buffer Registers.....	3558
34.3.5.1	RTCA <sub>n</sub> TIMEC — RTCA Time Count Register .....	3558
34.3.5.2	RTCA <sub>n</sub> TIME — RTCA Time Count Buffer Register .....	3559
34.3.5.3	RTCA <sub>n</sub> CALC — RTCA Calendar Count Register .....	3560
34.3.5.4	RTCA <sub>n</sub> CAL — RTCA Calendar Count Buffer Register .....	3561
34.3.6	Details of RTCA Alarm Time Setting Registers .....	3562
34.3.6.1	RTCA <sub>n</sub> ALM — RTCA Alarm Minute Setting Register .....	3562
34.3.6.2	RTCA <sub>n</sub> ALH — RTCA Alarm Hour Setting Register.....	3563
34.3.6.3	RTCA <sub>n</sub> ALW — RTCA Alarm Day of the Week Setting Register.....	3564
34.3.7	RTCA Emulation Register.....	3565
34.3.7.1	RTCA <sub>n</sub> EMU — RTCA Emulation Register .....	3565
34.4	Operation .....	3566

34.4.1	Clock Counter Format .....	3567
34.4.2	Fixed Interval Interrupt Function .....	3567
34.4.3	Alarm Interrupt Function .....	3568
34.4.4	Clock Error Correction .....	3569
34.4.4.1	Setting the Correction Value and the Operator .....	3570
34.4.4.2	Impact of the Repetition Interval .....	3570
34.4.4.3	Sample Settings .....	3571
34.5	Procedures for Setup, Writing and Reading .....	3573
34.5.1	Initial Setting of the RTCA .....	3573
34.5.1.1	RTCA Stop Procedure .....	3573
34.5.1.2	RTCA Initialization Procedure .....	3574
34.5.2	Updating Clock Counters .....	3575
34.5.3	Reading Clock Counters .....	3576
34.5.3.1	Procedure for Reading Count Buffer Registers .....	3576
34.5.3.2	Procedure for Reading Counter Registers Directly .....	3578
34.5.4	Reading RTCAnSRBU .....	3579
34.5.5	Writing to RTCAnSUBU .....	3580
34.5.6	Writing to RTCAnSCMP .....	3581
34.6	Timing Diagrams .....	3582
34.6.1	Timing of Counter Start .....	3582
34.6.2	Timing of Clock Counter Update while Counter Is Enabled .....	3583
34.6.3	Timing of Sub-Counter Read Buffer Reading while Counter is Enabled .....	3584
<b>Section 35</b>	<b>Encoder Timer (ENCA) .....</b>	<b>3585</b>
35.1	Features of RH850/F1KH, RH850/F1KM ENCA .....	3585

## Section 1A Overview of RH850/F1KH-D8

### 1A.1 RH850/F1KH Product Features

The features of the RH850/F1KH are described below.

The RH850/F1KH is a 32-bit single-chip microcontroller with two G3KH CPU core. The key features of the F1KH are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode in which the power supply to the most circuits of the microcontroller can be turned off.

#### Applications

The RH850/F1KH is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

## 1A.2 RH850/F1KH Functions

Table 1A.1 Overview of Product

Product Name		RH850/F1KH-D8			
		176 Pins	233 Pins	324 Pins	
Memory		See <b>Table 1A.2, Product Lineup.</b>			
External Memory Access Controller (MEMC)		23 bit Address Bus		24 bit Address Bus	
Serial Flash Memory I/F (SFMA)	Bus width	4 bit			
	Mode	SDR			
	Max. clock	40 MHz			
Memory Card I/F (MMCA)	Bus width	Not provided		8 bit	
	Mode			Backward-compatible	
	Max. clock			20 MHz	
CPU	CPU System		G3KH (Dual Core)		
	CPU frequency		240 MHz max.		
	FPU		Single-precision		
	Protection Function	Memory Protection Unit (MPU)	Provided		
		Internal Peripheral-device Guard (IPG)	Provided		
Processor Element Guard (PEG)		Provided			
DMA		64 channels			
Operating clock	Main Oscillator (MainOSC)		8/16/20/24 MHz		
	Low Speed Internal Oscillator (LS IntOSC)		240 kHz (typ.)		
	High Speed Internal Oscillator (HS IntOSC)		8 MHz (typ.)		
	PLL	PLL0 (for CPU, with SSCG)		Provided	
		PLL1 (for CPU/Peripheral)		Provided	
	Sub Oscillator (SubOSC)		32.768 kHz		
I/O port		144	174	246	
A/D converter	ADCA0	Physical input channels	Total 34 ch (12 bit resolution: 16 ch + 10 bit resolution: 18 ch)		
		External multiplexer support for channel number extension	Provided		
		Channels with T&H	Provided		
	ADCA1	Physical input channels	Total 24 ch (12 bit resolution: 16 ch + 10 bit resolution: 8 ch)	Total 36 ch (12 bit resolution: 16 ch + 10 bit resolution: 20 ch)	
		External multiplexer support for channel number extension	Not provided		
		Channels with T&H	Not provided		

Table 1A.1 Overview of Product

Product Name		RH850/F1KH-D8		
		176 Pins	233 Pins	324 Pins
Timer	Timer Array Unit D (TAUD)	1 unit (16 bit resolution timers × 16 channels /unit)		
	Timer Array Unit B (TAUB)	2 units (16 bit resolution timers × 16 channels /unit)		
	Timer Array Unit J (TAUJ)	4 units (32 bit resolution timers × 4 channels /unit)		
	Operating System Timer (OSTM)	10 units		
	Real-Time Clock (RTCA)	1 unit		
	Encoder Timer (ENCA)	1 unit		
	Window Watchdog Timer A (WDTA)	3 units		
Serial interfaces	Clocked Serial Interface G (CSIG)	5 channels		
	Clocked Serial Interface H (CSIH)	5 channels		
	CAN Interface (RS-CANFD)	8 channels	12 channels	
	LIN/UART Interface (RLIN3)	8 channels		
	LIN Master Interface (RLIN2)	10 channels	12 channels	16 channels
	I <sup>2</sup> C Interface (RIIC)	2 channels		
	Clock Extension Peripheral Interface (CXP1)	Not provided		
	Single Edge Nibble Transmission (RSENT)	2 channels		
	FlexRay Interface (FLXA)	2 channel (A ch, B ch)		
	Ethernet AVB (ETNB)	1 channel (MII)	2 channels (MII)	
External Interrupts	Maskable	24		
	Non-maskable (NMI)	1		
Other functions	Clock Monitors (CLMA)	For PLL0, PLL1, HS IntOSC, MainOSC		
	Data CRC (DCRA)	4 channels		
	Low-Voltage Indicator (LVI)	Provided		
	Power-On Clear (POC)	Provided		
	Core Voltage Monitors (CVM)	Provided		
	Error Correction Coding (ECC)	For Code flash, Data flash, Local RAM, Retention RAM, Global RAM, CSIH, RS-CANFD, FLXA, ETNB		For Code flash, Data flash, Local RAM, Retention RAM, Global RAM, CSIH, RS-CANFD, FLXA, ETNB, MMCA
	Low Power Sampler (LPS)	Provided		
	PWM Output/Diagnostic (PWM-Diag)	72 channels	80 channels	96 channels
	Motor Control	1 unit		
	Key Return (KR)	8 channels		
	CLOCK OUTPUT (FOUT)	Provided		
	RESET OUTPUT ( RESETOUT )	Provided		
	Intelligent Cryptographic Unit Master D (ICUMD)	Provided		
	On-Chip debug (OCD)	Provided		
	Boundary Scan	Provided		

Table 1A.1 Overview of Product

Product Name			RH850/F1KH-D8		
			176 Pins	233 Pins	324 Pins
Voltage supply	Internal supply	REG0VCC (for AWO)	VPOC to 5.5 V		
		REG1VCC (for ISO)	VPOC to 3.6 V		
	Input/output buffer supplies		VPOC to 5.5 V		
	A/D Converter supplies		3.0 to 5.5 V		
Package			176-pin LQFP	233-pin FPBGA	324-pin FPBGA

## Section 1B Overview of RH850/F1KM-S4, RH850/F1KM-S2

### 1B.1 RH850/F1KM Product Features

The features of the RH850/F1KM are described below.

The RH850/F1KM is a 32-bit single-chip microcontroller with a G3KH CPU core. The key features of the F1KM are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode in which the power supply to the most circuits of the microcontroller can be turned off.

#### Applications

The RH850/F1KM is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

## 1B.2 RH850/F1KM Functions

Table 1B.1 Overview of Product

Product Name		RH850/F1KM-S4					
		100 Pins	144 Pins	176 Pins	233 Pins	272 Pins	
Memory		See <b>Table 1B.3, Product Lineup.</b>					
External Memory Access Controller (MEMC)		Not provided		23 bit Address Bus		24 bit Address Bus	
Serial Flash Memory I/F (SFMA)	Bus width	Not provided	4 bit				
	Mode		SDR				
	Max. clock		40 MHz				
CPU	CPU System		G3KH				
	CPU frequency		240 MHz max.				
	FPU		Single-precision				
	Protection Function	Memory Protection Unit (MPU)	Provided				
Internal Peripheral-device Guard (IPG)		Provided					
Processor Element Guard (PEG)		Provided					
DMA		32 channels					
Operating clock	Main Oscillator (MainOSC)		8/16/20/24 MHz				
	Low Speed Internal Oscillator (LS IntOSC)		240 kHz (typ.)				
	High Speed Internal Oscillator (HS IntOSC)		8 MHz (typ.)				
	PLL	PLL0 (for CPU, with SSCG)		Provided			
		PLL1 (for CPU/Peripheral)		Provided			
Sub Oscillator (SubOSC)		Not provided	32.768 kHz				
I/O port		75	114	144	174	214	
A/D converter	ADCA0	Physical input channels	Total 32 ch (12 bit resolution: 16 ch + 10 bit resolution: 16 ch)	Total 34 ch (12 bit resolution: 16 ch + 10 bit resolution: 18 ch)			
		External multiplexer support for channel number extension	Provided				
		Channels with T&H	Provided				

Table 1B.1 Overview of Product

Product Name			RH850/F1KM-S4				
			100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
A/D converter	ADCA1	Physical input channels	Not provided	Total 12 ch (12 bit resolution: 8 ch + 10 bit resolution: 4 ch)	Total 24 ch (12 bit resolution: 16 ch + 10 bit resolution: 8 ch)	Total 36 ch (12 bit resolution: 16 ch + 10 bit resolution: 20 ch)	
		External multiplexer support for channel number extension	Not provided				
		Channels with T&H	Not provided				
Timer	Timer Array Unit D (TAUD)		1 unit (16 bit resolution timers × 16 channels /unit)				
	Timer Array Unit B (TAUB)		1 unit (16 bit resolution timers × 16 channels /unit)	2 units (16 bit resolution timers × 16 channels /unit)			
	Timer Array Unit J (TAUJ)		4 units (32 bit resolution timers × 4 channels /unit)				
	Operating System Timer (OSTM)		5 units				
	Real-Time Clock (RTCA)		1 unit				
	Encoder Timer (ENCA)		1 unit				
	Window Watchdog Timer A (WDTA)		2 units				
Serial interfaces	Clocked Serial Interface G (CSIG)		1 channel	2 channels	4 channels		
	Clocked Serial Interface H (CSIH)		4 channels				
	CAN Interface (RS-CANFD)		8 channels				
	LIN/UART Interface (RLIN3)		3 channels	6 channels	8 channels		
	LIN Master Interface (RLIN2)		3 channels	6 channels	10 channels	12 channels	
	I <sup>2</sup> C Bus Interface (RIIC)		2 channels				
	Clock Extension Peripheral Interface (CXP1)		Not provided				
	Single Edge Nibble Transmission (RSENT)		1 channel	2 channels			
	FlexRay Interface (FLXA)		2 channel (A ch, B ch)				
	Ethernet AVB (ETNB)		Not provided			1 channel (MII)	
External Interrupts	Maskable		14	24			
	Non-maskable (NMI)		1				
Other functions	Clock Monitors (CLMA)		For PLL0, PLL1, HS IntOSC, MainOSC				
	Data CRC (DCRA)		4 channels				
	Low-Voltage Indicator (LVI)		Provided				
	Power-On Clear (POC)		Provided				
	Core Voltage Monitors (CVM)		Provided				
Error Correction Coding (ECC)		For Code flash, Data flash, Local RAM, Retention RAM, Global RAM, CSIH, RS-CANFD, FLXA			For Code flash, Data flash, Local RAM, Retention RAM, Global RAM, CSIH, RS-CANFD, FLXA, ETNB

Table 1B.2 Overview of Product

Product Name		RH850/F1KM-S2		
		100 Pins	144 Pins	176 Pins
Other functions	Low Power Sampler (LPS)	Provided		
	PWM Output/Diagnostic (PWM-Diag)	44 channels	64 channels	72 channels
	Motor Control	1 unit		
	Key Return (KR)	8 channels		
	CLOCK OUTPUT (FOUT)	Provided		
	RESET OUTPUT ( RESETOUT )	Provided		
	Intelligent Cryptographic Unit Master D (ICUMD)	Provided		
	On-Chip debug (OCD)	Provided		
	Boundary Scan	Provided		
Voltage supply	Internal supply	VPOC to 5.5 V		
	Input/output buffer supplies	VPOC to 5.5 V		
	A/D Converter supplies	3.0 to 5.5 V		
Package	100-pin LQFP	144-pin LQFP	176-pin LQFP

## Section 1C Overview of RH850/F1KM-S1

### 1C.1 RH850/F1KM Product Features

The features of the RH850/F1KM are described below.

The RH850/F1KM is a 32-bit single-chip microcontroller with a G3KH CPU core. The key features of the F1KM are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode, in which the power supply to the most circuits of the microcontroller can be turned off.

#### Applications

The RH850/F1KM is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

## 1C.2 RH850/F1KM Functions

Table 1C.1 Overview of Product

Product Name			RH850/F1KM-S1				
			48 Pins	64 Pins	80 Pins	100 Pins	
Memory			See <b>Table 1C.2, Product Lineup.</b>				
External Memory Access Controller (MEMC)			Not provided				
CPU	CPU System		G3KH				
	CPU frequency		120 MHz max				
	FPU		Single-Precision				
	Protection Function	Memory Protection Unit (MPU)	Provided				
		Internal Peripheral Guard (IPG)	Provided				
Processor Element Guard (PEG)		Provided					
DMA			16 channels				
Operating clock	Main Oscillator (MainOSC)		8/16/20/24 MHz				
	Low Speed Internal Oscillator (LS IntOSC)		240 kHz(typ.)				
	High Speed Internal Oscillator (HS IntOSC)		8 MHz(typ.)				
	PLL	PLL0 (for CPU, with SSCG)		Not provided			
		PLL1 (for CPU/Peripheral)		Provided			
Sub Oscillator (SubOSC)			Not provided				
I/O port			33	49	65	81	
A/D converter	ADCA0	Physical input channels	Total 12 ch	Total 21 ch	Total 25 ch	Total 36 ch	
			(12 bit resolution: 8 ch + 10 bit resolution: 4 ch)	(12 bit resolution: 10 ch + 10 bit resolution: 11 ch)	(12 bit resolution: 11 ch + 10 bit resolution: 14 ch)	(12 bit resolution: 16 ch + 10 bit resolution: 20 ch)	
		External multiplexer support for channel number extension	Provided				
	Channels with T&H	3			6		
	ADCA1	Physical input channels	Not provided				
		External multiplexer support for channel number extension	Not provided				
Channels with T&H		Not provided					
Timer	Timer Array Unit D (TAUD)		1 unit (16 bit resolution timers × 16 channels /unit)				
	Timer Array Unit B (TAUB)		Not provided		1 unit (16 bit resolution timers × 16 channels /unit)		
	Timer Array Unit J (TAUJ)		4 units (32 bit resolution timers × 4 channels /unit)				
	Operating System Timer (OSTM)		1 unit				
	Real-Time Clock (RTCA)		1 unit				
	Encoder Timer (ENCA)		1 unit				
	Window Watchdog Timer A (WDTA)		2 units				

Table 1C.1 Overview of Product

Product Name		RH850/F1KM-S1			
		48 Pins	64 Pins	80 Pins	100 Pins
Serial interfaces	Clocked Serial Interface G (CSIG)	1 channel			
	Clocked Serial Interface H (CSIH)	1 channel		3 channels	4 channels
	CAN Interface (RS-CANFD)	1 channel	3 channels		6 channels
	LIN/UART Interface (RLIN3)	1 channel	2 channels	3 channels	4 channels
	LIN Master Interface (RLIN2)	2 channels			3 channels
	I <sup>2</sup> C Bus Interface (RIIC)	2 channels			
	Clock Extension Peripheral Interface (CXP1)	Not provided			
	Single Edge Nibble Transmission (RSENT)	2 channels			
External Interrupts	Maskable	8		12	13
	Non-maskable (NMI)	1			
Other functions	Clock Monitors (CLMA)	For PLL1, HS IntOSC, MainOSC			
	Data CRC (DCRA)	1 channel		4 channels	
	Low-Voltage Indicator (LVI)	Provided			
	Power-On Clear (POC)	Provided			
	Core Voltage Monitors (CVM)	Provided			
	Error Correction Coding (ECC)	For Code Flash, Data Flash, Local RAM, Retention RAM, CSIH, RS-CANFD			
	Low Power Sampler (LPS)	Provided			
	PWM Output/Diagnostic (PWM-Diag)	13 channels	24 channels		48 channels
	Motor Control	1 unit			
	Key Return (KR)	6 channels	8 channels		
	CLOCK OUTPUT (FOUT)	Provided			
	RESET OUTPUT ( $\overline{\text{RESETOUT}}$ )	Not Provided	Provided		
	Intelligent Cryptographic Unit E (ICUSE)	Provided			
	Secure WDT (SWDT)	Provided			
	On-Chip debug (OCD)	Provided			
	Boundary Scan	Provided			
Voltage supply	Internal supply	VPOC to 5.5 V			
	Input/output buffer supplies	VPOC to 5.5 V			
	A/D Converter supplies	3.0 V to 5.5 V			
Package	48-pin LQFP	64-pin LQFP	80-pin LQFP	100-pin LQFP

## Section 2A Pin Function of RH850/F1KH-D8

This section describes the pin and port functions.

**Section 2A.1, Pin Connection Diagram to Section 2A.5, Recommended Connection of Unused Pins** describe the pin connections and respective pins.

**Section 2A.6, Features of RH850/F1KH Port to Section 2A.13, Description of Port Noise Filter & Edge/Level Detection** describe the general port functions.

**CAUTION**

---

When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.

- **(e.g.)** When RS-CANFD channel 0 is used:

CAN0TX P0\_0 P10\_1

CAN0RX P0\_1 P10\_0

Use one of the following pin combinations:

- P0\_0 and P0\_1, or

- P10\_0 and P10\_1.

The combinations of P0\_0 and P10\_0, and P0\_1 and P10\_1 are not allowed.

- **(e.g.)** When CSIH4 is used:

CSIH4SC P1\_5 P23\_3

CSIH4SO P2\_4 P23\_1

CSIH4SI P1\_4 P23\_2

Use one of the following pin combinations:

- P1\_5, P2\_4 and P1\_4, or

- P23\_3, P23\_1 and P23\_2.

The pin combinations of the following are not allowed:

- P1\_5, P2\_4 and P23\_2

- P1\_5, P23\_1 and P1\_4

- P23\_3, P2\_4 and P23\_2

- P1\_5, P23\_1 and P23\_2

- P23\_3, P2\_4 and P1\_4

- P23\_3, P23\_1 and P1\_4.

---

## 2A.3 Pin Functions During and After Reset

Table 2A.6 Pin Functions During and After Reset

Pins	During Reset	After Reset
JP0_0	High impedance	JP0_0: High impedance Serial programming mode: FPDR, FPDT (1 wire UART) FPDR (2 wire UART) Nexus I/F: DCUTDI input LPD (4 pins): LPDI input LPD (1 pin): LPDIO input/output
JP0_1	High impedance	JP0_1: High impedance Serial programming mode: FPDT Nexus I/F: DCUTDO output LPD (4 pins): LPDO output LPD (1 pin): High impedance
JP0_2	High impedance	JP0_2: High impedance Serial programming mode: FPCK Nexus I/F: DCUTCK input LPD (4 pins): LPDCLK input LPD (1 pin): High impedance
JP0_3	High impedance	JP0_3: High impedance Serial programming mode: High impedance Nexus I/F: DCUTMS input LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_4	Input* <sup>3,*5</sup>	JP0_4: High impedance Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCUTRST}}$ input* <sup>1</sup> LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_5	High impedance	JP0_5: High impedance Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCURDY}}$ output LPD (4 pins): LPDCLKOUT output LPD (1 pin): High impedance
JP0_6	High impedance	JP0_6: High impedance Serial programming mode: High impedance Nexus I/F: $\overline{\text{EVTO}}$ output LPD (4 pins): High impedance LPD (1 pin): High impedance
P8_6	Output* <sup>2,*4</sup>	Output (OPBT0.RESETOUTEN = 1)* <sup>2</sup> High impedance (OPBT0.RESETOUTEN = 0)* <sup>2,*4</sup>
P0 to P3, P8 to P13, P18 to P24 (except P8_6, P10_1, P10_2, P10_6 and P10_8)	High impedance	High impedance
P10_1	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE0 input (FLMD0 = 1, FLMD1 = 1)
P10_2	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE1 input (FLMD0 = 1, FLMD1 = 1)

Table 2A.6 Pin Functions During and After Reset

Pins	During Reset	After Reset
P10_6	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 1) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0) MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1)
P10_8	High impedance	High impedance (FLMD0 = 0) FLMD1 input (FLMD0 = 1)
FLMD0	Input	Input
$\overline{\text{RESET}}$	Input	Input
AP0, AP1	High impedance	High impedance

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low level.

Note 2.  $\overline{\text{RESETOUT}}$  is output. For details, see **Section 2A.11, Port (Special I/O) Function Overview**.

Note 3. When the power is turned on or when  $\overline{\text{RESET}}$  is low level, JP0\_4 pin should be driven low level.

Note 4. If OPBT0.RESETOUTEN = 0, P8\_6 pin status has a possibility to become unstable (less than 15  $\mu$ s) at the transition moment to reset status by internal reset factors.

Note 5. When  $\overline{\text{RESET}}$  is low level, on-chip pull-down resistor is connected to JP0\_4.

## 2A.4 Port State in Standby Mode

For the port state in standby mode, see **Section 14.1.4, I/O Buffer Control**.

## 2A.5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.

Table 2A.7 Recommended Connection of Unused Pins

Pin	Recommended Connection of Unused Pins
A0VREF, A1VREF	Connected to EVCC or BVCC
A0VSS, A1VSS	Connected to EVSS or BVSS
$\overline{\text{RESET}}$	Connected to EVCC or BVCC via a resistor
XT1	Connected to REGnVCC or AWOVSS via a resistor*2 (bit 0 of IPIBC0 = 1) Connected to AWOVSS (bit 0 of IPIBC0 = 0)
X1	Connected to AWOVSS via a resistor
X2	Open
IP0_0	Connected to REGnVCC or AWOVSS via a resistor*2 (bit 0 of IPIBC0 = 1) Open (bit 0 of IPIBC0 = 0)
JP0 (excluding JP0_4) P0 P1 P2 P3 P8 (excluding P8_6) P9 P20 P23	Input: Open (when the PIBCN_m and PMCN_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCN_m or PMCN_m bits are 1) Output: Open
P8_6	Input: Open (when the PIBCN_m and PMCN_m bits are 0) Connected to EVSS via a resistor (when the PIBCN_m or PMCN_m bits are 1) Output: Open
JP0_4	Connected to EVSS via a resistor
P10_1, P10_2, P10_6, P10_8	Input: Open (when the PIBCN_m and PMCN_m bits are 0) Connected to EVSS via a resistor (when the PIBCN_m or PMCN_m bits are 1) Output: Open

Table 2A.7 Recommended Connection of Unused Pins

Pin	Recommended Connection of Unused Pins
P10 (excluding P10_1, P10_2, P10_6, P10_8)	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to BVCC or BVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1)
P11	Output: Open
P12	
P13	
P18	
P19	
P21	
P22	
P24	
AP0	Input: Open (when the PIBCn_m bit is 0) Connected to A0VREF or A0VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
AP1	Input: Open (when the PIBCn_m bit is 0) Connected to A1VREF or A1VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
Nexus/LPD I/F (JP0)	DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor DCUTDO/LPDO (JP0_1): Open DCUTCK/LPDCLK (JP0_2): Open DCUTMS (JP0_3): Connected to EVCC via a resistor <u>DCUTRST</u> (JP0_4): Connected to EVSS via a resistor*1 <u>DCURDY</u> /LPDCLKOUT (JP0_5): Open <u>EVTO</u> (JP0_6): Open

Note 1. For in case when a debugging interface is used, this pin should be connected to EVCC through resistor depending on the development tool made by a third party.

Note 2. XT1 = IP0\_0 (XT2) = REGnVCC or AWOVSS should be set.  
XT1 is connected to IP0\_0 (XT2) through an internal resistor. Therefore, it is necessary to maintain equal voltage level in order not to make a current path.

## 2A.6 Features of RH850/F1KH Port

### 2A.6.1 Port Group

The RH850/F1KH provides the following port groups, indicated by the numbers in the table below.

Table 2A.8 Port Groups in RH850/F1KH-D8

No. of Pins	Port Group	RH850/F1KH-D8
176 pins	Number	14
	Name	P0 to P2, P8 to P12, P18, P20, JP0, AP0, AP1, IP0
233 pins	Number	17
	Name	P0 to P3, P8 to P13, P18 to P20, JP0, AP0, AP1, IP0
324 pins	Number	21
	Name	P0 to P3, P8 to P13, P18 to P24, JP0, AP0, AP1, IP0

### 2A.6.2 Port Group Index n

Throughout this section, the port groups are identified by using the index “n”. For example, the port mode control register of the Pn pin is PMCN (n = 0 to 3, 8 to 13, 18 to 24).

### 2A.6.3 Register Base Addresses

Port and JTAG port base addresses are listed in the following table.

Port and JTAG port register addresses are given as offsets from the base addresses.

Table 2A.9 Register Base Addresses

Base Address Name	Base Address
<PORTn_base>	FFC1 0000 <sub>H</sub>
<JPORT0_base>	FFC2 0000 <sub>H</sub>

### 2A.6.4 Clock Supply

The clock supply to ports is shown in the following table.

Table 2A.10 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Port	Register access clock	CPUCLK_UL

## 2A.7 Port Functions

The microcontroller has various pins for input/output functions, known as ports. The ports are organized in port groups. The RH850/F1KH also has several control registers to enable pins to be used as other than general-purpose input/output pins.

For a description of the terms pin, port, and port group, see **Section 2A.7.2, Terms**.

### 2A.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16.
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.

**Table 2A.39, JTAG Port 0 (JP0), Table 2A.41, Port 0 (P0), Table 2A.43, Port 1 (P1), Table 2A.45, Port 2 (P2), Table 2A.47, Port 3 (P3), Table 2A.49, Port 8 (P8), Table 2A.51, Port 9 (P9), Table 2A.53, Port 10 (P10), Table 2A.55, Port 11 (P11), Table 2A.57, Port 12 (P12), Table 2A.59, Port 13 (P13), Table 2A.61, Port 18 (P18), Table 2A.63, Port 19 (P19), Table 2A.65, Port 20 (P20), Table 2A.67, Port 21 (P21), Table 2A.69, Port 22 (P22), Table 2A.71, Port 23 (P23), Table 2A.73, Port 24 (P24), Table 2A.75, Analog Port 0 (AP0), Table 2A.77, Analog Port 1 (AP1), Table 2A.79, Input Port 0 (IP0), and Section 2A.9.2, Pin Function Configuration.**

#### CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

#### [Example]

INTP0 is assigned to the following pins on this device. However, the INTP0 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- JP0\_0 (1st input alternative function)
- P0\_1 (2nd, 3rd input alternative function)
- P10\_0 (2nd input alternative function)

In the above case, when the 1st input alternative function (INTP0) of JP0\_0 is selected, using the 2nd input alternative function (CAN0RX/INTP0) of P0\_1 only for the CAN signal is also prohibited.

## 2A.7.2 Terms

The following terms are used in this section:

### Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.

A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

### Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

### Port mode and ports

A pin in port mode works as a general-purpose input/output pin. It is then called “port”.

The corresponding name is Pn\_m. For example, P0\_7 denotes port 7 of port group 0. It is referenced as “port P0\_7”.

### Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0\_0 and INTP0. The different names indicate the function of the pin at that time.

### 2A.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging.

JTAG port group registers and bit names are prefixed by a “J”. For example, JP0 denotes JTAG port group 0, and JPM0.JPM0\_m denotes the JPM0\_m port mode bit of the JPM0 port mode register.

#### NOTE

---

In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

---

### 2A.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMn.PMCn\_m bit = 0)  
A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn\_m bit.
- Software I/O control alternative mode (PMn.PMCn\_m bit = 1, PIPn.PIPCn\_m bit = 0)  
In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn\_m bit.
- Direct I/O control alternative mode (PMn.PMCn\_m bit = 1, PIPn.PIPCn\_m bit = 1)  
In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.

Table 2A.11 Pin Function Configuration (Overview)

Mode	Bit			I/O
	PMn_m	PMn_m	PIPn_m	
Port mode	0	0	X	O
		1*1		I
Software I/O control alternative mode	1	0	0	O
		1	0	I
Direct I/O control alternative mode		X	1	Controlled by the alternative function

Note 1. The input buffer must be enabled (PIBn\_m bit = 1).

- Software I/O control alternative mode (PIPn.PIPCn\_m bit = 0)
  - Output (PMn\_m bit = 0): Alternative output mode 1 to Alternative output mode 7
  - Input (PMn\_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPn.PIPCn\_m bit = 1)
  - The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2A.12 Alternative Mode Selection Overview (PM<sub>Cn</sub>.PM<sub>Cn\_m</sub> Bit = 1)

Mode	Register					I/O		
	PIPC*1	PM*1	PFCAE	PFCE	PFC			
Alternative output mode 1 (ALT-OUT1)	0	0	0	0	0	O		
Alternative input mode 1 (ALT-IN1)		1				I		
Alternative output mode 2 (ALT-OUT2)		0				1	O	
Alternative input mode 2 (ALT-IN2)		1					I	
Alternative output mode 3 (ALT-OUT3)		0		1	1	0	O	
Alternative input mode 3 (ALT-IN3)		1					I	
Alternative output mode 4 (ALT-OUT4)		0			1	1	0	O
Alternative input mode 4 (ALT-IN4)		1						I
Alternative output mode 5 (ALT-OUT5)		0	1	0	0	O		
Alternative input mode 5 (ALT-IN5)		1				I		
Alternative output mode 6 (ALT-OUT6)		0				1	1	0
Alternative input mode 6 (ALT-IN6)		1		I				
Alternative output mode 7 (ALT-OUT7)		0		1	0			
Alternative input mode 7 (ALT-IN7)		1				I		
Other than the above	Setting prohibited							

Note 1. If PIP<sub>Cn</sub>.PIP<sub>Cn\_m</sub> = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

If a pin is in alternative mode (PM<sub>Cn</sub>.PM<sub>Cn\_m</sub> bit = 1), one of up to seven alternative functions can be selected for that pin by using the PFC<sub>Cn</sub>, PFC<sub>Cn</sub>, and PFCA<sub>Cn</sub> registers.

## 2A.7.4 Pin Data Input/Output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

### 2A.7.4.1 Output Data

In the port mode (PMn.PMCn\_m = 0), the value of the Pn.Pn\_m is output from the Pn\_m pin.

### 2A.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn\_m pin, the value of the Pn.Pn\_m, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits.

The different PPRn read modes are shown in the table below.

Table 2A.13 PPRn\_m Read Values

PMC n_m	PM n_m	PIBC n_m	PIPC n_m	PODC n_m	Mode	PPRn_m Read Value	
0	1	0	X	X	Port input, input buffer disabled	Pn.Pn_m bit	
		1		X	Port input, input buffer enabled	Pn_m pin	
	0	X	0	Port push-pull output	Pn.Pn_m bit* <sup>1</sup>		
			1	Port open-drain output			
1	1	X	0	X	Software I/O control alternative input	Pn_m pin	
				0	Software I/O control alternative push-pull output		Output signal from the alternative function* <sup>1</sup>
				1	Software I/O control alternative open-drain output		
	X	X	1	0	Direct I/O control alternative input or push-pull output	I/O port in alternative mode: • Input: Pn_m pin • Output: Output signal from the alternative function* <sup>1</sup>	
				1	Direct I/O control alternative input or open-drain output		

Note 1. When PBDCn\_m = 1, the level of the Pn\_m pin is returned by the PPRn\_m bit.

The control registers in the above table have the following effects:

- PMCn.PMCn\_m bit  
This bit selects port mode (PMn.PMCn\_m = 0) or alternative mode (PMn.PMCn\_m = 1).
- PMn.PMn\_m bit  
This bit selects input (PMn.PMn\_m = 1) or output (PMn.PMn\_m = 0) when the port mode (PMn.PMCn\_m = 0) and software I/O control alternative mode (PMn.PMCn\_m = 1, PIPcn.PIPCn\_m = 0) have been selected.
- PIBcn.PIBcn\_m bit  
This bit disables (PIBCn.PIBcn\_m = 0) or enables (PIBCn.PIBcn\_m = 1) the input buffer in input port mode (PMn.PMCn\_m = 0 and PMn.PMn\_m = 1). If the input buffer is disabled, PPRn\_m reads the Pn.Pn\_m bit; otherwise the Pn\_m pin level is returned.
- PIPcn.PIPCn\_m bit  
This bit selects software I/O control alternative mode or direct I/O control alternative mode.
- PODcn.PODcn\_m bit  
This bit selects push-pull output (PODCn.PODcn\_m = 0) or open-drain output (PODCn.PODcn\_m = 1).

- PBDCn.PBDCn\_m bit

In output mode, when this bit is set to 1, the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn\_m pin can be read from PPRn.PPRn\_m.

---

**CAUTION**

---

When using Pn\_m as an alternative output function (PMc.PMc\_m = 1, PMn.PMn\_m = 0), the level of the Pn\_m pin can be read at the PPRn.PPRn\_m bit by enabling bidirectional mode (PBDCn.PBDCn\_m = 1).

Note, however, that the level of the Pn\_m pin will be input to the alternative function that the Pn\_m pin is being used as.

---

### 2A.7.4.3 Writing to the Pn Register

The data to be output via port Pn\_m in port mode (PMc.PMc\_m bit = 0) is held in port register Pn.

Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.  
In this case, new data can be written directly to the Pn register.
- By performing an indirect bitwise operation (a “set”, “reset”, or “not” operation) on the Pn register.  
An indirect bitwise operation (“set”, “reset”, or “not”) can be performed on the Pn register by using the following two registers:
  - Port Set/Reset register PSRn  
If the PSRn.PSRn (m + 16) bit = 1, the value of the Pn.Pn\_m bit is determined by the value of the PSRn.PSRn\_m bit.  
In other words, the Pn\_m bit can be set or reset without writing directly to the Pn register.
  - Port NOT register PNOTn  
By setting PNOTn.PNOTn\_m to 1, the Pn.Pn\_m bit can be inverted without writing directly to the Pn register.

An indirect bitwise operation on the Pn register (“set”, “reset”, or “not”) has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

## 2A.8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

Figure 2A.5 Schematic View of Port Control

### CAUTION

Use documented alternative functions only. The behavior and performance are not guaranteed when undocumented alternative functions are selected.

## 2A.9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

- Section 2A.9.2, Pin Function Configuration
- Section 2A.9.3, Pin Data Input/Output
- Section 2A.9.4, Configuration of Electrical Characteristics

### 2A.9.1 Overview

The following registers are used for setting the individual pins of the port groups.

For details on <PORTn\_base> and <JPORT0\_base>, see **Section 2A.6.3, Register Base Addresses**.

Table 2A.14 Port Group Configuration Registers

Module Name	Register Name	Symbol	Address
Pin function configuration			
PORT	Port mode control register	PMcN	<PORTn_base> + 0400 <sub>H</sub> + n × 4
JTAG		JPMC0	<JPORT0_base> + 0040 <sub>H</sub>

## Index n

In **Table 2A.14, Port Group Configuration Registers**, the index “n” in register symbols denotes the actual indices of the individual port groups. For example, PMCN generically indicates a port mode control register for port group n (Pn). The values for n differ according to the number of pins on the device in the way shown in **Table 2A.15, Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols**.

Table 2A.15 Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols

Number of Pins on the Device	Port Groups	Values for “n”
176 pins	P0, P1, P2, P8, P9, P10, P11, P12, P18, P20	0,1,2,8,9,10,11,12,18,20
	AP0, AP1	0, 1
233 pins	P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20	0,1,2,3,8,9,10,11,12,13,18,19,20
	AP0, AP1	0, 1
324 pins	P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, P23, P24	0,1,2,3,8,9,10,11,12,13,18,19,20,21,22,23,24
	AP0, AP1	0, 1

## JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.

All descriptions (except for those of the PFCAEn register and PIPCN register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

## Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

## 2A.9.2 Pin Function Configuration

### 2A.9.2.1 PMCn / JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

**Access:** PMCn: This register can be read or written in 16-bit units.

JPMC0: This register can be read or written in 8-bit units.

**Address:** PMCn: <PORTn\_base> + 0400H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 20, 21, 22, 23, 24)

JPMC0: <JPORT0\_base> + 0040H\*1

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMC n_15	PMC n_14	PMC n_13	PMC n_12	PMC n_11	PMC n_10	PMC n_9	PMC n_8	PMC n_7	PMC n_6	PMC n_5	PMC n_4	PMC n_3	PMC n_2	PMC n_1	PMC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).**

Table 2A.16 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

#### CAUTIONS

- I/O is not controlled by only setting alternative mode (PMCn.PMCn\_m bit = 1). If the alternative function requires direct I/O control, also set the PIPCn.PIPCn\_m bit to 1.
- If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLm\_<name>, DNFA<name>-CTL and the DNFA<name>-EN register. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, and **Section 2A.13, Description of Port Noise Filter & Edge/Level Detection**.

#### NOTE

The control bits of the JTAG port mode control register (JPMC0) are JPMC0\_[7:0].

### 2A.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn\_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

**Access:** PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>. Reading bits 15 to 0 returns the value of register PMCn.

JPMCSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000<sub>H</sub>. Reading bits 7 to 0 returns the value of register JPMCO.

**Address:** PMCSRn: <PORTn\_base> + 0900<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 20, 21, 22, 23, 24)  
JPMCSR0: <JPORT0\_base> + 0090<sub>H</sub>\*1

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMC SRn_31	PMC SRn_30	PMC SRn_29	PMC SRn_28	PMC SRn_27	PMC SRn_26	PMC SRn_25	PMC SRn_24	PMC SRn_23	PMC SRn_22	PMC SRn_21	PMC SRn_20	PMC SRn_19	PMC SRn_18	PMC SRn_17	PMC SRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMC SRn_15	PMC SRn_14	PMC SRn_13	PMC SRn_12	PMC SRn_11	PMC SRn_10	PMC SRn_9	PMC SRn_8	PMC SRn_7	PMC SRn_6	PMC SRn_5	PMC SRn_4	PMC SRn_3	PMC SRn_2	PMC SRn_1	PMC SRn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).**

Table 2A.17 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_ [31:16]	Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m. 0: PMCn_m is not affected by PMCSRn_m. 1: PMCn_m is PMCSRn_m. Example: If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15.
15 to 0	PMCSRn_ [15:0]	Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1. 0: PMCn_m is 0. 1: PMCn_m is 1.

#### NOTE

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0\_[31:0].

### 2A.9.2.3 PIPCN — Port IP Control Register

This register specifies whether the I/O direction of the Pn\_m pin is controlled by the port mode register PMn.PMn\_m or by an alternative function.

If the Pn\_m pin is operated in alternative mode (PMcn.PMCn\_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCN.PIPCN\_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn\_m setting.

Regarding the alternative functions for which the PIPC register must be set, see **Section 2A.11, Port (Special I/O) Function Overview**.

**Access:** This register can be read or written in 16-bit units.

**Address:** PIPCN: <PORTn\_base> + 4200<sub>H</sub> + n × 4 (n = 0, 1, 2, 10, 11, 12, 20, 21, 22, 23)\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPC n_15	PIPC n_14	PIPC n_13	PIPC n_12	PIPC n_11	PIPC n_10	PIPC n_9	PIPC n_8	PIPC n_7	PIPC n_6	PIPC n_5	PIPC n_4	PIPC n_3	PIPC n_2	PIPC n_1	PIPC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), and Table 2A.72, Control Registers (P23)**.

Table 2A.18 PIPCN Register Contents

Bit Position	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specifies the I/O mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

### 2A.9.2.4 PMn / APMn / JPM0 — Port Mode Register

This register specifies whether the individual pins of the port group n are in input mode or in output mode.

**Access:** PMn, APMn: These registers can be read or written in 16-bit units.

JPM0: This register can be read or written in 8-bit units.

**Address:** PMn: <PORTn\_base> + 0300<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APMn: <PORTn\_base> + 03C8<sub>H</sub> + n × 4 (n = 0, 1)

JPM0: <JPORT0\_base> + 0030<sub>H</sub>\*1

**Value after reset:** FFFF<sub>H</sub>\*2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_ 15	PMn_ 14	PMn_ 13	PMn_ 12	PMn_ 11	PMn_ 10	PMn_ 9	PMn_ 8	PMn_ 7	PMn_ 6	PMn_ 5	PMn_ 4	PMn_ 3	PMn_ 2	PMn_ 1	PMn_ 0
Value after reset	1	1	1	1	1	1	1	1	1	1*3	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).**

Note 2. The PM8 register is as follows.  
When the OPBT0.RESETOUTEN = 1, the PM8 register is FFBF<sub>H</sub>.  
When the OPBT0.RESETOUTEN = 0, the PM8 register is FFFF<sub>H</sub>.

Note 3. The PM8\_6 bit is as follows.  
When the OPBT0.RESETOUTEN = 1, the PM8\_6 bit is 0.  
When the OPBT0.RESETOUTEN = 0, the PM8\_6 bit is 1.

Table 2A.19 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

#### NOTES

- To use a port in input port mode (PMcn.PMCn\_m = 0 and PMn.PMn\_m = 1), the input buffer must be enabled (PIBCn.PIBCn\_m = 1).
- By default, PMn.PMn\_m specifies the I/O direction in port mode (PMcn.PMCn\_m = 0) and alternative mode (PMcn.PMCn\_m=1), since PIPcn.PIPcn\_m = 0 after reset.
- The control bits of the analog port register (APMn) are APMn\_[15:0].
- The control bits of the JTAG port mode register (JPM0) are JPM0\_[7:0].

### 2A.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn\_m is set by the corresponding bit in the lower 16 bits of PMSRn.

**Access:** PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>.

Reading bits 15 to 0 returns the value of registers PMn and APMn.

JPMSR0: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>. Bits 15 to 8 are read as FF<sub>H</sub>. Reading bits 7 to 0 returns the value of register JPM0.

**Address:** PMSRn: <PORTn\_base> + 0800<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APMSRn: <PORTn\_base> + 08C8<sub>H</sub> + n × 4 (n = 0, 1)

JPMSR0: <JPORT0\_base> + 0080<sub>H</sub>\*1

**Value after reset:** 0000 FFFF<sub>H</sub>\*2

	PMSR n_15	PMSR n_14	PMSR n_13	PMSR n_12	PMSR n_11	PMSR n_10	PMSR n_9	PMSR n_8	PMSR n_7	PMSR n_6	PMSR n_5	PMSR n_4	PMSR n_3	PMSR n_2	PMSR n_1	PMSR n_0
Value after reset	1	1	1	1	1	1	1	1	1	1*3	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).**

Note 2. The PMSR8 register is as follows.  
When the OPBT0.RESETOUTEN = 1, the PMSR8 register is 0000 FFBF<sub>H</sub>.  
When the OPBT0.RESETOUTEN = 0, the PMSR8 register is 0000 FFFF<sub>H</sub>.

Note 3. The PMSR8\_6 bit is as follows.  
When the OPBT0.RESETOUTEN = 1, the PMSR8\_6 bit is 0.  
When the OPBT0.RESETOUTEN = 0, the PMSR8\_6 bit is 1.

Table 2A.20 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to PMn_m. 0: PMn_m is not affected by PMSRn_m. 1: PMn_m is PMSRn_m. <b>Example:</b> If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15.
15 to 0	PMSRn_[15:0]	Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1. 0: PMn_m is 0. 1: PMn_m is 1.

**NOTES**

---

1. The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0\_[31:0].
  2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn\_[31:0].
-

### 2A.9.2.6 PIBCn / APIBCn / JPIBC0 / IPIBC0 — Port Input Buffer Control Register

In input port mode (PMnCn.PMCn\_m = 0 and PMn.PMn\_m = 1), this register enables the port pin's input buffer.

**Access:** PIBCn, APIBCn, IPIBC0: These registers can be read or written in 16-bit units.

JPIBC0: This register can be read or written in 8-bit units.

**Address:** PIBCn: <PORTn\_base> + 4000<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APIBCn: <PORTn\_base> + 40C8<sub>H</sub> + n × 4 (n = 0, 1)

JPIBC0: <JPORT0\_base> + 0400<sub>H</sub>

IPIBC0: <PORTn\_base> + 40F0<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device.

See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), Table 2A.78, Control Registers (AP1), and Table 2A.80, Control Registers (IP0).**

Table 2A.21 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer. 0: Input buffer disabled 1: Input buffer enabled

#### NOTES

- When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
- The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0\_[7:0].

#### CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn\_m = 1).

### 2A.9.2.7 PFCn / JPFC0 — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn\_m pin. For such alternative functions, PIPCN.PIPCN\_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn\_m.

**Access:** PFCn: This register can be read or written in 16-bit units.

JPFC0: This register can be read or written in 8-bit units.

**Address:** PFCn: <PORTn\_base> + 0500<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 20, 24)

JPFC0: <JPORT0\_base> + 0050<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFC n_15	PFC n_14	PFC n_13	PFC n_12	PFC n_11	PFC n_10	PFC n_9	PFC n_8	PFC n_7	PFC n_6	PFC n_5	PFC n_4	PFC n_3	PFC n_2	PFC n_1	PFC n_0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device.

See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.66, Control Registers (P20), and Table 2A.74, Control Registers (P24).**

Table 2A.22 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies the alternative function of the pin. For details, see <b>Table 2A.25, Setting Alternative Functions.</b>

#### NOTE

The control bits of the JTAG port function control register (JPFC0) are JPFC0\_[7:0].

### 2A.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn\_m pin. For such alternative functions, PIPCN.PIPCn\_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn\_m.

**Access:** PFCEn: This register can be read or written in 16-bit units.

JPFCE0: This register can be read or written in 8-bit units.

**Address:** PFCEn: <PORTn\_base> + 0600<sub>H</sub> + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)

JPFCE0: <JPORT0\_base> + 0060<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device.

See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.62, Control Registers (P18), and Table 2A.66, Control Registers (P20).**

Table 2A.23 PFCEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCEn_[15:0]	Specifies the alternative function of the pin. For details, see <b>Table 2A.25, Setting Alternative Functions.</b>

### 2A.9.2.9 PFCAEn — Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.

Some alternative functions directly control the I/O of the Pn\_m pin. For such alternative functions, PIPcn.PIPCn\_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn\_m.

**Access:** PFCAEn: This register can be read or written in 16-bit units.

**Address:** PFCAEn: <PORTn\_base> + 0A00H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 20)\*1

**Value after reset:** 0000H

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), and Table 2A.66, Control Registers (P20).**

Table 2A.24 PFCAEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCAEn_[15:0]	Specifies the alternative function of the pin. For details, see <b>Table 2A.25, Setting Alternative Functions.</b>

Table 2A.25 Setting Alternative Functions

PFCAEn_m	PFCEn_m	PFCn_m	PMn_m	Function
0	0	0	1	Alternative input mode 1
			0	Alternative output mode 1
		1	1	Alternative input mode 2
			0	Alternative output mode 2
	1	0	1	Alternative input mode 3
			0	Alternative output mode 3
		1	1	Alternative input mode 4
			0	Alternative output mode 4
1	0	0	1	Alternative input mode 5
			0	Alternative output mode 5
		1	1	Alternative input mode 6
			0	Alternative output mode 6
	1	0	1	Alternative input mode 7
			0	Alternative output mode 7
		1	X	Setting prohibited

**CAUTION**

---

- After selecting the alternative function by the PFCn\_m, PFCEn\_m, or PFCAEn\_m bit, set the PMCn\_m bit to "1".
  - With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited. For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as a pin function other than b.
- 

**NOTE**

---

For more details on the assignment of each function, see **Section 2A.10.1.2, Control Registers** to **Section 2A.10.15.2, Control Registers**.

---

## 2A.9.3 Pin Data Input/Output

### 2A.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn\_m pin can be read from PPRn.PPRn\_m.

**Access:** PBDCn, APBDCn: These registers can be read or written in 16-bit units.

JPBDC0: This register can be read or written in 8-bit units.

**Address:** PBDCn: <PORTn\_base> + 4100<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APBDCn: <PORTn\_base> + 41C8<sub>H</sub> + n × 4 (n = 0, 1)

JPBDC0: <JPORTo\_base> + 0410<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDC n_15	PBDC n_14	PBDC n_13	PBDC n_12	PBDC n_11	PBDC n_10	PBDC n_9	PBDC n_8	PBDC n_7	PBDC n_6	PBDC n_5	PBDC n_4	PBDC n_3	PBDC n_2	PBDC n_1	PBDC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).**

Table 2A.26 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin. 0: Bidirectional mode disabled 1: Bidirectional mode enabled

#### CAUTION

- When the Pn\_m port is used for the alternative output function (PMcn.PMCn\_m = 1, PMn.PMn\_m = 0), the level of the Pn\_m pin can be read from PPRn.PPRn\_m by enabling the bidirectional mode (PBDCn.PBDCn\_m = 1).
- However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn\_m, PFCEn.PFCEn\_m, and PFCAEn.PFCAEn\_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

#### NOTE

The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0\_[7:0].

### 2A.9.3.2 PPRn / APPRn / JPPR0 / IPPR0 — Port Pin Read Register

This register reflects the actual level of the Pn\_m pin, whether it is the value of the Pn.Pn\_m bit or the level of an alternative output function.

**Access:** PPRn, APPRn, IPPR0: These registers are read-only registers that can be read in 16-bit units.

JPPR0: This register is a read-only register that can be read in 8-bit units.

**Address:** PPRn: <PORTn\_base> + 0200<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APPRn: <PORTn\_base> + 02C8<sub>H</sub> + n × 4 (n = 0, 1)

JPPR0: <JPOR0\_base> + 0020<sub>H</sub>

IPPR0: <PORTn\_base> + 02F0<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), Table 2A.78, Control Registers (AP1), and Table 2A.80, Control Registers (IP0).**

Table 2A.27 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	The Pn_m Pin, Pn.Pn_m value or alternative function output.

#### NOTES

- For the read values of the PPRn register, see **Section 2A.7.4, Pin Data Input/Output**.
- The control bits of the JTAG port pin read register (JPPR0) are JPPR0\_[7:0].

### 2A.9.3.3 Pn / APn / JP0 — Port Register

This register holds the Pn.Pn\_m data to be output via the related Pn\_m port in output port mode (PMcn.PMCn\_m = 0 and PMn.PMn\_m = 0).

**Access:** Pn, APn: These registers can be read or written in 16-bit units.

JP0: This register can be read or written in 8-bit units.

**Address:** Pn: <PORTn\_base> + 0000H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APn: <PORTn\_base> + 00C8H + n × 4 (n = 0, 1)

JP0: <JP0\_base> + 0000H\*1

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).**

Table 2A.28 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

#### NOTE

The control bits of the JTAG port register (JP0) are JP0\_[7:0].

### 2A.9.3.4 PNOT<sub>n</sub> / APNOT<sub>n</sub> / JPNOT<sub>0</sub> — Port NOT Register

This register allows the P<sub>n</sub>\_m bit of the port register P<sub>n</sub> to be inverted without directly writing to P<sub>n</sub>.

**Access:** PNOT<sub>n</sub>, APNOT<sub>n</sub>: These registers are write-only registers that can be written in 16-bit units. When read, 0000<sub>H</sub> is returned.

JPNOT<sub>0</sub>: This register is a write-only register that can be written in 8-bit units. When read, 00<sub>H</sub> is returned.

**Address:** PNOT<sub>n</sub>: <PORT<sub>n</sub>\_base> + 0700<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APNOT<sub>n</sub>: <PORT<sub>n</sub>\_base> + 07C8<sub>H</sub> + n × 4 (n = 0, 1)

JPNOT<sub>0</sub>: <JPORT<sub>0</sub>\_base> + 0070<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOT <sub>n_15</sub>	PNOT <sub>n_14</sub>	PNOT <sub>n_13</sub>	PNOT <sub>n_12</sub>	PNOT <sub>n_11</sub>	PNOT <sub>n_10</sub>	PNOT <sub>n_9</sub>	PNOT <sub>n_8</sub>	PNOT <sub>n_7</sub>	PNOT <sub>n_6</sub>	PNOT <sub>n_5</sub>	PNOT <sub>n_4</sub>	PNOT <sub>n_3</sub>	PNOT <sub>n_2</sub>	PNOT <sub>n_1</sub>	PNOT <sub>n_0</sub>
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).**

Table 2A.29 PNOT<sub>n</sub> Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOT <sub>n</sub> _[15:0]	Specifies if P <sub>n</sub> .P <sub>n</sub> _m is inverted. 0: P <sub>n</sub> .P <sub>n</sub> _m is not inverted (P <sub>n</sub> _m → P <sub>n</sub> _m) 1: P <sub>n</sub> .P <sub>n</sub> _m is inverted ( $\overline{P_n_m} \rightarrow P_n_m$ )

#### NOTE

The control bits of the JTAG port NOT register are JPNOT<sub>0</sub>\_[7:0].

### 2A.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn\_m is set by the corresponding bit in the lower 16 bits of PSRn.

**Access:** PSRn, APSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000H. Reading bits 15 to 0 returns the value of registers Pn and APn.

JPSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000H. Reading bits 7 to 0 returns the value of register JP0.

**Address:** PSRn: <PORTn\_base> + 0100H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APSRn: <PORTn\_base> + 01C8H + n × 4 (n = 0, 1)

JPSR0: <JPORT0\_base> + 0010H\*1

**Value after reset:** 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSR n_31	PSR n_30	PSR n_29	PSR n_28	PSR n_27	PSR n_26	PSR n_25	PSR n_24	PSR n_23	PSR n_22	PSR n_21	PSR n_20	PSR n_19	PSR n_18	PSR n_17	PSR n_16

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).**

Table 2A.30 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to Pn_m. 0: Pn_m is not affected by PSRn_m 1: Pn_m is PSRn_m Example: If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15.
15 to 0	PSRn_[15:0]	Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1. 0: Pn_m = 0 1: Pn_m = 1

#### NOTE

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0\_[31:0].

## 2A.9.4 Configuration of Electrical Characteristics

### 2A.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

**Access:** PUn: This register can be read or written in 16-bit units.

JPU0: This register can be read or written in 8-bit units.

**Address:** PUn: <PORTn\_base> + 4300H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

JPU0: <JPORT0\_base> + 0430H\*1

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PUn_15	PUn_14	PUn_13	PUn_12	PUn_11	PUn_10	PUn_9	PUn_8	PUn_7	PUn_6	PUn_5	PUn_4	PUn_3	PUn_2	PUn_1	PUn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device.

See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).**

Table 2A.31 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether an internal pull-up resistor is connected to the corresponding pin. 0: No internal pull-up resistor connected 1: An internal pull-up resistor connected

#### NOTES

- If a pin is configured such that both an internal pull-up resistor (PUn.PUn\_m = 1) and pull-down resistor (PDn.PDn\_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
- The pull-up resistor has no effect when the pin is operated in output mode.
- The control bits of the JTAG pull-up option register (JPU0) are JPU0\_[7:0].

### 2A.9.4.2 PDn / JPD0 — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

**Access:** PDn: This register can be read or written in 16-bit units.

JPD0: This register can be read or written in 8-bit units.

**Address:** PDn: <PORTn\_base> + 4400<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

JPD0: <JPORT0\_base> + 0440<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).**

Table 2A.32 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether to connect an internal pull-down resistor to the corresponding pin. 0: No internal pull-down resistor connected 1: An internal pull-down resistor connected

#### NOTES

- If a pin is configured such that both an internal pull-up resistor (PUn.PUn\_m = 1) and pull-down resistor (PDn.PDn\_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
- The internal pull-down resistor has no effect when the pin is operated in output mode.
- The control bits of the JTAG pull-down option register (JPD0) are JPD0\_[7:0].

### 2A.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**. Regarding the alternative functions for which the PDSC register needs to be set, see **Section 2A.11.3.3, Output Buffer Control (PDSC)**.

**Access:** PDSCn, JPDSC0: These registers can be read or written in 32-bit units.

**Address:** PDSCn: <PORTn\_base> + 4600<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)  
JPDSC0: <JPORT0\_base> + 0460<sub>H</sub>\*1

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, and **Table 2A.74, Control Registers (P24)**.

Table 2A.33 PDSCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PDSCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. 0: Lower drive strength (when the frequency output from the pin is 10 MHz or below) 1: High drive strength (when the frequency output from the pin is 40 MHz or less).

### 2A.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** PODCn, JPODC0: These registers can be read or written in 32-bit units.

**Address:** PODCn: <PORTn\_base> + 4500<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)  
JPODC0: <JPORT0\_base> + 0450<sub>H</sub>\*1

**Value after reset:** 0000 0000<sub>H</sub>\*2

Value after reset	0	0	0	0	0	0	0	0	0	0*3	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).**

Note 2. The PODC8 register is as follows.  
When the OPBT0.RESETOUTEN = 1, the PODC8 register is 0000 0040<sub>H</sub>.  
When the OPBT0.RESETOUTEN = 0, the PODC8 register is 0000 0000<sub>H</sub>.

Note 3. The PODC8\_6 bit is as follows.  
When the OPBT0.RESETOUTEN = 1, the PODC8\_6 bit is 1.  
When the OPBT0.RESETOUTEN = 0, the PODC8\_6 bit is 0.

Table 2A.34 PODCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PODCn_[15:0]	Specifies the output buffer function. 0: Push-pull 1: Open-drain

#### NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0\_[31:0].

### 2A.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

**Access:** PISn: This register can be read or written in 16-bit units.

JPIS0: This register can be read or written in 8-bit units.

**Address:** PISn: <PORTn\_base> + 4700<sub>H</sub> + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

JPIS0: <JPOR0\_base> + 0470<sub>H</sub>\*1

**Value after reset:** FFFF<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).**

Table 2A.35 PISn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISn_[15:0]	Specifies the input buffer Characteristics: 0: Type 1 (SHMT1) 1: Type 2 (SHMT4)

#### NOTES

- Details of the definition of type 1 and type 2 are given in **Section 2A.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)**. For details, also see **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for input buffer characteristics.
- The control bits of the JTAG port input buffer selection register (JPIS0) are JPIS0\_[7:0].

### 2A.9.4.6 PISAn / JPISA0 — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

**Access:** PISAn: This register can be read or written in 16-bit units.

JPISA0: This register can be read or written in 8-bit units.

**Address:** PISAn: <PORTn\_base> + 4A00<sub>H</sub> + n × 4 (n = 10, 11, 12, 13, 18, 21, 22)

JPISA0: <JPORT0\_base> + 04A0<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.68, Control Registers (P21), and Table 2A.70, Control Registers (P22).**

Table 2A.36 PISAn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISA_[15:0]	Specifies the input buffer characteristics: 0: Type 2 (SHMT4) 1: Type 5 (TTL)

Table 2A.37 Port Input Selection Advanced Register Contents

PISAn	PISn	Function
0	0	Type 1 input buffer is selected (SHMT1)
	1	Type 2 input buffer is selected (SHMT4)
1	X	Type 5 input buffer is selected (TTL)

#### NOTE

Details of the definition of type 2 and type 5 are given in **Section 2A.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)**. For details, also see **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for input buffer characteristics.

### 2A.9.5 Port Register Protection

RH850/F1KH has Port Protection Command Register (PPCMDn) and Port Protection Status Register (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see **Section 5, Write-Protected Registers**.

### 2A.9.6 Flowchart Examples for Port Settings

Examples of the port settings are shown in the flowchart below.

#### **CAUTION**

---

If the port is set to the PIPCN.PIPCN\_m = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCN.PMCN\_m bit is set to 1 and when the PMN.PMN\_m bit is set to 0. If an interrupt-related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

---

### 2A.9.6.1 Batch Setting

An example of specifying batch port settings is shown in the flowchart below.

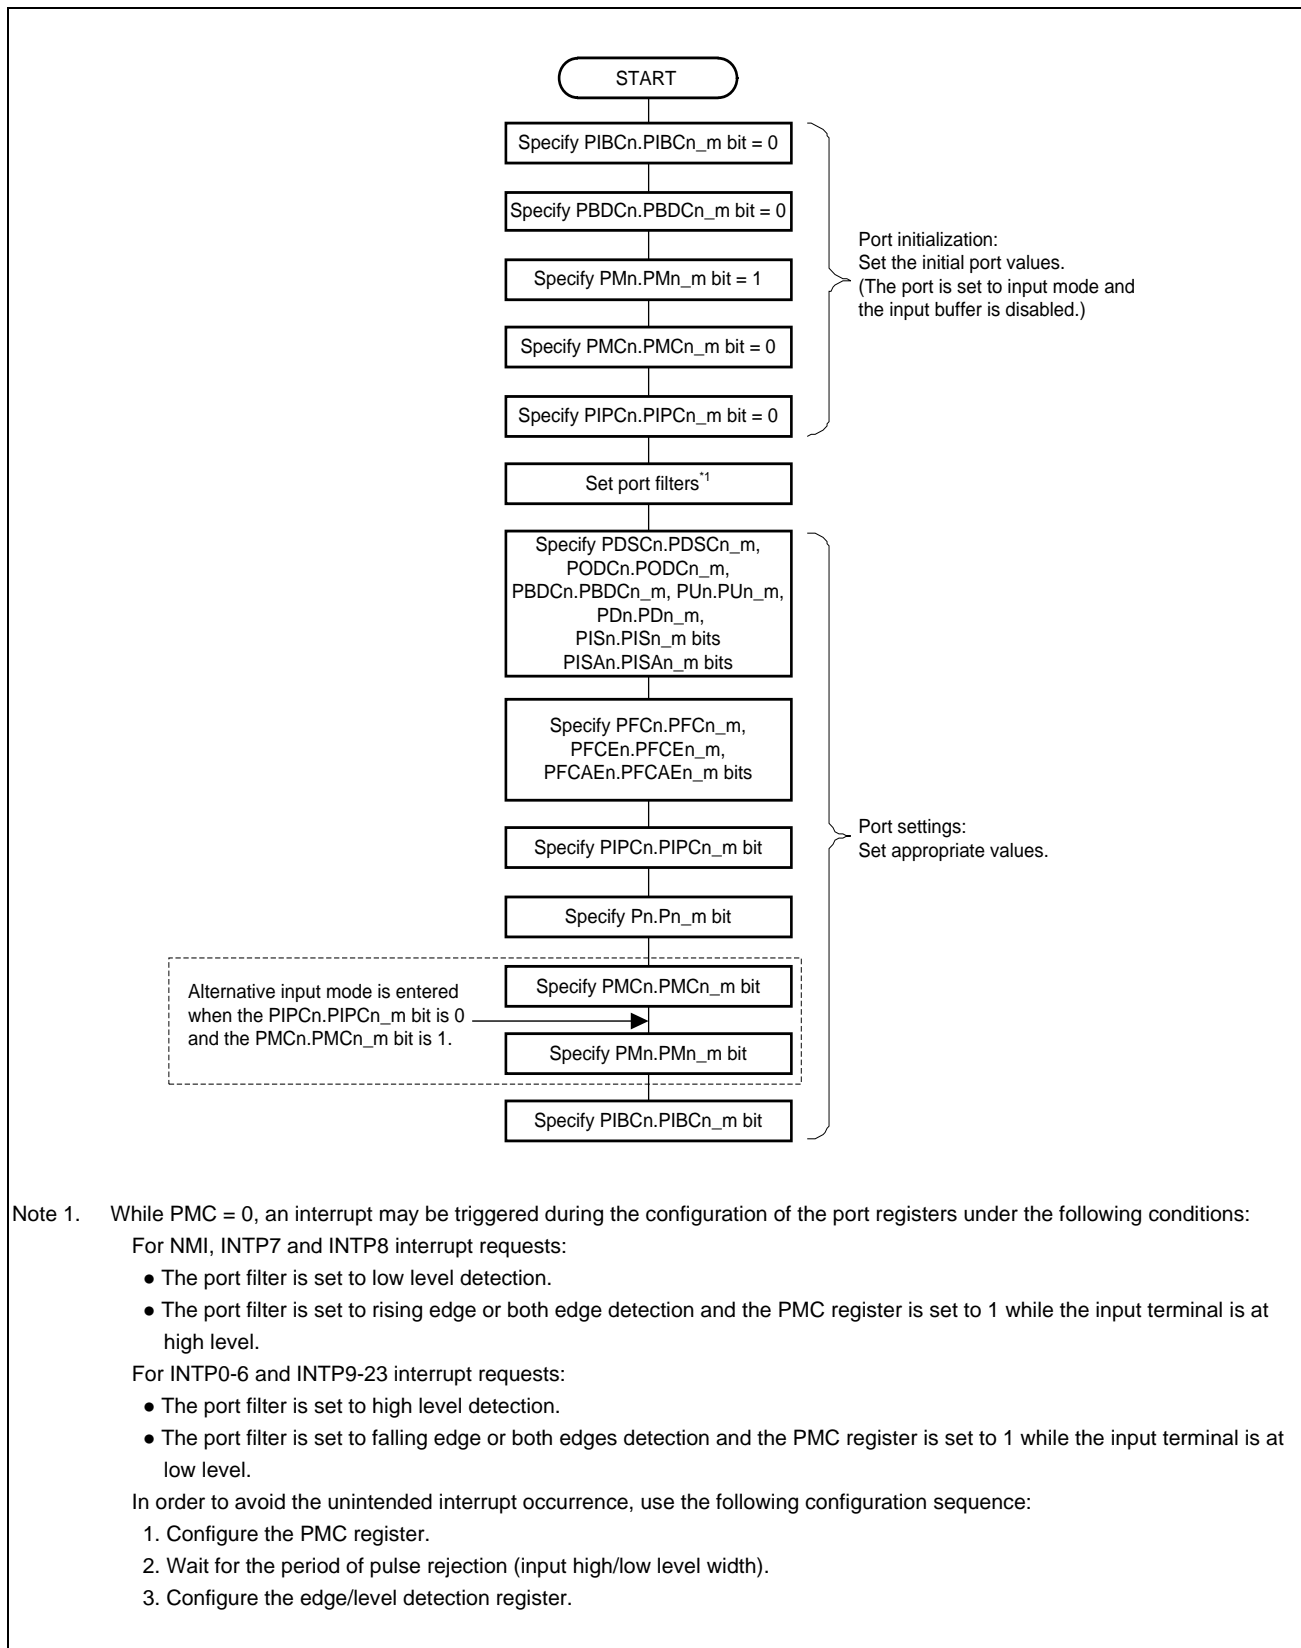

Figure 2A.6 Example of Port Settings (When Specified in Batch)

2A.9.6.2 Individual Settings

An example of specifying individual port settings is shown in the flowchart below.

Figure 2A.7 Example of Port Settings (in Port Mode)

(1) With IP Control (PIPCn.PIPCn\_m bit = 1)

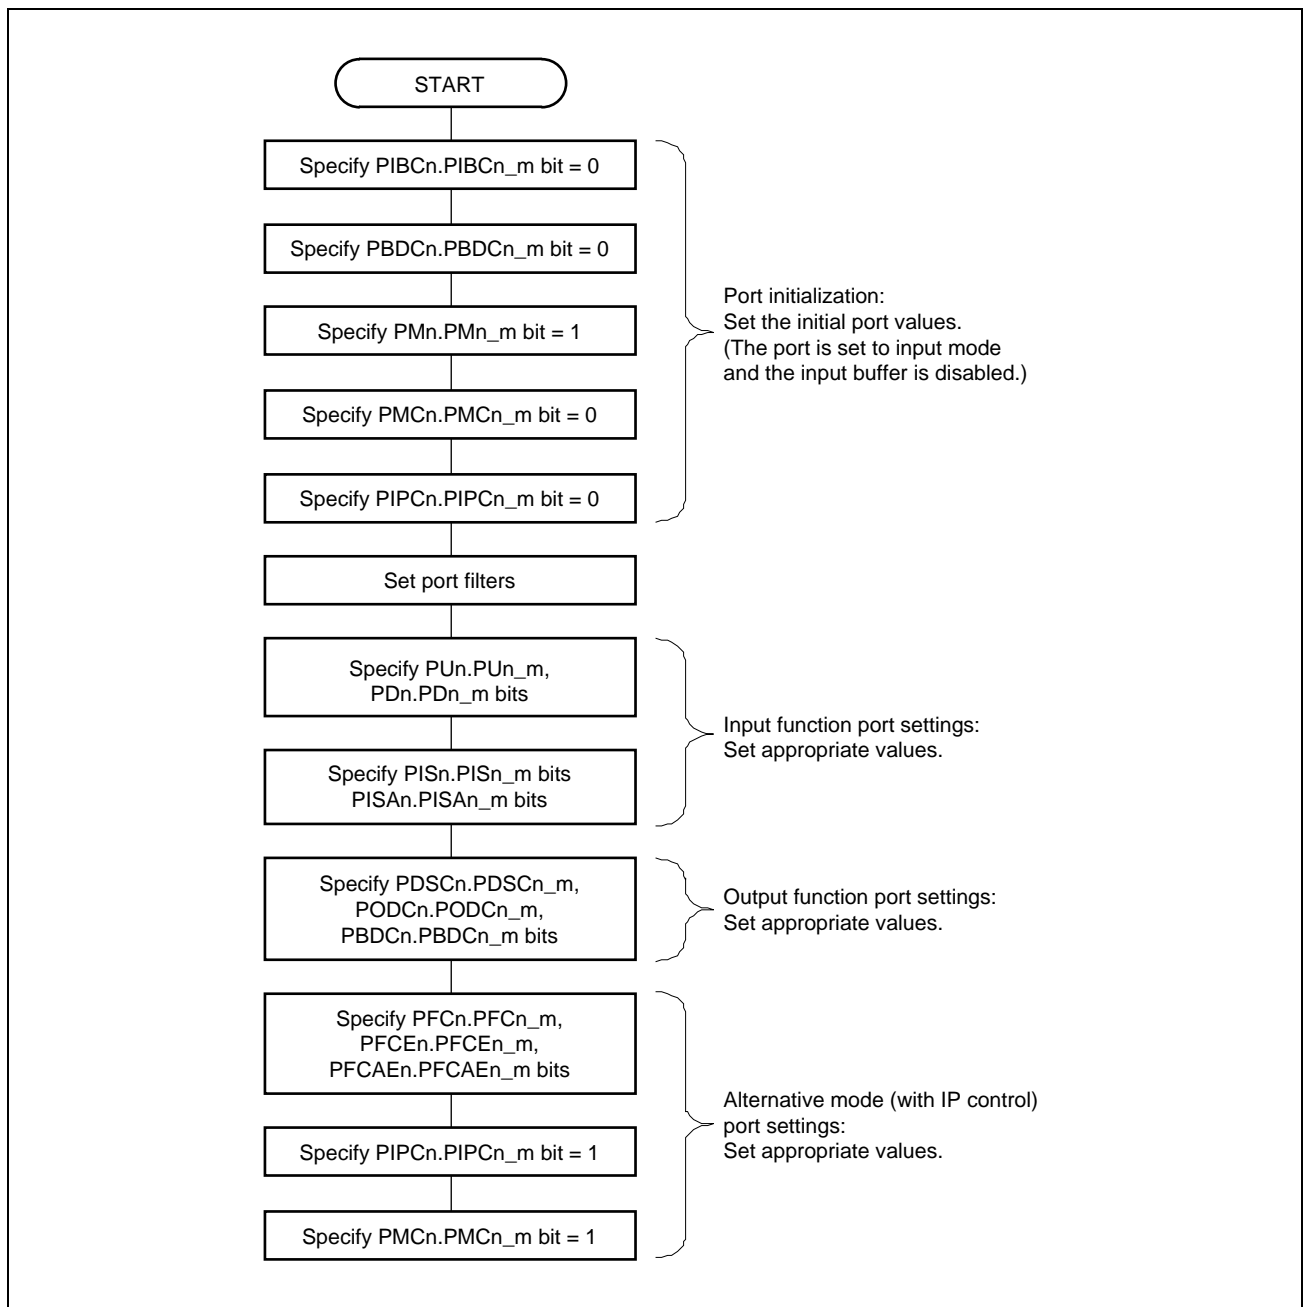

Figure 2A.8 Example of Port Settings (in Alternative Mode)

## (2) Without IP Control (PIPCn.PIPCn\_m bit = 0)

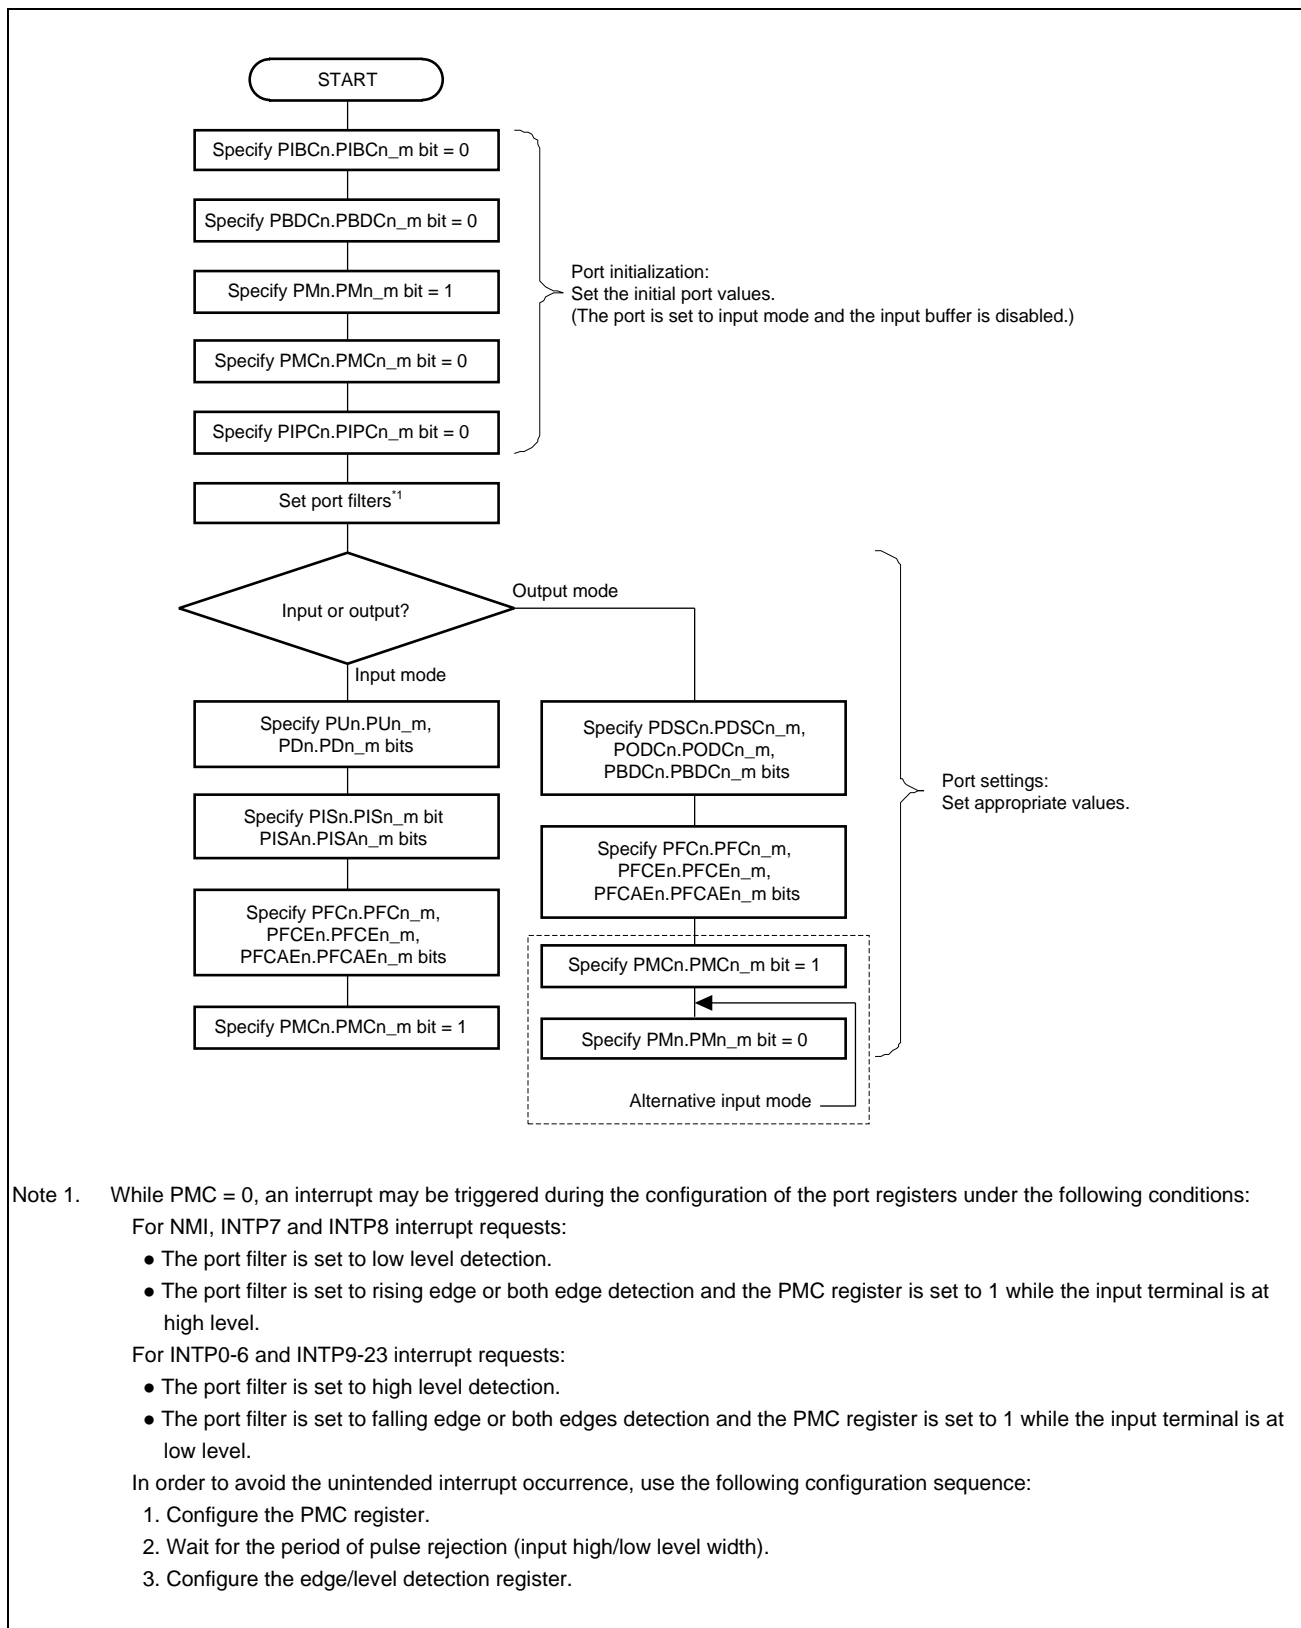

Figure 2A.9 Example of Port Settings (in Alternative Mode)

## 2A.10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCN register setting. When PMCN.PMCn\_m = 1, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2A.38 Port Function

Port	Pin Name	Size	Direction	Power Domain	Special Alternative Function	Device			
						176 Pins	233 Pins	272 Pins	324 Pins
JTAG Port 0	JP0_0 - 6	7 bits	In/Out	AWO	JTAG, LPD	✓	✓	—	✓
Port 0	P0_0 - 14	15 bits	In/Out	AWO		✓	✓	—	✓

## 2A.10.1 JTAG Port 0 (JP0)

### 2A.10.1.1 Alternative Function

The following alternative functions are available when JTAG port 0 is configured as a general-purpose I/O port by setting OPJTAG[1:0] on the corresponding option byte to 00<sub>B</sub>.

Table 2A.39 JTAG Port 0 (JP0)

Port Mode (JPMC0_m = 0)	Alternative Mode (JPMC0_m = 1)										ADC	Special Function	PKG No.			
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative				176 Pins	233 Pins	272 Pins	324 Pins
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output						
JP0_0*	INTP0		TAUJ2I0	TAUJ2O0	FPDR	FPDT						DCUTDI/LPDI/LPDIO	47	U4	—	AB4
JP0_1	INTP1		TAUJ0I0	TAUJ0O0		FPDT						DCUTDO/LPDO	46	P5	—	W6
JP0_2	INTP2		TAUJ0I1	TAUJ0O1	FPCK							DCUTCK/LPDCLK	45	T4	—	W5
JP0_3	INTP3	CSCXFOUT	TAUJ0I2	TAUJ0O2								DCUTMS	44	R4	—	Y5
JP0_4												DCUTRST	43	R3	—	AB3
JP0_5	NMI	RTCA0OUT	TAUJ0I3	TAUJ0O3								DCURDY /LPDCLKOUT	42	U3	—	AA4
JP0_6												EVTO	66	U11	—	Y10

Note 1. In LPD (1 pin) mode, the JP0\_0 output buffer state is Open-drain.

### CAUTION

The behavior and performance are not guaranteed when alternative functions are not assigned to the register.

## 2A.10.1.2 Control Registers

Table 2A.40 Control Registers (JP0)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device			
			Position	R/W*1			176 Pins	233 Pins	272 Pins	324 Pins

#### CAUTIONS

1. The behavior and performance are not guaranteed when undocumented alternative functions are selected.
2. Use ADC functions with their initial settings. For details, see **Table 2A.50, Control Registers (P8)**.
3. When the RESETOUT function is selected for the P8\_6 pin, the output on the pin is at the low level during a reset and after release from the reset state. For details, see **Section 2A.11.1.1, P8\_6: RESETOUT**.

## 2A.10.6.2 Control Registers

Table 2A.50 Control Registers (P8)

AP1_15															ADCA1115		134	C16	—	B22

#### CAUTION

Use ADC functions with their initial settings. For details, see **Table 2A.78, Control Registers (AP1)**.

## 2A.10.20.2 Control Registers

Table 2A.78 Control Registers (AP1)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device			
			Position	R/W*1			176 Pins	233 Pins	272 Pins	324 Pins
AP1	Analog port register 1	16	15-0	R/W	00CC <sub>H</sub>	0000 <sub>H</sub>	✓	✓	—	✓
APSR1	Analog port set/reset register 1	32	31-16, 15-0	R/W	01CC <sub>H</sub>	0000 0000 <sub>H</sub>	✓	✓	—	✓
APPR1	Analog port pin read register 1	16	15-0	R	02CC <sub>H</sub>	0000 <sub>H</sub>	✓	✓	—	✓
APM1	Analog port mode register 1	16	15-0	R/W	03CC <sub>H</sub>	FFFF <sub>H</sub>	✓	✓	—	✓
APNOT1	Analog port NOT register 1	16	15-0	W	07CC <sub>H</sub>	0000 <sub>H</sub>	✓	✓	—	✓
APMSR1	Analog port mode Set/reset register 1	32	31-16, 15-0	R/W	08CC <sub>H</sub>	0000 FFFF <sub>H</sub>	✓	✓	—	✓
APIBC1	Analog port input buffer control register 1	16	15-0	R/W	40CC <sub>H</sub>	0000 <sub>H</sub>	✓	✓	—	✓
APBDC1	Analog port bidirection control register 1	16	15-0	R/W	41CC <sub>H</sub>	0000 <sub>H</sub>	✓	✓	—	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.  
When writing to unused bits, write the value after reset.

## 2A.10.21 Input Port 0 (IP0)

### 2A.10.21.1 Alternative Function

Table 2A.79 Input Port 0 (IP0)

Port Mode	Alternative Mode														ADC	Special Function	PKG No.				
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative		6th Alternative		7th Alternative				176 Pins	233 Pins	272 Pins	324 Pins	
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output							
IP0_0																	XT2	57	T7	—	AA8

### 2A.10.21.2 Control Registers

Table 2A.80 Control Registers (IP0)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device			
			Position	R/W*1			176 Pins	233 Pins	272 Pins	324 Pins
IPPR0	Input port pin read register 0	16	0	R	02F0 <sub>H</sub>	0000 <sub>H</sub>	✓	✓	—	✓
IPIBC0	Port input buffer control register 0	16	0	R/W	40F0 <sub>H</sub>	0000 <sub>H</sub>	✓	✓	—	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.  
When writing to unused bits, write the value after reset.

#### CAUTION

When the IP0\_0/XT2 pin is used as an input port, set the IPIBC0.0 bit to 1 and stop the SOSC operation. For details on the settings for SOSC operations, see **Section 12AB.4.2.7, SOSCE — SubOSC Enable Register**. When the IP0\_0/XT2 pin is used for the SubOSC (SOSC) not as an input port, set the IPIBC0.0 bit to 0.

## 2A.11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

### 2A.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

#### 2A.11.1.1 P8\_6: RESETOUT

The P8\_6 pin ( RESETOUT signal) changes PM8.PM8\_6 and PODC8.PODC8\_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8\_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.

(Case 1): OPBT0.RESETOUTEN = 1

- P8.P8\_6 = 0: Outputs low level
- PM8.PM8\_6 = 0: Output mode
- PODC8.PODC8\_6 = 1: Open-drain

(Case 2): OPBT0.RESETOUTEN = 0

- P8.P8\_6 = 0: Outputs low level
- PM8.PM8\_6 = 1: Input mode
- PODC8.PODC8\_6 = 0: Push-pull

For detail of OPBT0.RESETOUTEN register, see **Section 44.9.2, OPBT0 — Option Byte 0**, also see **Section 9A.1.3, Reset Output ( RESETOUT )**.

When the P8\_6 pin setting is updated with another value, the pin operates by new setting.

Figure 2A.10 P8\_6 Pin ( $\overline{\text{RESETOUT}}$  Signal) Operation While a Reset is asserted and released:  
(Case 1) OPBT0.RESETOUTEN setting is 1

Figure 2A.11 P8\_6 Pin ( $\overline{\text{RESETOUT}}$  Signal) Operation While a Reset is asserted and released:  
(Case 2) OPBT0.RESETOUTEN setting is 0

### 2A.11.1.2 JP0\_0 to JP0\_6: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2A.81 Debug Interface

OPJTAG1	OPJTAG0	Mode	JP0_0	JP0_1	JP0_2	JP0_3	JP0_4	JP0_5	JP0_6
1	1	Nexus I/F	DCUTDI input	DCUTDO output	DCUTCK input	DCUTMS input	$\overline{\text{DCUTRST}}$ input	$\overline{\text{DCURDY}}$ output	$\overline{\text{EVTO}}$ output
0	1	LPD (4 pins)	LPDI input	LPDO output	LPDCLK input	Port/ alternative function	Port/ alternative function	LPDCLK OUT output	Port/ alternative function
1	0	LPD (1 pin)	LPDIO input/output	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function

#### NOTE

For the OPJTAG [1:0] settings, see **Section 44.9.2, OPBT0 — Option Byte 0**.

### 2A.11.1.3 FPDR(JP0\_0), FPDT(JP0\_1), FPCK(JP0\_2): Flash Programmer

These pins are used for connecting a flash programmer. See *Flash Programmer's Manual* for details.

### 2A.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10\_8: FLMD1 pin can select serial programming mode.

The FLMD0 pin in combination with the P10\_8: FLMD1, the P10\_2: MODE1 and the P10\_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10\_8: FLMD1, the P10\_6: MODE2, the P10\_2: MODE1 and the P10\_1: MODE0 pins can select user boot mode.

For details on the mode selection, see **Section 6, Operating Mode**.

### 2A.11.1.5 IP0\_0: XT2

This pin is the SubOSC (SOSC) input pin. When the IPIBC0\_0 bit = 1, the IP0\_0/XT2 pin is used as an input port. If you make this setting, stop SOSC operation at the same time.

## 2A.11.2 A/D Input Alternative I/O

The following ports are permanently connected to A/D input functions. (However, an analog input to the A/D is controlled by the A/D module.)

Table 2A.82 A/D Input Alternative Pins

Port	A/D Input	Device			
		176 Pins	233 Pins	272 Pins	324 Pins

## 2A.11.3 Special I/O Control

### 2A.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.

The following table lists all alternative functions where PIPCN.PIPCn\_m must be set to 1.

For details, see **Section 2A.9.2.3, PIPCN — Port IP Control Register**.

Table 2A.83 Alternative Modes that Require Setting PIPCN.PIPCn\_m = 1

Function	Alternative functions Name	Port Name	Power Supply Area	Control	Reference Section

### 2A.11.3.2 Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/PISAn/JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type 1/2 or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in **Table 2A.85, JTAG Port Input Buffer Characteristics Selection**.

Table 2A.84 Port Input Buffer Characteristics Selection

Port Name	Input Buffer Selection			Device			
	Type 1 (PISn_m = 0 & PISAn_m = 0)	Type 2 (PISn_m = 1 & PISAn_m = 0)	Type 5 (PISAn_m = 1)	176 Pins	233 Pins	272 Pins	324 Pins

JP0_5	SHMT1	SHMT4	—	✓	✓	—	✓
JP0_6	SHMT1	SHMT4	—	✓	✓	—	✓

Note 1. TTL is selected for Boundary scan mode without JPISA0 register setting.

Note 2. TTL is selected for Nexus in normal operating mode without JPISA0 register setting.

Note 3. TTL is selected for LPD (4 pins) in normal operating mode without JPISA0 register setting.

Note 4. TTL is selected for LPD (1 pin) in normal operating mode without JPISA0 register setting.

#### NOTES

- For the SHMT1, SHMT4 and TTL pin characteristics, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**.
- For the input buffer after reset, Type 2 (SHMT4) is selected.

### 2A.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2A.86 Output Buffer Characteristics Selection

Port Name	Output Drive Strength Selection		Device			
	Slow Mode (PDSCn_m = 0)	Fast Mode (PDSCn_m = 1)	176 Pins	233 Pins	272 Pins	324 Pins

Note 1. Supports Load: 100 pF (The load capacitance of CSIH0 is 100 pF.)

Note 2. Supports Load: 50 pF (The load capacitance of CSIH1 to CSIH4 are 50 pF.)

Note 3. In some of the functions, Fast mode or Slow mode is specified. For details, see **Section 47A.5, AC Characteristics**.

## 2A.12 Noise Filter & Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1KH supports both analog and digital filters.

It also supports the function for edge and level detection after the signals have passed through a filter.

The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter & edge/level detection control registers and control bits, and register addresses.

For details on the digital/analog filter function and noise filter & edge/level detection control registers, see **Section 2A.13, Description of Port Noise Filter & Edge/Level Detection**.

### NOTE

In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

### 2A.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

#### 2A.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

- Filter control register FCLA0CTLm\_<name> (m = 0 to 7)

A dedicated FCLA0CTLm\_<name> register is provided for each pin in a port that incorporates an analog filter.

Table 2A.87 Input Pins that Incorporate Analog Filter Type A

Module Name	Input Pin	FCLA0CTL Register Configuration		Device			
		Register	Address	176 Pins	233 Pins	272 Pins	324 Pins
FCLA0	NMI	FCLA0CTL0_NMI	FFC3 4000 <sub>H</sub>	✓	✓	—	✓

$\overline{\text{DCUTRST}}$

### 2A.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm\_<name> (m = 0 to 2)  
Each port with a digital filter has a special FCLA0CTLm\_<name> register.
- Digital noise elimination control register DNFA<name>CTL  
Each DNFA<name>CTL control register controls digital filter processing for three input signals per group.
- Digital noise elimination enable register DNFA<name>EN  
The setting of the DNFA<name>ENL[2:0] bits in DNFA<name>EN enables or disables digital noise elimination for three input signals per group.

Table 2A.90 Input Pins that Incorporate Digital Filter Type D

### 2A.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<name>CTL  
Each DNFA<name>CTL control register controls digital filter processing for up to 16 input signals per group.
- Digital noise elimination enable register DNFA<name>EN  
The setting of the DNFA<name>ENL[7:0] and DNFA<name>ENH[7:0] bits in DNFA<name>EN enables or disables digital noise elimination for up to 16 input signals per group.

Table 2A.91 Input Pins that Incorporate Digital Filter Type E

Note 4. RSENT does not have the edge detection.

## 2A.12.2 Clock Supply for Port Filters

The following table shows the clock supply for each filter type in each port domain.

Table 2A.92 Clock Supply for Port Filters

Peripheral Function	Port Domain*1	Filter Type	Filter Clock	Setting Register	
				Source Clock Selection	Clock Selection
ADCA0	Always-On area (AWO area)	Digital filter type D	DNFATCKI	CKSC_AADCAS_CTL	CKSC_AADCAD_CTL
ADCA1	Isolated area (ISO area)	Digital filter type D	DNFATCKI	CKSC_IADCAS_CTL	CKSC_IADCAD_CTL
TAUD0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI1S_CTL	—
TAUB0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—
TAUB1	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—
ENCA0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI1S_CTL	—
SENTn	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—

Note 1. Power Domain

### NOTE

For the Setting Register, see **Section 12AB.4.3, Clock Selector Control Register**.

## 2A.13 Description of Port Noise Filter & Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.

### NOTE

---

In this section, *<name>* in the noise filter control register represents the peripheral function connected to a filter.

---

### 2A.13.1 Overview

#### 2A.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.  
Used for external interrupt signals.
- Type B: An analog filter  
Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.
- Type C: An analog filter only  
Used for the external RESET input and mode signals.

#### 2A.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection.  
Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function.  
Used for the timer input signals and encoder input signals.

## 2A.13.2 Analog Filters

### 2A.13.2.1 Analog Filter Characteristic

See **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for the input conditions for signals input to pins that incorporate an analog filter.

### 2A.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm\_<name> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in **Table 2A.87, Input Pins that Incorporate Analog Filter Type A**.

### 2A.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

#### (1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

Figure 2A.12 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit `FCLA0CTLm_<name>.FCLA0INTLm_<name>`.

- `FCLA0INTLm_<name>` bit = 0: Edge detection

Whether a rising or falling edge is detected can be specified by setting the `FCLA0CTLm_<name>.FCLA0INTRm_<name>` and `FCLA0CTLm_<name>.FCLA0INTFm_<name>` bits.

- `FCLA0INTLm_<name>` bit = 1: Level detection

The detection of a high level or low level can be specified by setting `FCLA0CTLm_<name>.FCLA0INTRm_<name>` bit.

The table below summarizes the detection conditions of the analog filter.

Table 2A.93 Analog Filter Event Detection Conditions

<code>FCLA0INTLm_&lt;name&gt;</code>	<code>FCLA0INTFm_&lt;name&gt;</code>	<code>FCLA0INTRm_&lt;name&gt;</code>	Edge Detection	Level Detection
0	0	0	No edge detected	Disabled
	0	1	Rising edge	
	1	0	Falling edge	
	1	1	Rising and falling edges	
1	X	0	Disabled	Low level
	X	1		High level

### Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

### (2) Analog filter type B

A block diagram of analog filter type B is shown below.

Figure 2A.13 Block Diagram of Analog Filter Type B

### Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

### (3) Analog filter type C

A block diagram of analog filter type C is shown below.

Figure 2A.14 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

#### Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2A.13.3 Digital Filters

### 2A.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.

The input signal is sampled with the sampling frequency  $f_s$ .

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFA<name>CTL.DNFA<name>PRS[2:0] select the sampling frequency based on

$$f_s = f_{\text{DNFATCKI}} / 2^{\text{DNFA<name>PRS[2:0]}}$$

where  $f_{\text{DNFATCKI}}$  is the frequency of the DNFATCKI clock.

- DNFA<name>CTL.DNFA<name>NFSTS[1:0] determines the number of same level samples, “s”, (2 to 5):

$$s = \text{DNFA<name>NFSTS[1:0]} + 2$$

External signal pulses shorter than the following are suppressed at all times.

$$s \times 1/f_s$$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$$(s + 1) \times 1/f_s$$

External signal pulses in the following range may be suppressed or judged as valid.

$$s \times 1/f_s \text{ to } (s + 1) \times 1/f_s$$

The filter operation is illustrated in the figure below with DNFA<name>NFSTS[1:0] = 01<sub>B</sub>, i.e.  $s = 3$  same level samples.

Figure 2A.15 Digital Filter Function

### 2A.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFA<name>CTL.DNFA<name>PRS[2:0] and DNFA<name>NFSTS[1:0] apply to the signals.

However, the digital filter for each signal can be enabled or disabled separately by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

#### CAUTIONS

- When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) for the port pin to switch to the alternative function.
 
$$s = \text{DNFA<name>NFSTS}[1:0] + 2$$

$$s \times 1/f_s + 2 \times 1/f_{\text{DNFATCKI}}$$
- When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.
 
$$s \times 1/f_s + 3 \times 1/f_{\text{DNFATCKI}}$$

### 2A.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.

Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

### 2A.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA<name>CTL and digital noise elimination enable register DNFA<name>EN are used to set all the filters in the same group (<name> = peripheral function group).

The DNFA<name>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <name>.

The DNFA<name>EN register enables/disables each filter by setting the corresponding bit in DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTLm\_ADCn registers are ordered in groups of 3 registers with the same index n. The register index n is in 0 or 1.

The assignment of the input signals to the control registers and their addresses are given in **Table 2A.90, Input Pins that Incorporate Digital Filter Type D** and **Table 2A.91, Input Pins that Incorporate Digital Filter Type E** in **Section 2A.12.1, Port Filter Assignment**.

#### CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1. Otherwise an unintended filter output may be generated.

#### (1) Digital filter type D

A block diagram of digital filter type D is shown below.

Figure 2A.16 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.

Table 2A.94 Output Options for Digital Filter Type D

DNFA<name>EN.DNFA<name>ENLm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

## (2) Digital filter type E

A block diagram of digital filter type E is shown below.

Figure 2A.17 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.

Table 2A.95 Output Options for Digital Filter Type E

DNFA<name>EN.DNFA<name>ENLm and DNFA<name>EN.DNFA<name>ENHm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

## 2A.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:

Table 2A.96 List of Filter Registers

Module Name	Register Name	Symbol	Address
FCLA0	Filter control register m	FCLA0CTLm_<name>	The addresses are shown in the tables in <b>Section 2A.12.1, Port Filter Assignment.</b>
DNF	Digital noise elimination control register	DNFA<name>CTL	
	Digital noise elimination enable register	DNFA<name>EN	
	Digital noise elimination enable H register	DNFA<name>ENH	
	Digital noise elimination enable L register	DNFA<name>ENL	

### 2A.13.4.1 FCLA0CTLm\_<name> — Filter Control Register

This register controls the analog and digital filter operation.

**Access:** This register can be read or written in 8-bit units.

**Address:** The allocation of input signals to FCLA0CTLm\_<name> registers and the address of each register are shown in the tables in **Section 2A.12.1, Port Filter Assignment**.

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

However, digital filter type D is placed in edge detection mode.
0	FCLA0INTRm_<name>	<ul style="list-style-type: none"> <li>In level detection mode (FCLA0INTLm_&lt;name&gt; = 1): Detected level selection 0: Low level detection 1: High level detection</li> <li>In edge detection mode (FCLA0INTLm_&lt;name&gt; = 0): Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled</li> </ul> <b>NOTE:</b> This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.

#### CAUTION

Digital filter type D: Always set bit 2 to "0".

### 2A.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.

#### NOTE

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 8-bit units.

**Address:** For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see **Table 2A.90, Input Pins that Incorporate Digital Filter Type D** and **Table 2A.91, Input Pins that Incorporate Digital Filter Type E** in **Section 2A.12.1, Port Filter Assignment**.

### 2A.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.

#### NOTE

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 16-bit units.

The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

**Address:** For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see **Table 2A.90, Input Pins that Incorporate Digital Filter Type D** and **Table 2A.91, Input Pins that Incorporate Digital Filter Type E** in **Section 2A.12.1, Port Filter Assignment**.

**Value after reset:** 0000<sub>H</sub>

#### 2A.13.4.4 DNFA<name>ENH – Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>EN register.

##### NOTE

This register is only valid for digital filter type E.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see **Table 2A.91, Input Pins that Incorporate Digital Filter Type E in Section 2A.12.1, Port Filter Assignment.**

**Value after reset:** 00<sub>H</sub>

For details of the respective bit functions, see **Section 2A.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register.**

#### 2A.13.4.5 DNFA<name>ENL – Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>EN register.

##### NOTE

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see **Table 2A.90, Input Pins that Incorporate Digital Filter Type D** and **Table 2A.91, Input Pins that Incorporate Digital Filter Type E in Section 2A.12.1, Port Filter Assignment.**

XT1, XT2	—	✓	✓	✓	✓	—	Sub OSC connections	SOSC

Note 1. Only available for RH850/F1KM-S4.

### CAUTION

When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.

- (e.g.) When RS-CANFD channel 0 is used:

CAN0TX P0\_0 P10\_1

CAN0RX P0\_1 P10\_0

Use one of the following pin combinations:

- P0\_0 and P0\_1, or
- P10\_0 and P10\_1.

The combinations of P0\_0 and P10\_0, and P0\_1 and P10\_1 are not allowed.

## 2B.3 Pin Functions During and After Reset

Table 2B.10 Pin Functions During and After Reset

Pins	During Reset	After Reset
JP0_0	High impedance	JP0_0: High impedance Serial programming mode: FPDR, FPDT (1 wire UART) FPDR (2 wire UART) Nexus I/F: DCUTDI input LPD (4 pins): LPDI input LPD (1 pin): LPDIO input/output

JP0_4	Input <sup>+*3,*5</sup>	JP0_4: High impedance Serial programming mode: High impedance Nexus I/F: DCUTRST <sup>+</sup> input <sup>*1</sup> LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_5	High impedance	JP0_5: High impedance Serial programming mode: High impedance Nexus I/F: DCURDY <sup>+</sup> output LPD (4 pins): LPDCLKOUT output LPD (1 pin): High impedance
JP0_6	High impedance	JP0_6: High impedance Serial programming mode: High impedance Nexus I/F: EVTO <sup>+</sup> output LPD (4 pins): High impedance LPD (1 pin): High impedance
P8_6	Output <sup>*2,*4</sup>	Output (OPBT0.RESETOUTEN = 1) <sup>*2</sup> High impedance (OPBT0.RESETOUTEN = 0) <sup>*2,*4</sup>
P0 to P3, P8 to P13, P18 to P22 (except P8_6, P10_1, P10_2, P10_6 and P10_8)	High impedance	High impedance
P10_1	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE0 input (FLMD0 = 1, FLMD1 = 1)
P10_2	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE1 input (FLMD0 = 1, FLMD1 = 1)

Table 2B.10 Pin Functions During and After Reset

Pins	During Reset	After Reset
P10_6	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 1) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0) MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1)
P10_8	High impedance	High impedance (FLMD0 = 0) FLMD1 input (FLMD0 = 1)
FLMD0	Input	Input
$\overline{\text{RESET}}$	Input	Input
AP0, AP1	High impedance	High impedance

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low level.

Note 2.  $\overline{\text{RESETOUT}}$  is output. For details, see **Section 2B.11, Port (Special I/O) Function Overview**.

Note 3. When the power is turned on or when  $\overline{\text{RESET}}$  is low level, JP0\_4 pin should be driven low level.

Note 4. If OPBT0.RESETOUTEN = 0, P8\_6 pin status has a possibility to become unstable (less than 15  $\mu\text{s}$ ) at the transition moment to reset status by internal reset factors.

Note 5. When  $\overline{\text{RESET}}$  is low level, on-chip pull-down resistor is connected to JP0\_4.

## 2B.4 Port State in Standby Mode

For the port state in standby mode, see **Section 14.1.4, I/O Buffer Control**.

## 2B.5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.

Table 2B.11 Recommended Connection of Unused Pins (RH850/F1KM-S4, RH850/F1KM-S2)

Pin	Recommended Connection of Unused Pins
A0VREF, A1VREF* <sup>1</sup>	<b>[Excluding 100-Pin LQFP]</b> Connected to EVCC or BVCC <b>[100-Pin LQFP]</b> Connected to EVCC
A0VSS, A1VSS* <sup>1</sup>	<b>[Excluding 100-Pin LQFP]</b> Connected to EVSS or BVSS <b>[100-Pin LQFP]</b> Connected to EVSS
$\overline{\text{RESET}}$	<b>[Excluding 100-Pin LQFP]</b> Connected to EVCC or BVCC via a resistor <b>[100-Pin LQFP]</b> Connected to EVCC via a resistor
XT1	Connected to REGVCC or AWOVSS via a resistor* <sup>3</sup> (bit 0 of IPIBC0 = 1) Connected to AWOVSS (bit 0 of IPIBC0 = 0)
X1	Connected to AWOVSS via a resistor
X2	Open
IP0_0	Connected to REGVCC or AWOVSS via a resistor* <sup>3</sup> (bit 0 of IPIBC0 = 1) Open (bit 0 of IPIBC0 = 0)
JP0 (excluding JP0_4) P0 P1 P2 P3* <sup>4</sup> P8 (excluding P8_6) P9 P20	Input: Open (when the PIBCN_m and PMCN_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCN_m or PMCN_m bits are 1) Output: Open
P8_6	Input: Open (when the PIBCN_m and PMCN_m bits are 0) Connected to EVSS via a resistor (when the PIBCN_m or PMCN_m bits are 1) Output: Open
JP0_4	Connected to EVSS via a resistor
P10_1, P10_2, P10_6, P10_8	Input: Open (when the PIBCN_m and PMCN_m bits are 0) Connected to EVSS via a resistor (when the PIBCN_m or PMCN_m bits are 1) Output: Open

Table 2B.11 Recommended Connection of Unused Pins (RH850/F1KM-S4, RH850/F1KM-S2)

Pin	Recommended Connection of Unused Pins
P10 (excluding P10_1, P10_2, P10_6, P10_8)	<b>[Excluding 100-Pin LQFP]</b>
P11	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to BVCC or BVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1)
P12	Output: Open
P13*4	<b>[100-Pin LQFP]</b>
P18	Input: Open (when the PIBCn_m and PMCn_m bits are 0)

P21*4	Output: Open
P22*4	Output: Open
AP0	Input: Open (when the PIBCn_m bit is 0) Connected to A0VREF or A0VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
AP1	Input: Open (when the PIBCn_m bit is 0) Connected to A1VREF or A1VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
Nexus/LPD I/F (JP0)	DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor DCUTDO/LPDO (JP0_1): Open DCUTCK/LPDCLK (JP0_2): Open DCUTMS (JP0_3): Connected to EVCC via a resistor DCUTRST (JP0_4): Connected to EVSS via a resistor*2 DCURDY /LPDCLKOUT (JP0_5): Open EVT $\bar{O}$ (JP0_6): Open*1

Note 1. Only available for 272-pin, 233-pin, 176-pin and 144-pin devices

Note 2. For in case when a debugging interface is used, this pin should be connected to EVCC through resistor depending on the development tool made by a third party.

Note 3. XT1 = IP0\_0 (XT2) = REGVCC or AWOVSS should be set.  
XT1 is connected to IP0\_0 (XT2) through an internal resistor. Therefore, it is necessary to maintain equal voltage level in order not to make a current path.

Note 4. Only available for RH850/F1KM-S4.

## 2B.6 Features of RH850/F1KM Port

### 2B.6.1 Port Group

The RH850/F1KM provides the following port groups, indicated by the numbers in the table below.

Table 2B.12 Port Groups in RH850/F1KM-S4, RH850/F1KM-S2

No. of Pins	Port Group	RH850/F1KM-S4
100 pins	Number	7
	Name	P0, P8 to P11, JP0, AP0
144 pins	Number	13
	Name	P0, P1, P8 to P12, P18, P20, JP0, AP0, AP1, IP0
176 pins	Number	14
	Name	P0 to P2, P8 to P12, P18, P20, JP0, AP0, AP1, IP0
233 pins <sup>1</sup>	Number	17
	Name	P0 to P3, P8 to P13, P18 to P20, JP0, AP0, AP1, IP0
272 pins <sup>1</sup>	Number	19
	Name	P0 to P3, P8 to P13, P18 to P22, JP0, AP0, AP1, IP0

Note 1. Only available for RH850/F1KM-S4.

### 2B.6.2 Port Group Index n

Throughout this section, the port groups are identified by using the index “n”. For example, the port mode control register of the Pn pin is PMCN (n = 0 to 3, 8 to 13, 18 to 22).

### 2B.6.3 Register Base Addresses

Port and JTAG port base addresses are listed in the following table.

Port and JTAG port register addresses are given as offsets from the base addresses.

Table 2B.13 Register Base Addresses

Base Address Name	Base Address
<PORTn_base>	FFC1 0000 <sub>H</sub>
<JPORT0_base>	FFC2 0000 <sub>H</sub>

### 2B.6.4 Clock Supply

The clock supply to ports is shown in the following table.

Table 2B.14 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Port	Register access clock	CPUCLK_UL

## 2B.7 Port Functions

This product has various pins for input/output ports. The ports are organized in port groups.

The RH850/F1KM also has several control registers to enable pins to be used as other than general-purpose input/output pins.

For a description of the terms pin, port, and port group, see **Section 2B.7.2, Terms**

### 2B.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16.
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.

**Table 2B.43, JTAG Port 0 (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.45, Port 0 (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.47, Port 1 (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.49, Port 2 (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.51, Port 3 (P3) (RH850/F1KM-S4), Table 2B.53, Port 8 (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.55, Port 9 (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.57, Port 10 (P10) (RH850/F1KM-S4), Table 2B.58, Port 10 (P10) (RH850/F1KM-S2), Table 2B.61, Port 11 (P11) (RH850/F1KM-S4), Table 2B.62, Port 11 (P11) (RH850/F1KM-S2), Table 2B.65, Port 12 (P12) (RH850/F1KM-S4), Table 2B.66, Port 12 (P12) (RH850/F1KM-S2), Table 2B.69, Port 13 (P13) (RH850/F1KM-S4), Table 2B.71, Port 18 (P18) (RH850/F1KM-S4), Table 2B.72, Port 18 (P18) (RH850/F1KM-S2), Table 2B.75, Port 19 (P19) (RH850/F1KM-S4), Table 2B.77, Port 20 (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.79, Port 21 (P21) (RH850/F1KM-S4), Table 2B.81, Port 22 (P22) (RH850/F1KM-S4), Table 2B.83, Analog Port 0 (AP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.85, Analog Port 1 (AP1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.87, Input Port 0 (IP0) (RH850/F1KM-S4, RH850/F1KM-S2), and **Section 2B.9.2, Pin Function Configuration.****

#### CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

#### [Example]

INTP0 is assigned to the following pins on this device. However, the INTP0 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- JP0\_0 (1st input alternative function)
- P0\_1 (2nd, 3rd input alternative function)
- P10\_0 (2nd input alternative function)

In the above case, when the 1st input alternative function (INTP0) of JP0\_0 is selected, using the 2nd input alternative function (CAN0RX/INTP0) of P0\_1 only for the CAN signal is also prohibited.

## 2B.7.2 Terms

The following terms are used in this section:

### Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.

A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

### Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

### Port mode and ports

A pin in port mode works as a general-purpose input/output pin. It is then called “port”.

The corresponding name is Pn\_m. For example, P0\_7 denotes port 7 of port group 0. It is referenced as “port P0\_7”.

### Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0\_0 and INTP0. The different names indicate the function of the pin at that time.

### 2B.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging.

JTAG port group registers and bit names are prefixed by a “J”. For example, JP0 denotes JTAG port group 0, and JPM0.JPM0\_m denotes the JPM0\_m port mode bit of the JPM0 port mode register.

#### NOTE

---

In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

---

### 2B.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMn.PMCn\_m bit = 0)
  - A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn\_m bit.
- Software I/O control alternative mode (PMn.PMCn\_m bit = 1, PIPn.PIPCn\_m bit = 0)
  - In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn\_m bit.
- Direct I/O control alternative mode (PMn.PMCn\_m bit = 1, PIPn.PIPCn\_m bit = 1)
  - In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.

Table 2B.15 Pin Function Configuration (Overview)

Mode	Bit			I/O
	PMn_m	PMn_m	PIPn_m	
Port mode	0	0	X	O
		1*1		I
Software I/O control alternative mode	1	0	0	O
		1	0	I
Direct I/O control alternative mode		X	1	Controlled by the alternative function

Note 1. The input buffer must be enabled (PIPn\_m bit = 1).

- Software I/O control alternative mode (PIPn.PIPCn\_m bit = 0)
  - Output (PMn\_m bit = 0): Alternative output mode 1 to Alternative output mode 7
  - Input (PMn\_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPn.PIPCn\_m bit = 1)
  - The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2B.16 Alternative Mode Selection Overview (PMCn.PMCn\_m Bit = 1)

Mode	Register					I/O	
	PIPC*1	PM*1	PFCAE	PFCE	PFC		
Alternative output mode 1 (ALT-OUT1)	0	0	0	0	0	O	
Alternative input mode 1 (ALT-IN1)		1				I	
Alternative output mode 2 (ALT-OUT2)		0				1	O
Alternative input mode 2 (ALT-IN2)		1					I
Alternative output mode 3 (ALT-OUT3)		0	1	1	0	O	
Alternative input mode 3 (ALT-IN3)		1				I	
Alternative output mode 4 (ALT-OUT4)		0				1	O
Alternative input mode 4 (ALT-IN4)		1					I
Alternative output mode 5 (ALT-OUT5)		0	1	0	0	O	
Alternative input mode 5 (ALT-IN5)		1				I	
Alternative output mode 6 (ALT-OUT6)		0				1	O
Alternative input mode 6 (ALT-IN6)		1					I
Alternative output mode 7 (ALT-OUT7)		0	1	1	0	O	
Alternative input mode 7 (ALT-IN7)		1				I	
Other than the above	Setting prohibited						

Note 1. If PIPCN.PIPCn\_m = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

If a pin is in alternative mode (PMCn.PMCn\_m bit = 1), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

## 2B.7.4 Pin Data Input/Output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

### 2B.7.4.1 Output Data

In the port mode (PMCn.PMCn\_m bit = 0), the value of the Pn.Pn\_m bit is output from the Pn\_m pin.

### 2B.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn\_m pin, the value of the Pn.Pn\_m bit, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits.

The different PPRn read modes are shown in the table below.

Table 2B.17 PPRn\_m Read Values

PMC n_m	PM n_m	PIBC n_m	PIPC n_m	PODC n_m	Mode	PPRn_m Read Value
0	1	0	X	X	Port input, input buffer disabled	Pn.Pn_m bit
		1		X	Port input, input buffer enabled	Pn_m pin
	0	X		0	Port push-pull output	Pn.Pn_m bit*1
				1	Port open-drain output	
1	1	X	0	X	Software I/O control alternative input	Pn_m pin
				0	Software I/O control alternative push-pull output	Output signal from the alternative function*1
				1	Software I/O control alternative open-drain output	
	X		1	0	Direct I/O control alternative input or push-pull output	I/O port in alternative mode: • Input: Pn_m pin • Output: Output signal from the alternative function*1
				1	Direct I/O control alternative input or open-drain output	

Note 1. When PBCn\_m = 1, the level of the Pn\_m pin is returned by the PPRn\_m bit.

The control registers in the above table have the following effects:

- PMCn.PMCn\_m bit  
This bit selects port mode (PMCn\_m = 0) or alternative mode (PMCn\_m = 1).
- PMn.PMn\_m bit  
This bit selects input (PMn\_m = 1) or output (PMn\_m = 0) when the port mode (PMCn\_m = 0) and software I/O control alternative mode (PMCn\_m = 1, PIPcn\_m = 0) have been selected.
- PIBcn.PIBcn\_m bit  
This bit disables (PIBCn\_m = 0) or enables (PIBCn\_m = 1) the input buffer in input port mode (PMCn\_m = 0 and PMn\_m = 1). If the input buffer is disabled, PPRn\_m reads the Pn.Pn\_m bit; otherwise the Pn\_m pin level is returned.
- PIPcn.PIPcn\_m bit  
This bit selects software I/O control alternative mode or direct I/O control alternative mode.
- PODcn.PODcn\_m bit  
This bit selects push-pull output (PODCn\_m = 0) or open-drain output (PODCn\_m = 1).

- PBDCn.PBDCn\_m bit

In output mode, when this bit is set to 1, the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn\_m pin can be read from PPRn.PPRn\_m.

#### CAUTION

When using Pn\_m as an alternative output function (PMcN.PMcN\_m bit = 1, PMn.PMn\_m bit = 0), the level of the Pn\_m pin can be read at the PPRn.PPRn\_m bit by enabling bidirectional mode (PBDCn.PBDCn\_m bit = 1).

Note, however, that the level of the Pn\_m pin will be input to the alternative function that the Pn\_m pin is being used as.

### 2B.7.4.3 Writing to the Pn Register

The data to be output via port Pn\_m in port mode (PMcN.PMcN\_m bit = 0) is held in port register Pn.

Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.  
In this case, new data can be written directly to the Pn register.
- By performing an indirect bitwise operation (a “set”, “reset”, or “not” operation) on the Pn register.  
An indirect bitwise operation (“set”, “reset”, or “not”) can be performed on the Pn register by using the following two registers:
  - Port Set/Reset register PSRn  
If the PSRn.PSRn (m + 16) bit = 1, the value of the Pn.Pn\_m bit is determined by the value of the PSRn.PSRn\_m bit.  
In other words, the Pn\_m bit can be set or reset without writing directly to the Pn register.
  - Port NOT register PNOTn  
By setting PNOTn.PNOTn\_m bit to 1, the Pn.Pn\_m bit can be inverted without writing directly to the Pn register.

An indirect bitwise operation on the Pn register (“set”, “reset”, or “not”) has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

## 2B.8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

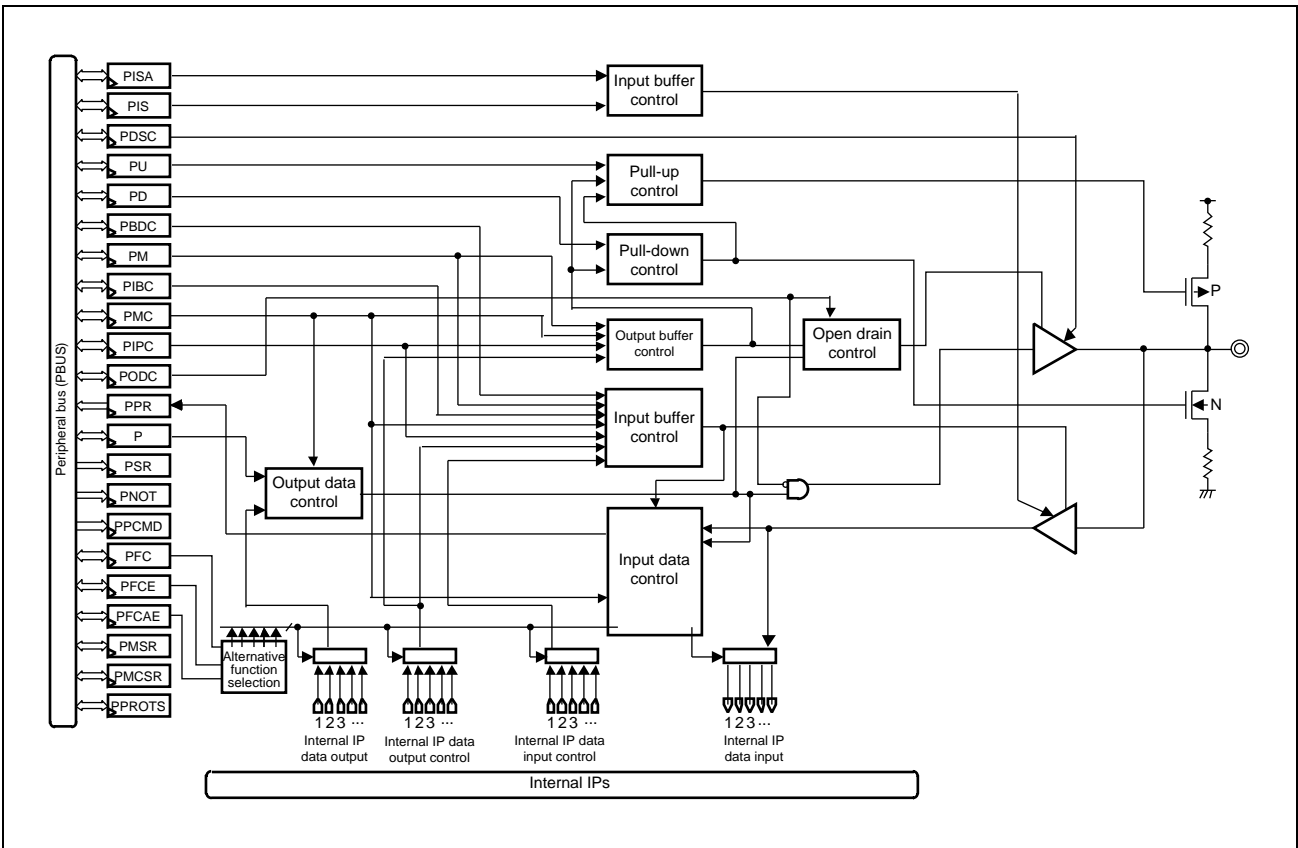

Figure 2B.6 Schematic View of Port Control

### CAUTION

Use documented alternative functions only. The behavior and performance are not guaranteed when undocumented alternative functions are selected.

## 2B.9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

- Section 2B.9.2, Pin Function Configuration
- Section 2B.9.3, Pin Data Input/Output
- Section 2B.9.4, Configuration of Electrical Characteristics

### 2B.9.1 Overview

The following registers are used for setting the individual pins of the port groups.

For details on <PORTn\_base> and <JPORT0\_base>, see **Section 2B.6.3, Register Base Addresses**.

Table 2B.18 Port Group Configuration Registers

Module Name	Register Name	Symbol	Address
Pin function configuration			
PORT	Port mode control register	PMcN	<PORTn_base> + 0400 <sub>H</sub> + n × 4
JTAG		JPMC0	<JPORT0_base> + 0040 <sub>H</sub>
PORT	Port mode control set/reset register	PMCSRn	<PORTn_base> + 0900 <sub>H</sub> + n × 4
JTAG		JPMCSR0	<JPORT0_base> + 0090 <sub>H</sub>
PORT	Port IP control register	PIPCn	<PORTn_base> + 4200 <sub>H</sub> + n × 4

## Index n

In **Table 2B.18, Port Group Configuration Registers**, the index “n” in register symbols denotes the actual indices of the individual port groups. For example, PMCN generically indicates a port mode control register for port group n (Pn). The values for n differ according to the number of pins on the device in the way shown in **Table 2B.19, Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols (RH850/F1KM-S4, RH850/F1KM-S2)**.

Table 2B.19 Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols (RH850/F1KM-S4, RH850/F1KM-S2)

Number of Pins on the Device	Port Groups	Values for “n”
100 pins	P0, P8, P9, P10, P11	0, 8, 9, 10, 11
	AP0	0
144 pins	P0, P1, P8, P9, P10, P11, P12, P18, P20	0, 1, 8, 9, 10, 11, 12, 18, 20
	AP0, AP1	0, 1
176 pins	P0, P1, P2, P8, P9, P10, P11, P12, P18, P20	0, 1, 2, 8, 9, 10, 11, 12, 18, 20
	AP0, AP1	0, 1
233 pins <sup>*1</sup>	P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20	0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20
	AP0, AP1	0, 1
272 pins <sup>*1</sup>	P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22	0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22
	AP0, AP1	0, 1

Note 1. Only available for RH850/F1KM-S4.

## JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.

All descriptions (except for those of the PFCAEn register and PIPCN register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

## Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

## 2B.9.2 Pin Function Configuration

### 2B.9.2.1 PMCn / JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

**Access:** PMCn: This register can be read or written in 16-bit units.

JPMC0: This register can be read or written in 8-bit units.

**Address:** PMCn: <PORTn\_base> + 0400<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*<sup>2</sup>, 8, 9, 10, 11, 12, 13\*<sup>2</sup>, 18, 20)

JPMC0: <JPORT0\_base> + 0040<sub>H</sub>\*<sup>1</sup>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMC n_15	PMC n_14	PMC n_13	PMC n_12	PMC n_11	PMC n_10	PMC n_9	PMC n_8	PMC n_7	PMC n_6	PMC n_5	PMC n_4	PMC n_3	PMC n_2	PMC n_1	PMC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), and Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.20 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

#### CAUTIONS

- I/O is not controlled by only setting alternative mode (PMCn.PMCn\_m bit = 1). If the alternative function requires direct I/O control, also set the PIPCN.PIPCn\_m bit to 1.
- If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLM\_<name>, DNFA<name>CTL and the DNFA<name>EN register. For details, see **Section 2B.12, Noise Filter & Edge/Level Detector**, and **Section 2B.13, Description of Port Noise Filter & Edge/Level Detection**.

#### NOTE

The control bits of the JTAG port mode control register (JPMC0) are JPMC0\_[7:0].

### 2B.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn\_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

**Access:** PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>. Reading bits 15 to 0 returns the value of register PMCn.

JPMCSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000<sub>H</sub>. Reading bits 7 to 0 returns the value of register JPMCO.

**Address:** PMCSRn: <PORTn\_base> + 0900<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*2, 8, 9, 10, 11, 12, 13\*2, 18, 20)

JPMCSR0: <JPORT0\_base> + 0090<sub>H</sub>\*1

**Value after reset:** 0000 0000<sub>H</sub>

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), and Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2).**
- Note 2. Only available for RH850/F1KM-S4.

Table 2B.21 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMCn_m (PMCSRn_[15:0]) is written to PMCn_m. 0: PMCn_m is not affected by PMCSRn_m. 1: PMCn_m is PMCSRn_m. <b>Example:</b> If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15.
15 to 0	PMCSRn_[15:0]	Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1. 0: PMCn_m is 0. 1: PMCn_m is 1.

## NOTE

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0\_[31:0].

### 2B.9.2.3 PIPCN — Port IP Control Register

This register specifies whether the I/O direction of the Pn\_m pin is controlled by the port mode register PMn.PMn\_m or by an alternative function.

If the Pn\_m pin is operated in alternative mode (PMn.PMn\_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCN.PIPCn\_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn\_m setting.

Regarding the alternative functions for which the PIPC register must be set, see **Section 2B.11, Port (Special I/O) Function Overview**.

**Access:** This register can be read or written in 16-bit units.

**Address:** PIPCN: <PORTn\_base> + 4200<sub>H</sub> + n × 4 (n = 0, 10, 11, 12, 20)\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), and Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2).**

Table 2B.22 PIPCN Register Contents

Bit Position	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specifies the I/O mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

### 2B.9.2.4 PMn / APMn / JPM0 — Port Mode Register

This register specifies whether the individual pins of the port group n are in input mode or in output mode.

**Access:** PMn, APMn: These registers can be read or written in 16-bit units.

JPM0: This register can be read or written in 8-bit units.

**Address:** PMn: <PORTn\_base> + 0300<sub>H</sub> + n × 4 (n = 0, 1, 2, 3<sup>4</sup>, 8, 9, 10, 11, 12, 13<sup>4</sup>, 18, 19<sup>4</sup>, 20, 21<sup>4</sup>, 22<sup>4</sup>)

APMn: <PORTn\_base> + 03C8<sub>H</sub> + n × 4 (n = 0, 1)

JPM0: <JPORT0\_base> + 0030<sub>H</sub>\*<sup>1</sup>

**Value after reset:** FFFF<sub>H</sub>\*<sup>2</sup>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_15	PMn_14	PMn_13	PMn_12	PMn_11	PMn_10	PMn_9	PMn_8	PMn_7	PMn_6	PMn_5	PMn_4	PMn_3	PMn_2	PMn_1	PMn_0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), Table 2B.82, Control Registers (P22) (RH850/F1KM-S4), Table 2B.84, Control Registers (AP0) (RH850/F1KM-S4, RH850/F1KM-S2), and Table 2B.86, Control Registers (AP1) (RH850/F1KM-S4, RH850/F1KM-S2).**

- Note 2. The PM8 register is as follows.  
When the OPBT0.RESETOUTEN = 1, the PM8 register is FFBF<sub>H</sub>.  
When the OPBT0.RESETOUTEN = 0, the PM8 register is FFFF<sub>H</sub>.

- Note 3. The PM8\_6 bit is as follows.  
When the OPBT0.RESETOUTEN = 1, the PM8\_6 bit is 0.  
When the OPBT0.RESETOUTEN = 0, the PM8\_6 bit is 1.

- Note 4. Only available for RH850/F1KM-S4.

Table 2B.23 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

**NOTES**

---

1. To use a port in input port mode (PMn.PMCn\_m = 0 and PMn.PMn\_m = 1), the input buffer must be enabled (PIBCn.PIBCn\_m = 1).
  2. By default, PMn.PMn\_m specifies the I/O direction in port mode (PMn.PMCn\_m = 0) and alternative mode (PMn.PMCn\_m = 1), since PIPCN.PIPCn\_m = 0 after reset.
  3. The control bits of the analog port register (APMn) are APMn\_[15:0].
  4. The control bits of the JTAG port mode register (JPM0) are JPM0\_[7:0].
-

### 2B.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn\_m is set by the corresponding bit in the lower 16 bits of PMSRn.

**Access:** PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>.

Reading bits 15 to 0 returns the value of registers PMn and APMn.

JPMSR0: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>. Bits 15 to 8 are read as FF<sub>H</sub>. Reading bits 7 to 0 returns the value of register JPM0.

**Address:** PMSRn: <PORTn\_base> + 0800<sub>H</sub> + n × 4 (n = 0, 1, 2, 3<sup>\*4</sup>, 8, 9, 10, 11, 12, 13<sup>\*4</sup>, 18, 19<sup>\*4</sup>, 20, 21<sup>\*4</sup>, 22<sup>\*4</sup>)

APMSRn: <PORTn\_base> + 08C8<sub>H</sub> + n × 4 (n = 0, 1)

JPMSR0: <JPORT0\_base> + 0080<sub>H</sub><sup>\*1</sup>

**Value after reset:** 0000 FFFF<sub>H</sub><sup>\*2</sup>

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), Table 2B.82, Control Registers (P22) (RH850/F1KM-S4), Table 2B.84, Control Registers (AP0) (RH850/F1KM-S4, RH850/F1KM-S2), and Table 2B.86, Control Registers (AP1) (RH850/F1KM-S4, RH850/F1KM-S2).**

Note 2. The PMSR8 register is as follows.  
When the OPBT0.RESETOUTEN = 1, the PMSR8 register is 0000 FFBF<sub>H</sub>.  
When the OPBT0.RESETOUTEN = 0, the PMSR8 register is 0000 FFFF<sub>H</sub>.

Note 3. The PMSR8\_6 bit is as follows.  
When the OPBT0.RESETOUTEN = 1, the PMSR8\_6 bit is 0.  
When the OPBT0.RESETOUTEN = 0, the PMSR8\_6 bit is 1.

Note 4. Only available for RH850/F1KM-S4.

Table 2B.24 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	<p>Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to PMn_m.</p> <p>0: PMn_m is not affected by PMSRn_m. 1: PMn_m is PMSRn_m.</p> <p><b>Example:</b> If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15.</p>
15 to 0	PMSRn_[15:0]	<p>Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1.</p> <p>0: PMn_m is 0. 1: PMn_m is 1.</p>

## NOTES

1. The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0\_[31:0].
2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn\_[31:0].

### 2B.9.2.6 PIBCn / APIBCn / JPIBC0 / IPIBC0 — Port Input Buffer Control Register

In input port mode (PMc.PMc<sub>n</sub><sub>m</sub> = 0 and PMn.PMn<sub>m</sub> = 1), this register enables the port pin's input buffer.

**Access:** PIBCn, APIBCn, IPIBC0: These registers can be read or written in 16-bit units.

JPIBC0: This register can be read or written in 8-bit units.

**Address:** PIBCn: <PORTn\_base> + 4000<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*2, 8, 9, 10, 11, 12, 13\*2, 18, 19\*2, 20, 21\*2, 22\*2)

APIBCn: <PORTn\_base> + 40C8<sub>H</sub> + n × 4 (n = 0, 1)

JPIBC0: <JPORTo\_base> + 0400<sub>H</sub>

IPIBC0: <PORTn\_base> + 40F0<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBC <sub>n_15</sub>	PIBC <sub>n_14</sub>	PIBC <sub>n_13</sub>	PIBC <sub>n_12</sub>	PIBC <sub>n_11</sub>	PIBC <sub>n_10</sub>	PIBC <sub>n_9</sub>	PIBC <sub>n_8</sub>	PIBC <sub>n_7</sub>	PIBC <sub>n_6</sub>	PIBC <sub>n_5</sub>	PIBC <sub>n_4</sub>	PIBC <sub>n_3</sub>	PIBC <sub>n_2</sub>	PIBC <sub>n_1</sub>	PIBC <sub>n_0</sub>

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), Table 2B.82, Control Registers (P22) (RH850/F1KM-S4), Table 2B.84, Control Registers (AP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.86, Control Registers (AP1) (RH850/F1KM-S4, RH850/F1KM-S2), and Table 2B.88, Control Registers (IP0) (RH850/F1KM-S4, RH850/F1KM-S2).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.25 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer. 0: Input buffer disabled 1: Input buffer enabled

#### NOTES

- When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
- The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0\_[7:0].

#### CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn<sub>m</sub> = 1).

### 2B.9.2.7 PFCn / JPFC0 — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn\_m pin. For such alternative functions, PIPCN.PIPCN\_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn\_m.

**Access:** PFCn: This register can be read or written in 16-bit units.

JPFC0: This register can be read or written in 8-bit units.

**Address:** PFCn: <PORTn\_base> + 0500<sub>H</sub> + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 13\*<sup>2</sup>, 18, 20)

JPFC0: <JPOR0\_base> + 0050<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), and Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.26 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies the alternative function of the pin. For details, see <b>Table 2B.29, Setting Alternative Functions.</b>

#### NOTE

The control bits of the JTAG port function control register (JPFC0) are JPFC0\_[7:0].

### 2B.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn\_m pin. For such alternative functions, PIPCN.PIPCN\_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn\_m.

**Access:** PFCEn: This register can be read or written in 16-bit units.

JPFCE0: This register can be read or written in 8-bit units.

**Address:** PFCEn: <PORTn\_base> + 0600<sub>H</sub> + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)

JPFCE0: <JPORT0\_base> + 0060<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), and Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2).**

Table 2B.27 PFCEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCE <sub>n</sub> _[15:0]	Specifies the alternative function of the pin. For details, see <b>Table 2B.29, Setting Alternative Functions.</b>

### 2B.9.2.9 PFCAn — Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.

Some alternative functions directly control the I/O of the Pn\_m pin. For such alternative functions, PIPcn.PIPcn\_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn\_m.

**Access:** PFCAn: This register can be read or written in 16-bit units.

**Address:** PFCAn: <PORTn\_base> + 0A00<sub>H</sub> + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 20)\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAn <sub>n_15</sub>	PFCAn <sub>n_14</sub>	PFCAn <sub>n_13</sub>	PFCAn <sub>n_12</sub>	PFCAn <sub>n_11</sub>	PFCAn <sub>n_10</sub>	PFCAn <sub>n_9</sub>	PFCAn <sub>n_8</sub>	PFCAn <sub>n_7</sub>	PFCAn <sub>n_6</sub>	PFCAn <sub>n_5</sub>	PFCAn <sub>n_4</sub>	PFCAn <sub>n_3</sub>	PFCAn <sub>n_2</sub>	PFCAn <sub>n_1</sub>	PFCAn <sub>n_0</sub>
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), and Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2).**

Table 2B.28 PFCAn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCAn <sub>[15:0]</sub>	Specifies the alternative function of the pin. For details, see <b>Table 2B.29, Setting Alternative Functions.</b>

Table 2B.29 Setting Alternative Functions

PFCAn <sub>m</sub>	PFCEn <sub>m</sub>	PFCn <sub>m</sub>	PMn <sub>m</sub>	Function
0	0	0	1	Alternative input mode 1
			0	Alternative output mode 1
		1	1	Alternative input mode 2
			0	Alternative output mode 2
	1	0	1	Alternative input mode 3
			0	Alternative output mode 3
		1	1	Alternative input mode 4
			0	Alternative output mode 4
1	0	0	1	Alternative input mode 5
			0	Alternative output mode 5
		1	1	Alternative input mode 6
	0		Alternative output mode 6	
	1	0	1	Alternative input mode 7
			0	Alternative output mode 7
	1	1	X	Setting prohibited

**CAUTION**

---

- After selecting the alternative function by the PFCn\_m, PFCEn\_m, or PFCAEn\_m bit, set the PMCn\_m bit to "1".
  - With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited. For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as a pin function other than b.
- 

**NOTE**

---

For more details on the assignment of each function, see **Section 2B.10.1.2, Control Registers** to **Section 2B.10.15.2, Control Registers**.

---

## 2B.9.3 Pin Data Input/Output

### 2B.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn\_m pin can be read from PPRn.PPRn\_m.

**Access:** PBDCn, APBDCn: These registers can be read or written in 16-bit units.

JPBDC0: This register can be read or written in 8-bit units.

**Address:** PBDCn: <PORTn\_base> + 4100<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*2, 8, 9, 10, 11, 12, 13\*2, 18, 19\*2, 20, 21\*2, 22\*2)

APBDCn: <PORTn\_base> + 41C8<sub>H</sub> + n × 4 (n = 0, 1)

JPBDC0: <JPORT0\_base> + 0410<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDC n_15	PBDC n_14	PBDC n_13	PBDC n_12	PBDC n_11	PBDC n_10	PBDC n_9	PBDC n_8	PBDC n_7	PBDC n_6	PBDC n_5	PBDC n_4	PBDC n_3	PBDC n_2	PBDC n_1	PBDC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), Table 2B.82, Control Registers (P22) (RH850/F1KM-S4), Table 2B.84, Control Registers (AP0) (RH850/F1KM-S4, RH850/F1KM-S2), and Table 2B.86, Control Registers (AP1) (RH850/F1KM-S4, RH850/F1KM-S2).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.30 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin. 0: Bidirectional mode disabled 1: Bidirectional mode enabled

#### CAUTION

- When the Pn\_m port is used for the alternative output function (PMcn.PMcn\_m = 1, PMn.PMn\_m = 0), the level of the Pn\_m pin can be read from PPRn.PPRn\_m by enabling the bidirectional mode (PBDCn.PBDCn\_m = 1).
- However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn\_m, PFCEn.PFCEn\_m, and PFCAEn.PFCAEn\_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

## NOTE

The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0\_[7:0].

### 2B.9.3.2 PPRn / APPRn / JPPR0 / IPPR0 — Port Pin Read Register

This register reflects the actual level of the Pn\_m pin, whether it is the value of the Pn.Pn\_m bit or the level of an alternative output function.

**Access:** PPRn, APPRn, IPPR0: These registers are read-only registers that can be read in 16-bit units.

JPPR0: This register is a read-only register that can be read in 8-bit units.

**Address:** PPRn: <PORTn\_base> + 0200H + n × 4 (n = 0, 1, 2, 3\*2, 8, 9, 10, 11, 12, 13\*2, 18, 19\*2, 20, 21\*2, 22\*2)

APPRn: <PORTn\_base> + 02C8H + n × 4 (n = 0, 1)

JPPR0: <JPORT0\_base> + 0020H

IPPR0: <PORTn\_base> + 02F0H\*1

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), Table 2B.82, Control Registers (P22) (RH850/F1KM-S4), Table 2B.84, Control Registers (AP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.86, Control Registers (AP1) (RH850/F1KM-S4, RH850/F1KM-S2), and Table 2B.88, Control Registers (IP0) (RH850/F1KM-S4, RH850/F1KM-S2).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.31 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	The Pn_m Pin, Pn.Pn_m value or alternative function output.

## NOTES

- For the read values of the PPRn register, see **Section 2B.7.4, Pin Data Input/Output**.
- The control bits of the JTAG port pin read register (JPPR0) are JPPR0\_[7:0].

### 2B.9.3.3 Pn / APn / JP0 — Port Register

This register holds the Pn.Pn\_m data to be output via the related Pn\_m port in output port mode (PMCn.PMCn\_m = 0 and PMn.PMn\_m = 0).

**Access:** Pn, APn: These registers can be read or written in 16-bit units.

JP0: This register can be read or written in 8-bit units.

**Address:** Pn: <PORTn\_base> + 0000H + n × 4 (n = 0, 1, 2, 3\*2, 8, 9, 10, 11, 12, 13\*2, 18, 19\*2, 20, 21\*2, 22\*2)

APn: <PORTn\_base> + 00C8H + n × 4 (n = 0, 1)

JP0: <JP0\_base> + 0000H\*1

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn_15	Pn_14	Pn_13	Pn_12	Pn_11	Pn_10	Pn_9	Pn_8	Pn_7	Pn_6	Pn_5	Pn_4	Pn_3	Pn_2	Pn_1	Pn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), Table 2B.82, Control Registers (P22) (RH850/F1KM-S4), Table 2B.84, Control Registers (AP0) (RH850/F1KM-S4, RH850/F1KM-S2), and Table 2B.86, Control Registers (AP1) (RH850/F1KM-S4, RH850/F1KM-S2).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.32 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

#### NOTE

The control bits of the JTAG port register (JP0) are JP0\_[7:0].

### 2B.9.3.4 PNOTn / APNOTn / JPNOT0 — Port NOT Register

This register allows the Pn\_m bit of the port register Pn to be inverted without directly writing to Pn.

**Access:** PNOTn, APNOTn: These registers are write-only registers that can be written in 16-bit units. When read, 0000<sub>H</sub> is returned.

JPNOT0: This register is a write-only register that can be written in 8-bit units. When read, 00<sub>H</sub> is returned.

**Address:** PNOTn: <PORTn\_base> + 0700<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*2, 8, 9, 10, 11, 12, 13\*2, 18, 19\*2, 20, 21\*2, 22\*2)

APNOTn: <PORTn\_base> + 07C8<sub>H</sub> + n × 4 (n = 0, 1)

JPNOT0: <JPORT0\_base> + 0070<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), Table 2B.82, Control Registers (P22) (RH850/F1KM-S4), Table 2B.84, Control Registers (AP0) (RH850/F1KM-S4, RH850/F1KM-S2), and Table 2B.86, Control Registers (AP1) (RH850/F1KM-S4, RH850/F1KM-S2).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.33 PNOTn Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOTn_[15:0]	Specifies if Pn.Pn_m is inverted. 0: Pn.Pn_m is not inverted ( $Pn_m \rightarrow Pn_m$ ) 1: Pn.Pn_m is inverted ( $\overline{Pn_m} \rightarrow Pn_m$ )

#### NOTE

The control bits of the JTAG port NOT register are JPNOT0\_[7:0].

### 2B.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn\_m is set by the corresponding bit in the lower 16 bits of PSRn.

**Access:** PSRn, APSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>. Reading bits 15 to 0 returns the value of registers Pn and APn.

JPSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000<sub>H</sub>. Reading bits 7 to 0 returns the value of register JP0.

**Address:** PSRn: <PORTn\_base> + 0100<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*<sup>2</sup>, 8, 9, 10, 11, 12, 13\*<sup>2</sup>, 18, 19\*<sup>2</sup>, 20, 21\*<sup>2</sup>, 22\*<sup>2</sup>)

APSRn: <PORTn\_base> + 01C8<sub>H</sub> + n × 4 (n = 0, 1)

JPSR0: <JPORT0\_base> + 0010<sub>H</sub>\*<sup>1</sup>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSR n_31	PSR n_30	PSR n_29	PSR n_28	PSR n_27	PSR n_26	PSR n_25	PSR n_24	PSR n_23	PSR n_22	PSR n_21	PSR n_20	PSR n_19	PSR n_18	PSR n_17	PSR n_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), Table 2B.82, Control Registers (P22) (RH850/F1KM-S4), Table 2B.84, Control Registers (AP0) (RH850/F1KM-S4, RH850/F1KM-S2), and Table 2B.86, Control Registers (AP1) (RH850/F1KM-S4, RH850/F1KM-S2).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.34 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	<p>Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to Pn_m.</p> <p>0: Pn_m is not affected by PSRn_m 1: Pn_m is PSRn_m</p> <p><b>Example:</b> If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15.</p>
15 to 0	PSRn_[15:0]	<p>Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1.</p> <p>0: Pn_m = 0 1: Pn_m = 1</p>

**NOTE**

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0\_[31:0].

## 2B.9.4 Configuration of Electrical Characteristics

### 2B.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

**Access:** PUn: This register can be read or written in 16-bit units.

JPU0: This register can be read or written in 8-bit units.

**Address:** PUn: <PORTn\_base> + 4300<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*, 8, 9, 10, 11, 12, 13\*, 18, 19\*, 20, 21\*, 22\*)

JPU0: <JPORT0\_base> + 0430<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PUn_15	PUn_14	PUn_13	PUn_12	PUn_11	PUn_10	PUn_9	PUn_8	PUn_7	PUn_6	PUn_5	PUn_4	PUn_3	PUn_2	PUn_1	PUn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), and Table 2B.82, Control Registers (P22) (RH850/F1KM-S4).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.35 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether an internal pull-up resistor is connected to the corresponding pin. 0: No internal pull-up resistor connected 1: An internal pull-up resistor connected

#### NOTES

- If a pin is configured such that both an internal pull-up resistor (PUn.PUn\_m = 1) and pull-down resistor (PDn.PDn\_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
- The pull-up resistor has no effect when the pin is operated in output mode.
- The control bits of the JTAG pull-up option register (JPU0) are JPU0\_[7:0].

### 2B.9.4.2 PDn / JPD0 — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

**Access:** PDn: This register can be read or written in 16-bit units.

JPD0: This register can be read or written in 8-bit units.

**Address:** PDn: <PORTn\_base> + 4400<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*, 8, 9, 10, 11, 12, 13\*, 18, 19\*, 20, 21\*, 22\*)

JPD0: <JPORT0\_base> + 0440<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), and Table 2B.82, Control Registers (P22) (RH850/F1KM-S4).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.36 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether to connect an internal pull-down resistor to the corresponding pin. 0: No internal pull-down resistor connected 1: An internal pull-down resistor connected

#### NOTES

- If a pin is configured such that both an internal pull-up resistor (PUn.PUn\_m = 1) and pull-down resistor (PDn.PDn\_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
- The internal pull-down resistor has no effect when the pin is operated in output mode.
- The control bits of the JTAG pull-down option register (JPD0) are JPD0\_[7:0].

### 2B.9.4.3 PDSCn / JPDS0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Regarding the alternative functions for which the PDSC register needs to be set, see **Section 2B.11.3.3, Output Buffer Control (PDSC)**.

**Access:** PDSCn, JPDS0: These registers can be read or written in 32-bit units.

**Address:** PDSCn: <PORTn\_base> + 4600<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*2, 10, 11, 12, 13\*2, 18, 19\*2, 20)  
JPDS0: <JPORT0\_base> + 0460<sub>H</sub>\*1

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2)**, **Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2)**, **Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2)**, **Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2)**, **Table 2B.52, Control Registers (P3) (RH850/F1KM-S4)**, **Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2)**, **Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2)**, **Table 2B.59, Control Registers (P10) (RH850/F1KM-S4)**, **Table 2B.60, Control Registers (P10) (RH850/F1KM-S2)**, **Table 2B.63, Control Registers (P11) (RH850/F1KM-S4)**, **Table 2B.64, Control Registers (P11) (RH850/F1KM-S2)**, **Table 2B.67, Control Registers (P12) (RH850/F1KM-S4)**, **Table 2B.68, Control Registers (P12) (RH850/F1KM-S2)**, **Table 2B.70, Control Registers (P13) (RH850/F1KM-S4)**, **Table 2B.73, Control Registers (P18) (RH850/F1KM-S4)**, **Table 2B.74, Control Registers (P18) (RH850/F1KM-S2)**, **Table 2B.76, Control Registers (P19) (RH850/F1KM-S4)**, and **Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2)**.

Note 2. Only available for RH850/F1KM-S4.

Table 2B.37 PDSCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PDSCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. 0: Lower drive strength (when the frequency output from the pin is 10 MHz or below) 1: High drive strength (when the frequency output from the pin is 40 MHz or less).

### 2B.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** PODCn, JPODC0: These registers can be read or written in 32-bit units.

**Address:** PODCn: <PORTn\_base> + 4500<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*<sup>4</sup>, 8, 9, 10, 11, 12, 13\*<sup>4</sup>, 18, 19\*<sup>4</sup>, 20, 21\*<sup>4</sup>, 22\*<sup>4</sup>)  
JPODC0: <JPORT0\_base> + 0450<sub>H</sub>\*<sup>1</sup>

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), and Table 2B.82, Control Registers (P22) (RH850/F1KM-S4).**

- Note 2. The PODC8 register is as follows.  
When the OPBT0.RESETOUTEN = 1, the PODC8 register is 0000 0040<sub>H</sub>.  
When the OPBT0.RESETOUTEN = 0, the PODC8 register is 0000 0000<sub>H</sub>.

- Note 3. The PODC8\_6 bit is as follows.  
When the OPBT0.RESETOUTEN = 1, the PODC8\_6 bit is 1.  
When the OPBT0.RESETOUTEN = 0, the PODC8\_6 bit is 0.

- Note 4. Only available for RH850/F1KM-S4.

Table 2B.38 PODCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PODCn_[15:0]	Specifies the output buffer function. 0: Push-pull 1: Open-drain

## NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0\_[31:0].

### 2B.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

**Access:** PISn: This register can be read or written in 16-bit units.

JPIS0: This register can be read or written in 8-bit units.

**Address:** PISn: <PORTn\_base> + 4700<sub>H</sub> + n × 4 (n = 0, 1, 2, 3\*<sup>2</sup>, 8, 9, 10, 11, 12, 13\*<sup>2</sup>, 18, 19\*<sup>2</sup>, 20, 21\*<sup>2</sup>, 22\*<sup>2</sup>)

JPIS0: <JPORT0\_base> + 0470<sub>H</sub>\*<sup>1</sup>

**Value after reset:** FFFF<sub>H</sub>

- Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.46, Control Registers (P0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.48, Control Registers (P1) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.50, Control Registers (P2) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.52, Control Registers (P3) (RH850/F1KM-S4), Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.56, Control Registers (P9) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.60, Control Registers (P10) (RH850/F1KM-S2), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.64, Control Registers (P11) (RH850/F1KM-S2), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.68, Control Registers (P12) (RH850/F1KM-S2), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), Table 2B.73, Control Registers (P18) (RH850/F1KM-S4), Table 2B.74, Control Registers (P18) (RH850/F1KM-S2), Table 2B.76, Control Registers (P19) (RH850/F1KM-S4), Table 2B.78, Control Registers (P20) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.80, Control Registers (P21) (RH850/F1KM-S4), and Table 2B.82, Control Registers (P22) (RH850/F1KM-S4).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.39 PISn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISn_[15:0]	Specifies the input buffer Characteristics: 0: Type 1 (SHMT1) 1: Type 2 (SHMT4)

## NOTES

- Details of the definition of type 1 and type 2 are given in **Section 2B.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)**. For details, also see **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2** for input buffer characteristics.
- The control bits of the JTAG port input buffer selection register (JPIS0) are JPIS0\_[7:0].

### 2B.9.4.6 PISAn / JPISA0 — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

**Access:** PISAn: This register can be read or written in 16-bit units.

JPISA0: This register can be read or written in 8-bit units.

**Address:** PISAn: <PORTn\_base> + 4A00<sub>H</sub> + n × 4 (n = 10, 11, 12, 13, 18)\*2

JPISA0: <JPORTo\_base> + 04A0<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PISA n_15	PISA n_14	PISA n_13	PISA n_12	PISA n_11	PISA n_10	PISA n_9	PISA n_8	PISA n_7	PISA n_6	PISA n_5	PISA n_4	PISA n_3	PISA n_2	PISA n_1	PISA n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview: Table 2B.44, Control Registers (JP0) (RH850/F1KM-S4, RH850/F1KM-S2), Table 2B.59, Control Registers (P10) (RH850/F1KM-S4), Table 2B.63, Control Registers (P11) (RH850/F1KM-S4), Table 2B.67, Control Registers (P12) (RH850/F1KM-S4), Table 2B.70, Control Registers (P13) (RH850/F1KM-S4), and Table 2B.73, Control Registers (P18) (RH850/F1KM-S4).**

Note 2. Only available for RH850/F1KM-S4.

Table 2B.40 PISAn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISA_[15:0]	Specifies the input buffer characteristics: 0: Type 2 (SHMT4) 1: Type 5 (TTL)

Table 2B.41 Port Input Selection Advanced Register Contents

PISAn	PISn	Function
0	0	Type 1 input buffer is selected (SHMT1)
	1	Type 2 input buffer is selected (SHMT4)
1	X	Type 5 input buffer is selected (TTL)

#### NOTE

Details of the definition of type 2 and type 5 are given in **Section 2B.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)**. For details, also see **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2** for input buffer characteristics.

### 2B.9.5 Port Register Protection

RH850/F1KM has Port Protection Command Registers (PPCMDn) and Port Protection Status Registers (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see **Section 5, Write-Protected Registers**.

### 2B.9.6 Flowchart Examples for Port Settings

Examples of the port settings are shown in the flowchart below.

#### **CAUTION**

---

If the port is set to the PIPCN.PIPCN\_m = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCN.PMCN\_m bit is set to 1 and when the PMN.PMN\_m bit is set to 0. If an interrupt-related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

---

### 2B.9.6.1 Batch Setting

An example of specifying batch port settings is shown in the flowchart below.

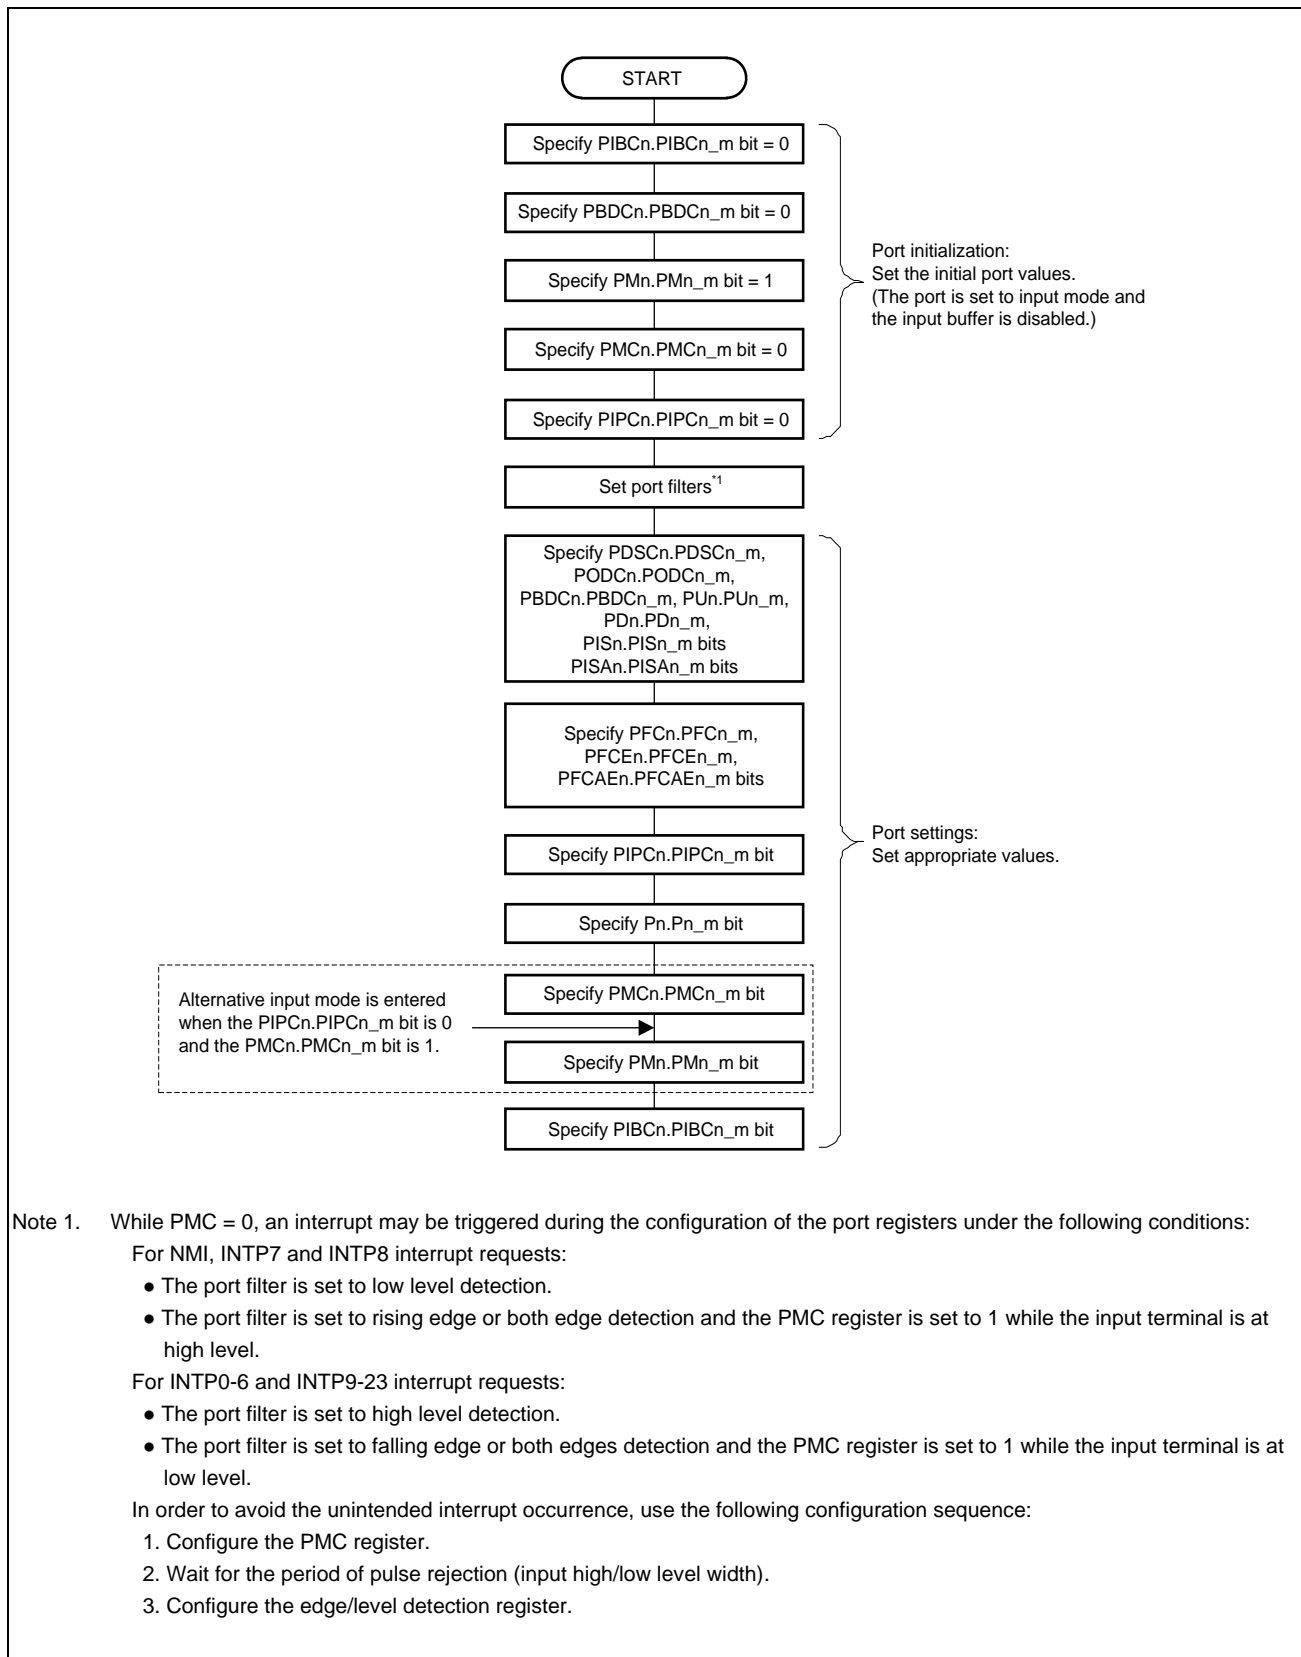

Figure 2B.7 Example of Port Settings (When Specified in Batch)

### 2B.9.6.2 Individual Settings

An example of specifying individual port settings is shown in the flowchart below.

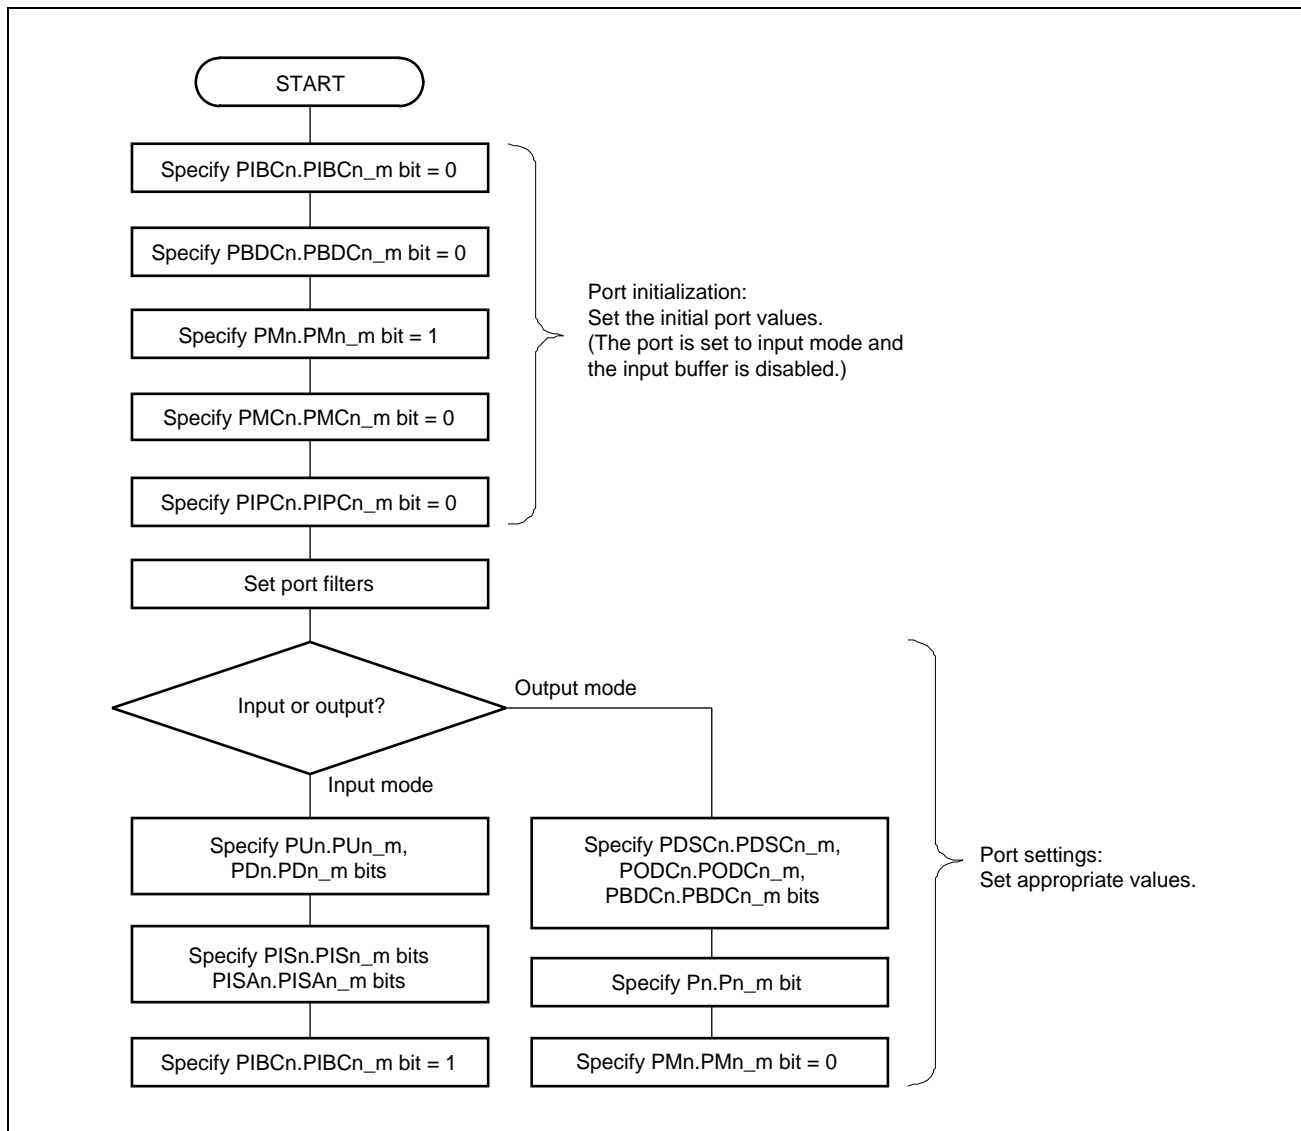

Figure 2B.8 Example of Port Settings (in Port Mode)

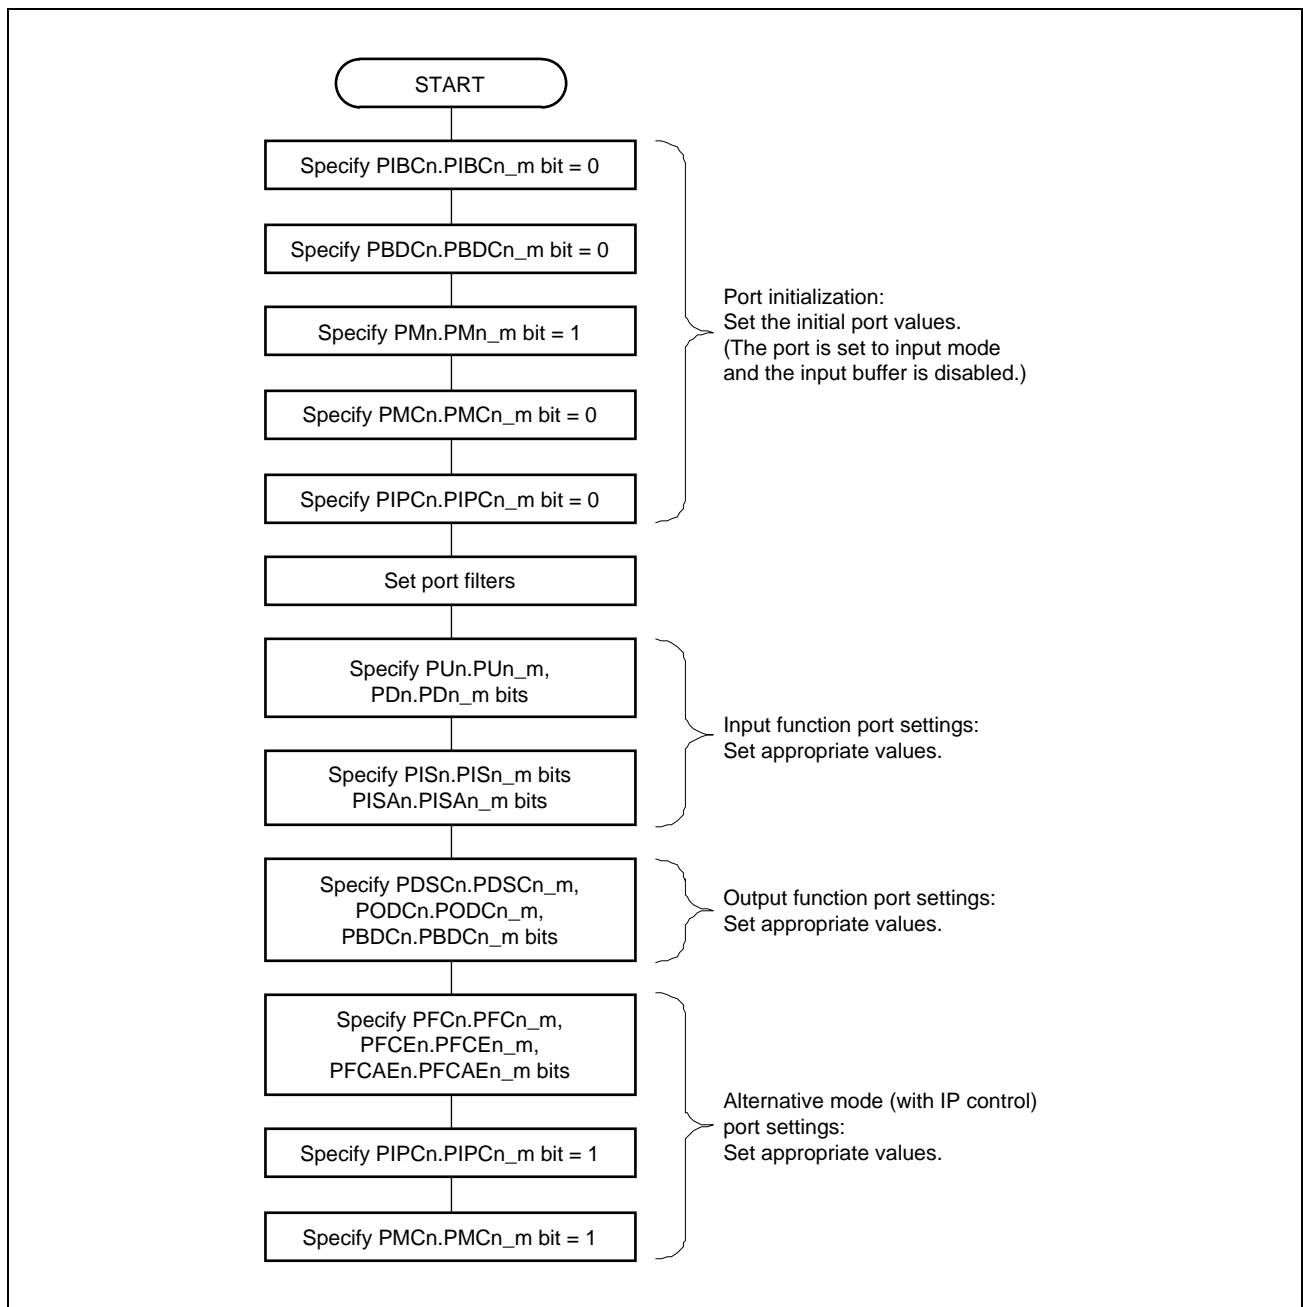

**(1) With IP Control (PIPCn.PIPCn\_m bit = 1)**

Figure 2B.9 Example of Port Settings (in Alternative Mode)

## (2) Without IP Control (PIPCn.PIPCn\_m bit = 0)

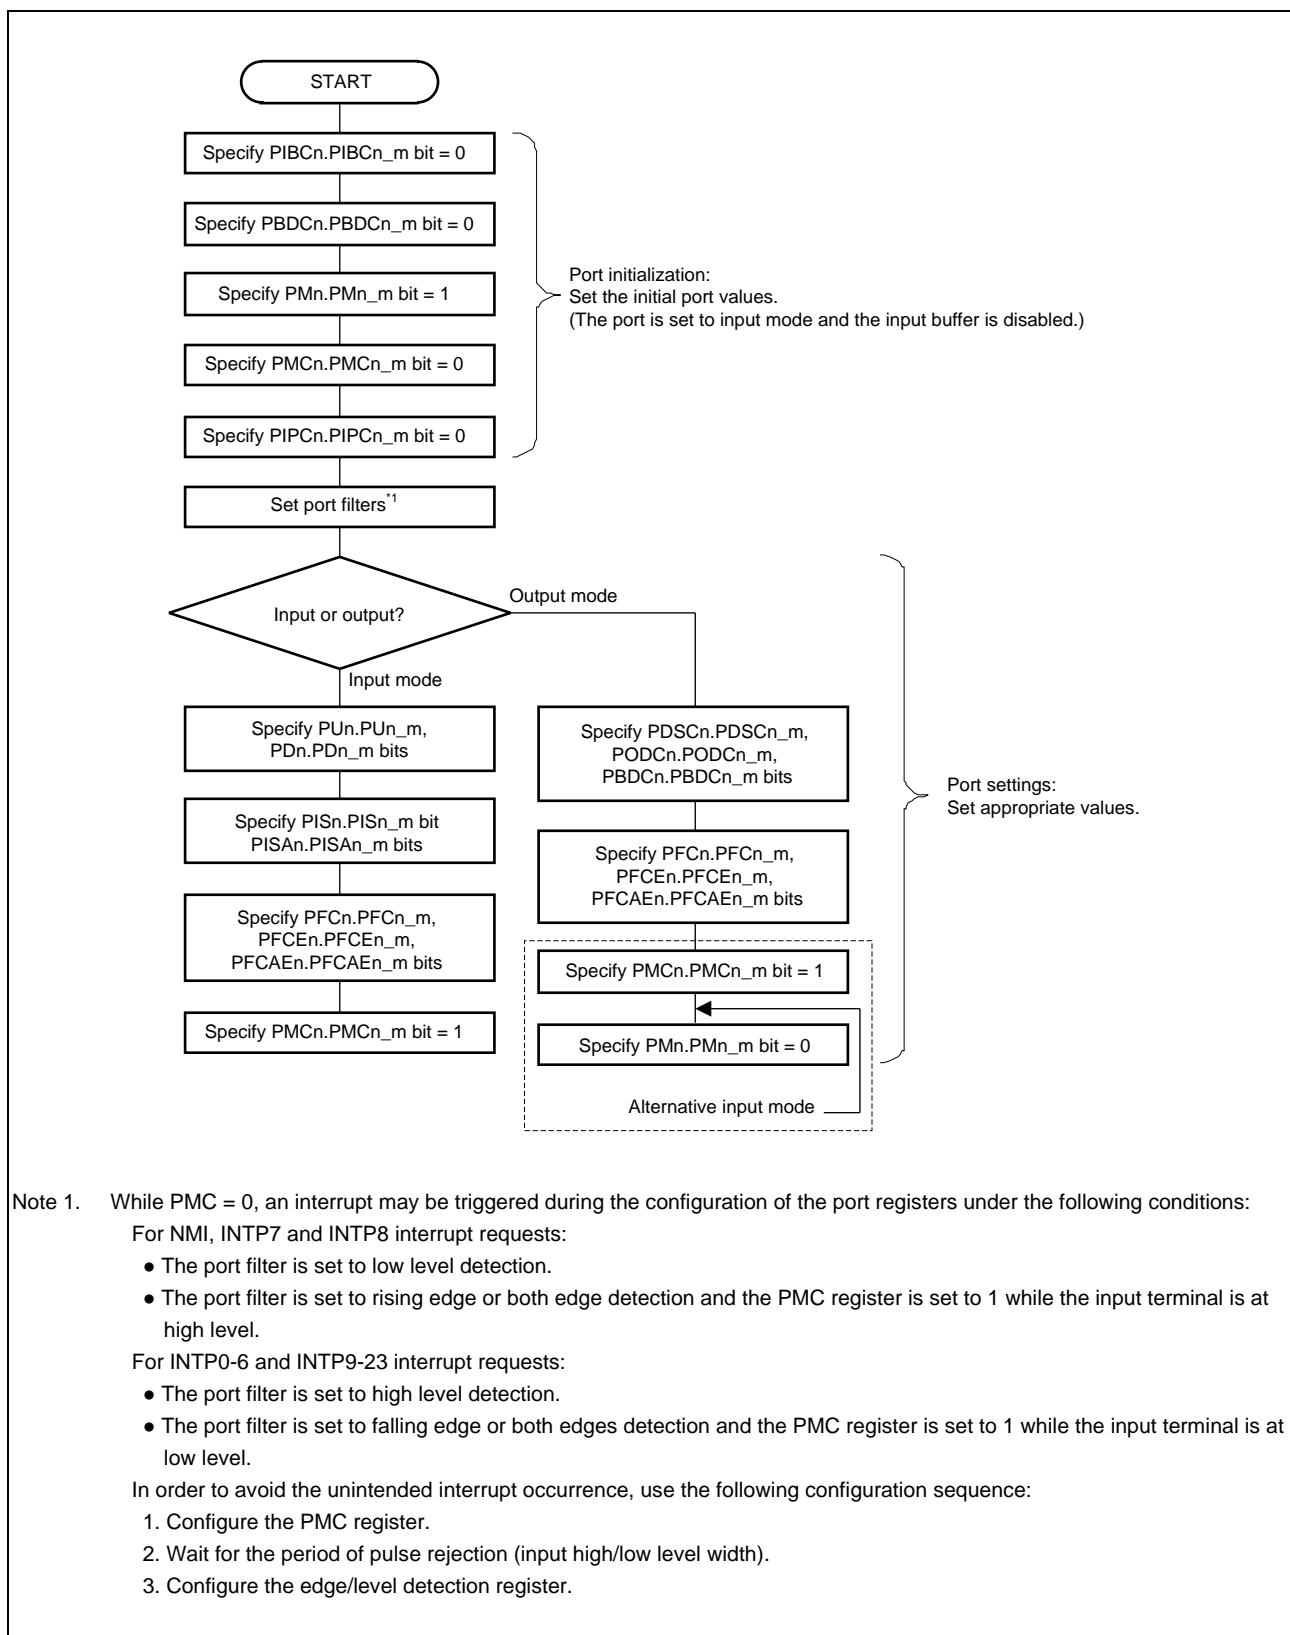

Figure 2B.10 Example of Port Settings (in Alternative Mode)

## 2B.10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCN register setting. When PMCN.PMCn\_m = 1, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2B.42 Port Function (RH850/F1KM-S4, RH850/F1KM-S2)

Port	Pin Name	Size	Direction	Power Domain	Special Alternative Function	Device				
						100 Pins	144 Pins	176 Pins	233 Pins*1	272 Pins*1

Note 1. Only available for RH850/F1KM-S4.

---

**CAUTIONS**

---

1. The behavior and performance are not guaranteed when undocumented alternative functions are selected.
  2. Use ADC functions with their initial settings. For details, see **Table 2B.54, Control Registers (P8) (RH850/F1KM-S4, RH850/F1KM-S2)**.
  3. When the  $\overline{\text{RESETOUT}}$  function is selected for the P8\_6 pin, the output on the pin is at the low level during a reset and after release from the reset state. For details, see **Section 2B.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  .

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.  
When writing to unused bits, write the value after reset.

Note 2. Only available for RH850/F1KM-S4.

**CAUTION**

P8\_6 drives a low level after any kind of reset release, until it is later configured differently by register settings. For details, see **Section 2B.11.1.1, P8\_6: RESETOUT**.

## 2B.10.7 Port 9 (P9)

### 2B.10.7.1 Alternative Function

#### CAUTIONS

1. The behavior and performance are not guaranteed when undocumented alternative functions are selected.
2. Use ADC functions with their initial settings. For details, see **Table 2B.73, Control Registers (P18) (RH850/F1KM-S4)**.

Table 2B.72 Port 18 (P18) (RH850/F1KM-S2)

			15-0				—	—	✓	✓	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.  
When writing to unused bits, write the value after reset.

Note 2. Only available for RH850/F1KM-S4.

## 2B.10.19 Input Port 0 (IP0)

### 2B.10.19.1 Alternative Function

Table 2B.87 Input Port 0 (IP0) (RH850/F1KM-S4, RH850/F1KM-S2)

Port Mode	Alternative Mode														Special Function	PKG No.				
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative		6th Alternative		7th Alternative			100 Pins	144 Pins	176 Pins	233 Pins*1	272 Pins*1
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output						
IP0_0															XT2	—	47	57	T7	W8

Note 1. Only available for RH850/F1KM-S4.

### 2B.10.19.2 Control Registers

Table 2B.88 Control Registers (IP0) (RH850/F1KM-S4, RH850/F1KM-S2)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device				
			Position	R/W*1			100 Pins	144 Pins	176 Pins	233 Pins*2	272 Pins*2
IPPR0	Input port pin read register 0	16	0	R	02F0 <sub>H</sub>	0000 <sub>H</sub>	—	✓	✓	✓	✓
IIBC0	Port input buffer control register 0	16	0	R/W	40F0 <sub>H</sub>	0000 <sub>H</sub>	—	✓	✓	✓	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.  
When writing to unused bits, write the value after reset.

Note 2. Only available for RH850/F1KM-S4.

#### CAUTION

When the IP0\_0/XT2 pin is used as an input port, set the IIBC0.0 bit to 1 and stop the SOSC operation. For details on the settings for SOSC operations, see **Section 12AB.4.2.7, SOSCE — SubOSC Enable Register**. When the IP0\_0/XT2 pin is used for the SubOSC (SOSC) not as an input port, set the IIBC0.0 bit to 0.

## 2B.11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

### 2B.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

#### 2B.11.1.1 P8\_6: RESETOUT

The P8\_6 pin ( RESETOUT signal) changes PM8.PM8\_6 and PODC8.PODC8\_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8\_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.

(Case 1): OPBT0.RESETOUTEN = 1

- P8.P8\_6 = 0: Outputs low level
- PM8.PM8\_6 = 0: Output mode
- PODC8.PODC8\_6 = 1: Open-drain

(Case 2): OPBT0.RESETOUTEN = 0

- P8.P8\_6 = 0: Outputs low level
- PM8.PM8\_6 = 1: Input mode
- PODC8.PODC8\_6 = 0: Push-pull

For detail of OPBT0.RESETOUTEN register, see **Section 44.9.2, OPBT0 — Option Byte 0**, also see **Section 9BC.1.3, Reset Output ( RESETOUT )**.

When the P8\_6 pin setting is updated with another value, the pin operates by new setting.

Figure 2B.11 P8\_6 Pin ( $\overline{\text{RESETOUT}}$  Signal) Operation While a Reset is asserted and released:  
(Case 1) OPBT0.RESETOUTEN setting is 1

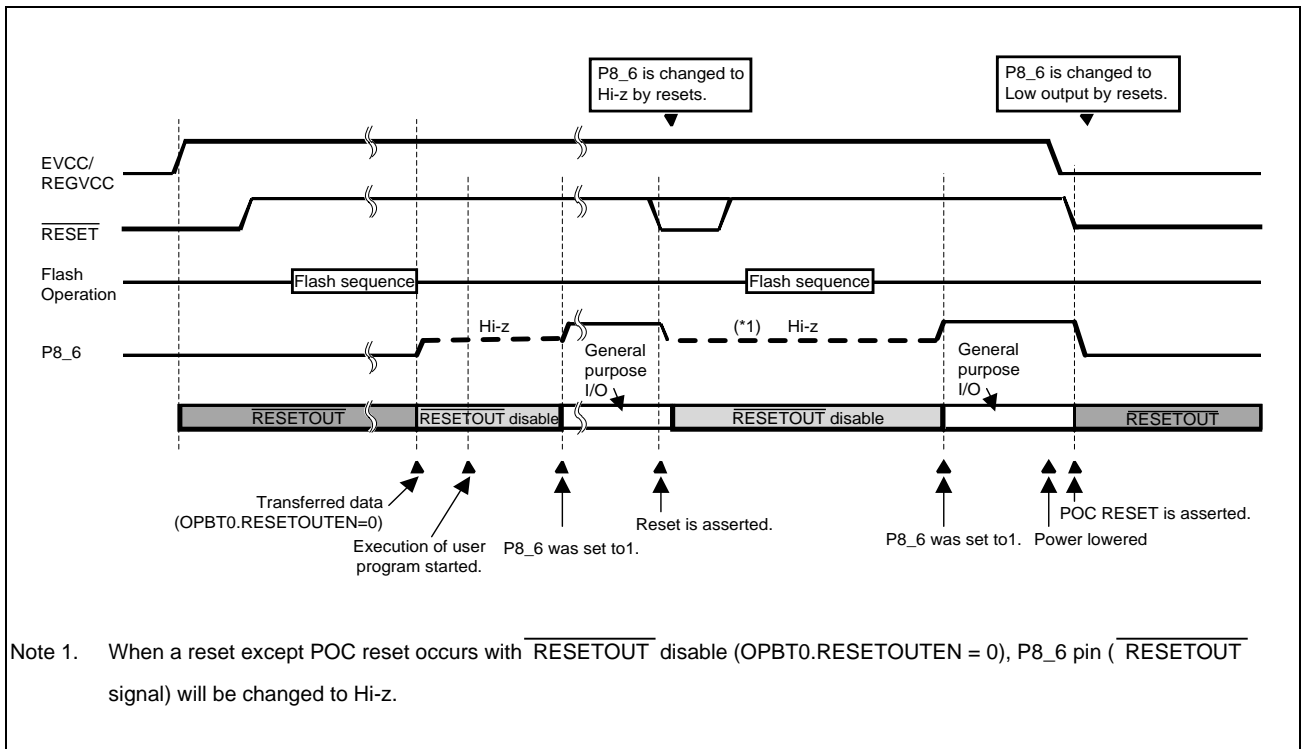

Figure 2B.12 P8\_6 Pin ( $\overline{\text{RESETOUT}}$  Signal) Operation While a Reset is asserted and released:  
(Case 2) OPBT0.RESETOUTEN setting is 0

### 2B.11.1.2 JP0\_0 to JP0\_6: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2B.89 Debug Interface

OPJTAG1	OPJTAG0	Mode	JP0_0	JP0_1	JP0_2	JP0_3	JP0_4	JP0_5	JP0_6
1	1	Nexus I/F	DCUTDI input	DCUTDO output	DCUTCK input	DCUTMS input	$\overline{\text{DCUTRST}}$ input	$\overline{\text{DCURDY}}$ output	$\overline{\text{EVTO}}$ output
0	1	LPD (4 pins)	LPDI input	LPDO output	LPDCLK input	Port/ alternative function	Port/ alternative function	LPDCLK OUT output	Port/ alternative function
1	0	LPD (1 pin)	LPDIO input/output	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function

#### NOTE

For the OPJTAG[1:0] settings, see **Section 44.9.2, OPBT0 — Option Byte 0**.

### 2B.11.1.3 FPDR(JP0\_0), FPDT(JP0\_1), FPCK(JP0\_2): Flash Programmer

These pins are used for connecting a flash programmer. See *Flash Programmer's Manual* for details.

#### 2B.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10\_8: FLMD1 pin can select serial programming mode.

The FLMD0 pin in combination with the P10\_8: FLMD1, the P10\_2: MODE1 and the P10\_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10\_8: FLMD1, the P10\_6: MODE2, the P10\_2: MODE1 and the P10\_1: MODE0 pins can select user boot mode.

For details on the mode selection, see **Section 6, Operating Mode**.

#### 2B.11.1.5 IP0\_0: XT2

This pin is the SubOSC (SOSC) input pin. When the IPIBC0\_0 bit = 1, the IP0\_0/XT2 pin is used as an input port. If you make this setting, stop SOSC operation at the same time.

## 2B.11.2 A/D Input Alternative I/O

The following ports are permanently connected to A/D input functions. (However, an analog input to the A/D is controlled by the A/D module.)

Table 2B.90 A/D Input Alternative Pins (RH850/F1KM-S4, RH850/F1KM-S2)

Port	A/D Input	Device				
		100 Pins	144 Pins	176 Pins	233 Pins*1	272 Pins*1

## 2B.11.3 Special I/O Control

### 2B.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.

The following table lists all alternative functions where PIPCN.PIPCn\_m must be set to 1.

For details, see **Section 2B.9.2.3, PIPCN — Port IP Control Register**.

Table 2B.91 Alternative Modes that Require Setting PIPCN.PIPCn\_m = 1 (RH850/F1KM-S4, RH850/F1KM-S2)

### 2B.11.3.2 Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/PISAn/JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type 1/2 or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in **Table 2B.94, JTAG Port Input Buffer Characteristics Selection (RH850/F1KM-S4, RH850/F1KM-S2)**.

Table 2B.92 Port Input Buffer Characteristics Selection (RH850/F1KM-S4)

Note 1. TTL is selected for Boundary scan mode without JPISA0 register setting.

Note 2. TTL is selected for Nexus in normal operating mode without JPISA0 register setting.

Note 3. TTL is selected for LPD (4 pins) in normal operating mode without JPISA0 register setting.

Note 4. TTL is selected for LPD (1 pin) in normal operating mode without JPISA0 register setting.

Note 5. Only available for RH850/F1KM-S4.

#### NOTES

- For the SHMT1, SHMT4 and TTL pin characteristics, see **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2**.
- For the input buffer after reset, Type 2 (SHMT4) is selected.

### 2B.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2B.95 Output Buffer Characteristics Selection (RH850/F1KM-S4, RH850/F1KM-S2)

Port Name	Output Drive Strength Selection		Device				
	Slow Mode (PDSCn_m = 0)	Fast Mode (PDSCn_m = 1)	100 Pins	144 Pins	176 Pins	233 Pins*4	272 Pins*4

Note 1. Supports Cload: 100 pF (The load capacitance of CSIH0 is 100 pF.)

Note 2. Supports Cload: 50 pF (The load capacitance of CSIH1 to CSIH3 are 50 pF.)

Note 3. In some of the functions, Fast mode or Slow mode is specified. For details, see **Section 47B.5, AC Characteristics**.

Note 4. Only available for RH850/F1KM-S4.

## 2B.12 Noise Filter & Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1KM supports both analog and digital filters.

It also supports the function for edge and level detection after the signals have passed through a filter.

The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter & edge/level detection control registers and control bits, and register addresses.

For details on the digital/analog filter function and noise filter & edge/level detection control registers, see **Section 2B.13, Description of Port Noise Filter & Edge/Level Detection.**

### NOTE

In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

### 2B.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

#### 2B.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

- Filter control register FCLA0CTLm\_<name> (m = 0 to 7)

A dedicated FCLA0CTLm\_<name> register is provided for each pin in a port that incorporates an analog filter.

Table 2B.96 Input Pins that Incorporate Analog Filter Type A (RH850/F1KM-S4, RH850/F1KM-S2)

### 2B.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm\_<name> (m = 0 to 2)  
Each port with a digital filter has a special FCLA0CTLm\_<name> register.
- Digital noise elimination control register DNFA<name>CTL  
Each DNFA<name>CTL control register controls digital filter processing for three input signals per group.
- Digital noise elimination enable register DNFA<name>EN  
The setting of the DNFA<name>ENL[2:0] bits in DNFA<name>EN enables or disables digital noise elimination for three input signals per group.

Table 2B.99 Input Pins that Incorporate Digital Filter Type D (RH850/F1KM-S4, RH850/F1KM-S2)

Note 1. Only available for RH850/F1KM-S4.

### 2B.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<name>CTL  
Each DNFA<name>CTL control register controls digital filter processing for up to 16 input signals per group.
- Digital noise elimination enable register DNFA<name>EN  
The setting of the DNFA<name>ENL[7:0] and DNFA<name>ENH[7:0] bits in DNFA<name>EN enables or disables digital noise elimination for up to 16 input signals per group.

Note 1. For the setting for TAUD edge detection, see **Section 32.3.3.4, TAUDnCMURm — TAUDn Channel Mode User Register.**

Note 2. For the setting for TAUB edge detection, see **Section 31.3.3.4, TAUBnCMURm — TAUBn Channel Mode User Register.**

Note 3. For the setting for ENCA edge detection, see **Section 35.3.3, ENCANIOC0 — ENCAN I/O Control Register 0.**

Note 4. RSENT does not have the edge detection.

Note 5. Only available for RH850/F1KM-S4.

## 2B.12.2 Clock Supply for Port Filters

The following table shows the clock supply for each filter type in each port domain.

Table 2B.101 Clock Supply for Port Filters

Peripheral Function	Port Domain*1	Filter Type	Filter Clock	Setting Register	
				Source Clock Selection	Clock Selection
ADCA0	Always-On area (AWO area)	Digital filter type D	DNFATCKI	CKSC_AADCAS_CTL	CKSC_AADCAD_CTL
ADCA1	Isolated area (ISO area)	Digital filter type D	DNFATCKI	CKSC_IADCAS_CTL	CKSC_IADCAD_CTL
TAUD0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI1S_CTL	—
TAUB0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—
TAUB1	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—
ENCA0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI1S_CTL	—
RSENTn	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—

Note 1. Power Domain

### NOTE

For the Setting Register, see **Section 12AB.4.3, Clock Selector Control Register.**

## 2B.13 Description of Port Noise Filter & Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.

### NOTE

---

In this section, *<name>* in the noise filter control register represents the peripheral function connected to a filter.

---

### 2B.13.1 Overview

#### 2B.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.  
Used for external interrupt signals.
- Type B: An analog filter  
Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.
- Type C: An analog filter only  
Used for the external RESET input and mode signals.

#### 2B.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection.  
Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function.  
Used for the timer input signals and encoder input signals.

## 2B.13.2 Analog Filters

### 2B.13.2.1 Analog Filter Characteristic

See **Section 47B, Electrical Characteristics of RH850/F1KM-S4, RH850/F1KM-S2** for the input conditions for signals input to pins that incorporate an analog filter.

### 2B.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm\_<name> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in **Table 2B.96, Input Pins that Incorporate Analog Filter Type A (RH850/F1KM-S4, RH850/F1KM-S2)**.

### 2B.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

#### (1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

Figure 2B.13 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit `FCLA0CTLm_<name>.FCLA0INTLm_<name>`.

- `FCLA0INTLm_<name>` bit = 0: Edge detection

Whether a rising or falling edge is detected can be specified by setting the `FCLA0CTLm_<name>.FCLA0INTRm_<name>` and `FCLA0CTLm_<name>.FCLA0INTFm_<name>` bits.

- `FCLA0INTLm_<name>` bit = 1: Level detection

The detection of a high level or low level can be specified by setting `FCLA0CTLm_<name>.FCLA0INTRm_<name>` bit.

The table below summarizes the detection conditions of the analog filter.

Table 2B.102 Analog Filter Event Detection Conditions

<code>FCLA0INTLm_&lt;name&gt;</code>	<code>FCLA0INTFm_&lt;name&gt;</code>	<code>FCLA0INTRm_&lt;name&gt;</code>	Edge Detection	Level Detection
0	0	0	No edge detected	Disabled
	0	1	Rising edge	
	1	0	Falling edge	
	1	1	Rising and falling edges	
1	X	0	Disabled	Low level
	X	1		High level

### Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

### (2) Analog filter type B

A block diagram of analog filter type B is shown below.

Figure 2B.14 Block Diagram of Analog Filter Type B

### Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

### (3) Analog filter type C

A block diagram of analog filter type C is shown below.

Figure 2B.15 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

#### Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2B.13.3 Digital Filters

### 2B.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.

The input signal is sampled with the sampling frequency  $f_s$ .

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFA<name>CTL.DNFA<name>PRS[2:0] select the sampling frequency based on

$$f_s = f_{\text{DNFATCKI}} / 2^{\text{DNFA<name>PRS[2:0]}}$$

where  $f_{\text{DNFATCKI}}$  is the frequency of the DNFATCKI clock.

- DNFA<name>CTL.DNFA<name>NFSTS[1:0] determines the number of same level samples, “s”, (2 to 5):

$$s = \text{DNFA<name>NFSTS[1:0]} + 2$$

External signal pulses shorter than the following are suppressed at all times.

$$s \times 1/f_s$$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$$(s + 1) \times 1/f_s$$

External signal pulses in the following range may be suppressed or judged as valid.

$$s \times 1/f_s \text{ to } (s + 1) \times 1/f_s$$

The filter operation is illustrated in the figure below with DNFA<name>NFSTS[1:0] = 01<sub>B</sub>, i.e.  $s = 3$  same level samples.

Figure 2B.16 Digital Filter Function

### 2B.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFA<name>CTL.DNFA<name>PRS[2:0] and DNFA<name>NFSTS[1:0] apply to the signals.

However, the digital filter for each signal can be enabled or disabled separately by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

#### CAUTIONS

1. When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) for the port pin to switch to the alternative function.

$$s = \text{DNFA<name>NFSTS}[1:0] + 2$$

$$s \times 1/f_s + 2 \times 1/f_{\text{DNFATCKI}}$$

2. When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.

$$s \times 1/f_s + 3 \times 1/f_{\text{DNFATCKI}}$$

### 2B.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.

Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

### 2B.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA<name>CTL and digital noise elimination enable register DNFA<name>EN are used to set all the filters in the same group (<name> = peripheral function group).

The DNFA<name>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <name>.

The DNFA<name>EN register enables/disables each filter by setting the corresponding bit in DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTLm\_ADCn registers are ordered in groups of 3 registers with the same index n. The register index n is in 0 or 1.

The assignment of the input signals to the control registers and their addresses are given in **Table 2B.99, Input Pins that Incorporate Digital Filter Type D (RH850/F1KM-S4, RH850/F1KM-S2)** and **Table 2B.100, Input Pins that Incorporate Digital Filter Type E (RH850/F1KM-S4, RH850/F1KM-S2)** in **Section 2B.12.1, Port Filter Assignment**.

#### CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1. Otherwise an unintended filter output may be generated.

#### (1) Digital filter type D

A block diagram of digital filter type D is shown below.

Figure 2B.17 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.

Table 2B.103 Output Options for Digital Filter Type D

DNFA<name>EN.DNFA<name>ENLm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

## (2) Digital filter type E

A block diagram of digital filter type E is shown below.

Figure 2B.18 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.

Table 2B.104 Output Options for Digital Filter Type E

DNFA<name>EN.DNFA<name>ENLm and DNFA<name>EN.DNFA<name>ENHm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

## 2B.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:

Table 2B.105 List of Filter Registers

Module Name	Register Name	Symbol	Address
FCLA0	Filter control register m	FCLA0CTLm_<name>	The addresses are shown in the tables in <b>Section 2B.12.1, Port Filter Assignment.</b>
DNF	Digital noise elimination control register	DNFA<name>CTL	
	Digital noise elimination enable register	DNFA<name>EN	
	Digital noise elimination enable H register	DNFA<name>ENH	
	Digital noise elimination enable L register	DNFA<name>ENL	

### 2B.13.4.1 FCLA0CTLm\_<name> — Filter Control Register

This register controls the analog and digital filter operation.

**Access:** This register can be read or written in 8-bit units.

**Address:** The allocation of input signals to FCLA0CTLm\_<name> registers and the address of each register are shown in the tables in **Section 2B.12.1, Port Filter Assignment**.

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

However, digital filter type D is placed in edge detection mode.
0	FCLA0INTRm_<name>	<ul style="list-style-type: none"> <li>In level detection mode (FCLA0INTLm_&lt;name&gt; = 1): Detected level selection 0: Low level detection 1: High level detection</li> <li>In edge detection mode (FCLA0INTLm_&lt;name&gt; = 0): Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled</li> </ul> <b>NOTE:</b> This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.

#### CAUTION

Digital filter type D: Always set bit 2 to "0".

### 2B.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.

#### NOTE

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 8-bit units.

**Address:** For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see **Table 2B.99, Input Pins that Incorporate Digital Filter Type D (RH850/F1KM-S4, RH850/F1KM-S2)** and **Table 2B.100, Input Pins that Incorporate Digital Filter Type E (RH850/F1KM-S4, RH850/F1KM-S2)** in **Section 2B.12.1, Port Filter Assignment**.

### 2B.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.

#### NOTE

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 16-bit units.

The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

**Address:** For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see **Table 2B.99, Input Pins that Incorporate Digital Filter Type D (RH850/F1KM-S4, RH850/F1KM-S2)** and **Table 2B.100, Input Pins that Incorporate Digital Filter Type E (RH850/F1KM-S4, RH850/F1KM-S2)** in **Section 2B.12.1, Port Filter Assignment**.

**Value after reset:** 0000<sub>H</sub>

#### 2B.13.4.4 DNFA<name>ENH – Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>EN register.

##### NOTE

This register is only valid for digital filter type E.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see **Table 2B.100, Input Pins that Incorporate Digital Filter Type E (RH850/F1KM-S4, RH850/F1KM-S2)** in **Section 2B.12.1, Port Filter Assignment**.

**Value after reset:** 00<sub>H</sub>

For details of the respective bit functions, see **Section 2B.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register**.

#### 2B.13.4.5 DNFA<name>ENL – Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>EN register.

##### NOTE

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see **Table 2B.99, Input Pins that Incorporate Digital Filter Type D (RH850/F1KM-S4, RH850/F1KM-S2)** and **Table 2B.100, Input Pins that Incorporate Digital Filter Type E (RH850/F1KM-S4, RH850/F1KM-S2)** in **Section 2B.12.1, Port Filter Assignment**.

## 2C.2 Pin Description

Table 2C.5 Pin Functions

Pin Name	No. of Pins				IO	Pin Function	Unit
	48 Pins	64 Pins	80 Pins	100 Pins			
A0VREF	✓	✓	✓	✓	—	ADCA <sub>n</sub> voltage supply and reference voltage	ADCA <sub>n</sub>
A0VSS	✓	✓	✓	✓	—	ADCA <sub>n</sub> ground	
ADCA0Im	✓	✓	✓	✓	I	ADCA0 input channel m with 12-bit resolution	
	m = 0 to 7	m = 0 to 9	m = 0 to 10	m = 0 to 15			
ADCA0ImS	✓	✓	✓	✓	I	ADCA0 input channel m with 10-bit resolution	
	m = 0 to 3	m = 0 to 10	m = 0 to 13	m = 0 to 19			
ADCA0SELY	✓	✓	✓	✓	O	External MPX selection pin y for ADCA0 input	
	y = 0 to 2	y = 0 to 2	y = 0 to 2	y = 0 to 2			
ADCA0TRGy	✓	✓	✓	✓	I	ADCA0 external trigger pin y	
	y = 0 to 2	y = 0 to 2	y = 0 to 2	y = 0 to 2			
AP0_m	✓	✓	✓	✓	IO	Analog port 0_m	Port
	m = 0 to 7	m = 0 to 9	m = 0 to 10	m = 0 to 15			
APO	✓	✓	✓	✓	O	Port output signal for analog input	LPS0
AWOVCL	✓	✓	✓	✓	—	Voltage regulator for Always-On area (AWO area) capacitor connection	Power
AWOVSS	✓	✓	✓	✓	—	Internal logic for Always-On area (AWO area) ground	
CANzRX	✓	✓	✓	✓	I	CANz receive data input	RCFDC <sub>n</sub>
	z = 0	z = 0 to 2	z = 0 to 2	z = 0 to 5			
CANzTX	✓	✓	✓	✓	O	CANz transmit data output	
	z = 0	z = 0 to 2	z = 0 to 2	z = 0 to 5			
CSCXFOUT	✓	✓	✓	✓	O	Clock output	Clock
CSIG0RYI	✓	✓	✓	✓	I	CSIG <sub>n</sub> ready (1) / busy (0) input signal	CSIG <sub>n</sub>
CSIG0RYO	✓	✓	✓	✓	O	CSIG <sub>n</sub> ready (1) / busy (0) output signal	
CSIG0SC	✓	✓	✓	✓	IO	CSIG <sub>n</sub> serial clock signal	
CSIG0SI	✓	✓	✓	✓	I	CSIG <sub>n</sub> serial data input	
CSIG0SO	✓	✓	✓	✓	O	CSIG <sub>n</sub> serial data output	
CSIG0SSI	✓	✓	✓	✓	I	CSIG <sub>n</sub> SS function control input signal	
CSIHnCSS0	✓	✓	✓	✓	O	CSIH <sub>n</sub> serial peripheral chip select signal 0	
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			
CSIHnCSS1	✓	✓	✓	✓	O	CSIH <sub>n</sub> serial peripheral chip select signal 1	
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			
CSIHnCSS2	—	✓	✓	✓	O	CSIH <sub>n</sub> serial peripheral chip select signal 2	
		n = 0	n = 0 to 2	n = 0 to 3			
CSIHnCSS3	—	✓	✓	✓	O	CSIH <sub>n</sub> serial peripheral chip select signal 3	
		n = 0	n = 0 to 2	n = 0 to 3			
CSIHnCSS4	—	—	✓	✓	O	CSIH <sub>n</sub> serial peripheral chip select signal 4	
			n = 0	n = 0, 1			
CSIHnCSS5	—	—	✓	✓	O	CSIH <sub>n</sub> serial peripheral chip select signal 5	
			n = 0	n = 0, 1			
CSIHnCSS6	—	—	✓	✓	O	CSIH <sub>n</sub> serial peripheral chip select signal 6	
			n = 0	n = 0			
CSIHnCSS7	—	—	✓	✓	O	CSIH <sub>n</sub> serial peripheral chip select signal 7	
			n = 0	n = 0			
CSIHnRYI	✓	✓	✓	✓	I	CSIH <sub>n</sub> ready (1) / busy (0) input signal	
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			
CSIHnRYO	✓	✓	✓	✓	O	CSIH <sub>n</sub> ready (1) / busy (0) output signal	
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			
CSIHnSC	✓	✓	✓	✓	IO	CSIH <sub>n</sub> serial clock signal	
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			

Table 2C.5 Pin Functions

Pin Name	No. of Pins				IO	Pin Function	Unit
	48 Pins	64 Pins	80 Pins	100 Pins			
CSIHnSI	✓	✓	✓	✓	I	CSIHn serial data input	CSIHn
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			
CSIHnSO	✓	✓	✓	✓	O	CSIHn serial data output	
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			
CSIHnSSI	✓	✓	✓	✓	I	CSIHn slave select input signal	
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			
DCURDY	✓	✓	✓	✓	O	Debug ready	OCD
DCUTCK	✓	✓	✓	✓	I	Debug clock	
DCUTDI	✓	✓	✓	✓	I	Debug data input	
DCUTDO	✓	✓	✓	✓	O	Debug data output	
DCUTMS	✓	✓	✓	✓	I	Debug mode select	
DCUTRST	✓	✓	✓	✓	I	Debug reset	
DPINm	✓	✓	✓	✓	I	Digital port input m	
	m = 0 to 2	m = 0 to 4, 8 to 10	m = 0 to 11	m = 0 to 16			
DPO	✓	✓	✓	✓	O	Port output signal for digital input	
ENCA0TINm	✓	✓	✓	✓	I	ENCA0 capture trigger input m	ENCAn
	m = 0, 1	m = 0, 1	m = 0, 1	m = 0, 1			
ENCA0EC	✓	✓	✓	✓	I	ENCA0 encoder clear input	
ENCA0E0	✓	✓	✓	✓	I	ENCA0 encoder input 0	
ENCA0E1	✓	✓	✓	✓	I	ENCA0 encoder input 1	
EVCC	✓	✓	✓	✓	—	Port buffer voltage supply	Power
EVSS	✓	✓	✓	✓	—	Port buffer ground	
FLMD0	✓	✓	✓	✓	I	Operating mode select pin 0	Mode
FLMD1	✓	✓	✓	✓	I	Operating mode select pin 1	
FPDR	✓	✓	✓	✓	I	Serial Communication Interface RXD	FLASH
FPDT	✓	✓	✓	✓	O	Serial Communication Interface TXD	
FPCK	✓	✓	✓	✓	I	Serial Communication Interface clock	
INTPm	✓	✓	✓	✓	I	External interrupt input m	INTC
	m = 0 to 5, 10, 11	m = 0 to 5, 10, 11	m = 0 to 8, 10 to 12	m = 0 to 8, 10 to 13			
ISOVCL	✓	✓	✓	✓	—	Voltage regulator for Isolated area (ISO area) capacitor connection	Power
ISOVSS	✓	✓	✓	✓	—	Internal logic for Isolated area (ISO area) ground	
JP0_m	✓	✓	✓	✓	IO	JTAG port 0_m	JTAG
	m = 0 to 5	m = 0 to 5	m = 0 to 5	m = 0 to 5			
KR0Im	✓	✓	✓	✓	I	KR0 key input signal	KRn
	m = 0 to 5	m = 0 to 7	m = 0 to 7	m = 0 to 7			
LPDCLK	✓	✓	✓	✓	I	LPD clock input (4-pin mode)	LPD
LPDCLKOUT	✓	✓	✓	✓	O	LPD clock output (4-pin mode)	
LPDI	✓	✓	✓	✓	I	LPD data input (4-pin mode)	
LPDIO	✓	✓	✓	✓	IO	LPD data input / output (1-pin mode)	
LPDO	✓	✓	✓	✓	O	LPD data output (4-pin mode)	
MODEm	✓	✓	✓	✓	I	Sub operating mode select (Boundary scan)	
	m = 0 to 2	m = 0 to 2	m = 0 to 2	m = 0 to 2			
NMI	✓	✓	✓	✓	I	External non-maskable interrupt input	INTC
P0_m	✓	✓	✓	✓	IO	Port 0_m	Port
	m = 0 to 3	m = 0 to 6	m = 0 to 12	m = 0 to 14			
P8_m	✓	✓	✓	✓	IO	Port 8_m	
	m = 0 to 1	m = 0 to 6	m = 0 to 6	m = 0 to 12			
P9_m	✓	✓	✓	✓	IO	Port 9_m	
	m = 0 to 1	m = 0 to 3	m = 0 to 6	m = 0 to 6			

Table 2C.5 Pin Functions

Pin Name	No. of Pins				IO	Pin Function	Unit
	48 Pins	64 Pins	80 Pins	100 Pins			
P10_m	✓	✓	✓	✓	IO	Port 10_m	Port
	m = 0 to 10	m = 0 to 14	m = 0 to 15	m = 0 to 15			
P11_m	—	—	✓	✓	IO	Port 11_m	
			m = 0 to 4	m = 0 to 7			
PWGAnO	✓	✓	✓	✓	O	PWGAn output signal	PWGAn
	n = 0 to 12	n = 0 to 23	m = 0 to 23	n = 0 to 47			
REGVCC	✓	✓	✓	✓	—	Voltage regulators voltage supply	Power
RESET	✓	✓	✓	✓	I	External reset input	Reset
RESETOUT	—	✓	✓	✓	O	Reset output	
RIICnSCL	✓	✓	✓	✓	IO	RIICn serial clock	RIICn
	n = 0 to 1	n = 0 to 1	n = 0 to 1	n = 0 to 1			
RIICnSDA	✓	✓	✓	✓	IO	RIICn serial data	
	n = 0 to 1	n = 0 to 1	n = 0 to 1	n = 0 to 1			
RLIN2mRX	✓	✓	✓	✓	I	RLIN2m receive data input	RLIN24n
	m = 0 to 1	m = 0 to 1	m = 0 to 1	m = 0 to 2			
RLIN2mTX	✓	✓	✓	✓	O	RLIN2m transmit data output	
	m = 0 to 1	m = 0 to 1	m = 0 to 1	m = 0 to 2			
RLIN3nRX	✓	✓	✓	✓	I	RLIN3n receive data input	RLIN3n
	n = 0	n = 0 to 1	n = 0 to 2	n = 0 to 3			
RLIN3nTX	✓	✓	✓	✓	O	RLIN3n transmit data output	
	n = 0	n = 0 to 1	n = 0 to 2	n = 0 to 3			
SENTnRX	✓	✓	✓	✓	I	SENT data input	RSENTn
	n = 0 to 1	n = 0 to 1	n = 0 to 1	n = 0 to 1			
SENTnSPCO	✓	✓	✓	✓	O	SENT SPC extension output	
	n = 0 to 1	n = 0 to 1	n = 0 to 1	n = 0 to 1			
RTCA0OUT	✓	✓	✓	✓	O	RTCA0 1Hz output	RTCA0n
SELDPk	—	✓	✓	✓	O	External multiplexer selection output signal k for digital port	LPS0
		k = 0 to 2	k = 0 to 2	k = 0 to 2			
TAPA0ESO	✓	✓	✓	✓	I	Hi-Z control	TAPAn
TAPA0UN	✓	✓	✓	✓	O	Motor control output U phase (negative)	
TAPA0UP	✓	✓	✓	✓	O	Motor control output U phase (positive)	
TAPA0VN	✓	✓	✓	✓	O	Motor control output V phase (negative)	
TAPA0VP	✓	✓	✓	✓	O	Motor control output V phase (positive)	
TAPA0WN	✓	✓	✓	✓	O	Motor control output W phase (negative)	
TAPA0WP	✓	✓	✓	✓	O	Motor control output W phase (positive)	
TAUD0Im	✓	✓	✓	✓	I	TAUD0 channel input m	TAUDn
	m = 0 to 15	m = 0 to 15	m = 0 to 15	m = 0 to 15			
TAUD0Om	✓	✓	✓	✓	O	TAUD0 channel output m	
	m = 0 to 15	m = 0 to 15	m = 0 to 15	m = 0 to 15			
TAUB0Im	—	—	✓	✓	I	TAUBn channel input m	TAUBn
			m = 0 to 15	m = 0 to 15			
TAUB0Om	—	—	✓	✓	O	TAUBn channel output m	
			m = 0 to 15	m = 0 to 15			

Table 2C.5 Pin Functions

Pin Name	No. of Pins				IO	Pin Function	Unit
	48 Pins	64 Pins	80 Pins	100 Pins			
TAUJnIm	✓	✓	✓	✓	I	TAUJn channel input m	TAUJn
	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3			
TAUJnOm	✓	✓	✓	✓	O	TAUJn channel output m	
	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3			
X1, X2	✓	✓	✓	✓	—	MainOSC connections	MOSC

**CAUTION**

When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.

- (e.g.) When RS-CANFD channel 0 is used:

CAN0TX P0\_0 P10\_1

CAN0RX P0\_1 P10\_0

Use one of the following pin combinations:

- P0\_0 and P0\_1, or
- P10\_0 and P10\_1.

The combinations of P0\_0 and P10\_0, and P0\_1 and P10\_1 are not allowed.

## 2C.3 Pin Functions During and After Reset

Table 2C.6 Pin Functions During and After Reset

Pins	During Reset	After Reset
JP0_0	High impedance	JP0_0: High impedance Serial programming mode: FPDR, FPDT (1 wire UART) FPDR (2 wire UART) Nexus I/F: DCUTDI input LPD (4 pins): LPDI input LPD (1 pin): LPDIO input/output
JP0_1	High impedance	JP0_1: High impedance Serial programming mode: FPDT Nexus I/F: DCUTDO output LPD (4 pins): LPDO output LPD (1 pin): High impedance
JP0_2	High impedance	JP0_2: High impedance Serial programming mode: FPCK Nexus I/F: DCUTCK input LPD (4 pins): LPDCLK input LPD (1 pin): High impedance
JP0_3	High impedance	JP0_3: High impedance Serial programming mode: High impedance Nexus I/F: DCUTMS input LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_4	Input*3,*5	JP0_4: High impedance Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCUTRST}}$ input*1 LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_5	High impedance	JP0_5: High impedance Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCURDY}}$ output LPD (4 pins): LPDCLKOUT output LPD (1 pin): High impedance
P8_6	Output*2 *4	Output (OPBT0.RESETOUTEN = 1)*2 High impedance (OPBT0.RESETOUTEN = 0)*2, *4
P0, P8 to 11 (except P8_6, P10_1, P10_2, P10_6 and P10_8)	High impedance	High impedance
P10_1	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE0 input (FLMD0 = 1, FLMD1 = 1)
P10_2	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE1 input (FLMD0 = 1, FLMD1 = 1)
P10_6	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 1) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0) MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1)
P10_8	High impedance	High impedance (FLMD0 = 0) FLMD1 input (FLMD0 = 1)
FLMD0	Input	Input
$\overline{\text{RESET}}$	Input	Input
AP0	High impedance	High impedance

- Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low level.
- Note 2.  $\overline{\text{RESETOUT}}$  is output. For details, see **Section 2C.11, Port (Special I/O) Function Overview**.
- Note 3. When the power is turned on or when  $\overline{\text{RESET}}$  is low level, JP0\_4 pin should be driven low level.
- Note 4. If OPBT0.RESETOUTEN = 0, P8\_6 pin status has a possibility to become unstable (less than 15  $\mu\text{s}$ ) at the transition moment to reset status by internal reset factors.
- Note 5. When  $\overline{\text{RESET}}$  is low level, on-chip pull-down resistor is connected to JP0\_4.

## 2C.4 Port State in Standby Mode

For the port state in standby mode, see **Section 14.1.4, I/O Buffer Control**.

## 2C.5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.

Table 2C.7 Recommended Connection of Unused Pins

Pin	Recommended Connection of Unused Pins
A0VREF	Connected to EVCC
A0VSS	Connected to EVSS
$\overline{\text{RESET}}$	Connected to EVCC via a resistor
X1	Connected to AWOVSS via a resistor
X2	Open
JP0 (excluding JP0_4) P0 P8 (excluding P8_6) P9	Input: Open (when the PIBCn_m and PMCN_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCN_m bits are 1) Output: Open
P8_6	Input: Open (when the PIBCn_m and PMCN_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCN_m bits are 1) Output: Open
JP0_4	Connected to EVSS via a resistor
P10 (excluding P10_1, P10_2, P10_6, P10_8) P11	Input: Open (when the PIBCn_m and PMCN_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCN_m bits are 1) Output: Open
P10_1, P10_2, P10_6, P10_8	Input: Open (when the PIBCn_m and PMCN_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCN_m bits are 1) Output: Open
AP0	Input: Open (when the PIBCn_m bit is 0) Connected to A0VREF or A0VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
Nexus/LPD I/F (JP0)	DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor DCUTDO/LPDO (JP0_1): Open DCUTCK/LPDCLK (JP0_2): Open DCUTMS (JP0_3): Connected to EVCC via a resistor $\overline{\text{DCUTRST}}$ (JP0_4): Connected to EVSS via a resistor*1 $\overline{\text{DCURDY}}$ /LPDCLKOUT (JP0_5): Open

Note 1. For in case when a debugging interface is used, this pin should be connected to EVCC through resistor depending on the development tool made by a third party.

## 2C.6 Features of RH850/F1KM Port

### 2C.6.1 Port Group

The RH850/F1KM provides the following port groups, indicated by the numbers in the table below.

Table 2C.8 Port Groups in RH850/F1KM-S1

No. of Pins	Port Group	RH850/F1KM-S1
48 pins	Number	6
	Name	P0, P8 to P10, JP0, AP0
64 pins	Number	6
	Name	P0, P8 to P10, JP0, AP0
80 pins	Number	7
	Name	P0, P8 to P11, JP0, AP0
100 pins	Number	7
	Name	P0, P8 to P11, JP0, AP0

### 2C.6.2 Port Group Index n

Throughout this section, the port groups are identified by using the index “n”. For example, the port mode control register of the Pn pin is PMCN (n = 0, and 8 to 11).

### 2C.6.3 Register Base Addresses

Port and JTAG port base addresses are listed in the following table.

Port and JTAG port register addresses are given as offsets from the base addresses.

Table 2C.9 Register Base Addresses

Base Address Name	Base Address
<PORTn_base>	FFC1 0000 <sub>H</sub>
<JPORT0_base>	FFC2 0000 <sub>H</sub>

### 2C.6.4 Clock Supply

The clock supply to ports is shown in the following table.

Table 2C.10 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Port	Register access clock	CPUCLK_UL

## 2C.7 Port Functions

This product has various pins for input/output ports. The ports are organized in port groups.

The RH850/F1KM also has several control registers to enable pins to be used as other than general-purpose input/output pins.

For a description of the terms pin, port, and port group, see **Section 2C.7.2, Terms**.

### 2C.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16.
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.

**Table 2C.39, JTAG Port 0 (JP0), Table 2C.41, Port 0 (P0), Table 2C.43, Port 8 (P8), Table 2C.45, Port 9 (P9), Table 2C.47, Port 10 (P10), Table 2C.49, Port 11 (P11), Table 2C.51, Analog Port 0 (AP0) and Section 2C.9.2, Pin Function Configuration.**

#### CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

[Example]

INTP0 is assigned to the following pins on this device. However, the INTP0 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- JP0\_0 (1st input alternative function)
- P0\_1 (2nd, 3rd input alternative function)
- P10\_0 (2nd input alternative function)

In the above case, when the 1st input alternative function (INTP0) of JP0\_0 is selected, using the 2nd input alternative function (CAN0RX/INTP0) of P0\_1 only for the CAN signal is also prohibited.

## 2C.7.2 Terms

The following terms are used in this section:

### Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.

A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

### Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

### Port mode and ports

A pin in port mode works as a general-purpose input/output pin. It is then called “port”.

The corresponding name is Pn\_m. For example, P0\_7 denotes port 7 of port group 0. It is referenced as “port P0\_7”.

### Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0\_0 and INTP0. The different names indicate the function of the pin at that time.

### 2C.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging.

JTAG port group registers and bit names are prefixed by a “J”. For example, JP0 denotes JTAG port group 0, and JPM0.JPM0\_m denotes the JPM0\_m port mode bit of the JPM0 port mode register.

#### NOTE

---

In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

---

### 2C.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMn.PMn\_m bit = 0)

A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn\_m bit.

- Software I/O control alternative mode (PMn.PMn\_m bit = 1, PIPn.PIPn\_m bit = 0)

In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn\_m bit.

- Direct I/O control alternative mode (PMn.PMn\_m bit = 1, PIPn.PIPn\_m bit = 1)

In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.

Table 2C.11 Pin Function Configuration (Overview)

Mode	Bit			I/O
	PMn_m	PMn_m	PIPn_m	
Port mode	0	0	X	O
		1 <sup>*1</sup>		I
Software I/O control alternative mode	1	0	0	O
		1	0	I
Direct I/O control alternative mode		X	1	Controlled by the alternative function

Note 1. The input buffer must be enabled (PIPn\_m bit = 1).

- Software I/O control alternative mode (PIPn.PIPn\_m bit = 0)
  - Output (PMn\_m bit = 0): Alternative output mode 1 to Alternative output mode 7
  - Input (PMn\_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPn.PIPn\_m bit = 1)
  - The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2C.12 Alternative Mode Selection Overview (PMCn.PMCn\_m Bit = 1)

Mode	Register					I/O	
	PIPC* <sup>1</sup>	PM* <sup>1</sup>	PFCAE	PFCE	PFC		
Alternative output mode 1 (ALT-OUT1)	0	0	0	0	0	O	
Alternative input mode 1 (ALT-IN1)		1				I	
Alternative output mode 2 (ALT-OUT2)		0				1	O
Alternative input mode 2 (ALT-IN2)		1					I
Alternative output mode 3 (ALT-OUT3)		0			1	0	O
Alternative input mode 3 (ALT-IN3)		1					I
Alternative output mode 4 (ALT-OUT4)		0			1	1	O
Alternative input mode 4 (ALT-IN4)		1					I
Alternative output mode 5 (ALT-OUT5)		0	1	0	0	O	
Alternative input mode 5 (ALT-IN5)		1				I	
Alternative output mode 6 (ALT-OUT6)		0			1	O	
Alternative input mode 6 (ALT-IN6)		1				I	
Alternative output mode 7 (ALT-OUT7)		0			1	0	O
Alternative input mode 7 (ALT-IN7)		1					I
Other than the above	Setting prohibited						

Note 1. If PIPCN.PIPCN\_m bit = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

If a pin is in alternative mode (PMCn.PMCn\_m bit = 1), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

## 2C.7.4 Pin Data Input/Output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

### 2C.7.4.1 Output Data

In the port mode (PMcn.PMCn\_m bit = 0), the value of the Pn.Pn\_m bit is output from the Pn\_m pin.

### 2C.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn\_m pin, the value of the Pn.Pn\_m bit, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits. The different PPRn read modes are shown in the table below.

Table 2C.13 PPRn\_m Read Values

PMC n_m	PM n_m	PIBC n_m	PIPC n_m	PODC n_m	Mode	PPRn_m Read Value
0	1	0	X	X	Port input, input buffer disabled	Pn.Pn_m bit
		1		X	Port input, input buffer enabled	Pn_m pin
	0	X		0	Port push-pull output	Pn.Pn_m bit*1
				1	Port open-drain output	
1	1	X	0	X	Software I/O control alternative input	Pn_m pin
				0	Software I/O control alternative push-pull output	Output signal from the alternative function*1
				1	Software I/O control alternative open-drain output	
	X		1	0	Direct I/O control alternative input or push-pull output	I/O port in alternative mode: • Input: Pn_m pin
				1	Direct I/O control alternative input or open-drain output	• Output: Output signal from the alternative function*1

Note 1. When PBDCn\_m = 1, the level of the Pn\_m pin is returned by the PPRn\_m bit.

The control registers in the above table have the following effects:

- PMcn.PMCn\_m bit

This bit selects port mode (PMcn\_m = 0) or alternative mode (PMcn\_m = 1).

- PMn.PMn\_m bit

This bit selects input (PMn\_m = 1) or output (PMn\_m = 0) when the port mode (PMcn\_m = 0) and software I/O control alternative mode (PMcn\_m = 1, PIPcn\_m = 0) have been selected.

- PIBcn.PIBcn\_m bit

This bit disables (PIBcn\_m = 0) or enables (PIBcn\_m = 1) the input buffer in input port mode (PMcn\_m = 0 and PMn\_m = 1). If the input buffer is disabled, PPRn\_m reads the Pn.Pn\_m bit; otherwise the Pn\_m pin level is returned.

- PIPcn.PIPcn\_m bit

This bit selects software I/O control alternative mode or direct I/O control alternative mode.

- **PODCn.PODCn\_m** bit

This bit selects push-pull output (PODCn\_m = 0) or open-drain output (PODCn\_m = 1).

- **PBDCn.PBDCn\_m** bit

In output mode, when this bit is set to 1, the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn\_m pin can be read from PPRn.PPRn\_m.

### CAUTION

When using Pn\_m as an alternative output function (PMc.PMc\_m bit = 1, PMn.PMn\_m bit = 0), the level of the Pn\_m pin can be read at the PPRn.PPRn\_m bit by enabling bidirectional mode (PBDCn.PBDCn\_m bit = 1).

Note, however, that the level of the Pn\_m pin will be input to the alternative input function that the Pn\_m pin is being used as.

#### 2C.7.4.3 Writing to the Pn Register

The data to be output via port Pn\_m in port mode (PMc.PMc\_m bit = 0) is held in port register Pn. Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.

In this case, new data can be written directly to the Pn register.

- By performing an indirect bitwise operation (a “set”, “reset”, or “not” operation) on the Pn register.

An indirect bitwise operation (“set”, “reset”, or “not”) can be performed on the Pn register by using the following two registers:

- Port Set/Reset register PSRn

If the PSRn.PSRn (m + 16) bit = 1, the value of the Pn.Pn\_m bit is determined by the value of the PSRn.PSRn\_m bit.

In other words, the Pn\_m bit can be set or reset without writing directly to the Pn register.

- Port NOT register PNOTn

By setting PNOTn.PNOTn\_m bit to 1, the Pn.Pn\_m bit can be inverted without writing directly to the Pn register.

An indirect bitwise operation on the Pn register (“set”, “reset”, or “not”) has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

### 2C.8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

Figure 2C.5 Schematic View of Port Control

**CAUTION**

Use documented alternative functions only. The behavior and performance are not guaranteed when undocumented alternative functions are selected.

## 2C.9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

- **Section 2C.9.2, Pin Function Configuration**
- **Section 2C.9.3, Pin Data Input/Output**
- **Section 2C.9.4, Configuration of Electrical Characteristics**

### 2C.9.1 Overview

The following registers are used for setting the individual pins of the port groups.

For details on <PORTn\_base> and <JPORT0\_base>, see **Section 2C.6.3, Register Base Addresses**.

Table 2C.14 Port Group Configuration Registers

Module Name	Register Name	Symbol	Address
Pin function configuration			
PORT	Port mode control register	PMCn	<PORTn_base> + 0400 <sub>H</sub> + n × 4
JTAG		JPMC0	<JPORT0_base> + 0040 <sub>H</sub>
PORT	Port mode control set/reset register	PMCSRn	<PORTn_base> + 0900 <sub>H</sub> + n × 4
JTAG		JPMCSR0	<JPORT0_base> + 0090 <sub>H</sub>
PORT	Port IP control register	PIPCn	<PORTn_base> + 4200 <sub>H</sub> + n × 4
PORT	Port mode register	PMn	<PORTn_base> + 0300 <sub>H</sub> + n × 4

## Index n

In **Table 2C.14, Port Group Configuration Registers**, the index “n” in register symbols denotes the actual indices of the individual port groups. For example, PMCN generically indicates a port mode control register for port group n (Pn). The values for n differ according to the number of pins on the device in the way shown in **Table 2C.15, Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols**.

Table 2C.15 Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols

Number of Pins on the Device	Port Groups	Values for “n”
48 pins	P0, P8, P9, P10	0, 8, 9, 10
	AP0	0
64 pins	P0, P8, P9, P10	0, 8, 9, 10
	AP0	0
80 pins	P0, P8, P9, P10, P11	0, 8, 9, 10, 11
	AP0	0
100 pins	P0, P8, P9, P10, P11	0, 8, 9, 10, 11
	AP0	0

**JTAG port registers**

JTAG port registers are not explicitly described in the following register descriptions.

All descriptions (except for those of the PFCAEn register and PIPCn register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

**Value after reset**

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

## 2C.9.2 Pin Function Configuration

### 2C.9.2.1 PMCn / JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

**Access:** PMCn: This register can be read or written in 16-bit units.

JPMC0: This register can be read or written in 8-bit units.

**Address:** PMCn: <PORTn\_base> + 0400<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

JPMC0: <JPORT0\_base> + 0040<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMC n_15	PMC n_14	PMC n_13	PMC n_12	PMC n_11	PMC n_10	PMC n_9	PMC n_8	PMC n_7	PMC n_6	PMC n_5	PMC n_4	PMC n_3	PMC n_2	PMC n_1	PMC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).**

Table 2C.16 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

#### CAUTIONS

- I/O is not controlled by only setting alternative mode (PMCn.PMCn\_m bit = 1). If the alternative function requires direct I/O control, also set the PIPn.PIPn\_m bit to 1.
- If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLm\_<name>, DNFA<name>CTL and the DNFA<name>EN register. For details, see **Section 2C.12, Noise Filter & Edge/Level Detector**, and **Section 2C.13, Description of Port Noise Filter & Edge/Level Detection**.

#### NOTE

The control bits of the JTAG port mode control register (JPMC0) are JPMC0\_[7:0].

### 2C.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn\_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

**Access:** PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>. Reading bits 15 to 0 returns the value of register PMCn.

JPMCSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000<sub>H</sub>. Reading bits 7 to 0 returns the value of register JPMCO.

**Address:** PMCSRn: <PORTn\_base> + 0900<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

JPMCSR0: <JPORT0\_base> + 0090<sub>H</sub>\*1

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).**

Table 2C.17 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m. 0: PMCn_m is not affected by PMCSRn_m. 1: PMCn_m is PMCSRn_m.  Example: If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15.
15 to 0	PMCSRn_[15:0]	Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1. 0: PMCn_m is 0. 1: PMCn_m is 1.

#### NOTE

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0\_[31:0].

### 2C.9.2.3 PIPCN — Port IP Control Register

This register specifies whether the I/O direction of the Pn\_m pin is controlled by the port mode register PMn.PMn\_m or by an alternative function.

If the Pn\_m pin is operated in alternative mode (PMcn.PMCn\_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCN.PIPCn\_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn\_m setting.

Regarding the alternative functions for which the PIPC register must be set, see **Section 2C.11, Port (Special I/O) Function Overview**.

**Access:** This register can be read or written in 16-bit units.

**Address:** PIPCN: <PORTn\_base> + 4200H + n × 4 (n = 0, 10, 11) \*1

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPC n_15	PIPC n_14	PIPC n_13	PIPC n_12	PIPC n_11	PIPC n_10	PIPC n_9	PIPC n_8	PIPC n_7	PIPC n_6	PIPC n_5	PIPC n_4	PIPC n_3	PIPC n_2	PIPC n_1	PIPC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.42, Control Registers (P0)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.18 PIPCN Register Contents

Bit Position	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specifies the I/O mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

### 2C.9.2.4 PMn / APMn / JPM0 — Port Mode Register

This register specifies whether the individual pins of the port group n are in input mode or in output mode.

**Access:** PMn, APMn: These registers can be read or written in 16-bit units.

JPM0: This register can be read or written in 8-bit units.

**Address:** PMn: <PORTn\_base> + 0300<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

APMn: <PORTn\_base> + 03C8<sub>H</sub> (n = 0)

JPM0: <JPORT0\_base> + 0030<sub>H</sub>\*1

**Value after reset:** FFFF<sub>H</sub>\*2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_15	PMn_14	PMn_13	PMn_12	PMn_11	PMn_10	PMn_9	PMn_8	PMn_7	PMn_6	PMn_5	PMn_4	PMn_3	PMn_2	PMn_1	PMn_0
Value after reset	1	1	1	1	1	1	1	1	1	1*3	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (AP0).**

Note 2. The PM8 register is as follows.  
When the OPBT0.RESETOUTEN = 1, the PM8 register is FFBF<sub>H</sub>.  
When the OPBT0.RESETOUTEN = 0, the PM8 register is FFFF<sub>H</sub>.

Note 3. The PM8\_6 bit is as follows.  
When the OPBT0.RESETOUTEN = 1, the PM8\_6 bit is 0.  
When the OPBT0.RESETOUTEN = 0, the PM8\_6 bit is 1.

Table 2C.19 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

#### NOTES

- To use a port in input port mode (PMcn.PMCn\_m = 0 and PMn.PMn\_m = 1), the input buffer must be enabled (PIBCn.PIBCn\_m = 1).
- By default, PMn.PMn\_m specifies the I/O direction in port mode (PMcn.PMCn\_m = 0) and alternative mode (PMcn.PMCn\_m=1), since PIPCn.PIPCn\_m = 0 (I/O mode is controlled by PMn.PMn\_m) after reset.
- The control bits of the analog port register (APMn) are APMn\_[15:0].
- The control bits of the JTAG port mode register (JPM0) are JPM0\_[7:0].

### 2C.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn\_m is set by the corresponding bit in the lower 16 bits of PMSRn.

**Access:** PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>.

Reading bits 15 to 0 returns the value of registers PMn and APMn.

JPMSR0: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000<sub>H</sub>. Bits 15 to 8 are read as FF<sub>H</sub>. Reading bits 7 to 0 returns the value of register JPM0.

**Address:** PMSRn: <PORTn\_base> + 0800<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

APMSRn: <PORTn\_base> + 08C8<sub>H</sub> (n = 0)

JPMSR0: <JPORT0\_base> + 0080<sub>H</sub>\*1

**Value after reset:** 0000 FFFF<sub>H</sub>\*2

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMSR n_31	PMSR n_30	PMSR n_29	PMSR n_28	PMSR n_27	PMSR n_26	PMSR n_25	PMSR n_24	PMSR n_23	PMSR n_22	PMSR n_21	PMSR n_20	PMSR n_19	PMSR n_18	PMSR n_17	PMSR n_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMSR n_15	PMSR n_14	PMSR n_13	PMSR n_12	PMSR n_11	PMSR n_10	PMSR n_9	PMSR n_8	PMSR n_7	PMSR n_6	PMSR n_5	PMSR n_4	PMSR n_3	PMSR n_2	PMSR n_1	PMSR n_0
Value after reset	1	1	1	1	1	1	1	1	1	1*	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (AP0).**

Note 2. The PMSR8 register is as follows.  
When the OPBT0.RESETOUTEN = 1, the PMSR8 register is 0000 FFBF<sub>H</sub>.  
When the OPBT0.RESETOUTEN = 0, the PMSR8 register is 0000 FFFF<sub>H</sub>.

Note 3. The PMSR8\_6 bit is as follows.  
When the OPBT0.RESETOUTEN = 1, the PMSR8\_6 bit is 0.  
When the OPBT0.RESETOUTEN = 0, the PMSR8\_6 bit is 1.

Table 2C.20 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to PMn_m. 0: PMn_m is not affected by PMSRn_m. 1: PMn_m is PMSRn_m. Example: If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15.
15 to 0	PMSRn_[15:0]	Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1. 0: PMn_m is 0. 1: PMn_m is 1.

**NOTES**

---

1. The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0\_[31:0].
  2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn\_[31:0].
-

### 2C.9.2.6 PIBCn / APIBCn / JPIBC0 — Port Input Buffer Control Register

In input port mode (PMnCn.PMCn\_m = 0 and PMn.PMn\_m = 1), this register enables the port pin's input buffer.

**Access:** PIBCn, APIBCn: These registers can be read or written in 16-bit units.

JPIBC0: This register can be read or written in 8-bit units.

**Address:** PIBCn: <PORTn\_base> + 4000<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

APIBCn: <PORTn\_base> + 40C8<sub>H</sub> (n = 0)

JPIBC0: <JPORT0\_base> + 0400<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBC n_15	PIBC n_14	PIBC n_13	PIBC n_12	PIBC n_11	PIBC n_10	PIBC n_9	PIBC n_8	PIBC n_7	PIBC n_6	PIBC n_5	PIBC n_4	PIBC n_3	PIBC n_2	PIBC n_1	PIBC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (AP0).**

Table 2C.21 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer. 0: Input buffer disabled 1: Input buffer enabled

#### NOTES

- When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
- The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0\_[7:0].

#### CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn\_m = 1).

### 2C.9.2.7 PFCn / JPFC0 — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn\_m pin. For such alternative functions, PIPn.PIPn\_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn\_m.

**Access:** PFCn: This register can be read or written in 16-bit units.

JPFC0: This register can be read or written in 8-bit units.

**Address:** PFCn: <PORTn\_base> + 0500<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

JPFC0: <JPORT0\_base> + 0050<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFC n_15	PFC n_14	PFC n_13	PFC n_12	PFC n_11	PFC n_10	PFC n_9	PFC n_8	PFC n_7	PFC n_6	PFC n_5	PFC n_4	PFC n_3	PFC n_2	PFC n_1	PFC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).**

Table 2C.22 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies the alternative function of the pin. For details, see <b>Table 2C.25, Setting Alternative Functions.</b>

#### NOTE

The control bits of the JTAG port function control register (JPFC0) are JPFC0\_[7:0].

### 2C.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn\_m pin. For such alternative functions, PIPn.PIPn\_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn\_m.

**Access:** PFCEn: This register can be read or written in 16-bit units.

JPFCE0: This register can be read or written in 8-bit units.

**Address:** PFCEn: <PORTn\_base> + 0600<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

JPFCE0: <JPORT0\_base> + 0060<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCE n_15	PFCE n_14	PFCE n_13	PFCE n_12	PFCE n_11	PFCE n_10	PFCE n_9	PFCE n_8	PFCE n_7	PFCE n_6	PFCE n_5	PFCE n_4	PFCE n_3	PFCE n_2	PFCE n_1	PFCE n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).**

Table 2C.23 PFCEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCEn_[15:0]	Specifies the alternative function of the pin. For details, see <b>Table 2C.25, Setting Alternative Functions.</b>

#### NOTE

The control bits of the JTAG port function control register (JPFCE0) are JPFCE0\_[7:0].

### 2C.9.2.9 PFCAEn — Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.

Some alternative functions directly control the I/O of the Pn\_m pin. For such alternative functions, PIPCN.PIPCn\_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn\_m.

**Access:** PFCAEn: This register can be read or written in 16-bit units.

**Address:** PFCAEn: <PORTn\_base> + 0A00H + n × 4 (n = 0, 8, 9, 10, 11)\*1

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAE n_15	PFCAE n_14	PFCAE n_13	PFCAE n_12	PFCAE n_11	PFCAE n_10	PFCAE n_9	PFCAE n_8	PFCAE n_7	PFCAE n_6	PFCAE n_5	PFCAE n_4	PFCAE n_3	PFCAE n_2	PFCAE n_1	PFCAE n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).**

Table 2C.24 PFCAEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCAEn_[15:0]	Specifies the alternative function of the pin. For details, see <b>Table 2C.25, Setting Alternative Functions.</b>

Table 2C.25 Setting Alternative Functions

PFCAEn_m	PFCEn_m	PFCn_m	PMn_m	Function
0	0	0	1	Alternative input mode 1
			0	Alternative output mode 1
		1	1	Alternative input mode 2
			0	Alternative output mode 2
	1	0	1	Alternative input mode 3
			0	Alternative output mode 3
		1	1	Alternative input mode 4
			0	Alternative output mode 4
1	0	0	1	Alternative input mode 5
			0	Alternative output mode 5
		1	1	Alternative input mode 6
			0	Alternative output mode 6
	1	0	1	Alternative input mode 7
			0	Alternative output mode 7
		1	X	Setting prohibited

**CAUTION**

---

- After selecting the alternative function by the PFCn\_m, PFCEn\_m, or PFCAEn\_m bit, set the PMCn\_m bit to "1".
  - With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited.  
For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as a pin function other than b.
- 

**NOTE**

---

For more details on the assignment of each function, see **Sections 2C.10.1, JTAG Port 0 (JP0) to 2C.10.7, Analog Port 0 (AP0)**.

---

## 2C.9.3 Pin Data Input/Output

### 2C.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn\_m pin can be read from PPRn.PPRn\_m.

**Access:** PBDCn, APBDCn: These registers can be read or written in 16-bit units.  
JPBDC0: This register can be read or written in 8-bit units.

**Address:** PBDCn: <PORTn\_base> + 4100<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)  
APBDCn: <PORTn\_base> + 41C8<sub>H</sub> (n = 0)  
JPBDC0: <JPORT0\_base> + 0410<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDC n_15	PBDC n_14	PBDC n_13	PBDC n_12	PBDC n_11	PBDC n_10	PBDC n_9	PBDC n_8	PBDC n_7	PBDC n_6	PBDC n_5	PBDC n_4	PBDC n_3	PBDC n_2	PBDC n_1	PBDC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (AP0).**

Table 2C.26 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin. 0: Bidirectional mode disabled 1: Bidirectional mode enabled

#### CAUTION

When the Pn\_m port is used for the alternative output function (PMCn.PMCn\_m = 1, PMn.PMn\_m = 0), the level of the Pn\_m pin can be read from PPRn.PPRn\_m by enabling the bidirectional mode (PBDCn.PBDCn\_m = 1).

However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn\_m, PFCEn.PFCEn\_m, and PFCAEn.PFCAEn\_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

#### NOTE

The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0\_[7:0].

### 2C.9.3.2 PPRn / APPRn / JPPR0 — Port Pin Read Register

This register reflects the actual level of the Pn\_m pin, whether it is the value of the Pn.Pn\_m bit or the level of an alternative output function.

**Access:** PPRn, APPRn: These registers are read-only registers that can be read in 16-bit units.

JPPR0: This register is a read-only register that can be read in 8-bit units.

**Address:** PPRn: <PORTn\_base> + 0200<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

APPRn: <PORTn\_base> + 02C8<sub>H</sub> (n = 0)

JPPR0: <JPORT0\_base> + 0020<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PPR n_15	PPR n_14	PPR n_13	PPR n_12	PPR n_11	PPR n_10	PPR n_9	PPR n_8	PPR n_7	PPR n_6	PPR n_5	PPR n_4	PPR n_3	PPR n_2	PPR n_1	PPR n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (AP0).**

Table 2C.27 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	The Pn_m Pin, Pn.Pn_m value or alternative function output.

#### NOTES

- For the read values of the PPRn register, see **Section 2C.7.4, Pin Data Input/Output.**
- The control bits of the JTAG port pin read register (JPPR0) are JPPR0\_[7:0].

### 2C.9.3.3 Pn / APn / JP0 — Port Register

This register holds the Pn.Pn\_m data to be output via the related Pn\_m port in output port mode (PMcn.PMCn\_m = 0 and PMn.PMn\_m = 0).

**Access:** Pn, APn: These registers can be read or written in 16-bit units.

JP0: This register can be read or written in 8-bit units.

**Address:** Pn: <PORTn\_base> + 0000H + n × 4 (n = 0, 8, 9, 10, 11)

APn: <PORTn\_base> + 00C8H (n = 0)

JP0: <JP0\_base> + 0000H\*1

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn_15	Pn_14	Pn_13	Pn_12	Pn_11	Pn_10	Pn_9	Pn_8	Pn_7	Pn_6	Pn_5	Pn_4	Pn_3	Pn_2	Pn_1	Pn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (AP0).**

Table 2C.28 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

#### NOTE

The control bits of the JTAG port register (JP0) are JP0\_[7:0].

### 2C.9.3.4 PNOTn / APNOTn / JPNOT0 — Port NOT Register

This register allows the Pn\_m bit of the port register Pn to be inverted without directly writing to Pn.

**Access:** PNOTn, APNOTn: These registers are write-only registers that can be written in 16-bit units. When read, 0000<sub>H</sub> is returned.

JPNOT0: This register is a write-only register that can be written in 8-bit units. When read, 00<sub>H</sub> is returned.

**Address:** PNOTn: <PORTn\_base> + 0700<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

APNOTn: <PORTn\_base> + 07C8<sub>H</sub> (n = 0)

JPNOT0: <JPORT0\_base> + 0070<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOT n_15	PNOT n_14	PNOT n_13	PNOT n_12	PNOT n_11	PNOT n_10	PNOT n_9	PNOT n_8	PNOT n_7	PNOT n_6	PNOT n_5	PNOT n_4	PNOT n_3	PNOT n_2	PNOT n_1	PNOT n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (AP0).**

Table 2C.29 PNOTn Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOTn_[15:0]	Specifies if Pn.Pn_m is inverted. 0: Pn.Pn_m is not inverted (Pn_m → Pn_m) 1: Pn.Pn_m is inverted ( $\overline{Pn\_m}$ → Pn_m)

#### NOTE

The control bits of the JTAG port NOT register are JPNOT0\_[7:0].

### 2C.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn\_m is set by the corresponding bit in the lower 16 bits of PSRn.

**Access:** PSRn, APSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000H. Reading bits 15 to 0 returns the value of registers Pn and APn.

JPSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000H. Reading bits 7 to 0 returns the value of register JP0.

**Address:** PSRn: <PORTn\_base> + 0100H + n × 4 (n = 0, 8, 9, 10, 11)

APSRn: <PORTn\_base> + 01C8H (n = 0)

JPSR0: <JPORT0\_base> + 0010H\*1

**Value after reset:** 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSR n_31	PSR n_30	PSR n_29	PSR n_28	PSR n_27	PSR n_26	PSR n_25	PSR n_24	PSR n_23	PSR n_22	PSR n_21	PSR n_20	PSR n_19	PSR n_18	PSR n_17	PSR n_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSR n_15	PSR n_14	PSR n_13	PSR n_12	PSR n_11	PSR n_10	PSR n_9	PSR n_8	PSR n_7	PSR n_6	PSR n_5	PSR n_4	PSR n_3	PSR n_2	PSR n_1	PSR n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (AP0).**

Table 2C.30 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to Pn_m. 0: Pn_m is not affected by PSRn_m 1: Pn_m is PSRn_m Example: If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15.
15 to 0	PSRn_[15:0]	Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1. 0: Pn_m = 0 1: Pn_m = 1

#### NOTE

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0\_[31:0].

## 2C.9.4 Configuration of Electrical Characteristics

### 2C.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

**Access:** PUn: This register can be read or written in 16-bit units.

JPU0: This register can be read or written in 8-bit units.

**Address:** PUn: <PORTn\_base> + 4300H + n × 4 (n = 0, 8, 9, 10, 11)

JPU0: <JPORT0\_base> + 0430H\*1

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PUn_15	PUn_14	PUn_13	PUn_12	PUn_11	PUn_10	PUn_9	PUn_8	PUn_7	PUn_6	PUn_5	PUn_4	PUn_3	PUn_2	PUn_1	PUn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).**

Table 2C.31 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether an internal pull-up resistor is connected to the corresponding pin. 0: No internal pull-up resistor connected 1: An internal pull-up resistor connected

#### NOTES

- If a pin is configured such that both an internal pull-up resistor (PUn.PUn\_m = 1) and pull-down resistor (PDn.PDn\_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
- The pull-up resistor has no effect when the pin is operated in output mode.
- The control bits of the JTAG pull-up option register (JPU0) are JPU0\_[7:0].

### 2C.9.4.2 PDn / JPD0 — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

**Access:** PDn: This register can be read or written in 16-bit units.

JPD0: This register can be read or written in 8-bit units.

**Address:** PDn: <PORTn\_base> + 4400<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

JPD0: <JPORT0\_base> + 0440<sub>H</sub>\*1

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).**

Table 2C.32 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether to connect an internal pull-down resistor to the corresponding pin. 0: No internal pull-down resistor connected 1: An internal pull-down resistor connected

#### NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn\_m = 1) and pull-down resistor (PDn.PDn\_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPD0) are JPD0\_[7:0].

### 2C.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Regarding the alternative functions for which the PDSC register needs to be set, see **Section 2C.11.3.3, Output Buffer Control (PDSC)**.

**Access:** PDSCn, JPDSC0: These registers can be read or written in 32-bit units.

**Address:** PDSCn: <PORTn\_base> + 4600<sub>H</sub> + n × 4 (n = 0, 10, 11)

JPDSC0: <JPORT0\_base> + 0460<sub>H</sub>\*1

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDSC n_15	PDSC n_14	PDSC n_13	PDSC n_12	PDSC n_11	PDSC n_10	PDSC n_9	PDSC n_8	PDSC n_7	PDSC n_6	PDSC n_5	PDSC n_4	PDSC n_3	PDSC n_2	PDSC n_1	PDSC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11)**.

Table 2C.33 PDSCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PDSCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. 0: Lower drive strength (when the frequency output from the pin is 10 MHz or below) 1: High drive strength (when the frequency output from the pin is 40 MHz or less).

#### NOTE

The control bits of the JTAG port drive strength control register (JPDSC0) are JPDSC0\_[31:0].

### 2C.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

**Access:** PODCn, JPODC0: These registers can be read or written in 32-bit units.

**Address:** PODCn: <PORTn\_base> + 4500<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)  
JPODC0: <JPORT0\_base> + 0450<sub>H</sub>\*1

**Value after reset:** 0000 0000<sub>H</sub>\*2

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PODC n_15	PODC n_14	PODC n_13	PODC n_12	PODC n_11	PODC n_10	PODC n_9	PODC n_8	PODC n_7	PODC n_6	PODC n_5	PODC n_4	PODC n_3	PODC n_2	PODC n_1	PODC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0*3	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11)**.

Note 2. The PODC8 register is as follows.  
When the OPBT0.RESETOUTEN = 1, the PODC8 register is 0000 0040<sub>H</sub>.  
When the OPBT0.RESETOUTEN = 0, the PODC8 register is 0000 0000<sub>H</sub>.

Note 3. The PODC8\_6 bit is as follows.  
When the OPBT0.RESETOUTEN = 1, the PODC8\_6 bit is 1.  
When the OPBT0.RESETOUTEN = 0, the PODC8\_6 bit is 0.

Table 2C.34 PODCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PODCn_[15:0]	Specifies the output buffer function. 0: Push-pull 1: Open-drain

#### NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0\_[31:0].

### 2C.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

**Access:** PISn: This register can be read or written in 16-bit units.

JPIS0: This register can be read or written in 8-bit units.

**Address:** PISn: <PORTn\_base> + 4700<sub>H</sub> + n × 4 (n = 0, 8, 9, 10, 11)

JPIS0: <JPORT0\_base> + 0470<sub>H</sub>\*1

**Value after reset:** FFFF<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIS <sub>n_15</sub>	PIS <sub>n_14</sub>	PIS <sub>n_13</sub>	PIS <sub>n_12</sub>	PIS <sub>n_11</sub>	PIS <sub>n_10</sub>	PISn_9	PISn_8	PISn_7	PISn_6	PISn_5	PISn_4	PISn_3	PISn_2	PISn_1	PISn_0
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).**

Table 2C.35 PISn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISn_[15:0]	Specifies the input buffer Characteristics: 0: Type 1 (SHMT1) 1: Type 2 (SHMT4)

#### NOTES

- Details of the definition of type 1 and type 2 are given in **Section 2C.11.3.2, Input Buffer Control (PISn/JPIS0, JPISA0)**. For details, also see **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for input buffer characteristics.
- The control bits of the JTAG port input buffer selection register (JPIS0) are JPIS0\_[7:0]

### 2C.9.4.6 JPISA0 — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

**Access:** JPISA0: This register can be read or written in 8-bit units.

**Address:** JPISA0: <JPORT0\_base> + 04A0<sub>H</sub>\*1

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	JPISA0_3	JPISA0_2	—	JPISA0_0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0)**.

Table 2C.36 JPISA0 Register Contents

Bit Position	Bit Name	Function
7 to 4, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2, 0	JPISA0_[3, 2, 0]	Specifies the input buffer characteristics: 0: Type 2 (SHMT4) 1: Type 5 (TTL)

Table 2C.37 JTAG Port Input Selection Advanced Register Contents

JPISA0	JPIS0	Function
0	0	Type 1 input buffer is selected (SHMT1)
	1	Type 2 input buffer is selected (SHMT4)
1	X	Type 5 input buffer is selected (TTL)

#### NOTE

Details of the definition of type 2 and type 5 are given in **Section 2C.11.3.2, Input Buffer Control (PISn/JPIS0, JPISA0)**. For details, also see **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for input buffer characteristics.

### 2C.9.5 Port Register Protection

RH850/F1KM has Port Protection Command Registers (PPCMDn) and Port Protection Status Registers (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see **Section 5, Write-Protected Registers**.

### 2C.9.6 Flowchart Examples for Port Settings

Examples of the port settings are shown in the flowchart below.

#### **CAUTION**

---

If the port is set to the PIPCn.PIPCn\_m bit = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCn.PMCn\_m bit is set to 1 and when the PMn.PMn\_m bit is set to 0. If an interrupt-related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

---

### 2C.9.6.1 Batch Setting

An example of specifying batch port group settings is shown in the flowchart below.

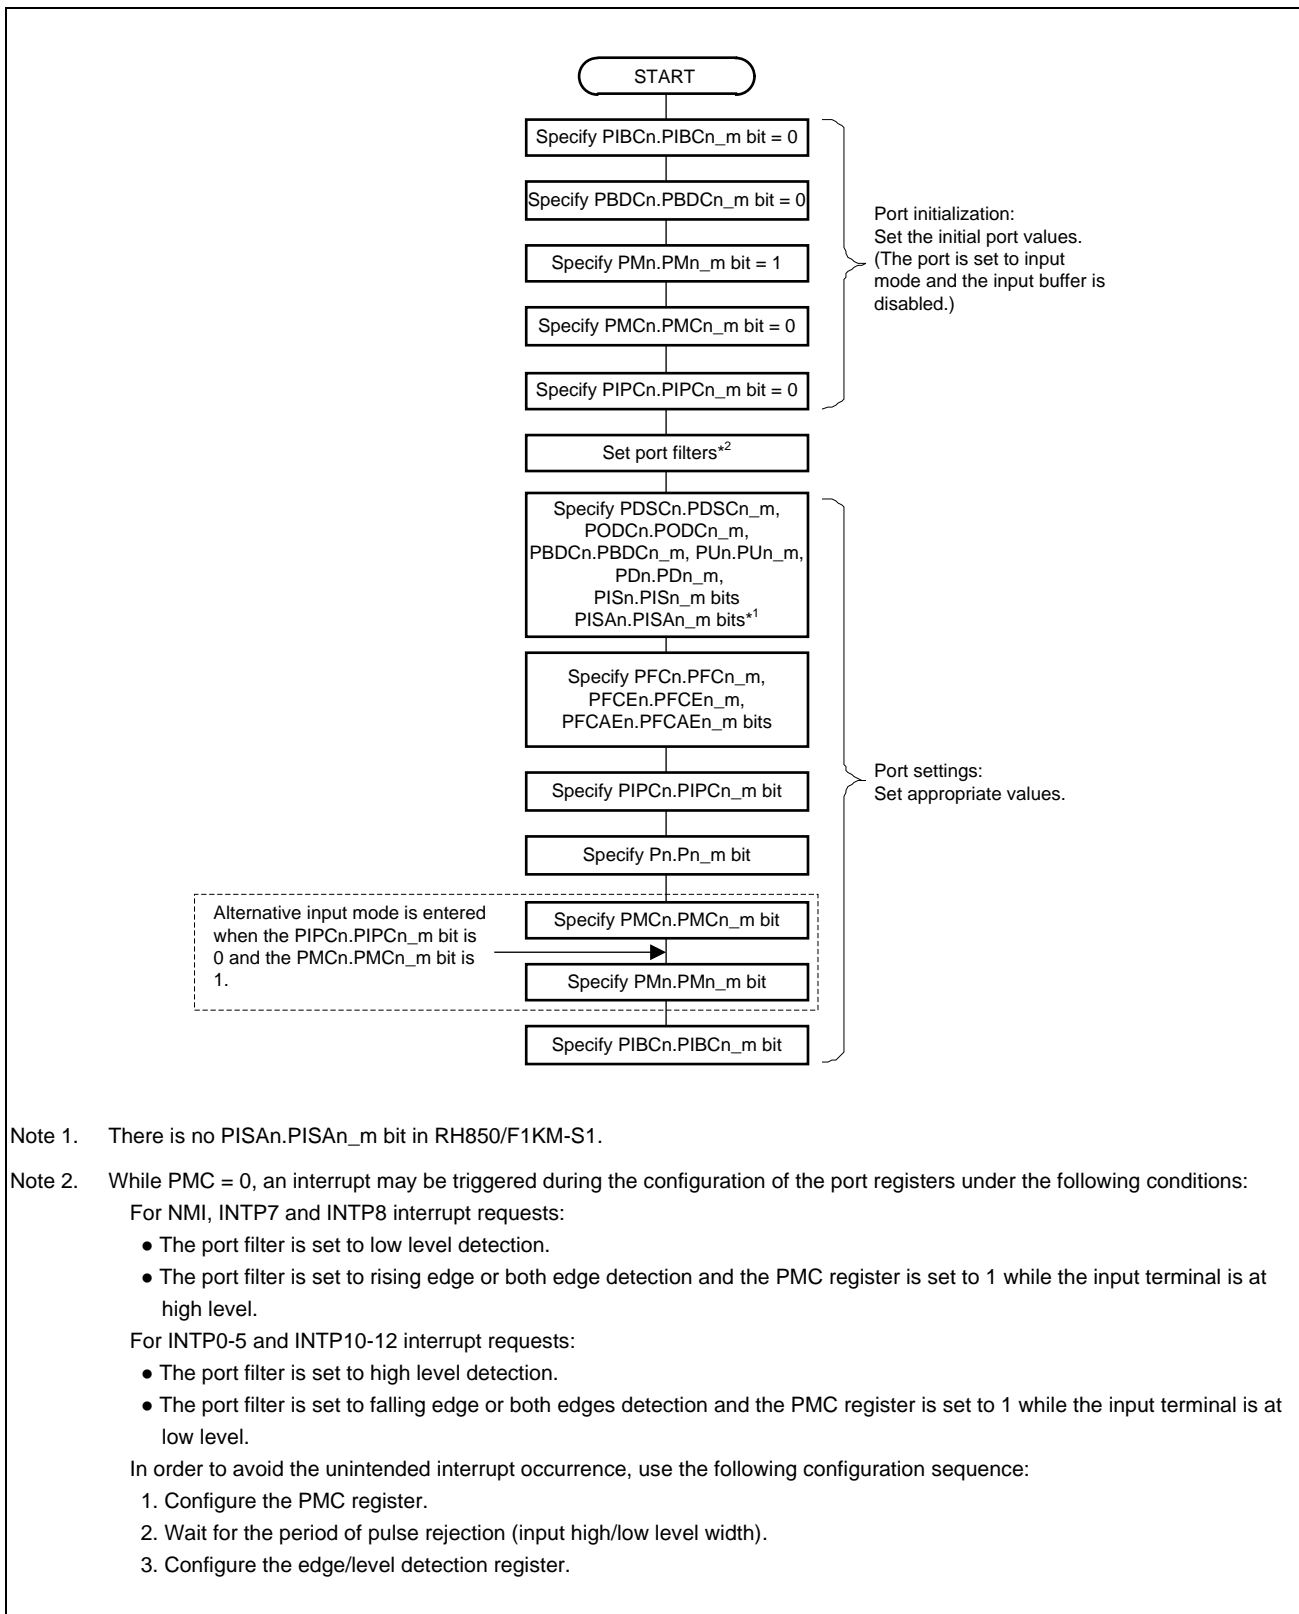

Figure 2C.6 Example of Port Settings (When Specified in Batch)

### 2C.9.6.2 Individual Settings

An example of specifying individual port settings is shown in the flowchart below.

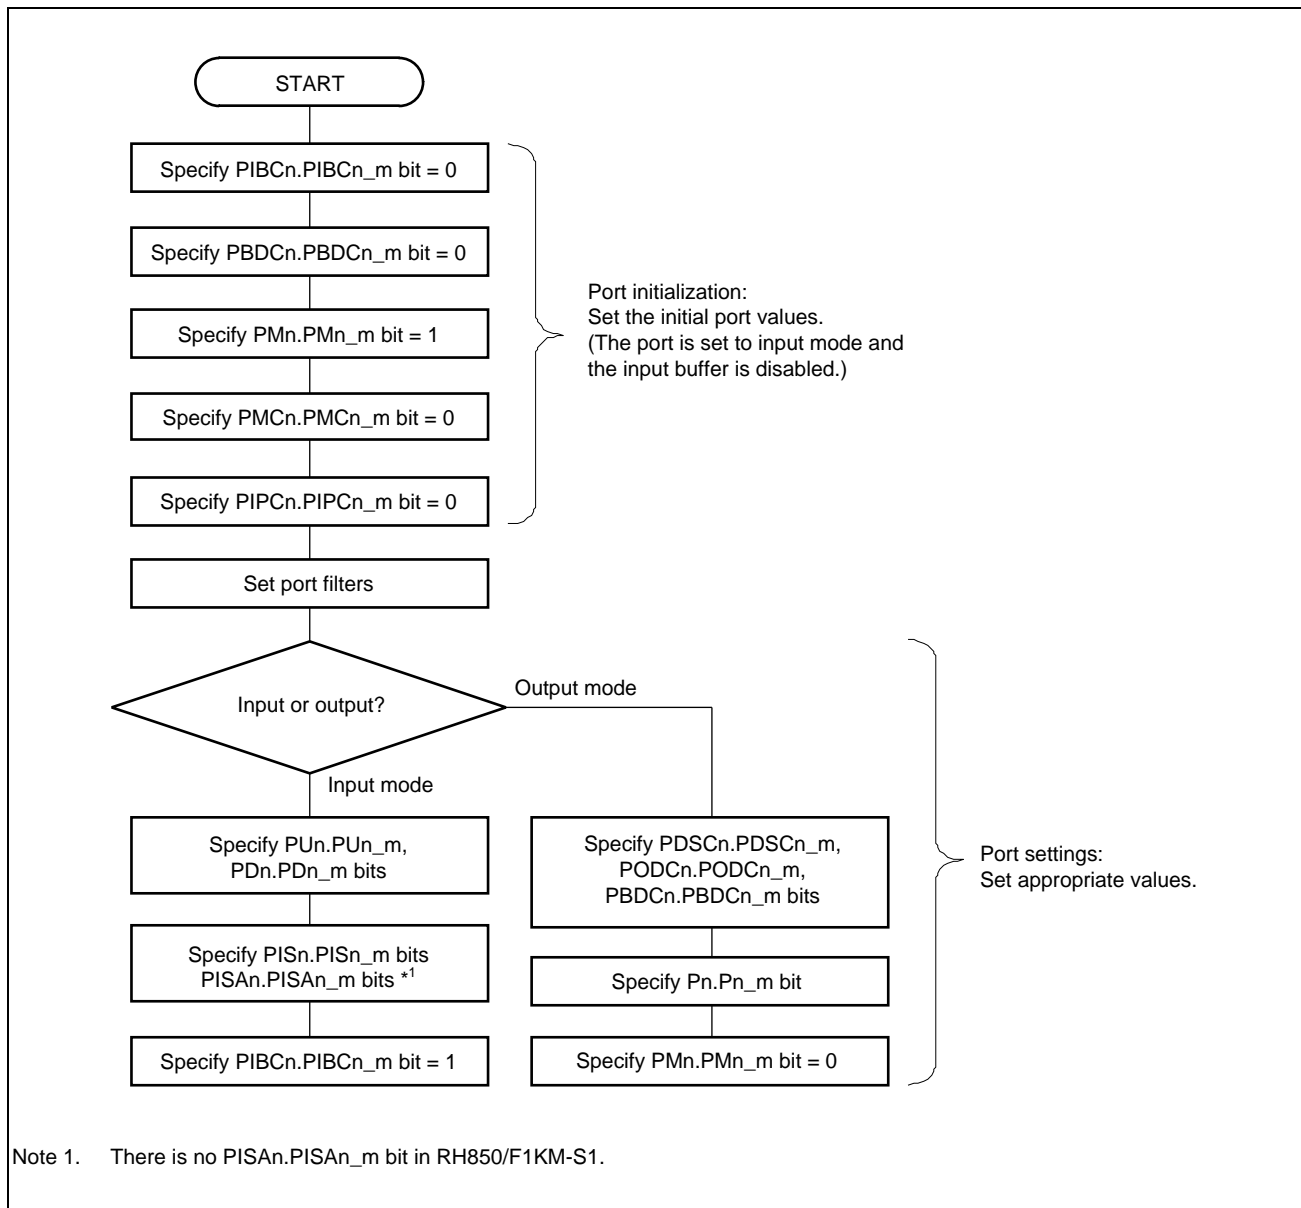

Figure 2C.7 Example of Port Settings (in Port Mode)

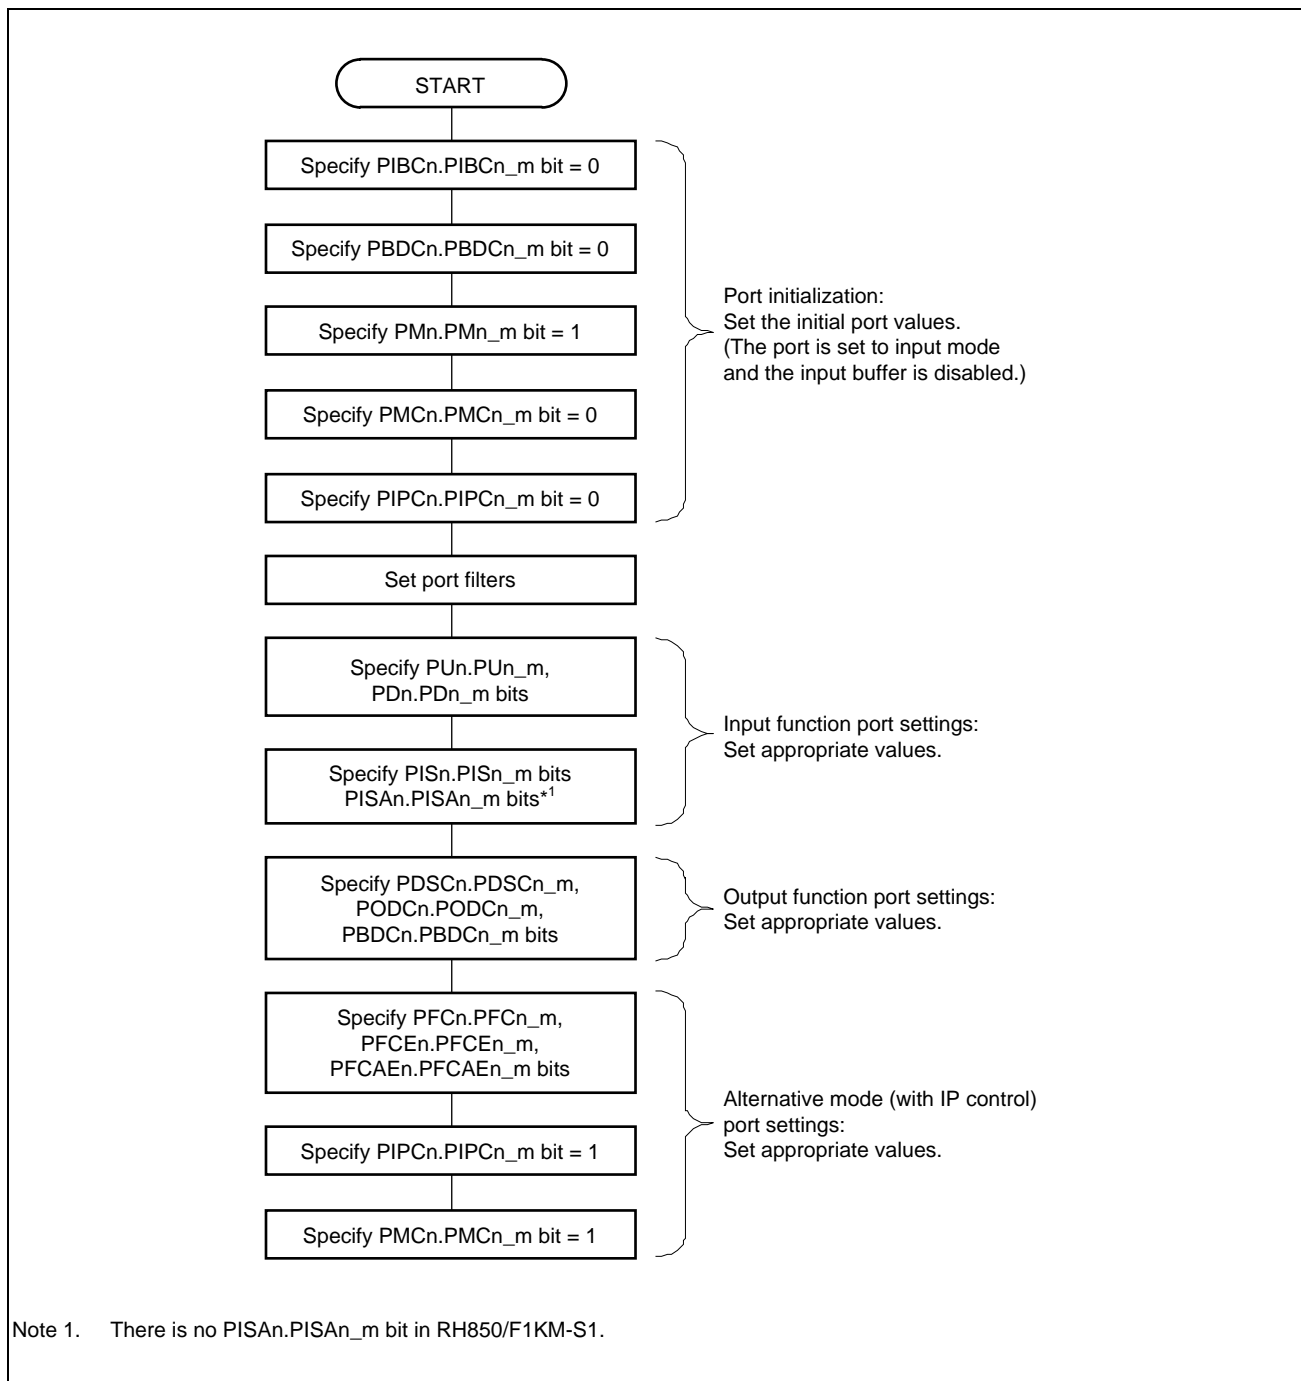

**(1) With IP Control (PIPCn.PIPCn\_m bit = 1)**

Figure 2C.8 Example of Port Settings (in Alternative Mode)

## (2) Without IP Control (PIPCn.PIPCn\_m bit = 0)

Figure 2C.9 Example of Port Settings (in Alternative Mode)

## 2C.10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCN register setting. When PMCN.PMCn\_m = 1, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2C.38 Port Function

Port	Pin Name	Size	Direction	Power Domain	Special Alternative Function	Device			
						48 Pins	64 Pins	80 Pins	100 Pins
JTAG Port 0	JP0_0 - 5	6 bits	In/Out	AWO	JTAG, LPD	✓	✓	✓	✓
Port 0	P0_0 - 3	4 bits	In/Out	AWO		✓	—	—	—
	P0_0 - 6	7 bits				—	✓	—	—
	P0_0 - 12	13 bits				—	—	✓	—
	P0_0 - 14	15 bits				—	—	—	✓
Port 8	P8_0 - 1	2 bits	In/Out	AWO	ADCA0 (10-bit resolution)	✓	—	—	—
	P8_0 - 6	7 bits				—	✓	✓	—
	P8_0 - 12	13 bits				—	—	—	✓
	P8_6	1 bit	In/Out	AWO	RESETOUT	—	✓	✓	✓
Port 9	P9_0 - 1	2 bits	In/Out	ISO	ADCA0 (10-bit resolution)	✓	—	—	—
	P9_0 - 3	4 bits				—	✓	—	—
	P9_0 - 6	7 bit				—	—	✓	✓
Port 10	P10_0 - 10	11 bits	In/Out	ISO		✓	—	—	—
	P10_0 - 14	15 bits				—	✓	—	—
	P10_0 - 15	16 bits				—	—	✓	✓
Port 11	P11_0 - 4	5 bits	In/Out	ISO		—	—	✓	—
	P11_0 - 7	8 bits				—	—	—	✓
Analog Port 0	AP0_0 - 7	8 bits	In/Out	AWO	ADCA0 (12/10-bit resolution)	✓	—	—	—
	AP0_0 - 9	10 bits				—	✓	—	—
	AP0_0 - 10	11 bits				—	—	✓	—
	AP0_0 - 15	16 bits				—	—	—	✓

## 2C.10.1 JTAG Port 0 (JP0)

### 2C.10.1.1 Alternative Function

The following alternative functions are available when JTAG port 0 is configured as a general-purpose I/O port by setting OPJTAG[1:0] on the corresponding option byte to 00<sub>B</sub>.

Table 2C.39 JTAG Port 0 (JP0)

Port Mode (JPMC0_m = 0)	Alternative Mode (JPMC0_m = 1)														ADC	Special function	PKG No.			
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative		6th Alternative		7th Alternative				48 Pins	64 Pins	80 Pins	100 Pins
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output						
JP0_0*	INTP0		TAUJ2I0	TAUJ2O0	FPDR	FPDT										DCUTDI/ LPDI/ LPDIO	15	19	23	28
JP0_1	INTP1		TAUJ0I0	TAUJ0O0		FPDT										DCUTDO/ LPDO	14	18	22	27
JP0_2	INTP2		TAUJ0I1	TAUJ0O1	FPCK											DCUTCK/ LPDCLK	13	17	21	26
JP0_3	INTP3	CSCXFOUT	TAUJ0I2	TAUJ0O2												DCUTMS	12	16	20	25
JP0_4																DCUTRST	11	15	19	24
JP0_5	NMI	RTCA0OUT	TAUJ0I3	TAUJ0O3												DCURDY / LPDCLKOUT	10	14	18	23

Note 1. In LPD (1 pin) mode, the JP0\_0 output buffer state is Open-drain.

### CAUTION

The behavior and performance are not guaranteed when alternative functions are not assigned to the register.

## 2C.10.1.2 Control Registers

Table 2C.40 Control Registers (JP0)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device			
			Position	R/W*1			48 Pins	64 Pins	80 Pins	100 Pins

---

**CAUTIONS**

---

1. The behavior and performance are not guaranteed when alternative functions are not assigned to the register.
  2. Use ADC functions with their initial settings. For details, see **Table 2C.44, Control Registers (P8)**.
  3. When the  $\overline{\text{RESETOUT}}$  function is selected for the P8\_6 pin, the P8\_6 pin outputs a low-level as the  $\overline{\text{RESETOUT}}$  signal while a reset is asserted and continues to output a low level after the reset is released. For details, see **Section 2C.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  .
-

			6-0				—	✓	✓	—
			12-0				—	—	—	✓
PPROTS8	Port protection status register 8	32	0	R	4B20 <sub>H</sub>	0000 0000 <sub>H</sub>	✓	✓	✓	✓
PPCMD8	Port protection command register 8	32	7-0	W	4C20 <sub>H</sub>	xxxx xx00 <sub>H</sub>	✓	✓	✓	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.  
When writing to unused bits, write the value after reset.

### CAUTION

P8\_6 drives a low level after any kind of reset release, until it is later configured differently by register settings. For details, see **Section 2C.11.1.1, P8\_6: RESETOUT**.

## 2C.10.4 Port 9 (P9)

### 2C.10.4.1 Alternative Function

Table 2C.45 Port 9 (P9)

#### CAUTIONS

1. The behavior and performance are not guaranteed when alternative functions are not assigned to the register.
2. Use ADC functions with their initial settings. For details, see **Table 2C.46, Control Registers (P9)**.

## 2C.10.4.2 Control Registers

			15-0				—	—	—	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.  
When writing to unused bits, write the value after reset.

## 2C.11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

### 2C.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

#### 2C.11.1.1 **P8\_6: $\overline{\text{RESETOUT}}$**

The P8\_6 pin (  $\overline{\text{RESETOUT}}$  signal) changes PM8.PM8\_6 and PODC8.PODC8\_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8\_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.

(Case 1): OPBT0.RESETOUTEN = 1

- P8.P8\_6 = 0: Outputs low level
- PM8.PM8\_6 = 0: Output mode
- PODC8.PODC8\_6 = 1: Open-drain

(Case 2): OPBT0.RESETOUTEN = 0

- P8.P8\_6 = 0: Outputs low level
- PM8.PM8\_6 = 1: Input mode
- PODC8.PODC8\_6 = 0: Push-pull

For detail of OPBT0.RESETOUTEN register, see **Section 44.9.2, OPBT0 — Option Byte 0**, also see **Section 9BC.1.3, Reset Output (  $\overline{\text{RESETOUT}}$  )**.

When the P8\_6 pin setting is updated with another value, the pin operates by new setting.

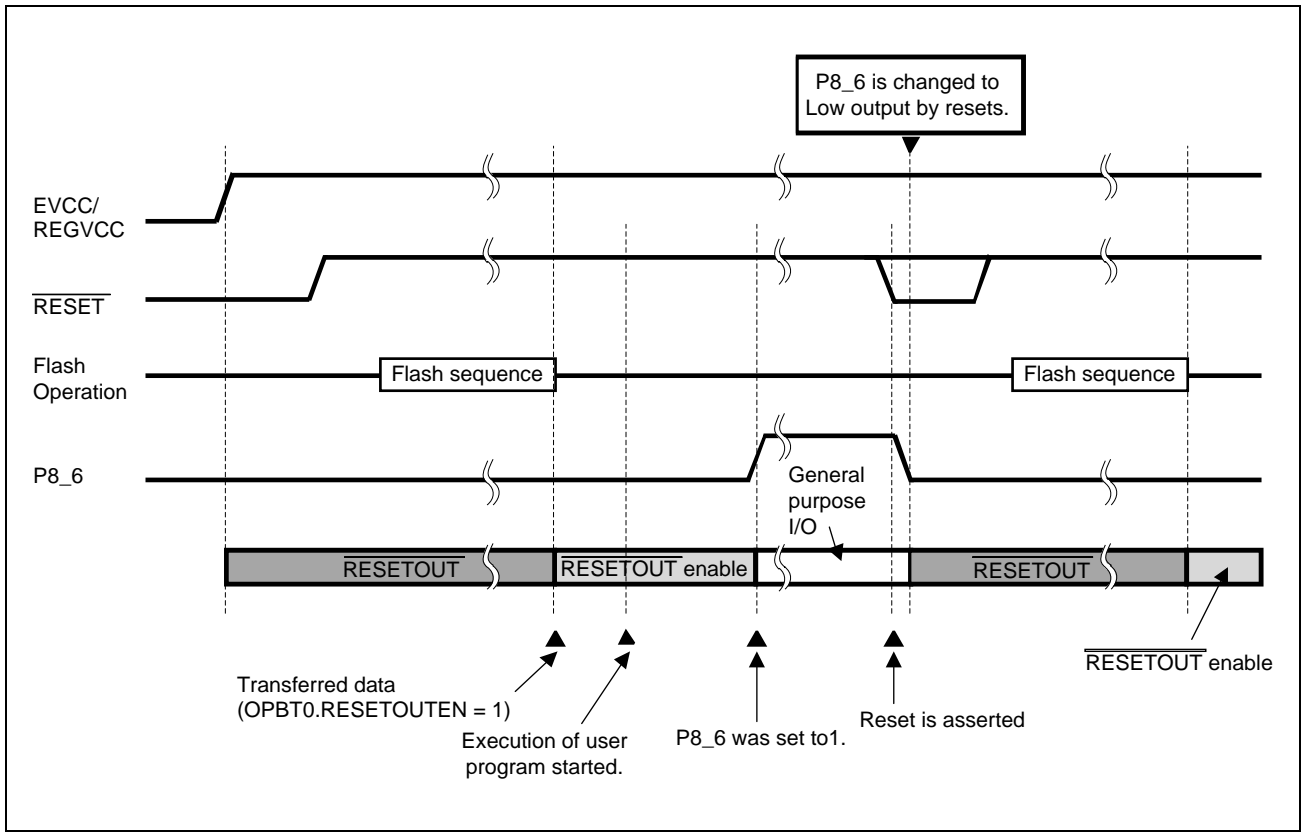

Figure 2C.10 P8\_6 Pin (  $\overline{\text{RESETOUT}}$  Signal) Operation While a Reset is asserted and released:  
 (Case 1) OPBT0.RESETOUTEN setting is 1

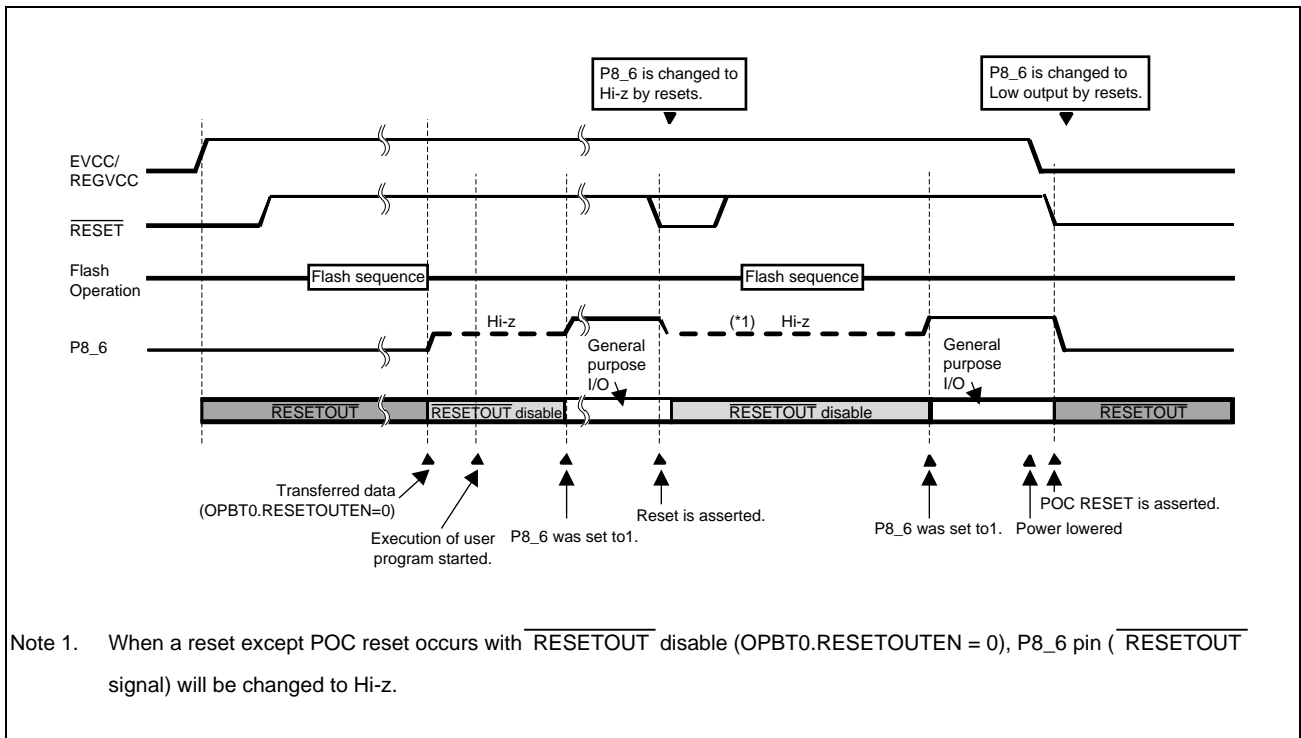

Figure 2C.11 P8\_6 Pin ( $\overline{\text{RESETOUT}}$  Signal) Operation While a Reset is asserted and released:  
(Case 2) OPBT0.RESETOUTEN setting is 0

### 2C.11.1.2 JP0\_0 to JP0\_5: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2C.53 Debug Interface

OPJTAG1	OPJTAG0	Mode	JP0_0	JP0_1	JP0_2	JP0_3	JP0_4	JP0_5
1	1	Nexus I/F	DCUTDI input	DCUTDO output	DCUTCK input	DCUTMS input	$\overline{\text{DCUTRST}}$ input	$\overline{\text{DCURDY}}$ output
0	1	LPD (4 pins)	LPDI input	LPDO output	LPDCLK input	Port/ alternative function	Port/ alternative function	LPDCLK OUT output
1	0	LPD (1 pin)	LPDIO input/output	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function

#### NOTE

For the OPJTAG[1:0] settings, see **Section 44.9.2, OPBT0 — Option Byte 0**.

### 2C.11.1.3 FPDR(JP0\_0), FPDT(JP0\_1), FPCK(JP0\_2): Flash Programmer

These pins are used for connecting a flash programmer. See *Flash Programmer's Manual* for details.

### 2C.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10\_8: FLMD1 pin can select serial programming mode.

The FLMD0 pin in combination with the P10\_8: FLMD1, the P10\_2: MODE1 and the P10\_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10\_8: FLMD1, the P10\_6: MODE2, the P10\_2: MODE1 and the P10\_1: MODE0 pins can select user boot mode.

For details on the mode selection, see **Section 6, Operating Mode**.

## 2C.11.2 A/D Input Alternative I/O

The following ports are permanently connected to A/D input functions. (However, an analog input to the A/D is controlled by the A/D module.)

Table 2C.54 A/D Input Alternative Pins

Port	A/D Input	Device			
		48 Pins	64 Pins	80 Pins	100 Pins
P8_0	ADCA0I0S	✓	✓	✓	✓

## 2C.11.3 Special I/O Control

### 2C.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.

The following table lists all alternative functions where PIPCN.PIPCn\_m must be set to 1. For details, see **Section 2C.9.2.3, PIPCN — Port IP Control Register**.

Table 2C.55 Alternative Modes that Require Setting PIPCN.PIPCn\_m = 1

Function	Alternative Functions Name	Port Name	Power Supply Area	Control	Reference Section
TAPA	TAPA0UP	P10_0	ISO	U phase Hi-Z control	<b>Section 36</b>
	TAPA0UN	P10_1	ISO		
	TAPA0VP	P10_2	ISO	V phase Hi-Z control	
	TAPA0VN	P10_3	ISO		
	TAPA0WP	P10_4	ISO	W phase Hi-Z control	
	TAPA0WN	P10_5	ISO

	CSIH3SC	P11_7	ISO	Master (1) / slave (0) mode signal	

### 2C.11.3.2 Input Buffer Control (PISn/JPIS0, JPISA0)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/ JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type 1/2 or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in **Table 2C.57, JTAG Port Input Buffer Characteristics Selection**.

Table 2C.56 Port Input Buffer Characteristics Selection

Port Name	Input Buffer Selection		Device			
	Type 1 (PISn_m = 0)	Type 2 (PISn_m = 1)	48 Pins	64 Pins	80 Pins	100 Pins

Table 2C.57 JTAG Port Input Buffer Characteristics Selection

Port Name	Input Buffer Selection			Devices			
	Type 1 (JPIS0_m = 0 & JPISA0_m = 0)	Type 2 (JPIS0_m = 1 & JPISA0_m = 0)	Type 5 (JPISA0_m = 1)	48 Pins	64 Pins	80 Pins	100 Pins
JP0_0	SHMT1	SHMT4	TTL <sup>*1,*2,*3,*4</sup>	✓	✓	✓	✓
JP0_1	SHMT1	SHMT4	—	✓	✓	✓	✓
JP0_2	SHMT1	SHMT4	TTL <sup>*1,*2,*3</sup>	✓	✓	✓	✓
JP0_3	SHMT1	SHMT4	TTL <sup>*1,*2</sup>	✓	✓	✓	✓
JP0_4	—	SHMT4	— <sup>*1,*2</sup>	✓	✓	✓	✓
JP0_5	SHMT1	SHMT4	—	✓	✓	✓	✓

Note 1. TTL is selected for Boundary scan mode without JPISA0 register setting.

Note 2. TTL is selected for Nexus in normal operating mode without JPISA0 register setting.

Note 3. TTL is selected for LPD (4 pins) in normal operating mode without JPISA0 register setting.

Note 4. TTL is selected for LPD (1 pin) in normal operating mode without JPISA0 register setting.

#### NOTES

- For the SHMT1, SHMT4, and TTL pin characteristics, see **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.
- For the input buffer after reset, Type 2 (SHMT4) is selected.

### 2C.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2C.58 Output Buffer Characteristics Selection

Port Name	Output Drive Strength Selection		Device			
	Slow Mode (PDSCn_m = 0)	Fast Mode (PDSCn_m = 1)	48 Pins	64 Pins	80 Pins	100 Pins
JP0_1	10 MHz	40 MHz	✓	✓	✓	✓
JP0_2	10 MHz	40 MHz	✓	✓	✓	✓

P11_7	10 MHz	40 MHz*2	—	—	—	✓

Note 1. Supports Cload: 100 pF (The load capacitance of CSIH0 is 100 pF.)

Note 2. Supports Cload: 50 pF (The load capacitance of CSIH1 to CSIH3 are 50 pF.)

Note 3. In some of the functions, Fast mode or Slow mode is specified. For details, see **Section 47C.5, AC Characteristics**.

## 2C.12 Noise Filter & Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1KM supports both analog and digital filters.

It also supports the function for edge and level detection after the signals have passed through a filter.

The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter & edge/level detection control registers and control bits, and register addresses.

For details on the digital/analog filter function and noise filter & edge/level detection control registers, see **Section 2C.13, Description of Port Noise Filter & Edge/Level Detection.**

### NOTE

In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

### 2C.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

#### 2C.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

Filter control register FCLA0CTLm\_<name> (m = 0 to 7)

A dedicated FCLA0CTLm\_<name> register is provided for each pin in a port that incorporates an analog filter.

Table 2C.59 Input Pins that Incorporate Analog Filter Type A

Module Name	Input Pin	FCLA0CTL Register Configuration		Device			
		Register	Address	48 Pins	64 Pins	80 Pins	100 Pins
FCLA0	NMI	FCLA0CTL0_NMI	FFC3 4000 <sub>H</sub>	✓	✓	✓	✓
	INTP0	FCLA0CTL0_INTPL	FFC3 4020 <sub>H</sub>	✓	✓	✓	✓
	INTP1	FCLA0CTL1_INTPL	FFC3 4024 <sub>H</sub>	✓	✓	✓	✓

DCUTRST

### 2C.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm\_<name> (m = 0 to 2)

Each port with a digital filter has a special FCLA0CTLm\_<name> register.

- Digital noise elimination control register DNFA<name>CTL

Each DNFA<name>CTL control register controls digital filter processing for three input signals per group.

- Digital noise elimination enable register DNFA<name>EN

The setting of the DNFA<name>ENL[2:0] bits in DNFA<name>EN enables or disables digital noise elimination for three input signals per group.

Table 2C.62 Input Pins that Incorporate Digital Filter Type D

Input Pin	Device				Digital Noise Elimination Control Register		Digital Noise Elimination Enable Register			Filter Control Register	
	48 Pins	64 Pins	80 Pins	100 Pins	Control Register	Address	Control Register	Control Bit	Address	Control Register	Address

ADCA0TRG2	✓	✓	✓	✓				DNFAADCTL0 ENL2		FCLA0CTL2 _ADC0	FFC3 4068 <sub>H</sub>

### 2C.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<name>CTL

Each DNFA<name>CTL control register controls digital filter processing for up to 16 input signals per group.

- Digital noise elimination enable register DNFA<name>EN

The setting of the DNFA<name>ENL[7:0] and DNFA<name>ENH[7:0] bits in DNFA<name>EN enables or disables digital noise elimination for up to 16 input signals per group.

Table 2C.63 Input Pins that Incorporate Digital Filter Type E

Note 2. For the setting for TAUB edge detection, see **Section 31.3.3.4, TAUBnCMURm — TAUBn Channel Mode User Register.**

Note 3. For the setting for ENCA edge detection, see **Section 35.3.3, ENCA<sub>n</sub>IOC0 — ENCA<sub>n</sub> I/O Control Register 0.**

Note 4. RSENT does not have the edge detection.

## 2C.12.2 Clock Supply for Port Filters

The following table shows the clock supply for each filter type in each port domain.

Table 2C.64 Clock Supply for Port Filters

Peripheral Function	Port Domain*1	Filter Type	Filter Clock	Setting Register	
				Source Clock Selection	Clock Selection
ADCA0	Always-On area (AWO area)	Digital filter type D	DNFATCKI	CKSC_AADCAS_CTL	CKSC_AADCAD_CTL
TAUD0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI1S_CTL	—
TAUB0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—
ENCA0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI1S_CTL	—
RSENTn	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—

Note 1. Power Domain

### NOTE

For the Setting Register, see **Section 12C.4.3, Clock Selector Control Register**.

## 2C.13 Description of Port Noise Filter & Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.

### NOTE

---

In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

---

### 2C.13.1 Overview

#### 2C.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.

Used for external interrupt signals.

- Type B: An analog filter

Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.

- Type C: An analog filter only

Used for the external  $\overline{\text{RESET}}$  input and mode signals.

#### 2C.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection. Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function. Used for the timer input signals and encoder input signals.

## 2C.13.2 Analog Filters

### 2C.13.2.1 Analog Filter Characteristic

See **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for the input conditions for signals input to pins that incorporate an analog filter.

### 2C.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm\_<name> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in **Table 2C.59, Input Pins that Incorporate Analog Filter Type A**.

### 2C.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

#### (1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

Figure 2C.12 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLA0CTLm\_<name>.FCLA0INTLm\_<name>.

- FCLA0INTLm\_<name> bit = 0: Edge detection

Whether a rising or falling edge is detected can be specified by setting the FCLA0CTLm\_<name>.FCLA0INTRm\_<name> and FCLA0CTLm\_<name>.FCLA0INTFm\_<name> bits.

- FCLA0INTLm\_<name> bit = 1: Level detection

The detection of a high level or low level can be specified by setting FCLA0CTLm\_<name>.FCLA0INTRm\_<name> bit.

The table below summarizes the detection conditions of the analog filter.

Table 2C.65 Analog Filter Event Detection Conditions

FCLA0INTLm_<name>	FCLA0INTFm_<name>	FCLA0INTRm_<name>	Edge Detection	Level Detection
0	0	0	No edge detected	Disabled
	0	1	Rising edge	
	1	0	Falling edge	
	1	1	Rising and falling edges	
1	X	0	Disabled	Low level
	X	1		High level

### Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

### (2) Analog filter type B

A block diagram of analog filter type B is shown below.

Figure 2C.13 Block Diagram of Analog Filter Type B

### Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

### (3) Analog filter type C

A block diagram of analog filter type C is shown below.

Figure 2C.14 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

#### Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2C.13.3 Digital Filters

### 2C.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.

The input signal is sampled with the sampling frequency  $f_s$ .

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFA<name>CTL.DNFA<name>PRS[2:0] select the sampling frequency based on

$$f_s = f_{\text{DNFATCKI}} / 2^{\text{DNFA<name>PRS[2:0]}}$$

where  $f_{\text{DNFATCKI}}$  is the frequency of the DNFATCKI clock.

- DNFA<name>CTL.DNFA<name>NFSTS[1:0] determines the number of same level samples, “s”, (2 to 5):

$$s = \text{DNFA<name>NFSTS[1:0]} + 2$$

External signal pulses shorter than the following are suppressed at all times.

$$s \times 1/f_s$$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$$(s + 1) \times 1/f_s$$

External signal pulses in the following range may be suppressed or judged as valid.

$$s \times 1/f_s \text{ to } (s + 1) \times 1/f_s$$

The filter operation is illustrated in the figure below with DNFA<name>NFSTS[1:0] = 01<sub>B</sub>, i.e. s = 3 same level samples.

Figure 2C.15 Digital Filter Function

### 2C.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFA<name>CTL.DNFA<name>PRS[2:0] and DNFA<name>NFSTS[1:0] apply to the signals.

However, the digital filter for each signal can be enabled or disabled separately by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

#### CAUTIONS

1. When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) for the port pin to switch to the alternative function.  

$$s = \text{DNFA}\langle\text{name}\rangle\text{NFSTS}[1:0] + 2$$

$$s \times 1/f_s + 2 \times 1/f_{\text{DNFATCKI}}$$
2. When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.  

$$s \times 1/f_s + 3 \times 1/f_{\text{DNFATCKI}}$$

### 2C.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.

Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

### 2C.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA<name>CTL and digital noise elimination enable register DNFA<name>EN are used to set all the filters in the same group (<name> = peripheral function group).

The DNFA<name>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <name>.

The DNFA<name>EN register enables/disables each filter by setting the corresponding bit in DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTLm\_ADCn registers are ordered in groups of 3 registers with the same index n. The register index n is in 0 or 1.

The assignment of the input signals to the control registers and their addresses are given in **Table 2C.62, Input Pins that Incorporate Digital Filter Type D** and **Table 2C.63, Input Pins that Incorporate Digital Filter Type E** in **Section 2C.12.1, Port Filter Assignment**.

#### CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1. Otherwise an unintended filter output may be generated.

#### (1) Digital filter type D

A block diagram of digital filter type D is shown below.

Figure 2C.16 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.

Table 2C.66 Output Options for Digital Filter Type D

DNFA<name>EN.DNFA<name>ENLm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

## (2) Digital filter type E

A block diagram of digital filter type E is shown below.

Figure 2C.17 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.

Table 2C.67 Output Options for Digital Filter Type E

DNFA<name>EN.DNFA<name>ENLm and DNFA<name>EN.DNFA<name>ENHm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

## 2C.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:

Table 2C.68 List of Filter Registers

Module Name	Register Name	Symbol	Address
FCLA0	Filter control register m	FCLA0CTLm_<name>	The addresses are shown in the tables in <b>Section 2C.12.1, Port Filter Assignment.</b>
DNF	Digital noise elimination control register	DNFA<name>CTL	
	Digital noise elimination enable register	DNFA<name>EN	
	Digital noise elimination enable H register	DNFA<name>ENH	
	Digital noise elimination enable L register	DNFA<name>ENL	

### 2C.13.4.1 FCLA0CTLm\_<name> — Filter Control Register

This register controls the analog and digital filter operation.

**Access:** This register can be read or written in 8-bit units.

**Address:** The allocation of input signals to FCLA0CTLm\_<name> registers and the address of each register are shown in the tables in **Section 2C.12.1, Port Filter Assignment**.

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	FCLA0INTLm_<name>	FCLA0INTFm_<name>	FCLA0INTRm_<name>
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 2C.69 FCLA0CTLm\_<name> Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	FCLA0INTLm_<name>	Detection Mode Selection 0: Edge detection 1: Level detection  <b>NOTE:</b> This bit is only valid for analog filter type A.
1	FCLA0INTFm_<name>	<ul style="list-style-type: none"> <li>In level detection mode (FCLA0INTLm_&lt;name&gt; = 1): This bit has no effect.</li> <li>In edge detection mode (FCLA0INTLm_&lt;name&gt; = 0): Falling edge detection control 0: Falling edge detection disabled 1: Falling edge detection enabled</li> </ul> <b>NOTE:</b> This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.
0	FCLA0INTRm_<name>	<ul style="list-style-type: none"> <li>In level detection mode (FCLA0INTLm_&lt;name&gt; = 1): Detected level selection 0: Low level detection 1: High level detection</li> <li>In edge detection mode (FCLA0INTLm_&lt;name&gt; = 0): Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled</li> </ul> <b>NOTE:</b> This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.

#### CAUTION

Digital filter type D: Always set bit 2 to "0".

### 2C.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.

#### NOTE

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 8-bit units.

**Address:** For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see **Table 2C.62, Input Pins that Incorporate Digital Filter Type D** and **Table 2C.63, Input Pins that Incorporate Digital Filter Type E** in **Section 2C.12.1, Port Filter Assignment**.

**Value after reset:** 00<sub>H</sub>

### 2C.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.

#### NOTE

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 16-bit units.

The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

**Address:** For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see **Table 2C.62, Input Pins that Incorporate Digital Filter Type D** and **Table 2C.63, Input Pins that Incorporate Digital Filter Type E** in **Section 2C.12.1, Port Filter Assignment**.

**Value after reset:** 0000<sub>H</sub>

Bit Position	Bit Name	Function
15 to 0	DNFA<name> ENH[7:0] DNFA<name> ENL[7:0]	Digital Noise Elimination Enable/Disable Control 0: Fixed to low level 1: Input signal passed through filter

#### 2C.13.4.4 DNFA<name>ENH — Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>EN register.

##### NOTE

This register is only valid for digital filter type E.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see **Table 2C.63, Input Pins that Incorporate Digital Filter Type E in Section 2C.12.1, Port Filter Assignment.**

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	DNFA<name>ENH7	DNFA<name>ENH6	DNFA<name>ENH5	DNFA<name>ENH4	DNFA<name>ENH3	DNFA<name>ENH2	DNFA<name>ENH1	DNFA<name>ENH0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

For details of the respective bit functions, see **Section 2C.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register.**

#### 2C.13.4.5 DNFA<name>ENL — Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>EN register.

##### NOTE

This register is only valid for digital filter type D and digital filter type E.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see **Table 2C.62, Input Pins that Incorporate Digital Filter Type D** and **Table 2C.63, Input Pins that Incorporate Digital Filter Type E in Section 2C.12.1, Port Filter Assignment.**

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	DNFA<name>ENL7	DNFA<name>ENL6	DNFA<name>ENL5	DNFA<name>ENL4	DNFA<name>ENL3	DNFA<name>ENL2	DNFA<name>ENL1	DNFA<name>ENL0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

For details of the respective bit functions, see **Section 2C.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register.**

## Section 3A CPU System of RH850/F1KH-D8

### 3A.1 Overview

#### 3A.1.1 Block Configuration

Figure 3A.1, Block Configuration Diagram of the RH850/F1KH shows the block configuration diagram of RH850/F1KH.

Figure 3A.1 Block Configuration Diagram of the RH850/F1KH

**CPU1 (PE1)**

The RH850G3KH2.0 Core is used as the main CPU.

**CPU2 (PE2)**

The RH850G3KH2.0 Core is used as an enhanced performance CPU.

**Local RAM**

Each CPU has a high-speed accessible RAM

**Global RAM**

The global RAM is a large-capacity RAM for data sharing among CPUs and with DMA.

**Retention RAM**

The retention RAM is used to retain values in DeepSTOP mode. Since the continuous global RAM area is assigned for the retention RAM, the retention RAM can also serve as a global RAM for sharing data with the DMA.

**Code flash**

The code flash memory is included for program storage. It is connected with CPU1 and CPU2 via the flash interface.

**Data flash**

The data flash memory can be rewritten by the CPUs. It has a greater write endurance than the code flash memory.

**P-Bus and H-Bus**

The P-Bus connects the peripheral IPs. The P-Bus is divided into five peripheral groups, 1 to 5.

**INTC1, INTC2**

There are two interrupt controllers, INTC1 and INTC2. INTC1 is an interrupt controller exclusive to each CPU. INTC2 is a common interrupt controller that CPU1 and CPU2 share. The PE to which an interrupt request is bound can be specified by a register setting.

**DMA**

The DMA transfer module (PDMA) is included.

**Slave guard**

The slave guard is a function to prevent unauthorized access from the specific bus master, and consists of the following guard structures:

(1) PE guard (PEG)

The PE guard is a function to prevent unauthorized access to the resources (local RAM) in the PE from an external master. After reset is released, access from other than the own PE is prohibited.

(2) Internal Peripheral Guard (IPG)

The PE with system interconnects supports "Internal Peripheral Guard" (IPG) that protects the registers of peripherals against invalid accesses.

(3) Global RAM guard (GRG)

The global RAM guard is a function to prevent unauthorized access to the global RAM and retention RAM from

an external master. The global RAM is in the unprotected state (accessible from all bus master) after reset is released. For details, see **Section 40A, Functional Safety of RH850/F1KH-D8**.

(4) Peripheral guard (PBG / HBG)

The peripheral guard is a function to prevent unauthorized access to peripherals. The control registers in the peripheral circuits are protected against illegal accesses.

For details, see **Section 40A, Functional Safety of RH850/F1KH-D8**.

## 3A.2 CPU

### 3A.2.1 Core Functions

#### 3A.2.1.1 Features

**Table 3A.1, Features of the RH850G3KH2.0 Core** lists features of the RH850G3KH2.0 core.

Table 3A.1 Features of the RH850G3KH2.0 Core

Item	Feature
CPU	<ul style="list-style-type: none"> <li>• Advanced 32-bit architecture for embedded control</li> <li>• 32-bit internal data bus</li> <li>• Thirty-two 32-bit general-purpose registers               <ul style="list-style-type: none"> <li>– RISC-type instruction set</li> <li>– Long-/short-format load/store instructions</li> <li>– Three-operand instructions</li> <li>– Instruction set based on C language</li> </ul> </li> <li>• CPU operating modes               <ul style="list-style-type: none"> <li>– User mode and supervisor mode</li> </ul> </li> <li>• Address space: 4-Gbyte linear address space for both data and instructions</li> </ul>
Coprocessor	<ul style="list-style-type: none"> <li>• Floating-point operation coprocessor (FPU)               <ul style="list-style-type: none"> <li>– Supports single precision (32 bits)</li> <li>– Supports data types and exceptions conforming to IEEE754.</li> <li>– Rounding mode: Neighborhood, 0 direction, <math>+\infty</math> direction, and <math>-\infty</math> direction</li> <li>– Handling of denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754</li> </ul> </li> </ul>
Exception/Interrupt	<ul style="list-style-type: none"> <li>• 16 interrupt priority levels settable for each channel</li> <li>• Vector selection method selectable according to performance request or memory usage               <ul style="list-style-type: none"> <li>– Direct branching exception vectors</li> <li>– Indirect branching exception vectors referring to the address table</li> </ul> </li> <li>• Supports the high-speed save/return processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt</li> </ul>
Memory management	<ul style="list-style-type: none"> <li>• Memory protection function (MPU): 16 areas settable</li> </ul>
Cache	<ul style="list-style-type: none"> <li>• No cache memory is equipped.</li> </ul>

### 3A.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

#### (1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).

Table 3A.2 Program Registers

Program Register	Name	Function	Description
General-purpose registers	r0	Zero register	Always retains "0"
	r1	Assembler reserved register	Used as working register for generating addresses
	r2	Register for address and data variables (used when the real-time OS used does not use this register)	
	r3	Stack pointer (SP)	Used for generating a stack frame when a function is called
	r4	Global pointer (GP)	Used for accessing a global variable in the data area
	r5	Text pointer (TP)	Used as a register that indicates the start of the text area (area where program code is placed)
	r6 to r29	Register for address and data variables	
	r30	Element pointer (EP)	Used as a base pointer for generating addresses when accessing memory
	r31	Link pointer (LP)	Used when the compiler calls a function
Program counter	PC	Retains instruction addresses during execution of programs	

#### NOTE

For further descriptions of r1, r3 to r5, and r31 used by the assembler and/or C compiler, see the specification of each software development environment.

**(a) General-Purpose Registers**

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables. Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

## 1. r0, r3, r30

These registers are implicitly used by instructions.

r0 is a register that always retains “0”. It is used for operations that use 0 and addressing with base address being 0.

r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.

r30 is used as a base pointer when the SLD or SST instruction accesses memory.

## 2. r1, r4, r5, r31

These registers are implicitly used by the assembler and C compiler.

When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

## 3. r2

This register might be used by a real-time OS in some cases. If the real-time OS that is being used does not use r2, r2 can be used as a register for address variables or data variables.

**(b) PC — Program Counter**

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0, and branching to an odd number address is disabled.

Table 3A.3 PC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	PC31 to PC1	These bits indicate the address of the instruction being executed.	R/W	*1
0	PC0	This bit is fixed to 0. Branching to an odd number address is disabled.	R/W	0

Note 1. The value after reset differs depending on the setting value of the reset vector. For details, see **(q) RBASE — Reset Vector Base Address Register**.

## (2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and a selection ID.

Table 3A.4 Basic System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 0	EIPC	Status save registers when acknowledging EI level exception	SV
SR1, 0	EIPSW	Status save registers when acknowledging EI level exception	SV
SR2, 0	FEPC	Status save registers when acknowledging FE level exception	SV
SR3, 0	FEPSW	Status save registers when acknowledging FE level exception	SV
SR5, 0	PSW	Program status word	*1
SR6, 0	FPSR	(Refer to FPU function registers.)	CU and SV
SR7, 0	FPEPC	(Refer to FPU function registers.)	CU and SV
SR8, 0	FPST	(Refer to FPU function registers.)	CU
SR9, 0	FPCC	(Refer to FPU function registers.)	CU
SR10, 0	FPCFG	(Refer to FPU function registers.)	CU
SR11, 0	FPEC	(Refer to FPU function registers.)	CU and SV
SR13, 0	EIIC	EI level exception source register	SV
SR14, 0	FEIC	FE level exception source register	SV
SR16, 0	CTPC	CALLT execution status save register	UM
SR17, 0	CTPSW	CALLT execution status save register	UM
SR20, 0	CTBP	CALLT base pointer register	UM
SR28, 0	EIWR	EI level exception working register	SV
SR29, 0	FEWR	FE level exception working register	SV
SR0, 1	MCFG0	Machine configuration register	SV
SR2, 1	RBASE	Reset vector base address register	SV
SR3, 1	EBASE	Exception handler vector address register	SV
SR4, 1	INTBP	Base address register of the interrupt handler address table	SV
SR5, 1	MCTL	CPU control	SV
SR6, 1	PID	Processor ID register	SV
SR11, 1	SCCFG	SYSCALL operation setting register	SV
SR12, 1	SCBP	SYSCALL base pointer register	SV
SR0, 2	HTCFG0	Thread configuration register	SV
SR6, 2	MEA	Memory error address register	SV
SR7, 2	ASID	Address space ID register	SV
SR8, 2	MEI	Memory error information register	SV

Note 1. The access permission differs depending on the bit.

**(a) EIPC — Status Save Register when Acknowledging EI Level Exception**

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see “*Types of Exceptions*” in *Software Manual*).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address cannot be specified.

Table 3A.5 EIPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	EIPC31 to EIPC1	These bits indicate the PC saved when an EI level exception is acknowledged.	R/W	Undefined
0	EIPC0	This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0.	R/W	Undefined

**(b) EIPSW — Status Save Register when Acknowledging EI Level Exception**

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3A.6 EIPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an EI level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an EI level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an EI level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an EI level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an EI level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an EI level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an EI level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an EI level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an EI level exception is acknowledged.	R/W	0

**(c) FEPC — Status Save Register when Acknowledging FE Level Exception**

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see “*Types of Exceptions*” in *Software Manual*).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address cannot be specified.

Table 3A.7 FEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FEPC31 to FEPC1	These bits indicate the PC saved when an FE level exception is acknowledged.	R/W	Undefined
0	FEPC0	This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0.	R/W	Undefined

**(d) FEPSW — Status Save Register when Acknowledging FE Level Exception**

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3A.8 FEPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an FE level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an FE level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an FE level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an FE level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an FE level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an FE level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an FE level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an FE level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an FE level exception is acknowledged.	R/W	0

**(e) PSW — Program Status Word**

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by conditional instructions (Bcond, CMOV, etc.)).

**CAUTIONS**

- When the LDSR instruction is used to change the contents of bit7 to 0 in this register, the changed contents become valid immediately after completion of the LDSR instruction execution. See “APPENDIX A. Hazard Resolution Procedure for System Registers” in *Software Manual* when the content of the other bits in this register is changed.
- The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See Table 3A.9, Access Permission for PSW Register for the access permission for each bit.

Table 3A.9 Access Permission for PSW Register

Bit		Access Permission when Reading	Access Permission when Writing
30	UM	UM	SV*1
16	CU	UM	SV*1
15	EBV	UM	SV*1
7	NP	UM	SV*1
6	EP	UM	SV*1
5	ID	UM	SV*1
4	SAT	UM	UM
3	CY	UM	UM
2	OV	UM	UM
1	S	UM	UM
0	Z	UM	UM

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

Table 3A.10 PSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit indicates that the CPU is in user mode (in UM mode) 0: Supervisor mode 1: User mode	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit indicates the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor unusable exception occurs if an instruction for the coprocessor is executed or a coprocessor resource (system register) is accessed. CU bit 16: FPU	R/W	0

Table 3A.10 PSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
15	EBV	This bit indicates the reset vector and exception vector operation. See the description on RBASE ((q) <b>RBASE — Reset Vector Base Address Register</b> ) and EBASE ((r) <b>EBASE — Exception Handler Vector Address Register</b> ) in this section.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see <b>Table 7A.1, List of Exception Sources</b> . 0: The acknowledgement of FE level exception is enabled. 1: The acknowledgement of FE level exception is disabled.	R/W	0
6	EP	This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: An exception other than an interrupt is not being serviced. 1: An exception other than an interrupt is being serviced.	R/W	0
5	ID	This bit disables the acknowledgement of EI level exception. When an EI level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level exception. As for the exceptions which the ID bit disables the acknowledgment, see <b>Table 7A.1, List of Exception Sources</b> . This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. 0: EI level exception is not being processed or the section is not a critical section (after execution of EI instruction). 1: EI level exception is being processed or the section is a critical section (after execution of DI instruction).	R/W	1
4	SAT*1	This bit indicates that the operation result is saturated because the operation result of a saturated operation instruction has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1, but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. 0: Not saturated 1: Saturated	R/W	0
3	CY	This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry and borrow have not occurred. 1: Carry or borrow has occurred.	R/W	0
2	OV*1	This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred.	R/W	0
1	S*1	This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative.	R/W	0
0	Z	This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0.	R/W	0

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. The SAT flag is set to 1 only when the OV flag is set to 1 in a saturated operation.

Operation Result Status	Flag Status			Operation Result after Saturation Processing
	SAT	OV	S	
Exceeded positive maximum value	1	1	0	7FFF FFFF <sub>H</sub>
Exceeded negative maximum value	1	1	1	8000 0000 <sub>H</sub>
Positive (maximum value not exceeded)	Value prior to operation is retained.	0	0	Operation result itself
Negative (maximum value not exceeded)			1	

### (f) EIIC — EI Level Exception Source Register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

Table 3A.11 EIIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIIC31 to EIIC0	These bits store the exception source code when an EI level exception is acknowledged. The EIIC15 to EIIC0 field stores the lower 16 bits of the exception source code. The EIIC31 to EIIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

### (g) FEIC — FE Level Exception Source Register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

Table 3A.12 FEIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEIC31 to FEIC0	These bits store the exception source code when an FE level exception is acknowledged. The FEIC15 to FEIC0 field stores the lower 16 bits of the exception source code. The FEIC31 to FEIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

**(h) CTPC — Status Save Register when Executing CALLT Instruction**

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address cannot be specified.

Table 3A.13 CTPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTPC31 to CTPC1	These bits indicate the PC of the instruction after the CALLT instruction.	R/W	Undefined
0	CTPC0	This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0.	R/W	Undefined

**(i) CTPSW — Status Save Register when Executing CALLT Instruction**

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

Table 3A.14 CTPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4	SAT	This bit stores the PSW.SAT bit setting when the CALLT instruction is executed.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when the CALLT instruction is executed.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when the CALLT instruction is executed.	R/W	0
1	S	This bit stores the PSW.S bit setting when the CALLT instruction is executed.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when the CALLT instruction is executed.	R/W	0

**(j) CTBP — CALLT Base Pointer Register**

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.

Be sure to set the CTBP register to a halfword address.

Table 3A.15 CTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTBP31 to CTBP1	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the start address of the table used by the CALLT instruction.	R/W	Undefined
0	CTBP0	This bit indicates the base pointer address of the CALLT instruction. This bit indicates the start address of the table used by the CALLT instruction. Always set this bit to 0.	R	0

**(k) ASID — Address Space ID Register**

This register indicates the address space ID. This is used to identify the address space provided by the memory management function.

Table 3A.16 ASID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
9 to 0	ASID	These bits indicate the address space ID.	R/W	Undefined

**(l) EIWR — EI Level Exception Working Register**

The EIWR register is used as a working register when an EI level exception has occurred.

Table 3A.17 EIWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIWR31 to EIWR0	These bits constitute a working register that can be used for any purpose during the servicing of an EI level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

**(m) FEWR — FE Level Exception Working Register**

The FEWR register is used as a working register when an FE level exception has occurred.

Table 3A.18 FEWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEWR31 to FEWR0	These bits constitute a working register that can be used for any purpose during the servicing of an FE level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

**(n) HTCFCG0 — Thread Configuration Register**

Table 3A.19 HTCFCG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 19	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
18 to 16	PEID	These bits indicate the processor element number.	R	*2
15	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
14 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

Note 1. The value after reset is 0001 8000<sub>H</sub> for CPU1 (PE1) and 0002 8000<sub>H</sub> for CPU2 (PE2).

Note 2. The value after reset is 001<sub>B</sub> for CPU1 (PE1) and 010<sub>B</sub> for CPU2 (PE2).

**(o) MEA — Memory Error Address Register**

Table 3A.20 MEA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MEA	These bits store the violation address when an MAE (misaligned) or MPU occurs.	R/W	Undefined

**(p) MEI — Memory Error Information Register**

This register is used to store information about the instruction that caused a misaligned (MAE) or memory protection (MDP) exception when such an exception occurred. This information is used during emulation.

Table 3A.21 MEI Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 21	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
20 to 16	REG	These bits indicate the number of the source or destination register accessed by the instruction that caused the exception. For details, see <b>Table 3A.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined
15 to 11	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
10, 9	DS	These bits indicate the data type of the instruction that caused the exception.*1 0: Byte (8 bits) 1: Halfword (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) For details, see <b>Table 3A.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined
8	U	This bit indicates the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see <b>Table 3A.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5 to 1	ITYPE	These bits indicate the instruction that caused the exception. For details, see <b>Table 3A.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined
0	RW	This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory). 0: Read (Load-memory) 1: Write (Store-memory) For details, see <b>Table 3A.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3A.22 Instructions Causing Exceptions and Values of MEI Register

Instruction	REG	DS	U	RW	ITYPE
SLD.B	dst	0 (byte)	0 (signed)	0 (read)	0000 <sub>B</sub>

CACHE	—	—	—	—	—
Interrupt (table reference)*1	—	2 (word)	0 (signed)	0 (read)	10101 <sub>B</sub>

Note 1. When reading the interrupt vector by using the table reference method.

#### NOTE

dst: destination register number, src: source register number

**(q) RBASE — Reset Vector Base Address Register**

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

Table 3A.23 RBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	RBASE31 to RBASE9	These bits indicate the reset vector when there is a reset. When PSW.EBV = 0, this address is also used as the exception vector. For RBASE8 to RBASE0, 0 is used implicitly.	R	CPU1: 0000 0000 0000 0000 0000 000 <sub>B</sub> CPU2: 0000 0000 1000 0000 0000 000 <sub>B</sub> *1
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See <b>Section 7A.10.1, Direct Vector Method</b> . This bit is valid when PSW.EBV = 0.	R	0

Note 1. The value depends on the reset vector. The values set at shipment are shown in the table. When the reset vector is modified, the address will be changed.

**(r) EBASE — Exception Handler Vector Address Register**

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

Table 3A.24 EBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	EBASE31 to EBASE9	The exception handler routine address is changed to the address resulting from adding the offset address of each exception to the base address specified for this register. For EBASE8 to EBASE0, 0 is used implicitly.	R/W	Undefined
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See <b>Section 7A.10.1, Direct Vector Method</b> .	R/W	Undefined

**(s) INTBP — Base Address Register of the Interrupt Handler Address Table**

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

Table 3A.25 INTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	INTBP31 to INTBP9	These bits indicate the base pointer address for an interrupt when the table reference method is used.  The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified by the table reference method (EIINT0 to EIINT511) is acknowledged. For INTBP8 to INTBP0, 0 is used implicitly.	R/W	Undefined
8 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

**(t) PID — Processor ID Register**

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

Table 3A.26 PID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 24	PID	Architecture Identifier  This identifier indicates the architecture of the processor.	R	05 <sub>H</sub>
23 to 8		Function Identifier  This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bits 23 to 11: Reserved Bit 10: Double-precision floating-point operation function Bit 9: Single-precision floating-point operation function Bit 8: Memory protection function (MPU)	R	0003 <sub>H</sub>
7 to 0		Version Identifier  This identifier indicates the version of the processor.	R	A8 <sub>H</sub>

**(u) SCCFG — SYSCALL Operation Setting Register**

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Table 3A.27 SCCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	SIZE	These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If vectors exceeding the maximum number of entries are specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry.	R/W	Undefined

**(v) SCBP — SYSCALL Base Pointer Register**

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

Table 3A.28 SCBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	SCBP31 to SCBP2	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction.	R/W	Undefined
1, 0	SCBP1, SCBP0	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction. Always set these bits to 0.	R	0

**(w) MCFG0 — Machine Configuration Register**

This register indicates the CPU configuration.

Table 3A.29 MCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 18	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
17, 16	SPID	These bits indicate the system protection number.	R/W	*2
15 to 3	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
2	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

Note 1. The value after reset is 0001 0004<sub>H</sub> for CPU1 (PE1) and 0002 0004<sub>H</sub> for CPU2 (PE2).

Note 2. The value after reset is 01<sub>B</sub> for CPU1 (PE1) and 10<sub>B</sub> for CPU2 (PE2).

**(x) MCTL — Machine Control Register**

This register is used to control the CPU.

Table 3A.30 MCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
30 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	MA	This bit is used to control the misaligned access. 0: In the event of a misaligned access, an exception is always generated.*1 1: The correct operation is controlled by hardware.*2	R/W	1
0	UIC	This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction in user mode becomes possible.	R/W	0

Note 1. Excluding LD.DW, and ST.DW for word boundary allocation.

Note 2. Exception still occurs in case of LD.DW or ST.DW for misaligned access except word boundary allocation.

**(3) Interrupt Function Registers**

Table 3A.31 Interrupt Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR7, 1	FPIPR	FPI exception interrupt priority setting register	SV
SR10, 2	ISPR	Priority of interrupt being serviced register	SV
SR11, 2	PMR	Interrupt priority masking register	SV
SR12, 2	ICSR	Interrupt control status register	SV
SR13, 2	INTCFG	Interrupt function setting register	SV

**(a) FPIPR — FPI Exception Interrupt Priority Setting Register**

This register is used to set the interrupt priority of FPI exception.

Table 3A.32 FPIPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	FPIPR	These bits are used to specify the interrupt priority of floating-point operation exceptions (imprecise) (FPI). Specify values from 0 to 16. Specifying 17 or greater is prohibited. FPI exceptions are handled using the specified interrupt priority. If an FPI exception occurs at the same time as an interrupt that has the same priority, the FPI exception is prioritized.	R/W	0

**NOTE:** A set value of more than 16 is treated as 16.

**(b) ISPR — Priority of Interrupt being Serviced Register**

This register retains the priority of the *EIINTn* interrupt being serviced by the CPU. This priority value is then used to perform priority ceiling processing when multiple interrupts occur.

Table 3A.33 ISPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	ISP15 to ISP0	These bits indicate the acknowledgment status of an <i>EIINTn</i> interrupt with a priority that corresponds to the relevant bit position. 0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged. 1: An interrupt request for an interrupt whose priority corresponds to the relevant bit position is being serviced by the CPU core.	R* <sup>3</sup>	0

The bit positions correspond to the following priority levels.

Bit	Priority
0	Priority 0 (highest)
1	Priority 1
:	
14	Priority 14
15	Priority 15 (lowest)

When an interrupt request (*EIINTn*) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISP0 bits that are set to 1 (0 is the highest priority) is cleared to 0.\*<sup>1</sup>

While a bit in this register is set to 1, same or lower priority interrupts (*EIINTn*) and FPI exceptions\*<sup>2</sup> are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged.

When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit.

- Note 1. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) to the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.
- Note 2. Since FPI exceptions have the same level of priority as *EIINTn* interrupts, they are affected by interrupts in the same way as the ISPR. The priority of FPI exceptions is set by the FPIPR register.
- Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

**(c) PMR — Interrupt Priority Masking Register**

This register is used to mask the specified interrupt priority.

Table 3A.34 PMR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	PM15 to PM0	These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. 0: Servicing of an interrupt with a priority that corresponds to the relevant bit position is enabled. 1: Servicing of an interrupt with a priority that corresponds to the relevant bit position is disabled.  The bit positions correspond to the following priority levels:	R/W	0

Bit	Priority
0	Priority 0 (highest)
1	Priority 1
⋮	
14	Priority 14
15	Priority 15 and priority 16 (lowest)

While a bit in this register is set to 1, interrupts (*EIINTn*) and FPI exceptions\*<sup>1</sup> with the priority corresponding to that bit are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged\*<sup>2</sup>.

Note 1. Since FPI exceptions are specified as the same level of priority as that of interrupts (*EIINTn*), it is affected by the PMR like interrupts. The priority of FPI exceptions is set by the FPIPR register.

Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, FF00<sub>H</sub> can be set, but F0F0<sub>H</sub> or 00FF<sub>H</sub> cannot.

**(d) ICSR — Interrupt Control Status Register**

This register indicates the interrupt control status in the CPU.

Table 3A.35 ICSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	PMFP	This bit indicates that an FPI exception with the priority level masked by the PMR register exists.	R	0
0	PMEI	This bit indicates that an interrupt ( <i>EIINTn</i> ) with the priority level masked by the PMR register exists.	R	0

**(e) INTCFG — Interrupt Function Setting Register**

This register is used to specify settings related to the CPU's internal interrupt function.

Table 3A.36 INTCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	ISPC	<p>This bit specifies how the ISPR register is updated.</p> <p>0: The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored.</p> <p>1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed.</p> <p>If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (<i>E/INTn</i>) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, updating by the program (via execution of an LDSR instruction) is ignored.</p> <p>If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (<i>E/INTn</i>) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program.</p> <p>In normal cases, the ISPC bit should be cleared to 0. When performing software-based control of interrupt priorities, however, set this bit (1) and perform priority control by using the PMR register.</p>	R/W	0

#### (4) FPU Function Registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations. The RH850/F1KH supports single-precision floating-point instruction and thirty-two 32-bit registers can be specified.

These registers correspond to general-purpose registers r0 to r31. The FPU can use the following system registers to control floating-point operation

Table 3A.37 FPU System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR6, 0	FPSR	Floating-point operation setting/status register	CU and SV
SR7, 0	FPEPC	Floating-point exception program counter register	CU and SV
SR8, 0	FPST	Floating-point operation status register	CU
SR9, 0	FPCCR	Floating-point operation comparison result register	CU
SR10, 0	FPCFG	Floating-point operation configuration register	CU
SR11, 0	FPEC	Floating-point exception control register	CU and SV

**(a) FPSR — Floating-point Operation Setting/Status Register**

This register indicates the execution status of floating-point operations and any exceptions that occur.

Note 1. Cause bits (XC)

Note 2. Enable bits(XE)

Note 3. Preservation bits (XP)

Table 3A.38 FPSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset																						
31 to 24	CC[7:0]	These are the CC (condition) bits. They store the results of floating-point comparison instructions. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined																						
23	FN	This bit enables flush-to-nearest mode. When the FN bit is set to 1, if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number.	R/W	0																						
22	IF	This bit accumulates and indicates information about the flushing of input operands.	R/W	0																						
21	PEM	This bit specifies whether to handle an exception as a precise exception. If the PEM bit is 1, exceptions that are caused by the execution of a floating-point operation instruction are handled as precise exceptions.	R/W	0																						
20	—	(Reserved for future expansion. Be sure to set to 0.)	R	0																						
19, 18	RM	These are the rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions.	R/W	00																						
		<table border="1"> <thead> <tr> <th colspan="2">RM Bits</th> <th rowspan="2">Mnemonic</th> <th rowspan="2">Description</th> </tr> <tr> <th>19</th> <th>18</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>RN</td> <td>Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.</td> </tr> <tr> <td>0</td> <td>1</td> <td>RZ</td> <td>Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.</td> </tr> <tr> <td>1</td> <td>0</td> <td>RP</td> <td>Rounds the result toward <math>+\infty</math>. The result is nearest to a value greater than the accurate result with infinite accuracy.</td> </tr> <tr> <td>1</td> <td>1</td> <td>RM</td> <td>Rounds the result toward <math>-\infty</math>. The result is nearest to a value less than the accurate result with infinite accuracy.</td> </tr> </tbody> </table>	RM Bits		Mnemonic	Description	19	18	0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.	0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.	1	0	RP	Rounds the result toward $+\infty$ . The result is nearest to a value greater than the accurate result with infinite accuracy.	1	1	RM	Rounds the result toward $-\infty$ . The result is nearest to a value less than the accurate result with infinite accuracy.		
RM Bits		Mnemonic	Description																							
19	18																									
0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.																							
0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.																							
1	0	RP	Rounds the result toward $+\infty$ . The result is nearest to a value greater than the accurate result with infinite accuracy.																							
1	1	RM	Rounds the result toward $-\infty$ . The result is nearest to a value less than the accurate result with infinite accuracy.																							
17	FS	This bit enables values that cannot be normalized (subnormal numbers) to be flushed. If the FS bit is set, input operands and operation results that are subnormal numbers are flushed without causing an unimplemented operation exception (E). An input operand that is a subnormal number is flushed to 0 with the same sign.  Operation results that are subnormal numbers either become 0 or the minimum normalized number, depending on the rounding mode.	R/W	1																						
		<table border="1"> <thead> <tr> <th rowspan="2">Operation Result that is a Subnormal Number</th> <th colspan="4">Rounding Mode and Value after Flushing</th> </tr> <tr> <th>RN*1</th> <th>RZ</th> <th>RP</th> <th>RM</th> </tr> </thead> <tbody> <tr> <td>Positive</td> <td>+0</td> <td>+0</td> <td><math>+2^{E_{min}}</math></td> <td>+0</td> </tr> <tr> <td>Negative</td> <td>-0</td> <td>-0</td> <td>-0</td> <td><math>-2^{E_{min}}</math></td> </tr> </tbody> </table>	Operation Result that is a Subnormal Number	Rounding Mode and Value after Flushing				RN*1	RZ	RP	RM	Positive	+0	+0	$+2^{E_{min}}$	+0	Negative	-0	-0	-0	$-2^{E_{min}}$					
Operation Result that is a Subnormal Number	Rounding Mode and Value after Flushing																									
	RN*1	RZ	RP	RM																						
Positive	+0	+0	$+2^{E_{min}}$	+0																						
Negative	-0	-0	-0	$-2^{E_{min}}$																						
Note 1. If the rounding mode is RN and the FPSR.FN bit is set to 1, flushing will occur in the direction of higher accuracy.																										
16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0																						
15 to 10	XC (E, V, Z, O, U, I)	These are the cause bits.	R/W	Undefined																						

Table 3A.38 FPSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
9 to 5	XE (V, Z, O, U, I)	These are the enable bits.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are the preservation bits.	R/W	Undefined

**(b) FPEPC — Floating-point Exception Program Counter Register**

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.

Table 3A.39 FPEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FPEPC31 to FPEPC1	These bits store the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs.	R/W	Undefined
0	FPEPC0	This bit stores the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs. Always set this bit to 0.	R	0

**(c) FPST — Floating-point Operation Status Register**

This register reflects the contents of the FPSR register bits related to the operation status.

Note 1. Cause bits (XC)

Note 2. Preservation bits (XP)

Table 3A.40 FPST Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 14	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
13 to 8	XC (E, V, Z, O, U, I)	These are cause bits. Values written to these bits are reflected in FPSR.XC bits.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	IF	This bit accumulates and indicates information about the flushing of input operands.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are preservation bits. Values written to these bits are reflected in FPSR.XP bits.	R/W	Undefined

**(d) FPCC — Floating-point Operation Comparison Result Register**

This register reflects the contents of the FPSR.CC[7:0] bits.

Table 3A.41 FPCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	CC[7:0]	These are CC (condition) bits. They store the result of a floating-point comparison instruction. The CC[7:0] bits are not affected by any instructions except the comparison instruction and LDSR instruction. Values written to these bits are reflected in the CC[7:0] bits of FPSR. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined

**(e) FPCFG — Floating-point Operation Configuration Register**

This register reflects the contents of the FPSR register bits related to the operation settings.

Table 3A.42 FPCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset																						
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0																						
9, 8	RM	These are rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions. Values written to these bits are reflected in RM bits of FPSR.	R/W	0																						
<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th colspan="2">RM Bits</th> <th rowspan="2">Mnemonic</th> <th rowspan="2">Description</th> </tr> <tr> <th>9</th> <th>8</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td style="text-align: center;">0</td> <td>RN</td> <td>Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.</td> </tr> <tr> <td style="text-align: center;">0</td> <td style="text-align: center;">1</td> <td>RZ</td> <td>Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.</td> </tr> <tr> <td style="text-align: center;">1</td> <td style="text-align: center;">0</td> <td>RP</td> <td>Rounds the result toward +∞. The result is nearest to a value greater than the accurate result with infinite accuracy.</td> </tr> <tr> <td style="text-align: center;">1</td> <td style="text-align: center;">1</td> <td>RM</td> <td>Rounds the result toward -∞. The result is nearest to a value less than the accurate result with infinite accuracy.</td> </tr> </tbody> </table>					RM Bits		Mnemonic	Description	9	8	0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.	0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.	1	0	RP	Rounds the result toward +∞. The result is nearest to a value greater than the accurate result with infinite accuracy.	1	1	RM	Rounds the result toward -∞. The result is nearest to a value less than the accurate result with infinite accuracy.
RM Bits		Mnemonic	Description																							
9	8																									
0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.																							
0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.																							
1	0	RP	Rounds the result toward +∞. The result is nearest to a value greater than the accurate result with infinite accuracy.																							
1	1	RM	Rounds the result toward -∞. The result is nearest to a value less than the accurate result with infinite accuracy.																							
7 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0																						
4 to 0	XE (V, Z, O, U, I)	These are the enable bits.	R/W	0																						

**(f) FPEC — Floating-point Exception Control Register**

This register controls the floating-point operation exception.

Table 3A.43 FPEC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	FPIVD*1	<p>This bit indicates the status of reporting the FPI exception.</p> <p>If this bit is set to 1, the FPI exception is reported to the CPU but is not acknowledged. It is automatically cleared to 0 when the CPU acknowledges the FPI exception.</p> <p>While this bit is set to 1, all the floating-point instructions are invalidated. Report of the FPI exception can be canceled by clearing (0) this bit by the LDSR instruction while it is set to 1. When report of the FPI exception is canceled, the CPU does not acknowledge the FPI exception.</p> <p>0: FPI exception is not reported. 1: FPI exception is reported.</p>	R/W	0

Note 1. The FPIVD bit can only be cleared to 0 by the write operation of the LDSR instruction. It cannot be set to 1.

**(5) MPU Function Registers**

Table 3A.44 MPU Function System Registers

Register No. (regID, sellID)	Symbol	Function	Access Permission
SR0, 5	MPM	Memory protection operation mode setting	SV
SR1, 5	MPRC	MPU region control	SV
SR4, 5	MPBRGN	MPU base region number	SV

**(a) MPM — Memory Protection Operation Mode Register**

The memory protection mode register is used to define the basic operating state of the memory protection function.

Table 3A.45 MPM Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	SVP	In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*1 0: As usual, implicitly enable all access in SV mode. 1: Restrict access according to the SX, SW, and SR bits even in SV mode.*2	R/W	0
0	MPE	This bit is used to specify whether to enable or disable the MPU function. 0: Disable 1: Enable	R/W	0

Note 1. If the SVP bit is set to 1, access will be restricted in accordance with the setting for each protection area, even in SV mode. Therefore, specify the protection area beforehand so that the access from the program which set the SVP bit is not restricted.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

**(b) MPRC — MPU Region Control Register**

Table 3A.46 MPRC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	E15 to E0	These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0).	R/W	0

**(c) MPBRGN — MPU Base Region Register**

This register indicates the minimum usable MPU area number.

Table 3A.47 MPBRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPBRGN	These bits indicate the smallest number of an MPU area. These bits always indicate 0.	R	0

**(d) MPTRGN — MPU End Region Register**

This register indicates the maximum usable MPU area number + 1.

Table 3A.48 MPTRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPTRGN	These bits indicate the largest number of an MPU area + 1. These bits indicate the maximum number of MPU areas incorporated into the hardware.	R	10000 <sub>B</sub>

**(e) MCA — Memory Protection Setting Check Address Register**

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

Table 3A.49 MCA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCA31 to MCA0	These bits are used to specify the start address of the memory area that is subject to a memory protection setting check in bytes.	R/W	Undefined

**(f) MCS — Memory Protection Setting Check Size Register**

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

Table 3A.50 MCS Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCS31 to MCS0	These bits are used to specify the size of the memory area that is subject to a memory protection setting check and the size of the target area in bytes. Because the specified size is assumed to represent an unsigned integer, it is not possible to check an area in the direction in which the address value decreases relative to the MCA register value. Do not specify 0000 0000 <sub>H</sub> for the MCS register.	R/W	Undefined

**(g) MCC — Memory Protection Setting Check Command Register**

This command register is used to start a memory protection setting check.

Table 3A.51 MCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCC31 to MCC0	When any value is written to the MCC register, a memory protection setting check starts. By setting up the MCA/MCS register and then writing to the MCC register, results are stored in MCR. Because the check is started by any written value, a check can be started by using r0 as the source register without using any unnecessary registers. Note that, for the check, the results are applied according to each area setting regardless of the state of the PSW.UM bit. When the MCC register is read, value 0000 0000 <sub>H</sub> is always returned.	R/W	0

**(h) MCR — Memory Protection Setting Check Result Register**

This register is used to store the results of a memory protection setting check.

Be sure to clear bits 31 to 9, 7 and 6.

Table 3A.52 MCR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
8	OV	If the specified area includes 0000 0000 <sub>H</sub> or 7FFF FFFF <sub>H</sub> , 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	SXE	If the specified area is contained within one of the protection areas and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
4	SWE	If the specified area is contained within one of the protection areas and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
3	SRE	If the specified area is contained within one of the protection areas and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
2	UXE	If the specified area is contained within one of the protection areas and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
1	UWE	If the specified area is contained within one of the protection areas and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
0	URE	If the specified area is contained within one of the protection areas and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined

**(i) MPLAn — Protection Area Lower Limit Address Register**

These registers indicate the lower limit address of area n (where n = 0 to 15).

Table 3A.53 MPLAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPLA31 to MPLA2	These bits indicate the lower limit address of area n. For MPLA1 and MPLA0, 0 is used implicitly.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

**(j) MPUAn — Protection Area Upper Limit Address Register**

These registers indicate the upper limit address of area n (where n = 0 to 15).

Table 3A.54 MPUAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPUA31 to MPUA2	These bits indicate the upper limit address of area n. For MPUAn.MPUA1 and MPUA0, 1 is used implicitly.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

**(k) MPATn — Protection Area Attribute Register**

These registers indicate the attributes of area n (where n = 0 to 15).

Table 3A.55 MPATn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 26	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
25 to 16	ASID	These bits indicate the ASID value to be used as the area match condition.	R/W	Undefined
15 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	E	This bit indicates whether area n is enabled or disabled. 0: Area n is disabled. 1: Area n is enabled.	R/W	0
6	G	0: Areas match only if ASIDs are equal. 1: Areas match even if ASIDs are not equal. If this bit is 0, MPATn.ASID = ASID.ASID is used as the area match condition. If this bit is 1, areas may match even if the values of MPATn.ASID and ASID.ASID are not equal.	R/W	Undefined
5	SX	This bit indicates the execution privilege for the supervisor mode.*1 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
4	SW	This bit indicates whether writing is enabled in the supervisor mode.*1 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
3	SR	This bit indicates whether reading is enabled in the supervisor mode.*1 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined
2	UX	This bit indicates the execution privilege for the user mode. 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
1	UW	This bit indicates whether writing is enabled in the user mode. 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
0	UR	This bit indicates whether reading is enabled in the user mode. 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

## (6) Cache Operation Function Registers

The RH850/F1KH does not include a cache operation function, so all the following registers return a value of 0 when read, and writing to these registers is ignored.

Table 3A.56 Cache Operation Function Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR12, 4	BWERRL	Not implemented. A value of 0 is returned when read and writing is ignored.	SV
SR13, 4	BWERRH		SV
SR14, 4	BRERRL		SV
SR15, 4	BRERRH		SV
SR16, 4	ICTAGL		SV
SR17, 4	ICTAGH		SV
SR18, 4	ICDATL		SV
SR19, 4	ICDATH		SV
SR20, 4	DCTAGL		SV
SR21, 4	DCTAGH		SV
SR22, 4	DCDATL		SV
SR23, 4	DCDATH		SV
SR24, 4	ICCTRL		SV
SR25, 4	DCCTRL		SV
SR26, 4	ICCFG		SV
SR27, 4	DCCFG		SV
SR28, 4	ICERR		SV
SR29, 4	DCERR		SV

### 3A.2.1.3 Instruction

See “*Instruction*” in *Software Manual*.

A snooze instruction halts operation of the CPU1/2 core for 32 clocks.

## 3A.2.2 Buffers for Code Flash

### 3A.2.2.1 Features

CPU<sub>n</sub> (n = 1, 2) accesses Code flash by two paths; instruction fetch access is direct to Flash interface, and data access is via System interconnect to Code Flash. Both paths equip buffers, which can be cleared by software. See also

**Figure 40A.1, Block Diagram of Code Flash ECC** for ECC decoders in these paths.

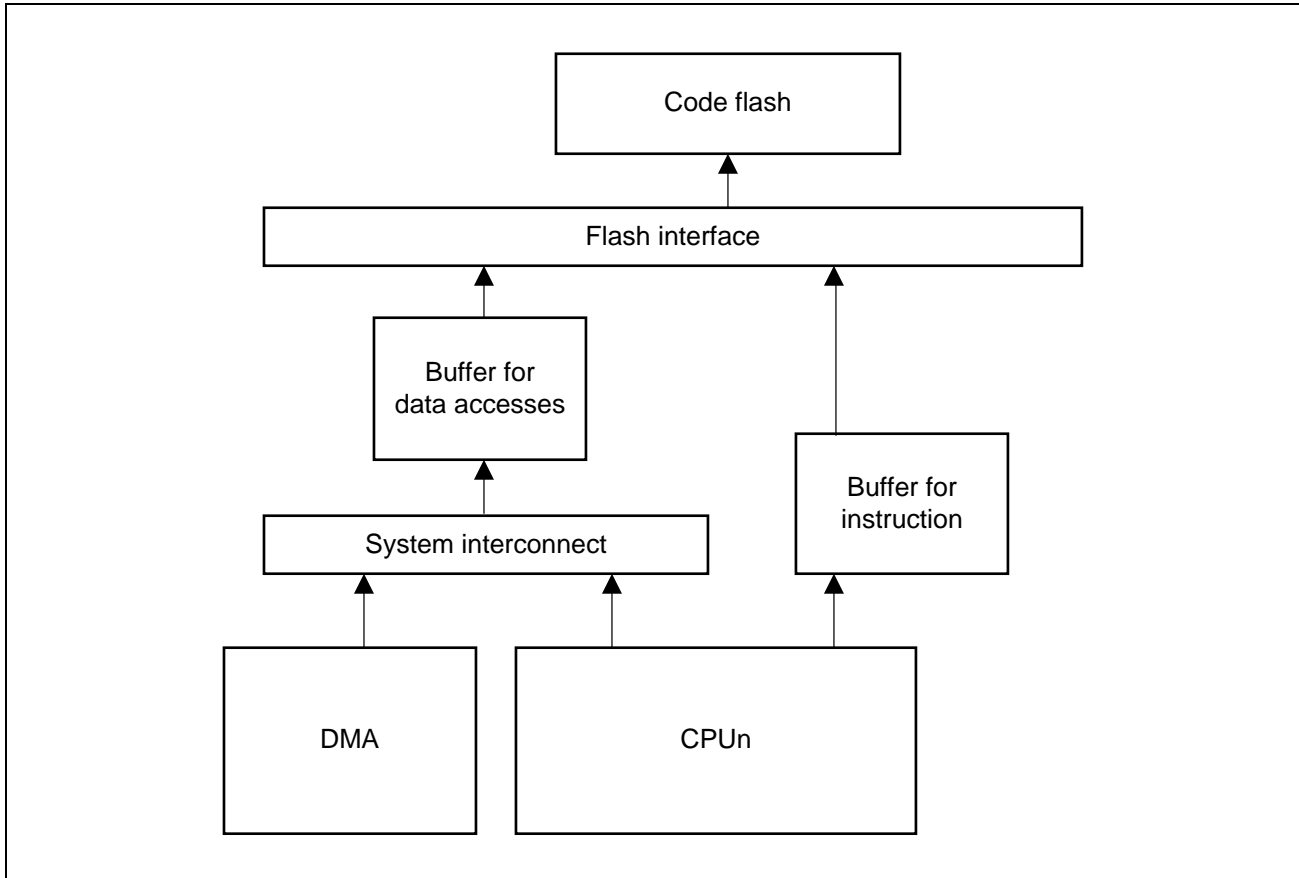

Figure 3A.2 Buffers for Code Flash

### 3A.2.2.2 Function of Buffers

One-line buffer with 128 bits is mounted for instruction fetches to code flash. The data is read out from the buffer after the next access to the same address, so the code flash is not accessed again within 128 bits location.

Two-line buffer with 128 bits is mounted as a data buffer. This buffer is not only used by the CPU but also used by DMA via system interconnect. The data is read out from the buffer if the next access is within the same 128 bits boundary.

16 entry branch history buffer is mounted to decrease branch penalty.

One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these three buffers.

### 3A.2.2.3 Registers for Buffer Control

#### (1) List of Buffer Control Registers

Table 3A.57 Buffer Control Register (Base Address: FFC5 B000<sub>H</sub>)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
FBUF_CTRL	+000 <sub>H</sub>	4	Flash buffer clear control register	FBUFCCTL	—	R/W	—	✓	✓	✓	0000 0000 <sub>H</sub>

#### (2) Register Sets

**Access:** FBUFCCTL register can be read or written in 32-bit units.  
 FBUFCCTLL register can be read or written in 16-bit units.  
 FBUFCCTLLL register can be read or written in 8-bit units.

**Address:** FBUFCCTL: FFC5 B000<sub>H</sub>  
 FBUFCCTLL: FFC5 B000<sub>H</sub>  
 FBUFCCTLLL: FFC5 B000<sub>H</sub>

Table 3A.58 FBUFCCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.	R	0
0	FBUFCCLR	Buffer clear bits. To clear buffers, write 1 to this bit and then write 0. 0: Buffers are valid 1: Buffers are invalid (cleared)	R/W	0

Please do following procedures when you want to clear the buffers.

- Step 1: Write 0 to FBUFCCTL.FBUFCCLR
- Step 2: Write 1 to FBUFCCTL.FBUFCCLR
- Step 3: Write 0 to FBUFCCTL.FBUFCCLR
- Step 4: Read the FBUFCCTL register (dummy read)
- Step 5: Execute the SYNCP instruction
- Step 6: Execute the SYNCI instruction

If you do not do Step 3 after Step 2, the buffers are kept invalid during FBUFCCTL.FBUFCCLR = 1.

### 3A.2.3 Inter-Processor Interrupts

Four registers (IPIR\_CHn) are provided for communicating four channels of interrupts between the CPUs (PEs).

IPIR\_CH0 to IPIR\_CH3 are assigned to CH0 to CH3 of user interrupts (EIINT). An interrupt for specific PEs (including own PE) can be requested by manipulating the bits corresponding to each PE.

#### 3A.2.3.1 Inter-Processor Interrupt Control Registers

These registers are located in the CPU Peripheral.

Table 3A.59 List of Registers

Module Name	Address	Register Name	Symbol	R/W	Access Size				Value after Reset
					1	8	16	32	
IPIRSS	FFFE EC80 <sub>H</sub>	Inter-PE interrupt register 0	IPIR_CH0	R/W	—	✓	✓	✓	0000 0000 <sub>H</sub>
	FFFE EC84 <sub>H</sub>	Inter-PE interrupt register 1	IPIR_CH1	R/W	—	✓	✓	✓	0000 0000 <sub>H</sub>
	FFFE EC88 <sub>H</sub>	Inter-PE interrupt register 2	IPIR_CH2	R/W	—	✓	✓	✓	0000 0000 <sub>H</sub>
	FFFE EC8C <sub>H</sub>	Inter-PE interrupt register 3	IPIR_CH3	R/W	—	✓	✓	✓	0000 0000 <sub>H</sub>

**(1) IPIR\_CHn — Inter-PE Interrupt Register n (n = 0 to 3)**

**Access:** IPIR\_CHn can be read or written in 32-bit units.  
 IPIR\_CHnL can be read or written in 16-bit units.  
 IPIR\_CHnLL can be read or written in 8-bit units.

**Address:** IPIR\_CHn: FFFE EC80<sub>H</sub> + n × 4<sub>H</sub>  
 IPIR\_CHnL: FFFE EC80<sub>H</sub> + n × 4<sub>H</sub>  
 IPIR\_CHnLL: FFFE EC80<sub>H</sub> + n × 4<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PE2	PE1
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 3A.60 IPIR\_CHn Registers Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PE2	Inter-PE Interrupt Request to PE2 Writing 1 to this bit enables an interrupt request to PE2. This bit is automatically cleared to 0 when the interrupt request has been notified. 0: Inter-PE interrupt request output is not specified or an interrupt request is not being output. 1: Interrupt request output is specified or an interrupt request is being output.
0	PE1	Inter-PE Interrupt Request to PE1 Writing 1 to this bit enables an interrupt request to PE1. This bit is automatically cleared to 0 when the interrupt request has been notified. 0: Inter-PE interrupt request output is not specified or an interrupt request is not being output. 1: Interrupt request output is specified or an interrupt request is being output.

## 3A.2.4 Reliability Functions

### 3A.2.4.1 PE Guard Function (PEG)

#### (1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the CPU (PE) from an external master. This function protects access to the local RAM in the PE. In the initial state after a reset, access by masters other than own PE is disabled. Setting the registers listed in (3) List of PEG Protection Setting Registers enables access by masters other than own PE.

##### (1) Detecting PE guard violation

If an external master makes an unauthorized access to the resource area in a PE for which PE guard is set, the access is detected as a PE guard violation.

##### (2) Blocking unauthorized access

When a PE guard violation is detected, unauthorized access to the internal resources of the PE are blocked to prevent unauthorized modification of the contents of PE resources.

##### (3) Notifying occurrence of violation

An error response to an unauthorized access is sent to the request source of external master. When DMA Controller makes an unauthorized access, meanwhile, a DMA transfer error is detected. A PE guard violation is notified as INTGUARD interrupt request which is a source of FEINT.

#### (2) Protection Made by SPID

##### • Setting PEG Protection

- Up to four areas can be set depending on the local RAM address of the own PE.
- The area range is specified by the base address and the mask bit (4 kbytes to 4 Gbytes).
- “Read enable” and “write enable” can be set for each area.
- “Enable” or “disable” can be selected based on the system protection identifier (SPID) for each area.

##### • Procedure for permitting access by using the system protection identifier (SPID)

1. Is the area subject to access is the local RAM area? If so, go to step 2.
2. Is the area subject to access is within the range of valid areas 0, 1, 2, or 3? If so, go to step 3. Otherwise, return an error response.
3. Are all the conditions below for the relevant area satisfied? If so, permit access.
  - The system protection identifier (SPID) is enabled.
  - Required operations (read/write) are enabled.
 Otherwise, return an error response.

### (3) List of PEG Protection Setting Registers

Specify the necessary settings in the registers below to protect PE resources from unauthorized access by an external master.

- Whether to permit access to the local RAM in the PE can be specified.

Table 3A.61 PEG Registers (Base Address: FFFE E600<sub>H</sub>)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SPEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 3A.62 PEGSP Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SPEN	Access permission to external master with specified SPID. 0: Not permit. 1: Permit.

**(b) PEGGnMK — PEG Area n Mask Setting Register (n = 0 to 3)**

The PEGGnMK register defines which bits of PEGGnBA.GnBASE are compared with the access address. If bit PEGGnMK.GnMASK[m] is cleared, bit PEGGnBA.GnBASE[m] is compared with bit m of the access address.

**Access:** PEGGnMK register can be read or written in 32-bit units.  
 PEGGnMKL, PEGGnMKH registers can be read or written in 16-bit units.  
 PEGGnMKLH, PEGGnMKHL, PEGGnMKHH registers can be read or written in 8-bit units.

**Address:** PEGGnMK: FFFE E680<sub>H</sub> + (10<sub>H</sub> × n)  
 PEGGnMKL: FFFE E680<sub>H</sub> + (10<sub>H</sub> × n),  
 PEGGnMKH: FFFE E682<sub>H</sub> + (10<sub>H</sub> × n)  
 PEGGnMKLH: FFFE E681<sub>H</sub> + (10<sub>H</sub> × n),  
 PEGGnMKHL: FFFE E682<sub>H</sub> + (10<sub>H</sub> × n),  
 PEGGnMKHH: FFFE E683<sub>H</sub> + (10<sub>H</sub> × n)

Table 3A.63 PEGGnMK Register Contents

Bit Position	Bit Name	Function
31 to 12	GnMASK	0: Target bits are compared when determining the PE guard area. 1: Target bits are not compared when determining the PE guard area.
11 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

**NOTE**

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

**(c) PEGGnBA — PEG Area n Base Setting Register (n = 0 to 3)**

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n. Setting the GnEN bit to 1 validates the access enable conditions specified by this register and the PEGGnMK register.

**Access:** PEGGnBA register can be read or written in 32-bit units.  
 PEGGnBAL, PEGGnBAH registers can be read or written in 16-bit units.  
 PEGGnBALL, PEGGnBALH, PEGGnBAHL, PEGGnBAHH registers can be read or written in 8-bit units.

**Address:** PEGGnBA: FFFE E684<sub>H</sub> + (10<sub>H</sub> × n)  
 PEGGnBAL: FFFE E684<sub>H</sub> + (10<sub>H</sub> × n),  
 PEGGnBAH: FFFE E686<sub>H</sub> + (10<sub>H</sub> × n)

Table 3A.64 PEGGnBA Register Contents

Bit Position	Bit Name	Function
31 to 12	GnBASE	Base address that specifies the range of PE guard protection area n.
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	GnSP3	Access permission setting from SPID = 3 external master to PE guard protection area n.*1 0: Not permit. 1: Permit.
6	GnSP2	Access permission setting from SPID = 2 (CPU2) external master to PE guard protection area n.*1 0: Not permit. 1: Permit.
5	GnSP1	Access permission setting from SPID = 1 (CPU1) external master to PE guard protection area n.*1 0: Not permit. 1: Permit.
4	GnSP0	Access permission setting from SPID = 0 external master to PE guard protection area n.*1 0: Not permit. 1: Permit.
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GnWR	Write access permission to PE guard protection area n. 0: Write access is disabled. 1: Write access is enabled.

Table 3A.64 PEGGnBA Register Contents

Bit Position	Bit Name	Function
1	GnRD	Read access permission to PE guard protection area n. 0: Read access is disabled. 1: Read access is enabled.
0	GnEN	Enables or Disables the setting for the access enable conditions to PE guard protection area n. 0: Settings for access enable conditions are disabled. 1: Settings for access enable conditions are enabled.

Note 1. For SPID, refer to **Table 40A.69, Identifiers for Slave Guard**.

#### NOTE

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

### 3A.2.4.2 PE's Internal Peripheral Device Protection Function (IPG)

#### (1) Overview of the IPG Function

The IPG is a function to prevent unauthorized accesses to peripheral devices from the CPU core equipped with the IPG. The IPG achieves the following functions. The IPG covers accesses to the SEG, the PEG, the IPIR, the MEV, the INTC1 and P-Bus.

##### (a) Detecting Violation of Peripheral Device Protection

If the CPU makes an unauthorized access to an area (peripheral device) for which peripheral device protection is set, the access is detected as “violation of peripheral device protection”.

##### (b) Storing Unauthorized Access Information

When a violation of peripheral device protection is detected, the unauthorized-access information is stored in the IPG's internal register.

##### (c) Blocking Unauthorized Accesses

When a violation of peripheral device protection is detected, unauthorized accesses to peripheral devices are blocked to prevent contents of peripheral devices from being modified illegally.

##### (d) Notifying Violation

When a violation of peripheral device protection is detected, a request for generating an exception is made to ask the CPU to stop the processing.

#### NOTE

---

Even if a request for generating an exception is immediately sent to the CPU in step **(d) Notifying Violation** above, a subsequent access issued (before receiving a request from the IPG) by the CPU that does not know an occurrence of violation may illegally modify contents of peripheral devices. (Accesses after a violation has occurred result in unauthorized accesses.)

---

#### (2) IPG Function

- This function invalidates accesses according to their attributes (including address, transfer type, and access right).
- After an access right violation is detected until the error flag (described later) is cleared by writing by the software, subsequent accesses are invalidated. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.
- When a request for accessing different peripheral devices simultaneously is made due to misalignment or double-word access, the access is executed when all such accesses are enabled.

#### (3) IPG Protection Setting Registers for Illegal Users

To protect peripheral devices from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses in user mode are to be detected.

Table 3A.65 IPG Registers (Base Address: FFFE E00H)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right*1	R/W	Operable Bit				Value after Reset
							1	8	16	32	
IPG	+002 <sub>H</sub>	2	Peripheral device protection violation access information register	IPGECRUM	SV	R/W	—	✓	✓	—	Undefined (retained)

Table 3A.66 IPGECRUM Register Contents

Bit Position	Bit Name	Function
15 to 7	Reserved	These bits are always read as 0. The write value should always be 0.
6	WD	This bit is set to 1 when a violation occurred in read word, instruction fetch read access, write word, CAXI, LDL or STC. In other cases, this bit is cleared to 0.
5	HW	This bit is set to 1 when a violation occurred in read halfword or write halfword. In other cases, this bit is cleared to 0.
4	BY	This bit is set to 1 when a violation occurred in read byte, write byte or bit operation. In other cases, this bit is cleared to 0.
3	EX	This bit is set to 1 when a violation occurred in an instruction fetch read access. In other cases, this bit is cleared to 0.
2	WR	This bit is set to 1 when a violation occurred in a write access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
1	RD	This bit is set to 1 when a violation occurred in a read access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
0	VD	This bit is set to 1 when a violation of peripheral device protection is detected by a program with the relevant right. Even if another violation of peripheral device protection is detected while this bit is 1, data of this IPGECRUM register and the IPGADRUM register is not updated and is retained.

**NOTE**

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

**(b) IPGADRUM — Peripheral Device Protection Violation Access Address Register**

**Access:** IPGADRUM register can be read or written in 32-bit units.  
 IPGADRUML, IPGADRUMH registers can be read or written in 16-bit units.  
 IPGADRUMLL, IPGADRUMLH, IPGADRUMHL, IPGADRUMHH registers can be read or written in 8-bit units.

**Address:** IPGADRUM: FFFE E008<sub>H</sub>  
 IPGADRUML: FFFE E008<sub>H</sub>, IPGADRUMH: FFFE E00A<sub>H</sub>  
 IPGADRUMLL: FFFE E008<sub>H</sub>, IPGADRUMLH: FFFE E009<sub>H</sub>,

Table 3A.72 IPGPMTUM4 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are always read as 0. The write value should always be 0.
1	W0	This bit sets whether to enable write access to its own PEG. 0: Write access to its own PEG is treated as violation. (Value after reset) 1: Write access to its own PEG is not restricted.
0	R0	This bit sets whether to enable read access to its own PEG. 0: Read access to its own PEG is treated as violation. (Value after reset) 1: Read access to its own PEG is not restricted

### 3A.2.4.3 System Error Generator Function (SEG)

SEG (SysErrGen) controls interrupt notification and recording after a system error occurred by a data access.

Multiple error occurrence inputs are categorized according to error factor, and are processed sequentially from the highest-priority error factor, generating an FE-level exception (SYSERR).

The bit position of the SEGFLAG register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits.

Error address information is recorded only once regardless of error frequency.

The error with the highest priority among the error factors is valid when errors occur simultaneously. Recorded error address information is not overwritten by subsequent errors.

#### (1) List of SEG Function Control Registers

Table 3A.73 SEG Register (Base Address: FFFE E980<sub>H</sub>)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right* <sup>1</sup>	R/W	Operable Bit				Value after Reset
							1	8	16	32	
SEG	+00 <sub>H</sub>	2	SEG error control register	SEGCONT	SV	R/W	—	—	✓	—	0000 <sub>H</sub>
	+02 <sub>H</sub>	2	SEG error flag register	SEGFLAG	SV	R/W	—	—	✓	—	0000 <sub>H</sub>
	+08 <sub>H</sub>	4	SEG error address information register	SEGADDR	SV	R/W	—	—	—	✓	Undefined (retained)

Note 1. Registers for which “SV” is described are writable with the SV right (UM = 0). Attempting to write, if these conditions do not hold, leads to a SYSERR exception with setting VCIF flag. No restriction is provided for read accesses.

**(2) Register Set****(a) SEGCONT — SEG Error Control Register**

This register is used to enable (= 1) or disable (= 0) notification of SysErr request in response to error flags that store the error occurrence status for each factor.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCSE	APIE	IPGE	—	TCME	—	VCIE	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R	R/W	R	R	R	R

Table 3A.74 SEGCONT Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSE	This bit enables notification of an error response detected inside system interconnect: <ul style="list-style-type: none"> <li>• Error response from external bus masters in write access</li> <li>• Illegal response to local RAM or peripherals or Flash from optional master in access (except instruction fetch from CPU). And illegal response to optional slave from external AHB master in access.</li> </ul>
9	APIE	This bit enables notification of an error response from peripherals. The error notification includes the following cases: <ul style="list-style-type: none"> <li>• Error response from peripherals in write access</li> <li>• PBG error in write access</li> </ul>
8	IPGE	This bit enables notification of IPG illegal access detection.
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCME	This bit enables notification of an error during data access to its own local RAM from PE master. <p>The error notification includes the following cases:</p> <ul style="list-style-type: none"> <li>• ECC uncorrectable error (DED or SED &amp; SECDIS=1)</li> <li>• Detection of an access to RAM unimplemented area</li> </ul>
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	VCIE	This bit enables notification of an error response during access to CPU peripherals, P-Bus (read access), global RAM, retention RAM, other PE local RAM, H-Bus and CodeFlash by PE. <p>The error notification includes the following cases:</p> <ul style="list-style-type: none"> <li>• IPG error from CPU peripherals and P-Bus</li> <li>• Error response from H-Bus peripherals</li> <li>• PBG error / HBG error from P-Bus and H-Bus</li> <li>• GRG error from global RAM and retention RAM</li> <li>• PEG error from other PE local RAM</li> <li>• ECC uncorrectable error from CodeFlash, global RAM, retention RAM and other PE local RAM (DED or SED &amp; SECDIS = 1)</li> </ul> <p>This bit enables notification of an error response when accessing to a part of access prohibited areas in address map.</p>
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

**(b) SEGFLAG — SEG Error Flag Register**

This register indicates error flags that store error occurrence status of each factors. The flags are set to 1 by an error occurrence input. The flags are not automatically cleared to 0. Both setting and clearing of each flag are supported in writing to the register.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCSF	APIF	IPGF	—	TCMF	—	VCIF	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R	R/W	R	R	R	R

Table 3A.75 SEGFLAG Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSF	Flag corresponding to bit 10 of the SEGCONT register
9	APIF	Flag corresponding to bit 9 of the SEGCONT register
8	IPGF	Flag corresponding to bit 8 of the SEGCONT register
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCMF	Flag corresponding to bit 6 of the SEGCONT register
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	VCIF	Flag corresponding to bit 4 of the SEGCONT register
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

**NOTE**

An error may lead to setting of multiple error flags in SEG. For example, if an IPG error occurs at peripheral registers read, both IPGF bit and VCIF bit in SEGFLAG are set.

**(c) SEGADDR — Error Address Information Register**

Address information (one record) which is notified with error occurrence is stored in the register. The register is not updated while one or more bits in SEGFLAG register are set.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Address[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Address[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3A.76 SEGADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	Address	These bits store the error address information.

**CAUTIONS**

- SEGADDR stores error address information in case of an error occurrence related to VCIF bit or TCMF bit in SEGFLAG register. SEGADDR register stores all 0 data in case of an error occurrence related to VCSF bit, APIF bit or IPGF bit in SEGFLAG register.
- In case of an error occurrence related to TCMF bit in SEGFLAG register, bit[18:0] of the error address are stored in SEGADDR[18:0] and SEGADDR[31:19] are filled with 0.

### (3) SEG Function

#### (a) SEG Function: SYSERR Request Notification by Error Flag

- Setting an error flag takes precedence over clearing the same flag.
  - A simultaneous clearing operation is ignored.
- Priority of error factors
  - The bit position of each flags in SEGFLAG register which error notification is enabled by SEGCONT register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
  - The bit position of error factors is reported as a “SysErr factor code.”
- Conditions for starting SysErr request notification
  - Even if a flag which error notification is disabled by SEGCONT register is set to 1, notification is not made.
  - Notification is made immediately after a flag which error notification is enabled by SEGCONT register is set to 1.
  - After clearing of a flag, notification is made if an other flag which error notification is enabled by SEGCONT register remains set.
- Finishing notification at a SysErr acknowledgement
  - Even after notification is finished, the flag is not cleared automatically.
  - Notification is not made until setting or clearing the flag again.
  - If an error flag that is prioritized higher than the error factor is set prior to an acknowledgement, the notification information may be replaced with a higher prioritized SysErr factor code.

#### (b) SEG Function: Recording Error Address Information

- When an error which error notification is enabled by SEGCONT register occurs, the error address is retained in the SEGADDR register.
  - No information is retained by setting or clearing an error flag in SEGFLAG register.
  - When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While a flag which error notification is enabled by SEGCONT register is set to 1, overwrite to the SEGADDR register is inhibited.
  - If error occurrence input continues, information of subsequent error factors is not retained.
  - To reset the inhibition of overwrite to the register, clear either SEGCONT or SEGFLAG register (or both of them).

#### (c) Supplementary Notes on SYSERR Exception

- Even when a SYSERR exception occurs, the value of the PSW.EBV bit is held, and the base address of the exception handler does not switch.

## 3A.3 Inter-CPU Functions

### 3A.3.1 Processor Element Identifier

The PEID, processor element ID number, can be read from the PEID field in the HTCFCG0 register. Which CPU core is executing a specific program can be checked by referring to the PEID. The following shows the PEID of this product.

CPU Core	PEID
CPU1 (PE1)	001 <sub>B</sub>
CPU2 (PE2)	010 <sub>B</sub>

### 3A.3.2 Inter-Processor Interrupt Function

Each CPU has the IPIR register as a peripheral function. Setting of the IPIR register enables an EI-level interrupt request from a PE to another PE. For details, see **Section 3A.2.3, Inter-Processor Interrupts**.

### 3A.3.3 Exclusive Control

The local RAM, global RAM, retention RAM, and exclusive control registers (G0MEV<sub>m</sub>; m = 0 to 31) are available as a resource for exclusive control. Atomic operation instructions LDL/STC, CAXI, SET1, CLR1, and NOT1 can be executed on the local RAM, global RAM, and retention RAM. CAXI, SET1, CLR1, and NOT1 can be executed on the exclusive control registers (G0MEV<sub>m</sub>). Note that the LD and ST instructions can also access these resources, but the access is not atomic.

#### 3A.3.3.1 Exclusive Control Register (G0MEV<sub>m</sub>; m = 0 to 31)

This register supports exclusive control for variable shared between PEs (common resources). (MEV: Mutual Exclusion Variable Register)

- Thirty-two 32-bit G0MEV<sub>m</sub> registers are included.
- G0MEV<sub>m</sub> can be accessed in 8-, 16-, or 32-bit units.
- Access from CPU1 (PE1) and CPU2 (PE2) can be made.
- Atomic operation instructions CAXI, SET1, CLR1, and NOT1 can be executed.

CPU1 (PE1) and CPU2 (PE2) each have an independent access path for G0MEV<sub>m</sub> registers. Therefore, when CPU1 (PE1) and CPU2 (PE2) each access different G0MEV<sub>m</sub> registers, they do not need to wait for access. When they access the same G0MEV<sub>m</sub> register, however, waiting for access is required.

Table 3A.77 List of Registers

Module Name	Address*1	Register Name	Symbol	R/W	Access Size				Value after Reset
					1	8	16	32	
MEV	+00 <sub>H</sub>	Exclusive control register 0	G0MEV0	R/W	—	✓	✓	✓	0000 0000 <sub>H</sub>

### 3A.3.3.2 Operation of the LDL.W and STC.W Instructions

The LDL.W and STC.W instructions can be used to perform atomic read-modify-write operations for accurate processing in the updating of memory in multicore systems. The LDL.W and STC.W instructions operate as follows.

- **Link generation:** The CPU is capable of generating links to both the local RAM and global RAM (including the retention RAM). Executing the LDL.W instruction on the target RAM for the operation leads to the link flag being set and a link being generated in response to reading by the instruction. Two link flag systems are provided, one each for the following two areas of RAM.
  - (1) The local RAM for the given processor
  - (2) The global RAM (including the retention RAM)
- **Success in storing:** After a link has been generated, storing will only proceed in response to executing an STC.W instruction corresponding to the generated link.
- **Failure in storing:** If a link is lost, storing does not proceed even when an STC.W instruction for the corresponding address is processed. Storing also does not proceed when an STC.W instruction that does not correspond to the link is processed.
- **Condition for successful storing:** If the following condition is met, the STC.W instruction is judged to be for the address corresponding to the link.
  - The address for the LDL.W instruction which generated the link matches that for the STC.W instruction.
- **Loss of the link:** If any of the following occurs, the link flag is cleared and the link is lost.
  - **Any of the following processing by the CPU for which the link was generated:**
    - Execution of a STC.W instruction. The corresponding link (for (1) or (2) above) will be lost irrespective of the success or failure of storing.
    - Occurrence of an exception or the CPU executing an instruction to return from an exception processing routine (FERET or EIRET). The link flags for both areas of RAM are cleared.
    - Successive execution of LDL.W instructions for a location with the same link flags. The link generated in response to the preceding LDL.W instruction will be lost. Do not execute such processing
    - Execution of a storing operation other than an STC.W instruction for the address generating the link. Do not execute such processing.
  - **Access as described below by another bus master:**  
Any storing operation, including execution of an STC.W instruction for the address generating the link.  
The corresponding link will be lost.

Success of the STC.W instruction means that the LDL.W and STC.W instructions have realized an atomic read-modify-write operation.

## 3A.4 CPU2 Boot Up Operation

After reset is released, CPU1 starts to fetch instruction. Initial condition of CPU2 is decided by option byte setting and its boot up condition can be set and confirmed by BOOTCTRL register.

### (1) List of Register

Table 3A.79 BOOTCTRL Register (Base Address: FFC5 8000<sub>H</sub>)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
—	+00 <sub>H</sub>	4	BOOTCTRL register	BOOTCTRL	—	R/W	—	—	—	✓	0000 0006 <sub>H</sub> or 0000 0002 <sub>H</sub>

### (2) BOOTCTRL — Boot Control Register

This register is used to control the start-up of CPU2. By setting bit to “1”, CPU2 starts its pipeline operation. When the value of CPU2EN is “1”, it cannot be overwritten to “0” excluding reset.

**Access:** BOOTCTRL register can be read or written in 32-bit units.

**Address:** FFC5 8000<sub>H</sub>

**Value after reset:** The value after reset depends on the option byte setting.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CPU2 EN	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0/1*1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R

Note 1. The setting of the option byte OPBT0.PE2BOOTEN is reflected. For details on the option byte, see **Section 44.9, Option Bytes**.

Table 3A.80 BOOTCTRL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	CPU2EN	CPU2 operation setting 0: Invalid boot up of CPU2. 1: Valid boot up of CPU2. When the value of PE2EN (option byte) is “0”, it cannot be overwritten to “1”.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

## 3A.5 Notes

### 3A.5.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see *APPENDIX A, Hazard Resolution Procedure for System Registers in the RH850G3KH User's Manual: Software*.

#### **When the updated results in the control registers are to be used by the subsequent instruction:**

*Example 1:* An interrupt is enabled by execution of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits.

Proceed as follows in this case.

- (1) Execute the store instruction to update a control register (ST.W, etc.).
- (2) Perform a dummy read of the above control register (LD.W, etc.).
- (3) Execute SYNCP.
- (4) Execute the subsequent instruction (EI).

In case of RH850/F1KH, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

*Example 2:* When you must wait until a control register (control register A) has been completely updated before accessing another control register (control register B), execute similar processing. For example, different peripheral functions are linked, or the interrupt mask for INTC is cleared after the peripheral function is set. Note that this processing is not required if the control registers A and B belong to the same peripheral group.

- (1) Execute the store instruction to update the control register A (ST.W, etc.).
- (2) Perform a dummy read of the above control register (LD.W, etc.).
- (3) Execute SYNCP.
- (4) Execute the store instruction to access the control register B (ST.W, LD.W, etc.).

In case of RH850/F1KH, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

The similar processing is also required when starting to access a memory or control register to be protected is started after a safety function (such as some kind of memory protection and ECC) has been completely set up.

**When the updated results of the control register or memory to be used in the instruction fetch of the subsequent instruction:**

- (a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.
- (1) Execute the store instruction to update a memory (ST.W, etc.).
  - (2) Perform a dummy read of the above memory (LD.W, etc.).
  - (3) Execute SYNCP.
  - (4) Execute SYNCL.
  - (5) Execute the subsequent instruction (branch instruction, etc.).
- (b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.
- (1) Execute the store instruction to update a control register (ST.W, etc.).
  - (2) Perform a dummy read of the control register (LD.W, etc.).
  - (3) Execute SYNCP.
  - (4) Execute SYNCL.
  - (5) Execute the subsequent instruction (branch instruction, etc.).

**When switching the code flash memory area:**

In this case, see *Section 10, Usage Notes, (7) Updating the BFASELR register in the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.*

### 3A.5.2 Ensure Coherency after Rewriting the Code Flash

The CPU1 is equipped with the buffer for the code flash area as described in **Section 3A.2.2, Buffers for Code Flash.**

Therefore, clear the buffer to ensure coherency after rewriting the code flash by self-programming.

### 3A.5.3 Access to Registers by Using Bit-Manipulation Instructions

Writing bit-manipulation instructions consists of read-modify-write processing in 8-bit units. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

### 3A.5.4 Caution of Prefetching

There is a possibility that the reading of the memory occurs by pre-fetch from the area where instruction codes do not exist. Secure more than 40-byte initialized area after the area where instruction codes are stored.

### 3A.5.5 Overwriting Context upon Acceptance of Multiple Exceptions

Acceptance of an exception depends on the type of exception source, regardless of the states of the ID and NP bits in the PSW register. When multiple exceptions are generated, the contents of the system register which hold the context information are overwritten. For the conditions for acceptance and whether correct return or recovery is possible for each exception source, see *the List of Exception Sources in the RH850G3KH User's Manual: Software.*

## Section 3BC CPU System of RH850/F1KM

### 3BC.1 Overview

#### 3BC.1.1 Block Configuration

**Figure 3BC.1, Block Configuration Diagram of the RH850/F1KM-S4, RH850/F1KM-S2** shows the block configuration diagram of RH850/F1KM-S4 and RH850/F1KM-S2.

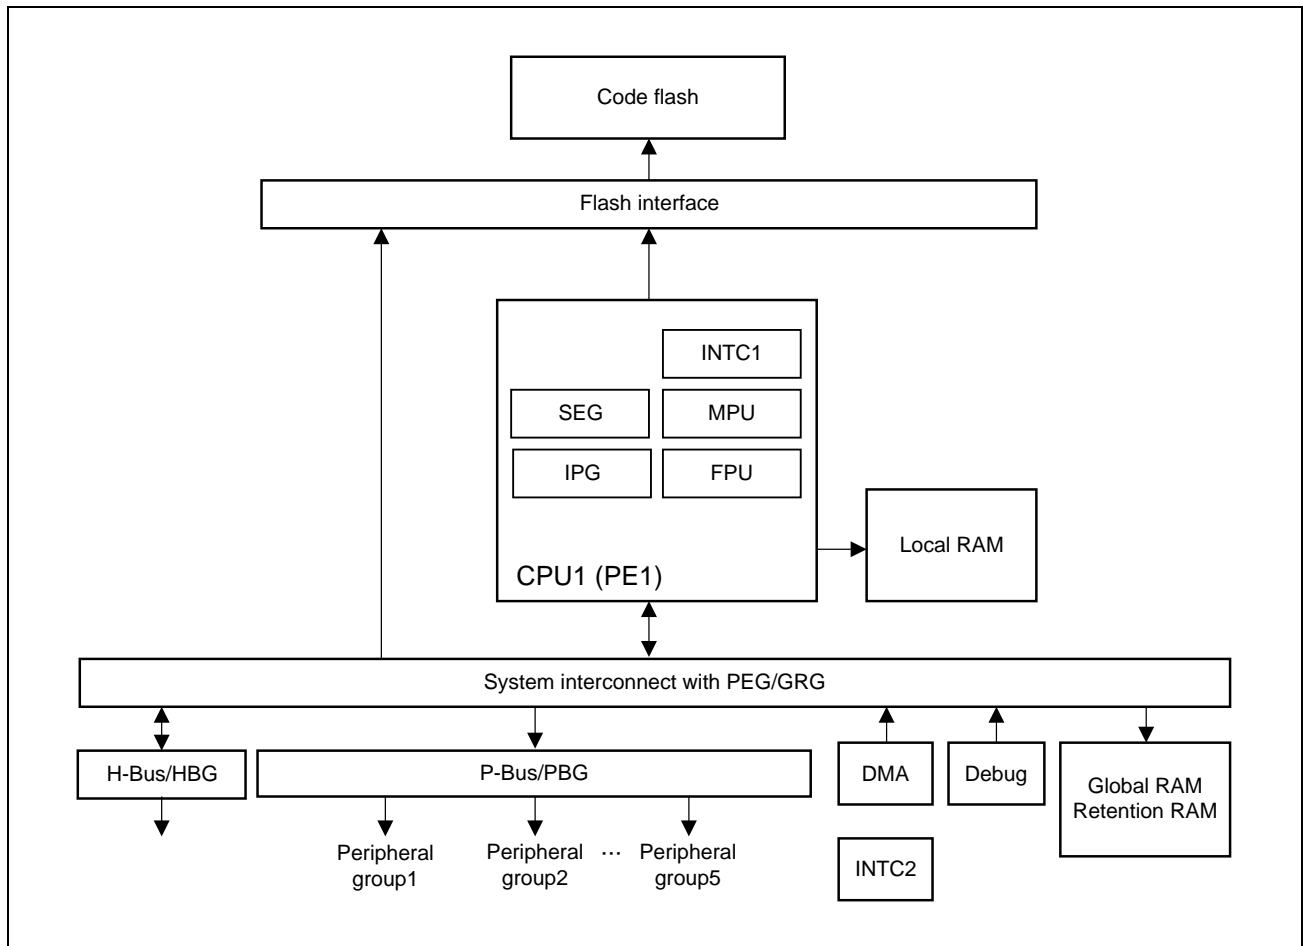

Figure 3BC.1 Block Configuration Diagram of the RH850/F1KM-S4, RH850/F1KM-S2

**Figure 3BC.2, Block Configuration Diagram of the RH850/F1KM-S1** shows the block configuration diagram of RH850/F1KM-S1.

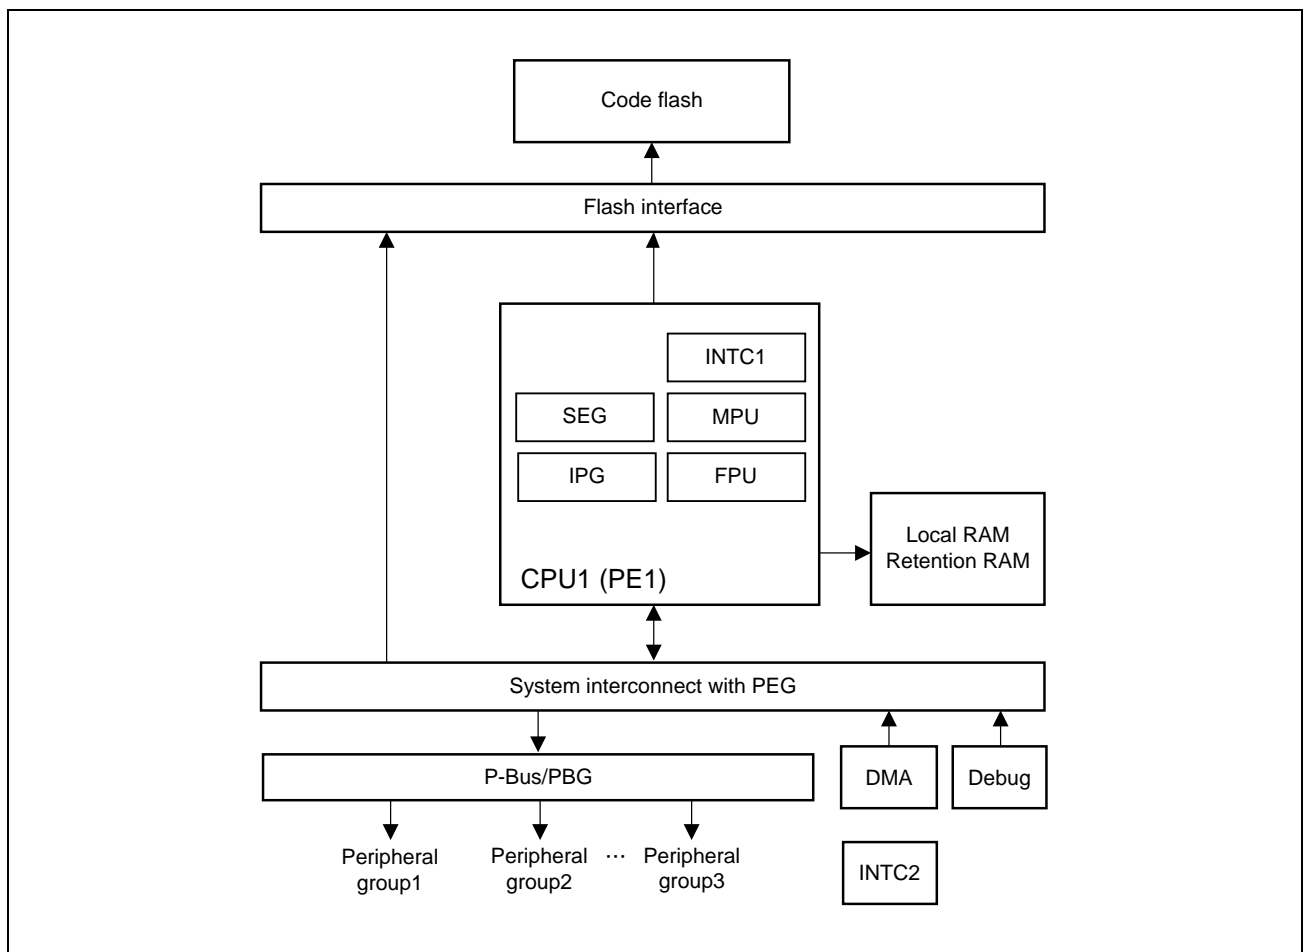

Figure 3BC.2 Block Configuration Diagram of the RH850/F1KM-S1

### CPU1 (PE1)

The RH850G3KH2.0 Core is used as the main CPU.

### Local RAM

This is a high-speed accessible RAM

### Global RAM

The global RAM is a large-capacity RAM for data sharing among CPU and with DMA.

This is not supported with RH850/F1KM-S1.

## Retention RAM

RH850/F1KM-S4, RH850/F1KM-S2:

The retention RAM is used to retain values in DeepSTOP mode. Since the continuous global RAM area is assigned for the retention RAM, the retention RAM can also serve as a global RAM for sharing data with the DMA.

RH850/F1KM-S1:

The retention RAM is used to retain values in DeepSTOP mode. Since the continuous local RAM area is assigned for the retention RAM, the retention RAM can also serve as a local RAM for sharing data with the DMA.

## Code flash

The code flash memory is included for program storage. It is connected with CPU1 via the flash interface.

## Data flash

The data flash memory can be rewritten by the CPU1. It has a greater write endurance than the code flash memory.

## P-Bus and H-Bus (RH850/F1KM-S4, RH850/F1KM-S2)

The P-Bus connects the peripheral IPs. The P-Bus is divided into five peripheral groups, 1 to 5.

## P-Bus (RH850/F1KM-S1)

The P-Bus connects the peripheral IPs. The P-Bus is divided into three peripheral groups, 1 to 3.

## INTC1, INTC2

There are two interrupt controllers, INTC1 and INTC2.

## DMA

The DMA transfer module (PDMA) is included.

## Slave guard

The slave guard is a function to prevent unauthorized access from the specific bus master, and consists of the following guard structures:

(1) PE guard (PEG)

The PE guard is a function to prevent unauthorized access to the resources (local RAM) in the PE from an external master. After reset is released, access from other than the own PE is prohibited.

(2) Internal Peripheral Guard (IPG)

The PE with system interconnects supports "Internal Peripheral Guard" (IPG) that protects the registers of peripherals against invalid accesses.

(3) Global RAM guard (GRG) (RH850/F1KM-S4, RH850/F1KM-S2)

The global RAM guard is a function to prevent unauthorized access to the global RAM and retention RAM from an external master. The global RAM is in the unprotected state (accessible from all bus master) after reset is released. For details, see **Section 40B, Functional Safety of RH850/F1KM-S4, RH850/F1KM-S2**.

(4) Peripheral guard (PBG / HBG (RH850/F1KM-S4, RH850/F1KM-S2))

The peripheral guard is a function to prevent unauthorized access to peripherals. The control registers in the peripheral circuits are protected against illegal accesses.

For details, see **Section 40B, Functional Safety of RH850/F1KM-S4, RH850/F1KM-S2** and **Section 40C, Functional Safety of RH850/F1KM-S1**.

## 3BC.2 CPU

### 3BC.2.1 Core Functions

#### 3BC.2.1.1 Features

**Table 3BC.1, Features of the RH850G3KH2.0 Core** lists features of the RH850G3KH2.0 core.

Table 3BC.1 Features of the RH850G3KH2.0 Core

Item	Feature
CPU	<ul style="list-style-type: none"> <li>• Advanced 32-bit architecture for embedded control</li> <li>• 32-bit internal data bus</li> <li>• Thirty-two 32-bit general-purpose registers               <ul style="list-style-type: none"> <li>– RISC-type instruction set</li> <li>– Long-/short-format load/store instructions</li> <li>– Three-operand instructions</li> <li>– Instruction set based on C language</li> </ul> </li> <li>• CPU operating modes               <ul style="list-style-type: none"> <li>– User mode and supervisor mode</li> </ul> </li> <li>• Address space: 4-Gbyte linear address space for both data and instructions</li> </ul>
Coprocessor	<ul style="list-style-type: none"> <li>• Floating-point operation coprocessor (FPU)               <ul style="list-style-type: none"> <li>– Supports single precision (32 bits)</li> <li>– Supports data types and exceptions conforming to IEEE754.</li> <li>– Rounding mode: Neighborhood, 0 direction, <math>+\infty</math> direction, and <math>-\infty</math> direction</li> <li>– Handling of denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754</li> </ul> </li> </ul>
Exception/Interrupt	<ul style="list-style-type: none"> <li>• 16 interrupt priority levels settable for each channel</li> <li>• Vector selection method selectable according to performance request or memory usage               <ul style="list-style-type: none"> <li>– Direct branching exception vectors</li> <li>– Indirect branching exception vectors referring to the address table</li> </ul> </li> <li>• Supports the high-speed save/return processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt</li> </ul>
Memory management	<ul style="list-style-type: none"> <li>• Memory protection function (MPU): 16 areas settable</li> </ul>
Cache	<ul style="list-style-type: none"> <li>• No cache memory is equipped.</li> </ul>

### 3BC.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

#### (1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).

Table 3BC.2 Program Registers

Program Register	Name	Function	Description
General-purpose registers	r0	Zero register	Always retains "0"
	r1	Assembler reserved register	Used as working register for generating addresses
	r2	Register for address and data variables (used when the real-time OS used does not use this register)	
	r3	Stack pointer (SP)	Used for generating a stack frame when a function is called
	r4	Global pointer (GP)	Used for accessing a global variable in the data area
	r5	Text pointer (TP)	Used as a register that indicates the start of the text area (area where program code is placed)
	r6 to r29	Register for address and data variables	
	r30	Element pointer (EP)	Used as a base pointer for generating addresses when accessing memory
	r31	Link pointer (LP)	Used when the compiler calls a function
Program counter	PC	Retains instruction addresses during execution of programs	

#### NOTE

For further descriptions of r1, r3 to r5, and r31 used by the assembler and/or C compiler, see the specification of each software development environment.

**(a) General-Purpose Registers**

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables. Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

## 1. r0, r3, r30

These registers are implicitly used by instructions.

r0 is a register that always retains “0”. It is used for operations that use 0 and addressing with base address being 0.

r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.

r30 is used as a base pointer when the SLD or SST instruction accesses memory.

## 2. r1, r4, r5, r31

These registers are implicitly used by the assembler and C compiler.

When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

## 3. r2

This register might be used by a real-time OS in some cases. If the real-time OS that is being used does not use r2, r2 can be used as a register for address variables or data variables.

**(b) PC — Program Counter**

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0, and branching to an odd number address is disabled.

Table 3BC.3 PC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	PC31 to PC1	These bits indicate the address of the instruction being executed.	R/W	*1
0	PC0	This bit is fixed to 0. Branching to an odd number address is disabled.	R/W	0

Note 1. The value after reset differs depending on the setting value of the reset vector. For details, see **(q) RBASE — Reset Vector Base Address Register**.

## (2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and a selection ID.

Table 3BC.4 Basic System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 0	EIPC	Status save registers when acknowledging EI level exception	SV
SR1, 0	EIPSW	Status save registers when acknowledging EI level exception	SV
SR2, 0	FEPC	Status save registers when acknowledging FE level exception	SV
SR3, 0	FEPSW	Status save registers when acknowledging FE level exception	SV
SR5, 0	PSW	Program status word	*1
SR6, 0	FPSR	(Refer to FPU function registers.)	CU and SV
SR7, 0	FPEPC	(Refer to FPU function registers.)	CU and SV
SR8, 0	FPST	(Refer to FPU function registers.)	CU
SR9, 0	FPCC	(Refer to FPU function registers.)	CU
SR10, 0	FPCFG	(Refer to FPU function registers.)	CU
SR11, 0	FPEC	(Refer to FPU function registers.)	CU and SV
SR13, 0	EIIC	EI level exception source register	SV
SR14, 0	FEIC	FE level exception source register	SV
SR16, 0	CTPC	CALLT execution status save register	UM
SR17, 0	CTPSW	CALLT execution status save register	UM
SR20, 0	CTBP	CALLT base pointer register	UM
SR28, 0	EIWR	EI level exception working register	SV
SR29, 0	FEWR	FE level exception working register	SV
SR0, 1	MCFG0	Machine configuration register	SV
SR2, 1	RBASE	Reset vector base address register	SV
SR3, 1	EBASE	Exception handler vector address register	SV
SR4, 1	INTBP	Base address register of the interrupt handler address table	SV
SR5, 1	MCTL	CPU control	SV
SR6, 1	PID	Processor ID register	SV
SR11, 1	SCCFG	SYSCALL operation setting register	SV
SR12, 1	SCBP	SYSCALL base pointer register	SV
SR0, 2	HTCFG0	Thread configuration register	SV
SR6, 2	MEA	Memory error address register	SV
SR7, 2	ASID	Address space ID register	SV
SR8, 2	MEI	Memory error information register	SV

Note 1. The access permission differs depending on the bit.

**(a) EIPC — Status Save Register when Acknowledging EI Level Exception**

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see “*Types of Exceptions*” in *Software Manual*).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address cannot be specified.

Table 3BC.5 EIPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	EIPC31 to EIPC1	These bits indicate the PC saved when an EI level exception is acknowledged.	R/W	Undefined
0	EIPC0	This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0.	R/W	Undefined

**(b) EIPSW — Status Save Register when Acknowledging EI Level Exception**

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3BC.6 EIPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an EI level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an EI level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an EI level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an EI level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an EI level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an EI level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an EI level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an EI level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an EI level exception is acknowledged.	R/W	0

**(c) FEPC — Status Save Register when Acknowledging FE Level Exception**

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see “*Types of Exceptions*” in *Software Manual*).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address cannot be specified.

Table 3BC.7 FEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FEPC31 to FEPC1	These bits indicate the PC saved when an FE level exception is acknowledged.	R/W	Undefined
0	FEPC0	This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0.	R/W	Undefined

**(d) FEPSW — Status Save Register when Acknowledging FE Level Exception**

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3BC.8 FEPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an FE level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an FE level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an FE level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an FE level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an FE level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an FE level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an FE level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an FE level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an FE level exception is acknowledged.	R/W	0

Table 3BC.10 PSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
15	EBV	This bit indicates the reset vector and exception vector operation. See the description on RBASE (( <b>q</b> ) <b>RBASE — Reset Vector Base Address Register</b> ) and EBASE (( <b>r</b> ) <b>EBASE — Exception Handler Vector Address Register</b> ) in this section.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see <b>Table 7BC.1, List of Exception Sources</b> . 0: The acknowledgement of FE level exception is enabled. 1: The acknowledgement of FE level exception is disabled.	R/W	0
6	EP	This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: An exception other than an interrupt is not being serviced. 1: An exception other than an interrupt is being serviced.	R/W	0
5	ID	This bit disables the acknowledgement of EI level exception. When an EI level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level exception. As for the exceptions which the ID bit disables the acknowledgment, see <b>Table 7BC.1, List of Exception Sources</b> . This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. 0: EI level exception is not being processed or the section is not a critical section (after execution of EI instruction). 1: EI level exception is being processed or the section is a critical section (after execution of DI instruction).	R/W	1
4	SAT*1	This bit indicates that the operation result is saturated because the operation result of a saturated operation instruction has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1, but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. 0: Not saturated 1: Saturated	R/W	0
3	CY	This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry and borrow have not occurred. 1: Carry or borrow has occurred.	R/W	0
2	OV*1	This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred.	R/W	0
1	S*1	This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative.	R/W	0
0	Z	This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0.	R/W	0

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. The SAT flag is set to 1 only when the OV flag is set to 1 in a saturated operation.

Operation Result Status	Flag Status			Operation Result after Saturation Processing
	SAT	OV	S	
Exceeded positive maximum value	1	1	0	7FFF FFFF <sub>H</sub>
Exceeded negative maximum value	1	1	1	8000 0000 <sub>H</sub>
Positive (maximum value not exceeded)	Value prior to operation is retained.	0	0	Operation result itself
Negative (maximum value not exceeded)			1	

**(f) EIIC — EI Level Exception Source Register**

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

Table 3BC.11 EIIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIIC31 to EIIC0	These bits store the exception source code when an EI level exception is acknowledged. The EIIC15 to EIIC0 field stores the lower 16 bits of the exception source code. The EIIC31 to EIIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

**(g) FEIC — FE Level Exception Source Register**

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

Table 3BC.12 FEIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEIC31 to FEIC0	These bits store the exception source code when an FE level exception is acknowledged. The FEIC15 to FEIC0 field stores the lower 16 bits of the exception source code. The FEIC31 to FEIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

**(h) CTPC — Status Save Register when Executing CALLT Instruction**

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address cannot be specified.

Table 3BC.13 CTPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTPC31 to CTPC1	These bits indicate the PC of the instruction after the CALLT instruction.	R/W	Undefined
0	CTPC0	This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0.	R/W	Undefined

**(i) CTPSW — Status Save Register when Executing CALLT Instruction**

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

Table 3BC.14 CTPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4	SAT	This bit stores the PSW.SAT bit setting when the CALLT instruction is executed.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when the CALLT instruction is executed.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when the CALLT instruction is executed.	R/W	0
1	S	This bit stores the PSW.S bit setting when the CALLT instruction is executed.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when the CALLT instruction is executed.	R/W	0

**(j) CTBP — CALLT Base Pointer Register**

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.

Be sure to set the CTBP register to a halfword address.

Table 3BC.15 CTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTBP31 to CTBP1	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the start address of the table used by the CALLT instruction.	R/W	Undefined
0	CTBP0	This bit indicates the base pointer address of the CALLT instruction. This bit indicates the start address of the table used by the CALLT instruction. Always set this bit to 0.	R	0

**(k) ASID — Address Space ID Register**

This register indicates the address space ID. This is used to identify the address space provided by the memory management function.

Table 3BC.16 ASID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
9 to 0	ASID	These bits indicate the address space ID.	R/W	Undefined

**(l) EIWR — EI Level Exception Working Register**

The EIWR register is used as a working register when an EI level exception has occurred.

Table 3BC.17 EIWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIWR31 to EIWR0	These bits constitute a working register that can be used for any purpose during the servicing of an EI level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

**(m) FEWR — FE Level Exception Working Register**

The FEWR register is used as a working register when an FE level exception has occurred.

Table 3BC.18 FEWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEWR31 to FEWR0	These bits constitute a working register that can be used for any purpose during the servicing of an FE level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

**(n) HTCFCG0 — Thread Configuration Register**

Table 3BC.19 HTCFCG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 19	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
18 to 16	PEID	These bits indicate the processor element number.	R	001 <sub>B</sub>
15	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
14 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

**(o) MEA — Memory Error Address Register**

Table 3BC.20 MEA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MEA	These bits store the violation address when an MAE (misaligned) or MPU occurs.	R/W	Undefined

**(p) MEI — Memory Error Information Register**

This register is used to store information about the instruction that caused a misaligned (MAE) or memory protection (MDP) exception when such an exception occurred. This information is used during emulation.

Table 3BC.21 MEI Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 21	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
20 to 16	REG	These bits indicate the number of the source or destination register accessed by the instruction that caused the exception. For details, see <b>Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined
15 to 11	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
10, 9	DS	These bits indicate the data type of the instruction that caused the exception.*1 0: Byte (8 bits) 1: Halfword (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) For details, see <b>Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined
8	U	This bit indicates the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see <b>Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5 to 1	ITYPE	These bits indicate the instruction that caused the exception. For details, see <b>Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined
0	RW	This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory). 0: Read (Load-memory) 1: Write (Store-memory) For details, see <b>Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register.</b>	R/W	Undefined

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3BC.22 Instructions Causing Exceptions and Values of MEI Register

Instruction	REG	DS	U	RW	ITYPE
SLD.B	dst	0 (byte)	0 (signed)	0 (read)	0000 <sub>B</sub>
SLD.BU	dst	0 (byte)	1 (unsigned)	0 (read)	0000 <sub>B</sub>

CACHE	—	—	—	—	—
Interrupt (table reference)*1	—	2 (word)	0 (signed)	0 (read)	10101 <sub>B</sub>

Note 1. When reading the interrupt vector by using the table reference method.

#### NOTE

dst: destination register number, src: source register number

**(q) RBASE — Reset Vector Base Address Register**

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

Table 3BC.23 RBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	RBASE31 to RBASE9	These bits indicate the reset vector when there is a reset. When PSW.EBV = 0, this address is also used as the exception vector. For RBASE8 to RBASE0, 0 is used implicitly.	R	0000 0000 0000 0000 0000 000B*1
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See <b>Section 7BC.10.1, Direct Vector Method</b> . This bit is valid when PSW.EBV = 0.	R	0

Note 1. The value depends on the reset vector. The values set at shipment are shown in the table. When the reset vector is modified, the address will be changed.

**(r) EBASE — Exception Handler Vector Address Register**

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

Table 3BC.24 EBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	EBASE31 to EBASE9	The exception handler routine address is changed to the address resulting from adding the offset address of each exception to the base address specified for this register. For EBASE8 to EBASE0, 0 is used implicitly.	R/W	Undefined
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See <b>Section 7BC.10.1, Direct Vector Method</b> .	R/W	Undefined

**(s) INTBP — Base Address Register of the Interrupt Handler Address Table**

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

Table 3BC.25 INTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	INTBP31 to INTBP9	These bits indicate the base pointer address for an interrupt when the table reference method is used.  The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified by the table reference method (EIINT0 to EIINT511) is acknowledged. For INTBP8 to INTBP0, 0 is used implicitly.	R/W	Undefined
8 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

**(t) PID — Processor ID Register**

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

Table 3BC.26 PID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 24	PID	Architecture Identifier  This identifier indicates the architecture of the processor.	R	05 <sub>H</sub>
23 to 8		Function Identifier  This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bits 23 to 11: Reserved Bit 10: Double-precision floating-point operation function Bit 9: Single-precision floating-point operation function Bit 8: Memory protection function (MPU)	R	0003 <sub>H</sub>
7 to 0		Version Identifier  This identifier indicates the version of the processor.	R	A8 <sub>H</sub>

**(u) SCCFG — SYSCALL Operation Setting Register**

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Table 3BC.27 SCCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	SIZE	These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If vectors exceeding the maximum number of entries are specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry.	R/W	Undefined

**(v) SCBP — SYSCALL Base Pointer Register**

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

Table 3BC.28 SCBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	SCBP31 to SCBP2	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction.	R/W	Undefined
1, 0	SCBP1, SCBP0	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction. Always set these bits to 0.	R	0

**(w) MCFG0 — Machine Configuration Register**

This register indicates the CPU configuration.

Table 3BC.29 MCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 18	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
17, 16	SPID	These bits indicate the system protection number.	R/W	01 <sub>B</sub>
15 to 3	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
2	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

**(x) MCTL — Machine Control Register**

This register is used to control the CPU.

Table 3BC.30 MCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
30 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	MA	This bit is used to control the misaligned access. 0: In the event of a misaligned access, an exception is always generated.*1 1: The correct operation is controlled by hardware.*2	R/W	1
0	UIC	This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction in user mode becomes possible.	R/W	0

Note 1. Excluding LD.DW, and ST.DW for word boundary allocation.

Note 2. Exception still occurs in case of LD.DW or ST.DW for misaligned access except word boundary allocation.

### (3) Interrupt Function Registers

Table 3BC.31 Interrupt Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR7, 1	FPIPR	FPI exception interrupt priority setting register	SV
SR10, 2	ISPR	Priority of interrupt being serviced register	SV
SR11, 2	PMR	Interrupt priority masking register	SV
SR12, 2	ICSR	Interrupt control status register	SV
SR13, 2	INTCFG	Interrupt function setting register	SV

**(a) FPIPR — FPI Exception Interrupt Priority Setting Register**

This register is used to set the interrupt priority of FPI exception.

Table 3BC.32 FPIPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	FPIPR	These bits are used to specify the interrupt priority of floating-point operation exceptions (imprecise) (FPI). Specify values from 0 to 16. Specifying 17 or greater is prohibited. FPI exceptions are handled using the specified interrupt priority. If an FPI exception occurs at the same time as an interrupt that has the same priority, the FPI exception is prioritized.	R/W	0

**NOTE:** A set value of more than 16 is treated as 16.

**(b) ISPR — Priority of Interrupt being Serviced Register**

This register retains the priority of the *EIINTn* interrupt being serviced by the CPU. This priority value is then used to perform priority ceiling processing when multiple interrupts occur.

Table 3BC.33 ISPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	ISP15 to ISP0	These bits indicate the acknowledgment status of an <i>EIINTn</i> interrupt with a priority that corresponds to the relevant bit position. 0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged. 1: An interrupt request for an interrupt whose priority corresponds to the relevant bit position is being serviced by the CPU core.	R* <sup>3</sup>	0

The bit positions correspond to the following priority levels.

Bit	Priority
0	Priority 0 (highest)
1	Priority 1
:	
14	Priority 14
15	Priority 15 (lowest)

When an interrupt request (*EIINTn*) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISP0 bits that are set to 1 (0 is the highest priority) is cleared to 0.\*<sup>1</sup>

While a bit in this register is set to 1, same or lower priority interrupts (*EIINTn*) and FPI exceptions\*<sup>2</sup> are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged.

When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit.

- Note 1. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) to the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.
- Note 2. Since FPI exceptions have the same level of priority as *EIINTn* interrupts, they are affected by interrupts in the same way as the ISPR. The priority of FPI exceptions is set by the FPIPR register.
- Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

**(c) PMR — Interrupt Priority Masking Register**

This register is used to mask the specified interrupt priority.

Table 3BC.34 PMR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	PM15 to PM0	These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. 0: Servicing of an interrupt with a priority that corresponds to the relevant bit position is enabled. 1: Servicing of an interrupt with a priority that corresponds to the relevant bit position is disabled.  The bit positions correspond to the following priority levels:	R/W	0

Bit	Priority
0	Priority 0 (highest)
1	Priority 1
⋮	
14	Priority 14
15	Priority 15 and priority 16 (lowest)

While a bit in this register is set to 1, interrupts (*EIINTn*) and FPI exceptions\*<sup>1</sup> with the priority corresponding to that bit are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged\*<sup>2</sup>.

Note 1. Since FPI exceptions are specified as the same level of priority as that of interrupts (*EIINTn*), it is affected by the PMR like interrupts. The priority of FPI exceptions is set by the FPIPR register.

Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, FF00<sub>H</sub> can be set, but F0F0<sub>H</sub> or 00FF<sub>H</sub> cannot.

**(d) ICSR — Interrupt Control Status Register**

This register indicates the interrupt control status in the CPU.

Table 3BC.35 ICSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	PMFP	This bit indicates that an FPI exception with the priority level masked by the PMR register exists.	R	0
0	PMEI	This bit indicates that an interrupt ( <i>EIINTn</i> ) with the priority level masked by the PMR register exists.	R	0

**(e) INTCFG — Interrupt Function Setting Register**

This register is used to specify settings related to the CPU's internal interrupt function.

Table 3BC.36 INTCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	ISPC	<p>This bit specifies how the ISPR register is updated.</p> <p>0: The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored.</p> <p>1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed.</p> <p>If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (<i>E/INTn</i>) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, updating by the program (via execution of an LDSR instruction) is ignored.</p> <p>If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (<i>E/INTn</i>) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program.</p> <p>In normal cases, the ISPC bit should be cleared to 0. When performing software-based control of interrupt priorities, however, set this bit (1) and perform priority control by using the PMR register.</p>	R/W	0

#### (4) FPU Function Registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations. The RH850/F1KM supports single-precision floating-point instruction and thirty-two 32-bit registers can be specified.

These registers correspond to general-purpose registers r0 to r31. The FPU can use the following system registers to control floating-point operation

Table 3BC.37 FPU System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR6, 0	FPSR	Floating-point operation setting/status register	CU and SV
SR7, 0	FPEPC	Floating-point exception program counter register	CU and SV
SR8, 0	FPST	Floating-point operation status register	CU
SR9, 0	FPCCR	Floating-point operation comparison result register	CU
SR10, 0	FPCFG	Floating-point operation configuration register	CU
SR11, 0	FPEC	Floating-point exception control register	CU and SV

**(a) FPSR — Floating-point Operation Setting/Status Register**

This register indicates the execution status of floating-point operations and any exceptions that occur.

Note 1. Cause bits (XC)

Note 2. Enable bits(XE)

Note 3. Preservation bits (XP)

Table 3BC.38 FPSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset																						
31 to 24	CC[7:0]	These are the CC (condition) bits. They store the results of floating-point comparison instructions. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined																						
23	FN	This bit enables flush-to-nearest mode. When the FN bit is set to 1, if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number.	R/W	0																						
22	IF	This bit accumulates and indicates information about the flushing of input operands.	R/W	0																						
21	PEM	This bit specifies whether to handle an exception as a precise exception. If the PEM bit is 1, exceptions that are caused by the execution of a floating-point operation instruction are handled as precise exceptions.	R/W	0																						
20	—	(Reserved for future expansion. Be sure to set to 0.)	R	0																						
19, 18	RM	These are the rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions.	R/W	00																						
		<table border="1"> <thead> <tr> <th colspan="2">RM Bits</th> <th rowspan="2">Mnemonic</th> <th rowspan="2">Description</th> </tr> <tr> <th>19</th> <th>18</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>RN</td> <td>Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.</td> </tr> <tr> <td>0</td> <td>1</td> <td>RZ</td> <td>Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.</td> </tr> <tr> <td>1</td> <td>0</td> <td>RP</td> <td>Rounds the result toward <math>+\infty</math>. The result is nearest to a value greater than the accurate result with infinite accuracy.</td> </tr> <tr> <td>1</td> <td>1</td> <td>RM</td> <td>Rounds the result toward <math>-\infty</math>. The result is nearest to a value less than the accurate result with infinite accuracy.</td> </tr> </tbody> </table>	RM Bits		Mnemonic	Description	19	18	0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.	0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.	1	0	RP	Rounds the result toward $+\infty$ . The result is nearest to a value greater than the accurate result with infinite accuracy.	1	1	RM	Rounds the result toward $-\infty$ . The result is nearest to a value less than the accurate result with infinite accuracy.		
RM Bits		Mnemonic	Description																							
19	18																									
0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.																							
0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.																							
1	0	RP	Rounds the result toward $+\infty$ . The result is nearest to a value greater than the accurate result with infinite accuracy.																							
1	1	RM	Rounds the result toward $-\infty$ . The result is nearest to a value less than the accurate result with infinite accuracy.																							
17	FS	This bit enables values that cannot be normalized (subnormal numbers) to be flushed. If the FS bit is set, input operands and operation results that are subnormal numbers are flushed without causing an unimplemented operation exception (E). An input operand that is a subnormal number is flushed to 0 with the same sign.  Operation results that are subnormal numbers either become 0 or the minimum normalized number, depending on the rounding mode.	R/W	1																						
		<table border="1"> <thead> <tr> <th rowspan="2">Operation Result that is a Subnormal Number</th> <th colspan="4">Rounding Mode and Value after Flushing</th> </tr> <tr> <th>RN*1</th> <th>RZ</th> <th>RP</th> <th>RM</th> </tr> </thead> <tbody> <tr> <td>Positive</td> <td>+0</td> <td>+0</td> <td><math>+2^{E_{min}}</math></td> <td>+0</td> </tr> <tr> <td>Negative</td> <td>-0</td> <td>-0</td> <td>-0</td> <td><math>-2^{E_{min}}</math></td> </tr> </tbody> </table>	Operation Result that is a Subnormal Number	Rounding Mode and Value after Flushing				RN*1	RZ	RP	RM	Positive	+0	+0	$+2^{E_{min}}$	+0	Negative	-0	-0	-0	$-2^{E_{min}}$					
Operation Result that is a Subnormal Number	Rounding Mode and Value after Flushing																									
	RN*1	RZ	RP	RM																						
Positive	+0	+0	$+2^{E_{min}}$	+0																						
Negative	-0	-0	-0	$-2^{E_{min}}$																						
Note 1. If the rounding mode is RN and the FPSR.FN bit is set to 1, flushing will occur in the direction of higher accuracy.																										
16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0																						
15 to 10	XC (E, V, Z, O, U, I)	These are the cause bits.	R/W	Undefined																						

Table 3BC.38 FPSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
9 to 5	XE (V, Z, O, U, I)	These are the enable bits.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are the preservation bits.	R/W	Undefined

**(b) FPEPC — Floating-point Exception Program Counter Register**

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.

Table 3BC.39 FPEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FPEPC31 to FPEPC1	These bits store the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs.	R/W	Undefined
0	FPEPC0	This bit stores the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs. Always set this bit to 0.	R	0

**(c) FPST — Floating-point Operation Status Register**

This register reflects the contents of the FPSR register bits related to the operation status.

Table 3BC.40 FPST Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 14	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
13 to 8	XC (E, V, Z, O, U, I)	These are cause bits. Values written to these bits are reflected in FPSR.XC bits.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	IF	This bit accumulates and indicates information about the flushing of input operands.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are preservation bits. Values written to these bits are reflected in FPSR.XP bits.	R/W	Undefined

**(d) FPCC — Floating-point Operation Comparison Result Register**

This register reflects the contents of the FPSR.CC[7:0] bits.

Table 3BC.41 FPCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	CC[7:0]	These are CC (condition) bits. They store the result of a floating-point comparison instruction. The CC[7:0] bits are not affected by any instructions except the comparison instruction and LDSR instruction. Values written to these bits are reflected in the CC[7:0] bits of FPSR. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined

**(e) FPCFG — Floating-point Operation Configuration Register**

This register reflects the contents of the FPSR register bits related to the operation settings.

Note 1. Enable bits (XE)

Table 3BC.42 FPCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset																						
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0																						
9, 8	RM	These are rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions. Values written to these bits are reflected in RM bits of FPSR.	R/W	0																						
		<table border="1"> <thead> <tr> <th colspan="2">RM Bits</th> <th rowspan="2">Mnemonic</th> <th rowspan="2">Description</th> </tr> <tr> <th>9</th> <th>8</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>RN</td> <td>Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.</td> </tr> <tr> <td>0</td> <td>1</td> <td>RZ</td> <td>Rounds the result toward 0. **(a) MPM — Memory Protection Operation Mode Register**

The memory protection mode register is used to define the basic operating state of the memory protection function.

Table 3BC.45 MPM Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	SVP	In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.* <sup>1</sup> 0: As usual, implicitly enable all access in SV mode. 1: Restrict access according to the SX, SW, and SR bits even in SV mode.* <sup>2</sup>	R/W	0
0	MPE	This bit is used to specify whether to enable or disable the MPU function. 0: Disable 1: Enable	R/W	0

Note 1. If the SVP bit is set to 1, access will be restricted in accordance with the setting for each protection area, even in SV mode. Therefore, specify the protection area beforehand so that the access from the program which set the SVP bit is not restricted.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

**(b) MPRC — MPU Region Control Register**

Table 3BC.46 MPRC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	E15 to E0	These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0).	R/W	0

**(c) MPBRGN — MPU Base Region Register**

This register indicates the minimum usable MPU area number.

Table 3BC.47 MPBRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPBRGN	These bits indicate the smallest number of an MPU area. These bits always indicate 0.	R	0

**(d) MPTRGN — MPU End Region Register**

This register indicates the maximum usable MPU area number + 1.

Table 3BC.48 MPTRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPTRGN	These bits indicate the largest number of an MPU area + 1. These bits indicate the maximum number of MPU areas incorporated into the hardware.	R	10000 <sub>B</sub>

**(e) MCA — Memory Protection Setting Check Address Register**

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

Table 3BC.49 MCA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCA31 to MCA0	These bits are used to specify the start address of the memory area that is subject to a memory protection setting check in bytes.	R/W	Undefined

**(f) MCS — Memory Protection Setting Check Size Register**

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

Table 3BC.50 MCS Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCS31 to MCS0	These bits are used to specify the size of the memory area that is subject to a memory protection setting check and the size of the target area in bytes. Because the specified size is assumed to represent an unsigned integer, it is not possible to check an area in the direction in which the address value decreases relative to the MCA register value. Do not specify 0000 0000 <sub>H</sub> for the MCS register.	R/W	Undefined

**(g) MCC — Memory Protection Setting Check Command Register**

This command register is used to start a memory protection setting check.

Table 3BC.51 MCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCC31 to MCC0	When any value is written to the MCC register, a memory protection setting check starts. By setting up the MCA/MCS register and then writing to the MCC register, results are stored in MCR. Because the check is started by any written value, a check can be started by using r0 as the source register without using any unnecessary registers. Note that, for the check, the results are applied according to each area setting regardless of the state of the PSW.UM bit. When the MCC register is read, value 0000 0000 <sub>H</sub> is always returned.	R/W	0

**(j) MPUAn — Protection Area Upper Limit Address Register**

These registers indicate the upper limit address of area n (where n = 0 to 15).

Table 3BC.54 MPUAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPUA31 to MPUA2	These bits indicate the upper limit address of area n. For MPUAn.MPUA1 and MPUA0, 1 is used implicitly.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

**(k) MPATn — Protection Area Attribute Register**

These registers indicate the attributes of area n (where n = 0 to 15).

Table 3BC.55 MPATn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 26	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
25 to 16	ASID	These bits indicate the ASID value to be used as the area match condition.	R/W	Undefined
15 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	E	This bit indicates whether area n is enabled or disabled. 0: Area n is disabled. 1: Area n is enabled.	R/W	0
6	G	0: Areas match only if ASIDs are equal. 1: Areas match even if ASIDs are not equal. If this bit is 0, MPATn.ASID = ASID.ASID is used as the area match condition. If this bit is 1, areas may match even if the values of MPATn.ASID and ASID.ASID are not equal.	R/W	Undefined
5	SX	This bit indicates the execution privilege for the supervisor mode.*1 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
4	SW	This bit indicates whether writing is enabled in the supervisor mode.*1 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
3	SR	This bit indicates whether reading is enabled in the supervisor mode.*1 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined
2	UX	This bit indicates the execution privilege for the user mode. 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
1	UW	This bit indicates whether writing is enabled in the user mode. 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
0	UR	This bit indicates whether reading is enabled in the user mode. 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

## (6) Cache Operation Function Registers

The RH850/F1KM does not include a cache operation function, so all the following registers return a value of 0 when read, and writing to these registers is ignored.

Table 3BC.56 Cache Operation Function Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR12, 4	BWERRL	Not implemented. A value of 0 is returned when read and writing is ignored.	SV
SR13, 4	BWERRH		SV
SR14, 4	BRERRL		SV
SR15, 4	BRERRH		SV
SR16, 4	ICTAGL		SV
SR17, 4	ICTAGH		SV
SR18, 4	ICDATL		SV
SR19, 4	ICDATH		SV
SR20, 4	DCTAGL		SV
SR21, 4	DCTAGH		SV
SR22, 4	DCDATL		SV
SR23, 4	DCDATH		SV
SR24, 4	ICCTRL		SV
SR25, 4	DCCTRL		SV
SR26, 4	ICCFG		SV
SR27, 4	DCCFG		SV
SR28, 4	ICERR		SV
SR29, 4	DCERR		SV

### 3BC.2.1.3 Instruction

See “*Instruction*” in *Software Manual*.

A snooze instruction halts operation of the CPU core for 32 clocks.

## 3BC.2.2 Buffers for Code Flash

### 3BC.2.2.1 Features

CPU accesses Code flash by two paths; instruction fetch access is direct to Flash interface, and data access is via System interconnect to Code Flash. Both paths equip buffers, which can be cleared by software. See also

**Figure 40B.1, Block Diagram of Code Flash ECC, Figure 40C.1, Block Diagram of Code Flash ECC** for ECC decoders in these paths.

Figure 3BC.3 Buffers for Code Flash

### 3BC.2.2.2 Function of Buffers

One-line buffer with 128 bits is mounted for instruction fetches to code flash. The data is read out from the buffer after the next access to the same address, so the code flash is not accessed again within 128 bits location.

One-line buffer with 128 bits is mounted as a data buffer. This buffer is not only used by the CPU but also used by DMA via system interconnect. The data is read out from the buffer if the next access is within the same 128 bits boundary.

RH850/F1KM-S4, RH850/F1KM-S2:

16 entry branch history buffer is mounted to decrease branch penalty.

One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these three buffers.

RH850/F1KM-S1:

One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these two buffers.

3BC.2.2.3 Registers for Buffer Control

(1) List of Buffer Control Registers

Table 3BC.57 Buffer Control Register (Base Address: FFC5 B000<sub>H</sub>)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
FBUF_CTRL	+000 <sub>H</sub>	4	Flash buffer clear control register	FBUFCCTL	—	R/W	—	✓	✓	✓	0000 0000 <sub>H</sub>

(2) Register Sets

- Access:** FBUFCCTL register can be read or written in 32-bit units.  
 FBUFCCTLL register can be read or written in 16-bit units.  
 FBUFCCTLLL register can be read or written in 8-bit units.

- Address:** FBUFCCTL: FFC5 B000<sub>H</sub>  
 FBUFCCTLL: FFC5 B000<sub>H</sub>  
 FBUFCCTLLL: FFC5 B000<sub>H</sub>

Table 3BC.58 FBUFCCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.	R	0
0	FBUFCCLR	Buffer clear bits. To clear buffers, write 1 to this bit and then write 0. 0: Buffers are valid 1: Buffers are invalid (cleared)	R/W	0

Please do following procedures when you want to clear the buffers.

- Step 1: Write 0 to FBUFCCTL.FBUFCCLR
- Step 2: Write 1 to FBUFCCTL.FBUFCCLR
- Step 3: Write 0 to FBUFCCTL.FBUFCCLR
- Step 4: Read the FBUFCCTL register (dummy read)
- Step 5: Execute the SYNCP instruction
- Step 6: Execute the SYNCI instruction

If you do not do Step 3 after Step 2, the buffers are kept invalid during FBUFCCTL.FBUFCCLR = 1.

## 3BC.2.3 Reliability Functions

### 3BC.2.3.1 PE Guard Function (PEG)

#### (1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the CPU (PE) from an external master. This function protects access to the local RAM\*<sup>1</sup> in the PE. In the initial state after a reset, access by masters other than own PE is disabled. Setting the registers listed in (3) List of PEG Protection Setting Registers enables access by masters other than own PE.

**Note 1.** It is the local RAM and the retention RAM in RH850/F1KM-S1.

##### (1) Detecting PE guard violation

If an external master makes an unauthorized access to the resource area in a PE for which PE guard is set, the access is detected as a PE guard violation.

##### (2) Blocking unauthorized access

When a PE guard violation is detected, unauthorized access to the internal resources of the PE are blocked to prevent unauthorized modification of the contents of PE resources.

##### (3) Notifying occurrence of violation

An error response to an unauthorized access is sent to the request source of external master. When DMA Controller makes an unauthorized access, meanwhile, a DMA transfer error is detected.

A PE guard violation is notified as INTGUARD interrupt request which is a source of FEINT.

#### (2) Protection Made by SPID

##### • Setting PEG Protection

- Up to four areas can be set depending on the local RAM address\*<sup>1</sup> of the own PE.
- The area range is specified by the base address and the mask bit (4 kbytes to 4 Gbytes).
- “Read enable” and “write enable” can be set for each area.
- “Enable” or “disable” can be selected based on the system protection identifier (SPID) for each area.

**Note 1.** It is the local RAM address and the retention RAM address in RH850/F1KM-S1.

##### • Procedure for permitting access by using the system protection identifier (SPID)

1. Is the area subject to access is the local RAM area\*<sup>1</sup>? If so, go to step 2.
2. Is the area subject to access is within the range of valid areas 0, 1, 2, or 3? If so, go to step 3.  
Otherwise, return an error response.
3. Are all the conditions below for the relevant area satisfied? If so, permit access.
  - The system protection identifier (SPID) is enabled.
  - Required operations (read/write) are enabled.
 Otherwise, return an error response.

**Note 1.** It is the local RAM area and the retention RAM area in RH850/F1KM-S1.

### (3) List of PEG Protection Setting Registers

Specify the necessary settings in the registers below to protect PE resources from unauthorized access by an external master.

- Whether to permit access to the local RAM\*<sup>1</sup> in the PE can be specified.

**Note 1.** It is local RAM and retention RAM in RH850/F1KM-S1.

Table 3BC.59 PEG Registers (Base Address: FFFE E600<sub>H</sub>)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset

Table 3BC.60 PEGSP Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SPEN	Access permission to external master with specified SPID. 0: Not permit. 1: Permit.

**(b) PEGGnMK — PEG Area n Mask Setting Register (n = 0 to 3)**

The PEGGnMK register defines which bits of PEGGnBA.GnBASE are compared with the access address. If bit PEGGnMK.GnMASK[m] is cleared, bit PEGGnBA.GnBASE[m] is compared with bit m of the access address.

**Access:** PEGGnMK register can be read or written in 32-bit units.

PEGGnMKL, PEGGnMKH registers can be read or written in 16-bit units.

PEGGnMKLH, PEGGnMKHL, PEGGnMKHH registers can be read or written in 8-bit units.

**Address:** PEGGnMK: FFFE E680<sub>H</sub> + (10<sub>H</sub> × n)

PEGGnMKL: FFFE E680<sub>H</sub> + (10<sub>H</sub> × n),

PEGGnMKH: FFFE E682<sub>H</sub> + (10<sub>H</sub> × n)

PEGGnMKLH: FFFE E681<sub>H</sub> + (10<sub>H</sub> × n),

PEGGnMKHL: FFFE E682<sub>H</sub> + (10<sub>H</sub> × n),

PEGGnMKHH: FFFE E683<sub>H</sub> + (10<sub>H</sub> × n)

Table 3BC.61 PEGGnMK Register Contents

Bit Position	Bit Name	Function
31 to 12	GnMASK	0: Target bits are compared when determining the PE guard area. 1: Target bits are not compared when determining the PE guard area.
11 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

**NOTE**

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

**(c) PEGGnBA — PEG Area n Base Setting Register (n = 0 to 3)**

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n. Setting the GnEN bit to 1 validates the access enable conditions specified by this register and the PEGGnMK register.

**Access:** PEGGnBA register can be read or written in 32-bit units.  
 PEGGnBAL, PEGGnBAH registers can be read or written in 16-bit units.  
 PEGGnBALL, PEGGnBALH, PEGGnBAHL, PEGGnBAHH registers can be read or written in 8-bit units.

**Address:** PEGGnBA: FFFE E684<sub>H</sub> + (10<sub>H</sub> × n)  
 PEGGnBAL: FFFE E684<sub>H</sub> + (10<sub>H</sub> × n),  
 PEGGnBAH: FFFE E686<sub>H</sub> + (10<sub>H</sub> × n)  
 PEGGnBALL: FFFE E684<sub>H</sub> + (10<sub>H</sub> × n),

Table 3BC.62 PEGGnBA Register Contents

Bit Position	Bit Name	Function
31 to 12	GnBASE	Base address that specifies the range of PE guard protection area n.
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	GnSP3	Access permission setting from SPID = 3 external master to PE guard protection area n.*1 0: Not permit. 1: Permit.
6	GnSP2	Access permission setting from SPID = 2 external master to PE guard protection area n.*1 0: Not permit. 1: Permit.
5	GnSP1	Access permission setting from SPID = 1 (CPU1) external master to PE guard protection area n.*1 0: Not permit. 1: Permit.
4	GnSP0	Access permission setting from SPID = 0 external master to PE guard protection area n.*1 0: Not permit. 1: Permit.
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GnWR	Write access permission to PE guard protection area n. 0: Write access is disabled. 1: Write access is enabled.

Table 3BC.62 PEGGnBA Register Contents

Bit Position	Bit Name	Function
1	GnRD	Read access permission to PE guard protection area n. 0: Read access is disabled. 1: Read access is enabled.
0	GnEN	Enables or Disables the setting for the access enable conditions to PE guard protection area n. 0: Settings for access enable conditions are disabled. 1: Settings for access enable conditions are enabled.

Note 1. For SPID, refer to **Table 40B.69, Identifiers for Slave Guard**, **Table 40C.53, Identifiers for Slave Guard**.

#### NOTE

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

### 3BC.2.3.2 PE's Internal Peripheral Device Protection Function (IPG)

#### (1) Overview of the IPG Function

The IPG is a function to prevent unauthorized accesses to peripheral devices from the CPU core equipped with the IPG. The IPG achieves the following functions. The IPG covers accesses to the SEG, the PEG, the INTC1 and P-Bus.

##### (a) Detecting Violation of Peripheral Device Protection

If the CPU makes an unauthorized access to an area (peripheral device) for which peripheral device protection is set, the access is detected as “violation of peripheral device protection”.

##### (b) Storing Unauthorized Access Information

When a violation of peripheral device protection is detected, the unauthorized-access information is stored in the IPG's internal register.

##### (c) Blocking Unauthorized Accesses

When a violation of peripheral device protection is detected, unauthorized accesses to peripheral devices are blocked to prevent contents of peripheral devices from being modified illegally.

##### (d) Notifying Violation

When a violation of peripheral device protection is detected, a request for generating an exception is made to ask the CPU to stop the processing.

#### NOTE

---

Even if a request for generating an exception is immediately sent to the CPU in step **(d) Notifying Violation** above, a subsequent access issued (before receiving a request from the IPG) by the CPU that does not know an occurrence of violation may illegally modify contents of peripheral devices. (Accesses after a violation has occurred result in unauthorized accesses.)

---

#### (2) IPG Function

- This function invalidates accesses according to their attributes (including address, transfer type, and access right).
- After an access right violation is detected until the error flag (described later) is cleared by writing by the software, subsequent accesses are invalidated. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.
- When a request for accessing different peripheral devices simultaneously is made due to misalignment or double-word access, the access is executed when all such accesses are enabled.

#### (3) IPG Protection Setting Registers for Illegal Users

To protect peripheral devices from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses in user mode are to be detected.

Table 3BC.63 IPG Registers (Base Address: FFFE E00H)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right*1	R/W	Operable Bit				Value after Reset
							1	8	16	32	
IPG	+002 <sub>H</sub>	2	Peripheral device protection violation access information register	IPGECRUM	SV	R/W	—	✓	✓	—	Undefined (retained)
	+008 <sub>H</sub>	4	Peripheral device protection violation access address register	IPGADRUM	SV	R/W	—	✓	✓	✓	Undefined (retained)
	+00D <sub>H</sub>	1	Peripheral device protection enable register	IPGENUM	SV	R/W	—	✓	—	—	00 <sub>H</sub>
	+020 <sub>H</sub>	1	Peripheral device protection setting register 0	IPGPMTUM0	SV	R/W	—	✓	—	—	00 <sub>H</sub>
	+022 <sub>H</sub>	1	Peripheral device protection setting register 2	IPGPMTUM2	SV	R/W	—	✓	—	—	00 <sub>H</sub>
	+023 <sub>H</sub>	1	Peripheral device protection setting register 3	IPGPMTUM3	SV	R/W	—	✓	—	—	00 <sub>H</sub>
	+024 <sub>H</sub>	1	Peripheral device protection setting register 4	IPGPMTUM4	SV	R/W	—	✓	—	—	00 <sub>H</sub>

Note 1. Registers for which “SV” is described are accessible by accesses with SV right (UM = 0).

**(4) Register Set****(a) IPGECRUM — Peripheral Device Protection Violation Access Information Register**

**Access:** IPGECRUM register can be read or written in 16-bit units.

IPGECRUMML register can be read or written in 8-bit units.

**Address:** IPGECRUM: FFFE E002<sub>H</sub>

IPGECRUMML: FFFE E002<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	WD	HW	BY	EX	WR	RD	VD
Value after reset	0	0	0	0	0	0	0	0	0	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3BC.64 IPGECRUM Register Contents

Bit Position	Bit Name	Function
15 to 7	Reserved	These bits are always read as 0. The write value should always be 0.
6	WD	This bit is set to 1 when a violation occurred in read word, instruction fetch read access, write word, CAXI, LDL or STC. In other cases, this bit is cleared to 0.
5	HW	This bit is set to 1 when a violation occurred in read halfword or write halfword. In other cases, this bit is cleared to 0.
4	BY	This bit is set to 1 when a violation occurred in read byte, write byte or bit operation. In other cases, this bit is cleared to 0.
3	EX	This bit is set to 1 when a violation occurred in an instruction fetch read access. In other cases, this bit is cleared to 0.
2	WR	This bit is set to 1 when a violation occurred in a write access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
1	RD	This bit is set to 1 when a violation occurred in a read access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
0	VD	This bit is set to 1 when a violation of peripheral device protection is detected by a program with the relevant right. Even if another violation of peripheral device protection is detected while this bit is 1, data of this IPGECRUM register and the IPGADRUM register is not updated and is retained.

**NOTE**

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

**(b) IPGADRUM — Peripheral Device Protection Violation Access Address Register**

**Access:** IPGADRUM register can be read or written in 32-bit units.  
 IPGADRUML, IPGADRUMH registers can be read or written in 16-bit units.  
 IPGADRUMLL, IPGADRUMLH, IPGADRUMHL, IPGADRUMHH registers can be read or written in 8-bit units.

**Address:** IPGADRUM: FFFE E008<sub>H</sub>  
 IPGADRUML: FFFE E008<sub>H</sub>, IPGADRUMH: FFFE E00A<sub>H</sub>  
 IPGADRUMLL: FFFE E008<sub>H</sub>, IPGADRUMLH: FFFE E009<sub>H</sub>,  
 IPGADRUMHL: FFFE E00A<sub>H</sub>, IPGADRUMHH: FFFE E00B<sub>H</sub>

Table 3BC.70 IPGPMTUM4 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are always read as 0. The write value should always be 0.
1	W0	This bit sets whether to enable write access to its own PEG. 0: Write access to its own PEG is treated as violation. (Value after reset) 1: Write access to its own PEG is not restricted.
0	R0	This bit sets whether to enable read access to its own PEG. 0: Read access to its own PEG is treated as violation. (Value after reset) 1: Read access to its own PEG is not restricted

### 3BC.2.3.3 System Error Generator Function (SEG)

SEG (SysErrGen) controls interrupt notification and recording after a system error occurred by a data access.

Multiple error occurrence inputs are categorized according to error factor, and are processed sequentially from the highest-priority error factor, generating an FE-level exception (SYSERR).

The bit position of the SEGFLAG register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits.

Error address information is recorded only once regardless of error frequency.

The error with the highest priority among the error factors is valid when errors occur simultaneously. Recorded error address information is not overwritten by subsequent errors.

#### (1) List of SEG Function Control Registers

Table 3BC.71 SEG Register (Base Address: FFFE E980<sub>H</sub>)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right*1	R/W	Operable Bit				Value after Reset
							1	8	16	32	
SEG	+00 <sub>H</sub>	2	SEG error control register	SEGCONT	SV	R/W	—	—	✓	—	0000 <sub>H</sub>
	+02 <sub>H</sub>	2	SEG error flag register	SEGFLAG	SV	R/W	—	—	✓	—	0000 <sub>H</sub>
	+08 <sub>H</sub>	4	SEG error address information register	SEGADDR	SV	R/W	—	—	—	✓	Undefined (retained)

Note 1. Registers for which “SV” is described are writable with the SV right (UM = 0). Attempting to write, if these conditions do not hold, leads to a SYSERR exception with setting VCIF flag. No restriction is provided for read accesses.

**(2) Register Set****(a) SEGCONT — SEG Error Control Register**

This register is used to enable (= 1) or disable (= 0) notification of SysErr request in response to error flags that store the error occurrence status for each factor.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 3BC.72 SEGCONT Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSE	This bit enables notification of an error response detected inside system interconnect: <ul style="list-style-type: none"> <li>• Error response from external bus masters in write access</li> <li>• Illegal response to local RAM or peripherals or Flash from optional master in access (except instruction fetch from CPU). And illegal response to optional slave from external AHB master in access.</li> </ul>
9	APIE	This bit enables notification of an error response from peripherals. The error notification includes the following cases: <ul style="list-style-type: none"> <li>• Error response from peripherals in write access</li> <li>• PBG error in write access</li> </ul>
8	IPGE	This bit enables notification of IPG illegal access detection.
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCME	This bit enables notification of an error during data access to its own local RAM*1 from PE master. <p>The error notification includes the following cases:</p> <ul style="list-style-type: none"> <li>• ECC uncorrectable error (DED or SED &amp; SECDIS=1)</li> <li>• Detection of an access to RAM unimplemented area</li> </ul>
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 3BC.72 SEGCONT Register Contents

Bit Position	Bit Name	Function
4	VCIE	<p>RH850/F1KM-S4, RH850/F1KM-S2:</p> <p>This bit enables notification of an error response during access to CPU peripherals, P-Bus (read access), global RAM, retention RAM, H-Bus and CodeFlash by PE.</p> <p>The error notification includes the following cases:</p> <ul style="list-style-type: none"> <li>• IPG error from CPU peripherals and P-Bus</li> <li>• Error response from H-Bus peripherals</li> <li>• PBG error / HBG error from P-Bus and H-Bus</li> <li>• GRG error from global RAM and retention RAM</li> <li>• ECC uncorrectable error from CodeFlash, global RAM and retention RAM (DED or SED &amp; SECDIS = 1)</li> </ul> <p>This bit enables notification of an error response when accessing to a part of access prohibited areas in address map.</p> <p>RH850/F1KM-S1:</p> <p>This bit enables notification of an error response during access to CPU peripherals, P-Bus (read access), global RAM and CodeFlash by PE.</p> <p>The error notification includes the following cases:</p> <ul style="list-style-type: none"> <li>• IPG error from CPU peripherals and P-Bus</li> <li>• PBG error from P-Bus</li> <li>• ECC uncorrectable error from CodeFlash (DED or SED &amp; SECDIS = 1)</li> </ul> <p>This bit enables notification of an error response when accessing to a part of access prohibited areas in address map.</p>
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. It is local RAM and retention RAM in RH850/F1KM-S1.

**(b) SEGFLAG — SEG Error Flag Register**

This register indicates error flags that store error occurrence status of each factors. The flags are set to 1 by an error occurrence input. The flags are not automatically cleared to 0. Both setting and clearing of each flag are supported in writing to the register.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCSF	APIF	IPGF	—	TCMF	—	VCIF	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R	R/W	R	R	R	R

Table 3BC.73 SEGFLAG Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSF	Flag corresponding to bit 10 of the SEGCONT register
9	APIF	Flag corresponding to bit 9 of the SEGCONT register
8	IPGF	Flag corresponding to bit 8 of the SEGCONT register
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCMF	Flag corresponding to bit 6 of the SEGCONT register
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	VCIF	Flag corresponding to bit 4 of the SEGCONT register
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

**NOTE**

An error may lead to setting of multiple error flags in SEG. For example, if an IPG error occurs at peripheral registers read, both IPGF bit and VCIF bit in SEGFLAG are set.

**(c) SEGADDR — Error Address Information Register**

Address information (one record) which is notified with error occurrence is stored in the register. The register is not updated while one or more bits in SEGFLAG register are set.

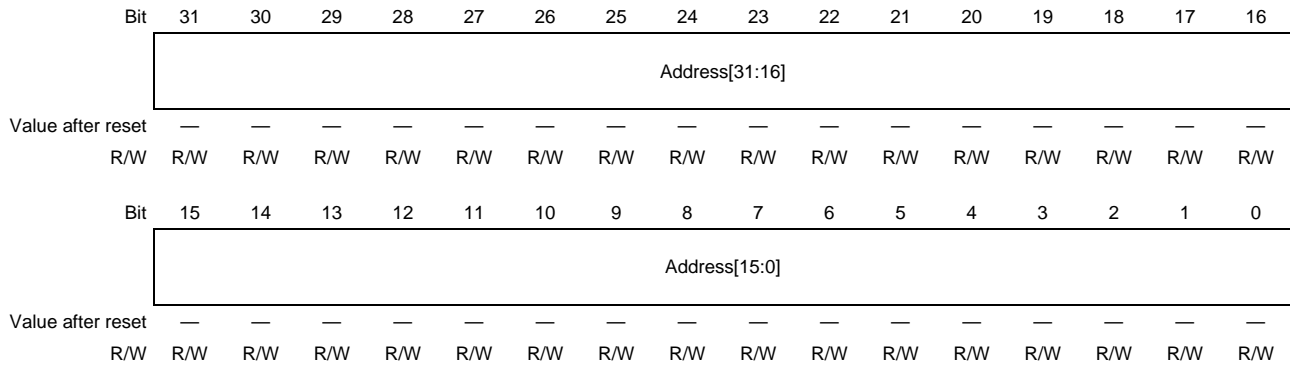

Table 3BC.74 SEGADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	Address	These bits store the error address information.

**CAUTIONS**

- SEGADDR stores error address information in case of an error occurrence related to VCIF bit or TCMF bit in SEGFLAG register. SEGADDR register stores all 0 data in case of an error occurrence related to VCSF bit, APIF bit or IPGF bit in SEGFLAG register.
- In case of an error occurrence related to TCMF bit in SEGFLAG register, bit[18:0] of the error address are stored in SEGADDR[18:0] and SEGADDR[31:19] are filled with 0.

### (3) SEG Function

#### (a) SEG Function: SYSERR Request Notification by Error Flag

- Setting an error flag takes precedence over clearing the same flag.
  - A simultaneous clearing operation is ignored.
- Priority of error factors
  - The bit position of each flags in SEGFLAG register which error notification is enabled by SEGCONT register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
  - The bit position of error factors is reported as a “SysErr factor code.”
- Conditions for starting SysErr request notification
  - Even if a flag which error notification is disabled by SEGCONT register is set to 1, notification is not made.
  - Notification is made immediately after a flag which error notification is enabled by SEGCONT register is set to 1.
  - After clearing of a flag, notification is made if an other flag which error notification is enabled by SEGCONT register remains set.
- Finishing notification at a SysErr acknowledgement
  - Even after notification is finished, the flag is not cleared automatically.
  - Notification is not made until setting or clearing the flag again.
  - If an error flag that is prioritized higher than the error factor is set prior to an acknowledgement, the notification information may be replaced with a higher prioritized SysErr factor code.

#### (b) SEG Function: Recording Error Address Information

- When an error which error notification is enabled by SEGCONT register occurs, the error address is retained in the SEGADDR register.
  - No information is retained by setting or clearing an error flag in SEGFLAG register.
  - When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While a flag which error notification is enabled by SEGCONT register is set to 1, overwrite to the SEGADDR register is inhibited.
  - If error occurrence input continues, information of subsequent error factors is not retained.
  - To reset the inhibition of overwrite to the register, clear either SEGCONT or SEGFLAG register (or both of them).

#### (c) Supplementary Notes on SYSERR Exception

- Even when a SYSERR exception occurs, the value of the PSW.EBV bit is held, and the base address of the exception handler does not switch.

## 3BC.3 Notes

### 3BC.3.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see *APPENDIX A, Hazard Resolution Procedure for System Registers in the RH850G3KH User's Manual: Software*.

#### **When the updated results in the control registers are to be used by the subsequent instruction:**

*Example 1:* An interrupt is enabled by execution of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits.

Proceed as follows in this case.

- (1) Execute the store instruction to update a control register (ST.W, etc.).
- (2) Perform a dummy read of the above control register (LD.W, etc.).
- (3) Execute SYNCP.
- (4) Execute the subsequent instruction (EI).

In case of RH850/F1KM, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

*Example 2:* When you must wait until a control register (control register A) has been completely updated before accessing another control register (control register B), execute similar processing. For example, different peripheral functions are linked, or the interrupt mask for INTC is cleared after the peripheral function is set. Note that this processing is not required if the control registers A and B belong to the same peripheral group.

- (1) Execute the store instruction to update the control register A (ST.W, etc.).
- (2) Perform a dummy read of the above control register (LD.W, etc.).
- (3) Execute SYNCP.
- (4) Execute the store instruction to access the control register B (ST.W, LD.W, etc.).

In case of RH850/F1KM, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

The similar processing is also required when starting to access a memory or control register to be protected is started after a safety function (such as some kind of memory protection and ECC) has been completely set up.

**When the updated results of the control register or memory to be used in the instruction fetch of the subsequent instruction:**

- (a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.
- (1) Execute the store instruction to update a memory (ST.W, etc.).
  - (2) Perform a dummy read of the above memory (LD.W, etc.).
  - (3) Execute SYNCP.
  - (4) Execute SYNCL.
  - (5) Execute the subsequent instruction (branch instruction, etc.).
- (b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.
- (1) Execute the store instruction to update a control register (ST.W, etc.).
  - (2) Perform a dummy read of the control register (LD.W, etc.).
  - (3) Execute SYNCP.
  - (4) Execute SYNCL.
  - (5) Execute the subsequent instruction (branch instruction, etc.).

**When switching the code flash memory area:**

In this case, see *Section 10, Usage Notes, (7) Updating the BFASELR register in the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.*

**3BC.3.2 Ensure Coherency after Rewriting the Code Flash**

The CPU1 is equipped with the buffer for the code flash area as described in **Section 3BC.2.2, Buffers for Code Flash.**

Therefore, clear the buffer to ensure coherency after rewriting the code flash by self-programming.

**3BC.3.3 Access to Registers by Using Bit-Manipulation Instructions**

Writing bit-manipulation instructions consists of read-modify-write processing in 8-bit units. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

**3BC.3.4 Caution of Prefetching**

There is a possibility that the reading of the memory occurs by pre-fetch from the area where instruction codes do not exist. Secure more than 40-byte initialized area after the area where instruction codes are stored.

**3BC.3.5 Overwriting Context upon Acceptance of Multiple Exceptions**

Acceptance of an exception depends on the type of exception source, regardless of the states of the ID and NP bits in the PSW register. When multiple exceptions are generated, the contents of the system register which hold the context information are overwritten. For the conditions for acceptance and whether correct return or recovery is possible for each exception source, see *the List of Exception Sources in the RH850G3KH User's Manual: Software.*

## Section 4A Address Space of RH850/F1KH-D8

### 4A.1 Address Space

Table 4A.1, Address Space (8-MB 176/233/324-Pin Product) to Table 4A.2, Address Space (6-MB 176/233/324-Pin Product) show the address space of the RH850/F1KH.

#### CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in Table 4A.1, Address Space (8-MB 176/233/324-Pin Product) to Table 4A.2, Address Space (6-MB 176/233/324-Pin Product). If such an address is accessed, operation is not guaranteed.

#### NOTE

The Local RAM is accessible through the following three address areas in the address space.

CPU1 area: Address area accessible from CPU1, CPU2, DMA, FlexRay and ETNB.

CPU2 area: Address area accessible from CPU1, CPU2, DMA, FlexRay and ETNB.

Self area: Mirrored address area, accessible only from CPU (CPU1, CPU2) to refer the CPU's self resource.

Table 4A.1 Address Space (8-MB 176/233/324-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 003F FFFF <sub>H</sub>	Code Flash (bank A)	4 MB
0040 0000 <sub>H</sub> to 007F FFFF <sub>H</sub>	Access prohibited area	
0080 0000 <sub>H</sub> to 00BF FFFF <sub>H</sub>	Code Flash (bank B)	4 MB
00C0 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area	
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	8 KB
1002 2000 <sub>H</sub> to 1002 FFFF <sub>H</sub>	Access prohibited area	
1003 0000 <sub>H</sub> to 1003 03FF <sub>H</sub>	External Memory Access Controller (MEMC)	1 KB
1003 0400 <sub>H</sub> to 1003 FFFF <sub>H</sub>	Access prohibited area	
1004 0000 <sub>H</sub> to 1004 0FFF <sub>H</sub>	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000 <sub>H</sub> to 1FFF FFFF <sub>H</sub>	Access prohibited area	
2000 0000 <sub>H</sub> to 20FF FFFF <sub>H</sub>	External Memory Area(CS0)	16 MB*4
2100 0000 <sub>H</sub> to 21FF FFFF <sub>H</sub>	Access prohibited area	
2200 0000 <sub>H</sub> to 22FF FFFF <sub>H</sub>	External Memory Area(CS1)	16 MB*4
2300 0000 <sub>H</sub> to 23FF FFFF <sub>H</sub>	Access prohibited area	
2400 0000 <sub>H</sub> to 24FF FFFF <sub>H</sub>	External Memory Area(CS2)	16 MB*4
2500 0000 <sub>H</sub> to 27FF FFFF <sub>H</sub>	Access prohibited area	
2800 0000 <sub>H</sub> to 28FF FFFF <sub>H</sub>	External Memory Area(CS3)	16 MB*4
2900 0000 <sub>H</sub> to 2FFF FFFF <sub>H</sub>	Access prohibited area	
3000 0000 <sub>H</sub> to 33FF FFFF <sub>H</sub>	External Serial Flash Memory Area	64 MB
3400 0000 <sub>H</sub> to FE9C FFFF <sub>H</sub>	Access prohibited area	
FE9D 0000 <sub>H</sub> to FE9F FFFF <sub>H</sub>	Local RAM (CPU2 area)	192 KB*1
FEA0 0000 <sub>H</sub> to FEBC FFFF <sub>H</sub>	Access prohibited area	
FEBD 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	192 KB*1

Table 4A.1 Address Space (8-MB 176/233/324-Pin Product)

Address	Address Space Type	Size
FEC0 0000 <sub>H</sub> to FEDC FFFF <sub>H</sub>	Access prohibited area	
FEDD 0000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Local RAM (self area)	192 KB* <sup>1</sup>
FEE0 0000 <sub>H</sub> to FEEB 7FFF <sub>H</sub>	Access prohibited area	
FEEB 8000 <sub>H</sub> to FEEF FFFF <sub>H</sub>	Global RAM A	288 KB* <sup>2</sup>
FEF0 0000 <sub>H</sub> to FEF0 FFFF <sub>H</sub>	Retention RAM	64 KB
FEF1 0000 <sub>H</sub> to FEFB 7FFF <sub>H</sub>	Access prohibited area	
FEFB 8000 <sub>H</sub> to FEFF FFFF <sub>H</sub>	Global RAM B	288 KB* <sup>2</sup>
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF23 FFFF <sub>H</sub>	Data flash	256 KB* <sup>3</sup>
FF24 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 256 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Note 4. 8 MB in 176/233-pin products: For details, see **Section 16, External Memory Access Controller (MEMC)**.

Table 4A.2 Address Space (6-MB 176/233/324-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 002F FFFF <sub>H</sub>	Code Flash (bank A)	3 MB
0030 0000 <sub>H</sub> to 007F FFFF <sub>H</sub>	Access prohibited area	
0080 0000 <sub>H</sub> to 00AF FFFF <sub>H</sub>	Code Flash (bank B)	3 MB
00B0 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area	
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	8 KB
1002 2000 <sub>H</sub> to 1002 FFFF <sub>H</sub>	Access prohibited area	
1003 0000 <sub>H</sub> to 1003 03FF <sub>H</sub>	External Memory Access Controller (MEMC)	1 KB
1003 0400 <sub>H</sub> to 1003 FFFF <sub>H</sub>	Access prohibited area	
1004 0000 <sub>H</sub> to 1004 0FFF <sub>H</sub>	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000 <sub>H</sub> to 1FFF FFFF <sub>H</sub>	Access prohibited area	
2000 0000 <sub>H</sub> to 20FF FFFF <sub>H</sub>	External Memory Area (CS0)	16 MB*4
2100 0000 <sub>H</sub> to 21FF FFFF <sub>H</sub>	Access prohibited area	
2200 0000 <sub>H</sub> to 22FF FFFF <sub>H</sub>	External Memory Area (CS1)	16 MB*4
2300 0000 <sub>H</sub> to 23FF FFFF <sub>H</sub>	Access prohibited area	
2400 0000 <sub>H</sub> to 24FF FFFF <sub>H</sub>	External Memory Area (CS2)	16 MB*4
2500 0000 <sub>H</sub> to 27FF FFFF <sub>H</sub>	Access prohibited area	
2800 0000 <sub>H</sub> to 28FF FFFF <sub>H</sub>	External Memory Area (CS3)	16 MB*4
2900 0000 <sub>H</sub> to 2FFF FFFF <sub>H</sub>	Access prohibited area	
3000 0000 <sub>H</sub> to 33FF FFFF <sub>H</sub>	External Serial Flash Memory Area	64 MB
3400 0000 <sub>H</sub> to FE9D 7FFF <sub>H</sub>	Access prohibited area	
FE9D 8000 <sub>H</sub> to FE9F FFFF <sub>H</sub>	Local RAM (CPU2 area)	160 KB*1
FEA0 0000 <sub>H</sub> to FEBD 7FFF <sub>H</sub>	Access prohibited area	
FEBD 8000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	160 KB*1
FEC0 0000 <sub>H</sub> to FEDD 7FFF <sub>H</sub>	Access prohibited area	
FEDD 8000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Local RAM (self area)	160 KB*1
FEE0 0000 <sub>H</sub> to FEEB FFFF <sub>H</sub>	Access prohibited area	
FEEC 0000 <sub>H</sub> to FEEF FFFF <sub>H</sub>	Global RAM A	256 KB*2
FEF0 0000 <sub>H</sub> to FEF0 FFFF <sub>H</sub>	Retention RAM	64 KB
FEF1 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Access prohibited area	
FEFC 0000 <sub>H</sub> to FEFF FFFF <sub>H</sub>	Global RAM B	256 KB*2
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF23 FFFF <sub>H</sub>	Data flash	256 KB*3
FF24 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 48 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Note 4. 8 MB in 176/233-pin products: For details, see **Section 16, External Memory Access Controller (MEMC)**.

## 4A.2 Address Space Viewed from Each Bus Master

**Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** shows address spaces viewed from each bus master.

### 4A.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, local RAM, global RAM, and retention RAM.

### 4A.2.2 Data Space Accessible by CPU1

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the CPU1.

### 4A.2.3 Data Space Accessible by CPU2

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the CPU2.

### 4A.2.4 Data Space Accessible by DMA

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the DMA.

### 4A.2.5 Data Space Accessible by Flexray

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the Flexray.

### 4A.2.6 Data Space Accessible by ETNB

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the ETNB.

## 4A.2.7 Data Space Accessible by Each Bus Master

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from Each Bus Master.

Table 4A.3 Address Space Viewed from Each Bus Master (8-MB Product)

Address	Resource	From CPU1	From CPU2	From DMA	From FlexRay	From ETNB
0000 0000 <sub>H</sub> to 003F FFFF <sub>H</sub>	Code Flash (bank A)	✓	✓	✓		
0040 0000 <sub>H</sub> to 007F FFFF <sub>H</sub>	Access prohibited area					
0080 0000 <sub>H</sub> to 00BF FFFF <sub>H</sub>	Code Flash (bank B)	✓	✓	✓		
00C0 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area					
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	✓	✓	✓		
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area					
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	✓	✓	✓		
1002 2000 <sub>H</sub> to 1002 FFFF <sub>H</sub>	Access prohibited area					
1003 0000 <sub>H</sub> to 1003 03FF <sub>H</sub>	External Memory Access Controller (MEMC)	✓	✓	✓		
1003 0400 <sub>H</sub> to 1003 FFFF <sub>H</sub>	Access prohibited area					
1004 0000 <sub>H</sub> to 1004 0FFF <sub>H</sub>	Serial Flash Memory Interface (SFMA)	✓	✓	✓		
1004 1000 <sub>H</sub> to 1FFF FFFF <sub>H</sub>	Access prohibited area					
2000 0000 <sub>H</sub> to 20FF FFFF <sub>H</sub>	External Memory Area (CS0)	✓	✓	✓		
2100 0000 <sub>H</sub> to 21FF FFFF <sub>H</sub>	Access prohibited area					
2200 0000 <sub>H</sub> to 22FF FFFF <sub>H</sub>	External Memory Area (CS1)	✓	✓	✓		
2300 0000 <sub>H</sub> to 23FF FFFF <sub>H</sub>	Access prohibited area					
2400 0000 <sub>H</sub> to 24FF FFFF <sub>H</sub>	External Memory Area (CS2)	✓	✓	✓		
2500 0000 <sub>H</sub> to 27FF FFFF <sub>H</sub>	Access prohibited area					
2800 0000 <sub>H</sub> to 28FF FFFF <sub>H</sub>	External Memory Area (CS3)	✓	✓	✓		
2900 0000 <sub>H</sub> to 2FFF FFFF <sub>H</sub>	Access prohibited area					
3000 0000 <sub>H</sub> to 33FF FFFF <sub>H</sub>	External Serial Flash Memory Area	✓	✓	✓		
3400 0000 <sub>H</sub> to FE9C FFFF <sub>H</sub>	Access prohibited area					
FE9D 0000 <sub>H</sub> to FE9F FFFF <sub>H</sub>	Local RAM (CPU2 area)	✓	✓	✓	✓	✓
FEA0 0000 <sub>H</sub> to FEBC FFFF <sub>H</sub>	Access prohibited area					
FEBD 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	✓	✓	✓	✓	✓
FEC0 0000 <sub>H</sub> to FEDC FFFF <sub>H</sub>	Access prohibited area

### 4A.3 Peripheral I/O Address Map

**Table 4A.4, Peripheral I/O Address Map** shows peripheral I/O address map.

Table 4A.4 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	—	Access prohibited area
FF20 0000 <sub>H</sub> to FF23 FFFF <sub>H</sub>	4	Data Flash
FF24 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	—	Access prohibited area
FFA0 0000 <sub>H</sub> to FFA0 001F <sub>H</sub>	1	FLMD
FFA0 0020 <sub>H</sub> to FFA0 0FFF <sub>H</sub>	—	Access prohibited area
FFA0 1000 <sub>H</sub> to FFA0 103F <sub>H</sub>	—	Access prohibited area
FFA0 1040 <sub>H</sub> to FFA0 1FFF <sub>H</sub>	—	Access prohibited area
FFA0 2000 <sub>H</sub> to FFA0 201F <sub>H</sub>	—	Access prohibited area
FFA0 2020 <sub>H</sub> to FFA0 7FFF <sub>H</sub>	—	Access prohibited area
FFA0 8000 <sub>H</sub> to FFA0 801F <sub>H</sub>	—	Access prohibited area
FFA0 8020 <sub>H</sub> to FFA0 FFFF <sub>H</sub>	—	Access prohibited area
FFA1 0000 <sub>H</sub> to FFA1 1FFF <sub>H</sub>	1	FPSYS (Register)
FFA1 2000 <sub>H</sub> to FFA1 FFFF <sub>H</sub>	—	Access prohibited area
FFA2 0000 <sub>H</sub> to FFA2 FFFF <sub>H</sub>	1	FACI command-issuing area
FFA3 0000 <sub>H</sub> to FFBF FFFF <sub>H</sub>	—	Access prohibited area
FFC0 0000 <sub>H</sub> to FFC0 000F <sub>H</sub>	1	FENMI (ECON_NMI)
FFC0 0010 <sub>H</sub> to FFC0 00FF <sub>H</sub>	—	Access prohibited area
FFC0 0100 <sub>H</sub> to FFC0 010F <sub>H</sub>	1	FEINT (ECON_FEINT)
FFC0 0110 <sub>H</sub> to FFC0 0FFF <sub>H</sub>	—	Access prohibited area
FFC0 1000 <sub>H</sub> to FFC0 1003 <sub>H</sub>	1	SELB_INTC (SL_INTC)
FFC0 1004 <sub>H</sub> to FFC0 1FFF <sub>H</sub>	—	Access prohibited area
FFC0 2000 <sub>H</sub> to FFC0 200F <sub>H</sub>	1	SELB_DMAC (SL_DMAC)
FFC0 2010 <sub>H</sub> to FFC0 2FFF <sub>H</sub>	—	Access prohibited area
FFC0 3000 <sub>H</sub> to FFC0 300F <sub>H</sub>	1	GRZF
FFC0 3010 <sub>H</sub> to FFC0 FFFF <sub>H</sub>	—	Access prohibited area
FFC1 0000 <sub>H</sub> to FFC1 FFFF <sub>H</sub>	1	PORT <sub>n</sub>
FFC2 0000 <sub>H</sub> to FFC2 FFFF <sub>H</sub>	1	PORT (JTAG)
FFC3 0000 <sub>H</sub> to FFC3 000F <sub>H</sub>	1	DNFA_TAUD0 (DNF)
FFC3 0010 <sub>H</sub> to FFC3 001F <sub>H</sub>	—	Access prohibited area
FFC3 0020 <sub>H</sub> to FFC3 002F <sub>H</sub>	1	DNFA_TAUB0 (DNF)
FFC3 0030 <sub>H</sub> to FFC3 003F <sub>H</sub>	—	Access prohibited area
FFC3 0040 <sub>H</sub> to FFC3 004F <sub>H</sub>	1	DNFA_TAUB1 (DNF)
FFC3 0050 <sub>H</sub> to FFC3 005F <sub>H</sub>	—	Access prohibited area
FFC3 0060 <sub>H</sub> to FFC3 006F <sub>H</sub>	1	DNFA_ENCA0 (DNF)
FFC3 0070 <sub>H</sub> to FFC3 009F <sub>H</sub>	—	Access prohibited area
FFC3 00A0 <sub>H</sub> to FFC3 00AF <sub>H</sub>	1	DNFA_ADCA0 (DNF)
FFC3 00B0 <sub>H</sub> to FFC3 00BF <sub>H</sub>	—	Access prohibited area
FFC3 00C0 <sub>H</sub> to FFC3 00CF <sub>H</sub>	1	DNFA_ADCA1 (DNF)
FFC3 00D0 <sub>H</sub> to FFC3 00DF <sub>H</sub>	—	Access prohibited area
FFC3 00E0 <sub>H</sub> to FFC3 00EF <sub>H</sub>	1	DNFA_SENT (DNF)
FFC3 00F0 <sub>H</sub> to FFC3 00FF <sub>H</sub>	—	Access prohibited area

Table 4A.4 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFC3 0100 <sub>H</sub> to FFC3 010F <sub>H</sub>	—	Access prohibited area
FFC3 0110 <sub>H</sub> to FFC3 3FFF <sub>H</sub>	—	Access prohibited area
FFC3 4000 <sub>H</sub> to FFC3 401F <sub>H</sub>	1	FCLA_NMI (FCLA0)
FFC3 4020 <sub>H</sub> to FFC3 403F <sub>H</sub>	1	FCLA_INTPL (FCLA0)
FFC3 4040 <sub>H</sub> to FFC3 405F <sub>H</sub>	1	FCLA_INTPH (FCLA0)

FFC3 40A0 <sub>H</sub> to FFC3 40BF <sub>H</sub>	1	FCLA_INTPU (FCLA0)
FFC3 40C0 <sub>H</sub> to FFC3 FFFF <sub>H</sub>	—	Access prohibited area
FFC4 0000 <sub>H</sub> to FFC4 004F <sub>H</sub>	1	P-Bus guard (PBG10)
FFC4 0050 <sub>H</sub> to FFC4 00FF <sub>H</sub>	—	Access prohibited area
FFC4 0100 <sub>H</sub> to FFC4 014F <sub>H</sub>	1	P-Bus guard (PBG11)
FFC4 0150 <sub>H</sub> to FFC4 03FF <sub>H</sub>	—	Access prohibited area
FFC4 0400 <sub>H</sub> to FFC4 044F <sub>H</sub>	1	P-Bus guard (PBG12)
FFC4 0450 <sub>H</sub> to FFC4 04FF <sub>H</sub>	—	Access prohibited area
FFC4 0500 <sub>H</sub> to FFC4 054F <sub>H</sub>	1	P-Bus guard (PBG13)
FFC4 0550 <sub>H</sub> to FFC4 05FF <sub>H</sub>	—	Access prohibited area
FFC4 0600 <sub>H</sub> to FFC4 064F <sub>H</sub>	1	P-Bus guard (PBG14)
FFC4 0650 <sub>H</sub> to FFC4 8FFF <sub>H</sub>	—	Access prohibited area
FFC4 9000 <sub>H</sub> to FFC4 907F <sub>H</sub>	2	Global RAM Guard Bank A (MGDGR)
FFC4 9080 <sub>H</sub> to FFC4 91FF <sub>H</sub>	—	Access prohibited area
FFC4 9200 <sub>H</sub> to FFC4 927F <sub>H</sub>	2	Global RAM Guard Bank B (MGDGR)
FFC4 9280 <sub>H</sub> to FFC4 BFFF <sub>H</sub>	—	Access prohibited area
FFC4 C000 <sub>H</sub> to FFC4 C00F <sub>H</sub>	2	P-Bus guard (PBG0)
FFC4 C010 <sub>H</sub> to FFC4 C10F <sub>H</sub>	—	Access prohibited area
FFC4 C110 <sub>H</sub> to FFC4 C13F <sub>H</sub>	2	P-Bus guard (PBG1)
FFC4 C140 <sub>H</sub> to FFC4 C7FF <sub>H</sub>	—	Access prohibited area
FFC4 C800 <sub>H</sub> to FFC4 C80F <sub>H</sub>	2	ERRSLV (PBG0)
FFC4 C810 <sub>H</sub> to FFC4 C8FF <sub>H</sub>	—	Access prohibited area
FFC4 C900 <sub>H</sub> to FFC4 C90F <sub>H</sub>	2	ERRSLV (PBG1)
FFC4 C910 <sub>H</sub> to FFC5 7FFF <sub>H</sub>	—	Access prohibited area
FFC5 8000 <sub>H</sub> to FFC5 803F <sub>H</sub>	2	BOOTCTRL
FFC5 8040 <sub>H</sub> to FFC5 97FF <sub>H</sub>	—	Access prohibited area
FFC5 9800 <sub>H</sub> to FFC5 981F <sub>H</sub>	4	EEPRDCYCL (DCIB)
FFC5 9820 <sub>H</sub> to FFC5 9BFF <sub>H</sub>	—	Access prohibited area
FFC5 9C00 <sub>H</sub> to FFC5 9C4F <sub>H</sub>	4	P-Bus guard (PBG40)
FFC5 9C50 <sub>H</sub> to FFC5 AFFF <sub>H</sub>	—	Access prohibited area
FFC5 B000 <sub>H</sub> to FFC5 B003 <sub>H</sub>	2	FBUFCCTL (FBUF_CTRL)
FFC5 B004 <sub>H</sub> to FFC6 21FF <sub>H</sub>	—	Access prohibited area
FFC6 2200 <sub>H</sub> to FFC6 23FF <sub>H</sub>	2	Code Flash ECC (CFECC_VCI)
FFC6 2400 <sub>H</sub> to FFC6 25FF <sub>H</sub>	2	Code Flash ECC (CFECC_CPU1)
FFC6 2600 <sub>H</sub> to FFC6 29FF <sub>H</sub>	—	Access prohibited area
FFC6 2A00 <sub>H</sub> to FFC6 2A3F <sub>H</sub>	4	Data Flash ECC (DFECC)
FFC6 2A40 <sub>H</sub> to FFC6 3FFF <sub>H</sub>	—	Access prohibited area

Table 4A.4 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFC6 4000 <sub>H</sub> to FFC6 403F <sub>H</sub>	2	Global RAM ECC Bank A (GRECC)
FFC6 4040 <sub>H</sub> to FFC6 41FF <sub>H</sub>	—	Access prohibited area
FFC6 4200 <sub>H</sub> to FFC6 423F <sub>H</sub>	2	Global RAM ECC Bank B (GRECC)
FFC6 4240 <sub>H</sub> to FFC6 4FFF <sub>H</sub>	—	Access prohibited area
FFC6 5000 <sub>H</sub> to FFC6 501F <sub>H</sub>	2	Local RAM ECC TEST PE1 (LRTST)
FFC6 5020 <sub>H</sub> to FFC6 53FF <sub>H</sub>	—	Access prohibited area
FFC6 5400 <sub>H</sub> to FFC6 547F <sub>H</sub>	2	Local RAM ECC PE1 (LRECC)
FFC6 5480 <sub>H</sub> to FFC6 55FF <sub>H</sub>	—	Access prohibited area
FFC6 5600 <sub>H</sub> to FFC6 567F <sub>H</sub>	2	Local RAM ECC PE2 (LRECC)
FFC6 5680 <sub>H</sub> to FFC7 00FF <sub>H</sub>	—	Access prohibited area

FFD8 9020 <sub>H</sub> to FFD8 9FFF <sub>H</sub>	—	Access prohibited area
FFD8 A000 <sub>H</sub> to FFD8 A01F <sub>H</sub>	3	CSIG1 (CSIG1CTL0-2, CSIG1STR0, CSIG1STCR0, CSIG1EMU)
FFD8 A020 <sub>H</sub> to FFD8 AFFF <sub>H</sub>	—	Access prohibited area
FFD8 B000 <sub>H</sub> to FFD8 B01F <sub>H</sub>	3	CSIG1 (CSIG1 registers other than above)
FFD8 B020 <sub>H</sub> to FFD8 BFFF <sub>H</sub>	—	Access prohibited area
FFD8 C000 <sub>H</sub> to FFD8 C01F <sub>H</sub>	3	CSIG2 (CSIG2CTL0-2, CSIG2STR0, CSIG2STCR0, CSIG2EMU)
FFD8 C020 <sub>H</sub> to FFD8 CFFF <sub>H</sub>	—	Access prohibited area
FFD8 D000 <sub>H</sub> to FFD8 D01F <sub>H</sub>	3	CSIG2 (CSIG2 registers other than above)
FFD8 D020 <sub>H</sub> to FFD8 DFFF <sub>H</sub>	—	Access prohibited area
FFD8 E000 <sub>H</sub> to FFD8 E01F <sub>H</sub>	3	CSIG3 (CSIG3CTL0-2, CSIG3STR0, CSIG3STCR0, CSIG3EMU)
FFD8 E020 <sub>H</sub> to FFD8 EFFF <sub>H</sub>	—	Access prohibited area
FFD8 F000 <sub>H</sub> to FFD8 F01F <sub>H</sub>	3	CSIG3 (CSIG3 registers other than above)

Table 4A.4 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFD8 F020 <sub>H</sub> to FFD8 FFFF <sub>H</sub>	—	Access prohibited area
FFD9 0000 <sub>H</sub> to FFD9 001F <sub>H</sub>	3	CSIH4 (CSIH4CTL0-2, CSIH4STR0, CSIH4STCR0, CSIH4EMU)
FFD9 0020 <sub>H</sub> to FFD9 0FFF <sub>H</sub>	—	Access prohibited area
FFD9 1000 <sub>H</sub> to FFD9 107F <sub>H</sub>	3	CSIH4 (CSIH4 registers other than above)
FFD9 1080 <sub>H</sub> to FFD9 1FFF <sub>H</sub>	—	Access prohibited area
FFD9 2000 <sub>H</sub> to FFD9 201F <sub>H</sub>	3	CSIG4 (CSIG4CTL0-2, CSIG4STR0, CSIG4STCR0, CSIG4EMU)
FFD9 2020 <sub>H</sub> to FFD9 2FFF <sub>H</sub>	—	Access prohibited area
FFD9 3000 <sub>H</sub> to FFD9 301F <sub>H</sub>	3	CSIG4 (CSIG4 registers other than above)
FFD9 3020 <sub>H</sub> to FFDC FFFF <sub>H</sub>	—	Access prohibited area
FFDD 0000 <sub>H</sub> to FFDD 00FF <sub>H</sub>	2	PIC0
FFDD 0100 <sub>H</sub> to FFDD CFFF <sub>H</sub>	—	Access prohibited area
FFDD D000 <sub>H</sub> to FFDD D04F <sub>H</sub>	2	P-Bus guard (PBG20)
FFDD D050 <sub>H</sub> to FFDD D0FF <sub>H</sub>	—	Access prohibited area
FFDD D100 <sub>H</sub> to FFDD D14F <sub>H</sub>	2	P-Bus guard (PBG21)
FFDD D150 <sub>H</sub> to FFE1 FFFF <sub>H</sub>	—	Access prohibited area
FFE2 0000 <sub>H</sub> to FFE2 03FF <sub>H</sub>	2	TAUD0
FFE2 0400 <sub>H</sub> to FFE2 3FFF <sub>H</sub>	—	Access prohibited area
FFE2 4000 <sub>H</sub> to FFE2 4003 <sub>H</sub>	2	SELB_TAUD0 (SL_TAUD0)
FFE2 4004 <sub>H</sub> to FFE2 FFFF <sub>H</sub>	—	Access prohibited area
FFE3 0000 <sub>H</sub> to FFE3 03FF <sub>H</sub>	2	TAUB0
FFE3 0400 <sub>H</sub> to FFE3 0FFF <sub>H</sub>	—	Access prohibited area
FFE3 1000 <sub>H</sub> to FFE3 13FF <sub>H</sub>	2	TAUB1
FFE3 1400 <sub>H</sub> to FFE3 1FFF <sub>H</sub>	—	Access prohibited area
FFE3 2000 <sub>H</sub> to FFE3 2003 <sub>H</sub>	2	SELB_TAUB0 (SL_TAUB0)
FFE3 2004 <sub>H</sub> to FFE3 2FFF <sub>H</sub>	—	Access prohibited area
FFE3 3000 <sub>H</sub> to FFE3 3003 <sub>H</sub>	2	SELB_TAUB1 (SL_TAUB1)
FFE3 3004 <sub>H</sub> to FFE4 FFFF <sub>H</sub>	—	Access prohibited area
FFE5 0000 <sub>H</sub> to FFE5 00FF <sub>H</sub>	2	TAUJ0
FFE5 0100 <sub>H</sub> to FFE5 01FF <sub>H</sub>	2	TAUJ2
FFE5 0200 <sub>H</sub> to FFE5 0FFF <sub>H</sub>	—	Access prohibited area
FFE5 1000 <sub>H</sub> to FFE5 10FF <sub>H</sub>	2	TAUJ1
FFE5 1100 <sub>H</sub> to FFE5 11FF <sub>H</sub>	2	TAUJ3
FFE5 1200 <sub>H</sub> to FFE5 3FFF <sub>H</sub>	—	Access prohibited area
FFE5 4000 <sub>H</sub> to FFE5 4003 <sub>H</sub>	2	SELB_TAUJ0 (SL_TAUJ0)
FFE5 4004 <sub>H</sub> to FFE5 4007 <sub>H</sub>	2	SELB_TAUJ2 (SL_TAUJ2)
FFE5 4008 <sub>H</sub> to FFE6 FFFF <sub>H</sub>	—	Access prohibited area
FFE7 0000 <sub>H</sub> to FFE7 03FF <sub>H</sub>	2	PWSA0
FFE7 0400 <sub>H</sub> to FFE7 0FFF <sub>H</sub>	—	Access prohibited area
FFE7 1000 <sub>H</sub> to FFE7 27FF <sub>H</sub>	2	PWGAn
FFE7 2800 <sub>H</sub> to FFE7 281F <sub>H</sub>	2	PWBA0
FFE7 2820 <sub>H</sub> to FFE7 2FFF <sub>H</sub>	—	Access prohibited area
FFE7 3000 <sub>H</sub> to FFE7 301F <sub>H</sub>	2	SLPWG
FFE7 3020 <sub>H</sub> to FFE7 30FF <sub>H</sub>	—	Access prohibited area
FFE7 3100 <sub>H</sub> to FFE7 315F <sub>H</sub>	2	PWGA_INTF
FFE7 3160 <sub>H</sub> to FFE7 7FFF <sub>H</sub>	—	Access prohibited area

Table 4A.4 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFE7 8000 <sub>H</sub> to FFE7 807F <sub>H</sub>	2	RTCA0
FFE7 8080 <sub>H</sub> to FFE7 FFFF <sub>H</sub>	—	Access prohibited area

FFFF B000 <sub>H</sub> to FFFF BFFF <sub>H</sub>	2	INTC2
FFFF C000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	—	Access prohibited area

## Section 4B Address Space of RH850/F1KM-S4, RH850/F1KM-S2

### 4B.1 Address Space

Table 4B.1, Address Space (RH850/F1KM-S4 4-MB 176/233/272-Pin Product) to Table 4B.8, Address Space (RH850/F1KM-S2 2-MB 100-Pin Product) show the address space of the RH850/F1KM.

#### CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in Table 4B.1, Address Space (RH850/F1KM-S4 4-MB 176/233/272-Pin Product) to Table 4B.8, Address Space (RH850/F1KM-S2 2-MB 100-Pin Product). If such an address is accessed, operation is not guaranteed.

#### NOTE

The Local RAM is accessible through the following two address areas in the address space.

CPU1 area: Address area accessible from CPU, DMA, FlexRay and ETNB.

Self area: Mirrored address area, accessible only from CPU to refer the CPU's self resource.

Table 4B.1 Address Space (RH850/F1KM-S4 4-MB 176/233/272-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 003F FFFF <sub>H</sub>	Code Flash	4 MB
0040 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area	
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	8 KB
1002 2000 <sub>H</sub> to 1002 FFFF <sub>H</sub>	Access prohibited area	
1003 0000 <sub>H</sub> to 1003 03FF <sub>H</sub>	External Memory Access Controller (MEMC)	1 KB
1003 0400 <sub>H</sub> to 1003 FFFF <sub>H</sub>	Access prohibited area	
1004 0000 <sub>H</sub> to 1004 0FFF <sub>H</sub>	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000 <sub>H</sub> to 1FFF FFFF <sub>H</sub>	Access prohibited area	
2000 0000 <sub>H</sub> to 20FF FFFF <sub>H</sub>	External Memory Area (CS0)	16 MB*4
2100 0000 <sub>H</sub> to 21FF FFFF <sub>H</sub>	Access prohibited area	
2200 0000 <sub>H</sub> to 22FF FFFF <sub>H</sub>	External Memory Area (CS1)	16 MB*4
2300 0000 <sub>H</sub> to 23FF FFFF <sub>H</sub>	Access prohibited area	
2400 0000 <sub>H</sub> to 24FF FFFF <sub>H</sub>	External Memory Area (CS2)	16 MB*4
2500 0000 <sub>H</sub> to 27FF FFFF <sub>H</sub>	Access prohibited area	
2800 0000 <sub>H</sub> to 28FF FFFF <sub>H</sub>	External Memory Area (CS3)	16 MB*4
2900 0000 <sub>H</sub> to 2FFF FFFF <sub>H</sub>	Access prohibited area	
3000 0000 <sub>H</sub> to 33FF FFFF <sub>H</sub>	External Serial Flash Memory Area	64 MB
3400 0000 <sub>H</sub> to FEBB FFFF <sub>H</sub>	Access prohibited area	
FEBC 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	256 KB*1
FEC0 0000 <sub>H</sub> to FEDB FFFF <sub>H</sub>	Access prohibited area	
FEDC 0000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Local RAM (self area)	256 KB*1
FEE0 0000 <sub>H</sub> to FEEE 7FFF <sub>H</sub>	Access prohibited area	
FEEE 8000 <sub>H</sub> to FEEF FFFF <sub>H</sub>	Global RAM A	96 KB*2

Table 4B.1 Address Space (RH850/F1KM-S4 4-MB 176/233/272-Pin Product)

Address	Address Space Type	Size
FEF0 0000 <sub>H</sub> to FEF0 FFFF <sub>H</sub>	Retention RAM	64 KB
FEF1 0000 <sub>H</sub> to FEFE 7FFF <sub>H</sub>	Access prohibited area	
FEFE 8000 <sub>H</sub> to FEFF FFFF <sub>H</sub>	Global RAM B	96 KB* <sup>2</sup>
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF21 FFFF <sub>H</sub>	Data flash	128 KB* <sup>3</sup>
FF22 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

Note 1. 192 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 64 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Note 4. 8 MB in 176/233-pin products: For details, see **Section 16, External Memory Access Controller (MEMC)**.

Table 4B.2 Address Space (RH850/F1KM-S4 4-MB 144-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 003F FFFF <sub>H</sub>	Code Flash	4 MB
0040 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area	
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	8 KB
1002 2000 <sub>H</sub> to 1003 FFFF <sub>H</sub>	Access prohibited area	
1004 0000 <sub>H</sub> to 1004 0FFF <sub>H</sub>	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000 <sub>H</sub> to 2FFF FFFF <sub>H</sub>	Access prohibited area	
3000 0000 <sub>H</sub> to 33FF FFFF <sub>H</sub>	External Serial Flash Memory Area	64 MB
3400 0000 <sub>H</sub> to FEBB FFFF <sub>H</sub>	Access prohibited area	
FEBC 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	256 KB*1
FEC0 0000 <sub>H</sub> to FEDB FFFF <sub>H</sub>	Access prohibited area	
FEDC 0000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Local RAM (self area)	256 KB*1
FEE0 0000 <sub>H</sub> to FEEE 7FFF <sub>H</sub>	Access prohibited area	
FEEE 8000 <sub>H</sub> to FEEF FFFF <sub>H</sub>	Global RAM A	96 KB*2
FEF0 0000 <sub>H</sub> to FEF0 FFFF <sub>H</sub>	Retention RAM	64 KB
FEF1 0000 <sub>H</sub> to FEFE 7FFF <sub>H</sub>	Access prohibited area	
FEFE 8000 <sub>H</sub> to FEFF FFFF <sub>H</sub>	Global RAM B	96 KB*2
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF21 FFFF <sub>H</sub>	Data flash	128 KB*3
FF22 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

Note 1. 192 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 64 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Table 4B.3 Address Space (RH850/F1KM-S4 4-MB 100-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 003F FFFF <sub>H</sub>	Code Flash	4 MB
0040 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area	
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	8 KB
1002 2000 <sub>H</sub> to FEBB FFFF <sub>H</sub>	Access prohibited area	
FEB0 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	256 KB* <sup>1</sup>
FEC0 0000 <sub>H</sub> to FEDB FFFF <sub>H</sub>	Access prohibited area	
FEDC 0000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Local RAM (self area)	256 KB* <sup>1</sup>
FEE0 0000 <sub>H</sub> to FEEE 7FFF <sub>H</sub>	Access prohibited area	
FEEE 8000 <sub>H</sub> to FEEF FFFF <sub>H</sub>	Global RAM A	96 KB* <sup>2</sup>
FEF0 0000 <sub>H</sub> to FEF0 FFFF <sub>H</sub>	Retention RAM	64 KB
FEF1 0000 <sub>H</sub> to FEFE 7FFF <sub>H</sub>	Access prohibited area	
FEFE 8000 <sub>H</sub> to FEFF FFFF <sub>H</sub>	Global RAM B	96 KB* <sup>2</sup>
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF21 FFFF <sub>H</sub>	Data flash	128 KB* <sup>3</sup>
FF22 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

Note 1. 192 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 64 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Table 4B.4 Address Space (RH850/F1KM-S4 3-MB 176/233/272-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 002F FFFF <sub>H</sub>	Code Flash	3 MB
0030 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area	
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	8 KB
1002 2000 <sub>H</sub> to 1002 FFFF <sub>H</sub>	Access prohibited area	
1003 0000 <sub>H</sub> to 1003 03FF <sub>H</sub>	External Memory Access Controller (MEMC)	1 KB
1003 0400 <sub>H</sub> to 1003 FFFF <sub>H</sub>	Access prohibited area	
1004 0000 <sub>H</sub> to 1004 0FFF <sub>H</sub>	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000 <sub>H</sub> to 1FFF FFFF <sub>H</sub>	Access prohibited area	
2000 0000 <sub>H</sub> to 20FF FFFF <sub>H</sub>	External Memory Area (CS0)	16 MB*4
2100 0000 <sub>H</sub> to 21FF FFFF <sub>H</sub>	Access prohibited area	
2200 0000 <sub>H</sub> to 22FF FFFF <sub>H</sub>	External Memory Area (CS1)	16 MB*4
2300 0000 <sub>H</sub> to 23FF FFFF <sub>H</sub>	Access prohibited area	
2400 0000 <sub>H</sub> to 24FF FFFF <sub>H</sub>	External Memory Area (CS2)	16 MB*4
2500 0000 <sub>H</sub> to 27FF FFFF <sub>H</sub>	Access prohibited area	
2800 0000 <sub>H</sub> to 28FF FFFF <sub>H</sub>	External Memory Area (CS3)	16 MB*4
2900 0000 <sub>H</sub> to 2FFF FFFF <sub>H</sub>	Access prohibited area	
3000 0000 <sub>H</sub> to 33FF FFFF <sub>H</sub>	External Serial Flash Memory Area	64 MB
3400 0000 <sub>H</sub> to FEBC FFFF <sub>H</sub>	Access prohibited area	
FEBD 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	192 KB*1
FEC0 0000 <sub>H</sub> to FEDC FFFF <sub>H</sub>	Access prohibited area	
FEDD 0000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Local RAM (self area)	192 KB*1
FEE0 0000 <sub>H</sub> to FEEE FFFF <sub>H</sub>	Access prohibited area	
FEEF 0000 <sub>H</sub> to FEEF FFFF <sub>H</sub>	Global RAM A	64 KB*2
FEF0 0000 <sub>H</sub> to FEF0 FFFF <sub>H</sub>	Retention RAM	64 KB
FEF1 0000 <sub>H</sub> to FEFE FFFF <sub>H</sub>	Access prohibited area	
FEFF 0000 <sub>H</sub> to FEFF FFFF <sub>H</sub>	Global RAM B	64 KB*2
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF21 FFFF <sub>H</sub>	Data flash	128 KB*3
FF22 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 48 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Note 4. 8 MB in 176/233-pin products: For details, see **Section 16, External Memory Access Controller (MEMC)**.

Table 4B.5 Address Space (RH850/F1KM-S4 3-MB 144-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 002F FFFF <sub>H</sub>	Code Flash	3 MB
0030 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area	
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	8 KB
1002 2000 <sub>H</sub> to 1003 FFFF <sub>H</sub>	Access prohibited area	
1004 0000 <sub>H</sub> to 1004 0FFF <sub>H</sub>	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000 <sub>H</sub> to 2FFF FFFF <sub>H</sub>	Access prohibited area	
3000 0000 <sub>H</sub> to 33FF FFFF <sub>H</sub>	External Serial Flash Memory Area	64 MB
3400 0000 <sub>H</sub> to FEBC FFFF <sub>H</sub>	Access prohibited area	
FEBD 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	192 KB*1
FEC0 0000 <sub>H</sub> to FEDC FFFF <sub>H</sub>	Access prohibited area	
FEDD 0000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Local RAM (self area)	192 KB*1
FEE0 0000 <sub>H</sub> to FEEE FFFF <sub>H</sub>	Access prohibited area	
FEED 0000 <sub>H</sub> to FEED FFFF <sub>H</sub>	Global RAM A	64 KB*2
FEF0 0000 <sub>H</sub> to FEF0 FFFF <sub>H</sub>	Retention RAM	64 KB
FEF1 0000 <sub>H</sub> to FEFE FFFF <sub>H</sub>	Access prohibited area	
FEFF 0000 <sub>H</sub> to FEFF FFFF <sub>H</sub>	Global RAM B	64 KB*2
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF21 FFFF <sub>H</sub>	Data flash	128 KB*3
FF22 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 48 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Table 4B.6 Address Space (RH850/F1KM-S4 3-MB 100-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 002F FFFF <sub>H</sub>	Code Flash	3 MB
0030 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area	
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	8 KB
1002 2000 <sub>H</sub> to FEBC FFFF <sub>H</sub>	Access prohibited area	
FEBD 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	192 KB* <sup>1</sup>
FEC0 0000 <sub>H</sub> to FEDC FFFF <sub>H</sub>	Access prohibited area	
FEDD 0000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Local RAM (self area)	192 KB* <sup>1</sup>
FEE0 0000 <sub>H</sub> to FEEE FFFF <sub>H</sub>	Access prohibited area	
FEEF 0000 <sub>H</sub> to FEEF FFFF <sub>H</sub>	Global RAM A	64 KB* <sup>2</sup>
FEF0 0000 <sub>H</sub> to FEF0 FFFF <sub>H</sub>	Retention RAM	64 KB
FEF1 0000 <sub>H</sub> to FEFE FFFF <sub>H</sub>	Access prohibited area	
FEFF 0000 <sub>H</sub> to FEFF FFFF <sub>H</sub>	Global RAM B	64 KB* <sup>2</sup>
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF21 FFFF <sub>H</sub>	Data flash	128 KB* <sup>3</sup>
FF22 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area

## 4B.2 Address Space Viewed from Each Bus Master

**Table 4B.9, Address Space Viewed from Each Bus Master (RH850/F1KM-S4 4-MB Product)** and **Table 4B.10, Address Space Viewed from Each Bus Master (RH850/F1KM-S2 2-MB Product)** shows address spaces viewed from each bus master.

### 4B.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, local RAM, global RAM, and retention RAM.

### 4B.2.2 Data Space Accessible by CPU

See **Table 4B.9, Address Space Viewed from Each Bus Master (RH850/F1KM-S4 4-MB Product)** and **Table 4B.10, Address Space Viewed from Each Bus Master (RH850/F1KM-S2 2-MB Product)** for the spaces accessible from the CPU.

### 4B.2.3 Data Space Accessible by DMA

See **Table 4B.9, Address Space Viewed from Each Bus Master (RH850/F1KM-S4 4-MB Product)** and **Table 4B.10, Address Space Viewed from Each Bus Master (RH850/F1KM-S2 2-MB Product)** for the spaces accessible from the DMA.

### 4B.2.4 Data Space Accessible by Flexray

See **Table 4B.9, Address Space Viewed from Each Bus Master (RH850/F1KM-S4 4-MB Product)** for the spaces accessible from the Flexray.

### 4B.2.5 Data Space Accessible by ETNB

See **Table 4B.9, Address Space Viewed from Each Bus Master (RH850/F1KM-S4 4-MB Product)** for the spaces accessible from the ETNB.

## 4B.2.6 Data Space Accessible by Each Bus Master

See **Table 4B.9, Address Space Viewed from Each Bus Master (RH850/F1KM-S4 4-MB Product)** and **Table 4B.10, Address Space Viewed from Each Bus Master (RH850/F1KM-S2 2-MB Product)** for the spaces accessible from Each Bus Master.

Table 4B.9 Address Space Viewed from Each Bus Master (RH850/F1KM-S4 4-MB Product)

Address	Resource	From CPU	From DMA	From FlexRay	From ETNB
0000 0000 <sub>H</sub> to 003F FFFF <sub>H</sub>	Code Flash	✓	✓		
0040 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area				
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	✓	✓		
0100 8000 <sub>H</sub> to 1001 FFFF <sub>H</sub>	Access prohibited area				
1002 0000 <sub>H</sub> to 1002 1FFF <sub>H</sub>	FlexRay Interface (FLXA)	✓	✓		
1002 2000 <sub>H</sub> to 1002 FFFF <sub>H</sub>	Access prohibited area				
1003 0000 <sub>H</sub> to 1003 03FF <sub>H</sub>	External Memory Access Controller (MEMC)	✓	✓		
1003 0400 <sub>H</sub> to 1003 FFFF <sub>H</sub>	Access prohibited area				
1004 0000 <sub>H</sub> to 1004 0FFF <sub>H</sub>	Serial Flash Memory Interface (SFMA)	✓	✓		
1004 1000 <sub>H</sub> to 1FFF FFFF <sub>H</sub>	Access prohibited area				
2000 0000 <sub>H</sub> to 20FF FFFF <sub>H</sub>	External Memory Area (CS0)	✓	✓		
2100 0000 <sub>H</sub> to 21FF FFFF <sub>H</sub>	Access prohibited area				
2200 0000 <sub>H</sub> to 22FF FFFF <sub>H</sub>	External Memory Area (CS1)	✓	✓		
2300 0000 <sub>H</sub> to 23FF FFFF <sub>H</sub>	Access prohibited area				
2400 0000 <sub>H</sub> to 24FF FFFF <sub>H</sub>	External Memory Area (CS2)	✓	✓		
2500 0000 <sub>H</sub> to 27FF FFFF <sub>H</sub>	Access prohibited area				
2800 0000 <sub>H</sub> to 28FF FFFF <sub>H</sub>	External Memory Area (CS3)	✓	✓		
2900 0000 <sub>H</sub> to 2FFF FFFF <sub>H</sub>	Access prohibited area				
3000 0000 <sub>H</sub> to 33FF FFFF <sub>H</sub>	External Serial Flash Memory Area	✓	✓		
3400 0000 <sub>H</sub> to FEBB FFFF <sub>H</sub>	Access prohibited area				
FEB0 0000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Local RAM (CPU1 area)	✓	✓	✓	✓
FEC0 0000 <sub>H</sub> to FEDB FFFF <sub>H</sub>	Access prohibited area				
FED0 0000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Local RAM (self area)	✓			
FEE0 0000 <sub>H</sub> to FEEE 7FFF <sub>H</sub>	Access prohibited area				
FEEE 8000 <sub>H</sub> to FEEF FFFF <sub>H</sub>	Global RAM A	✓	✓	✓	✓
FEF0 0000 <sub>H</sub> to FEF0 FFFF <sub>H</sub>	Retention RAM	✓	✓	✓	✓
FEF1 0000 <sub>H</sub> to FEFE 7FFF <sub>H</sub>	Access prohibited area				
FEFE 8000 <sub>H</sub> to FEFF FFFF <sub>H</sub>	Global RAM B	✓	✓	✓	✓
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area				
FF20 0000 <sub>H</sub> to FF21 FFFF <sub>H</sub>	Data flash	✓	✓		
FF22 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area				
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	✓	✓		
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area				
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	✓			
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area

### 4B.3 Peripheral I/O Address Map

**Table 4B.11, Peripheral I/O Address Map (RH850/F1KM-S4) and Table 4B.12, Peripheral I/O Address Map (RH850/F1KM-S2)** shows peripheral I/O address map.

Table 4B.11 Peripheral I/O Address Map (RH850/F1KM-S4)

Address	Peripheral Group	Peripheral I/O
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	—	Access prohibited area
FF20 0000 <sub>H</sub> to FF21 FFFF <sub>H</sub>	4	Data Flash
FF22 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	—	Access prohibited area
FFA0 0000 <sub>H</sub> to FFA0 001F <sub>H</sub>	1	FLMD
FFA0 0020 <sub>H</sub> to FFA0 0FFF <sub>H</sub>	—	Access prohibited area
FFA0 1000 <sub>H</sub> to FFA0 103F <sub>H</sub>	—	Access prohibited area
FFA0 1040 <sub>H</sub> to FFA0 1FFF <sub>H</sub>	—	Access prohibited area
FFA0 2000 <sub>H</sub> to FFA0 201F <sub>H</sub>	—	Access prohibited area
FFA0 2020 <sub>H</sub> to FFA0 FFFF <sub>H</sub>	—	Access prohibited area
FFA1 0000 <sub>H</sub> to FFA1 1FFF <sub>H</sub>	1	Flash controller
FFA1 2000 <sub>H</sub> to FFA1 FFFF <sub>H</sub>	—	Access prohibited area
FFA2 0000 <sub>H</sub> to FFA2 FFFF <sub>H</sub>	1	FACI command-issuing area
FFA3 0000 <sub>H</sub> to FFBF FFFF <sub>H</sub>	—	Access prohibited area
FFC0 0000 <sub>H</sub> to FFC0 000F <sub>H</sub>	1	FENMI (ECON_NMI)
FFC0 0010 <sub>H</sub> to FFC0 00FF <sub>H</sub>	—	Access prohibited area
FFC0 0100 <sub>H</sub> to FFC0 010F <sub>H</sub>	1	FEINT (ECON_FEINT)
FFC0 0110 <sub>H</sub> to FFC0 0FFF <sub>H</sub>	—	Access prohibited area
FFC0 1000 <sub>H</sub> to FFC0 1003 <sub>H</sub>	1	SELB_INTC (SL_INTC)
FFC0 1004 <sub>H</sub> to FFC0 1FFF <sub>H</sub>	—	Access prohibited area
FFC0 2000 <sub>H</sub> to FFC0 200F <sub>H</sub>	1	SELB_DMAL (SL_DMAL)
FFC0 2010 <sub>H</sub> to FFC0 2FFF <sub>H</sub>	—	Access prohibited area
FFC0 3000 <sub>H</sub> to FFC0 300F <sub>H</sub>	1	GRZF
FFC0 3010 <sub>H</sub> to FFC0 FFFF <sub>H</sub>	—	Access prohibited area
FFC1 0000 <sub>H</sub> to FFC1 4CCF <sub>H</sub>	1	PORT
FFC1 4CD0 <sub>H</sub> to FFC1 FFFF <sub>H</sub>	—	Access prohibited area
FFC2 0000 <sub>H</sub> to FFC2 04CF <sub>H</sub>	1	PORT(JTAG)
FFC2 04D0 <sub>H</sub> to FFC2 FFFF <sub>H</sub>	—	Access prohibited area
FFC3 0000 <sub>H</sub> to FFC3 000F <sub>H</sub>	1	DNFA_TAUD0 (DNF)
FFC3 0010 <sub>H</sub> to FFC3 001F <sub>H</sub>	—	Access prohibited area
FFC3 0020 <sub>H</sub> to FFC3 002F <sub>H</sub>	1	DNFA_TAUB0 (DNF)
FFC3 0030 <sub>H</sub> to FFC3 003F <sub>H</sub>	—	Access prohibited area
FFC3 0040 <sub>H</sub> to FFC3 004F <sub>H</sub>	1	DNFA_TAUB1 (DNF)
FFC3 0050 <sub>H</sub> to FFC3 005F <sub>H</sub>	—	Access prohibited area
FFC3 0060 <sub>H</sub> to FFC3 006F <sub>H</sub>	1	DNFA_ENCA0 (DNF)
FFC3 0070 <sub>H</sub> to FFC3 009F <sub>H</sub>	—	Access prohibited area
FFC3 00A0 <sub>H</sub> to FFC3 00AF <sub>H</sub>	1	DNFA_ADCA0 (DNF)
FFC3 00B0 <sub>H</sub> to FFC3 00BF <sub>H</sub>	—	Access prohibited area
FFC3 00C0 <sub>H</sub> to FFC3 00CF <sub>H</sub>	1	DNFA_ADCA1 (DNF)
FFC3 00D0 <sub>H</sub> to FFC3 00DF <sub>H</sub>	—	Access prohibited area

Table 4B.11 Peripheral I/O Address Map (RH850/F1KM-S4)

Address	Peripheral Group	Peripheral I/O
FFC3 00E0 <sub>H</sub> to FFC3 00EF <sub>H</sub>	1	DNFA_SENT (DNF)
FFC3 00F0 <sub>H</sub> to FFC3 00FF <sub>H</sub>	—	Access prohibited area
FFC3 0100 <sub>H</sub> to FFC3 010F <sub>H</sub>	—	Access prohibited area
FFC3 0110 <sub>H</sub> to FFC3 3FFF <sub>H</sub>	—	Access prohibited area
FFC3 4000 <sub>H</sub> to FFC3 401F <sub>H</sub>	1	FCLA_NMI (FCLA0)
FFC3 4020 <sub>H</sub> to FFC3 403F <sub>H</sub>	1	FCLA_INTPL (FCLA0)
FFC3 4040 <sub>H</sub> to FFC3 405F <sub>H</sub>	1	FCLA_INTPH (FCLA0)
FFC3 4060 <sub>H</sub> to FFC3 407F <sub>H</sub>	1	FCLA_ADCA0 (FCLA0)
FFC3 4080 <sub>H</sub> to FFC3 409F <sub>H</sub>	1	FCLA_ADCA1 (FCLA0)
FFC3 40A0 <sub>H</sub> to FFC3 40BF <sub>H</sub>	1	FCLA_INTPU (FCLA0)
FFC3 40C0 <sub>H</sub> to FFC3 FFFF <sub>H</sub>	—	Access prohibited area
FFC4 0000 <sub>H</sub> to FFC4 004F <sub>H</sub>	1	P-Bus guard (PBG10)
FFC4 0050 <sub>H</sub> to FFC4 00FF <sub>H</sub>	—	Access prohibited area
FFC4 0100 <sub>H</sub> to FFC4 014F <sub>H</sub>	1	P-Bus guard (PBG11)
FFC4 0150 <sub>H</sub> to FFC4 03FF <sub>H</sub>	—	Access prohibited area
FFC4 0400 <sub>H</sub> to FFC4 044F <sub>H</sub>	1	P-Bus guard (PBG12)
FFC4 0450 <sub>H</sub> to FFC4 04FF <sub>H</sub>	—	Access prohibited area
FFC4 0500 <sub>H</sub> to FFC4 054F <sub>H</sub>	1	P-Bus guard (PBG13)
FFC4 0550 <sub>H</sub> to FFC4 8FFF <sub>H</sub>	—	Access prohibited area
FFC4 9000 <sub>H</sub> to FFC4 907F <sub>H</sub>	2	Global RAM Guard Bank A (MGDGR)
FFC4 9080 <sub>H</sub> to FFC4 91FF <sub>H</sub>	—	Access prohibited area
FFC4 9200 <sub>H</sub> to FFC4 927F <sub>H</sub>	2	Global RAM Guard Bank B (MGDGR)
FFC4 9280 <sub>H</sub> to FFC4 BFFF <sub>H</sub>	—	Access prohibited area
FFC4 C000 <sub>H</sub> to FFC4 C00F <sub>H</sub>	2	P-Bus guard (PBGC0)
FFC4 C010 <sub>H</sub> to FFC4 C10F <sub>H</sub>	—	Access prohibited area
FFC4 C110 <sub>H</sub> to FFC4 C13F <sub>H</sub>	2	P-Bus guard (PBGC1)
FFC4 C140 <sub>H</sub> to FFC4 C7FF <sub>H</sub>	—	Access prohibited area
FFC4 C800 <sub>H</sub> to FFC4 C80F <sub>H</sub>	2	ERRSLV (PBGC0)
FFC4 C810 <sub>H</sub> to FFC4 C8FF <sub>H</sub>	—	Access prohibited area
FFC4 C900 <sub>H</sub> to FFC4 C90F <sub>H</sub>	2	ERRSLV (PBGC1)
FFC4 C910 <sub>H</sub> to FFC5 97FF <sub>H</sub>	—	Access prohibited area
FFC5 9800 <sub>H</sub> to FFC5 981F <sub>H</sub>	4	EEPRDCYCL (DCIB)
FFC5 9820 <sub>H</sub> to FFC5 9BFF <sub>H</sub>	—	Access prohibited area
FFC5 9C00 <sub>H</sub> to FFC5 9C4F <sub>H</sub>	4	P-Bus guard (PBG40)
FFC5 9C50 <sub>H</sub> to FFC5 AFFF <sub>H</sub>	—	Access prohibited area
FFC5 B000 <sub>H</sub> to FFC5 B003 <sub>H</sub>	2	FBUFCCTL (FBUF_CTRL)
FFC5 B004 <sub>H</sub> to FFC6 21FF <sub>H</sub>	—	Access prohibited area
FFC6 2200 <sub>H</sub> to FFC6 23FF <sub>H</sub>	2	Code Flash ECC (CFECC_VCI)
FFC6 2400 <sub>H</sub> to FFC6 25FF <sub>H</sub>	2	Code Flash ECC (CFECC_CPU1)
FFC6 2600 <sub>H</sub> to FFC6 29FF <sub>H</sub>	—	Access prohibited area
FFC6 2A00 <sub>H</sub> to FFC6 2A3F <sub>H</sub>	4	Data Flash ECC (DFECC)

Table 4B.11 Peripheral I/O Address Map (RH850/F1KM-S4)

Address	Peripheral Group	Peripheral I/O
FFC6 2A40 <sub>H</sub> to FFC6 3FFF <sub>H</sub>	—	Access prohibited area
FFC6 4000 <sub>H</sub> to FFC6 403F <sub>H</sub>	2	Global RAM ECC Bank A (GRECC)
FFC6 4040 <sub>H</sub> to FFC6 41FF <sub>H</sub>	—	Access prohibited area
FFC6 4200 <sub>H</sub> to FFC6 423F <sub>H</sub>	2	Global RAM ECC Bank B (GRECC)
FFC6 4240 <sub>H</sub> to FFC6 4FFF <sub>H</sub>	—	Access prohibited area
FFC6 5000 <sub>H</sub> to FFC6 501F <sub>H</sub>	2	Local RAM ECC TEST PE1 (LRTST)
FFC6 5020 <sub>H</sub> to FFC6 53FF <sub>H</sub>	—	Access prohibited area
FFC6 5400 <sub>H</sub> to FFC6 547F <sub>H</sub>	2	Local RAM ECC PE1 (LRECC)
FFC6 5480 <sub>H</sub> to FFC7 00FF <sub>H</sub>	—	Access prohibited area
FFC7 0100 <sub>H</sub> to FFC7 011F <sub>H</sub>	3	ECCCSIH0
FFC7 0120 <sub>H</sub> to FFC7 01FF <sub>H</sub>	—	Access prohibited area
FFC7 0200 <sub>H</sub> to FFC7 021F <sub>H</sub>	3	ECCCSIH1
FFC7 0220 <sub>H</sub> to FFC7 02FF <sub>H</sub>	—	Access prohibited area
FFC7 0300 <sub>H</sub> to FFC7 031F <sub>H</sub>	3	ECCCSIH2
FFC7 0320 <sub>H</sub> to FFC7 03FF <sub>H</sub>	—	Access prohibited area
FFC7 0400 <sub>H</sub> to FFC7 041F <sub>H</sub>	3	ECCCSIH3
FFC7 0420 <sub>H</sub> to FFC7 12FF <sub>H</sub>	—	Access prohibited area
FFC7 1300 <sub>H</sub> to FFC7 131F <sub>H</sub>	5	ECCCFD0MB
FFC7 1320 <sub>H</sub> to FFC7 13FF <sub>H</sub>	—	Access prohibited area
FFC7 1400 <sub>H</sub> to FFC7 141F <sub>H</sub>	5	ECCCFD0AFL0
FFC7 1420 <sub>H</sub> to FFC7 14FF <sub>H</sub>	—	Access prohibited area
FFC7 1500 <sub>H</sub> to FFC7 151F <sub>H</sub>	5	ECCCFD0AFL1
FFC7 1520 <sub>H</sub> to FFC7 17FF <sub>H</sub>	—	Access prohibited area
FFC7 1800 <sub>H</sub> to FFC7 184F <sub>H</sub>	5	P-Bus guard (PBG60)
FFC7 1850 <sub>H</sub> to FFC7 30FF <sub>H</sub>	—	Access prohibited area
FFC7 3100 <sub>H</sub> to FFC7 311F <sub>H</sub>	3	ECCFLXA0
FFC7 3120 <sub>H</sub> to FFC7 31FF <sub>H</sub>	—	Access prohibited area
FFC7 3200 <sub>H</sub> to FFC7 321F <sub>H</sub>	3	ECCFLXA0T0
FFC7 3220 <sub>H</sub> to FFC7 32FF <sub>H</sub>	—	Access prohibited area
FFC7 3300 <sub>H</sub> to FFC7 331F <sub>H</sub>	3	ECCFLXA0T1
FFC7 3320 <sub>H</sub> to FFC7 40FF <sub>H</sub>	—	Access prohibited area
FFC7 4100 <sub>H</sub> to FFC7 411F <sub>H</sub>	3	ECETNB0TX
FFC7 4120 <sub>H</sub> to FFC7 41FF <sub>H</sub>	—	Access prohibited area
FFC7 4200 <sub>H</sub> to FFC7 421F <sub>H</sub>	3	ECETNB0RX
FFC7 4220 <sub>H</sub> to FFC7 7FFF <sub>H</sub>	—	Access prohibited area
FFC7 8000 <sub>H</sub> to FFC7 8003 <sub>H</sub>	1	SELB READ TEST (SL_READTEST)
FFC7 8004 <sub>H</sub> to FFC9 FFFF <sub>H</sub>	—	Access prohibited area
FFCA 0000 <sub>H</sub> to FFCA 007F <sub>H</sub>	1	RIIC0
FFCA 0080 <sub>H</sub> to FFCA 00FF <sub>H</sub>	1	RIIC1
FFCA 0100 <sub>H</sub> to FFCC FFFF <sub>H</sub>	—	Access prohibited area
FFCD 0000 <sub>H</sub> to FFCD 01FF <sub>H</sub>	1	PRDNAME/CHIPID (SCDS)
FFCD 0200 <sub>H</sub> to FFCD FFFF <sub>H</sub>	—	Access prohibited area
FFCE 0000 <sub>H</sub> to FFCE 007F <sub>H</sub>	1	RLN240
FFCE 0080 <sub>H</sub> to FFCE 00FF <sub>H</sub>	1	RLN241
FFCE 0100 <sub>H</sub> to FFCE 017F <sub>H</sub>	1	RLN242

Table 4B.11 Peripheral I/O Address Map (RH850/F1KM-S4)

Address	Peripheral Group	Peripheral I/O
FFCE 0180 <sub>H</sub> to FFCE 1FFF <sub>H</sub>	—	Access prohibited area
FFCE 2000 <sub>H</sub> to FFCE 203F <sub>H</sub>	1	RLN30
FFCE 2040 <sub>H</sub> to FFCE 207F <sub>H</sub>	1	RLN31
FFCE 2080 <sub>H</sub> to FFCE 20BF <sub>H</sub>	1	RLN32
FFCE 20C0 <sub>H</sub> to FFCE 20FF <sub>H</sub>	1	RLN33
FFCE 2100 <sub>H</sub> to FFCE 213F <sub>H</sub>	1	RLN34
FFCE 2140 <sub>H</sub> to FFCE 217F <sub>H</sub>	1	RLN35
FFCE 2180 <sub>H</sub> to FFCE 21BF <sub>H</sub>	1	RLN36
FFCE 21C0 <sub>H</sub> to FFCE 21FF <sub>H</sub>	1	RLN37
FFCE 2200 <sub>H</sub> to FFCE FFFF <sub>H</sub>	—	Access prohibited area
FFCF 0000 <sub>H</sub> to FFCF 007F <sub>H</sub>	1	RSENT0
FFCF 0080 <sub>H</sub> to FFCF 00FF <sub>H</sub>	—	Access prohibited area
FFCF 0100 <sub>H</sub> to FFCF 017F <sub>H</sub>	1	RSENT1
FFCF 0180 <sub>H</sub> to FFCF FFFF <sub>H</sub>	—	Access prohibited area
FFD0 0000 <sub>H</sub> to FFD1 FFFF <sub>H</sub>	5	RCFDC0
FFD2 0000 <sub>H</sub> to FFD6 CFFF <sub>H</sub>	—	Access prohibited area
FFD6 D000 <sub>H</sub> to FFD6 D7FF <sub>H</sub>	3	ADCA1
FFD6 D800 <sub>H</sub> to FFD6 DFFF <sub>H</sub>	—	Access prohibited area
FFD6 E000 <sub>H</sub> to FFD6 E7FF <sub>H</sub>	3	ETNB0
FFD6 E800 <sub>H</sub> to FFD6 FFFF <sub>H</sub>	—	Access prohibited area
FFD7 0000 <sub>H</sub> to FFD7 003F <sub>H</sub>	3	OSTM0
FFD7 0040 <sub>H</sub> to FFD7 00FF <sub>H</sub>	—	Access prohibited area
FFD7 0100 <sub>H</sub> to FFD7 013F <sub>H</sub>	3	OSTM1
FFD7 0140 <sub>H</sub> to FFD7 01FF <sub>H</sub>	—	Access prohibited area
FFD7 0200 <sub>H</sub> to FFD7 023F <sub>H</sub>	3	OSTM2
FFD7 0240 <sub>H</sub> to FFD7 02FF <sub>H</sub>	—	Access prohibited area
FFD7 0300 <sub>H</sub> to FFD7 033F <sub>H</sub>	3	OSTM3
FFD7 0340 <sub>H</sub> to FFD7 03FF <sub>H</sub>	—	Access prohibited area
FFD7 0400 <sub>H</sub> to FFD7 043F <sub>H</sub>	3	OSTM4
FFD7 0440 <sub>H</sub> to FFD7 FFFF <sub>H</sub>	—	Access prohibited area
FFD8 0000 <sub>H</sub> to FFD8 001F <sub>H</sub>	3	CSIH0 (CSIH0CTL0-2, CSIH0STR0, CSIH0STCR0, CSIH0EMU)
FFD8 0020 <sub>H</sub> to FFD8 0FFF <sub>H</sub>	—	Access prohibited area
FFD8 1000 <sub>H</sub> to FFD8 107F <sub>H</sub>	3	CSIH0 (CSIH0 registers other than above)
FFD8 1080 <sub>H</sub> to FFD8 1FFF <sub>H</sub>	—	Access prohibited area
FFD8 2000 <sub>H</sub> to FFD8 201F <sub>H</sub>	3	CSIH1 (CSIH1CTL0-2, CSIH1STR0, CSIH1STCR0, CSIH1EMU)
FFD8 2020 <sub>H</sub> to FFD8 2FFF <sub>H</sub>	—	Access prohibited area
FFD8 3000 <sub>H</sub> to FFD8 307F <sub>H</sub>	3	CSIH1 (CSIH1 registers other than above)
FFD8 3080 <sub>H</sub> to FFD8 3FFF <sub>H</sub>	—	Access prohibited area
FFD8 4000 <sub>H</sub> to FFD8 401F <sub>H</sub>	3	CSIH2 (CSIH2CTL0-2, CSIH2STR0, CSIH2STCR0, CSIH2EMU)
FFD8 4020 <sub>H</sub> to FFD8 4FFF <sub>H</sub>	—	Access prohibited area
FFD8 5000 <sub>H</sub> to FFD8 507F <sub>H</sub>	3	CSIH2 (CSIH2 registers other than above)
FFD8 5080 <sub>H</sub> to FFD8 5FFF <sub>H</sub>	—	Access prohibited area
FFD8 6000 <sub>H</sub> to FFD8 601F <sub>H</sub>	3	CSIH3 (CSIH3CTL0-2, CSIH3STR0, CSIH3STCR0, CSIH3EMU)
FFD8 6020 <sub>H</sub> to FFD8 6FFF <sub>H</sub>	—	Access prohibited area
FFD8 7000 <sub>H</sub> to FFD8 707F <sub>H</sub>	3	CSIH3 (CSIH3 registers other than above)

Table 4B.11 Peripheral I/O Address Map (RH850/F1KM-S4)

Address	Peripheral Group	Peripheral I/O
FFD8 7080 <sub>H</sub> to FFD8 7FFF <sub>H</sub>	—	Access prohibited area
FFD8 8000 <sub>H</sub> to FFD8 801F <sub>H</sub>	3	CSIG0 (CSIG0CTL0-2, CSIG0STR0, CSIG0STCR0, CSIG0EMU)
FFD8 8020 <sub>H</sub> to FFD8 8FFF <sub>H</sub>	—	Access prohibited area
FFD8 9000 <sub>H</sub> to FFD8 901F <sub>H</sub>	3	CSIG0 (CSIG0 registers other than above)
FFD8 9020 <sub>H</sub> to FFD8 9FFF <sub>H</sub>	—	Access prohibited area
FFD8 A000 <sub>H</sub> to FFD8 A01F <sub>H</sub>	3	CSIG1 (CSIG1CTL0-2, CSIG1STR0, CSIG1STCR0, CSIG1EMU)
FFD8 A020 <sub>H</sub> to FFD8 AFFF <sub>H</sub>	—	Access prohibited area
FFD8 B000 <sub>H</sub> to FFD8 B01F <sub>H</sub>	3	CSIG1 (CSIG1 registers other than above)
FFD8 B020 <sub>H</sub> to FFD8 BFFF <sub>H</sub>	—	Access prohibited area
FFD8 C000 <sub>H</sub> to FFD8 C01F <sub>H</sub>	3	CSIG2 (CSIG2CTL0-2, CSIG2STR0, CSIG2STCR0, CSIG2EMU)
FFD8 C020 <sub>H</sub> to FFD8 CFFF <sub>H</sub>	—	Access prohibited area
FFD8 D000 <sub>H</sub> to FFD8 D01F <sub>H</sub>	3	CSIG2 (CSIG2 registers other than above)
FFD8 D020 <sub>H</sub> to FFD8 DFFF <sub>H</sub>	—	Access prohibited area
FFD8 E000 <sub>H</sub> to FFD8 E01F <sub>H</sub>	3	CSIG3 (CSIG3CTL0-2, CSIG3STR0, CSIG3STCR0, CSIG3EMU)
FFD8 E020 <sub>H</sub> to FFD8 EFFF <sub>H</sub>	—	Access prohibited area
FFD8 F000 <sub>H</sub> to FFD8 F01F <sub>H</sub>	3	CSIG3 (CSIG3 registers other than above)
FFD8 F020 <sub>H</sub> to FFDC FFFF <sub>H</sub>	—	Access prohibited area
FFDD 0000 <sub>H</sub> to FFDD 00FF <sub>H</sub>	2	PIC0
FFDD 0100 <sub>H</sub> to FFDD CFFF <sub>H</sub>	—	Access prohibited area
FFDD D000 <sub>H</sub> to FFDD D04F <sub>H</sub>	2	P-Bus guard (PBG20)
FFDD D050 <sub>H</sub> to FFDD D0FF <sub>H</sub>	—	Access prohibited area
FFDD D100 <sub>H</sub> to FFDD D14F <sub>H</sub>	2	P-Bus guard (PBG21)
FFDD D150 <sub>H</sub> to FFE1 FFFF <sub>H</sub>	—	Access prohibited area
FFE2 0000 <sub>H</sub> to FFE2 03FF <sub>H</sub>	2	TAUD0
FFE2 0400 <sub>H</sub> to FFE2 3FFF <sub>H</sub>	—	Access prohibited area
FFE2 4000 <sub>H</sub> to FFE2 4003 <sub>H</sub>	2	SELB_TAUD0 (SL_TAUD0)
FFE2 4004 <sub>H</sub> to FFE2 FFFF <sub>H</sub>	—	Access prohibited area
FFE3 0000 <sub>H</sub> to FFE3 03FF <sub>H</sub>	2	TAUB0
FFE3 0400 <sub>H</sub> to FFE3 0FFF <sub>H</sub>	—	Access prohibited area
FFE3 1000 <sub>H</sub> to FFE3 13FF <sub>H</sub>	2	TAUB1
FFE3 1400 <sub>H</sub> to FFE3 1FFF <sub>H</sub>	—	Access prohibited area
FFE3 2000 <sub>H</sub> to FFE3 2003 <sub>H</sub>	2	SELB_TAUB0 (SL_TAUB0)
FFE3 2004 <sub>H</sub> to FFE3 2FFF <sub>H</sub>	—	Access prohibited area
FFE3 3000 <sub>H</sub> to FFE3 3003 <sub>H</sub>	2	SELB_TAUB1 (SL_TAUB1)
FFE3 3004 <sub>H</sub> to FFE4 FFFF <sub>H</sub>	—	Access prohibited area
FFE5 0000 <sub>H</sub> to FFE5 00FF <sub>H</sub>	2	TAUJ0
FFE5 0100 <sub>H</sub> to FFE5 01FF <sub>H</sub>	2	TAUJ2
FFE5 0200 <sub>H</sub> to FFE5 0FFF <sub>H</sub>	—	Access prohibited area
FFE5 1000 <sub>H</sub> to FFE5 10FF <sub>H</sub>	2	TAUJ1
FFE5 1100 <sub>H</sub> to FFE5 11FF <sub>H</sub>	2	TAUJ3
FFE5 1200 <sub>H</sub> to FFE5 3FFF <sub>H</sub>	—	Access prohibited area
FFE5 4000 <sub>H</sub> to FFE5 4003 <sub>H</sub>	2	SELB_TAUJ0 (SL_TAUJ0)
FFE5 4004 <sub>H</sub> to FFE5 4007 <sub>H</sub>	2	SELB_TAUJ2 (SL_TAUJ2)
FFE5 4008 <sub>H</sub> to FFE6 FFFF <sub>H</sub>	—	Access prohibited area
FFE7 0000 <sub>H</sub> to FFE7 03FF <sub>H</sub>	2	PWSA0

Table 4B.11 Peripheral I/O Address Map (RH850/F1KM-S4)

Address	Peripheral Group	Peripheral I/O
FFE7 0400 <sub>H</sub> to FFE7 0FFF <sub>H</sub>	—	Access prohibited area
FFE7 1000 <sub>H</sub> to FFE7 27FF <sub>H</sub>	2	PWGAn

FFD8 1080 <sub>H</sub> to FFD8 1FFF <sub>H</sub>	—	Access prohibited area
FFD8 2000 <sub>H</sub> to FFD8 201F <sub>H</sub>	3	CSIH1 (CSIH1CTL0-2, CSIH1STR0, CSIH1STCR0, CSIH1EMU)
FFD8 2020 <sub>H</sub> to FFD8 2FFF <sub>H</sub>	—	Access prohibited area
FFD8 3000 <sub>H</sub> to FFD8 307F <sub>H</sub>	3	CSIH1 (CSIH1 registers other than above)
FFD8 3080 <sub>H</sub> to FFD8 3FFF <sub>H</sub>	—	Access prohibited area
FFD8 4000 <sub>H</sub> to FFD8 401F <sub>H</sub>	3	CSIH2 (CSIH2CTL0-2, CSIH2STR0, CSIH2STCR0, CSIH2EMU)
FFD8 4020 <sub>H</sub> to FFD8 4FFF <sub>H</sub>	—	Access prohibited area
FFD8 5000 <sub>H</sub> to FFD8 507F <sub>H</sub>	3	CSIH2 (CSIH2 registers other than above)
FFD8 5080 <sub>H</sub> to FFD8 5FFF <sub>H</sub>	—	Access prohibited area
FFD8 6000 <sub>H</sub> to FFD8 601F <sub>H</sub>	3	CSIH3 (CSIH3CTL0-2, CSIH3STR0, CSIH3STCR0, CSIH3EMU)
FFD8 6020 <sub>H</sub> to FFD8 6FFF <sub>H</sub>	—	Access prohibited area
FFD8 7000 <sub>H</sub> to FFD8 707F <sub>H</sub>	3	CSIH3 (CSIH3 registers other than above)

Table 4B.12 Peripheral I/O Address Map (RH850/F1KM-S2)

Address	Peripheral Group	Peripheral I/O
FFD8 7080 <sub>H</sub> to FFD8 7FFF <sub>H</sub>	—	Access prohibited area
FFD8 8000 <sub>H</sub> to FFD8 801F <sub>H</sub>	3	CSIG0 (CSIG0CTL0-2, CSIG0STR0, CSIG0STCR0, CSIG0EMU)
FFD8 8020 <sub>H</sub> to FFD8 8FFF <sub>H</sub>	—	Access prohibited area
FFD8 9000 <sub>H</sub> to FFD8 901F <sub>H</sub>	3	CSIG0 (CSIG0 registers other than above)
FFD8 9020 <sub>H</sub> to FFD8 9FFF <sub>H</sub>	—	Access prohibited area
FFD8 A000 <sub>H</sub> to FFD8 A01F <sub>H</sub>	3	CSIG1 (CSIG1CTL0-2, CSIG1STR0, CSIG1STCR0, CSIG1EMU)
FFD8 A020 <sub>H</sub> to FFD8 AFFF <sub>H</sub>	—	Access prohibited area
FFD8 B000 <sub>H</sub> to FFD8 B01F <sub>H</sub>	3	CSIG1 (CSIG1 registers other than above)
FFD8 B020 <sub>H</sub> to FFD8 BFFF <sub>H</sub>	—	Access prohibited area
FFD8 C000 <sub>H</sub> to FFD8 C01F <sub>H</sub>	3	CSIG2 (CSIG2CTL0-2, CSIG2STR0, CSIG2STCR0, CSIG2EMU)
FFD8 C020 <sub>H</sub> to FFD8 CFFF <sub>H</sub>	—	Access prohibited area
FFD8 D000 <sub>H</sub> to FFD8 D01F <sub>H</sub>	3	CSIG2 (CSIG2 registers other than above)
FFD8 D020 <sub>H</sub> to FFD8 DFFF <sub>H</sub>	—	Access prohibited area
FFD8 E000 <sub>H</sub> to FFD8 E01F <sub>H</sub>	3	CSIG3 (CSIG3CTL0-2, CSIG3STR0, CSIG3STCR0, CSIG3EMU)
FFD8 E020 <sub>H</sub> to FFD8 EFFF <sub>H</sub>	—	Access prohibited area
FFD8 F000 <sub>H</sub> to FFD8 F01F <sub>H</sub>	3	CSIG3 (CSIG3 registers other than above)
FFD8 F020 <sub>H</sub> to FFDC FFFF <sub>H</sub>	—	Access prohibited area
FFDD 0000 <sub>H</sub> to FFDD 00FF <sub>H</sub>	2	PIC0
FFDD 0100 <sub>H</sub> to FFDD CFFF <sub>H</sub>	—	Access prohibited area
FFDD D000 <sub>H</sub> to FFDD D04F <sub>H</sub>	2	P-Bus guard (PBG20)
FFDD D050 <sub>H</sub> to FFDD D0FF <sub>H</sub>	—	Access prohibited area
FFDD D100 <sub>H</sub> to FFDD D14F <sub>H</sub>	2	P-Bus guard (PBG21)
FFDD D150 <sub>H</sub> to FFE1 FFFF <sub>H</sub>	—	Access prohibited area
FFE2 0000 <sub>H</sub> to FFE2 03FF <sub>H</sub>	2	TAUD0
FFE2 0400 <sub>H</sub> to FFE2 3FFF <sub>H</sub>	—	Access prohibited area
FFE2 4000 <sub>H</sub> to FFE2 4003 <sub>H</sub>	2	SELB_TAUD0 (SL_TAUD0)
FFE2 4004 <sub>H</sub> to FFE2 FFFF <sub>H</sub>	—	Access prohibited area
FFE3 0000 <sub>H</sub> to FFE3 03FF <sub>H</sub>	2	TAUB0
FFE3 0400 <sub>H</sub> to FFE3 0FFF <sub>H</sub>	—	Access prohibited area
FFE3 1000 <sub>H</sub> to FFE3 13FF <sub>H</sub>	2	TAUB1
FFE3 1400 <sub>H</sub> to FFE3 1FFF <sub>H</sub>	—	Access prohibited area
FFE3 2000 <sub>H</sub> to FFE3 2003 <sub>H</sub>	2	SELB_TAUB0 (SL_TAUB0)
FFE3 2004 <sub>H</sub> to FFE3 2FFF <sub>H</sub>	—	Access prohibited area
FFE3 3000 <sub>H</sub> to FFE3 3003 <sub>H</sub>	2	SELB_TAUB1 (SL_TAUB1)
FFE3 3004 <sub>H</sub> to FFE4 FFFF <sub>H</sub>	—	Access prohibited area
FFE5 0000 <sub>H</sub> to FFE5 00FF <sub>H</sub>	2	TAUJ0
FFE5 0100 <sub>H</sub> to FFE5 01FF <sub>H</sub>	2	TAUJ2
FFE5 0200 <sub>H</sub> to FFE5 0FFF <sub>H</sub>	—	Access prohibited area
FFE5 1000 <sub>H</sub> to FFE5 10FF <sub>H</sub>	2	TAUJ1
FFE5 1100 <sub>H</sub> to FFE5 11FF <sub>H</sub>	2	TAUJ3
FFE5 1200 <sub>H</sub> to FFE5 3FFF <sub>H</sub>	—	Access prohibited area
FFE5 4000 <sub>H</sub> to FFE5 4003 <sub>H</sub>	2	SELB_TAUJ0 (SL_TAUJ0)
FFE5 4004 <sub>H</sub> to FFE5 4007 <sub>H</sub>	2	SELB_TAUJ2 (SL_TAUJ2)
FFE5 4008 <sub>H</sub> to FFE6 FFFF <sub>H</sub>	—	Access prohibited area
FFE7 0000 <sub>H</sub> to FFE7 03FF <sub>H</sub>	2	PWSA0

Table 4B.12 Peripheral I/O Address Map (RH850/F1KM-S2)

Address	Peripheral Group	Peripheral I/O
FFE7 0400 <sub>H</sub> to FFE7 0FFF <sub>H</sub>	—	Access prohibited area
FFE7 1000 <sub>H</sub> to FFE7 21FF <sub>H</sub>	2	PWGAn
FFE7 2200 <sub>H</sub> to FFE7 27FF <sub>H</sub>	—	Access prohibited area
FFE7 2800 <sub>H</sub> to FFE7 281F <sub>H</sub>	2	PWBA0
FFE7 2820 <sub>H</sub> to FFE7 2FFF <sub>H</sub>	—	Access prohibited area
FFE7 3000 <sub>H</sub> to FFE7 301F <sub>H</sub>	2	SLPWG
FFE7 3020 <sub>H</sub> to FFE7 30FF <sub>H</sub>	—	Access prohibited area
FFE7 3100 <sub>H</sub> to FFE7 315F <sub>H</sub>	2	PWGA_INTF
FFE7 3160 <sub>H</sub> to FFE7 7FFF <sub>H</sub>	—	Access prohibited area
FFE7 8000 <sub>H</sub> to FFE7 807F <sub>H</sub>	2	RTCA0
FFE7 8080 <sub>H</sub> to FFE7 FFFF <sub>H</sub>	—	Access prohibited area
FFE8 0000 <sub>H</sub> to FFE8 007F <sub>H</sub>	2	ENCA0
FFE8 0080 <sub>H</sub> to FFE8 FFFF <sub>H</sub>	—	Access prohibited area
FFE9 0000 <sub>H</sub> to FFE9 003F <sub>H</sub>	2	TAPA0
FFE9 0040 <sub>H</sub> to FFEC FFFF <sub>H</sub>	—	Access prohibited area
FFED 0000 <sub>H</sub> to FFED 000F <sub>H</sub>	2	WDTA0
FFED 0010 <sub>H</sub> to FFED 0FFF <sub>H</sub>	—	Access prohibited area
FFED 1000 <sub>H</sub> to FFED 100F <sub>H</sub>	2	WDTA1
FFED 1010 <sub>H</sub> to FFF1 FFFF <sub>H</sub>	—	Access prohibited area
FFF2 0000 <sub>H</sub> to FFF2 07FF <sub>H</sub>	1	ADCA0
FFF2 0800 <sub>H</sub> to FFF6 FFFF <sub>H</sub>	—	Access prohibited area
FFF7 0000 <sub>H</sub> to FFF7 003F <sub>H</sub>	1	DCRA0
FFF7 0040 <sub>H</sub> to FFF7 0FFF <sub>H</sub>	—	Access prohibited area
FFF7 1000 <sub>H</sub> to FFF7 103F <sub>H</sub>	1	DCRA1
FFF7 1040 <sub>H</sub> to FFF7 1FFF <sub>H</sub>	—	Access prohibited area
FFF7 2000 <sub>H</sub> to FFF7 203F <sub>H</sub>	1	DCRA2
FFF7 2040 <sub>H</sub> to FFF7 2FFF <sub>H</sub>	—	Access prohibited area
FFF7 3000 <sub>H</sub> to FFF7 303F <sub>H</sub>	1	DCRA3
FFF7 3040 <sub>H</sub> to FFF7 7FFF <sub>H</sub>	—	Access prohibited area
FFF7 8000 <sub>H</sub> to FFF7 8003 <sub>H</sub>	1	KR0
FFF7 8004 <sub>H</sub> to FFF7 FFFF <sub>H</sub>	—	Access prohibited area
FFF8 0000 <sub>H</sub> to FFF8 000F <sub>H</sub>	1	Write protected register (WPROTR)
FFF8 0010 <sub>H</sub> to FFF8 00FF <sub>H</sub>	—	Access prohibited area
FFF8 0100 <sub>H</sub> to FFF8 011F <sub>H</sub>	1	STBC0
FFF8 0120 <sub>H</sub> to FFF8 03FF <sub>H</sub>	—	Access prohibited area
FFF8 0400 <sub>H</sub> to FFF8 040F <sub>H</sub>	1	STBC_WUF0
FFF8 0410 <sub>H</sub> to FFF8 041F <sub>H</sub>	1	STBC_WUF1
FFF8 0420 <sub>H</sub> to FFF8 051F <sub>H</sub>	—	Access prohibited area
FFF8 0520 <sub>H</sub> to FFF8 052F <sub>H</sub>	1	STBC_WUF20
FFF8 0530 <sub>H</sub> to FFF8 075F <sub>H</sub>	—	Access prohibited area
FFF8 0760 <sub>H</sub> to FFF8 0AFF <sub>H</sub>	1	Reset controller / Supply voltage monitor (LVI,VLVI)
FFF8 0B00 <sub>H</sub> to FFF8 0FFF <sub>H</sub>	1	STBC_IOHOLD
FFF8 1000 <sub>H</sub> to FFF8 2FFF <sub>H</sub>	1	Clock controller (CLKCTL)
FFF8 3000 <sub>H</sub> to FFF8 307F <sub>H</sub>	1	LPS0
FFF8 3080 <sub>H</sub> to FFF8 30FF <sub>H</sub>	—	Access prohibited area

Table 4B.12 Peripheral I/O Address Map (RH850/F1KM-S2)

Address	Peripheral Group	Peripheral I/O
FFF8 3100 <sub>H</sub> to FFF8 3207 <sub>H</sub>	1	CVM (SVM)
FFF8 3208 <sub>H</sub> to FFF8 3603 <sub>H</sub>	—	Access prohibited area
FFF8 3604 <sub>H</sub> to FFF8 7FFF <sub>H</sub>	—	Access prohibited area
FFF8 8000 <sub>H</sub> to FFF8 800F <sub>H</sub>	1	Write protected register (WPROTR)
FFF8 8010 <sub>H</sub> to FFF8 810F <sub>H</sub>	—	Access prohibited area
FFF8 8110 <sub>H</sub> to FFF8 811F <sub>H</sub>	1	STBC_WUFISO
FFF8 8120 <sub>H</sub> to FFF8 BFFF <sub>H</sub>	1	Clock controller (CLKCTL)
FFF8 C000 <sub>H</sub> to FFF8 CFFF <sub>H</sub>	1	CLMA0, CLMA
FFF8 D000 <sub>H</sub> to FFF8 DFFF <sub>H</sub>	1	CLMA1
FFF8 E000 <sub>H</sub> to FFF8 EFFF <sub>H</sub>	1	CLMA2
FFF8 F000 <sub>H</sub> to FFF8 FFFF <sub>H</sub>	1	CLMA3
FFF9 0000 <sub>H</sub> to FFF9 004F <sub>H</sub>	1	P-Bus guard (PBG50)
FFF9 0050 <sub>H</sub> to FFF9 3FFF <sub>H</sub>	—	Access prohibited area
FFF9 4000 <sub>H</sub> to FFF9 404F <sub>H</sub>	3	P-Bus guard (PBG30)
FFF9 4050 <sub>H</sub> to FFF9 40FF <sub>H</sub>	—	Access prohibited area
FFF9 4100 <sub>H</sub> to FFF9 414F <sub>H</sub>	3	P-Bus guard (PBG31)
FFF9 4150 <sub>H</sub> to FFF9 41FF <sub>H</sub>	—	Access prohibited area
FFF9 4200 <sub>H</sub> to FFF9 424F <sub>H</sub>	3	P-Bus guard (PBG32)
FFF9 4250 <sub>H</sub> to FFF9 BFFF <sub>H</sub>	—	Access prohibited area
FFF9 C000 <sub>H</sub> to FFF9 C04F <sub>H</sub>	—	Access prohibited area
FFF9 C050 <sub>H</sub> to FFF9 C0FF <sub>H</sub>	—	Access prohibited area
FFF9 C100 <sub>H</sub> to FFF9 C14F <sub>H</sub>	3	H-Bus guard (HBG01)
FFF9 C150 <sub>H</sub> to FFF9 C1FF <sub>H</sub>	—	Access prohibited area
FFF9 C200 <sub>H</sub> to FFF9 C24F <sub>H</sub>	—	Access prohibited area
FFF9 C250 <sub>H</sub> to FFFE DFFF <sub>H</sub>	—	Access prohibited area
FFFE E000 <sub>H</sub> to FFFE E03F <sub>H</sub>	CPU local peripheral	IPG
FFFE E040 <sub>H</sub> to FFFE E5FF <sub>H</sub>		Access prohibited area

## Section 4C Address Space of RH850/F1KM-S1

### 4C.1 Address Space

**Table 4C.1, Address Space (1-MB 48/64/80/100-Pin Product), Table 4C.2, Address Space (768-KB 48/64/80/100-Pin Product), and Table 4C.3, Address Space (512-KB 48/64/80/100-Pin Product)** show the address space of the RH850/F1KM.

#### CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in **Table 4C.1, Address Space (1-MB 48/64/80/100-Pin Product), Table 4C.2, Address Space (768-KB 48/64/80/100-Pin Product), and Table 4C.3, Address Space (512-KB 48/64/80/100-Pin Product)**. If such an address is accessed, operation is not guaranteed.

#### NOTE

The Local RAM is accessible through the following two address areas in the address space.

CPU1 area: Address area accessible from CPU and DMA.

Self area: Mirrored address area, accessible only from CPU to refer the CPU's self resource.

Table 4C.1 Address Space (1-MB 48/64/80/100-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 000F FFFF <sub>H</sub>	Code Flash	1 MB
0010 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to FEBD FFFF <sub>H</sub>	Access prohibited area	
FEBE 0000 <sub>H</sub> to FEBF 7FFF <sub>H</sub>	Local RAM (CPU1 area)	96 KB
FEBF 8000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Retention RAM (CPU1 area)	32 KB
FEC0 0000 <sub>H</sub> to FEDD FFFF <sub>H</sub>	Access prohibited area	
FEDE 0000 <sub>H</sub> to FEDF 7FFF <sub>H</sub>	Local RAM (self area)	96 KB
FEDF 8000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Retention RAM (self area)	32 KB
FEE0 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF20 FFFF <sub>H</sub>	Data Flash	64 KB
FF21 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

Table 4C.2 Address Space (768-KB 48/64/80/100-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 000B FFFF <sub>H</sub>	Code Flash	768 KB
000C 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to FEBE 7FFF <sub>H</sub>	Access prohibited area	
FEBE 8000 <sub>H</sub> to FEBF 7FFF <sub>H</sub>	Local RAM (CPU1 area)	64 KB
FEBF 8000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Retention RAM (CPU1 area)	32 KB
FEC0 0000 <sub>H</sub> to FEDE 7FFF <sub>H</sub>	Access prohibited area	
FEDE 8000 <sub>H</sub> to FEDF 7FFF <sub>H</sub>	Local RAM (self area)	64 KB
FEDF 8000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Retention RAM (self area)	32 KB
FEE0 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF20 FFFF <sub>H</sub>	Data Flash	64 KB
FF21 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

Table 4C.3 Address Space (512-KB 48/64/80/100-Pin Product)

Address	Address Space Type	Size
0000 0000 <sub>H</sub> to 0007 FFFF <sub>H</sub>	Code Flash	512 KB
0008 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area	
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	32 KB
0100 8000 <sub>H</sub> to FEBE FFFF <sub>H</sub>	Access prohibited area	
FEBF 0000 <sub>H</sub> to FEBF 7FFF <sub>H</sub>	Local RAM (CPU1 area)	32 KB
FEBF 8000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Retention RAM (CPU1 area)	32 KB
FEC0 0000 <sub>H</sub> to FEDE FFFF <sub>H</sub>	Access prohibited area	
FEDF 0000 <sub>H</sub> to FEDF 7FFF <sub>H</sub>	Local RAM (self area)	32 KB
FEDF 8000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Retention RAM (self area)	32 KB
FEE0 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area	
FF20 0000 <sub>H</sub> to FF20 FFFF <sub>H</sub>	Data Flash	64 KB
FF21 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area	
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	44 KB

## 4C.2 Address Space Viewed from Each Bus Master

**Table 4C.4, Address Space Viewed from Each Bus Master (1-MB Product)** shows address spaces viewed from each bus master.

### 4C.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, local RAM, and retention RAM.

### 4C.2.2 Data Space Accessible by CPU

See **Table 4C.4, Address Space Viewed from Each Bus Master (1-MB Product)** for the spaces accessible from the CPU.

### 4C.2.3 Data Space Accessible by Each Bus Master

See **Table 4C.4, Address Space Viewed from Each Bus Master (1-MB Product)** for the spaces accessible from Each Bus Master.

Table 4C.4 Address Space Viewed from Each Bus Master (1-MB Product)

Address	Resource	From CPU	From DMA
0000 0000 <sub>H</sub> to 000F FFFF <sub>H</sub>	Code Flash	✓	✓
0010 0000 <sub>H</sub> to 00FF FFFF <sub>H</sub>	Access prohibited area		
0100 0000 <sub>H</sub> to 0100 7FFF <sub>H</sub>	Code Flash (Extended user area)	✓	✓
0100 8000 <sub>H</sub> to FEBD FFFF <sub>H</sub>	Access prohibited area		
FEBE 0000 <sub>H</sub> to FEBF 7FFF <sub>H</sub>	Local RAM (CPU1 area)	✓	✓
FEBF 8000 <sub>H</sub> to FEBF FFFF <sub>H</sub>	Retention RAM (CPU1 area)	✓	✓
FEC0 0000 <sub>H</sub> to FEDD FFFF <sub>H</sub>	Access prohibited area		
FEDE 0000 <sub>H</sub> to FEDF 7FFF <sub>H</sub>	Local RAM (self area)	✓	
FEDF 8000 <sub>H</sub> to FEDF FFFF <sub>H</sub>	Retention RAM (self area)	✓	
FEE0 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	Access prohibited area		
FF20 0000 <sub>H</sub> to FF20 FFFF <sub>H</sub>	Data Flash	✓	✓
FF21 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	Access prohibited area		
FFA0 0000 <sub>H</sub> to FFFD FFFF <sub>H</sub>	On-chip peripheral I/O area	✓	✓
FFFE 0000 <sub>H</sub> to FFFE DFFF <sub>H</sub>	Access prohibited area		
FFFE E000 <sub>H</sub> to FFFE FFFF <sub>H</sub>	On-chip peripheral I/O area (self area)	✓	
FFFF 0000 <sub>H</sub> to FFFF 4FFF <sub>H</sub>	Access prohibited area		
FFFF 5000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	On-chip peripheral I/O area	✓	✓

**Note:** The following color coding is used in the map above.

Fetch and data access available
Data access available
Access prohibited

### 4C.3 Peripheral I/O Address Map

**Table 4C.5, Peripheral I/O Address Map** shows peripheral I/O address map.

Table 4C.5 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FF00 0000 <sub>H</sub> to FF1F FFFF <sub>H</sub>	—	Access prohibited area
FF20 0000 <sub>H</sub> to FF20 FFFF <sub>H</sub>	2	Data Flash
FF21 0000 <sub>H</sub> to FF9F FFFF <sub>H</sub>	—	Access prohibited area
FFA0 0000 <sub>H</sub> to FFA0 001F <sub>H</sub>	1	FLMD
FFA0 0020 <sub>H</sub> to FFA0 0FFF <sub>H</sub>	—	Access prohibited area
FFA0 1000 <sub>H</sub> to FFA0 103F <sub>H</sub>	—	Access prohibited area
FFA0 1040 <sub>H</sub> to FFA0 1FFF <sub>H</sub>	—	Access prohibited area
FFA0 2000 <sub>H</sub> to FFA0 201F <sub>H</sub>	—	Access prohibited area
FFA0 2020 <sub>H</sub> to FFA0 FFFF <sub>H</sub>	—	Access prohibited area
FFA1 0000 <sub>H</sub> to FFA1 1FFF <sub>H</sub>	1	Flash controller
FFA1 2000 <sub>H</sub> to FFA1 FFFF <sub>H</sub>	—	Access prohibited area
FFA2 0000 <sub>H</sub> to FFA2 FFFF <sub>H</sub>	1	FACI command-issuing area
FFA3 0000 <sub>H</sub> to FFBF FFFF <sub>H</sub>	—	Access prohibited area
FFC0 0000 <sub>H</sub> to FFC0 000F <sub>H</sub>	1	FENMI (ECON_NMI)
FFC0 0010 <sub>H</sub> to FFC0 00FF <sub>H</sub>	—	Access prohibited area
FFC0 0100 <sub>H</sub> to FFC0 010F <sub>H</sub>	1	FEINT (ECON_FEINT)
FFC0 0110 <sub>H</sub> to FFC0 0FFF <sub>H</sub>	—	Access prohibited area
FFC0 1000 <sub>H</sub> to FFC0 1003 <sub>H</sub>	1	SELB_INTC (SL_INTC)
FFC0 1004 <sub>H</sub> to FFC0 1FFF <sub>H</sub>	—	Access prohibited area
FFC0 2000 <sub>H</sub> to FFC0 2007 <sub>H</sub>	1	SELB_DMAL (SL_DMAL)
FFC0 2008 <sub>H</sub> to FFC0 FFFF <sub>H</sub>	—	Access prohibited area
FFC1 0000 <sub>H</sub> to FFC1 4CCF <sub>H</sub>	1	PORT
FFC1 4CD0 <sub>H</sub> to FFC1 FFFF <sub>H</sub>	—	Access prohibited area
FFC2 0000 <sub>H</sub> to FFC2 04CF <sub>H</sub>	1	PORT (JTAG)
FFC2 04D0 <sub>H</sub> to FFC2 FFFF <sub>H</sub>	—	Access prohibited area
FFC3 0000 <sub>H</sub> to FFC3 000F <sub>H</sub>	1	DNFA_TAUD0 (DNF)
FFC3 0010 <sub>H</sub> to FFC3 001F <sub>H</sub>	—	Access prohibited area
FFC3 0020 <sub>H</sub> to FFC3 002F <sub>H</sub>	1	DNFA_TAUB0 (DNF)
FFC3 0030 <sub>H</sub> to FFC3 003F <sub>H</sub>	—	Access prohibited area
FFC3 0040 <sub>H</sub> to FFC3 004F <sub>H</sub>	—	Access prohibited area
FFC3 0050 <sub>H</sub> to FFC3 005F <sub>H</sub>	—	Access prohibited area
FFC3 0060 <sub>H</sub> to FFC3 006F <sub>H</sub>	1	DNFA_ENCA0 (DNF)
FFC3 0070 <sub>H</sub> to FFC3 009F <sub>H</sub>	—	Access prohibited area
FFC3 00A0 <sub>H</sub> to FFC3 00AF <sub>H</sub>	1	DNFA_ADCA0 (DNF)
FFC3 00B0 <sub>H</sub> to FFC3 00BF <sub>H</sub>	—	Access prohibited area
FFC3 00C0 <sub>H</sub> to FFC3 00CF <sub>H</sub>	—	Access prohibited area
FFC3 00D0 <sub>H</sub> to FFC3 00DF <sub>H</sub>	—	Access prohibited area
FFC3 00E0 <sub>H</sub> to FFC3 00EF <sub>H</sub>	1	DNFA_SENT (DNF)
FFC3 00F0 <sub>H</sub> to FFC3 00FF <sub>H</sub>	—	Access prohibited area
FFC3 0100 <sub>H</sub> to FFC3 010F <sub>H</sub>	—	Access prohibited area
FFC3 0110 <sub>H</sub> to FFC3 3FFF <sub>H</sub>	—	Access prohibited area
FFC3 4000 <sub>H</sub> to FFC3 401F <sub>H</sub>	1	FCLA_NMI (FCLA0)

Table 4C.5 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFC3 4020 <sub>H</sub> to FFC3 403F <sub>H</sub>	1	FCLA_INTPL (FCLA0)
FFC3 4040 <sub>H</sub> to FFC3 405F <sub>H</sub>	1	FCLA_INTPH (FCLA0)
FFC3 4060 <sub>H</sub> to FFC3 407F <sub>H</sub>	1	FCLA_ADCA0 (FCLA0)
FFC3 4080 <sub>H</sub> to FFC3 FFFF <sub>H</sub>	—	Access prohibited area
FFC4 0000 <sub>H</sub> to FFC4 004F <sub>H</sub>	1	P-Bus guard (PBG10)
FFC4 0050 <sub>H</sub> to FFC4 00FF <sub>H</sub>	—	Access prohibited area
FFC4 0100 <sub>H</sub> to FFC4 014F <sub>H</sub>	1	P-Bus guard (PBG11)
FFC4 0150 <sub>H</sub> to FFC4 03FF <sub>H</sub>	—	Access prohibited area
FFC4 0400 <sub>H</sub> to FFC4 044F <sub>H</sub>	1	P-Bus guard (PBG12)
FFC4 0450 <sub>H</sub> to FFC4 04FF <sub>H</sub>	—	Access prohibited area
FFC4 0500 <sub>H</sub> to FFC4 054F <sub>H</sub>	1	P-Bus guard (PBG13)
FFC4 0550 <sub>H</sub> to FFC4 BFFF <sub>H</sub>	—	Access prohibited area
FFC4 C000 <sub>H</sub> to FFC4 C00F <sub>H</sub>	2	P-Bus guard (PBG0)
FFC4 C010 <sub>H</sub> to FFC4 C0FF <sub>H</sub>	—	Access prohibited area
FFC4 C100 <sub>H</sub> to FFC4 C13F <sub>H</sub>	2	P-Bus guard (PBG1)
FFC4 C140 <sub>H</sub> to FFC4 C7FF <sub>H</sub>	—	Access prohibited area
FFC4 C800 <sub>H</sub> to FFC4 C80F <sub>H</sub>	2	ERRSLV (PBG0)
FFC4 C810 <sub>H</sub> to FFC4 C8FF <sub>H</sub>	—	Access prohibited area
FFC4 C900 <sub>H</sub> to FFC4 C90F <sub>H</sub>	2	ERRSLV (PBG1)
FFC4 C910 <sub>H</sub> to FFC5 97FF <sub>H</sub>	—	Access prohibited area
FFC5 9800 <sub>H</sub> to FFC5 981F <sub>H</sub>	2	EEPRDCYCL (DCIB)
FFC5 9820 <sub>H</sub> to FFC5 AFFF <sub>H</sub>	—	Access prohibited area
FFC5 B000 <sub>H</sub> to FFC5 B003 <sub>H</sub>	2	FBUFCCTL (FBUFC_CTRL)
FFC5 B004 <sub>H</sub> to FFC6 21FF <sub>H</sub>	—	Access prohibited area
FFC6 2200 <sub>H</sub> to FFC6 23FF <sub>H</sub>	2	Code Flash ECC (CFECC_VCI)
FFC6 2400 <sub>H</sub> to FFC6 25FF <sub>H</sub>	2	Code Flash ECC (CFECC_CPU1)
FFC6 2600 <sub>H</sub> to FFC6 29FF <sub>H</sub>	—	Access prohibited area
FFC6 2A00 <sub>H</sub> to FFC6 2A3F <sub>H</sub>	2	Data Flash ECC (DFECC)
FFC6 2A40 <sub>H</sub> to FFC6 4FFF <sub>H</sub>	—	Access prohibited area
FFC6 5000 <sub>H</sub> to FFC6 501F <sub>H</sub>	2	Local RAM ECC TEST PE1 (LRTST)
FFC6 5020 <sub>H</sub> to FFC6 53FF <sub>H</sub>	—	Access prohibited area
FFC6 5400 <sub>H</sub> to FFC6 547F <sub>H</sub>	2	Local RAM ECC PE1 (LRECC)
FFC6 5480 <sub>H</sub> to FFC7 00FF <sub>H</sub>	—	Access prohibited area
FFC7 0100 <sub>H</sub> to FFC7 011F <sub>H</sub>	3	ECCCSIH0
FFC7 0120 <sub>H</sub> to FFC7 01FF <sub>H</sub>	—	Access prohibited area
FFC7 0200 <sub>H</sub> to FFC7 021F <sub>H</sub>	3	ECCCSIH1
FFC7 0220 <sub>H</sub> to FFC7 02FF <sub>H</sub>	—	Access prohibited area
FFC7 0300 <sub>H</sub> to FFC7 031F <sub>H</sub>	3	ECCCSIH2
FFC7 0320 <sub>H</sub> to FFC7 03FF <sub>H</sub>	—	Access prohibited area
FFC7 0400 <sub>H</sub> to FFC7 041F <sub>H</sub>	3	ECCCSIH3
FFC7 0420 <sub>H</sub> to FFC7 12FF <sub>H</sub>	—	Access prohibited area
FFC7 1300 <sub>H</sub> to FFC7 131F <sub>H</sub>	3	ECCCFD0MB
FFC7 1320 <sub>H</sub> to FFC7 13FF <sub>H</sub>	—	Access prohibited area
FFC7 1400 <sub>H</sub> to FFC7 141F <sub>H</sub>	3	ECCCFD0AFL0
FFC7 1420 <sub>H</sub> to FFC7 14FF <sub>H</sub>	—	Access prohibited area

Table 4C.5 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFC7 1500 <sub>H</sub> to FFC7 151F <sub>H</sub>	3	ECCCFD0AFL1
FFC7 1520 <sub>H</sub> to FFC7 7FFF <sub>H</sub>	—	Access prohibited area
FFC7 8000 <sub>H</sub> to FFC7 8003 <sub>H</sub>	1	SELB READ TEST (SL_READTEST)
FFC7 8004 <sub>H</sub> to FFC9 FFFF <sub>H</sub>	—	Access prohibited area
FFCA 0000 <sub>H</sub> to FFCA 007F <sub>H</sub>	1	RIIC0
FFCA 0080 <sub>H</sub> to FFCA 00FF <sub>H</sub>	1	RIIC1
FFCA 0100 <sub>H</sub> to FFCC FFFF <sub>H</sub>	—	Access prohibited area
FFCD 0000 <sub>H</sub> to FFCD 01FF <sub>H</sub>	1	PRDNAME/CHIPID (SCDS)
FFCD 0200 <sub>H</sub> to FFCD FFFF <sub>H</sub>	—	Access prohibited area
FFCE 0000 <sub>H</sub> to FFCE 007F <sub>H</sub>	1	RLN240
FFCE 0080 <sub>H</sub> to FFCE 1FFF <sub>H</sub>	—	Access prohibited area
FFCE 2000 <sub>H</sub> to FFCE 203F <sub>H</sub>	1	RLN30
FFCE 2040 <sub>H</sub> to FFCE 207F <sub>H</sub>	1	RLN31
FFCE 2080 <sub>H</sub> to FFCE 20BF <sub>H</sub>	1	RLN32
FFCE 20C0 <sub>H</sub> to FFCE 20FF <sub>H</sub>	1	RLN33
FFCE 2100 <sub>H</sub> to FFCE FFFF <sub>H</sub>	—	Access prohibited area
FFCF 0000 <sub>H</sub> to FFCF 007F <sub>H</sub>	1	RSENT0
FFCF 0080 <sub>H</sub> to FFCF 00FF <sub>H</sub>	—	Access prohibited area
FFCF 0100 <sub>H</sub> to FFCF 017F <sub>H</sub>	1	RSENT1
FFCF 0180 <sub>H</sub> to FFCF FFFF <sub>H</sub>	—	Access prohibited area
FFD0 0000 <sub>H</sub> to FFD1 FFFF <sub>H</sub>	3	RCFDC0
FFD2 0000 <sub>H</sub> to FFD6 CFFF <sub>H</sub>	—	Access prohibited area
FFD6 D000 <sub>H</sub> to FFD6 D7FF <sub>H</sub>	—	Access prohibited area
FFD6 D800 <sub>H</sub> to FFD6 FFFF <sub>H</sub>	—	Access prohibited area
FFD7 0000 <sub>H</sub> to FFD7 003F <sub>H</sub>	3	OSTM0
FFD7 0040 <sub>H</sub> to FFD7 FFFF <sub>H</sub>	—	Access prohibited area
FFD8 0000 <sub>H</sub> to FFD8 001F <sub>H</sub>	3	CSIH0 (CSIH0CTL0-2, CSIH0STR0, CSIH0STCR0, CSIH0EMU)
FFD8 0020 <sub>H</sub> to FFD8 0FFF <sub>H</sub>	—	Access prohibited area
FFD8 1000 <sub>H</sub> to FFD8 107F <sub>H</sub>	3	CSIH0 (CSIH0 registers other than above)
FFD8 1080 <sub>H</sub> to FFD8 1FFF <sub>H</sub>	—	Access prohibited area
FFD8 2000 <sub>H</sub> to FFD8 201F <sub>H</sub>	3	CSIH1 (CSIH1CTL0-2, CSIH1STR0, CSIH1STCR0, CSIH1EMU)
FFD8 2020 <sub>H</sub> to FFD8 2FFF <sub>H</sub>	—	Access prohibited area
FFD8 3000 <sub>H</sub> to FFD8 307F <sub>H</sub>	3	CSIH1 (CSIH1 registers other than above)
FFD8 3080 <sub>H</sub> to FFD8 3FFF <sub>H</sub>	—	Access prohibited area
FFD8 4000 <sub>H</sub> to FFD8 401F <sub>H</sub>	3	CSIH2 (CSIH2CTL0-2, CSIH2STR0, CSIH2STCR0, CSIH2EMU)
FFD8 4020 <sub>H</sub> to FFD8 4FFF <sub>H</sub>	—	Access prohibited area
FFD8 5000 <sub>H</sub> to FFD8 507F <sub>H</sub>	3	CSIH2 (CSIH2 registers other than above)
FFD8 5080 <sub>H</sub> to FFD8 5FFF <sub>H</sub>	—	Access prohibited area
FFD8 6000 <sub>H</sub> to FFD8 601F <sub>H</sub>	3	CSIH3 (CSIH3CTL0-2, CSIH3STR0, CSIH3STCR0, CSIH3EMU)
FFD8 6020 <sub>H</sub> to FFD8 6FFF <sub>H</sub>	—	Access prohibited area

Table 4C.5 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFD8 7000 <sub>H</sub> to FFD8 707F <sub>H</sub>	3	CSIH3 (CSIH3 registers other than above)
FFD8 7080 <sub>H</sub> to FFD8 7FFF <sub>H</sub>	—	Access prohibited area
FFD8 8000 <sub>H</sub> to FFD8 801F <sub>H</sub>	3	CSIG0 (CSIG0CTL0-2, CSIG0STR0, CSIG0STCR0, CSIG0EMU)
FFD8 8020 <sub>H</sub> to FFD8 8FFF <sub>H</sub>	—	Access prohibited area
FFD8 9000 <sub>H</sub> to FFD8 901F <sub>H</sub>	3	CSIG0 (CSIG0 registers other than above)
FFD8 9020 <sub>H</sub> to FFDC FFFF <sub>H</sub>	—	Access prohibited area

FFF8 0010 <sub>H</sub> to FFF8 00FF <sub>H</sub>	—	Access prohibited area
FFF8 0100 <sub>H</sub> to FFF8 011F <sub>H</sub>	1	STBC0
FFF8 0120 <sub>H</sub> to FFF8 03FF <sub>H</sub>	—	Access prohibited area
FFF8 0400 <sub>H</sub> to FFF8 040F <sub>H</sub>	1	STBC_WUF0
FFF8 0410 <sub>H</sub> to FFF8 041F <sub>H</sub>	1	STBC_WUF1
FFF8 0420 <sub>H</sub> to FFF8 051F <sub>H</sub>	—	Access prohibited area
FFF8 0520 <sub>H</sub> to FFF8 052F <sub>H</sub>	1	STBC_WUF20
FFF8 0530 <sub>H</sub> to FFF8 075F <sub>H</sub>	—	Access prohibited area
FFF8 0760 <sub>H</sub> to FFF8 0AFF <sub>H</sub>	1	Reset controller / Supply voltage monitor (LVI,VLVI)
FFF8 0B00 <sub>H</sub> to FFF8 0FFF <sub>H</sub>	1	STBC_IOHOLD
FFF8 1000 <sub>H</sub> to FFF8 2FFF <sub>H</sub>	1	Clock controller (CLKCTL)
FFF8 3000 <sub>H</sub> to FFF8 307F <sub>H</sub>	1	LPS0
FFF8 3080 <sub>H</sub> to FFF8 30FF <sub>H</sub>	—	Access prohibited area
FFF8 3100 <sub>H</sub> to FFF8 3207 <sub>H</sub>	1	CVM (SVM)
FFF8 3208 <sub>H</sub> to FFF8 35FF <sub>H</sub>	—	Access prohibited area
FFF8 3600 <sub>H</sub> to FFF8 3603 <sub>H</sub>	1	Reset controller CYCRBASE (RESCTL)
FFF8 3604 <sub>H</sub> to FFF8 7FFF <sub>H</sub>	—	Access prohibited area
FFF8 8000 <sub>H</sub> to FFF8 800F <sub>H</sub>	1	Write protected register (WPROTR)
FFF8 8010 <sub>H</sub> to FFF8 810F <sub>H</sub>	—	Access prohibited area
FFF8 8110 <sub>H</sub> to FFF8 811F <sub>H</sub>	1	STBC_WUFISO
FFF8 8120 <sub>H</sub> to FFF8 BFFF <sub>H</sub>	1	Clock controller (CLKCTL)
FFF8 C000 <sub>H</sub> to FFF8 CFFF <sub>H</sub>	1	CLMA0, CLMA
FFF8 D000 <sub>H</sub> to FFF8 DFFF <sub>H</sub>	1	CLMA1
FFF8 E000 <sub>H</sub> to FFF8 EFFF <sub>H</sub>	1	CLMA3
FFF8 F000 <sub>H</sub> to FFF8 FFFF <sub>H</sub>	—	Access prohibited area
FFF9 0000 <sub>H</sub> to FFF9 004F <sub>H</sub>	1	P-Bus guard (PBG50)
FFF9 0050 <sub>H</sub> to FFF9 3FFF <sub>H</sub>	—	Access prohibited area
FFF9 4000 <sub>H</sub> to FFF9 404F <sub>H</sub>	3	P-Bus guard (PBG30)

Table 4C.5 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O	
FFF9 4050 <sub>H</sub> to FFF9 40FF <sub>H</sub>	—	Access prohibited area	
FFF9 4100 <sub>H</sub> to FFF9 414F <sub>H</sub>	3	P-Bus guard (PBG31)	
FFF9 4150 <sub>H</sub> to FFF9 41FF <sub>H</sub>	—	Access prohibited area	
FFF9 4200 <sub>H</sub> to FFF9 424F <sub>H</sub>	3	P-Bus guard (PBG32)	
FFF9 4250 <sub>H</sub> to FFFE DFFF <sub>H</sub>	—	Access prohibited area	
FFFE E000 <sub>H</sub> to FFFE E03F <sub>H</sub>	CPU local peripheral	IPG	
FFFE E040 <sub>H</sub> to FFFE E5FF <sub>H</sub>		Access prohibited area	
FFFE E600 <sub>H</sub> to FFFE E6FF <sub>H</sub>		PEG	
FFFE E700 <sub>H</sub> to FFFE E97F <sub>H</sub>		Access prohibited area	
FFFE E980 <sub>H</sub> to FFFE E98F <sub>H</sub>		SEG	
FFFE E990 <sub>H</sub> to FFFE E9FF <sub>H</sub>		Access prohibited area	
FFFE EA00 <sub>H</sub> to FFFE EBFF <sub>H</sub>		INTC1	
FFFE EC00 <sub>H</sub> to FFFF 4FFF <sub>H</sub>		Access prohibited area	
FFFF 5000 <sub>H</sub> to FFFF 7FFF <sub>H</sub>		—	Access prohibited area
FFFF 8000 <sub>H</sub> to FFFF 8FFF <sub>H</sub>		2	PDMA0
FFFF 9000 <sub>H</sub> to FFFF AFFF <sub>H</sub>	—	Access prohibited area	
FFFF B000 <sub>H</sub> to FFFF BFFF <sub>H</sub>	2	INTC2	
FFFF C000 <sub>H</sub> to FFFF FFFF <sub>H</sub>	—	Access prohibited area	

## Section 5 Write-Protected Registers

This section contains a generic description of the write-protected registers.

The first part in this section describes the features specific to the write-protected registers, and the ensuing sections describe the various registers.

### 5.1 Overview

#### 5.1.1 Functional Overview

The RH850/F1KH, RH850/F1KM products require a special procedure using write-protected registers to set important registers that affect the system, such as clock, reset, and port-related registers. The settings of protected registers are protected against illegal writing by programs by requiring a special procedure. For details about the protected registers, see **Section 5.1.5, Write-Protection Target Registers**. Write-protected registers are managed in units of protected registers called register protection clusters.

#### 5.1.2 Writing Procedure to Write-Protected Registers

Write access to a write-protected register is enabled by using the following protection unlock sequence:

1. Write the fixed value 0000 00A5<sub>H</sub> to the protection command register.
2. Write the desired value to the protected register.
3. Write the bit-wise inversion of the desired value to the protected register.
4. Write the desired value to the protected register.
5. Verify that the desired value has been written to the protected register.

Verify successful write of the desired value to the protected register by verifying that the error monitor bit in the protection status register is “0”.

In case the write was not successful, indicated by the error monitor bit set to “1”, the entire sequence has to be restarted at step 1.

If another register (second register) is accessed between step 1 and step 4 of the above sequence for writing to a write-protected register (first register), the protection mechanism operates as follows:

- If the second register belongs to the same cluster, the write to the protected register fails (the error monitor bit is set to 1). The entire sequence has to be restarted at step 1.
- If the second register does not belong to the same cluster, the protection unlock sequence is not disrupted and the write to the first register completes successfully.

### 5.1.3 Interrupt during Write Protection Unlock

If an interrupt occurs during the protection unlock sequence, the protection mechanism operates as follows:

- (1) If an interrupt request is accepted during the protection unlock sequence and write access to a register of the same cluster is performed.

The protection unlock sequence is disrupted, so the write operation to the protected register cannot be completed upon returning from the interrupt service routine. **Figure 5.1, Example of Interruption of Register Protection Unlock Sequence** shows an execution example.

Figure 5.1 Example of Interruption of Register Protection Unlock Sequence

- (2) If an interrupt request is accepted during the protection unlock sequence and write access to a register of a different cluster is performed.

The protection unlock sequence is not disrupted, so the write operation to the protected register is completed upon returning from the interrupt service routine. **Figure 5.2, Example of Successful Protection Unlock Sequence** shows an execution example.

Figure 5.2 Example of Successful Protection Unlock Sequence

For more information on registers of RH850/F1KH, RH850/F1KM register protection clusters, see **Section 5.1.5, Write-Protection Target Registers**.

### 5.1.4 Emulation Break during Write Protection Unlock Sequence

If an emulation break occurs during the protection unlock sequence, e.g. because of a breakpoint hit, the register protection is suspended until normal operation is resumed.

Even if any register of the same cluster is accessed during the break, the protection unlock sequence is not disrupted and the error monitor bit is not set to 1.

### 5.1.5 Write-Protection Target Registers

The registers that are protected through the write-protection control registers are listed below.

Table 5.1 Write-Protection Target Registers (RH850/F1KH-D8)

Protection Target	Protection Target Register	Protection Control Register		Protection Cluster
		Command Register	Status Register	
Clock controller	MOSCE	PROTCMD0	PROTS0	Control protection cluster 0
	ROSCE			
	SOSCE			
	CKSC_AWDTAD_CTL			
	CKSC_ATAUJS_CTL			
	CKSC_ATAUJD_CTL			
	CKSC_ARTCAS_CTL			
	CKSC_ARTCAD_CTL			
	CKSC_AADCAS_CTL			
	CKSC_AADCAD_CTL			
	CKSC_AFOUTS_CTL			
	ROSCUT

Note 1. Each port group has its own protection command register and status register. For details, see **Section 5.1.5(1), Port Protection Clusters**.

### CAUTION

The RH850/F1KH is a dual-core product; it is equipped with two CPUs (CPU1 and CPU2). Even if the CPU1 and CPU2 access different registers, a conflict may arise when the write operation includes writing to the same PROT register. Such cases may disorder the protection unlock procedure, resulting in the error monitor bit being set to "1".

To avoid this, when registers in the same protection cluster are to be set (see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**), are not recommended the settings to be made by different CPU cores. For example, for control protection cluster 0, CPU1 would not be used to set the STBC0PSC register if CPU2 is to be used to set the LVICNT register.

### (1) Port Protection Clusters

The following port control registers have a write protection function:

- Port open drain control registers (PODCn, JPODC0)
- Port drive strength control registers (PDSCn, JPDSC0)

The write protected port registers are divided into two port protection clusters as shown in the following table:

Table 5.5 Port Protection Clusters (RH850/F1KH-D8)

Port Protection Cluster	Port Group
0	JP0, P0, P1, P2, P3, P8
1	P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, P23, P24

Table 5.6 Port Protection Clusters (RH850/F1KM-S4)

Port Protection Cluster	Port Group
0	JP0, P0, P1, P2, P3, P8
1	P9, P10, P11, P12, P13, P18, P19, P20, P21, P22

Table 5.7 Port Protection Clusters (RH850/F1KM-S2)

Port Protection Cluster	Port Group
0	JP0, P0, P1, P2, P8
1	P9, P10, P11, P12, P18, P20

Table 5.8 Port Protection Clusters (RH850/F1KM-S1)

Port Protection Cluster	Port Group
0	JP0, P0, P8
1	P9, P10, P11

#### NOTE

Each port group n has its own port protection command register PPCMDn and port protection status register PPROTSn. However, any port protection command registers of the same port protection cluster can be used in the protection unlock sequence. For instance, PPCMD0 can be used to unlock PODC8.

## 5.2 Registers

### 5.2.1 List of Registers

The following table lists the write-protection control registers.

Table 5.9 List of Registers (RH850/F1KH-D8)

Module Name	Register Name	Symbol	Address

## 5.2.2 Details of Control Protection Cluster Registers

### 5.2.2.1 PROTCMDn — Protection Command Register

This register is used to initiate the write protection unlock sequence for write-protected registers.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)**, **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S2)** and **Table 5.4, Write-Protection Target Registers (RH850/F1KM-S1)**.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See **Table 5.9, List of Registers (RH850/F1KH-D8)**, **Table 5.10, List of Registers (RH850/F1KM-S4)**, **Table 5.11, List of Registers (RH850/F1KM-S2)** and **Table 5.12, List of Registers (RH850/F1KM-S1)**.

**Value after reset:** XXXX XX00<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write 0.
7 to 0	PCMDn[7:0]	Protection command register bits to enable writing to protected registers of control protection cluster

### 5.2.2.2 PROTSn — Protection Status Register

This register indicates the status of the protection unlock sequence performed by PROTCMDn.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)**, **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S2)** and **Table 5.4, Write-Protection Target Registers (RH850/F1KM-S1)**.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See **Table 5.9, List of Registers (RH850/F1KH-D8)**, **Table 5.10, List of Registers (RH850/F1KM-S4)**, **Table 5.11, List of Registers (RH850/F1KM-S2)** and **Table 5.12, List of Registers (RH850/F1KM-S1)**.

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	PROTSnERR	Write protection sequence error monitor 0: No protection error occurred 1: Protection error occurred

## 5.2.3 Details of Clock Monitor Control and Test Protection Cluster Registers

### 5.2.3.1 CLMAnPCMD — CLMAn Protection Command Register

This register is a protection command register for the CLMAnCTL0 register.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)**, **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S2)** and **Table 5.4, Write-Protection Target Registers (RH850/F1KM-S1)**.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** See **Table 5.9, List of Registers (RH850/F1KH-D8)**, **Table 5.10, List of Registers (RH850/F1KM-S4)**, **Table 5.11, List of Registers (RH850/F1KM-S2)** and **Table 5.12, List of Registers (RH850/F1KM-S1)**.

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
7 to 0	CLMAnREG[7:0]	Protection command register bits to enable writing to the CLMAnCTL0 register

### 5.2.3.2 CLMAnPS — CLMAn Protection Status Register

This register is used to verify whether the write-protected register (CLMAnCTL0) has been successfully written or not.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)**, **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S2)** and **Table 5.4, Write-Protection Target Registers (RH850/F1KM-S1)**.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** See **Table 5.9, List of Registers (RH850/F1KH-D8)**, **Table 5.10, List of Registers (RH850/F1KM-S4)**, **Table 5.11, List of Registers (RH850/F1KM-S2)** and **Table 5.12, List of Registers (RH850/F1KM-S1)**.

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

Table 5.16 CLMAnPS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	CLMAnPRERR	Write protection sequence error monitor 0: No protection error occurred 1: Protection error occurred

### 5.2.3.3 PROTCMDCLMA — Clock Monitor Test Protection Command Register

This register is a protection command register for the CLMATEST register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See Table 5.9, List of Registers (RH850/F1KH-D8), Table 5.10, List of Registers (RH850/F1KM-S4), Table 5.11, List of Registers (RH850/F1KM-S2) and Table 5.12, List of Registers (RH850/F1KM-S1).

**Value after reset:** XXXX XX00<sub>H</sub>

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write "0".
0	CLMATREG[7:0]	Protection command register bits to enable writing to the CLMATEST register

### 5.2.3.4 PROTSCLMA — Clock Monitor Test Protection Status Register

This register is used to verify whether the write-protected register (CLMATEST) has been successfully written or not.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See Table 5.9, List of Registers (RH850/F1KH-D8), Table 5.10, List of Registers (RH850/F1KM-S4), Table 5.11, List of Registers (RH850/F1KM-S2) and Table 5.12, List of Registers (RH850/F1KM-S1).

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

0	CLMATPRERR	Write protection sequence error monitor 0: No protection error occurred 1: Protection error occurred

## 5.2.4 Details of Core Voltage Monitor Protection Cluster Registers

### 5.2.4.1 PROTCMDCVM — Core Voltage Monitor Protection Command Register

This register is a protection command register for the CVMF and CVMDIAG registers.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See Table 5.9, List of Registers (RH850/F1KH-D8), Table 5.10, List of Registers (RH850/F1KM-S4), Table 5.11, List of Registers (RH850/F1KM-S2) and Table 5.12, List of Registers (RH850/F1KM-S1).

**Value after reset:** XXXX XX00<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 8	Reserved	When writing to these bits, write 0.
7 to 0	CVMFREG[7:0]	Protection command register bits to enable writing to the CVMF and CVMDIAG registers

### 5.2.4.2 PROTSCVM — Core Voltage Monitor Protection Status Register

This register is used to verify whether the write-protected register (CVMF, CVMDIAG) has been successfully written or not.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See Table 5.9, List of Registers (RH850/F1KH-D8), Table 5.10, List of Registers (RH850/F1KM-S4), Table 5.11, List of Registers (RH850/F1KM-S2) and Table 5.12, List of Registers (RH850/F1KM-S1).

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	CVMFPRERR	Write protection sequence error monitor 0: No protection error occurred 1: Protection error occurred

## 5.2.5 Details of Port Protection Cluster Registers

### 5.2.5.1 PPCMDn — Port Protection Command Register

PPCMDn is a protection command register for port group n.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)**, **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S2)** and **Table 5.4, Write-Protection Target Registers (RH850/F1KM-S1)**.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See **Table 5.9, List of Registers (RH850/F1KH-D8)**, **Table 5.10, List of Registers (RH850/F1KM-S4)**, **Table 5.11, List of Registers (RH850/F1KM-S2)** and **Table 5.12, List of Registers (RH850/F1KM-S1)**.

**Value after reset:** XXXX XX00<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	PPCMDn[7:0]							
Value after reset	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 5.21 PPCMDn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write 0.
7 to 0	PPCMDn[7:0]	Protection command register bits that enable writing to port protection cluster registers

#### NOTE

The protection command register for port group JP0 is JPPCMD0. Its bits are JPPCMD0[7:0].

### 5.2.5.2 PPROTSn — Port Protection Status Register

PPROTSn is a protection status register for write-protected registers of port group n. It indicates the status of the protection sequence operated by PPCMDn.

#### Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)**, **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S2)** and **Table 5.4, Write-Protection Target Registers (RH850/F1KM-S1)**.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See **Table 5.9, List of Registers (RH850/F1KH-D8)**, **Table 5.10, List of Registers (RH850/F1KM-S4)**, **Table 5.11, List of Registers (RH850/F1KM-S2)** and **Table 5.12, List of Registers (RH850/F1KM-S1)**.

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPROT SnPRE RR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 5.22 PPROTSn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	PPROTSnPRERR	Write protection sequence error monitor 0: No protection error occurred 1: Protection error occurred

#### NOTE

The protection status register for port group JP0 is JPPROTS0. Its bit is JPPROTS0PRERR.

## 5.2.6 Details of Self-Programming Protection Cluster Registers

### 5.2.6.1 FLMDPCMD — FLMD Protection Command Register

FLMDPCMD is a protection command register for the FLMDCNT register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** See Table 5.9, List of Registers (RH850/F1KH-D8), Table 5.10, List of Registers (RH850/F1KM-S4), Table 5.11, List of Registers (RH850/F1KM-S2) and Table 5.12, List of Registers (RH850/F1KM-S1).

**Value after reset:** XXXX XX00<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	FLMDPC[7:0]							
Value after reset	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 5.23 FLMDPCMD Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write 0.
7 to 0	FLMDPC[7:0]	Protection command register bits that enable writing to FLMDCNT register

### 5.2.6.2 FLMDPS — FLMD Protection Error Status Register

This register is used to verify whether the write-protected register (FLMDCNT) has been successfully written or not.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** See Table 5.9, List of Registers (RH850/F1KH-D8), Table 5.10, List of Registers (RH850/F1KM-S4), Table 5.11, List of Registers (RH850/F1KM-S2) and Table 5.12, List of Registers (RH850/F1KM-S1).

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FLMDP RERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 5.24 FLMDPS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	FLMDPRERR	Write protection sequence error monitor 0: No protection error occurred 1: Protection error occurred

## Section 6 Operating Mode

This section describes the operating mode and mode selection of the RH850/F1KH, RH850/F1KM.

The RH850/F1KH, RH850/F1KM has the operating mode shown below.

- Normal operating mode

This mode is for execution of the user program. The on-chip debug functions also use this mode. If FLMD0 is pulled up high during operation in this mode, writing to the code flash memory through self-programming is enabled.

RH850/F1KH-D8:

CPU2 (PE2) start-up control at reset release depends on the option byte setting. For details of the option byte, see **Section 44.9.2, OPBT0 — Option Byte 0**.

- Serial programming mode

The dedicated flash memory programmer enables erasing/writing to flash memory.

- Boundary scan mode

This mode allows boundary scan tests compliant with IEEE Standard 1149.1.

- User boot mode

This mode is the same as normal operating mode except that the reset vector address is fixed to “0100 0000<sub>H</sub>”, and transition to standby modes is not supported.

RH850/F1KH-D8:

CPU2 (PE2) is disabled regardless of the option byte setting in this mode.

When the external reset or power-on clear reset is generated, the state of the FLMD0, FLMD1, MODE0, MODE1, and MODE2 pins are used to determine the operating mode after reset is released. The operating mode is fixed by the release of these reset factors. **Table 6.1, Selection of Operating Mode** lists the relationship between the pin settings and the operating mode.

Table 6.1 Selection of Operating Mode

Pins					Operating Mode
FLMD0	FLMD1 (P10_8)	MODE0 (P10_1)	MODE1 (P10_2)	MODE2 (P10_6)	
0	x	x	x	x	Normal operating mode
1	0	x	x	x	Serial programming mode
1	1	0	1	x	Boundary scan mode
1	1	1	1	1	User boot mode
Other than the above					Setting prohibited

### CAUTION

To change operating mode, restart from power-on clear reset. (Remove the power supply once and apply it again.) In the case of only by the external reset, some functions are not initialized after the mode transitions. For details of functions not initialized by the external reset, see **Section 9A.1.1, Reset Sources** and **9BC.1.1, Reset Sources**.

## Section 7A Exception/Interrupts of RH850/F1KH-D8

### 7A.1 Features of RH850/F1KH Exception/Interrupts

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions.

The details on exceptions are described in *the RH850G3KH User's Manual: Software*.

Table 7A.1 List of Exception Sources

Name	Symbol	Source	Priority	Saved to	
Reset	RESET	Reset input	High	—	
FE level non-maskable interrupt*1	FENMI	FENMI input	↑ ↓	FE	
System error exception	SYSERR	SYSERR input		FE	
FE level maskable interrupt*1	FEINT	FEINT input		FE	
Floating-point arithmetic exception (imprecise)	FPI	Execution of FPU instruction		EI	
EI level maskable interrupt*1	EIINT	Interrupt controller		EI	
Memory protection exception (execution right)	MIP	Memory protection violation		FE	
System error exception	SYSERR	Error input at instruction fetch		FE	
Reserved instruction exception	RIE	Execution of reserved instruction		FE	
Coprocessor unusable exception	UCPOP	Execution of coprocessor instruction/access right violation		FE	
Privileged instruction exception	PIE	Execution of privileged instruction		FE	
Misaligned exception	MAE	Generation of misaligned access		FE	
Memory protection exception (access right)	MDP	Memory protection violation		FE	
Floating-point arithmetic exception (precise)	FPP	Execution of FPU instruction		EI	
System call	SYSCALL	Execution of SYSCALL instruction		EI	
FE level trap	FETRAP	Execution of FETRAP instruction		FE	
EI level trap 0	TRAP0	Execution of TRAP instruction		EI	
EI level trap 1	TRAP1	Execution of TRAP instruction		Low	EI

Note 1. These interrupt exceptions are described in this section.

## (1) Interrupts

The following three exceptions in **Table 7A.1, List of Exception Sources** are called interrupts, and are described in this section.

- FE level non-maskable interrupt (FENMI)
  - An FENMI interrupt is acknowledged even if another FE level interrupt - FEINT - has been generated.
  - An FENMI interrupt is acknowledged even if the CPU system register PSW.NP = 1.
  - Return from an FENMI interrupt is not possible and neither is recovery.
- FE level maskable interrupt (FEINT)
  - FEINT can be acknowledged if the CPU system register PSW.NP = 0. It is masked if PSW.NP = 1.
  - Return from an FEINT interrupt is possible and so is recovery.
- EI level maskable interrupt (EIINT)
  - An EIINT interrupt can be acknowledged if an FE level interrupt - FENMI or FEINT - has not been generated.
  - EIINT can be acknowledged if the CPU system register PSW.NP = 0.
  - It is masked if PSW.NP = 1, EIINT with a higher priority is being processed, or PSW.ID = 1.
  - Return from an EIINT interrupt is possible and so is recovery.
  - Interrupt masking can be specified for each interrupt channel.
  - 16 interrupt priority levels can be specified for each interrupt channel
  - In this section, the EIINT that corresponds to interrupt channel n is indicated by “INTn”, whereas the EIINT that corresponds to interrupt source xxx is indicated by “INTxxx”.

For the PSW register, see **Table 3A.10, PSW Register Contents** and *the RH850G3KH User's Manual: Software*.

### NOTE

---

Return: Indicates whether or not the program can resume from where it was interrupted.

Recovery: Indicates whether or not the processor status (status of processor resources including general-purpose registers and system registers) can be restored to the status they were in when the program was interrupted.

---

These interrupt sources are described in **Section 7A.2, Interrupt Sources**.

**(2) Overview of interrupts**

- Simultaneous distribution of interrupt sources to multiple cores
  - A single interrupt source can be distributed to multiple CPU cores.  
(Distribution target cores: CPU1/CPU2)
  - Target interrupt sources: Non-maskable interrupt 1 source,  
FE level interrupt 1 source,  
EI level interrupts 29 sources
- Priority levels for interrupt  
16 priority levels of maskable interrupts by request can be set by interrupt control register.
- Detecting methods of external interrupts (TNMI/INTPm)  
A method of detecting external interrupts (TNMI and INTPm) can be selected from five types:  
rising edge, falling edge, both edges, low level, and high level.
- 2 types of interrupt handler address setting Direct branching method or table referencing method is selectable by register setting.
- Inter-processor interrupts  
High-speed inter-processor interrupts are enabled.

## 7A.2 Interrupt Sources

### 7A.2.1 Interrupt Sources

#### 7A.2.1.1 FE Level Non-Maskable Interrupts

##### (1) Priority

See **Table 7A.1, List of Exception Sources**.

##### (2) Return PC

Return or recovery from an FE non-maskable interrupt is not possible.

##### (3) Status Register

See **Section 7A.4.5, FNC — FE Level NMI Status Register**.

##### (4) Return Instruction

None

Table 7A.2 FE Level Non-Maskable Interrupt Requests

Interrupt			Interrupt Request			Unit	Priority	Exception Source Code	Handler Address 00000...
Symbol	Control Register		Name	Source					
	Name	Address							
FENMI	FNC	FFFE EA78 <sub>H</sub>	TNMI	NMI pin	Port	*1	0E0 <sub>H</sub>	0E0 <sub>H</sub>	
			WDTA0NMI	WDTA0 FENMI interrupt	WDTA0				
			WDTA1NMI	WDTA1 FENMI interrupt	WDTA1				
			WDTA2NMI	WDTA2 FENMI interrupt	WDTA2				

Note 1. See **Table 7A.1, List of Exception Sources**.

The source of the FENMI interrupt can be evaluated by a dedicated flag register. See **Section 7A.2.2, FE Level Non-Maskable Interrupt Sources** for details.

#### 7A.2.1.2 FE Level Maskable Interrupts

##### (1) Priority

See **Table 7A.1, List of Exception Sources**.

##### (2) Return PC

The return PC returned from an interrupt handling routine by the FERET instruction is the PC from when the program was suspended (current PC).

##### (3) Status Register

See **Section 7A.4.6, FIC — FE Level Maskable Interrupt Status Register**.

##### (4) Return Instruction

FERET

Table 7A.3 FE Level Maskable Interrupt Requests (RH850/F1KH-D8)

Interrupt			Interrupt Request				Unit	176 Pins	233 Pins	272 Pins	324 Pins	Priority	Exception Source Code	Handler Address 00000...
Symbol	Control Register		Name	Source										
	Name	Address												
FEINT	FIC	FFFE EA7A <sub>H</sub>	INTLVIL	LVI voltage detection (falling)	LVI	✓	✓	—	✓	*1	0F0 <sub>H</sub>	0F0 <sub>H</sub>		
			INTECCCEEP0	Data flash ECC 1-bit error or 2-bit error interrupt	Data flash	✓	✓	—	✓					
			INTECCFLRAM	FLXA0 ECC 1-bit error or 2-bit error interrupt	FLXA0	✓	✓	—	✓					
			INTECCCNFDRAM0	RCFDC0 ECC 1-bit error or 2-bit error interrupt	RCFDC0	✓	✓	—	✓					
			INTECCCSIH0	CSIH0 ECC 1-bit error or 2-bit error interrupt	CSIH0	✓	✓	—	✓					
			INTECCCSIH1	CSIH1 ECC 1-bit error or 2-bit error interrupt	CSIH1	✓	✓	—	✓					
			INTECCCSIH2	CSIH2 ECC 1-bit error or 2-bit error interrupt	CSIH2	✓	✓	—	✓					
			INTECCCSIH3	CSIH3 ECC 1-bit error or 2-bit error interrupt	CSIH3	✓	✓	—	✓					
			INTECCCSIH4	CSIH4 ECC 1-bit error or 2-bit error interrupt	CSIH4	✓	✓	—	✓					
			INTECCFLIO	Code Flash ECC 1-bit error or 2-bit error interrupt	Code flash	✓	✓	—	✓					
			INTECCRAM	RAM ECC 1-bit error or 2-bit error interrupt	RAM	✓	✓	—	✓					
			INTOSTM0_FE*2	OSTM0 interrupt	OSTM0	✓	✓	—	✓					
			INTLVIH	LVI voltage detection (rising)	LVI	✓	✓	—	✓					
			INTGUARD	PE Guard (PEG) error or Global RAM Guard (GRG) error or Peripheral Guard (PBG/HBG/PBGC)	PEG, GRG, PBG/HBG/PBGC	✓	✓	—	✓					
			INTOSTM1_FE	OSTM1 interrupt	OSTM1	✓	✓	—	✓					
			INTOSTM2_FE	OSTM2 interrupt	OSTM2	✓	✓	—	✓					
			INTOSTM3_FE	OSTM3 interrupt	OSTM3	✓	✓	—	✓					
			INTOSTM4_FE	OSTM4 interrupt	OSTM4	✓	✓	—	✓					
			INTECCCNFDRAM1	RCFDC1 ECC 1-bit error or 2-bit error interrupt	RCFDC1	—	—	—	✓					
			INTECCETH0	ETNB0 ECC 1-bit error or 2-bit error interrupt	ETNB0	✓	✓	—	✓					
			INTOSTM5_FE*3	OSTM5 interrupt	OSTM5	✓	✓	—	✓					
			INTOSTM6_FE	OSTM6 interrupt	OSTM6	✓	✓	—	✓					
			INTOSTM7_FE	OSTM7 interrupt	OSTM7	✓	✓	—	✓					
			INTOSTM8_FE	OSTM8 interrupt	OSTM8	✓	✓	—	✓					
			INTOSTM9_FE	OSTM9 interrupt	OSTM9	✓	✓	—	✓					
			INTECCETH1	ETNB1 ECC 1-bit error or 2-bit error interrupt	ETNB1	—	—	—	✓					
INTECCMMCA0RAM	MMCA0 ECC 1-bit error or 2-bit error interrupt	MMCA0	—	—	—	✓								
INTDMAERR	DMA transfer error interrupt	PDMA <sub>n</sub>	✓	✓	—	✓								

Note 1. See Table 7A.1, List of Exception Sources.

Note 2. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTM0 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM0.

Note 3. INTOSTM5 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTM5 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM5

\* Timing monitor (TSU)

This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

### 7A.2.1.3 EI Level Maskable Interrupts

#### (1) Interrupt Naming Rules

The composition of the interrupt request signal names, their assigned interrupt control registers and the bits in these registers follow special rules.

In the following the name of the specific interrupt request is represented by *<name>*.

For details of the names used in **IC<name>**, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

- Interrupt request name: **INT<name>**  
The prefix “**INT**” is appended to *<name>*.
- Interrupt request control register: **IC<name>**  
The prefix “**IC**” is appended to *<name>*.  
The 16-bit register **IC<name>** can also be accessed in byte units:
  - Low byte (bits [7:0]) of the **IC <name>** register: **IC <name>L**  
The suffix “**L**” is appended to the register name **IC<name>**.
  - High byte (bits [15:8]) of the **IC <name>** register: **IC <name>H**  
The suffix “**H**” is appended to the register name **IC<name>**.
- Interrupt control register bit names: **CT<name>**, **RF<name>**, **MK<name>**, **TB<name>**, **P3<name>**, **P2<name>**, **P1<name>**, **P0<name>**  
The bit prefix “**CT**”, “**RF**”, “**MK**”, “**TB**”, “**P3**”, “**P2**”, “**P1**”, or “**P0**” is appended to the interrupt *<name>*.

#### Example

The interrupt request from channel 2 of TAUD0 channel (*<name>* = *TAUD0I2*) is named

**INTTAUD0I2**

The related interrupt control registers are

**ICTAUD0I2, ICTAUD0I2L, ICTAUD0I2H**

The bits in this register are

**CTTAUD0I2, RFTAUD0I2, MKTAUD0I2, TBTAUD0I2, P3TAUD0I2, P2TAUD0I2, P1TAUD0I2, P0TAUD0I2**

#### (2) Priority

See **Table 7A.1, List of Exception Sources**.

#### (3) Return PC

The return PC returned from an interrupt handling routine by the EIRET instruction is the PC from when the program was suspended (current PC).

#### (4) Control Register

EI level maskable interrupt control register

See **Section 7A.4.2, ICxxx — EI Level Interrupt Control Registers**.

#### (5) Return Instruction

EIRET instruction

## (6) Configuration

EI-level maskable interrupts are controlled by the two controllers, INTC1 and INTC2. The interrupts are supported on a total of 382 channels with a cascade connection of INTC1 and INTC2.

- INTC1

CPU1 and CPU2 have their own interrupt controllers.

Each CPU accesses the INTC1 register that corresponds to respective CPUs.

INTC1 controls high-speed interrupt and has the following functions:

- Priority setting
- Interrupt mask setting

- INTC2

INTC2 is a common interrupt controller that CPU1 and CPU2 share.

INTC2 controls low-speed interrupts and has the following functions.

- Priority setting
- Interrupt mask setting
- Binding setting

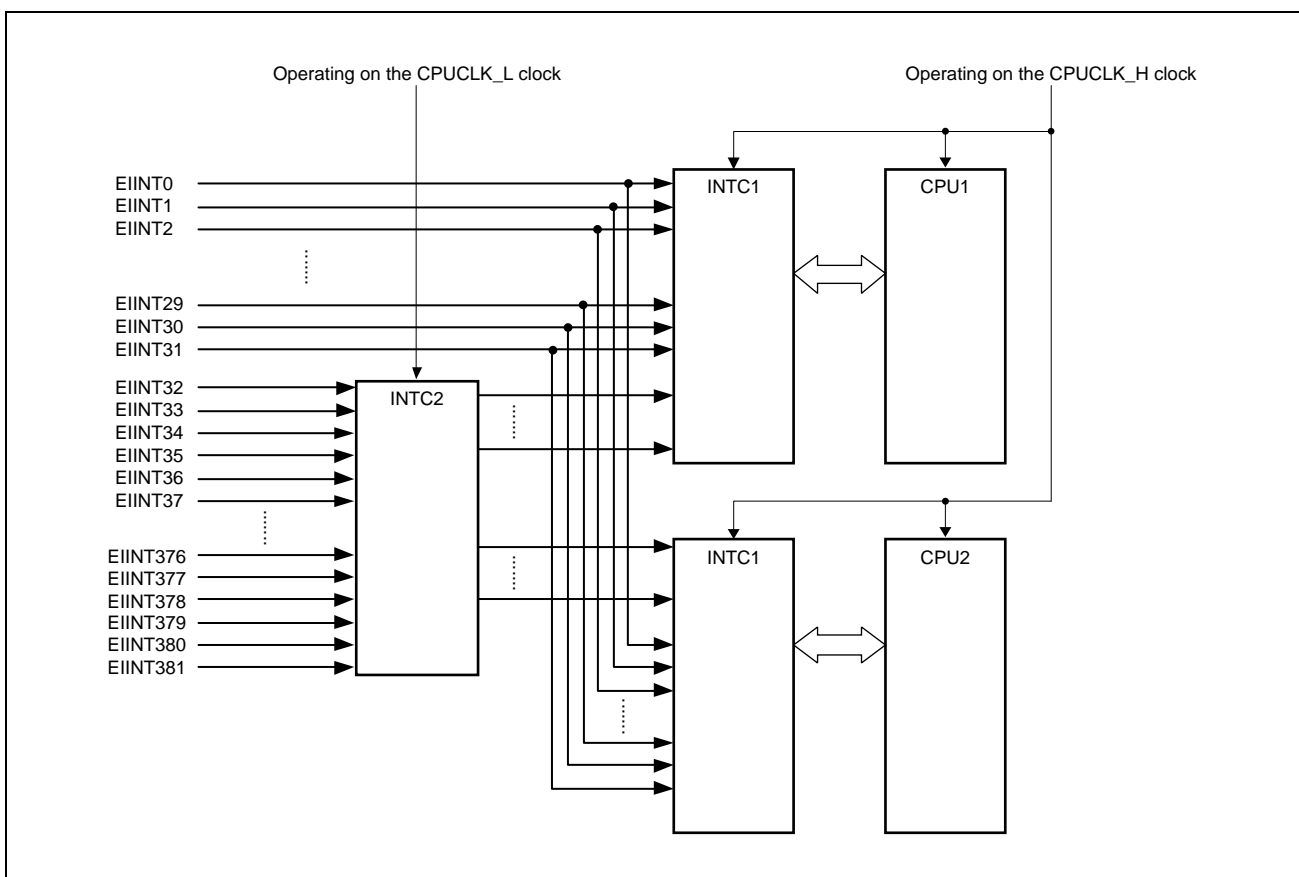

Figure 7A.1 Configuration Diagram of EI Level Maskable Interrupt

### CAUTION

As CPUCLK\_L is the operating clock for INTC2, the EIINT32 to EIINT381 interrupts, which are connected to INTC2, are delayed more than the interrupts directly connected to INTC1.

See **Table 7A.4, EI Level Maskable Interrupt Sources** lists EI level maskable interrupts.

Table 7A.4 EI Level Maskable Interrupt Sources

Channel No. <sup>*1</sup>	Interrupt		Interrupt Request				Exception Source Code	176 Pins	233 Pins	272 Pins	324 Pins	Handler Address (Offset) <sup>*8</sup>		Reference to a Table <sup>*5</sup>

380	ICETNB1MAC	FFFF B2F8 <sub>H</sub>	INTETNB1MAC	MAC interrupt	ETNB1	Level	117C <sub>H</sub>	—	—	—	✓			+5F0 <sub>H</sub>
381	ICDMA63	FFFF B2FA <sub>H</sub>	INTDMA63	DMA37 transfer completion	PDMA1	Edge	117D <sub>H</sub>	✓	✓	—	✓			+5F4 <sub>H</sub>

Note 1. Each interrupt is connected to INTC1 channel 0 to 31 and INTC2 channel 32 to 381.

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an EI level interrupt control register. For details, see **Section 7A.4.2, ICxxx — EI Level Interrupt Control Registers**. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in **Section 3A.5.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution** are required to reflect the result of the register update to the subsequent instruction.

Note 3. Irrespective of interrupt channels, an offset address is determined in the range from +100<sub>H</sub> to 1F0<sub>H</sub> according to the priority (0 to 15).

Note 4. Irrespective of the priority, offset addresses are uniformly +100<sub>H</sub>.

- Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.  
Exception handler address read position = INTBP register + channel number × 4 bytes
- Note 6. The same interrupt source is assigned to different interrupt channels. For details, see **Section 7A.5.2, SELB\_INTC1 — INTC1 Interrupt Select Register**.
- Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.
- Note 8. For details, see **Section 7A.10, Exception Handler Address**.
- Note 9. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTM0 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU function.
- Note 10. INTOSTM5 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTM5 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM5 functions as anything other than the TSU function.
- Note 11. For details on the interrupt source, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

## 7A.2.2 FE Level Non-Maskable Interrupt Sources

### 7A.2.2.1 List of Registers

The following table lists the FE Level Non-Maskable Interrupt Sources registers.

Table 7A.5 List of Registers

Module Name	Register Name	Symbol	Address
ECON_NMI	FENMI factor register	WDTNMIF	FFC0 0000 <sub>H</sub>
	WDTNMI factor clear register	WDTNMIFC	FFC0 0008 <sub>H</sub>

### 7A.2.2.2 WDTNMIF — FENMI Factor Register

This register contains information about which source has generated the FE level non-maskable interrupt (FENMI). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFC0 0000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	WDTA2NMIF	WDTA1NMIF	WDTA0NMIF	TNMIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7A.6 WDTNMIF Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	WDTA2NMIF	WDTA2NMI flag 0: No WDTA2NMI occurred 1: WDTA2NMI has occurred
2	WDTA1NMIF	WDTA1NMI flag 0: No WDTA1NMI occurred 1: WDTA1NMI has occurred
1	WDTA0NMIF	WDTA0NMI flag 0: No WDTA0NMI occurred 1: WDTA0NMI has occurred
0	TNMIF	Input signal flag from the NMI pin 0: No TNMI occurred 1: TNMI has occurred

### 7A.2.2.3 WDTNMIFC — WDTNMI Factor Clear Register

This register clears the FE level non-maskable interrupt flags of the WDTNMIF register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFC0 0008<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W

Table 7A.7 WDTNMIFC Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When writing, write the value after reset.
3	WDTA2NMIFC	WDTA2NMIF flag clear 0: — 1: Clear
2	WDTA1NMIFC	WDTA1NMIF flag clear 0: — 1: Clear
1	WDTA0NMIFC	WDTA0NMIF flag clear 0: — 1: Clear
0	TNMIFC	TNMIF flag clear 0: — 1: Clear

## 7A.2.3 FE Level Maskable Interrupt Sources

### 7A.2.3.1 List of Registers

The following table lists the FE Level Maskable Interrupt Sources registers.

Table 7A.8 List of Registers

Module Name	Register Name	Symbol	Address
ECON_FEINT	FEINT factor register	FEINTF	FFC0 0100 <sub>H</sub>
	FEINT factor mask register	FEINTFMSK	FFC0 0104 <sub>H</sub>
	FEINT factor clear register	FEINTFC	FFC0 0108 <sub>H</sub>

### 7A.2.3.2 FEINTF — FEINT Factor Register

This register contains information about which source has generated the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFC0 0100<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3 to 1	Reserved	When read, the value after reset is returned.
0	LVILFEIF	INTLVIL interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred

Note 1. For the supported products, see **Table 7A.3, FE Level Maskable Interrupt Requests (RH850/F1KH-D8)**.

### 7A.2.3.3 FEINTFMSK — FEINT Factor Mask Register

This register masks the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFC0 0104<sub>H</sub>

**Value after reset:** FFFF FFFF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. For the supported products, see **Table 7A.3, FE Level Maskable Interrupt Requests (RH850/F1KH-D8)**.

### 7A.2.3.4 FEINTFC — FEINT Factor Clear Register

This register clears the bits of the FEINT factor register (FEINTF).

#### CAUTION

After confirming that handling by both handlers is complete after the completion of processing by a handler for an FEINT interrupt of CPU1 or CPU2, use the FEINT factor clear register (FEINTFC) to clear the flag for the given FEINT interrupt. For example, if processing by CPU1 takes less time than that by CPU2, checking only for the advance completion of processing by CPU1 creates a concern of repeated processing of the interrupt.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFC0 0108<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Note 1. For the supported products, see **Table 7A.3, FE Level Maskable Interrupt Requests (RH850/F1KH-D8)**.

### 7A.3 Edge/Level Detection

External interrupts (TNMI and INTP<sub>m</sub>) can be specified to be generated when a rising edge, falling edge, rising or falling edge, low level, or high level is detected at an external interrupt pin.

The following registers are used to specify the edge and level of each interrupt:

Table 7A.12 External Interrupt Edge/Level Detection Registers (RH850/F1KH-D8)

Interrupt	Register
TNMI	FCLA0CTL0_NMI
INTP0	FCLA0CTL0_INTPL
INTP1	FCLA0CTL1_INTPL
INTP2	FCLA0CTL2_INTPL
INTP3	FCLA0CTL3_INTPL
INTP4	FCLA0CTL4_INTPL
INTP5	FCLA0CTL5_INTPL
INTP6	FCLA0CTL6_INTPL
INTP7	FCLA0CTL7_INTPL

INTP16* <sup>1</sup>	FCLA0CTL0_INTPU
INTP17* <sup>1</sup>	FCLA0CTL1_INTPU
INTP18* <sup>1</sup>	FCLA0CTL2_INTPU
INTP19* <sup>1</sup>	FCLA0CTL3_INTPU
INTP20* <sup>1</sup>	FCLA0CTL4_INTPU
INTP21* <sup>1</sup>	FCLA0CTL5_INTPU
INTP22* <sup>1</sup>	FCLA0CTL6_INTPU
INTP23* <sup>1</sup>	FCLA0CTL7_INTPU

Note 1. For the supported products, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

See **Section 2A, Pin Function of RH850/F1KH-D8** for details of these registers.

## 7A.4 Interrupt Controller Control Registers

Writing to the ICxxx, IMRm (m = 0 to 11), IBDxxx, FNC, and FIC registers is enabled only in supervisor mode (PSW.UM = 0).

### 7A.4.1 List of Registers

The following table lists the Interrupt Controller Control registers.

Table 7A.13 List of Registers

Module Name	Register Name	Symbol	Address
INTC1	EI level interrupt control registers	ICxxx <sup>*1</sup>	See <b>Table 7A.4, EI Level Maskable Interrupt Sources</b>
	EI level interrupt mask registers	IMR0	FFFE EA0 <sub>H</sub>
	EI level interrupt binding registers	IBDxxx <sup>*1</sup>	See <b>Table 7A.17, List of IBDxxx Registers</b>
INTC2	EI level interrupt control registers	ICxxx <sup>*2</sup>	See <b>Table 7A.4, EI Level Maskable Interrupt Sources</b>
	EI level interrupt mask registers	IMRm	FFFF B40 <sub>H</sub> + (04 <sub>H</sub> × m)
	EI level interrupt binding registers	IBDxxx <sup>*2</sup>	See <b>Table 7A.17, List of IBDxxx Registers</b>
INTC1	FE level NMI status register	FNC	FFFE EA78 <sub>H</sub>
	FE level maskable interrupt status register	FIC	FFFE EA7A <sub>H</sub>

Note 1. Channel No.0 to 31.

Note 2. Channel No.32 or more.

Among the registers shown in **Table 7A.16, IBDxxx Register Contents**, ICxxx, IMR0, and IBDxxx, which correspond to interrupt channel numbers 0 to 31, are located in INTC1 of the CPU peripheral field included in each CPU. Each register of these can only be accessed from CPU1 or CPU2 which includes it.

Writing is only possible in supervisor mode (PSW.UM = 0).

Among the registers shown in **Table 7A.16, IBDxxx Register Contents**, ICxxx, IMR1 to IMR11, and IBDxxx, which correspond to interrupt channel numbers 32 to 381, are located in INTC2 of peripheral group 0. Writing to these registers is only possible in supervisor mode (UM = 0) by a PE bound to IBDxxx or in supervisor mode (UM = 0) by CPU1.

When writing to IMR1 to IMR11, only the bits corresponding to the conditions described above are overwritten; other bits are not updated.

Among the registers shown in **Table 7A.16, IBDxxx Register Contents**, the values of those listed as reserved for the given channel numbers in **Table 7A.4, EI Level Maskable Interrupt Sources**, must retain their values after a reset.

## 7A.4.2 ICxxx — EI Level Interrupt Control Registers

One of these registers is assigned to each EI level maskable interrupt (EIINT) channel and is used to set the conditions for controlling that channel. This register is initialized by any reset. For each source, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

### CAUTION

If 0 is written to the RFxxx bit immediately after a peripheral module generates the corresponding interrupt request in edge detection mode (before an interrupt is accepted by the CPU), the request may be lost.

Writing 1 to the RFxxx bit immediately after an interrupt is accepted by the CPU may lead to re-issuing of the request.

Writing method to these registers contains the use of bit manipulation instructions (set1, clr1, and not1).

For bit-manipulation instructions, see also **Section 3A.5.3, Access to Registers by Using Bit-Manipulation Instructions**.

Executing a bit-manipulation instruction to the lower bytes including the MKxxx bit has no effect on the RFxxx bit.

**Access:** ICxxx can be read or written in 16-bit units.

ICxxxH and ICxxxL can be read or written in 8- or 1-bit units.

Access to bits 14, 13, 11 to 8, 5, and 4 by using a SET1, CLR1, or NOT1 instruction is prohibited.

**Address:** See **Table 7A.4, EI Level Maskable Interrupt Sources**.

**Value after reset:** 008FH (edge detection), 808FH (level detection)\*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTxxx	—	—	RFxxx	—	—	—	—	MKxxx	TBxxx	—	—	P3xxx	P2xxx	P1xxx	P0xxx
Value after reset	0/1*1	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Note 1. The value after reset differs depending on the detection type of a given interrupt (edge detection: 0, level detection: 1). For details, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

Table 7A.14 ICxxx Register Contents

Bit Position	Bit Name	Function						
15	CTxxx	This bit indicates the type of interrupt detection. This bit is read only. 0: Edge detection 1: Level detection When writing in 8-bit or 16-bit units, write the value after reset.						
14, 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.						
12	RFxxx	This is an interrupt request flag. The RFxxx bit can be written from a program. Setting the RFxxx bit to 1 generates an EI level maskable interrupt n (EIINTn), just as when an interrupt request is acknowledged. 0: No interrupt request is made. 1: Interrupt request is made.						
		<table border="1"> <thead> <tr> <th>Input Interface</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>Edge detection (CTxxx = 0)</td> <td>This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software.</td> </tr> <tr> <td>Level detection (CTxxx = 1)</td> <td>This bit cannot be set or cleared by software. It can only be read. It is not cleared when an interrupt request is acknowledged by the CPU core.</td> </tr> </tbody> </table>	Input Interface	Operation	Edge detection (CTxxx = 0)	This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software.	Level detection (CTxxx = 1)	This bit cannot be set or cleared by software. It can only be read. It is not cleared when an interrupt request is acknowledged by the CPU core.
Input Interface	Operation							
Edge detection (CTxxx = 0)	This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software.							
Level detection (CTxxx = 1)	This bit cannot be set or cleared by software. It can only be read. It is not cleared when an interrupt request is acknowledged by the CPU core.							

Table 7A.14 ICxxx Register Contents

Bit Position	Bit Name	Function
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	MKxxx	<p>This is the interrupt request mask bit.</p> <p>When the MKxxx bit is set, interrupt requests from the channel are masked and are not issued to the CPU core. The interrupt pending status is not reflected in the ICSR.PMEI bit for any channels that are masked.</p> <p>When the interrupt request from the channel is masked with MKxxx = 1, the RFxxx still reflects the interrupt request for the channel and can be polled in software. When the MKxxx bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the MKxxx bit is also reflected in the corresponding IMRm register.</p> <p>0: Enables interrupt processing 1: Disables interrupt processing</p>
6	TBxxx	<p>This bit is used to select the way to determine the interrupt vector.</p> <p>0: Direct jumping to an address determined from the level of priority 1: Table reference</p> <p>For details on the way to determine the interrupt vector, see <i>the RH850G3KH User's Manual: Software</i>.</p>
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	P3xxx to P0xxx	<p>These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest.</p> <p>When multiple EI level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core for servicing first. When P3xxx to P0xxx bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority.</p>

**CAUTIONS**

- Do not access ICxxx registers of interrupt channels listed as "Reserved" in **Table 7A.4, EI Level Maskable Interrupt Sources**, and of the channels which are not incorporated in the product.
- When a channel n is defined as broadcast interrupt (IBDxxx.CST = 1), MKxxx and RFxxx bits of the ICxxx register of the channel must be set to 0 after an initial configuration of the channel. In the period when the EIINTn interrupt is enabled, it is prohibited to mask (MKxxx = 1) an interrupt processing of the channel. When it is necessary to mask a broadcast interrupt, MKBN0 of ICBN0 registers in INTC1 of each PE can be used to mask the corresponding broadcast interrupt.

### 7A.4.3 IMRm — EI Level Interrupt Mask Registers (m = 0 to 11)

These registers are a collection of the MKxxx bits of the ICxxx registers. Each bit of IMRm reflects the setting of the corresponding MKxxx bit. The setting for IMRm is also reflected in the corresponding MKxxx bit. This register is initialized by any reset.

**Access:** IMRm can be read or written in 32-bit units.  
 IMRmH and IMRmL can be read or written in 16-bit units.  
 IMRmHH, IMRmHL, IMRmLH, and IMRmLL can be read or written in 8- or 1-bit units.

**Address:** IMR0: FFFE EAF0<sub>H</sub>  
 IMR0L: FFFE EAF0<sub>H</sub>,  
 IMR0H: FFFE EAF2<sub>H</sub>  
 IMR0LH: FFFE EAF1<sub>H</sub>,  
 IMR0HL: FFFE EAF2<sub>H</sub>,  
 IMR0HH: FFFE EAF3<sub>H</sub>  
 IMRm (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m)  
 IMRmL (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m)  
 IMRmH (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m) + 2<sub>H</sub>,  
 IMRmLL (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m)  
 IMRmLH (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m) + 1<sub>H</sub>,  
 IMRmHL (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m) + 2<sub>H</sub>,  
 IMRmHH (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m) + 3<sub>H</sub>

Table 7A.15 IMRm Register Contents

Bit Position	Bit Name	Function
31 to 0	IMRmEIMK (m × 32 + 31) to IMRmEIMK (m × 32 + 0)	These are interrupt mask bits for EI level maskable interrupt (EIINT) channels 0 to 381. 0: Enables interrupt servicing 1: Disables interrupt servicing

#### CAUTIONS

- MKxxx bits which correspond to channels listed as “Reserved” in **Table 7A.4, EI Level Maskable Interrupt Sources** and to channels which are not incorporated in the product must be set to “1”.
- When a channel is used as broadcast interrupt (IBDxxx.CST = 1), IMRmEIMKn bit corresponding to the channel must be set to 0.

### 7A.4.4 IBDxxx — EI Level Interrupt Binding Registers

These registers, each of which is for an EI level maskable interrupt (EIINT), are used to set the conditions for control of the interrupts. The registers are initialized by any type of reset.

**Access:** This register can be read or written in 32-bit units.

**Address:** See Table 7A.17 List of IBDxxx Registers.

**Value after reset:** \*1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CST	—	—	—	—	—	—	BCP0	—	—	—	—	—	—	GPID[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PEID[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	*1		
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Note 1. IBDxxx registers of CPU1 (PE1) (interrupt number 0 to 31): PEID[2:0] = 001<sub>B</sub>  
 IBDxxx registers of CPU2 (PE2) (interrupt number 0 to 31): PEID[2:0] = 010<sub>B</sub>  
 IBDxxx registers (from interrupt number 32): PEID[2:0] = 001<sub>B</sub>

Table 7A.16 IBDxxx Register Contents

Bit Position	Bit Name	Function
31	CST	This bit specifies whether interrupt input to the corresponding interrupt channel is or is not conveyed to multiple destinations (broadcast). It can only be set in INTC2. The bit in IBDxxx for interrupt number 0 to 31 (INTC1) has the fixed value 0. 0: The interrupt is handled as a normal interrupt (default value). 1: The interrupt is conveyed to multiple destinations.
30 to 25	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
24	BCP0	These bits specify the number of the broadcast port for output when the CST bit is 1. If the CST bit is 0, the setting of these bits are ignored. The bits in IBDxxx for interrupt number 0 to 31 (INTC1) has the fixed value 0. 0: Output to broadcast port 0 1: Output to broadcast port 1
23 to 18	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
17, 16	GPID[1:0]	These bits are implemented only in the IBDxxx registers (the interrupt number 32 or later). Select one of the followings for setting according to PEID settings. 00: When CPU1 is selected for a binding destination by using PEID 01: When CPU2 is selected for a binding destination by using PEID Other than the above: Setting prohibited These bits are reserved in the IBDxxx registers corresponding to interrupt number 0 to 31. When writing, write 0. These bits are always read as 0.
15 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Table 7A.16 IBDxxx Register Contents

Bit Position	Bit Name	Function
2 to 0	PEID[2:0]	Specify destination for binding (requesting) an interrupt. However, the PEID bit in the IBDxxx registers (interrupt number 0 to 31) multiplexed by each CPU (PE) is fixed to each CPU (PE) number and cannot be changed. 001: An interrupt is bound to CPU1. 010: An interrupt is bound to CPU2. When an interrupt corresponding to a source is performed, select one of the above settings.

**CAUTIONS**

- Do not change the value of the corresponding IBDxxx register while the request for EIINT is being processed.
- Only INTBN0 and INTBN1 support broadcast interrupts in this product. So, total 2 IBDxxx register of CST = 1 can be set.
- The channel of INTC2 that can be bind to broadcast communication input is only edge detection type.

Table 7A.17 List of IBDxxx Registers

### 7A.4.5 FNC — FE Level NMI Status Register

This register indicates the status of an FE level non-maskable interrupt (FENMI).

This register is initialized by any reset.

**Access:** FNC is a read-only register that can be read in 16-bit units.  
FNCH is a read-only register that can be read in 8- or 1-bit units.

**Address:** FNC: FFFE EA78<sub>H</sub>  
FNCH: FFFE EA79<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FNRF	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7A.18 FNC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FNRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit is automatically cleared when an FE level NMI interrupt request is acknowledged by the CPU core.
11 to 0	Reserved	When read, the value after reset is returned.

### 7A.4.6 FIC — FE Level Maskable Interrupt Status Register

This register indicates the status of an FE level maskable interrupt (FEINT).

This register is initialized by any reset.

**Access:** FIC is a read-only register that can be read in 16-bit units.  
FICH is a read-only register that can be read in 8- or 1-bit units.

**Address:** FIC: FFFE EA7A<sub>H</sub>  
FICH: FFFE EA7B<sub>H</sub>

**Value after reset:** 8000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIRF	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7A.19 FIC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FIRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit cannot be set or cleared by software. It can only be read.
11 to 0	Reserved	When read, the value after reset is returned.

## 7A.5 EI Level Maskable Interrupt Select Register

The following registers are used to select an EI level maskable interrupt.

### 7A.5.1 List of Registers

The following table lists the EI Level Maskable Interrupt Select register.

Table 7A.20 List of Register

Module Name	Register Name	Symbol	Address
SL_INTC	INTC1 interrupt select register	SELB_INTC1	FFC0 1000 <sub>H</sub>

## 7A.5.2 SELB\_INTC1 — INTC1 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled. This register is initialized by any reset.

### NOTE

The channel described in each bit setting indicates the channel of an interrupt and the priority. For details on channels, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

**Access:** This register can be read or written in 16-bit units.

**Address:** FFC0 1000<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

9	SELB_INTC1_9	Interrupt channel selection 0: INTTAUD0I10 (Channel 13) INTCSIH3IR (Channel 159) 1: INTCSIH3IR_1 (Channel 13) INTTAUD0I10_2 (Channel 159)
8	SELB_INTC1_8	Interrupt channel selection 0: INTTAUD0I2 (Channel 9) INTCSIH3IC (Channel 158) 1: INTCSIH3IC_1 (Channel 9) INTTAUD0I2_2 (Channel 158)

Table 7A.21 SELB\_INTC1 Register Contents

Bit Position	Bit Name	Function
7	SELB_INTC1_7	Interrupt channel selection 0: INTTAUD018 (Channel 12) INTCSIH2IJC (Channel 135) 1: INTCSIH2IJC_1 (Channel 12) INTTAUD018_2 (Channel 135)
6	SELB_INTC1_6	Interrupt channel selection 0: INTTAUD016 (Channel 11) INTCSIH2IRE (Channel 134) 1: INTCSIH2IRE_1 (Channel 11) INTTAUD016_2 (Channel 134)
5	SELB_INTC1_5	Interrupt channel selection 0: INTTAUD014 (Channel 10) INTCSIH2IR (Channel 133) 1: INTCSIH2IR_1 (Channel 10) INTTAUD014_2 (Channel 133)
4	SELB_INTC1_4	Interrupt channel selection 0: INTTAUD010 (Channel 8) INTCSIH2IC (Channel 132) 1: INTCSIH2IC_1 (Channel 8) INTTAUD010_2 (Channel 132)
3	SELB_INTC1_3	Interrupt channel selection 0: INTCSIG0IR (Channel 28) INTCSIH1IJC (Channel 119) 1: INTCSIH1IJC_1 (Channel 28) INTCSIG0IR_2 (Channel 119)
2	SELB_INTC1_2	Interrupt channel selection 0: INTCSIG0IC (Channel 27) INTCSIH1IRE (Channel 118) 1: INTCSIH1IRE_1 (Channel 27) INTCSIG0IC_2 (Channel 118)
1	SELB_INTC1_1	Interrupt channel selection 0: INTTAPA0IVLY0 (Channel 17) INTCSIH1IR (Channel 117) 1: INTCSIH1IR_1 (Channel 17) INTTAPA0IVLY0_2 (Channel 117)
0	SELB_INTC1_0	Interrupt channel selection 0: INTTAPA0IPEK0 (Channel 16) INTCSIH1IC (Channel 116) 1: INTCSIH1IC_1 (Channel 16) INTTAPA0IPEK0_2 (Channel 116)

**NOTE**

For the supported products, see **Table 7A.4, EI Level Maskable Interrupt Sources.**

**CAUTION**

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by SELB\_INTC1.

## 7A.6 Interrupt Function System Registers

See Table 3A.31, Interrupt Function System Registers.

### 7A.6.1 FPIPR — FPI Exception Interrupt Priority

See Table 3A.32, FPIPR Register Contents.

### 7A.6.2 ISPR — Priority of Interrupt being Serviced

See Table 3A.33, ISPR Register Contents.

### 7A.6.3 PMR — Interrupt Priority Masking

See Table 3A.34, PMR Register Contents.

### 7A.6.4 ICSR — Interrupt Control Status

See Table 3A.35, ICSR Register Contents.

### 7A.6.5 INTCFG — Interrupt Function Setting

See Table 3A.36, INTCFG Register Contents.

## 7A.7 Operation when Acknowledging an Interrupt

Check whether each interrupt that is reported during instruction execution is acknowledged according to the priority. The procedure for acknowledging each interrupt is shown below.

- (1) Check whether the acknowledgment conditions are satisfied and whether interrupts are acknowledged according to their priority.
- (2) Calculate the exception handler address according to the current PSW value.\*<sup>1</sup>
- (3) For FE-level non-maskable/maskable interrupts, the following processing is performed:
  - Save the PC to the FEPC.
  - Save the PSW to the FEPSW.
  - Store the exception source code in the FEIC.
  - Update the PSW.\*<sup>2</sup>
  - Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.
- (4) For EI level exceptions, the following processing is performed:
  - Save the PC to the EIPC.
  - Save the PSW to the EIPSW.
  - Store the exception source code in the EIIC.
  - Update the PSW.\*<sup>2</sup>
  - Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

**Note 1.** For details, see **Section 7A.10, Exception Handler Address**.

**Note 2.** For the values to be updated, see *Table 4.1 Exception Cause List* in the *RH850G3KH User's Manual: Software*.

The following figure shows steps (1) to (4).

Figure 7A.2 Operation when Acknowledging an Interrupt

### 7A.7.1 Exception Source Codes for Different Types of SYSERR Exceptions

The following table lists exception source codes for the different types of SYSERR exceptions.

Table 7A.22 Exception Source Codes for Different Types of SYSERR Exceptions

Exception Source Code	Source of SYSERR Generation
11 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during the fetching of an instruction from the code flash memory area</li> </ul>
13 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during the fetching of an instruction from the local, global or retention RAM areas</li> </ul>
14 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during access to data in the code flash area</li> <li>Detection of an error during read access to a module via the system interconnect or PBUS</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to VCIF bit of SEGFLAG register*1</p>
16 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during access to data in the own local RAM areas</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to TCMF bit of SEGFLAG register*1</p>
18 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an IPG error</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to VCIF, IPGF bit of SEGFLAG register*1</p>
19 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during write access to a module via the PBUS</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to APIF bit of SEGFLAG register*1</p>
1A <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error inside system interconnect</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to VCSF bit of SEGFLAG register*1</p>

Note 1. See Section 3A.2.4.3, System Error Generator Function (SEG) for details.

## 7A.8 Return from Interrupts

To return from interrupt handling, execute the return instruction (EIRET or FERET) corresponding to each relevant interrupt level.

When a context has been saved in a stack and the like, the context must be restored before executing the return instruction.

The EIRET instruction is used to return from the EI level maskable interrupt handling and the FERET instruction is used to return from FE-level maskable interrupt handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes its control to the return PC address:

- (1) When returning from the service routine for an EI-level exception, the PC and PSW values on return are loaded from the EIPC and EIPSW registers.  
When returning from the service routine for an FE-level exception, the PC and PSW values on return are loaded from the FEPC and FEPSW registers.
- (2) Control is passed to the addresses indicated by the return PC and PSW that were loaded.
- (3) When  $EP = 0$  and  $INTCFG.ISPC = 0$ , the CPU updates the ISPR register.

The flows for returning from exception handling using the EIRET and FERET instructions are shown below.

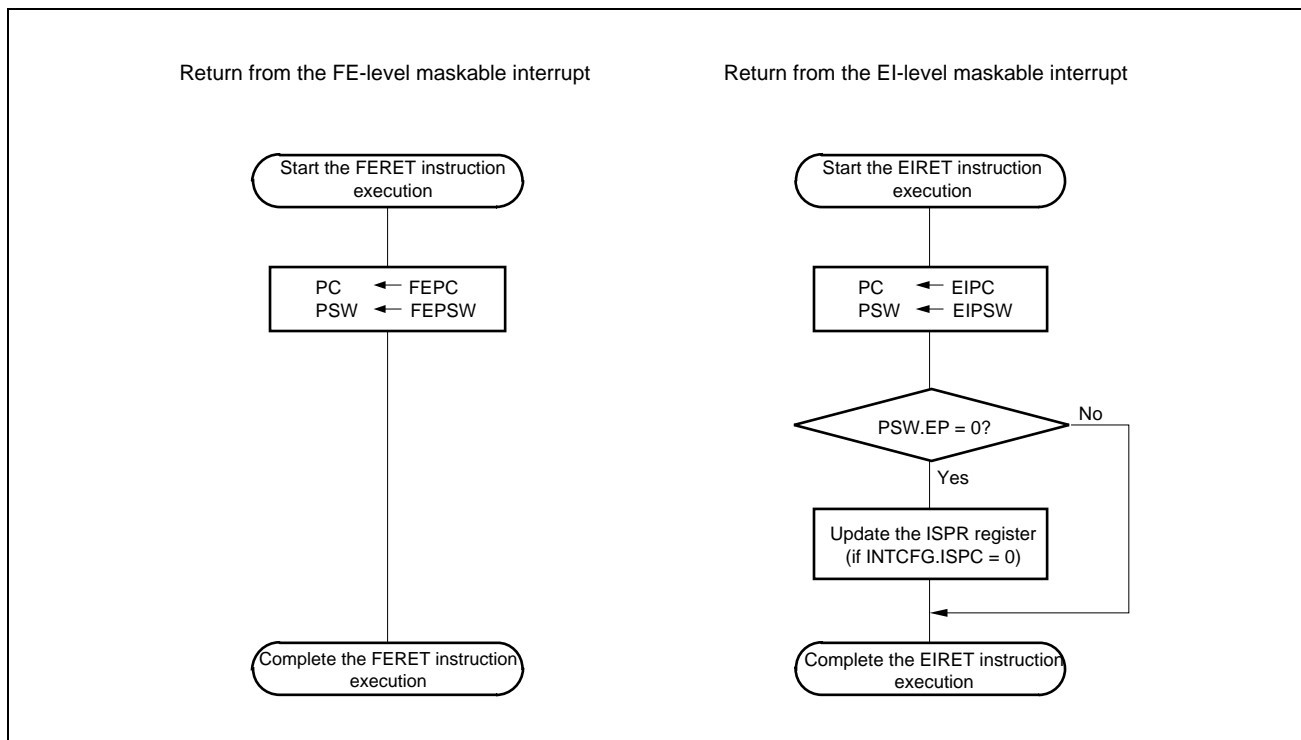

Figure 7A.3 Flow of Return from Interrupts

## 7A.9 Interrupt Operation

### 7A.9.1 Interrupt Mask Function of EI Level Maskable Interrupt (EIINT)

Interrupt masking can be specified for each respective interrupt channel of EIINT. Interrupt masking is performed by the following register settings.

Table 7A.23 Operation of the MKxxx Bit

ICxxx.MKxxx	Operation
1	Masks interrupt
0	Enables interrupt

The ICxxx.MKxxx bits can also be read and written via the corresponding IMRmEIMKn bits of the IMRm registers. The interrupt mask state is reflected in both the ICxxx registers and the IMRm registers.

#### [Operation example]

- (1) When a 1 is written to an IMRm.IMRmEIMKn bit, interrupts are prohibited for the corresponding channel.
- (2) When the corresponding ICxxx.MKxxx bit is read, 1 is returned.

#### CAUTION

If the MKxxx bit is set to 0 while an interrupt request is pending (RFxxx = 1), the interrupt service routine will be executed at that time (subject to the rules of interrupt prioritization). Even if an interrupt request is issued in software by setting the RFxxx bit to 1, the interrupt will not occur as long as the interrupt is masked with MKxxx = 1. To cancel an interrupt request that is pending, clear the corresponding RFxxx bit in software.

### 7A.9.2 Interrupt Priority Level Judgment

When FE level non-maskable interrupts (FENMI), FE level maskable interrupts (FEINT), and EI level maskable interrupts (EIINT) are input, priorities including other exceptions are determined, and the exception with the highest priority (including interrupts) is processed. Exceptions occurred at the same time (including interrupts) are processed in a pre-allocated priority order (the default priority order). The priority orders of FENMI, FEINT, and EIINT interrupts are as follows.

FENMI > FEINT > EIINT

See *the RH850G3KH User's Manual: Software* for other exceptions.

For EIINT(INTn) interrupts, the interrupt priority can be set independently for each interrupt source. Specify the interrupt priority with the bits P3xxx to P0xxx. The interrupt priority levels can be set from 0 to 15: 0 is the highest and 15 is the lowest. Among multiple EIINT(INTn) interrupts with the same priority level, the interrupt with the lowest interrupt channel number has priority.

Table 7A.24 Example of EIINT (INTn) Interrupt Priority Level Settings and Priority Levels during Operation

EIINT (INTn)	ICxxx.P[3:0]xxx Setting	Priority Level During Operation
INT0	3	10
INT1	4	11
INT2	0	1
INT3	0	2
INT4	1	3
INT5	2	6
INT6	2	7
INT7	1	4
INT8	1	5
INT9	2	8
INT10	2	9

The interrupt controller executes multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing is being executed. When multiple EIINT (INTn) interrupts occur at the same time, the interrupt to be acknowledged is determined by the following procedure.

#### 7A.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled

Interrupts with the same or lower priority level as the interrupt currently being handled are held pending.

The priority level of the interrupt currently being handled is stored in the ISPR register.

Interrupts with a higher priority level than the interrupt currently being handled proceed to the next priority judgment stage.

#### 7A.9.2.2 Masking through Priority Mask Register (PMR)

Only interrupts enabled by the PMR register proceed to the next priority judgment stage.

For the PMR register, see **Table 3A.34, PMR Register Contents**, or *the RH850G3KH User's Manual: Software*.

#### 7A.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected

When interrupts are requested simultaneously from multiple sources, the interrupt set the highest priority by ICxxx.P[3:0]xxx bits takes priority.

When there are multiple highest priority interrupts, the lowest interrupt channel number is selected.

#### 7A.9.2.4 Interrupt Suspended by CPU

Interrupt acknowledgment is held according to the state of the NP and ID bits of the PSW register. At this time, priority judgment among EIINT interrupts, and priority judgment among EIINT, FEINT and FENMI interrupts are performed even while interrupt acknowledgment is pending, and the interrupt with the highest priority is selected when the acknowledgment condition is satisfied.

#### Example

An EIINT interrupt with the priority level 5 has already been requested and interrupt generation is pending because the value of the PSW.ID bit is 1. If a subsequent EIINT interrupt with the priority level 3 is requested and the PSW.ID bit is cleared to 0, the latter EIINT interrupt (with the priority level 3) will be generated.

**Figure 7A.4, Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)** shows an example of multiple interrupt handling when another interrupt request is acknowledged while interrupt processing is being executed.

When an interrupt request signal is acknowledged, the PSW.ID flag is automatically set to 1. Therefore, the ID flag should be cleared to 0 to execute multiple interrupt handling. Specifically, execute the EI instruction and the like in an interrupt handling program to enable the interrupt.

Figure 7A.4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)

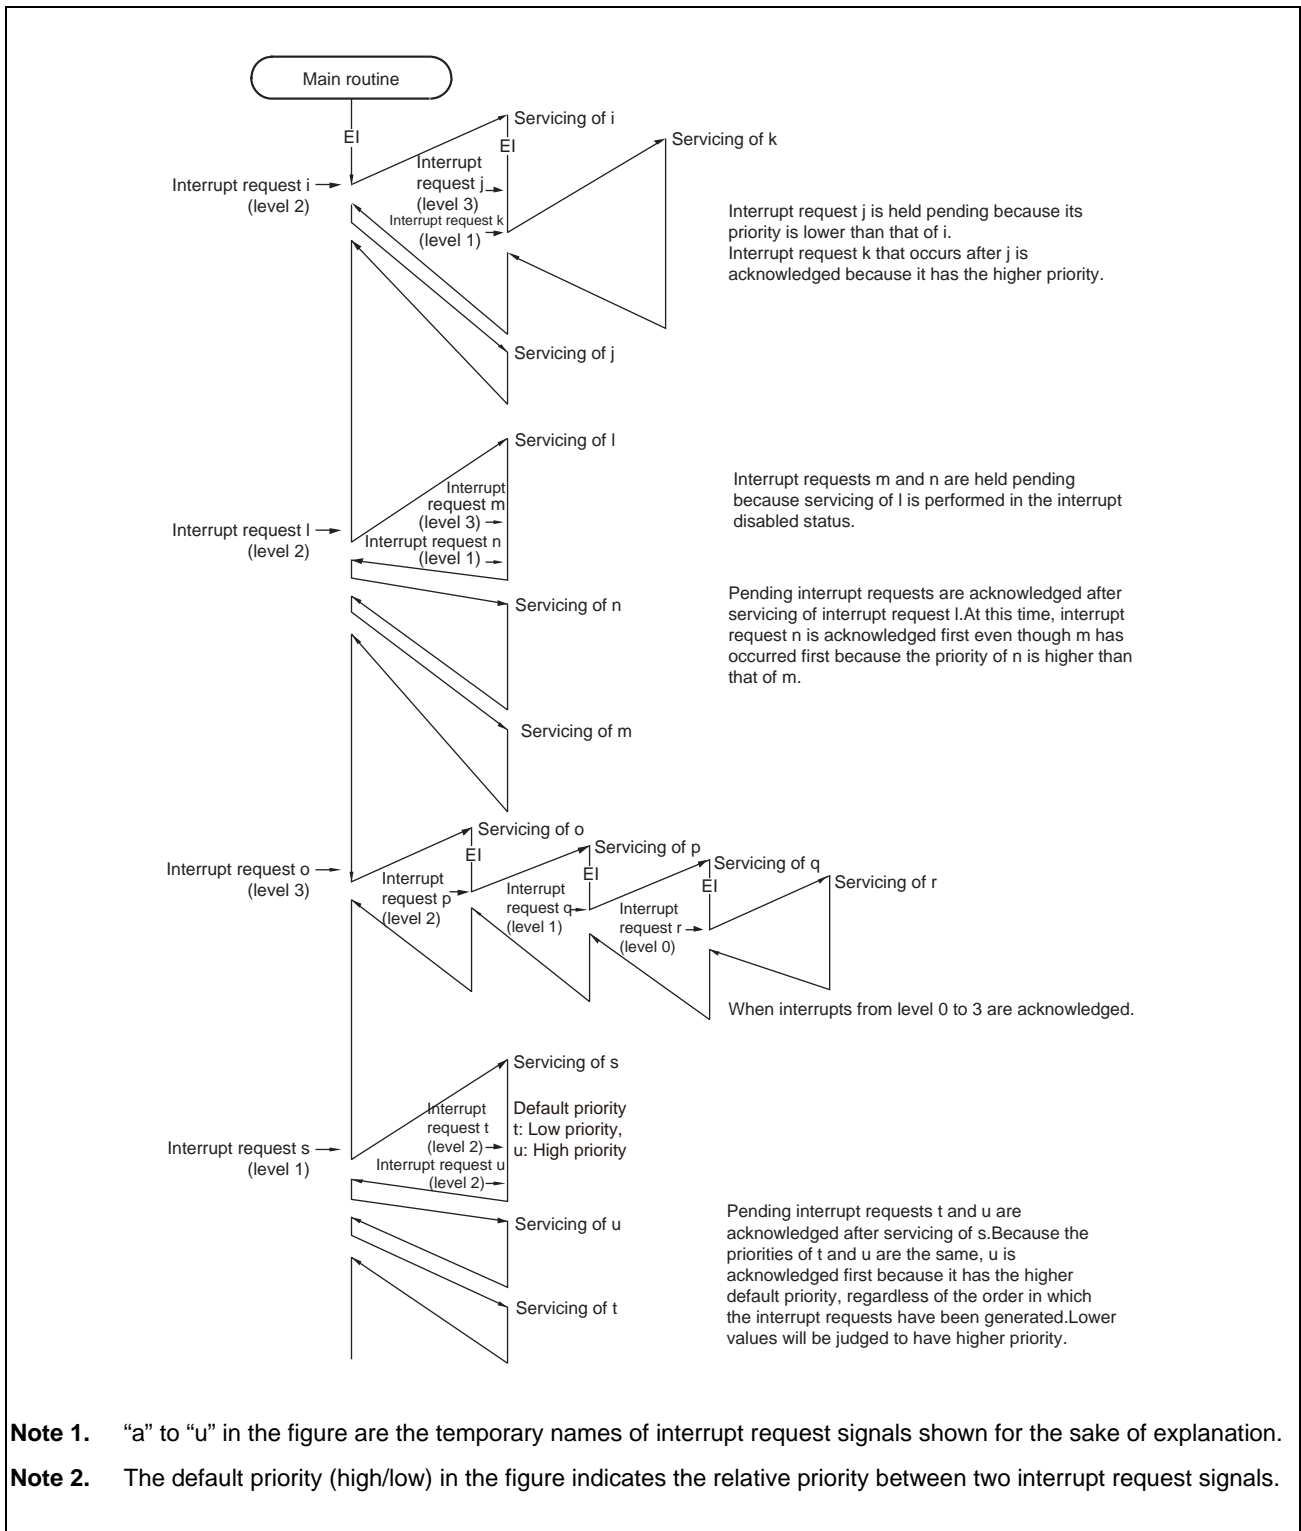

Figure 7A.5 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (2)

**CAUTION**

To perform multiple interrupt servicing, the values of the EIPC and EIPSW registers must be saved before executing the EI instruction. When returning from multiple interrupt servicing, restore the values of EIPC and EIPSW after executing the DI instruction.

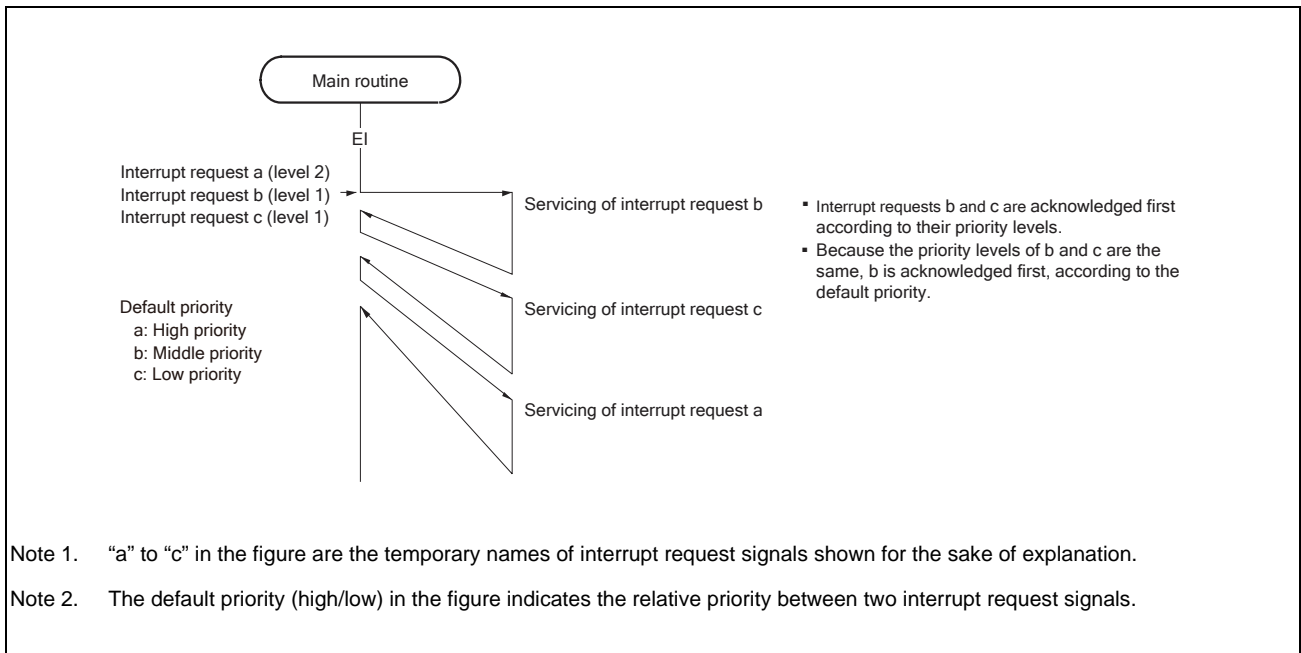

Figure 7A.6 Example of Servicing Simultaneously Generated Interrupt Requests

### 7A.9.3 Interrupt Request Acknowledgement Conditions and the Priority

See the *RH850G3KH User's Manual: Software*.

### 7A.9.4 Exception Priority of Interrupts and the Priority Mask

See the *RH850G3KH User's Manual: Software*.

### 7A.9.5 Interrupt Priority Mask

See the *RH850G3KH User's Manual: Software*.

### 7A.9.6 Priority Mask Function

The priority mask function prohibits all EIINT interrupts of the specified interrupt priority level.

The interrupt priority levels to be masked are specified in the PMR register. Masking and acknowledgment can be set for each priority level.

The following operations are possible using this function:

- Temporary prohibition of interrupts that have a priority level that is lower than a given priority level
- Temporary prohibition of interrupts that have a given priority level

Table 7A.25 Operation of the PMR.PMm Bit

PMR.PMm	Operation
0	Acknowledges requests from priority level m interrupt source.
1	Masks requests from priority level m interrupt source.

**Note:** m = 0 to 15

The presence of EIINT interrupts held pending with this function can be checked with **Section 7A.9.7, Exception Management**.

For details on the PMR register, see **Table 3A.34, PMR Register Contents**, or the *RH850G3KH User's Manual: Software*.

### 7A.9.7 Exception Management

Pending interrupts can be checked in the RH850/F1KH. For details, see the *RH850G3KH User's Manual: Software*.

### 7A.9.8 Inter-Processor Interrupts

Four registers (IPIR\_CHn) for conveying interrupts between PEs are provided.

IPIR\_CH0 to IPIR\_CH3 are assigned to CH0 to CH3 of user interrupt (EIINT). An interrupt for specific PEs (including own PE) can be requested by manipulating bits corresponding to respective PEs.

Interrupt priority levels can be set for each source in interrupt control registers, 16 levels for CPU1 and CPU2.

### 7A.9.9 Broadcast Function (Broadcast Communication Function)

All interrupts have an interrupt register and an interrupt-binding register.

Any single interrupt can be allocated to each PE by setting IBDxxx.CST to 0 (value after a reset) and IBDxxx.PEID[2:0] to a desired value.

Each interrupt which is type of edge detection can be conveyed to both PEs by using the broadcast function (setting IBDxxx.CST to 1). For detection type of each interrupt, refer to **Table 7A.4, EI Level Maskable Interrupt Sources**.

This product only supports the use of two broadcast interrupt. Accordingly, only two IBDxxx.CST bit can be set to 1 and broadcast destination (INTBN0 or INTBN1) can be selected by BCP0 bit setting.

All interrupts for INTC1 that have interrupt number 4 or 5 are allocated to the broadcast interrupt, INTBN0 or INTBN1.

- Allocating multiple interrupt channels to the broadcast interrupt is prohibited.
- The setting of the ICxxx.P[3:0] bits for the interrupt priority level of an INTxxx allocated as a broadcast interrupt is ignored.
- The ICBN0.MKBN0, ICBN1.MKBN1 interrupt mask bit of INTC1 can be used to mask broadcast interrupts for PEs.
- The interrupt vector for the broadcast interrupt of INTC1 (INTBN0, INTBN1) is the same for both PEs.

### 7A.9.9.1 Example of Operation

- The example is described about INTOSTM0 interrupt, which is allocated to interrupt number 84 of INTC2.
- Multiple-conveyance (broadcast) port 0 is in use (INTBN0 is in use).
- The broadcast interrupt (INTBN0) is connected to INTC1 as interrupt number 4.
- Set the IBDOSTM0.CST bit to 1<sub>B</sub> (enabling broadcasting).
- Set the IBDOSTM0.BCP0 bit to 0<sub>B</sub> (selecting broadcast port 0).
- Doing so leads to the allocation of the INTOSTM0 interrupt to interrupt number 4 of PE1 and PE2.
- The ICBN0.P[3:0]BN0 bits define the order of priority for this interrupt.
- The allocated mask bit is ICBN0.MKBN0 and ICBN0.RFBN0 is the interrupt request flag (accordingly, INTBN0 can be separately enabled or disabled for each PE in each INTC1).

When INTOSTM0 is generated, this interrupt request is conveyed from INTC2 to INTC1 through the broadcast interrupt.

Accordingly, the ICBN0.RFBN0 bit for INTC1 is set to 1<sub>B</sub> in both PE1 and PE2.

Both PEs execute the corresponding interrupt routine and each ICBN0.RFBN0 is automatically cleared.

All register settings are listed in the table overleaf.

Table 7A.26 Register Settings (INTC2)

Register Name	Bit Name	Setting Value	Description
ICOSTM0	CTOSTM0	0	The user can only read the value.
	RFOSTM0	—	No function if the setting is for broadcast interrupts
	MKOSTM0	1/0	The user can set the value.
	TBOSTM0	—	No function if the setting is for broadcast interrupts
	P[3:0]OSTM0	—	No function if the setting is for broadcast interrupts
IBDOSTM0	CST	1	Interrupt input is conveyed to multiple destinations (broadcast).
	BCP0	0	Output to broadcast port 0
	PEID[2:0]	—	No function if the setting is for broadcast interrupts

Table 7A.27 Register Settings (INTC1)

Register Name	Bit Name	Setting Value	Description
ICBN0	CTBN0	0	The user can only read the value.
	RFBN0	1/0	Interrupt flag for broadcast interrupts
	MKBN0	1/0	Mask flag for broadcast interrupts
	TBBN0	1/0	The user can set the value.
	P[3:0]BN0	0 to 15	The user can set the value.
IBDBN0	CST	0	Fixed to 0
	BCP0	0	Fixed to 0
	PEID[2:0]	001 (PE1) 010 (PE2)	Fixed

### 7A.9.9.2 Inter-Processor Interrupt Flow

**Figure 7A.7, Example of Inter-Processor Interrupt Processing Flow** shows a flow example of inter-processor interrupt processing.

- Inter-processor interrupt generates an interrupt request by writing 1 to applicable bits of PE to which an interrupt of the inter-processor interrupt register (IPIR\_CHn (n = 0 to 3)) are requested.
- The settings of interrupt request of the inter-PE interrupt registers (IPIR\_CHn (n = 0 to 3)) are automatically cleared to 0 after notification of an interrupt request is complete.

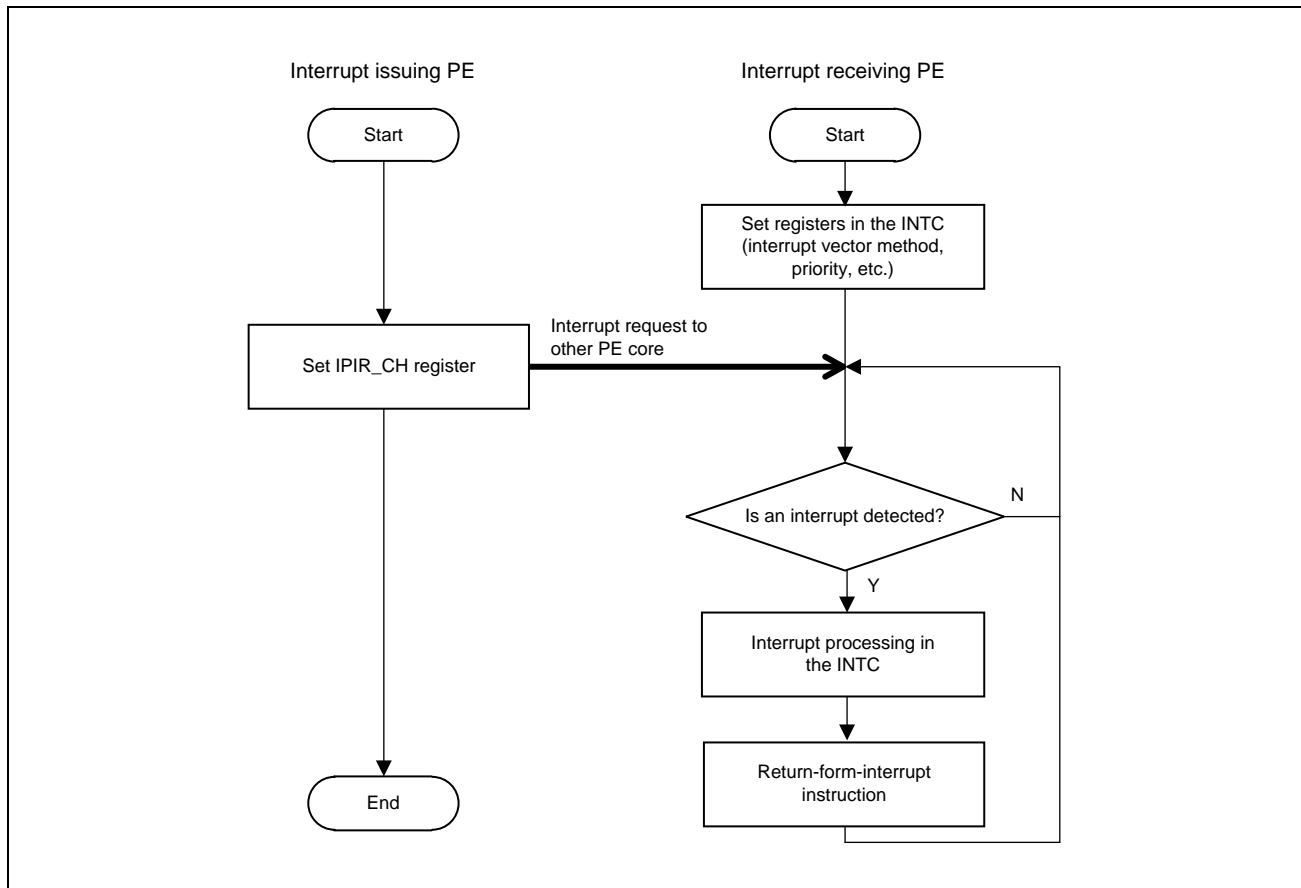

Figure 7A.7 Example of Inter-Processor Interrupt Processing Flow

## 7A.10 Exception Handler Address

In the RH850/F1KH, the exception handler address from which the handler is executed after a reset is input or when an exception or interrupt is acknowledged can be changed according to a setting.

The exception handler address for resets and exceptions (including interrupts) is determined with the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, the RBASE register, and the EBASE register. For interrupts, the direct vector method and table reference method can be selected for each channel. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

### **CAUTION**

---

The exception handler address of EIINT (INT<sub>n</sub>) selected using the direct vector method differs from that of the V850E2 core products. In the V850E2 core products, a different exception handler address is individually assigned to each interrupt channel (EIINT (INT<sub>n</sub>)). In the RH850/F1KH, one exception handler address is assigned to each interrupt priority. Consequently, interrupts that have the same priority level branch to the same exception handler.

---

### 7A.10.1 Direct Vector Method

The CPU uses the result of adding the offset shown in **Table 7A.28, Selection of Base Register/Offset Address** to the base address indicated by the RBASE or EBASE register as the exception handler address.

Select whether the RBASE or EBASE register is used as the base address by using the PSW.EBV bit\*<sup>1</sup>. When the PSW.EBV bit is set to 1, the value of the EBASE register is used as the base address. When the PSW.EBV bit is cleared to 0, the value of the RBASE register is used as the base address.

For reset input the RBASE register is always used for reference.

In addition, user interrupts see the RINT bit of the corresponding base register, and reduce the offset address according to the bit status. If the RBASE.RINT bit or EBASE.RINT bit is set to 1, all user interrupts are handled using an offset of 100<sub>H</sub>. If the bit is cleared to 0, the offset address is determined according to **Table 7A.28, Selection of Base Register/Offset Address**.

**Note 1.** Exception acknowledgment itself may sometimes update the status of the PSW.EBV bit. In this case, the base register is selected based on the updated value.

Figure 7A.8 Direct Vector Method

The table below shows how base register selection and offset address reduction function for each exception to determine the exception handler address. The value of the PSW bit determines the exception handler address on the basis of the value updated by the acknowledgment of an exception.

Table 7A.28 Selection of Base Register/Offset Address

Exception/Interrupt	PSW.EBV = 0	PSW.EBV = 1	RINT = 0	RINT = 1
	Base Register		Offset Address	
RESET	RBASE	N.A.	000 <sub>H</sub>	000 <sub>H</sub>
SYSEERR		EBASE	010 <sub>H</sub>	010 <sub>H</sub>
Reserved			020 <sub>H</sub>	020 <sub>H</sub>
FETRAPP			030 <sub>H</sub>	030 <sub>H</sub>
TRAPP0			040 <sub>H</sub>	040 <sub>H</sub>
TRAPP1			050 <sub>H</sub>	050 <sub>H</sub>
RIE			060 <sub>H</sub>	060 <sub>H</sub>
FPP/FPI			070 <sub>H</sub>	070 <sub>H</sub>
UCPOP			080 <sub>H</sub>	080 <sub>H</sub>
MIP/MDP			090 <sub>H</sub>	090 <sub>H</sub>
PIE			0A0 <sub>H</sub>	0A0 <sub>H</sub>
MAE			0C0 <sub>H</sub>	0C0 <sub>H</sub>
Reserved			0D0 <sub>H</sub>	0D0 <sub>H</sub>
FENMI			0E0 <sub>H</sub>	0E0 <sub>H</sub>
FEINT			0F0 <sub>H</sub>	0F0 <sub>H</sub>
INTn (Priority level 0)			100 <sub>H</sub>	100 <sub>H</sub>
INTn (Priority level 1)			110 <sub>H</sub>	
INTn (Priority level 2)			120 <sub>H</sub>	
INTn (Priority level 3)			130 <sub>H</sub>	
INTn (Priority level 4)			140 <sub>H</sub>	
INTn (Priority level 5)			150 <sub>H</sub>	
INTn (Priority level 6)			160 <sub>H</sub>	
INTn (Priority level 7)			170 <sub>H</sub>	
INTn (Priority level 8)			180 <sub>H</sub>	
INTn (Priority level 9)			190 <sub>H</sub>	
INTn (Priority level 10)			1A0 <sub>H</sub>	
INTn (Priority level 11)			1B0 <sub>H</sub>	
INTn (Priority level 12)			1C0 <sub>H</sub>	
INTn (Priority level 13)			1D0 <sub>H</sub>	
INTn (Priority level 14)			1E0 <sub>H</sub>	
INTn (Priority level 15)			1F0 <sub>H</sub>	

Base register selection is used to execute exception handling for resets and some hardware errors by using the programs in a relatively reliable area such as ROM instead of the areas that are easily affected by software errors such as RAM and cache area. The user interrupt offset address reduction function is used to reduce the memory occupation size required by the exception handler for specific system-internal operating modes. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

## 7A.10.2 Table Reference Method

With the direct vector method, there is one user-interrupt exception handler for each interrupt priority level, and interrupt channels that indicate multiple interrupts with the same priority branch to the same interrupt handler, but some users might want to use different code areas for each interrupt handler from the beginning.

The RH850/F1KH uses the table reference method for interrupts that assume the above usage.

If the table reference method is specified as the interrupt channel vector selection method in the interrupt controller and the like, the method for determining the exception handler address when an interrupt request corresponding to that interrupt channel is acknowledged differs as follows:

<1> In any of the following cases, the exception handler address is determined by using the direct vector method:

- When  $PSW.EBV = 0$  and  $RBASE.RINT = 1$
- When  $PSW.EBV = 1$  and  $Ebase.RINT = 1$
- When the interrupt channel setting is not the table reference method

<2> In cases other than <1>, calculate the table reference position.

Exception handler address read position = INTBP register + channel number  $\times$  4 bytes

<3> Read word data starting at the interrupt handler address read position calculated in <2>.

<4> Use the word data read in <3> as the exception handler address.

**Table 7A.29, Exception Handler Address Expansion** shows the exception handler address read positions corresponding to each interrupt channel and

**Figure 7A.9, Table Reference Method** shows an overview of the allocation in memory.

Table 7A.29 Exception Handler Address Expansion

Type of Interrupt	Exception Handler Address Read Position
EI level maskable interrupt channel 0	INTBP register value + 0 $\times$ 4
EI level maskable interrupt channel 1	INTBP register value + 1 $\times$ 4
EI level maskable interrupt channel 2	INTBP register value + 2 $\times$ 4
:	:
EI level maskable interrupt channel 380	INTBP register value + 380 $\times$ 4
EI level maskable interrupt channel 381	INTBP register value + 381 $\times$ 4

Figure 7A.9 Table Reference Method

## Section 7BC Exception/Interrupts of RH850/F1KM

### 7BC.1 Features of RH850/F1KM Exception/Interrupts

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions.

The details on exceptions are described in *the RH850G3KH User's Manual: Software*.

Table 7BC.1 List of Exception Sources

Name	Symbol	Source	Priority	Saved to	
Reset	RESET	Reset input	High	—	
FE level non-maskable interrupt*1	FENMI	FENMI input		FE	
System error exception	SYSERR	SYSERR input		FE	
FE level maskable interrupt*1	FEINT	FEINT input		FE	
Floating-point arithmetic exception (imprecise)	FPI	Execution of FPU instruction		EI	
EI level maskable interrupt*1	EIINT	Interrupt controller		EI	
Memory protection exception (execution right)	MIP	Memory protection violation		FE	
System error exception	SYSERR	Error input at instruction fetch		FE	
Reserved instruction exception	RIE	Execution of reserved instruction		FE	
Coprocessor unusable exception	UCPOP	Execution of coprocessor instruction/access right violation		FE	
Privileged instruction exception	PIE	Execution of privileged instruction		FE	
Misaligned exception	MAE	Generation of misaligned access		FE	
Memory protection exception (access right)	MDP	Memory protection violation		FE	
Floating-point arithmetic exception (precise)	FPP	Execution of FPU instruction		EI	
System call	SYSCALL	Execution of SYSCALL instruction		EI	
FE level trap	FETRAP	Execution of FETRAP instruction		FE	
EI level trap 0	TRAP0	Execution of TRAP instruction		EI	
EI level trap 1	TRAP1	Execution of TRAP instruction		Low	EI

Note 1. These interrupt exceptions are described in this section.

## (1) Interrupts

The following three exceptions in **Table 7BC.1, List of Exception Sources** are called interrupts, and are described in this section.

- FE level non-maskable interrupt (FENMI)
  - An FENMI interrupt is acknowledged even if another FE level interrupt - FEINT - has been generated.
  - An FENMI interrupt is acknowledged even if the CPU system register PSW.NP = 1.
  - Return from an FENMI interrupt is not possible and neither is recovery.
- FE level maskable interrupt (FEINT)
  - FEINT can be acknowledged if the CPU system register PSW.NP = 0. It is masked if PSW.NP = 1.
  - Return from an FEINT interrupt is possible and so is recovery.
- EI level maskable interrupt (EIINT)
  - An EIINT interrupt can be acknowledged if an FE level interrupt - FENMI or FEINT - has not been generated.
  - EIINT can be acknowledged if the CPU system register PSW.NP = 0.  
It is masked if PSW.NP = 1, EIINT with a higher priority is being processed, or PSW.ID = 1.
  - Return from an EIINT interrupt is possible and so is recovery.
  - Interrupt masking can be specified for each interrupt channel.
  - 16 interrupt priority levels can be specified for each interrupt channel
  - In this section, the EIINT that corresponds to interrupt channel n is indicated by “INTn”, whereas the EIINT that corresponds to interrupt source xxx is indicated by “INTxxx”.

For the PSW register, see **Table 3BC.10, PSW Register Contents** and *the RH850G3KH User's Manual: Software*.

### NOTE

Return: Indicates whether or not the program can resume from where it was interrupted.

Recovery: Indicates whether or not the processor status (status of processor resources including general-purpose registers and system registers) can be restored to the status they were in when the program was interrupted.

These interrupt sources are described in **Section 7BC.2, Interrupt Sources**.

## (2) Overview of interrupts

- Priority levels for interrupt
  - 16 priority levels of maskable interrupts by request can be set by interrupt control register.
- Detecting methods of external interrupts (TNMI/INTPm)
  - A method of detecting external interrupts (TNMI and INTPm) can be selected from five types: rising edge, falling edge, both edges, low level, and high level.
- 2 types of interrupt handler address setting Direct branching method or table referencing method is selectable by register setting.

## 7BC.2 Interrupt Sources

### 7BC.2.1 Interrupt Sources

#### 7BC.2.1.1 FE Level Non-Maskable Interrupts

##### (1) Priority

See **Table 7BC.1, List of Exception Sources.**

##### (2) Return PC

Return or recovery from an FE non-maskable interrupt is not possible.

##### (3) Status Register

See **Section 7BC.4.4, FNC — FE Level NMI Status Register.**

##### (4) Return Instruction

None

Table 7BC.2 FE Level Non-Maskable Interrupt Requests

Interrupt			Interrupt Request			Unit	Priority	Exception Source Code	Handler Address 00000...
Symbol	Control Register		Name	Source					
	Name	Address							
FENMI	FNC	FFFE EA78 <sub>H</sub>	TNMI	NMI pin	Port	*1	0E0 <sub>H</sub>	0E0 <sub>H</sub>	
			WDTA0NMI	WDTA0 FENMI interrupt	WDTA0				
			WDTA1NMI	WDTA1 FENMI interrupt	WDTA1				

Note 1. See **Table 7BC.1, List of Exception Sources.**

The source of the FENMI interrupt can be evaluated by a dedicated flag register. See **Section 7BC.2.2, FE Level Non-Maskable Interrupt Sources** for details.

#### 7BC.2.1.2 FE Level Maskable Interrupts

##### (1) Priority

See **Table 7BC.1, List of Exception Sources.**

##### (2) Return PC

The return PC returned from an interrupt handling routine by the FERET instruction is the PC from when the program was suspended (current PC).

##### (3) Status Register

See **Section 7BC.4.5, FIC — FE Level Maskable Interrupt Status Register.**

##### (4) Return Instruction

FERET

Table 7BC.3 FE Level Maskable Interrupt Requests (RH850/F1KM-S4)

Interrupt			Interrupt Request					Priority	Exception Source Code	Handler Address 00000...			
Symbol	Control Register		Name	Source	Unit	100 Pins	144 Pins				176 Pins	233 Pins	272 Pins
	Name	Address											
FEINT	FIC	FFFE EA7A <sub>H</sub>	INTLVIL	LVI voltage detection (falling)	LVI	✓	✓	✓	✓	✓	*1	0F0 <sub>H</sub>	0F0 <sub>H</sub>
			INTECCCEEP0	Data flash ECC 1-bit error or 2-bit error interrupt	Data flash	✓	✓	✓	✓	✓			
			INTECCFLRAM	FLXA0 ECC 1-bit error or 2-bit error interrupt	FLXA0	✓	✓	✓	✓	✓			
			INTECCCNFDRAM	RCFDC0 ECC 1-bit error or 2-bit error interrupt	RCFDC0	✓	✓	✓	✓	✓			
			INTECCCSIH0	CSIH0 ECC 1-bit error or 2-bit error interrupt	CSIH0	✓	✓	✓	✓	✓			
			INTECCCSIH1	CSIH1 ECC 1-bit error or 2-bit error interrupt	CSIH1	✓	✓	✓	✓	✓			
			INTECCCSIH2	CSIH2 ECC 1-bit error or 2-bit error interrupt	CSIH2	✓	✓	✓	✓	✓			
			INTECCCSIH3	CSIH3 ECC 1-bit error or 2-bit error interrupt	CSIH3	✓	✓	✓	✓	✓			
			INTECCFLIO	Code Flash ECC 1-bit error or 2-bit error interrupt	Code flash	✓	✓	✓	✓	✓			
			INTECCRAM	RAM ECC 1-bit error or 2-bit error interrupt	RAM	✓	✓	✓	✓	✓			
			INTOSTM0_FE*2	OSTM0 interrupt	OSTM0	✓	✓	✓	✓	✓			
			INTLVIH	LVI voltage detection (rising)	LVI	✓	✓	✓	✓	✓			
			INTGUARD	PE Guard (PEG) error or Global RAM Guard (GRG) error or Peripheral Guard (PBG/HBG/PBGC)	PEG, GRG, PBG/HBG/PBGC	✓	✓	✓	✓	✓			
			INTOSTM1_FE	OSTM1 interrupt	OSTM1	✓	✓	✓	✓	✓			
			INTOSTM2_FE	OSTM2 interrupt	OSTM2	✓	✓	✓	✓	✓			
			INTOSTM3_FE	OSTM3 interrupt	OSTM3	✓	✓	✓	✓	✓			
			INTOSTM4_FE	OSTM4 interrupt	OSTM4	✓	✓	✓	✓	✓			
			INTECCETH	ETNB0 ECC 1-bit error or 2-bit error interrupt	ETNB0	—	—	✓	✓	✓			
INTDMAERR	DMA transfer error interrupt	PDMA0	✓	✓	✓	✓	✓						

Note 1. See Table 7BC.1, List of Exception Sources.

Note 2. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTM0 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM0.

\* Timing monitor (TSU)

This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

Table 7BC.4 FE Level Maskable Interrupt Requests (RH850/F1KM-S2)

Interrupt			Interrupt Request				Unit	100 Pins	144 Pins	176 Pins	Priority	Exception Source Code	Handler Address 00000...
Symbol	Control Register		Name	Source									
	Name	Address

			INTECCCSIH1	CSIH1 ECC 1-bit error or 2-bit error interrupt	CSIH1	—	—	✓	✓					
			INTECCCSIH2	CSIH2 ECC 1-bit error or 2-bit error interrupt	CSIH2	—	—	✓	✓					
			INTECCCSIH3	CSIH3 ECC 1-bit error or 2-bit error interrupt	CSIH3	—	—	—	✓					
			INTECCFLI0	Code Flash ECC 1-bit error or 2-bit error interrupt	Code flash	✓	✓	✓	✓					
			INTECCRAM	RAM ECC 1-bit error or 2-bit error interrupt	RAM	✓	✓	✓	✓					
			INTOSTM0_FE*2	OSTM0 interrupt	OSTM0	✓	✓	✓	✓					
			INTLVIH	LVI voltage detection (rising)	LVI	✓	✓	✓	✓					
			INTGUARD	PE Guard (PEG) error or Peripheral Guard (PBG/PBGC)	PEG, PBG/PBGC	✓	✓	✓	✓					
INTDMAERR	DMA transfer error interrupt	PDMA0	✓	✓	✓	✓								

Note 1. See **Table 7BC.1, List of Exception Sources**.

Note 2. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTM0 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM0.

\* Timing monitor (TSU)

This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

### 7BC.2.1.3 EI Level Maskable Interrupts

#### (1) Interrupt Naming Rules

The composition of the interrupt request signal names, their assigned interrupt control registers and the bits in these registers follow special rules.

In the following the name of the specific interrupt request is represented by *<name>*.

For details of the names used in **IC<name>**, see **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2)**, **Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

- Interrupt request name: **INT<name>**  
The prefix “**INT**” is appended to *<name>*.
- Interrupt request control register: **IC<name>**  
The prefix “**IC**” is appended to *<name>*.  
The 16-bit register **IC<name>** can also be accessed in byte units:
  - Low byte (bits [7:0]) of the **IC<name>** register: **IC<name>L**  
The suffix “**L**” is appended to the register name **IC<name>**.
  - High byte (bits [15:8]) of the **IC<name>** register: **IC<name>H**  
The suffix “**H**” is appended to the register name **IC<name>**.
- Interrupt control register bit names: **CT<name>**, **RF<name>**, **MK<name>**, **TB<name>**, **P3<name>**, **P2<name>**, **P1<name>**, **P0<name>**  
The bit prefix “**CT**”, “**RF**”, “**MK**”, “**TB**”, “**P3**”, “**P2**”, “**P1**”, or “**P0**” is appended to the interrupt *<name>*.

#### Example

The interrupt request from channel 2 of TAUD0 channel (*<name>* = *TAUD0I2*) is named

**INTTAUD0I2**

The related interrupt control registers are

**ICTAUD0I2, ICTAUD0I2L, ICTAUD0I2H**

The bits in this register are

**CTTAUD0I2, RFTAUD0I2, MKTAUD0I2, TBTAUD0I2, P3TAUD0I2, P2TAUD0I2, P1TAUD0I2, P0TAUD0I2**

#### (2) Priority

See **Table 7BC.1, List of Exception Sources**.

#### (3) Return PC

The return PC returned from an interrupt handling routine by the EIRET instruction is the PC from when the program was suspended (current PC).

#### (4) Control Register

EI level maskable interrupt control register

See **Section 7BC.4.2, ICxxx — EI Level Interrupt Control Registers**.

**(5) Return Instruction**

EIRET instruction

**(6) Configuration**

EI-level maskable interrupts are controlled by the two controllers, INTC1 and INTC2. The interrupts are supported on a total of 377 channels with a cascade connection of INTC1 and INTC2.

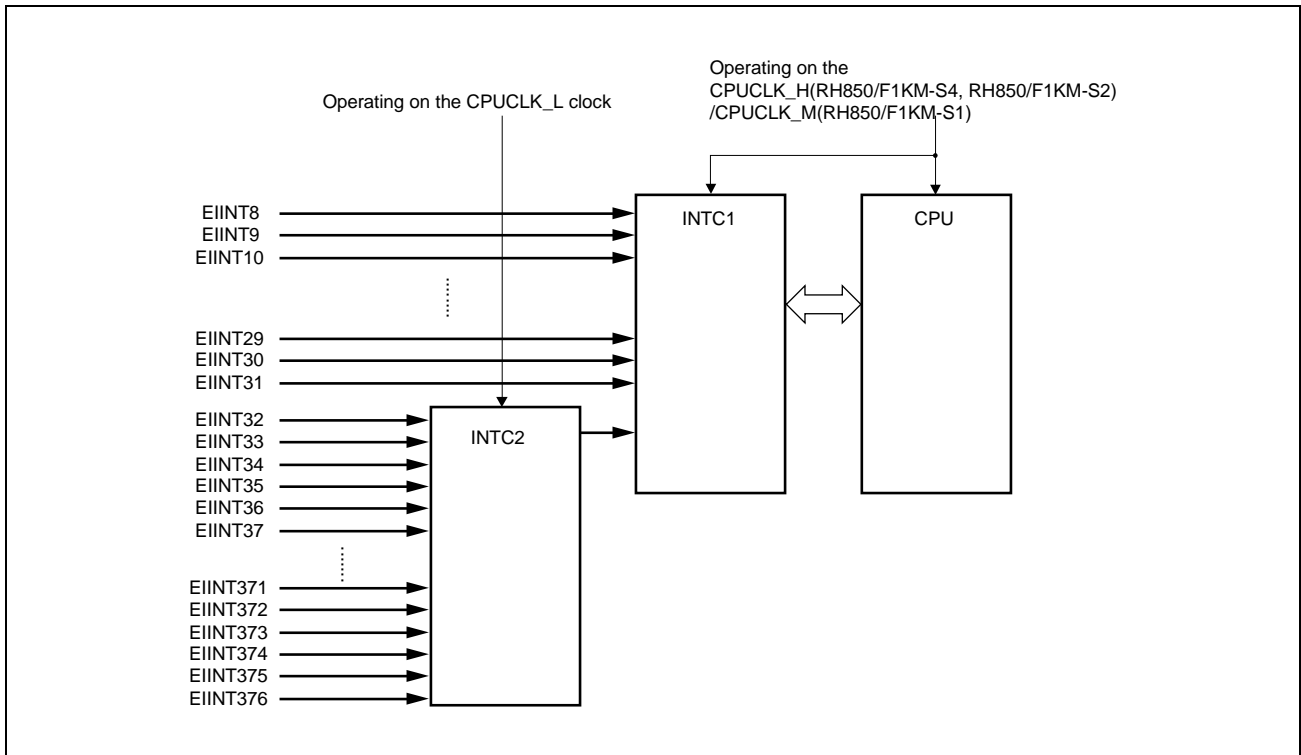

Figure 7BC.1 Configuration Diagram of EI Level Maskable Interrupt

**CAUTION**

As CPUCLK\_L is the operating clock for INTC2, the EIINT32 to EIINT376 interrupts, which are connected to INTC2, are delayed more than the interrupts directly connected to INTC1.

**Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2), Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)** lists EI level maskable interrupts.

**Table 7BC.6 EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**

Note 1. Each interrupt is connected to INTC1 channel 8 to 31 and INTC2 channel 32 to 376.

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an EI level interrupt control register. For details, see **Section 7BC.4.2, ICxxx — EI Level Interrupt Control Registers**. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in **Section 3BC.3.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution** are required to reflect the result of the register update to the subsequent instruction.

Note 3. Irrespective of interrupt channels, an offset address is determined in the range from +100<sub>H</sub> to 1F0<sub>H</sub> according to the priority (0 to 15).

Note 4. Irrespective of the priority, offset addresses are uniformly +100<sub>H</sub>.

Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.  
Exception handler address read position = INTBP register + channel number × 4 bytes

Note 6. The same interrupt source is assigned to different interrupt channels. For details, see **Section 7BC.5.2, SELB\_INTC1 — INTC1 Interrupt Select Register**.

Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

Note 8. For details, see **Section 7BC.10, Exception Handler Address**.

Note 9. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTM0 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU function.

Note 10. For details on the interrupt source, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

Table 7BC.7 EI Level Maskable Interrupt Sources (RH850/F1KM-S2)

Note 1. Each interrupt is connected to INTC1 channel 8 to 31 and INTC2 channel 32 to 376.

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an EI level interrupt control register. For details, see **Section 7BC.4.2, ICxxx — EI Level Interrupt Control Registers**. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in **Section 3BC.3.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution** are required to reflect the result of the register update to the subsequent instruction.

Note 3. Irrespective of interrupt channels, an offset address is determined in the range from +100<sub>H</sub> to 1F0<sub>H</sub> according to the priority (0 to 15).

Note 4. Irrespective of the priority, offset addresses are uniformly +100<sub>H</sub>.

Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.  
Exception handler address read position = INTBP register + channel number × 4 bytes

Note 6. The same interrupt source is assigned to different interrupt channels. For details, see **Section 7BC.5.2, SELB\_INTC1 — INTC1 Interrupt Select Register**.

Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

Note 8. For details, see **Section 7BC.10, Exception Handler Address**.

Note 9. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTM0 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU function.

Note 10. For details on the interrupt source, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

Table 7BC.8 EI Level Maskable Interrupt Sources (RH850/F1KM-S1)

350	ICSENT1RI	FFFF B2BC <sub>H</sub>	INTSENT1RI	Receive interrupt for RSENT1	RSENT1	Edge	115E <sub>H</sub>	✓	✓	✓	✓			+578 <sub>H</sub>		
351	Reserved	FFFF B2BE <sub>H</sub>					115F <sub>H</sub>	—	—	—	—			+57C <sub>H</sub>		
352	Reserved	FFFF B2C0 <sub>H</sub>					1160 <sub>H</sub>	—	—	—	—			+580 <sub>H</sub>		
353	Reserved	FFFF B2C2 <sub>H</sub>					1161 <sub>H</sub>	—	—	—	—			+584 <sub>H</sub>		
354	Reserved	FFFF B2C4 <sub>H</sub>					1162 <sub>H</sub>	—	—	—	—			+588 <sub>H</sub>		
355	Reserved	FFFF B2C6 <sub>H</sub>					1163 <sub>H</sub>	—	—	—	—			+58C <sub>H</sub>		
356	ICDPE	FFFF B2C8 <sub>H</sub>	INTDPE	LPS0 digital port error interrupt	LPS0	Level	1164 <sub>H</sub>	✓	✓	✓	✓			+590 <sub>H</sub>		
357	ICAPE	FFFF B2CA <sub>H</sub>	INTAPE	LPS0 analog port error interrupt	LPS0	Level	1165 <sub>H</sub>	✓	✓	✓	✓			+594 <sub>H</sub>		

Note 1. Each interrupt is connected to INTC1 channel 8 to 31 and INTC2 channel 32 to 357.

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an EI level interrupt control register. For details, see **Section 7BC.4.2, ICxxx — EI Level Interrupt Control Registers**. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in **Section 3BC.3.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution** are required to reflect the result of the register update to the subsequent instruction.

Note 3. Irrespective of interrupt channels, an offset address is determined in the range from +100<sub>H</sub> to 1F0<sub>H</sub> according to the priority (0 to 15).

Note 4. Irrespective of the priority, offset addresses are uniformly +100<sub>H</sub>.

Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.  
Exception handler address read position = INTBP register + channel number × 4 bytes

Note 6. The same interrupt source is assigned to different interrupt channels. For details, see **Section 7BC.5.2, SELB\_INTC1 — INTC1 Interrupt Select Register**.

Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

Note 8. For details, see **Section 7BC.10, Exception Handler Address**.

Note 9. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTM0 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU function.

Note 10. For details on the interrupt source, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

## 7BC.2.2 FE Level Non-Maskable Interrupt Sources

### 7BC.2.2.1 List of Registers

The following table lists the FE Level Non-Maskable Interrupt Sources registers.

Table 7BC.9 List of Registers

Module Name	Register Name	Symbol	Address
ECON_NMI	FENMI factor register	WDTNMIF	FFC0 0000 <sub>H</sub>
	WDTNMI factor clear register	WDTNMIFC	FFC0 0008 <sub>H</sub>

### 7BC.2.2.2 WDTNMIF — FENMI Factor Register

This register contains information about which source has generated the FE level non-maskable interrupt (FENMI). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFC0 0000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTA1NMIF	WDTA0NMIF	TNMIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7BC.10 WDTNMIF Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	WDTA1NMIF	WDTA1NMI flag 0: No WDTA1NMI occurred 1: WDTA1NMI has occurred
1	WDTA0NMIF	WDTA0NMI flag 0: No WDTA0NMI occurred 1: WDTA0NMI has occurred
0	TNMIF	Input signal flag from the NMI pin 0: No TNMI occurred 1: TNMI has occurred

### 7BC.2.2.3 WDTNMIFC — WDTNMI Factor Clear Register

This register clears the FE level non-maskable interrupt flags of the WDTNMIF register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFC0 0008<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTA1 NMIFC	WDTA0 NMIFC	TNMIF C
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W

Table 7BC.11 WDTNMIFC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When writing, write the value after reset.
2	WDTA1NMIFC	WDTA1NMIF flag clear 0: — 1: Clear
1	WDTA0NMIFC	WDTA0NMIF flag clear 0: — 1: Clear
0	TNMIFC	TNMIF flag clear 0: — 1: Clear

## 7BC.2.3 FE Level Maskable Interrupt Sources

### 7BC.2.3.1 List of Registers

The following table lists the FE Level Maskable Interrupt Sources registers.

Table 7BC.12 List of Registers

Module Name	Register Name	Symbol	Address
ECON_FEINT	FEINT factor register	FEINTF	FFC0 0100 <sub>H</sub>
	FEINT factor mask register	FEINTFMSK	FFC0 0104 <sub>H</sub>
	FEINT factor clear register	FEINTFC	FFC0 0108 <sub>H</sub>

### 7BC.2.3.2 FEINTF — FEINT Factor Register

This register contains information about which source has generated the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFC0 0100<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LVIFFEIF	OSTM0FEIF	ECCRAMFEIF	ECCFLI0FEIF	—	ECCCSIH3FEIF	ECCCSIH2FEIF	ECCCSIH1FEIF	ECCCSIH0FEIF	ECCCNFDRAMFEIF	ECCFLRAMFEIF	ECCEEP0FEIF	—	—	—	LVILFEIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7BC.13 FEINTF Register Contents

Bit Position	Bit Name	Function
31	DMAFEIF	INTDMAERR interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
30 to 24	Reserved	When read, the value after reset is returned.
23	ECCEHFEIF*1	RH850/F1KM-S4: INTECCEH interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S2, RH850/F1KM-S1: When read, the value after reset is returned.
22	Reserved	When read, the value after reset is returned.
21	OSTM4FEIF	RH850/F1KM-S4, RH850/F1KM-S2: INTOSTM4_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.
20	OSTM3FEIF	RH850/F1KM-S4, RH850/F1KM-S2: INTOSTM3_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.

Table 7BC.13 FEINTF Register Contents

Bit Position	Bit Name	Function
19	OSTM2FEIF	RH850/F1KM-S4, RH850/F1KM-S2: INTOSTM2_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.
18	OSTM1FEIF	RH850/F1KM-S4, RH850/F1KM-S2: INTOSTM1_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.
17	GUARDFEIF	INTGUARD interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
16	Reserved	When read, the value after reset is returned.
15	LVIHFEIF	INTLVIH interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
14	OSTM0 FEIF	INTOSTM0_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
13	ECCRAM FEIF	INTECCRAM interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
12	ECCFLI0 FEIF	INTECCFLI0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
11	Reserved	When read, the value after reset is returned.
10	ECCCSIH3 FEIF*2	INTECCCSIH3 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
9	ECCCSIH2 FEIF*2	INTECCCSIH2 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
8	ECCCSIH1 FEIF*2	INTECCCSIH1 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
7	ECCCSIH0 FEIF	INTECCCSIH0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
6	ECCCNFDRA MFEIF	INTECCCNFDRA interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred

Table 7BC.13 FEINTF Register Contents

Bit Position	Bit Name	Function
5	ECCFLRAM FEIF	RH850/F1KM-S4: INTECCFLRAM interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S2, RH850/F1KM-S1: When read, the value after reset is returned.
4	ECCEEP0 FEIF	INTECCEEP0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
3 to 1	Reserved	When read, the value after reset is returned.
0	LVILFEIF	INTLVIL interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred

Note 1. For the supported products, see **Table 7BC.3, FE Level Maskable Interrupt Requests (RH850/F1KM-S4)**.

Note 2. For the supported products, see **Table 7BC.5, FE Level Maskable Interrupt Requests (RH850/F1KM-S1)**.

### 7BC.2.3.3 FEINTFMSK — FEINT Factor Mask Register

This register masks the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

**Access:** This register can be read or written in 32-bit units.

**Address:** FFC0 0104<sub>H</sub>

**Value after reset:** FFFF FFFF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	LVILFEIFC	LVILFEIF flag clear 0: — 1: Clear

Note 1. For the supported products, see **Table 7BC.3, FE Level Maskable Interrupt Requests (RH850/F1KM-S4)**.

Note 2. For the supported products, see **Table 7BC.5, FE Level Maskable Interrupt Requests (RH850/F1KM-S1)**.

### 7BC.3 Edge/Level Detection

External interrupts (TNMI and INTPm) can be specified to be generated when a rising edge, falling edge, rising or falling edge, low level, or high level is detected at an external interrupt pin.

The following registers are used to specify the edge and level of each interrupt:

Table 7BC.16 External Interrupt Edge/Level Detection Registers (RH850/F1KM-S4, RH850/F1KM-S2)

Interrupt	Register
TNMI	FCLA0CTL0_NMI
INTP0	FCLA0CTL0_INTPL
INTP1	FCLA0CTL1_INTPL
INTP2	FCLA0CTL2_INTPL
INTP3	FCLA0CTL3_INTPL
INTP4	FCLA0CTL4_INTPL
INTP5	FCLA0CTL5_INTPL
INTP6	FCLA0CTL6_INTPL
INTP7	FCLA0CTL7_INTPL
INTP8	FCLA0CTL0_INTPH
INTP9	FCLA0CTL1_INTPH
INTP10	FCLA0CTL2_INTPH
INTP11	FCLA0CTL3_INTPH
INTP12	FCLA0CTL4_INTPH
INTP13	FCLA0CTL5_INTPH
INTP14*1,*2	FCLA0CTL6_INTPH
INTP15*1,*2	FCLA0CTL7_INTPH
INTP16*1,*2	FCLA0CTL0_INTPU
INTP17*1,*2	FCLA0CTL1_INTPU
INTP18*1,*2	FCLA0CTL2_INTPU
INTP19*1,*2	FCLA0CTL3_INTPU
INTP20*1,*2	FCLA0CTL4_INTPU
INTP21*1,*2	FCLA0CTL5_INTPU
INTP22*1,*2	FCLA0CTL6_INTPU
INTP23*1,*2	FCLA0CTL7_INTPU

Note 1. For the supported products, see **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**.

Note 2. For the supported products, see **Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2)**.

See **Section 2B, Pin Function of RH850/F1KM-S4, RH850/F1KM-S2** for details of these registers.

Table 7BC.17 External Interrupt Edge/Level Detection Registers (RH850/F1KM-S1)

Interrupt	Register
TNMI	FCLA0CTL0_NMI
INTP0	FCLA0CTL0_INTPL
INTP1	FCLA0CTL1_INTPL
INTP2	FCLA0CTL2_INTPL
INTP3	FCLA0CTL3_INTPL
INTP4	FCLA0CTL4_INTPL
INTP5	FCLA0CTL5_INTPL
INTP6*1	FCLA0CTL6_INTPL
INTP7*1	FCLA0CTL7_INTPL
INTP8*1	FCLA0CTL0_INTPH
INTP10	FCLA0CTL2_INTPH
INTP11	FCLA0CTL3_INTPH
INTP12*1	FCLA0CTL4_INTPH
INTP13*1	FCLA0CTL5_INTPH

Note 1. For the supported products, see **Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

See **Section 2C, Pin Function of RH850/F1KM-S1** for details of these registers.

## 7BC.4 Interrupt Controller Control Registers

Writing to the ICxxx, IMRm (m = 0 to 11), FNC, and FIC registers is enabled only in supervisor mode (PSW.UM = 0).

### 7BC.4.1 List of Registers

The following table lists the Interrupt Controller Control registers.

Table 7BC.18 List of Registers

Module Name	Register Name	Symbol	Address
INTC1	EI level interrupt control registers	ICxxx <sup>*1</sup>	See Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2), Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)
	EI level interrupt mask registers	IMR0	FFFE EAF0 <sub>H</sub>
INTC2	EI level interrupt control registers	ICxxx <sup>*2</sup>	See Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2), Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)
	EI level interrupt mask registers	IMRm	FFFF B400 <sub>H</sub> + (04 <sub>H</sub> × m)
INTC1	FE level NMI status register	FNC	FFFE EA78 <sub>H</sub>
	FE level maskable interrupt status register	FIC	FFFE EA7A <sub>H</sub>

Note 1. Channel No.0 to 31.

Note 2. Channel No.32 or more.

## 7BC.4.2 ICxxx — EI Level Interrupt Control Registers

One of these registers is assigned to each EI level maskable interrupt (EIINT) channel and is used to set the conditions for controlling that channel. This register is initialized by any reset. For each source, see **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2)**, **Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

### CAUTION

If 0 is written to the RFxxx bit immediately after a peripheral module generates the corresponding interrupt request in edge detection mode (before an interrupt is accepted by the CPU), the request may be lost.

Writing 1 to the RFxxx bit immediately after an interrupt is accepted by the CPU may lead to re-issuing of the request.

Writing method to these registers contains the use of bit manipulation instructions (set1, clr1, and not1).

For bit-manipulation instructions, see also **Section 3BC.3.3, Access to Registers by Using Bit-Manipulation Instructions**.

Executing a bit-manipulation instruction to the lower bytes including the MKxxx bit has no effect on the RFxxx bit.

**Access:** ICxxx can be read or written in 16-bit units.

ICxxxH and ICxxxL can be read or written in 8- or 1-bit units.

Access to bits 14, 13, 11 to 8, 5, and 4 by using a SET1, CLR1, or NOT1 instruction is prohibited.

**Address:** See **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2)**, **Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

**Value after reset:** 008FH (edge detection), 808FH (level detection)\*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTxxx	—	—	RFxxx	—	—	—	—	MKxxx	TBxxx	—	—	P3xxx	P2xxx	P1xxx	P0xxx
Value after reset	0/1*1	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Note 1. The value after reset differs depending on the detection type of a given interrupt (edge detection: 0, level detection: 1). For details, see **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2)**, **Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

Table 7BC.19 ICxxx Register Contents

Bit Position	Bit Name	Function						
15	CTxxx	This bit indicates the type of interrupt detection. This bit is read only. 0: Edge detection 1: Level detection When writing in 8-bit or 16-bit units, write the value after reset.						
14, 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.						
12	RFxxx	This is an interrupt request flag. The RFxxx bit can be written from a program. Setting the RFxxx bit to 1 generates an EI level maskable interrupt n (EIINTn), just as when an interrupt request is acknowledged. 0: No interrupt request is made. 1: Interrupt request is made.						
		<table border="1"> <thead> <tr> <th>Input Interface</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>Edge detection (CTxxx = 0)</td> <td>This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software.</td> </tr> <tr> <td>Level detection (CTxxx = 1)</td> <td>This bit cannot be set or cleared by software. It can only be read. It is not cleared when an interrupt request is acknowledged by the CPU core.</td> </tr> </tbody> </table>	Input Interface	Operation	Edge detection (CTxxx = 0)	This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software.	Level detection (CTxxx = 1)	This bit cannot be set or cleared by software. It can only be read. It is not cleared when an interrupt request is acknowledged by the CPU core.
Input Interface	Operation							
Edge detection (CTxxx = 0)	This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software.							
Level detection (CTxxx = 1)	This bit cannot be set or cleared by software. It can only be read. It is not cleared when an interrupt request is acknowledged by the CPU core.							

Table 7BC.19 ICxxx Register Contents

Bit Position	Bit Name	Function
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	MKxxx	<p>This is the interrupt request mask bit.</p> <p>When the MKxxx bit is set, interrupt requests from the channel are masked and are not issued to the CPU core. The interrupt pending status is not reflected in the ICSR.PMEI bit for any channels that are masked.</p> <p>When the interrupt request from the channel is masked with MKxxx = 1, the RFxxx still reflects the interrupt request for the channel and can be polled in software. When the MKxxx bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the MKxxx bit is also reflected in the corresponding IMRm register.</p> <p>0: Enables interrupt processing 1: Disables interrupt processing</p>
6	TBxxx	<p>This bit is used to select the way to determine the interrupt vector.</p> <p>0: Direct jumping to an address determined from the level of priority 1: Table reference</p> <p>For details on the way to determine the interrupt vector, see <i>the RH850G3KH User's Manual: Software</i>.</p>
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	P3xxx to P0xxx	<p>These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest.</p> <p>When multiple EI level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core for servicing first. When P3xxx to P0xxx bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority.</p>

**CAUTION**

Do not access ICxxx registers of interrupt channels listed as "Reserved" in **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2)**, **Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)** and of the channels which are not incorporated in the product.

### 7BC.4.3 IMRm — EI Level Interrupt Mask Registers (m = 0 to 11)

These registers are a collection of the MKxxx bits of the ICxxx registers. Each bit of IMRm reflects the setting of the corresponding MKxxx bit. The setting for IMRm is also reflected in the corresponding MKxxx bit. This register is initialized by any reset.

**Access:** IMRm can be read or written in 32-bit units.  
 IMRmH and IMRmL can be read or written in 16-bit units.  
 IMRmHH, IMRmHL, IMRmLH, and IMRmLL can be read or written in 8- or 1-bit units.

**Address:** IMR0: FFFE EAF0<sub>H</sub>  
 IMR0L: FFFE EAF0<sub>H</sub>,  
 IMR0H: FFFE EAF2<sub>H</sub>  
 IMR0LH: FFFE EAF1<sub>H</sub>,  
 IMR0HL: FFFE EAF2<sub>H</sub>,  
 IMR0HH: FFFE EAF3<sub>H</sub>  
 IMRm (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m)  
 IMRmL (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m)  
 IMRmH (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m) + 2<sub>H</sub>,  
 IMRmLL (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m)  
 IMRmLH (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m) + 1<sub>H</sub>,  
 IMRmHL (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m) + 2<sub>H</sub>,  
 IMRmHH (m = 1 to 11): FFFF B400<sub>H</sub> + (04<sub>H</sub> × m) + 3<sub>H</sub>

**Value after reset:** FFFF FFFF<sub>H</sub>

Table 7BC.20 IMRm Register Contents

Bit Position	Bit Name	Function
31 to 0	IMRmEIMK (m × 32 + 31) to IMRmEIMK (m × 32 + 0)	These are interrupt mask bits for EI level maskable interrupt (EIINT) channels 0 to 376. 0: Enables interrupt servicing 1: Disables interrupt servicing

#### CAUTION

MKxxx bits which correspond to channels listed as “Reserved” in Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2), Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1) and to channels which are not incorporated in the product must be set to “1”.

### 7BC.4.4 FNC — FE Level NMI Status Register

This register indicates the status of an FE level non-maskable interrupt (FENMI).

This register is initialized by any reset.

**Access:** FNC is a read-only register that can be read in 16-bit units.  
FNCH is a read-only register that can be read in 8- or 1-bit units.

**Address:** FNC: FFFE EA78<sub>H</sub>  
FNCH: FFFE EA79<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FNRF	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7BC.21 FNC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FNRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit is automatically cleared when an FE level NMI interrupt request is acknowledged by the CPU core.
11 to 0	Reserved	When read, the value after reset is returned.

### 7BC.4.5 FIC — FE Level Maskable Interrupt Status Register

This register indicates the status of an FE level maskable interrupt (FEINT).

This register is initialized by any reset.

**Access:** FIC is a read-only register that can be read in 16-bit units.  
FICH is a read-only register that can be read in 8- or 1-bit units.

**Address:** FIC: FFFE EA7A<sub>H</sub>  
FICH: FFFE EA7B<sub>H</sub>

**Value after reset:** 8000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIRF	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7BC.22 FIC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FIRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit cannot be set or cleared by software. It can only be read.
11 to 0	Reserved	When read, the value after reset is returned.

## 7BC.5 EI Level Maskable Interrupt Select Register

The following registers are used to select an EI level maskable interrupt.

### 7BC.5.1 List of Registers

The following table lists the EI Level Maskable Interrupt Select register.

Table 7BC.23 List of Register

Module Name	Register Name	Symbol	Address
SL_INTC	INTC1 interrupt select register	SELB_INTC1	FFC0 1000 <sub>H</sub>

## 7BC.5.2 SELB\_INTC1 — INTC1 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled. This register is initialized by any reset.

### NOTE

The channel described in each bit setting indicates the channel of an interrupt and the priority. For details on channels, see **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2)**, **Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

**Access:** This register can be read or written in 16-bit units.

**Address:** FFC0 1000<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

10	SELB_INTC1_10	Interrupt channel selection 0: INTTAUD0I12 (Channel 14) INTCSIH3IRE (Channel 160) 1: INTCSIH3IRE_1 (Channel 14) INTTAUD0I12_2 (Channel 160)
9	SELB_INTC1_9	Interrupt channel selection 0: INTTAUD0I10 (Channel 13) INTCSIH3IR (Channel 159) 1: INTCSIH3IR_1 (Channel 13) INTTAUD0I10_2 (Channel 159)
8	SELB_INTC1_8	Interrupt channel selection 0: INTTAUD0I2 (Channel 9) INTCSIH3IC (Channel 158) 1: INTCSIH3IC_1 (Channel 9) INTTAUD0I2_2 (Channel 158)

Table 7BC.24 SELB\_INTC1 Register Contents

Bit Position	Bit Name	Function
7	SELB_INTC1 _7	Interrupt channel selection 0: INTTAUD0I8 (Channel 12) INTCSIH2IJC (Channel 135) 1: INTCSIH2IJC_1 (Channel 12) INTTAUD0I8_2 (Channel 135)
6	SELB_INTC1 _6	Interrupt channel selection 0: INTTAUD0I6 (Channel 11) INTCSIH2IRE (Channel 134) 1: INTCSIH2IRE_1 (Channel 11) INTTAUD0I6_2 (Channel 134)
5	SELB_INTC1 _5	Interrupt channel selection 0: INTTAUD0I4 (Channel 10) INTCSIH2IR (Channel 133) 1: INTCSIH2IR_1 (Channel 10) INTTAUD0I4_2 (Channel 133)
4	SELB_INTC1 _4	Interrupt channel selection 0: INTTAUD0I0 (Channel 8) INTCSIH2IC (Channel 132) 1: INTCSIH2IC_1 (Channel 8) INTTAUD0I0_2 (Channel 132)
3	SELB_INTC1 _3	Interrupt channel selection 0: INTCSIG0IR (Channel 28) INTCSIH1IJC (Channel 119) 1: INTCSIH1IJC_1 (Channel 28) INTCSIG0IR_2 (Channel 119)
2	SELB_INTC1 _2	Interrupt channel selection 0: INTCSIG0IC (Channel 27) INTCSIH1IRE (Channel 118) 1: INTCSIH1IRE_1 (Channel 27) INTCSIG0IC_2 (Channel 118)
1	SELB_INTC1 _1	Interrupt channel selection 0: INTTAPA0IVLY0 (Channel 17) INTCSIH1IR (Channel 117) 1: INTCSIH1IR_1 (Channel 17) INTTAPA0IVLY0_2 (Channel 117)
0	SELB_INTC1 _0	Interrupt channel selection 0: INTTAPA0IPEK0 (Channel 16) INTCSIH1IC (Channel 116) 1: INTCSIH1IC_1 (Channel 16) INTTAPA0IPEK0_2 (Channel 116)

**NOTE**

For the supported products, see **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.7, EI Level Maskable Interrupt Sources (RH850/F1KM-S2)**, **Table 7BC.8, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

**CAUTION**

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by SELB\_INTC1.

## 7BC.7 Operation when Acknowledging an Interrupt

Check whether each interrupt that is reported during instruction execution is acknowledged according to the priority. The procedure for acknowledging each interrupt is shown below.

- (1) Check whether the acknowledgment conditions are satisfied and whether interrupts are acknowledged according to their priority.
- (2) Calculate the exception handler address according to the current PSW value.\*<sup>1</sup>
- (3) For FE-level non-maskable/maskable interrupts, the following processing is performed:
  - Save the PC to the FEPC.
  - Save the PSW to the FEPSW.
  - Store the exception source code in the FEIC.
  - Update the PSW.\*<sup>2</sup>
  - Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.
- (4) For EI level exceptions, the following processing is performed:
  - Save the PC to the EIPC.
  - Save the PSW to the EIPSW.
  - Store the exception source code in the EIIC.
  - Update the PSW.\*<sup>2</sup>
  - Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

**Note 1.** For details, see **Section 7BC.10, Exception Handler Address.**

**Note 2.** For the values to be updated, see *Table 4.1 Exception Cause List* in the *RH850G3KH User's Manual: Software*.

The following figure shows steps (1) to (4).

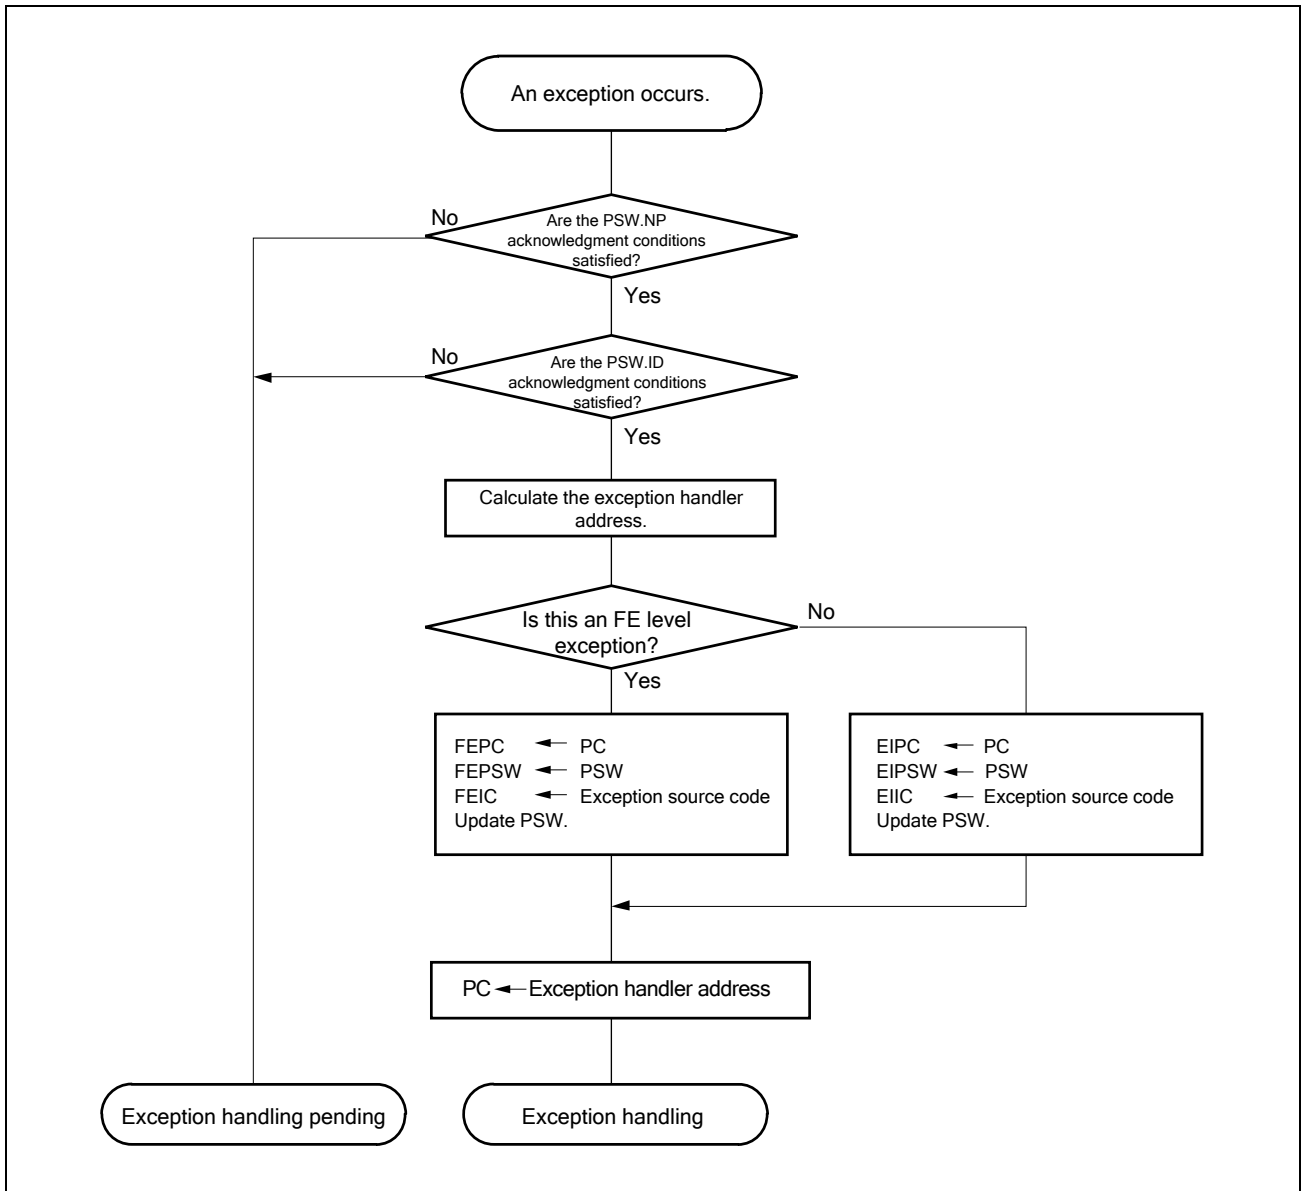

Figure 7BC.2 Operation when Acknowledging an Interrupt

### 7BC.7.1 Exception Source Codes for Different Types of SYSERR Exceptions

The following table lists exception source codes for the different types of SYSERR exceptions.

Table 7BC.25 Exception Source Codes for Different Types of SYSERR Exceptions

Exception Source Code	Source of SYSERR Generation
11 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during the fetching of an instruction from the code flash memory area</li> </ul>
13 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during the fetching of an instruction from the local, global or retention RAM areas</li> </ul>
14 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during access to data in the code flash area</li> <li>Detection of an error during read access to a module via the system interconnect or PBUS</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to VCIF bit of SEGFLAG register*1</p>
16 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during access to data in the own local RAM areas</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to TCMF bit of SEGFLAG register*1</p>
18 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an IPG error</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to VCIF, IPGF bit of SEGFLAG register*1</p>
19 <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error during write access to a module via the PBUS</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to APIF bit of SEGFLAG register*1</p>
1A <sub>H</sub>	<ul style="list-style-type: none"> <li>Detection of an error inside system interconnect</li> </ul> <p>The exception source code reports an occurrence of a system error factor corresponding to VCSF bit of SEGFLAG register*1</p>

Note 1. See Section 3BC.2.3.3, System Error Generator Function (SEG) for details.

## 7BC.8 Return from Interrupts

To return from interrupt handling, execute the return instruction (EIRET or FERET) corresponding to each relevant interrupt level.

When a context has been saved in a stack and the like, the context must be restored before executing the return instruction.

The EIRET instruction is used to return from the EI level maskable interrupt handling and the FERET instruction is used to return from FE-level maskable interrupt handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes its control to the return PC address:

- (1) When returning from the service routine for an EI-level exception, the PC and PSW values on return are loaded from the EIPC and EIPSW registers.  
When returning from the service routine for an FE-level exception, the PC and PSW values on return are loaded from the FEPC and FEPSW registers.
- (2) Control is passed to the addresses indicated by the return PC and PSW that were loaded.
- (3) When  $EP = 0$  and  $INTCFG.ISPC = 0$ , the CPU updates the ISPR register.

The flows for returning from exception handling using the EIRET and FERET instructions are shown below.

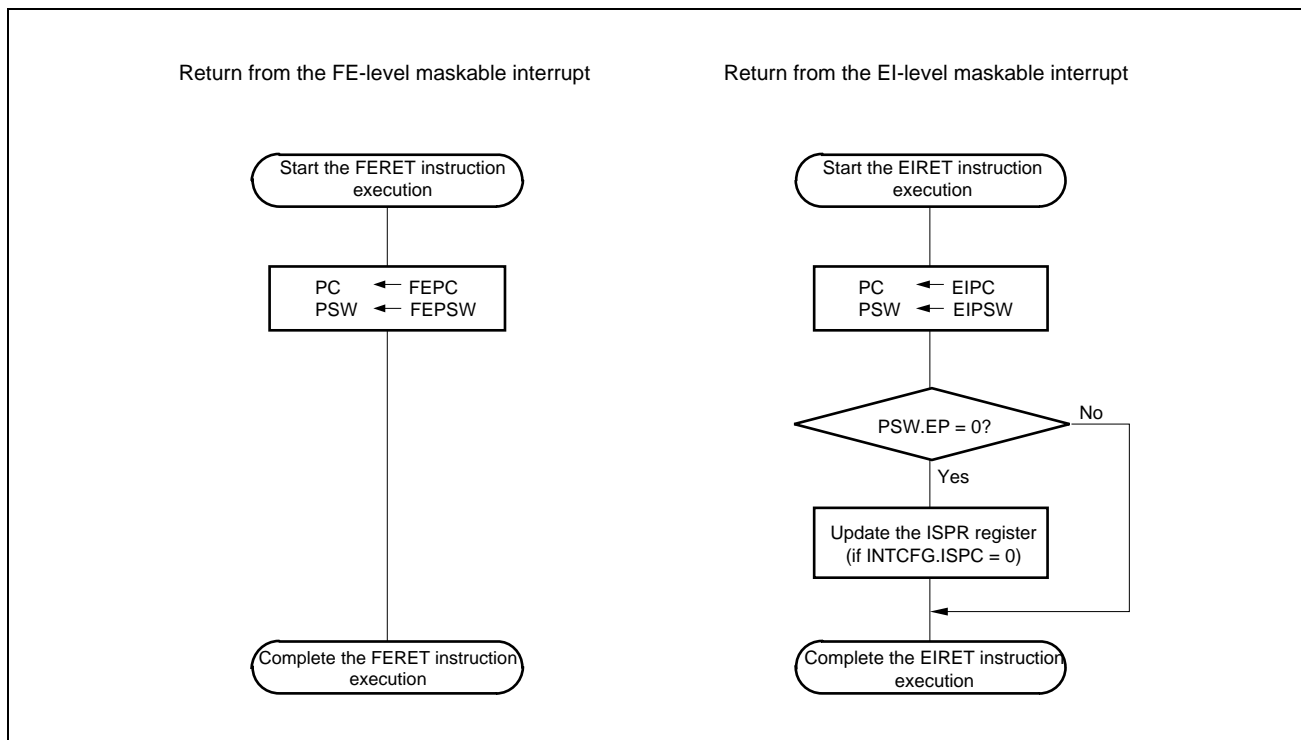

Figure 7BC.3 Flow of Return from Interrupts

## 7BC.9 Interrupt Operation

### 7BC.9.1 Interrupt Mask Function of EI Level Maskable Interrupt (EIINT)

Interrupt masking can be specified for each respective interrupt channel of EIINT. Interrupt masking is performed by the following register settings.

Table 7BC.26 Operation of the MKxxx Bit

ICxxx.MKxxx	Operation
1	Masks interrupt
0	Enables interrupt

The ICxxx.MKxxx bits can also be read and written via the corresponding IMRmEIMKn bits of the IMRm registers. The interrupt mask state is reflected in both the ICxxx registers and the IMRm registers.

#### [Operation example]

- (1) When a 1 is written to an IMRm.IMRmEIMKn bit, interrupts are prohibited for the corresponding channel.
- (2) When the corresponding ICxxx.MKxxx bit is read, 1 is returned.

#### CAUTION

If the MKxxx bit is set to 0 while an interrupt request is pending (RFxxx = 1), the interrupt service routine will be executed at that time (subject to the rules of interrupt prioritization). Even if an interrupt request is issued in software by setting the RFxxx bit to 1, the interrupt will not occur as long as the interrupt is masked with MKxxx = 1. To cancel an interrupt request that is pending, clear the corresponding RFxxx bit in software.

### 7BC.9.2 Interrupt Priority Level Judgment

When FE level non-maskable interrupts (FENMI), FE level maskable interrupts (FEINT), and EI level maskable interrupts (EIINT) are input, priorities including other exceptions are determined, and the exception with the highest priority (including interrupts) is processed. Exceptions occurred at the same time (including interrupts) are processed in a pre-allocated priority order (the default priority order). The priority orders of FENMI, FEINT, and EIINT interrupts are as follows.

FENMI > FEINT > EIINT

See *the RH850G3KH User's Manual: Software* for other exceptions.

For EIINT (INTn) interrupts, the interrupt priority can be set independently for each interrupt source. Specify the interrupt priority with the bits P3xxx to P0xxx. The interrupt priority levels can be set from 0 to 15: 0 is the highest and 15 is the lowest. Among multiple EIINT (INTn) interrupts with the same priority level, the interrupt with the lowest interrupt channel number has priority.

Table 7BC.27 Example of EIINT (INTn) Interrupt Priority Level Settings and Priority Levels during Operation

EIINT (INTn)	ICxxx.P[3:0]xxx Setting	Priority Level During Operation
INT0	3	10
INT1	4	11
INT2	0	1
INT3	0	2
INT4	1	3
INT5	2	6
INT6	2	7
INT7	1	4
INT8	1	5
INT9	2	8
INT10	2	9

The interrupt controller executes multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing is being executed. When multiple EIINT (INTn) interrupts occur at the same time, the interrupt to be acknowledged is determined by the following procedure.

#### 7BC.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled

Interrupts with the same or lower priority level as the interrupt currently being handled are held pending.

The priority level of the interrupt currently being handled is stored in the ISPR register.

Interrupts with a higher priority level than the interrupt currently being handled proceed to the next priority judgment stage.

#### 7BC.9.2.2 Masking through Priority Mask Register (PMR)

Only interrupts enabled by the PMR register proceed to the next priority judgment stage.

For the PMR register, see **Table 3BC.34, PMR Register Contents**, or *the RH850G3KH User's Manual: Software*.

#### 7BC.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected

When interrupts are requested simultaneously from multiple sources, the interrupt set the highest priority by ICxxx.P[3:0]xxx bits takes priority.

When there are multiple highest priority interrupts, the lowest interrupt channel number is selected.

#### 7BC.9.2.4 Interrupt Suspended by CPU

Interrupt acknowledgment is held according to the state of the NP and ID bits of the PSW register. At this time, priority judgment among EIINT interrupts, and priority judgment among EIINT, FEINT and FENMI interrupts are performed even while interrupt acknowledgment is pending, and the interrupt with the highest priority is selected when the acknowledgment condition is satisfied.

#### Example

An EIINT interrupt with the priority level 5 has already been requested and interrupt generation is pending because the value of the PSW.ID bit is 1. If a subsequent EIINT interrupt with the priority level 3 is requested and the PSW.ID bit is cleared to 0, the latter EIINT interrupt (with the priority level 3) will be generated.

**Figure 7BC.4, Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)** shows an example of multiple interrupt handling when another interrupt request is acknowledged while interrupt processing is being executed.

When an interrupt request signal is acknowledged, the PSW.ID flag is automatically set to 1. Therefore, the ID flag should be cleared to 0 to execute multiple interrupt handling. Specifically, execute the EI instruction and the like in an interrupt handling program to enable the interrupt.

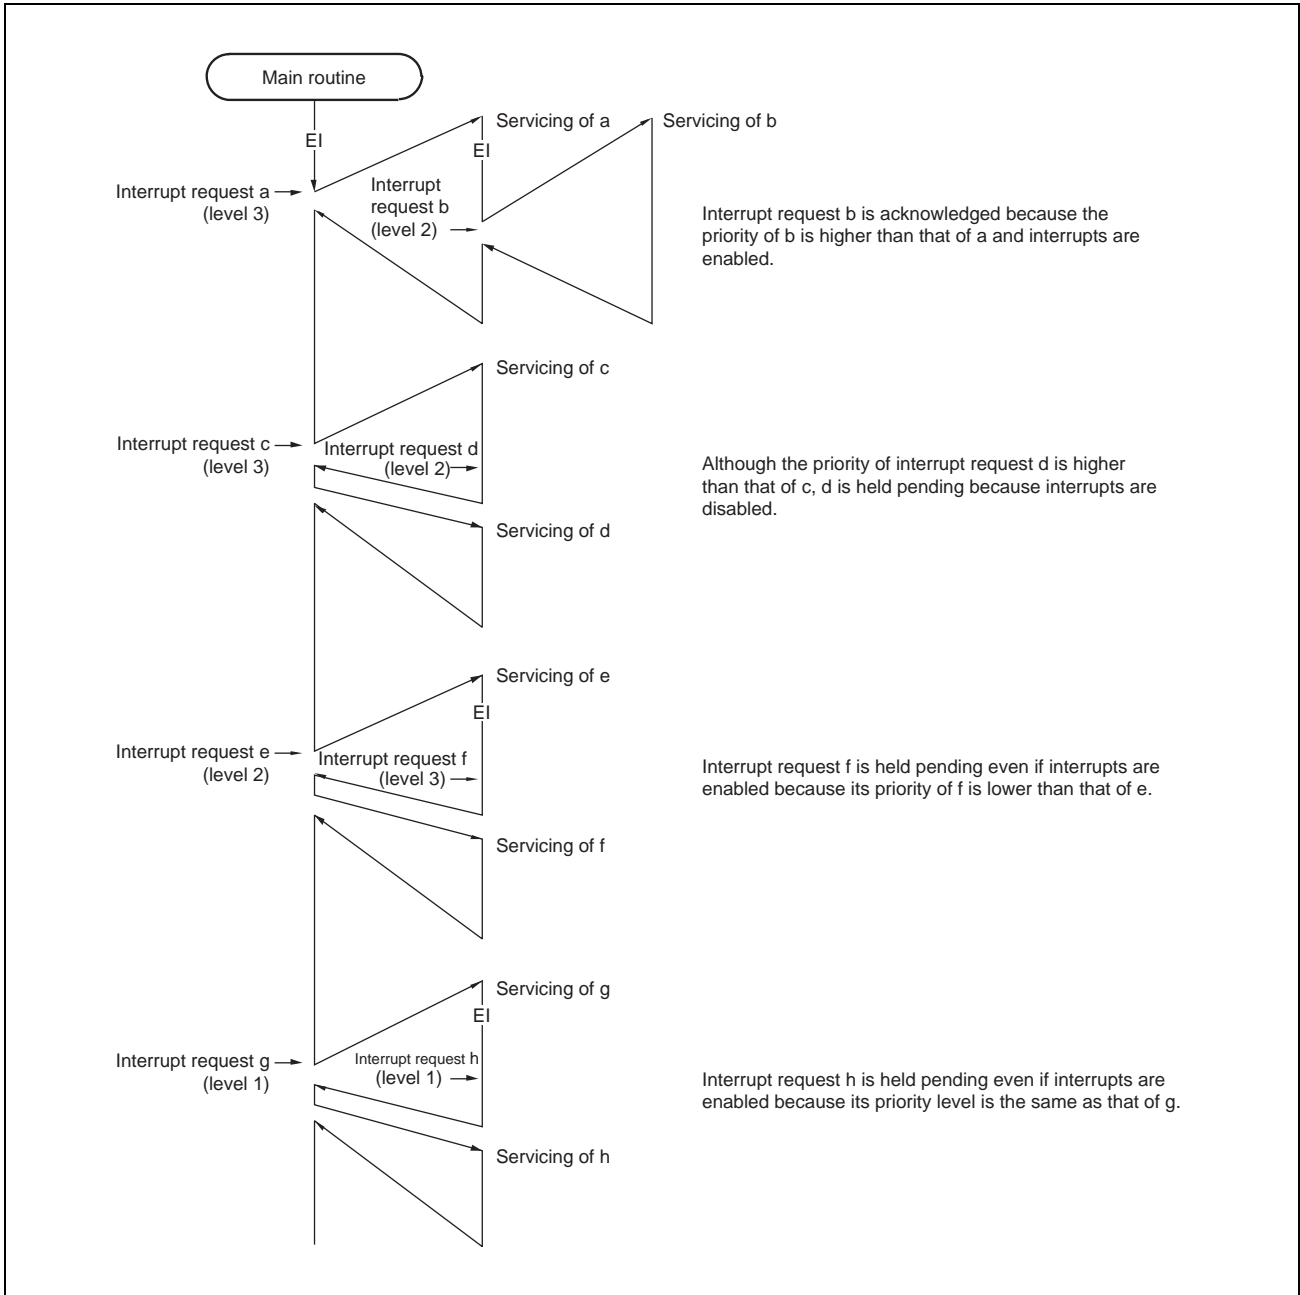

Figure 7BC.4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)

Figure 7BC.4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (2)

**CAUTION**

To perform multiple interrupt servicing, the values of the EIPC and EIPSW registers must be saved before executing the EI instruction. When returning from multiple interrupt servicing, restore the values of EIPC and EIPSW after executing the DI instruction.

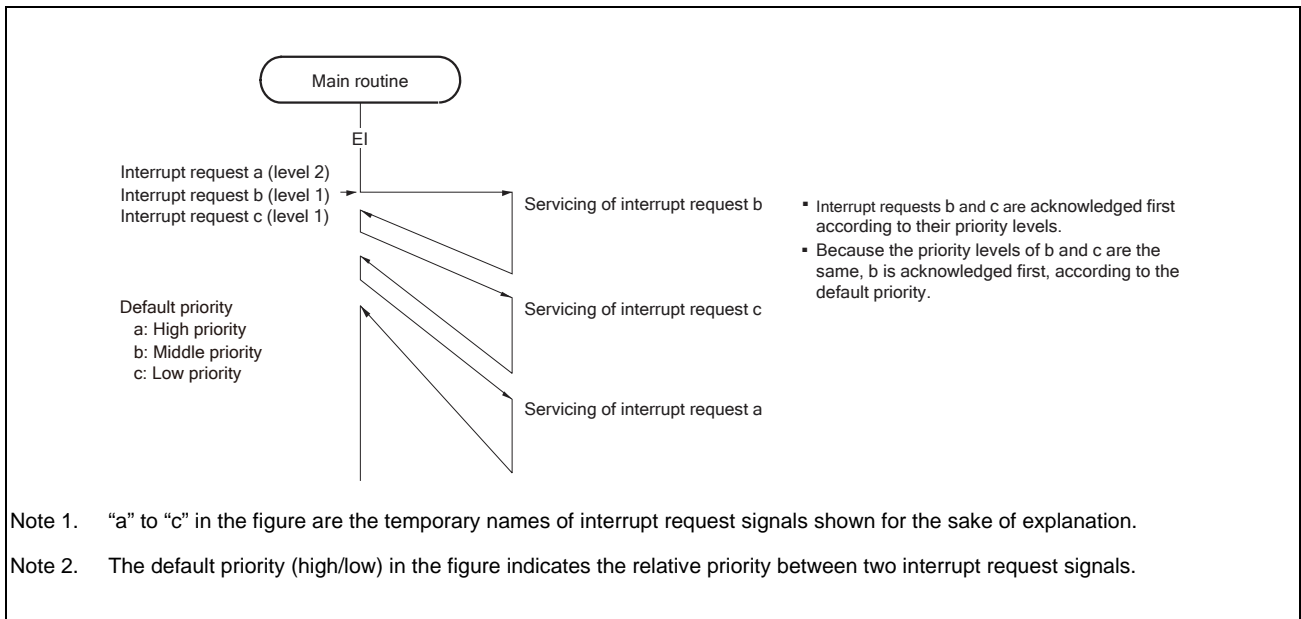

Figure 7BC.5 Example of Servicing Simultaneously Generated Interrupt Requests

### 7BC.9.3 Interrupt Request Acknowledgement Conditions and the Priority

See the *RH850G3KH User's Manual: Software*.

### 7BC.9.4 Exception Priority of Interrupts and the Priority Mask

See the *RH850G3KH User's Manual: Software*.

### 7BC.9.5 Interrupt Priority Mask

See the *RH850G3KH User's Manual: Software*.

### 7BC.9.6 Priority Mask Function

The priority mask function prohibits all EIINT interrupts of the specified interrupt priority level.

The interrupt priority levels to be masked are specified in the PMR register. Masking and acknowledgment can be set for each priority level.

The following operations are possible using this function:

- Temporary prohibition of interrupts that have a priority level that is lower than a given priority level
- Temporary prohibition of interrupts that have a given priority level

Table 7BC.28 Operation of the PMR.PMm Bit

PMR.PMm	Operation
0	Acknowledges requests from priority level m interrupt source.
1	Masks requests from priority level m interrupt source.

**Note:** m = 0 to 15

The presence of EIINT interrupts held pending with this function can be checked with **Section 7BC.9.7, Exception Management**.

For details on the PMR register, see **Table 3BC.34, PMR Register Contents**, or the *RH850G3KH User's Manual: Software*.

### 7BC.9.7 Exception Management

Pending interrupts can be checked in the RH850/F1KM. For details, see the *RH850G3KH User's Manual: Software*.

## 7BC.10 Exception Handler Address

In the RH850/F1KM, the exception handler address from which the handler is executed after a reset is input or when an exception or interrupt is acknowledged can be changed according to a setting.

The exception handler address for resets and exceptions (including interrupts) is determined with the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, the RBASE register, and the EBASE register. For interrupts, the direct vector method and table reference method can be selected for each channel. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

### CAUTION

The exception handler address of EIINT (INT<sub>n</sub>) selected using the direct vector method differs from that of the V850E2 core products. In the V850E2 core products, a different exception handler address is individually assigned to each interrupt channel (EIINT (INT<sub>n</sub>)). In the RH850/F1KM, one exception handler address is assigned to each interrupt priority. Consequently, interrupts that have the same priority level branch to the same exception handler.

### 7BC.10.1 Direct Vector Method

The CPU uses the result of adding the offset shown in **Table 7BC.29, Selection of Base Register/Offset Address** to the base address indicated by the RBASE or EBASE register as the exception handler address.

Select whether the RBASE or EBASE register is used as the base address by using the PSW.EBV bit\*<sup>1</sup>. When the PSW.EBV bit is set to 1, the value of the EBASE register is used as the base address. When the PSW.EBV bit is cleared to 0, the value of the RBASE register is used as the base address.

For reset input the RBASE register is always used for reference.

In addition, user interrupts see the RINT bit of the corresponding base register, and reduce the offset address according to the bit status. If the RBASE.RINT bit or EBASE.RINT bit is set to 1, all user interrupts are handled using an offset of 100<sub>H</sub>. If the bit is cleared to 0, the offset address is determined according to **Table 7BC.29, Selection of Base Register/Offset Address**.

**Note 1.** Exception acknowledgment itself may sometimes update the status of the PSW.EBV bit. In this case, the base register is selected based on the updated value.

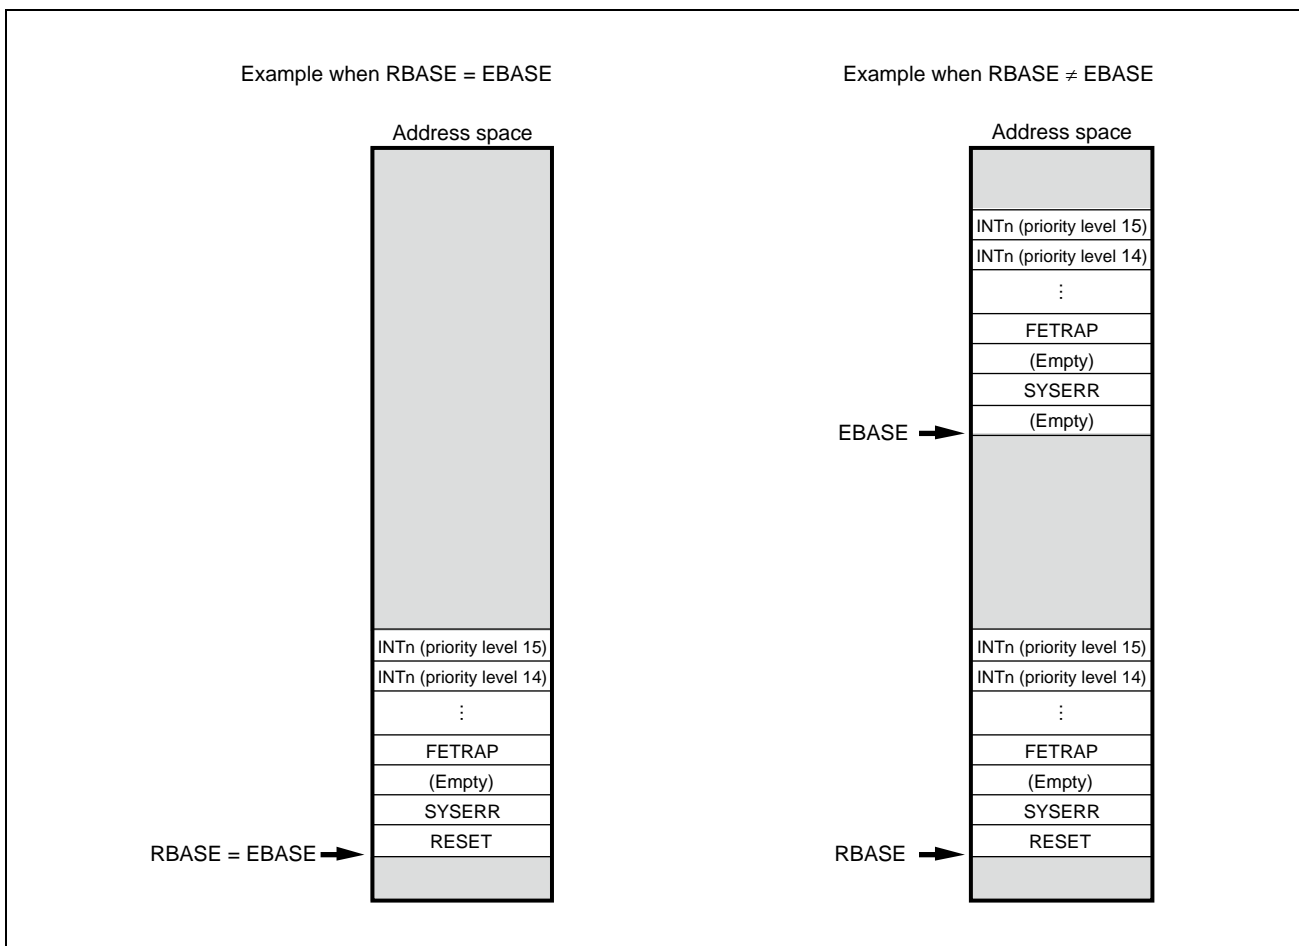

Figure 7BC.6 Direct Vector Method

The table below shows how base register selection and offset address reduction function for each exception to determine the exception handler address. The value of the PSW bit determines the exception handler address on the basis of the value updated by the acknowledgment of an exception.

Table 7BC.29 Selection of Base Register/Offset Address

Exception/Interrupt	PSW.EBV = 0	PSW.EBV = 1	RINT = 0	RINT = 1
	Base Register		Offset Address

INTn (Priority level 12)			1C0 <sub>H</sub>	
INTn (Priority level 13)			1D0 <sub>H</sub>	
INTn (Priority level 14)			1E0 <sub>H</sub>	
INTn (Priority level 15)			1F0 <sub>H</sub>	

Base register selection is used to execute exception handling for resets and some hardware errors by using the programs in a relatively reliable area such as ROM instead of the areas that are easily affected by software errors such as RAM and cache area. The user interrupt offset address reduction function is used to reduce the memory occupation size required by the exception handler for specific system-internal operating modes. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

## 7BC.10.2 Table Reference Method

With the direct vector method, there is one user-interrupt exception handler for each interrupt priority level, and interrupt channels that indicate multiple interrupts with the same priority branch to the same interrupt handler, but some users might want to use different code areas for each interrupt handler from the beginning.

The RH850/F1KM uses the table reference method for interrupts that assume the above usage.

If the table reference method is specified as the interrupt channel vector selection method in the interrupt controller and the like, the method for determining the exception handler address when an interrupt request corresponding to that interrupt channel is acknowledged differs as follows:

<1> In any of the following cases, the exception handler address is determined by using the direct vector method:

- When PSW.EBV = 0 and RBASE.RINT = 1
- When PSW.EBV = 1 and EBASE.RINT = 1
- When the interrupt channel setting is not the table reference method

<2> In cases other than <1>, calculate the table reference position.

Exception handler address read position = INTBP register + channel number × 4 bytes

<3> Read word data starting at the interrupt handler address read position calculated in <2>.

<4> Use the word data read in <3> as the exception handler address.

**Table 7BC.30, Exception Handler Address Expansion** shows the exception handler address read positions corresponding to each interrupt channel and

**Figure 7BC.7, Table Reference Method** shows an overview of the allocation in memory.

Table 7BC.30 Exception Handler Address Expansion

Type of Interrupt	Exception Handler Address Read Position
EI level maskable interrupt channel 0	INTBP register value + 0 × 4
EI level maskable interrupt channel 1	INTBP register value + 1 × 4
EI level maskable interrupt channel 2	INTBP register value + 2 × 4
:	:
EI level maskable interrupt channel 375	INTBP register value + 375 × 4
EI level maskable interrupt channel 376	INTBP register value + 376 × 4

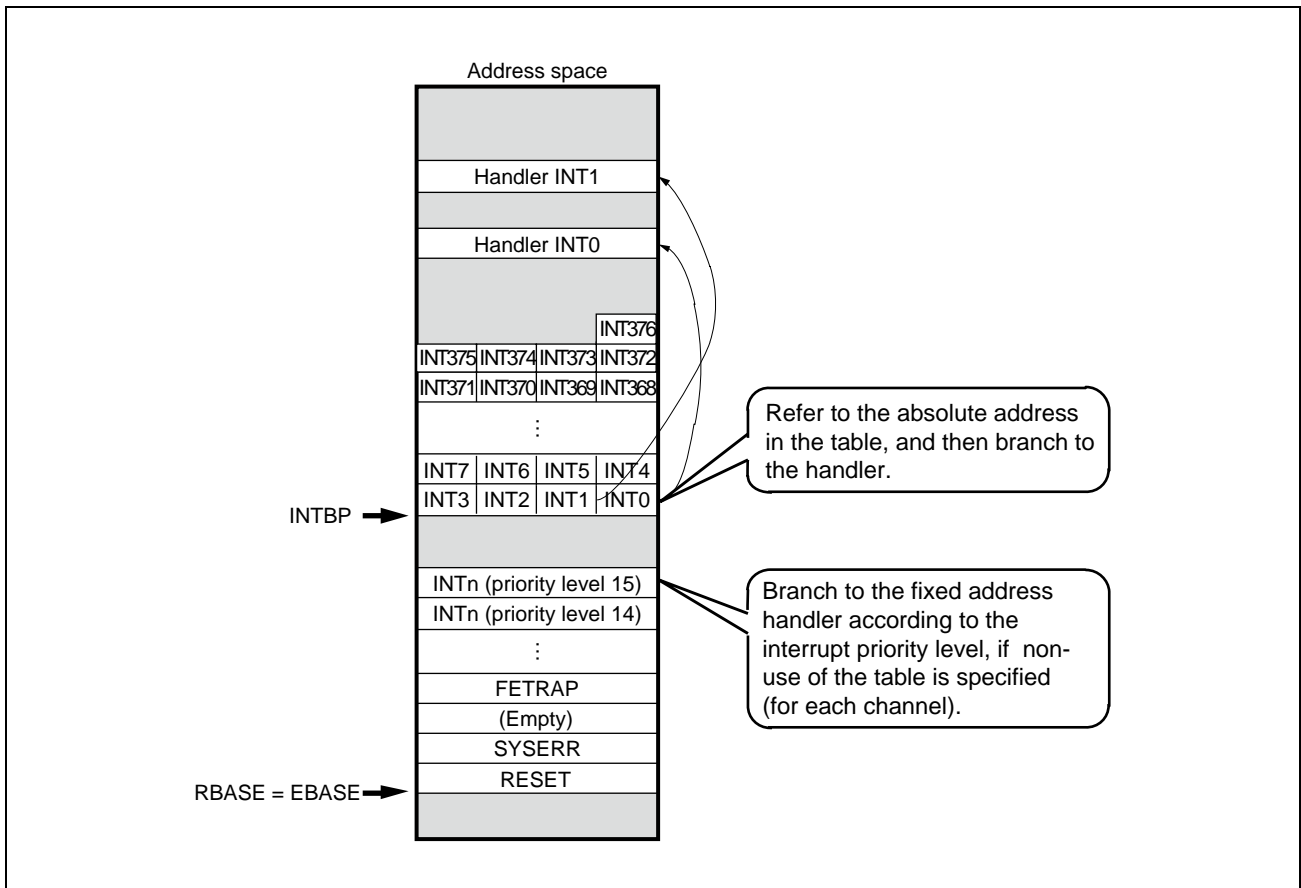

Figure 7BC.7 Table Reference Method

## Section 8 DMA Controller

This section contains a generic description of the DMA controller (DMA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of channels, register base addresses, etc.

The remainder of the section describes the functions and registers of DMA.

### 8.1 Features of RH850/F1KH, RH850/F1KM DMA Controller

#### 8.1.1 Number of Channels

This microcontroller has the following number of DMA channels.

Table 8.1 Number of Channels (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Channels	64 ch (8 ch × 4 × 2)	64 ch (8 ch × 4 × 2)	64 ch (8 ch × 4 × 2)

Table 8.2 Number of Channels (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of channels	32 ch (8 ch × 4)	32 ch (8 ch × 4)	32 ch (8 ch × 4)	32 ch (8 ch × 4)	32 ch (8 ch × 4)

Table 8.3 Number of Channels (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of channels	32 ch (8 ch × 4)	32 ch (8 ch × 4)	32 ch (8 ch × 4)

Table 8.4 Number of Channels (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of channels	16 ch (8 ch × 2)	16 ch (8 ch × 2)	16 ch (8 ch × 2)	16 ch (8 ch × 2)

Table 8.5 Indices (RH850/F1KH-D8)

Index	Description
n	In this section, the DMA units are identified with an index "n" for example, as PDMA <sub>n</sub> (n = 0, 1).
y	In this section, the DMA groups are identified with an index "y" for example, as DMAC <sub>y</sub> (y = 0 to 3).
m	In this section, the DMA channels are identified with an index "m". For example, PDMA <sub>n</sub> DSAm (m = 0 to 31) is the DMA source address register.
i	In this section, the DMAC channels are identified with an index "i". For example, PDMA <sub>n</sub> DMYiCM (i = 0 to 7) is the DMAC channel master.

Table 8.6 Indices (RH850/F1KM-S4, RH850/F1KM-S2)

Index	Description
n	In this section, the DMA units are identified with an index "n" for example, as PDMA <sub>n</sub> (n = 0).
y	In this section, the DMA groups are identified with an index "y" for example, as DMAC <sub>y</sub> (y = 0 to 3).
m	In this section, the DMA channels are identified with an index "m". For example, PDMA <sub>n</sub> DSAm (m = 0 to 31) is the DMA source address register.
i	In this section, the DMAC channels are identified with an index "i". For example, PDMA <sub>n</sub> DMYiCM (i = 0 to 7) is the DMAC channel master.

Table 8.7 Indices (RH850/F1KM-S1)

Index	Description
n	In this section, the DMA units are identified with an index "n" for example, as PDMA <sub>n</sub> (n = 0).
y	In this section, the DMA groups are identified with an index "y" for example, as DMAC <sub>y</sub> (y = 0, 1).
m	In this section, the DMA channels are identified with an index "m". For example, PDMA <sub>n</sub> DSAm (m = 0 to 15) is the DMA source address register.
i	In this section, the DMAC channels are identified with an index "i". For example, PDMA <sub>n</sub> DMyiCM (i = 0 to 7) is the DMAC channel master.

## 8.1.2 Register Base Addresses

The DMA base addresses are listed in the following table.

The DMA register addresses are given as offsets from the base addresses.

Table 8.8 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<DMA0_base>	FFFF 8000 <sub>H</sub>
<DMA1_base>	FFFF 9000 <sub>H</sub>

Table 8.9 Register Base Address (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<DMA0_base>	FFFF 8000 <sub>H</sub>

### 8.1.3 Interrupt Requests

The DMA interrupt requests are listed in the following table.

Table 8.10 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number
PDMA0		
INTDMA0	PDMA0 DMA00 transfer completion	60
INTDMA1	PDMA0 DMA01 transfer completion	61
INTDMA2	PDMA0 DMA02 transfer completion	62
INTDMA3	PDMA0 DMA03 transfer completion	63
INTDMA4	PDMA0 DMA04 transfer completion	64
INTDMA5	PDMA0 DMA05 transfer completion	65
INTDMA6	PDMA0 DMA06 transfer completion	66
INTDMA7	PDMA0 DMA07 transfer completion	67
INTDMA8	PDMA0 DMA10 transfer completion	68
INTDMA9	PDMA0 DMA11 transfer completion	69

## 8.2 Overview

### 8.2.1 Overview

Direct memory access (DMA) is used to access data without intervention of the CPU.

DMA includes a DMA transfer module called DMAC. A DMAC includes registers for storing transfer information.

- RH850/F1KH-D8

DMA has two 8-channel × 4-group DMAC modules. 2 DMA modules operate respectively as different master. This chapter describes the function of one DMAC unit.

- RH850/F1KM-S4, RH850/F1KM-S2

DMA has one 8-channel × 4-group DMAC modules.

- RH850/F1KM-S1

DMA has one 8-channel × 2-group DMAC modules.

In this manual, DTFR denotes the function to select among hardware DMA transfer sources for a DMAC and retain the DMA transfer request. The DTFR can handle 128 types of hardware DMA transfer sources.

The address space that can be used for DMA transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DMA, see **Section 4A, Address Space of RH850/F1KH-D8**, **Section 4B, Address Space of RH850/F1KM-S4, RH850/F1KM-S2** and **Section 4C, Address Space of RH850/F1KM-S1**.

#### CAUTION

---

DMA can be used after PEG access permission setting.

- RH850/F1KH-D8:

When accessing from the DMA to the local RAM in the PE, the PEGSP register, PEGGnMK register (n = 0 to 3), PEGGnBA register (n = 0 to 3) and PDMA<sub>n</sub>DMYiCM register (yi = 00 to 07, 10 to 17, 20 to 27, and 30 to 37) must be set.

- RH850/F1KM-S4, RH850/F1KM-S2:

When accessing from the DMA to the local RAM in the PE, the PEGSP register, PEGGnMK register (n = 0 to 3), PEGGnBA register (n = 0 to 3) and PDMA<sub>n</sub>DMYiCM register (yi = 00 to 07, 10 to 17, 20 to 27, and 30 to 37) must be set.

- RH850/F1KM-S1:

When accessing from the DMA to the local RAM and the retention RAM in the PE, the PEGSP register, PEGGnMK register (n = 0 to 3), PEGGnBA register (n = 0 to 3) and PDMA<sub>n</sub>DMYiCM register (yi = 00 to 07, 10 to 17) must be set.

---

## 8.2.2 Term Definition

**Table 8.18, List of Term Definitions** shows the terms used in this section.

Table 8.18 List of Term Definitions

Term	Description
DMA transfer	A general term for data transfer carried out by DMA.
DMA cycle	A series of actions that consist of reading an amount of data specified by the transfer size (8/16/32/64/128 bits) from the address specified by the source address and writing it to the address specified by the destination address. The first half of the DMA cycle (reading part) is called a read cycle, and the second half (writing part) is called a write cycle.
Hardware DMA transfer source	A trigger for a DMA transfer request sent by an internal peripheral device.
Hardware DMA transfer request	A DMA transfer request generated by a hardware DMA transfer source.
Software DMA transfer request	A DMA transfer request generated by software writing to a register.
DMA transfer request	A trigger to start DMA transfer with the DMAC.
Transfer information	The information required for DMA transfer, including the source address, destination address, transfer data size, and transfer count.
Single transfer	DMA transfer consisting of one DMA cycle started by one DMA transfer request.
Block transfer 1	DMA transfer consisting of the number of DMA cycles specified by the transfer count in the transfer information, started by one DMA transfer request.
Block transfer 2	DMA transfer consisting of the number of DMA cycles specified by the address reload count in the transfer information, started by one DMA transfer request.
Block transfer	A general term for both block transfer 1 and block transfer 2.
Last transfer	The DMA cycle carried out when the transfer count in the transfer information is 1.
Address reload transfer	The DMA cycle carried out when the address reload count in the transfer information is 1 if the reload function 2 is used.
Suspension	An action of pausing DMA transfer during block transfer. You can resume DMA transfer after suspension.
Resume	An action of resuming suspended DMA transfer.
Transfer abort	An action of aborting DMA transfer in the middle. You cannot resume DMA transfer after that.

## 8.3 DMA Function

### 8.3.1 Basic Operation of DMA Transfer

#### 8.3.1.1 Transfer Mode

DMA has three transfer modes.

##### Single Transfer

One DMA cycle is executed when a DMA transfer request is acknowledged.

##### Block Transfer 1

The number of DMA cycles specified in the transfer count register are executed when a DMA transfer request is acknowledged.

##### Block Transfer 2

The number of DMA cycles specified by the address reload count are executed when a DMA transfer request is acknowledged. If the value specified in the address reload count is larger than the value in the transfer count register, the number of DMA cycles specified in the transfer count register are executed.

#### 8.3.1.2 Executing a DMA Cycle

DMA always executes a write cycle after a read cycle is complete.

For example, if the transfer data size is 128 bits, a write cycle is executed after a read cycle for the 128-bit data is finished. A write cycle never starts in the middle of a read cycle.

#### 8.3.1.3 Updating Transfer Information

When a DMA cycle is executed, DMA updates transfer information as follows:

##### Source Address and Destination Address

Transfer information will be updated as described in **Table 8.19, Updating the Source Addresses and the Destination Addresses** according to the settings in the transfer control register such as the count directions of source address and destination address and transfer data size.

Table 8.19 Updating the Source Addresses and the Destination Addresses

Count Direction	Transfer Data Size	Address after Update
Increment	8 bits	(address before update) + 0000 0001 <sub>H</sub>
	16 bits	(address before update) + 0000 0002 <sub>H</sub>
	32 bits	(address before update) + 0000 0004 <sub>H</sub>
	64 bits	(address before update) + 0000 0008 <sub>H</sub>
	128 bits	(address before update) + 0000 0010 <sub>H</sub>
Decrement	8 bits	(address before update) – 0000 0001 <sub>H</sub>
	16 bits	(address before update) – 0000 0002 <sub>H</sub>
	32 bits	(address before update) – 0000 0004 <sub>H</sub>
	64 bits	(address before update) – 0000 0008 <sub>H</sub>
	128 bits	(address before update) – 0000 0010 <sub>H</sub>
Fixed	—	Same as the address before update.

When you use the reload function, a special update rule is applied other than the one described in **Table 8.19, Updating the Source Addresses and the Destination Addresses** for the last transfer and the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

#### Transfer Count/Address Reload Count

The transfer count is decremented by one for every DMA cycle.

The address reload count is decremented by one for every DMA cycle when the reload function 2 or block transfer 2 is used. When the reload function 2 or block transfer 2 is not used, it is not updated.

When you use the reload function, a special update rule is applied for the last transfer and the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

#### Other transfer information

Other transfer information is not updated during execution of a DMA cycle.

#### 8.3.1.4 Last Transfer and Address Reload Transfer

The last transfer means a DMA cycle executed when the value in the transfer count register, which shows the remaining number of transfers, is one. The last transfer differs in operation compared to other DMA cycles as follows.

- The transfer completion flag (PDMA<sub>n</sub>DCST<sub>m</sub>.TC) is set when the last transfer is complete.  
The channel operation enable (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) bit is cleared when the last transfer is complete (when continuous transfer is disabled).
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When the reload function 1 is enabled, the reload function 1 is executed at the timing of the last transfer. For details, see **Section 8.3.3, Reload Function**.

The address reload transfer means a DMA cycle executed when the reload function 2 is enabled and the address reload count is one. The reload function 2 is executed during the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

#### 8.3.1.5 Transfer Completion Interrupt Output

DMA can output a transfer completion interrupt to external devices.

#### Transfer Completion Interrupt Output

When the transfer completion interrupt output enable (PDMA<sub>n</sub>DTCT<sub>m</sub>.TCE) is set in the transfer control register, a DMAC requests a transfer completion interrupt when the last transfer is complete.

**Figure 8.1, Transfer Completion Interrupt** shows the operation of the transfer completion interrupt.

Figure 8.1 Transfer Completion Interrupt

### 8.3.1.6 Continuous Transfer

If the continuous transfer is not used, a DMAC sets the transfer completion flag (PDMA<sub>n</sub>DCST<sub>m</sub>.TC) and clears the channel operation enable (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) bit when the last transfer is complete. In this case, a DMA transfer request is not accepted when the request is generated after the completion of the last transfer.

If the continuous transfer is used, the channel operation enable (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) bit is not cleared when the last transfer is complete, and a DMA transfer request can be accepted even when the transfer completion flag is set. If DMA is used for a case where a specified number of DMA transfers are executed repetitively, software overhead associated with clearing the transfer completion flag and setting the channel operation enable bit after the completion of the last transfer can be reduced by using the continuous transfer.

The continuous transfer is enabled by setting the continuous transfer enable (PDMA<sub>n</sub>DTCT<sub>m</sub>.MLE) in the DMAC transfer control register.

The continuous transfer is designed to work with the reload function 1. The continuous transfer function itself does not update the source address register, destination address register, and transfer count register. If, after the last transfer is complete, you want to restore the source address register, destination address register, and transfer count register to the state before the DMA transfer starts, use the reload function 1 and set the values of the source address register, destination address register, and the transfer count register before the DMA transfer starts to the reload source address register, reload destination address register, and reload transfer count register respectively.

**Figure 8.2, Operation of Continuous Transfer by a DMAC** shows an operation of continuous transfer by a DMAC.

Figure 8.2 Operation of Continuous Transfer by a DMAC

## 8.3.2 Channel Priority Order

This subsection explains arbitration between multiple DMA channels.

### 8.3.2.1 DMAC Channel Arbitration

A DMAC select one channel out of eight channels with arbitration. Arbitration is done according to the fixed priority order. The priority order is “channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7” for DMAC0, and “channel 8 > channel 9 > channel 10 > channel 11 > channel 12 > channel 13 > channel 14 > channel 15” for DMAC1, “channel 16 > channel 17 > channel 18 > channel 19 > channel 20 > channel 21 > channel 22 > channel 23” for DMAC2, and “channel 24 > channel 25 > channel 26 > channel 27 > channel 28 > channel 29 > channel 30 > channel 31” for DMAC3.

Arbitration is done for every DMA cycle. No arbitration occurs between the read and write of a DMA cycle.

If, at the timing when one DMA cycle completes in the middle of a block transfer of a channel, there is a DMA transfer request from a channel with a higher priority, a DMA cycle of the channel with the higher priority will be executed as the result of arbitration.

If a DMAC executes the block transfer 1 or block transfer 2, DMAC channel arbitration is done for every DMA cycle, and possibly a DMA cycle of another DMAC channel with a higher priority may interrupt.

Figure 8.3 DMAC Channel Arbitration

Cycle numbers shown in **Figure 8.3, DMAC Channel Arbitration** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 8.3, DMAC Channel Arbitration**, DMA transfer requests for channels 0 and 2 are generated at Cycle 1. As a result of arbitration, a DMA cycle for channel 0 starts because its priority is higher. At Cycle 4, a DMA cycle for channel 2 starts. At Cycle 5, a DMA transfer request for channel 1 is generated. However, since the DMA cycle for channel 2 is still ongoing, no arbitration is done at this point. At Cycle 7, a DMA cycle for channel 1 starts. Because channel 1 uses block transfer, this DMA cycle continues at Cycle 10 where there are no other DMA transfer requests from other channel. At Cycle 11, a DMA transfer request for channel 0 is generated. However, since the DMA cycle for channel 1 is still ongoing, no arbitration is done at this point. At Cycle 12, the DMA cycle for channel 1 is complete. At Cycle 13, a DMA cycle for channel 0 starts as a result of arbitration between DMA channels 0 and 1.

It should be noted that, even though a block transfer of channel 1 has been already started, a DMA cycle of not channel 1 but channel 0 is executed at Cycle 13 because the priority of the latter is higher. At Cycle 15, the DMA cycle for

channel 0 is complete. At Cycle 16, a DMA cycle for channel 1 starts again. At Cycle 18, the last DMA cycle of the block transfer of channel 1 is complete.

### **8.3.2.2 Interface Arbitration**

DMAC0, DMAC1, DMAC2, and DMAC3 work independently and execute DMA transfer.

## **8.3.3 Reload Function**

### **8.3.3.1 Overview of the Reload Function**

The reload function updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values during DMA transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

### 8.3.3.2 Operation of Reload Function 1

When the reload function 1 is enabled, actions described in **Table 8.20, Operation of Reload Function 1** are executed at the timing of the last transfer according to the reload function 1 setting.

Table 8.20 Operation of Reload Function 1

Reload Function 1 Setting	Register	Action at the Last Transfer
00 (Reload function 1 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Transfer count	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 1 enabled. Reloading source address and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	If the reload function 2 is disable: Not reloaded. If the reload function 2 is enabled: The reload address reload count is copied to this.
10 (Reload function 1 enabled. Reloading destination address and transfer count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	If the reload function 2 is disable: Not reloaded. If the reload function 2 is enabled: The reload address reload count is copied to this.
11 (Reload function 1 enabled. Reloading source address, destination address, and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	If the reload function 2 is disable: Not reloaded. If the reload function 2 is enabled: The reload address reload count is copied to this.

Figure 8.4, Operation of Reload Function 1 shows an operation of the reload function 1.

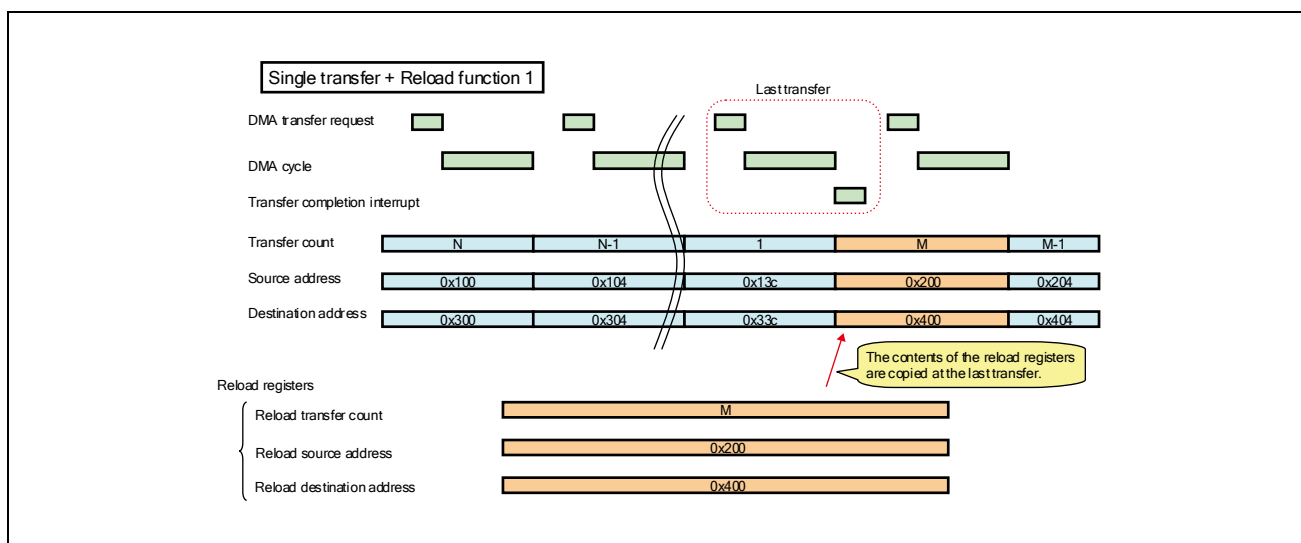

Figure 8.4 Operation of Reload Function 1

### 8.3.3.3 Reload Function 2

When the reload function 2 is enabled, actions described in **Table 8.21, Operation of Reload Function 2** are executed at the timing of the address reload transfer according to the reload function 2 setting.

Table 8.21 Operation of Reload Function 2

Reload Function 2 Setting	Register	Action at the Address Reload Transfer
00 (Reload function 2 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 2 enabled. Reloading source address and address reload count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Address reload count	The reload address reload count is copied to this.
10 (Reload function 2 enabled. Reloading destination address and address reload count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.
11 (Reload function 2 enabled. Reloading source address and destination address and address reload count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.

Figure 8.5, Operation of Reload Function 2 shows an operation of the reload function 2.

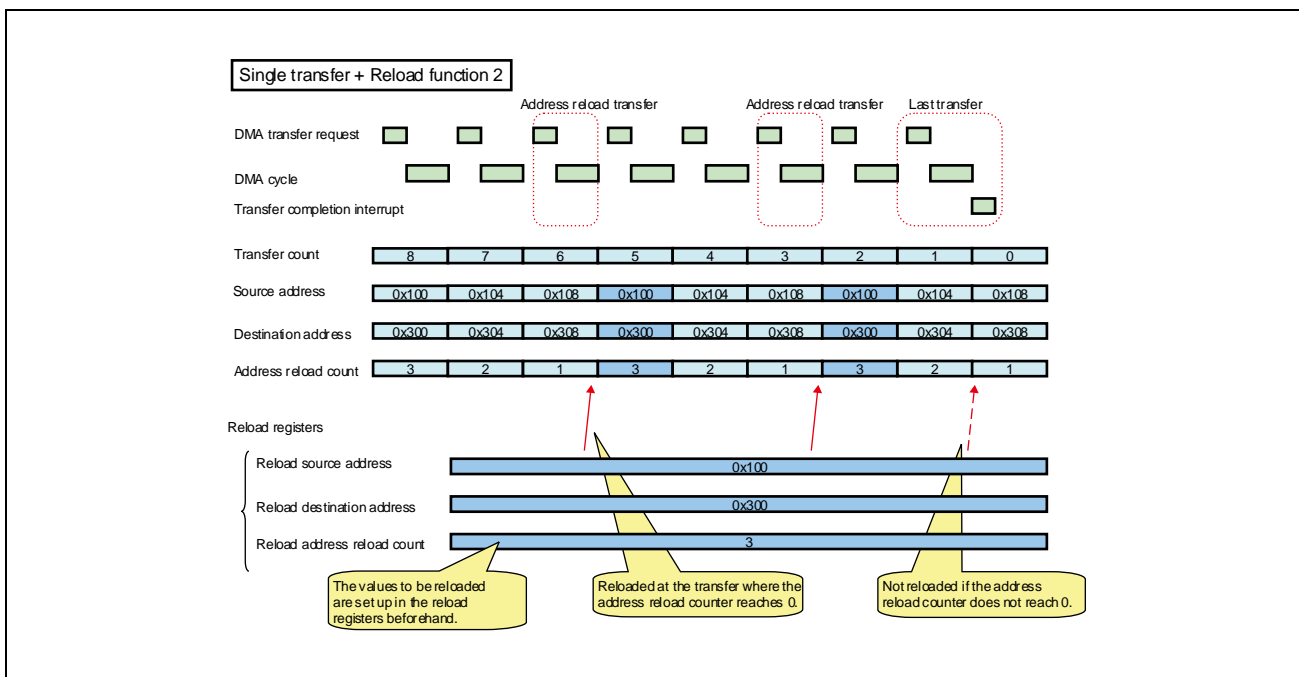

Figure 8.5 Operation of Reload Function 2

**Figure 8.6, Operation when Combining the Reload Function 1 and the Reload Function 2** shows an operation when both the reload function 1 and the reload function 2 are used simultaneously.

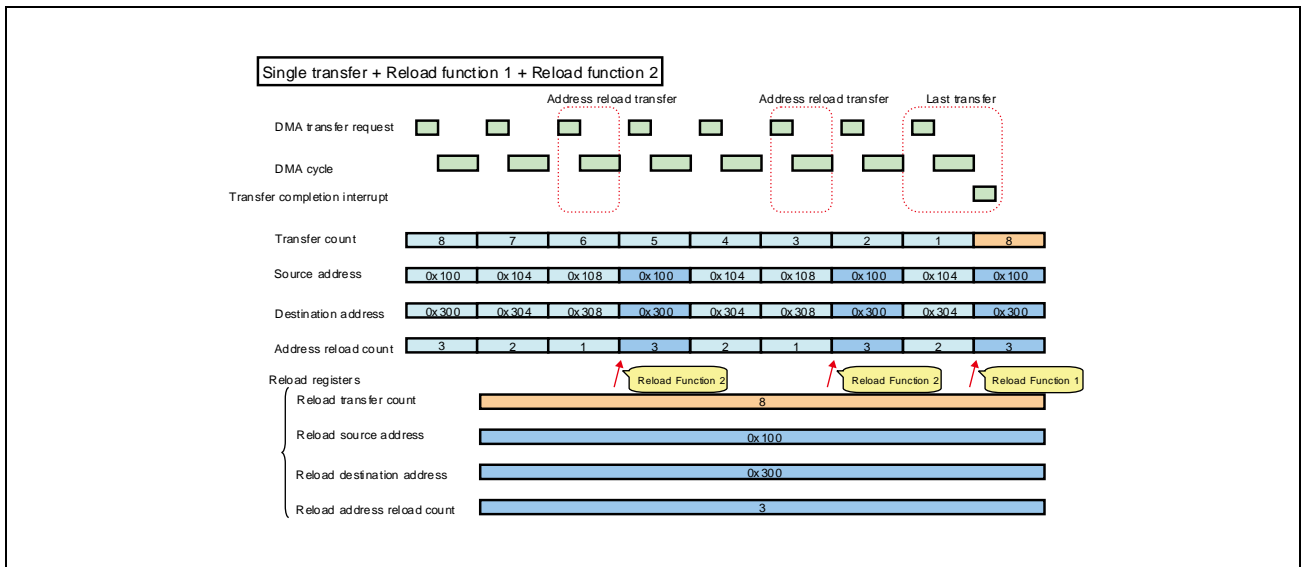

Figure 8.6 Operation when Combining the Reload Function 1 and the Reload Function 2

### 8.3.3.4 Timing of Setting DMAC Reload Registers

You can set up the reload source address register, reload destination address register, and reload transfer count register any time (even during DMA transfer). However, if you update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, there may be a conflict between reloading at the last transfer or address reload transfer and update of the reload register by users. In order to avoid this conflict, setting up reload registers must be completed before the last transfer or address reload transfer starts.

### 8.3.4 Chain Function

#### 8.3.4.1 Overview

DMA offers a function called a chain function. With this function, the completion of the DMA cycle or last transfer for one channel can trigger a DMA transfer request for another channel. A DMA transfer request for another channel initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options:

- Always chain: A chain request is generated at the completion of every DMA cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 8.7, Operation of “Always Chain” shows the operation of “always chain.”

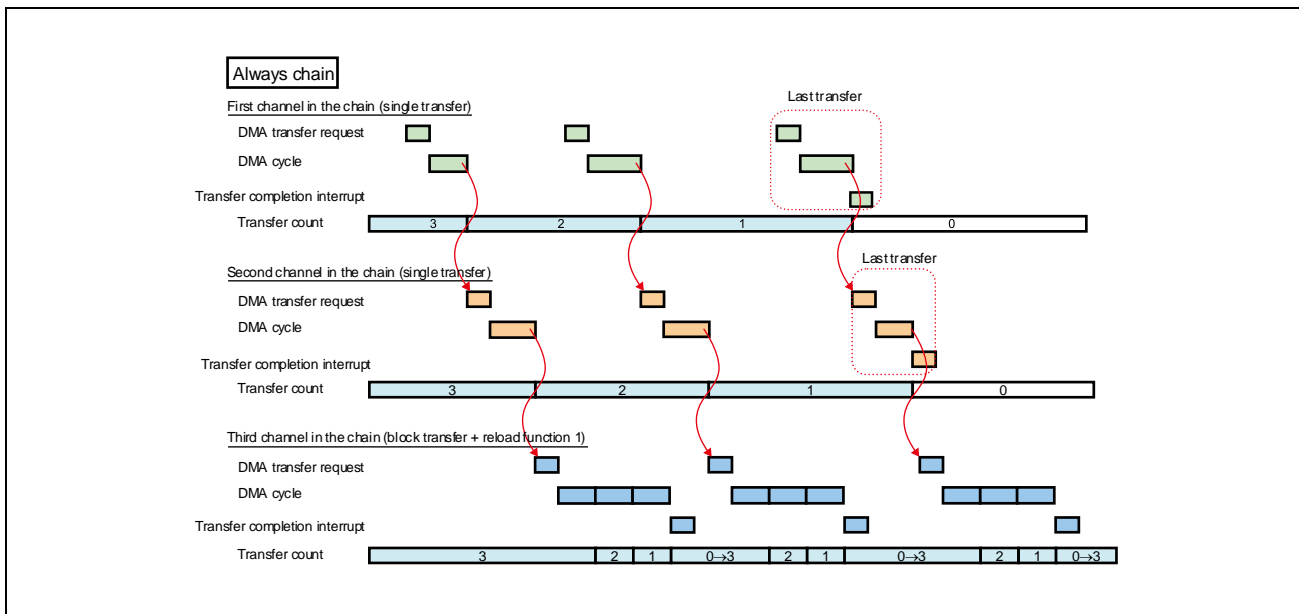

Figure 8.7 Operation of “Always Chain”

**Figure 8.8, Operation of “Chain at the Last Transfer”** shows the operation of “chain at the last transfer.”

Figure 8.8 Operation of “Chain at the Last Transfer”

### 8.3.4.2 Setting Up the Chain Function

For a DMAC, you need to write to the chain enable (PDMA<sub>n</sub>DTCTm.CHNE) and the next channel in the chain selection (PDMA<sub>n</sub>DTCTm.CHNSEL) in the DMAC transfer control register in order to set up the type of chain function and the next channel number in the chain.

### 8.3.4.3 Caution for Using the Chain Function

The chain function is enabled by setting the software DMA transfer request flag of the next channel in the chain as a part of its function. Therefore, you need to set up the channel settings of the next channel in the chain in the same way as when the software DMA transfer request is used. If you specify a channel using the hardware DMA transfer request for the next channel in the chain, the chain function does not work.

A channel and its next channel in the chain must belong to the same group (DMAC0, DMAC1, DMAC2, and DMAC3). You cannot specify a channel in another group for its next channel in the chain.

### 8.3.5 DMAC Operation

#### 8.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request selection assignment (PDMA<sub>n</sub>DTCT<sub>m</sub>.DRS) bit in the DMAC transfer control register (PDMA<sub>n</sub>DTCT<sub>m</sub>) determines whether a hardware DMA transfer request or a software DMA transfer request is used.

In the case of a hardware DMA transfer request for a DMAC, DTFR selects one out of 128 hardware DMA transfer factor and assigned to each channel of the DMAC. This assignment is configured in the DTFR setting registers.

#### 8.3.5.2 Generating and Accepting a Software DMA Transfer Request

By setting the software DMA transfer request flag (PDMA<sub>n</sub>DCST<sub>m</sub>.SR) in the DMAC transfer status register (PDMA<sub>n</sub>DCST<sub>m</sub>) using the DMAC transfer status set register (PDMA<sub>n</sub>DCST<sub>S</sub><sub>m</sub>), a software DMA transfer request can be generated.

The software DMA transfer request flag is automatically cleared when the DMAC processes the DMA transfer request. The timing when the software DMA transfer request flag is automatically cleared differs depending on the transfer mode of the DMA transfer to be executed.

- In the single transfer mode, the software DMA transfer request flag is cleared whenever the software DMA transfer request is accepted.
- In the block transfer 1 mode, the software DMA transfer request flag is cleared when the last transfer starts.
- In the block transfer 2 mode, the software DMA transfer request flag is cleared when the last transfer or address reload transfer starts.

The software DMA transfer request flag can also be cleared by software using the DMAC transfer status clear register (PDMA<sub>n</sub>DCST<sub>C</sub><sub>m</sub>). When you abort a DMA transfer of a DMAC channel, you must clear the software DMA transfer request flag.

#### 8.3.5.3 Executing DMA Transfer

When the DMAC accepts a DMA transfer request for a channel, the DMAC executes DMA transfer of the channel. If there are DMA transfer requests from multiple channels, DMAC does DMAC channel arbitration and decides a channel to be acknowledged.

## 8.4 Suspension, Resume, Transfer Abort, and Clearing of a DMA Transfer Request

### 8.4.1 DMA Suspension and Resume by Software Control

The DMA control register (PDMA<sub>n</sub>DMACTL) is used to suspend DMA transfer for all channels.

When the DMA suspension bit (PDMA<sub>n</sub>DMACTL.DMASPD) in the DMA control register is set, DMA puts all channels into the suspended state. If all channels are in the suspended state and the DMA suspension bit in the DMA control register is cleared, DMA restores all channels from the suspended state to the normal state and resumes the DMA transfer of the suspended channel.

When all channels are in the suspended state, DMA transfer is suspended for all channels without changing the value of the PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit of each DMAC channel.

### 8.4.2 Suspension, Resume, and Transfer Abort of a DMAC Channel

You can suspend the DMA transfer of a DMAC channel by clearing the channel operation enable bit (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) in the DMAC channel operation enable setting register for the channel. If a DMA cycle is ongoing, the DMA transfer of the channel is suspended after the currently ongoing DMA cycle is finished. If you set the PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit again while the DMA transfer of the channel is suspended, the DMA transfer of the channel is resumed.

If you want to abort the currently ongoing DMA transfer of a DMAC channel, similarly clear the channel operation enable bit (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) in the DMAC channel operation enable setting register, and then clear the hardware DMA transfer request in the DTFR in the case of a hardware DMA transfer request, or clear the software DMA transfer request flag (PDMA<sub>n</sub>DCST<sub>m</sub>.SR) using the DMAC transfer request flag clear bit (PDMA<sub>n</sub>DCST<sub>m</sub>.SRC) in the DMAC transfer status clear register in the case of a software DMA transfer request.

In case that the continuous transfer enable bit (PDMA<sub>n</sub>DTCT<sub>m</sub>.MLE) is set, the channel operation enable bit (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) is kept to be set. Even though the channel operation enable bit (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) is cleared by software during a DMA cycle in a last transfer, the function of the continuous transfer enable bit (PDMA<sub>n</sub>DTCT<sub>m</sub>.MLE) is given high priority and the channel operation enable bit (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) is set after completion of the last transfer.

If you want to abort an ongoing DMA transfer of a DMAC channel when continuous transfer function is enabled, please clear the continuous transfer enable bit (PDMA<sub>n</sub>DTCT<sub>m</sub>.MLE) first and then clear the channel operation enable bit (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) to abort DMA transfer of the DMAC channel. Only for the operation, DMAC Transfer Control Register (PDMA<sub>n</sub>DTCT<sub>m</sub>) can be written under the channel operation is enabled (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE = 1).

**Figure 8.9, Example of Suspension, Resume, and Transfer Abort of a DMAC Channel** shows an example of suspension, resume, and transfer abort of a DMAC channel.

In **Figure 8.9, Example of Suspension, Resume, and Transfer Abort of a DMAC Channel**, both channels 0 and 1 execute block transfer. At time tick 1, DMA transfer of channel 1 starts. At time tick 2, a DMA transfer request for channel 0 is accepted. As a result of DMAC channel arbitration, DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 1. At time tick 3, the last transfer of channel 0 is complete, and the remaining DMA transfer in the block transfer of channel 1 starts. At time tick 4, the last transfer of channel 1 is complete. After time tick 5, DMA transfer of channel 0 and DMA transfer of channel 1 are executed similarly. At time tick 7, the DMA transfer of channel 0 is suspended and, as a result of DMAC channel arbitration, the DMA transfer of channel 1 starts. At time tick 8, the last transfer of channel 1 is complete, and then, at time tick 9, the DMA transfer of channel 0 resumes. At time tick 10, the DMA transfer of channel 0 is suspended again, and then, at time tick 11, the DMA transfer of channel 0 is aborted. At time tick 12, the suspended state for channel 0 is cleared, but the DMA transfer of channel 0 is not executed because the DMA transfer is aborted at time tick 11.

Figure 8.9 Example of Suspension, Resume, and Transfer Abort of a DMAC Channel

### 8.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR

If a DMAC uses a hardware DMA transfer request, you can temporarily disable (mask) the hardware DMA transfer request output from the DTFR to the DMAC by clearing the hardware DMA transfer source selection enable bit (PDMAAnDTFRm.REQEN) in the DTFR setting register.

Also, if a hardware DMA transfer source is used, you can clear a hardware DMA transfer request retained in the DTFR by using the hardware DMA transfer request clear (PDMAAnDTFRm.DRQC) bit in the DTFR transfer request clear register.

Even if you suspend or abort DMA transfer of a DMAC channel, the hardware DMA transfer request selection/hold circuit of the DTFR is still running, and consequently, the DTFR may retain a hardware DMA transfer request that was input to the DTFR during the suspension or transfer abort period of the DMAC channel. When you resume or start DMA transfer of a DMAC channel, clear the hardware DMA transfer request retained in the DTFR as required.

In case that DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode, if DTFR hardware DMA transfer source selection enable bit is set to disable (PDMAAnDTFRm.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended.

### 8.4.4 List of Suspend, Resume, and Transfer Abort Functions

Table 8.22 List of Suspend, Resume, and Transfer Abort Functions

Function	How to Execute the Function	Operation	Possibility of DMA Transfer Abort	Master that can Execute the Function (See <b>Section 8.6, Reliability Functions.</b> )
DMA suspension and resume by software control	Setting and clearing the PDMAAnDMACTL.DMAS PD	All channels are in the suspended state.	Not possible*1	Special master
Suspension and resume of a DMAC channel	Clearing and setting the PDMAAnDCENm.DTE in each channel register*2	DMA transfer of a channel is suspended.	Possible (by clearing the DMA transfer request flag in suspension state)	Special master, and general master assigned to the channel.

Note 1. In order to abort DMA transfer, you need to abort transfer for the DMAC channel.

Note 2. In case that the continuous transfer enable bit (PDMAAnDTCTm.MLE) is set, please clear the continuous transfer enable bit (PDMAAnDTCTm.MLE) first before clearing the PDMAAnDCENm.DTE bit to suspend the channel and set the continuous transfer enable bit (PDMAAnDTCTm.MLE) before setting the PDMAAnDCENm.DTE bit to resume the channel.

## 8.5 Error Control

### 8.5.1 Type of Error

DMA can generate the following type of error.

- DMA Transfer Error

This error is generated when error is detected in the read cycle or write cycle in a DMA cycle. This error can be generated in all DMAC channels during execution of DMA transfer.

A DMA transfer error leads to INTDMAERR interrupt request which is a source of FEINT.

### 8.5.2 DMA Transfer Error

#### 8.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs

When DMA transfer error occurs in a DMAC, the transfer error flag (PDMA<sub>n</sub>DCST<sub>m</sub>.ER) in the DMAC transfer status register of the channel where the DMA transfer error occurred is set. The DMAC error register (PDMA<sub>n</sub>DMACER) shows the transfer error flags of all 32 DMAC channels.

On a channel where the transfer error flag is set, a new DMA cycle is not executed if the transfer disable on transfer error setting (PDMA<sub>n</sub>DTCT<sub>m</sub>.ESE) bit is set. On the other hand, a DMA cycle is executed regardless of the value of the transfer error flag if the transfer error case DMA transfer disable setting (PDMA<sub>n</sub>DTCT<sub>m</sub>.ESE) bit is cleared.

If you want to abort the DMA transfer of a channel where the DMA transfer error occurred is set, follow the procedure to abort DMA transfer of the DMAC channel.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the result of write operation is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address register, destination address register, transfer count register, and address reload count register are updated.

## 8.6 Reliability Functions

### 8.6.1 Overview

In this product, DMA provides the following reliability functions:

- Register access protection function
- Master information inherit function

### 8.6.2 Register Access Protection Function

- RH850/F1KH-D8  
This product is designed to assign each DMA channel to CPU1 or CPU2.
- RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1  
This product is designed to assign DMA channel to a CPU1.

The register access protection function allows write access to the transfer information of each DMA channel only from the master assigned to the channel and prohibits write access from other masters.

The register access protection function enables you, for example, to prevent the settings of the channel from being updated by masters other than the one assigned to the channel.

#### 8.6.2.1 Identifying the Accessing Master

DMA identifies a master based on the processor element ID number (PEID) of the accessing master, the system protection ID configured by the accessing CPU (SPID), and whether the CPU is in the supervisor mode (PSW.UM = 0) or the user mode (PSW.UM = 1).

#### 8.6.2.2 Master Access

DMA handles accesses from CPU in the supervisor mode (PSW.UM = 0) as accesses from special masters. Special masters are allowed to read from or write to all DMA registers.

DMA handles the other masters except special masters as general masters. General masters are allowed to read from all DMA registers, but allowed to write to the following specific registers.

- Channel registers of the channels assigned by the channel assignment. (For details, see **Section 8.6.2.3, Channel Assignment**.)

From general masters, write access to registers other than the above is not allowed.

#### 8.6.2.3 Channel Assignment

To each channel, DMA can assign a master so that the master is allowed to use the channel. Channel assignment is configured in the channel master setting register (PDMAnDMYiCM) by the CPU in the supervisor mode (PSW.UM = 0).

In general master access, the master assigned to a channel by the channel assignment is allowed to write the channel registers of the channel. If the channel registers of a channel is written by a master other than the master assigned to the channel, the access is called illegal access. For information about illegal access, see **Section 8.6.2.4, Illegal Access**.

### 8.6.2.4 Illegal Access

DMA handles the following access as illegal access.

- (1) Write access to global registers from general masters
- (2) Write access to channel registers from general masters who are not assigned to the channel

DMA never treat read access from any master as illegal access.

DMA's actions against illegal access are as follows:

For both cases (1) and (2),

- Write access is ignored.

Only for the case (2),

- The information about the illegal access is stored in a register access protection violation register.
- The DMAC0, DMAC1, DMAC2, and DMAC3 have their own register access protection violation registers (PDMA<sub>n</sub>DM0CMV, PDMA<sub>n</sub>DM1CMV, PDMA<sub>n</sub>DM2CMV, and PDMA<sub>n</sub>DM3CMV respectively).

Only the special master can access the register access protection violation registers. The special master can check whether illegal access has occurred by checking the register access protection violation registers periodically.

In addition, it is recommended that, when a master uses DMA and configures transfer information in the channel registers, the master should check whether the configuration has been successfully completed without illegal access by, for example, reading back the settings.

### 8.6.3 Master Information Inherit Function

In this product, DMA inherits master information that is equivalent to the master information of the master to which the DMA channel is assigned.

The master information that is output from DMA is shown in **Table 8.23, Master Information that is Output from DMA**.

Table 8.23 Master Information that is Output from DMA

Meaning	Value that is Output from DMA
UM	UM bit value in the channel master setting register
SPID	SPID bit value in the channel master setting register
PEID	PEID bit value in the channel master setting register
DMA	1

## 8.6.4 Other Reliability Functions

### 8.6.4.1 Restriction on the Next Channel in the Chain

The reliability function limits the channels you can select as the next channel in the chain.

When you use the chain function, the channel master settings of a channel and its next channel in the chain must be the same.

The chain function is designed so that a channel and its next channel in the chain are managed by the same master.

When DMA detects that different masters are assigned to a channel and its next channel in the chain, it is deemed illegal and the chain function is suppressed. More specifically, when DMA tries to execute the chain function, DMA compares the chain master settings of the channel and its next channel in the chain, and if the settings are the same for both PEID and UM, the chain function is allowed and a chain request is sent to the next channel. If the channel master settings are not the same for either PEID or UM, a chain request is not sent.

## 8.7 Setting Up DMA Transfer

### 8.7.1 Overview of Setting Up DMA

Table 8.24 Overview of Setting Up DMA

No.	Master that Configures the Setting	Description	Register		Necessity of the Setting	
1	Special master (CPU1/2 in the supervisor mode (UM = 0))	Overall DMA operation setting	PDMAAnDM00CM to PDMAAnDM37CM	DMAC channel master setting	Mandatory	
2		Status clear	PDMAAnCMVC	Channel protection violation clear register	Recommended	
3	Master assigned to the DMAC channel	Channel setting	PDMAAnDSAm	DMAC source address	Mandatory	
4			PDMAAnDDAm	DMAC destination address	Mandatory	
5			PDMAAnDTCm	DMAC transfer count	Mandatory	
6			PDMAAnDTCTm	DMAC transfer control	Mandatory	
7			PDMAAnDRSAm	DMAC reload source address	Mandatory if the reload function is used	
8			PDMAAnDRDAm	DMAC reload destination address	Mandatory if the reload function is used	
9			PDMAAnDRTCm	DMAC reload transfer count	Mandatory if the reload function is used	
10			PDMAAnDTFRm	DTFR setting register	Mandatory	
11			Status clear	PDMAAnDCSTCm	DMAC transfer status clear	Mandatory
12				PDMAAnDTFRRQCm	DTFR transfer request clear	Recommended
13	Channel operation enable	PDMAAnDCENm	DMAC channel operation enable setting	Mandatory		

### 8.7.2 Setting Up the Overall DMA Operation

You need to set up the overall DMA operation before you start using DMA.

To configure the overall DMA operation, the special master (CPU1/2 in the supervisor mode (UM = 0)) needs to set up global registers. Global registers can be set up only by special master access. For details, see **Section 8.6, Reliability Functions**.

The following register must be set up to configure the overall DMA operation.

- DMAC channel master setting registers (PDMAAnDM*yi*CM)

These registers configure channel assignment. (For details, see **Section 8.6, Reliability Functions**.)

If the DMAC channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

Also, if errors are detected in the following registers while the overall DMA operation is set up, clearing the errors is recommended.

- DMAC0 register access protection violation register (PDMAAnDM0CMV)
- DMAC1 register access protection violation register (PDMAAnDM1CMV)
- DMAC2 register access protection violation register (PDMAAnDM2CMV)
- DMAC3 register access protection violation register (PDMAAnDM3CMV)

### 8.7.3 Setting Up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC.

To configure the DMA channel setting, each channel's master assigned by the channel assignment sets channel registers.

#### 8.7.3.1 Setting Up the DMAC Channel Setting

Follow the procedure below to set up the DMAC channel setting in case of using DMAC.

##### (1) Disabling the DMAC Channel Operation

If the channel operation enable (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) in the DMAC channel operation enable setting register (PDMA<sub>n</sub>DCEN<sub>m</sub>) is set, clear the PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit to disable the channel operation.

##### (2) Setting Up the Transfer Information

When you set up the transfer information of the DMAC, the following registers need to be set up.

- DMAC source address register (PDMA<sub>n</sub>DSAm)
- DMAC destination address register (PDMA<sub>n</sub>DDAm)
- DMAC transfer count register (PDMA<sub>n</sub>DTCm)
- DMAC transfer control register (PDMA<sub>n</sub>DTCTm)
- DMAC reload source address register (PDMA<sub>n</sub>DRSAm)
- DMAC reload destination address register (PDMA<sub>n</sub>DRDAm)
- DMAC reload transfer count register (PDMA<sub>n</sub>DRTCm)

##### (3) Setting Up the DMA Transfer Request

While setting the transfer information, you need to set up the DMA transfer request selection assignment (PDMA<sub>n</sub>DTCTm.DRS) bit in the DMAC transfer control register (PDMA<sub>n</sub>DTCTm) to define whether the hardware or software DMA transfer request is used.

You cannot use both the hardware and software DMA transfer requests for the same channel at the same time.

If you use the hardware DMA transfer request, you need to select the source used as the hardware DMA transfer request out of 128 hardware DMA transfer sources using the hardware DMA transfer source selection (PDMA<sub>n</sub>DTFRm.REQSEL) in the DTFR setting register. Also, you need to enable the hardware DMA transfer source selection (PDMA<sub>n</sub>DTFRm.REQEN) in the same register.

The DTFR may retain a hardware DMA transfer request before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (PDMA<sub>n</sub>DTFRm.DRQ) retained in the DTFR using the DTFR transfer request clear register (PDMA<sub>n</sub>DTFRm.DRQC) if necessary.

If you use the software DMA transfer request, disable the hardware DMA transfer source selection (PDMA<sub>n</sub>DTFRm.REQEN) in the DTFR setting register.

##### (4) Clearing the Transfer Status

The DMAC transfer status register (PDMA<sub>n</sub>DCSTm) may retain the result of the previous DMA transfer, so clear the flags in the DMAC transfer status register using the DMAC transfer status clear register (PDMA<sub>n</sub>DCSTCm).

**(5) Enabling the DMAC Channel Operation**

Set the channel operation enable (PDMAnDCENm.DTE) bit in the DMAC channel operation enable setting register to enable the channel operation.

After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and become ready for DMA transfer.

## 8.8 Global Registers

### 8.8.1 List of Global Register Address

The global register addresses are listed in the table below.

For <DMAn\_base>, see **Section 8.1.2, Register Base Addresses**.

Table 8.25 List of Global Register Address (RH850/F1KH-D8)

Unit Name	Register Name	Symbol	Address	Access Permission	
				Special Master	General Master
PDMAn	DMA control register	PDMAAnDMACTL	<DMAn_base> + 0000 <sub>H</sub>	✓	—*1
	DMAC error register	PDMAAnDMACER	<DMAn_base> + 0020 <sub>H</sub>	✓	✓
	DMAC0 register access protection violation register	PDMAAnDM0CMV	<DMAn_base> + 0030 <sub>H</sub>	✓	✓
	DMAC1 register access protection violation register	PDMAAnDM1CMV	<DMAn_base> + 0034 <sub>H</sub>	✓	✓
	Register access protection violation clear register	PDMAAnCMVC	<DMAn_base> + 003C <sub>H</sub>	✓	—*1
	DMAC2 register access protection violation register	PDMAAnDM2CMV	<DMAn_base> + 0040 <sub>H</sub>	✓	✓
	DMAC3 register access protection violation register	PDMAAnDM3CMV	<DMAn_base> + 0044 <sub>H</sub>	✓	✓
	DMAC0 channel 0 channel master setting	PDMAAnDM00CM	<DMAn_base> + 0100 <sub>H</sub>	✓	—*1
	DMAC0 channel 1 channel master setting	PDMAAnDM01CM	<DMAn_base> + 0104 <sub>H</sub>	✓	—*1
	DMAC0 channel 2 channel master setting	PDMAAnDM02CM	<DMAn_base> + 0108 <sub>H</sub>	✓	—*1
	DMAC0 channel 3 channel master setting	PDMAAnDM03CM	<DMAn_base> + 010C <sub>H</sub>	✓	—*1
	DMAC0 channel 4 channel master setting	PDMAAnDM04CM	<DMAn_base> + 0110 <sub>H</sub>	✓	—*1
	DMAC0 channel 5 channel master setting	PDMAAnDM05CM	<DMAn_base> + 0114 <sub>H</sub>	✓	—*1
	DMAC0 channel 6 channel master setting	PDMAAnDM06CM	<DMAn_base> + 0118 <sub>H</sub>	✓	—*1
	DMAC0 channel 7 channel master setting	PDMAAnDM07CM	<DMAn_base> + 011C <sub>H</sub>	✓	—*1
	DMAC1 channel 0 channel master setting	PDMAAnDM10CM	<DMAn_base> + 0120 <sub>H</sub>	✓	—*1
	DMAC1 channel 1 channel master setting	PDMAAnDM11CM	<DMAn_base> + 0124 <sub>H</sub>	✓	—*1
	DMAC1 channel 2 channel master setting	PDMAAnDM12CM	<DMAn_base> + 0128 <sub>H</sub>	✓	—*1
	DMAC1 channel 3 channel master setting	PDMAAnDM13CM	<DMAn_base> + 012C <sub>H</sub>	✓	—*1
	DMAC1 channel 4 channel master setting	PDMAAnDM14CM	<DMAn_base> + 0130 <sub>H</sub>	✓	—*1
	DMAC1 channel 5 channel master setting	PDMAAnDM15CM	<DMAn_base> + 0134 <sub>H</sub>	✓	—*1
	DMAC1 channel 6 channel master setting	PDMAAnDM16CM	<DMAn_base> + 0138 <sub>H</sub>	✓	—*1
	DMAC1 channel 7 channel master setting	PDMAAnDM17CM	<DMAn_base> + 013C <sub>H</sub>	✓	—*1
	DMAC2 channel 0 channel master setting	PDMAAnDM20CM	<DMAn_base> + 0140 <sub>H</sub>	✓	—*1
	DMAC2 channel 1 channel master setting	PDMAAnDM21CM	<DMAn_base> + 0144 <sub>H</sub>	✓	—*1
	DMAC2 channel 2 channel master setting	PDMAAnDM22CM	<DMAn_base> + 0148 <sub>H</sub>	✓	—*1
	DMAC2 channel 3 channel master setting	PDMAAnDM23CM	<DMAn_base> + 014C <sub>H</sub>	✓	—*1
	DMAC2 channel 4 channel master setting	PDMAAnDM24CM	<DMAn_base> + 0150 <sub>H</sub>	✓	—*1
	DMAC2 channel 5 channel master setting	PDMAAnDM25CM	<DMAn_base> + 0154 <sub>H</sub>	✓	—*1
	DMAC2 channel 6 channel master setting	PDMAAnDM26CM	<DMAn_base> + 0158 <sub>H</sub>	✓	—*1
	DMAC2 channel 7 channel master setting	PDMAAnDM27CM	<DMAn_base> + 015C <sub>H</sub>	✓	—*1
	DMAC3 channel 0 channel master setting	PDMAAnDM30CM	<DMAn_base> + 0160 <sub>H</sub>	✓	—*1
	DMAC3 channel 1 channel master setting	PDMAAnDM31CM	<DMAn_base> + 0164 <sub>H</sub>	✓	—*1
	DMAC3 channel 2 channel master setting	PDMAAnDM32CM	<DMAn_base> + 0168 <sub>H</sub>	✓	—*1
	DMAC3 channel 3 channel master setting	PDMAAnDM33CM	<DMAn_base> + 016C <sub>H</sub>	✓	—*1
DMAC3 channel 4 channel master setting	PDMAAnDM34CM	<DMAn_base> + 0170 <sub>H</sub>	✓	—*1	
DMAC3 channel 5 channel master setting	PDMAAnDM35CM	<DMAn_base> + 0174 <sub>H</sub>	✓	—*1	

Table 8.25 List of Global Register Address (RH850/F1KH-D8)

Unit Name	Register Name	Symbol	Address	Access Permission	
				Special Master	General Master
PDMAn	DMAC3 channel 6 channel master setting	PDMAnDM36CM	<DMAn_base> + 0178 <sub>H</sub>	✓	—*1
	DMAC3 channel 7 channel master setting	PDMAnDM37CM	<DMAn_base> + 017C <sub>H</sub>	✓	—*1

Note 1. The registers are read only for general master.

Table 8.26 List of Global Register Address (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Name	Register Name	Symbol	Address	Access Permission	
				Special Master	General Master
PDMAn	DMA control register	PDMAnDMACTL	<DMAn_base> + 0000 <sub>H</sub>	✓	—*1
	DMAC error register	PDMAnDMACER	<DMAn_base> + 0020 <sub>H</sub>	✓	✓
	DMAC0 register access protection violation register	PDMAnDM0CMV	<DMAn_base> + 0030 <sub>H</sub>	✓	✓
	DMAC1 register access protection violation register	PDMAnDM1CMV	<DMAn_base> + 0034 <sub>H</sub>	✓	✓
	Register access protection violation clear register	PDMAnCMVC	<DMAn_base> + 003C <sub>H</sub>	✓	—*1
	DMAC2 register access protection violation register	PDMAnDM2CMV	<DMAn_base> + 0040 <sub>H</sub>	✓	✓
	DMAC3 register access protection violation register	PDMAnDM3CMV	<DMAn_base> + 0044 <sub>H</sub>	✓	✓
	DMAC0 channel 0 channel master setting	PDMAnDM00CM	<DMAn_base> + 0100 <sub>H</sub>	✓	—*1
	DMAC0 channel 1 channel master setting	PDMAnDM01CM	<DMAn_base> + 0104 <sub>H</sub>	✓	—*1
	DMAC0 channel 2 channel master setting	PDMAnDM02CM	<DMAn_base> + 0108 <sub>H</sub>	✓	—*1
	DMAC0 channel 3 channel master setting	PDMAnDM03CM	<DMAn_base> + 010C <sub>H</sub>	✓	—*1
	DMAC0 channel 4 channel master setting	PDMAnDM04CM	<DMAn_base> + 0110 <sub>H</sub>	✓	—*1
	DMAC0 channel 5 channel master setting	PDMAnDM05CM	<DMAn_base> + 0114 <sub>H</sub>	✓	—*1
	DMAC0 channel 6 channel master setting	PDMAnDM06CM	<DMAn_base> + 0118 <sub>H</sub>	✓	—*1
	DMAC0 channel 7 channel master setting	PDMAnDM07CM	<DMAn_base> + 011C <sub>H</sub>	✓	—*1
	DMAC1 channel 0 channel master setting	PDMAnDM10CM	<DMAn_base> + 0120 <sub>H</sub>	✓	—*1
	DMAC1 channel 1 channel master setting	PDMAnDM11CM	<DMAn_base> + 0124 <sub>H</sub>	✓	—*1
	DMAC1 channel 2 channel master setting	PDMAnDM12CM	<DMAn_base> + 0128 <sub>H</sub>	✓	—*1
	DMAC1 channel 3 channel master setting	PDMAnDM13CM	<DMAn_base> + 012C <sub>H</sub>	✓	—*1
	DMAC1 channel 4 channel master setting	PDMAnDM14CM	<DMAn_base> + 0130 <sub>H</sub>	✓	—*1
	DMAC1 channel 5 channel master setting	PDMAnDM15CM	<DMAn_base> + 0134 <sub>H</sub>	✓	—*1
	DMAC1 channel 6 channel master setting	PDMAnDM16CM	<DMAn_base> + 0138 <sub>H</sub>	✓	—*1
	DMAC1 channel 7 channel master setting	PDMAnDM17CM	<DMAn_base> + 013C <sub>H</sub>	✓	—*1
	DMAC2 channel 0 channel master setting	PDMAnDM20CM	<DMAn_base> + 0140 <sub>H</sub>	✓	—*1
	DMAC2 channel 1 channel master setting	PDMAnDM21CM	<DMAn_base> + 0144 <sub>H</sub>	✓	—*1

## 8.8.2 Details of Global Registers

### 8.8.2.1 PDMA<sub>n</sub>DMACTL — DMA Control Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA SPD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.28 PDMA<sub>n</sub>DMACTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DMASPD	<p>DMA suspension</p> <p>This bit indicates that DMA transfer for all channels is suspended. If a user writes 1 to this bit, DMA transfer for all channels can be suspended. If a user writes 0 to this bit, suspension of DMA transfer for all channels can be released.</p> <p>The suspension controlled by this bit is independent from the suspension controlled by the transfer enable bit (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE) of each DMAC channel. That means, if this bit is set to 1, all DMA transfers are suspended regardless of the values of the PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit of each DMAC channel.</p> <p>Writing to this bit does not affect the PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit of each DMAC channel.</p> <p>0: DMA suspension cleared 1: DMA suspension request/DMA suspension ongoing</p>

### 8.8.2.2 PDMA<sub>n</sub>DMAC<sub>ER</sub> — DMAC Error Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0020<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 8.29 PDMA<sub>n</sub>DMAC<sub>ER</sub> Register Contents

Bit Position	Bit Name	Function
31 to 24	DM3ER[7:0]	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2 DMAC3 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC3. Each bit is mapped from the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit of each channel of the DMAC3 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated RH850/F1KM-S1: When read, the value after reset is returned.
23 to 16	DM2ER[7:0]	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2 DMAC2 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC2. Each bit is mapped from the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit of each channel of the DMAC2 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated RH850/F1KM-S1: When read, the value after reset is returned.
15 to 8	DM1ER[7:0]	DMAC1 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC1. Each bit is mapped from the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit of each channel of the DMAC1 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated
7 to 0	DM0ER[7:0]	DMAC0 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC0. Each bit is mapped from the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit of each channel of the DMAC0 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated

### 8.8.2.3 PDMA<sub>n</sub>DM0CMV — DMAC0 Register Access Protection Violation Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0030<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	PEID2	PEID1	PEID0	SPID1	SPID0	UM	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	VCH2	VCH1	VCH0	—	—	—	VF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.30 PDMA<sub>n</sub>DM0CMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned.
22 to 17	PEID[2:0] SPID[1:0] UM	Illegal access master information These bits retain the accessing master information of the first illegal access after the PDMA <sub>n</sub> DM0CMV.VF bit is cleared to 0. If illegal access occurs while the PDMA <sub>n</sub> DM0CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
16 to 7	Reserved	When read, the value after reset is returned.
6 to 4	VCH[2:0]	Channel where an illegal access occurred. These bits retain the channel number (0 to 7) of the first illegal access after the PDMA <sub>n</sub> DM0CMV.VF bit is cleared to 0. If illegal access occurs while the PDMA <sub>n</sub> DM0CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned.
0	VF	Illegal access flag This bit shows whether illegal access occurred in the DMAC0. 0: No illegal access has occurred in the DMAC0 1: Illegal access has occurred in the DMAC0 If illegal access occurs in the DMAC0 while this bit is 0, this bit is set, and PDMA <sub>n</sub> DM0CMV.PEID[2:0], PDMA <sub>n</sub> DM0CMV.SPID[1:0], PDMA <sub>n</sub> DM0CMV.UM and PDMA <sub>n</sub> DM0CMV.VCH[2:0] store their respective information. If illegal access occurs in the DMAC0 while this bit is 1, this bit remains 1, and the contents of PDMA <sub>n</sub> DM0CMV.PEID[2:0], PDMA <sub>n</sub> DM0CMV.SPID[1:0], PDMA <sub>n</sub> DM0CMV.UM and PDMA <sub>n</sub> DM0CMV.VCH[2:0] do not change. This bit can be cleared by using the PDMA <sub>n</sub> CMVC register.

### 8.8.2.4 PDMA<sub>n</sub>DM1CMV — DMAC1 Register Access Protection Violation Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0034<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	PEID2	PEID1	PEID0	SPID1	SPID0	UM	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	VCH2	VCH1	VCH0	—	—	—	VF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.31 PDMA<sub>n</sub>DM1CMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned.
22 to 17	PEID[2:0] SPID[1:0] UM	Illegal access master information These bits retain the accessing master information of the first illegal access after the PDMA <sub>n</sub> DM1CMV.VF bit is cleared to 0. If illegal access occurs while the PDMA <sub>n</sub> DM1CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
16 to 7	Reserved	When read, the value after reset is returned.
6 to 4	VCH[2:0]	Channel where an illegal access occurred. These bits retain the channel number (0 to 7) of the first illegal access after the PDMA <sub>n</sub> DM1CMV.VF bit is cleared to 0. If illegal access occurs while the PDMA <sub>n</sub> DM1CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned.
0	VF	Illegal access flag This bit shows whether illegal access occurred in the DMAC1. 0: No illegal access has occurred in the DMAC1 1: Illegal access has occurred in the DMAC1 If illegal access occurs in the DMAC1 while this bit is 0, this bit is set, and PDMA <sub>n</sub> DM1CMV.PEID[2:0], PDMA <sub>n</sub> DM1CMV.SPID[1:0], PDMA <sub>n</sub> DM1CMV.UM and PDMA <sub>n</sub> DM1CMV.VCH[2:0] store their respective information. If illegal access occurs in the DMAC1 while this bit is 1, this bit remains 1, and the contents of PDMA <sub>n</sub> DM1CMV.PEID[2:0], PDMA <sub>n</sub> DM1CMV.SPID[1:0], PDMA <sub>n</sub> DM1CMV.UM and PDMA <sub>n</sub> DM1CMV.VCH[2:0] do not change. This bit can be cleared by using the PDMA <sub>n</sub> CMVC register.

### 8.8.2.5 PDMA<sub>n</sub>DM2CMV — DMAC2 Register Access Protection Violation Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0040<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.33 PDMA<sub>n</sub>DM3CMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned.
22 to 17	PEID[2:0] SPID[1:0] UM	Illegal access master information These bits retain the accessing master information of the first illegal access after the PDMA <sub>n</sub> DM3CMV.VF bit is cleared to 0. If illegal access occurs while the PDMA <sub>n</sub> DM3CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
16 to 7	Reserved	When read, the value after reset is returned.
6 to 4	VCH[2:0]	Channel where an illegal access occurred. These bits retain the channel number (0 to 7) of the first illegal access after the PDMA <sub>n</sub> DM3CMV.VF bit is cleared to 0. If illegal access occurs while the PDMA <sub>n</sub> DM3CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned.
0	VF	Illegal access flag This bit shows whether illegal access occurred in the DMAC3. 0: No illegal access has occurred in the DMAC3 1: Illegal access has occurred in the DMAC3 If illegal access occurs in the DMAC3 while this bit is 0, this bit is set, and PDMA <sub>n</sub> DM3CMV.PEID[2:0], PDMA <sub>n</sub> DM3CMV.SPID[1:0], PDMA <sub>n</sub> DM3CMV.UM and PDMA <sub>n</sub> DM3CMV.VCH[2:0] store their respective information. If illegal access occurs in the DMAC3 while this bit is 1, this bit remains 1, and the contents of PDMA <sub>n</sub> DM3CMV.PEID[2:0], PDMA <sub>n</sub> DM3CMV.SPID[1:0], PDMA <sub>n</sub> DM3CMV.UM and PDMA <sub>n</sub> DM3CMV.VCH[2:0] do not change. This bit can be cleared by using the PDMA <sub>n</sub> CMVC register.

### 8.8.2.7 PDMA<sub>n</sub>CMVC — Register Access Protection Violation Clear Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 003C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	DM3VC	DM2VC	—	—	DM1VC	DM0VC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Table 8.34 PDMA<sub>n</sub>CMVC Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	DM3VC	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2: DMAC3 illegal access flag clear The DMAC3 illegal access flag (PDMA <sub>n</sub> DM3CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0. RH850/F1KM-S1: When read, the value after reset is returned. When writing, write the value after reset.
4	DM2VC	RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2: DMAC2 illegal access flag clear The DMAC2 illegal access flag (PDMA <sub>n</sub> DM2CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0. RH850/F1KM-S1: When read, the value after reset is returned. When writing, write the value after reset.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DM1VC	DMAC1 illegal access flag clear The DMAC1 illegal access flag (PDMA <sub>n</sub> DM1CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.
0	DM0VC	DMAC0 illegal access flag clear The DMAC0 illegal access flag (PDMA <sub>n</sub> DM0CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.

### 8.8.2.8 PDMA<sub>n</sub>DM<sub>y</sub>iCM — DMAC Channel Master Setting ( $y_i = 00$ to $07$ , $10$ to $17$ , $20$ to $27$ , and $30$ to $37$ in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, $y_i = 00$ to $07$ and $10$ to $17$ in RH850/F1KM-S1)

**Access:** This register can be read or written in 32-bit units.

**Address:** PDMA<sub>n</sub>DM0iCM: <DMA<sub>n</sub>\_base> + 0100<sub>H</sub> + 4<sub>H</sub> × Ch. No.  $i$  ( $i = 0$  to  $7$ )  
 PDMA<sub>n</sub>DM1iCM: <DMA<sub>n</sub>\_base> + 0120<sub>H</sub> + 4<sub>H</sub> × Ch. No.  $i$  ( $i = 0$  to  $7$ )  
 PDMA<sub>n</sub>DM2iCM: <DMA<sub>n</sub>\_base> + 0140<sub>H</sub> + 4<sub>H</sub> × Ch. No.  $i$  ( $i = 0$  to  $7$ )  
 PDMA<sub>n</sub>DM3iCM: <DMA<sub>n</sub>\_base> + 0160<sub>H</sub> + 4<sub>H</sub> × Ch. No.  $i$  ( $i = 0$  to  $7$ )

**Value after reset:** 0000 0010<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 8.35 PDMA<sub>n</sub>DM<sub>y</sub>iCM Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 4	PEID[2:0]	Channel master PEID setting Specifies the PEID information of the master assigned to the channel. Set PEID value of PE that configures this register.
3, 2	SPID[1:0]	Channel master SPID setting Specifies the SPID information used by the master assigned to the channel.
1	UM	Channel master UM setting 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### CAUTION

PDMA<sub>n</sub>DM00CM to PDMA<sub>n</sub>DM07CM configure the channel master information of the DMAC0 channel 0 to 7 respectively.

PDMA<sub>n</sub>DM10CM to PDMA<sub>n</sub>DM17CM configure the channel master information of the DMAC1 channel 0 to 7 respectively.

PDMA<sub>n</sub>DM20CM to PDMA<sub>n</sub>DM27CM configure the channel master information of the DMAC2 channel 0 to 7 respectively.

PDMA<sub>n</sub>DM30CM to PDMA<sub>n</sub>DM37CM configure the channel master information of the DMAC3 channel 0 to 7 respectively.

For information about the functions this register offers, see **Section 8.6, Reliability Functions**.

## 8.9 DMAC Channel Registers

### 8.9.1 DMAC Channel Register Addresses

The DMAC channel registers are listed in the table below.

For <DMAn\_base>, see **Section 8.1.2, Register Base Addresses**.

Table 8.36 DMAC Channel Register Addresses

Module Name	Register Name	Symbol	Address	Access Permission	
				Special Master	General Master
PDMAn	DMAC source address	PDMAnDSAm	<DMAn_base> + 0400 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC destination address	PDMAnDDAm	<DMAn_base> + 0404 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC transfer count	PDMAnDTcM	<DMAn_base> + 0408 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC transfer control	PDMAnDTCTm	<DMAn_base> + 040C <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC reload source address	PDMAnDRSAm	<DMAn_base> + 0410 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC reload destination address	PDMAnDRDAm	<DMAn_base> + 0414 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC reload transfer count	PDMAnDRTCm	<DMAn_base> + 0418 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC channel operation enable setting	PDMAnDCENm	<DMAn_base> + 0420 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC transfer status	PDMAnDCSTm	<DMAn_base> + 0424 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC transfer status set	PDMAnDCSTSm	<DMAn_base> + 0428 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DMAC transfer status clear	PDMAnDCSTCm	<DMAn_base> + 042C <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DTFR setting	PDMAnDTFRm	<DMAn_base> + 0430 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DTFR transfer request status	PDMAnDTFRRQm	<DMAn_base> + 0434 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓
	DTFR transfer request clear	PDMAnDTFRRQCm	<DMAn_base> + 0438 <sub>H</sub> + 40 <sub>H</sub> × [channel number]	✓	✓

**Note:** The channel number in the offset addresses and “m” in the register symbols are numbers in the range from 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, from 0 to 15 in RH850/F1KM-S1. The correspondence is as follows.

Channel Number m	Channel	Channel Number m	Channel
0	DMAC0 channel 0	16	DMAC2 channel 0
1	DMAC0 channel 1	17	DMAC2 channel 1
2	DMAC0 channel 2	18	DMAC2 channel 2
3	DMAC0 channel 3	19	DMAC2 channel 3
4	DMAC0 channel 4	20	DMAC2 channel 4
5	DMAC0 channel 5	21	DMAC2 channel 5
6	DMAC0 channel 6	22	DMAC2 channel 6
7	DMAC0 channel 7	23	DMAC2 channel 7
8	DMAC1 channel 0	24	DMAC3 channel 0
9	DMAC1 channel 1	25	DMAC3 channel 1
10	DMAC1 channel 2	26	DMAC3 channel 2
11	DMAC1 channel 3	27	DMAC3 channel 3
12	DMAC1 channel 4	28	DMAC3 channel 4
13	DMAC1 channel 5	29	DMAC3 channel 5
14	DMAC1 channel 6	30	DMAC3 channel 6
15	DMAC1 channel 7	31	DMAC3 channel 7

## 8.9.2 Details of DMAC Channel Registers

### 8.9.2.1 PDMA<sub>n</sub>DSAm — DMAC Source Address Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0400<sub>H</sub> + 40<sub>H</sub> × Ch. No. m  
(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA31	SA30	SA29	SA28	SA27	SA26	SA25	SA24	SA23	SA22	SA21	SA20	SA19	SA18	SA17	SA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA15	SA14	SA13	SA12	SA11	SA10	SA9	SA8	SA7	SA6	SA5	SA4	SA3	SA2	SA1	SA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.37 PDMA<sub>n</sub>DSAm Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address Specifies the DMA transfer source address. These bits are updated whenever a DMA cycle is executed. If you read from these bits, the transfer source address for the next DMA cycle is read.

#### CAUTIONS

- It is forbidden to write to these bits when the channel operation is enabled (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit = 1). If you do, the correct operation is not guaranteed.
- If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the source address is updated.
- DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.)

The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	SA3	SA2	SA1	SA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

### 8.9.2.2 PDMA<sub>n</sub>DDAm — DMAC Destination Address Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0404<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA31	DA30	DA29	DA28	DA27	DA26	DA25	DA24	DA23	DA22	DA21	DA20	DA19	DA18	DA17	DA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DA15	DA14	DA13	DA12	DA11	DA10	DA9	DA8	DA7	DA6	DA5	DA4	DA3	DA2	DA1	DA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.38 PDMA<sub>n</sub>DDAm Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address Specifies the DMA transfer destination address. These bits are updated whenever a DMA cycle is executed. If you read from these bits, the transfer destination address for the next DMA cycle is read.

#### CAUTIONS

- It is forbidden to write to these bits when the channel operation is enabled (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit = 1). If you do, the correct operation is not guaranteed.
- If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
- DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.)

The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	DA3	DA2	DA1	DA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

### 8.9.2.3 PDMAAnDTCm — DMAC Transfer Count Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0408<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Table 8.39 PDMAAnDTCm Register Contents

Bit Position	Bit Name	Function										
31 to 16	ARC[15:0]	<p>Address reload count</p> <p>Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. If you read from those bits during DMA transfer, the address reload count for the next DMA cycle is read. When the reload function 2 or block transfer 2 is used, PDMAAnDTCm.ARC[15:0] is decremented by one for every DMA cycle. When the reload function 2 or block transfer 2 is not used, PDMAAnDTCm.ARC[15:0] is not updated.</p> <p>If the value is 0000<sub>H</sub>, it means that the number of transfers until the address reload when the reload function 2 is used and the number of transfers when the block transfer 2 is used are 65536.</p>										
15 to 0	TRC[15:0]	<p>Transfer count</p> <p>Configures the number of transfers. PDMAAnDTCm.TRC[15:0] is decremented by one whenever a DMA cycle is executed. If you read from those bits, the remaining number of transfers for the next DMA cycle is read. If the reload function is not used, after the last transfer is complete, the value at the completion (0000<sub>H</sub>) is retained.</p> <table border="1"> <thead> <tr> <th>TRC15-0</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>0000<sub>H</sub></td> <td>The number of transfers is 65536, or the transfer is complete.</td> </tr> <tr> <td>0001<sub>H</sub></td> <td>The number of transfers is 1, or remaining transfer count is 1.</td> </tr> <tr> <td>:</td> <td>:</td> </tr> <tr> <td>FFFF<sub>H</sub></td> <td>The number of transfers is 65535, or remaining transfer count is 65535.</td> </tr> </tbody> </table>	TRC15-0	Operation	0000 <sub>H</sub>	The number of transfers is 65536, or the transfer is complete.	0001 <sub>H</sub>	The number of transfers is 1, or remaining transfer count is 1.	:	:	FFFF <sub>H</sub>	The number of transfers is 65535, or remaining transfer count is 65535.
TRC15-0	Operation											
0000 <sub>H</sub>	The number of transfers is 65536, or the transfer is complete.											
0001 <sub>H</sub>	The number of transfers is 1, or remaining transfer count is 1.											
:	:											
FFFF <sub>H</sub>	The number of transfers is 65535, or remaining transfer count is 65535.											

#### CAUTIONS

- It is forbidden to write to those bits when the channel operation is enabled (PDMAAnDCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
- If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.

### 8.9.2.4 PDMA<sub>n</sub>DTCT<sub>m</sub> — DMAC Transfer Control Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 040C<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Table 8.40 PDMA<sub>n</sub>DTCT<sub>m</sub> Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27	ESE	DMA transfer disable on transfer error setting Specifies whether to execute a DMA cycle when the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit is set due to DMA transfer error. If this bit is cleared to 0, even when the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit is set due to DMA transfer error, the following DMA cycles can be executed. If this bit is set to 1, the following DMA cycles are not executed when the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit is set due to DMA transfer error. 0: DMA cycles are executed while the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit is set. 1: DMA cycles are not executed while the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit is set.
26	DRS	DMA transfer request selection assignment Selects the type of DMA transfer requests to be accepted. 0: Software DMA transfer request 1: Hardware DMA transfer request
25 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 18	CHNSEL[2:0]	Selection of next channel in the chain Specifies the next channel in the chain. The next channel must be another channel in the same DMAC. You cannot specify a channel in the different DMAC. It is prohibited to specify the channel as the next channel in the chain. (If you do, the correct operation is not guaranteed.)
17, 16	CHNE[1:0]	Chain enable Selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle when the remaining transfer count is one. 10: Setting prohibited. (The operation is not guaranteed.) 11: Always chain A chain request is generated at the completion of every DMA cycle.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	TCE	Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.

Table 8.40 PDMAAnDTCTm Register Contents

Bit Position	Bit Name	Function															
13	MLE	<p>Continuous transfer enable</p> <p>If this bit is set, the PDMAAnDCENm.DTE bit is not cleared at the completion of DMA transfer. 4 to 2	DS[2:0]	Transfer data size																												
		Specifies the transfer data size.																												
		<table border="1"> <thead> <tr> <th>DS2</th> <th>DS1</th> <th>DS0</th> <th>Transfer Data Size</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>8 bits</td> </tr> <tr> <td>0</td> <td>0</td> <td>1</td> <td>16 bits</td> </tr> <tr> <td>0</td> <td>1</td> <td>0</td> <td>32 bits</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> <td>64 bits</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>128 bits</td> </tr> <tr> <td colspan="3">Other than the above</td> <td>Setting prohibited (The operation is not guaranteed.)</td> </tr> </tbody> </table>	DS2	DS1	DS0	Transfer Data Size	0	0	0	8 bits	0	0	1	16 bits	0	1	0	32 bits	0	1	1	64 bits	1	0	0	128 bits	Other than the above			Setting prohibited (The operation is not guaranteed.)
		DS2	DS1	DS0	Transfer Data Size																									
		0	0	0	8 bits																									
		0	0	1	16 bits																									
		0	1	0	32 bits																									
		0	1	1	64 bits																									
1	0	0	128 bits																											
Other than the above			Setting prohibited (The operation is not guaranteed.)																											
1, 0	TRM[1:0]	Transfer mode																												
Specifies the DMA transfer mode.																														
00: Single transfer																														
01: Block transfer 1 (The number of transfers is specified by the transfer count.)																														
10: Block transfer 2 (The number of transfers is specified by the address reload count.)																														
11: Setting prohibited (The operation is not guaranteed.)																														

**CAUTIONS**

1. Except for the case to clear PDMA<sub>n</sub>DTCT<sub>m</sub>.MLE bit, it is forbidden to write to those bits when the channel operation is enabled (PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If forbidden settings are used for each bits, the correct operation is not guaranteed.

### 8.9.2.5 PDMA<sub>n</sub>DRSA<sub>m</sub> — DMAC Reload Source Address Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0410<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSA31	RSA30	RSA29	RSA28	RSA27	RSA26	RSA25	RSA24	RSA23	RSA22	RSA21	RSA20	RSA19	RSA18	RSA17	RSA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 8.41 PDMA<sub>n</sub>DRSA<sub>m</sub> Register Contents

Bit Position	Bit Name	Function
31 to 0	RSA[31:0]	Reload source address Specifies the source address to be reloaded to the DMA source address register when the reload function 1 or reload function 2 is used.

#### CAUTION

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (x denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	RSA3	RSA2	RSA1	RSA0
8 bits	x	x	x	x
16 bits	x	x	x	0
32 bits	x	x	0	0
64 bits	x	0	0	0
128 bits	0	0	0	0

### 8.9.2.6 PDMA<sub>n</sub>DRDA<sub>m</sub> — DMAC Reload Destination Address Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0414<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 8.42 PDMA<sub>n</sub>DRDA<sub>m</sub> Register Contents

Bit Position	Bit Name	Function
31 to 0	RDA[31:0]	Reload destination address Specifies the destination address to be reloaded to the DMA destination address register when the reload function 1 or reload function 2 is used.

#### CAUTION

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (x denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	RDA3	RDA2	RDA1	RDA0
8 bits	x	x	x	x
16 bits	x	x	x	0
32 bits	x	x	0	0
64 bits	x	0	0	0
128 bits	0	0	0	0

### 8.9.2.7 PDMA nDRTC<sub>m</sub> — DMAC Reload Transfer Count Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0418<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Table 8.43 PDMA nDRTC<sub>m</sub> Register Contents

Bit Position	Bit Name	Function
31 to 16	RARC[15:0]	Reload address reload count Specifies the value to be reloaded to the address reload count in the transfer count register at the timing of reload when the reload function 2 is used.
15 to 0	RTRC[15:0]	Reload transfer count Specifies the value to be reloaded to the transfer count in the transfer count register at the timing of reload when the reload function 1 is used.

### 8.9.2.8 PDMA<sub>n</sub>DCEN<sub>m</sub> — DMAC Channel Operation Enable Setting Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0420<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.44 PDMA<sub>n</sub>DCEN<sub>m</sub> Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DTE	<p>Channel operation enable</p> <p>Specifies whether to enable or disable the transfer operation of the channel. If the PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit is 1, DMA transfer starts when there is a DMA transfer request. If the PDMA<sub>n</sub>DTCT<sub>m</sub>.MLE bit is 0, this bit is automatically cleared when DMA transfer is completed. In addition, if 0 is written to the PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit during DMA transfer, the DMA transfer is suspended. If 1 is written to the PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit during suspension, the suspension is cleared and the DMA transfer resumes.</p> <p>0: Channel operation is disabled/Channel suspended 1: Channel operation is enabled/Channel suspension cleared</p>

### 8.9.2.9 PDMA<sub>n</sub>DCST<sub>m</sub> — DMAC Transfer Status Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0424<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	ERWR	—	—	CY	ER	—	—	TC	—	—	DR	SR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.45 PDMA<sub>n</sub>DCST<sub>m</sub> Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11	ERWR	DMA Transfer Error occurring cycle This bit is updated at the same time as setting of the DMA transfer error flag (PDMA <sub>n</sub> DCST <sub>m</sub> .ER), indicating in which cycle of read or write the DMA transfer error occurred. This bit is not updated when a new DMA transfer error occurs after the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit has been set. If the PDMA <sub>n</sub> DCST <sub>m</sub> .ER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in the read cycle. 1: DMA transfer error occurs in the write cycle.
10, 9	Reserved	When read, the value after reset is returned.
8	CY	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing.
7	ER	Transfer error flag This bit is set when DMA transfer error is generated. If this bit is 1 and the PDMA <sub>n</sub> DTCT <sub>m</sub> .ESE bit is set, a DMA cycle is not executed even when a DMA transfer request is generated. 0: No DMA transfer error is generated 1: DMA transfer error is generated
6, 5	Reserved	When read, the value after reset is returned.
4	TC	Transfer completion flag This bit is set at the completion of the last transfer and indicates that the DMA transfer is complete. If the PDMA <sub>n</sub> DTCT <sub>m</sub> .MLE bit is 0 and this bit is 1, a DMA cycle is not executed when a DMA transfer request is generated. 0: DMA transfer is incomplete 1: DMA transfer is complete
3, 2	Reserved	When read, the value after reset is returned.

Table 8.45 PDMA<sub>n</sub>DCST<sub>m</sub> Register Contents

Bit Position	Bit Name	Function
1	DR	<p>Hardware DMA transfer request status</p> <p>This bit shows whether there is a hardware DMA transfer request (PDMA<sub>n</sub>DMARQ) from the DTFR.</p> <p>This bit changes regardless of the value of the PDMA<sub>n</sub>DCEN<sub>m</sub>.DTE bit when a hardware DMA transfer request from the DTFR is generated. If the software DMA transfer request has been selected in the transfer request selection bit (PDMA<sub>n</sub>DTCT<sub>m</sub>.DRS) in the DMAC transfer control register, this bit is not set even when a hardware DMA transfer request is input from the DTFR.</p> <p>0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request</p>
0	SR	<p>Software DMA transfer request flag</p> <p>This bit shows whether there is a software DMA transfer request. This bit is automatically cleared when executing the DMA transfer. A user can set this bit by writing 1 to the PDMA<sub>n</sub>DCST<sub>Sm</sub>.SRS bit in the DMAC transfer status set register (PDMA<sub>n</sub>DCST<sub>Sm</sub>). In addition, a user can clear this bit by writing 1 to the PDMA<sub>n</sub>DCST<sub>Cm</sub>.SRC bit in the DMAC transfer status clear register (PDMA<sub>n</sub>DCST<sub>Cm</sub>), but if this is done, the ongoing DMA transfer is aborted and cannot be resumed.</p> <p>0: There is no software DMA transfer request 1: There is a software DMA transfer request</p>

### 8.9.2.10 PDMA<sub>n</sub>DCST<sub>m</sub> — DMAC Transfer Status Set Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0428<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.46 PDMA<sub>n</sub>DCST<sub>m</sub> Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SRS	Software DMA transfer request flag A user can set the software DMA transfer request flag (PDMA <sub>n</sub> DCST <sub>m</sub> .SR) by writing 1 to this bit. When read, this bit is always read as 0.

### 8.9.2.11 PDMA<sub>n</sub>DCSTC<sub>m</sub> — DMAC Transfer Status Clear Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 042C<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	ERC	—	—	TCC	—	—	—	SRC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R	R	R	R/W

Table 8.47 PDMA<sub>n</sub>DCSTC<sub>m</sub> Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ERC	Transfer error flag clear The DMA transfer error flag (PDMA <sub>n</sub> DCST <sub>m</sub> .ER) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	TCC	Transfer completion flag clear The transfer completion flag (PDMA <sub>n</sub> DCST <sub>m</sub> .TC) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.
3 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SRC	Software DMA transfer request flag clear The software DMA transfer request flag (PDMA <sub>n</sub> DCST <sub>m</sub> .SR) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.

### 8.9.2.12 PDMA nDTFRm — DTFR Setting Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <DMA n\_base> + 0430<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.48 PDMA nDTFRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 1	REQSEL[6:0]	Hardware DMA transfer source selection Selects one out of 128 hardware DMA transfer sources as the hardware DMA transfer request. 000_0000: Select the DMACTRG[0] input : 111_1111: Select the DMACTRG[127] input
0	REQEN	Hardware DMA transfer source selection enable This bit enables/disables the hardware DMA transfer source selection. 0: Hardware DMA transfer source selection is disabled. 1: Hardware DMA transfer source selection is enabled. If this bit is 0, even when the hardware DMA transfer source selected by the PDMA nDTFRm.REQSEL[6:0] bits is activated, it is not recognized as a hardware DMA transfer request, and a hardware DMA transfer request is not generated.

### 8.9.2.13 PDMA<sub>n</sub>DTFRRQ<sub>m</sub> — DTFR Transfer Request Status Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <DMA<sub>n</sub>\_base> + 0434<sub>H</sub> + 40<sub>H</sub> × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, m = 0 to 15 in RH850/F1KM-S1)

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

## 8.10 DMA Trigger Factor Select Registers

The following registers are used to select a DMA Trigger Factor.

### 8.10.1 List of DMA Trigger Factor Select Register Address

The DMA Trigger Factor Select Register addresses are listed in the table below.

Table 8.51 List of DMA Trigger Factor Select Register (RH850/F1KH-D8)

Module Name	Register Name	Symbol	Address
SL_DMAC	DMA trigger factor select register of TAUD0	DTFSEL_TAUD0	FFC0 2000 <sub>H</sub>
	DMA trigger factor select register of TAUB0	DTFSEL_TAUB0	FFC0 2004 <sub>H</sub>
	DMA trigger factor select register of TAUB1	DTFSEL_TAUB1	FFC0 2008 <sub>H</sub>

Table 8.52 List of DMA Trigger Factor Select Register (RH850/F1KM-S4, RH850/F1KM-S2)

Module Name	Register Name	Symbol	Address
SL_DMAC	DMA trigger factor select register of TAUD0	DTFSEL_TAUD0	FFC0 2000 <sub>H</sub>
	DMA trigger factor select register of TAUB0	DTFSEL_TAUB0	FFC0 2004 <sub>H</sub>
	DMA trigger factor select register of TAUB1	DTFSEL_TAUB1	FFC0 2008 <sub>H</sub>

**Note:** DTFSEL\_TAUB1 is not supported on 100-pin and 144-pin products.

Table 8.53 List of DMA Trigger Factor Select Register (RH850/F1KM-S1)

Module Name	Register Name	Symbol	Address
SL_DMAC	DMA trigger factor select register of TAUD0	DTFSEL_TAUD0	FFC0 2000 <sub>H</sub>
	DMA trigger factor select register of TAUB0	DTFSEL_TAUB0	FFC0 2004 <sub>H</sub>

## 8.10.2 DTFSEL\_TAUD0/DTFSEL\_TAUB0/DTFSEL\_TAUB1 — DMA Trigger Factor Select Register

When 16 or 17 DMA Trigger Factors are assigned to one DMA Trigger Number, this register selects which DMA Trigger Factor is enabled.

**Access:** This register can be read or written in 32-bit units.

**Address:** DTFSEL\_TAUD0: FFC0 2000<sub>H</sub>  
DTFSEL\_TAUB0: FFC0 2004<sub>H</sub>  
DTFSEL\_TAUB1: FFC0 2008<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## Section 9A Reset Controller of RH850/F1KH-D8

### 9A.1 Overview

Several system reset functions are provided in order to initialize CPU core and peripheral functions as well as their associated registers.

A reset can be caused by the following events:

Table 9A.1 Reset Sources and Reset Targets

Reset Source	Symbol	RH850/F1KH-D8
External reset	$\overline{\text{RESET}}$	✓
Power-On Clear	POCRES	✓
Watchdog timer reset	WDTA0RES	✓
	WDTA1RES	✓
	WDTA2RES	✓
Clock monitor reset	$\overline{\text{CLMA0RES}}$	✓
	$\overline{\text{CLMA1RES}}$	✓
	$\overline{\text{CLMA2RES}}$	✓
	$\overline{\text{CLMA3RES}}$	✓
Low-voltage indicator reset	$\overline{\text{LVIRES}}$	✓
Software reset	SWRES	✓
Debugger reset	$\overline{\text{DBRES}}$	✓
Core voltage monitor reset	$\overline{\text{CVMRES}}$	✓
Transition to DeepSTOP mode		✓

### 9A.1.1 Reset Sources

Reset levels and reset sources are shown below.

Various reset sources are assigned to the different levels of the reset.

Table 9A.2 Reset Sources and Reset Targets

Reset Level	Reset Source	Clock Generation (except PLL)/Real-Time Clock/CVM/LVI	Always-On area (AWO area) Modules*1	Isolated area (ISO area) Modules*2
1	Power-On Clear (POCRES) Debugger reset ( $\overline{\text{DBRES}}$ )	Reset	Reset	Reset
2	External reset ( $\overline{\text{RESET}}$ ) Watchdog timer reset (WDTA0RES, WDTA1RES, WDTA2RES) Clock monitor reset ( $\overline{\text{CLMA0RES}}$ , $\overline{\text{CLMA1RES}}$ , $\overline{\text{CLMA2RES}}$ , $\overline{\text{CLMA3RES}}$ ) Core voltage monitor reset ( $\overline{\text{CVMRES}}$ ) Low voltage indicator reset ( $\overline{\text{LVIRES}}$ ) Software reset (SWRES)	Not reset target*3	Reset	Reset
3	Reset by DeepSTOP mode	Not reset target	Not reset target	Reset

Note 1. Clock generator, real-time clock, CVM, and LVI are excluded.

Note 2. PLL is included.

Note 3. In clock monitor reset, oscillator-related registers for clock monitoring are initialized.

Reset level 1: Initializes the entire microcontroller.

Reset level 2: For a quick return to normal operating mode by eliminating the oscillator stabilization time, initializes the entire microcontroller except for the clock generator and the real-time clock.

Reset level 3: At the transition to DeepSTOP mode, initializes all the Isolated area (ISO area).

If each reset is generated, local RAM data and global RAM data are not guaranteed to retain.

If each reset is generated, retention RAM data can be retained as long as the power-supply voltage (REG0VCC) does not fall below the RAM retention voltage (VVLVI).

In this case, data value writing to retention RAM address will be before or after writing.

### 9A.1.2 Reset Controller Redundancy

The reset controller of the microcontroller has a redundant configuration, and includes duplicated reset generation circuits. Such configuration enables initialization of the reset targeted area without failure even if one of the two reset generation circuits fails.

The configuration of the reset generation circuits is shown in the figure below.

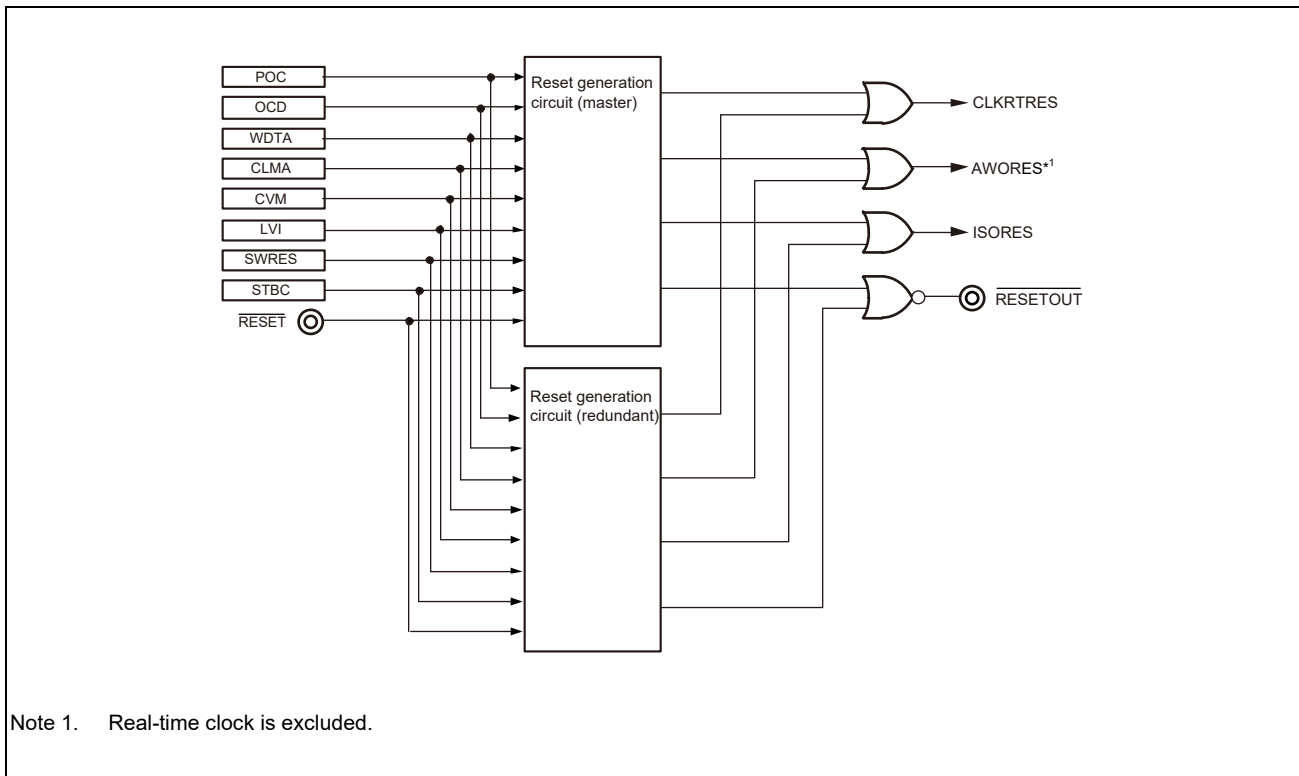

Figure 9A.1 Reset Controller Redundancy

At the generation of a reset, the same reset source signal is input to two reset generation circuits.

According to the reset source, the two reset generation circuits output the Always-On area (AWO area) reset signal (AWORES), Isolated area (ISO area) reset signal (ISORES), clock generator/real-time clock reset signal (CLKRTRES), and  $\overline{\text{RESETOUT}}$  signal.

The AWORES, ISORES, CLKRTRES, and  $\overline{\text{RESETOUT}}$  signals are generated by executing the logical OR of the signals output from two reset generation circuits. Thus, a reset signal is generated normally even if one of the two reset generation circuits fails.

Whether a reset generation circuit operates normally can be checked by reading and comparing the reset factor registers of the respective reset generation circuits.

### 9A.1.3 Reset Output ( $\overline{\text{RESETOUT}}$ )

When a reset source of reset level 1 or 2 is generated, a reset output signal (  $\overline{\text{RESETOUT}}$  ) is output to the outside. Reset output is used to reset external devices at the same time as a reset is generated inside the microcontroller.

For details, see **Section 2A.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  .

### 9A.1.4 Reset Flag

To identify a reset source, two registers with a flag for each reset source are provided. The main elements of the reset controller are shown in **Figure 9A.2, Block Diagram of the Reset Controller**.

### 9A.1.5 Clock Supply

The clock supply to the reset controller is shown in the following table.

Table 9A.3 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Reset	Register access clock	CPUCLK_UL

## 9A.2 Configuration

### 9A.2.1 Block Diagram

Block diagram of reset circuits are shown below.

Figure 9A.2 Block Diagram of the Reset Controller

## (1) Reset Signals

The reset controller manages the generation of three reset signals upon occurrence of reset signals from various reset sources:

- Always-On area (AWO area) reset (AWORES)  
AWORES is generated by all reset sources except the transition to DeepSTOP mode.  
AWORES resets all modules in the Always-On area (AWO area) except clock generation circuit, real-time clock, core voltage monitor, and low-voltage detection circuit.
- Isolated area (ISO area) reset (ISORES)  
ISORES is generated by all reset sources.  
ISORES resets all modules (including PLL) in the Isolated area (ISO area).
- CLKRTRES  
CLKRTRES is generated by the power-on clear or debugger reset sources.  
CLKRTRES resets the clock generation circuit (excluding PLL) and real-time clock.

The power-up reset (PURES) is caused by the power-on clear and debugger reset sources.

Following the generation of an AWORES reset, with the exception of the PLL, all clock-generation circuits that were operating at the time (LS IntOSC, HS IntOSC, MainOSC, SubOSC) continue to operate. On the generation of a CLMA0RES reset, the HS IntOSC that was the target for CLMA0 monitoring is reset. On the generation of a CLMA1RES reset, the MainOSC that was the target for CLMA1 monitoring is reset.

The PURES initializes all of the clock generation circuits. It is necessary to restart the clock generation circuit after recovery from the PURES.

The CPU reset is the Isolated area (ISO area) reset (ISORES) to the CPU sub system.

## (2) Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) hold a flag for each reset source, and this flag is set when the corresponding reset is asserted.

All reset flags except RESF9 and RESFR9 are initialized by a power-up reset (PURES). (Bits RESF9 and RESFR9 are set to 1 after initialization.) In addition, all the bits can be cleared by software.

For details, see **Section 9A.1.4, Reset Flag**.

## (3) On-Chip Module Resets

### (a) Watchdog Timer Resets

The watchdog timers can generate three types of resets: WDTA0RES, WDTA1RES and WDTA2RES.

For details, see **Section 9A.4.6, Watchdog Timer (WDTA) Reset**

### (b) Clock Monitor Resets

The clock monitors can generate four resets: CLMA0RES , CLMA1RES , CLMA2RES , and CLMA3RES .

For details, see **Section 9A.4.8, Clock Monitor (CLMA) Reset**.

### (c) Debugger Reset

A reset is generated by a command from a debugger. This leads to a generation of power-up reset

PURES. For details, see **Section 9A.4.9, Debugger Reset**.

**(4) Software Controlled Reset (SWRES)**

A software reset SWRES can be generated by use of the software reset register SWRESA.

For details, see **Section 9A.4.7, Software Reset**.

**(5) Reset Output Signal**

During reset and after release from the reset, port P8\_6 outputs low level as  $\overline{\text{RESETOUT}}$  function.

For details, see **Section 2A.11.1.1, P8\_6: RESETOUT**.

**(6) Power Supply Monitoring**

The following power supply detection circuits observe the level of the external power supply REG0VCC and REG1VCC.

**(a) Low-Voltage Indicator**

The low-voltage indicator (LVI) generates the  $\overline{\text{LVIREs}}$  reset, if the voltage level of REG0VCC drops below a certain level. The level can be adjusted and the  $\overline{\text{LVIREs}}$  can be masked.

For details, see **Section 9A.4.3, Low-Voltage Indicator (LVI) Reset**.

**(b) Power-On Clear**

The power-on clear circuit (POC) continuously compares the power supply voltage REG0VCC and REG1VCC with an internal reference voltage. Thus, a reset is generated when the power supply voltage goes below a certain level.

For details, see **Section 9A.4.2, Power-On Clear (POC) Reset**.

**(c) Core Voltage Monitor**

A reset can be generated when the core voltage monitor (CVM) detects over- or undervoltage in core voltage. (Output/not output can be set by option byte.)

For details, see **Section 9A.4.4, Core Voltage Monitor (CVM) Reset**.

**(7) Masking of Reset Sources in Debugging Mode**

The following reset sources can be masked during debugging:

Table 9A.4 Reset Sources to be Masked during Debugging

Reset Source	Maskable/Non-maskable
Power-on clear (POCRES)	—
Debugger reset ( $\overline{\text{DBRES}}$ )	—
External reset ( $\overline{\text{RESET}}$ )	✓
Low-voltage indicator reset ( $\overline{\text{LVIREs}}$ )	✓
Clock monitor reset ( $\overline{\text{CLMA0RES}}$ , $\overline{\text{CLMA1RES}}$ , $\overline{\text{CLMA2RES}}$ , $\overline{\text{CLMA3RES}}$ )	✓
Watchdog timer reset (WDTA0RES, WDTA1RES, WDTA2RES)	✓
Core voltage monitor reset ( $\overline{\text{CVMRES}}$ )	✓
Software reset (SWRES)	✓
Reset by DeepSTOP mode	—

## 9A.3 Registers

This section contains a description of all registers of the reset controller.

### 9A.3.1 Reset Controller Registers Overview

The reset controller is controlled and operated by the following registers:

Table 9A.5 Reset Controller Registers Overview

Module Name	Register Name	Symbol	Address
RESCTL	Reset flag registers		
	Reset factor register	RESF	FFF8 0760 <sub>H</sub>
	Reset factor clear register	RESFC	FFF8 0768 <sub>H</sub>
	Redundant reset factor register	RESFR	FFF8 0860 <sub>H</sub>
	Redundant reset factor clear register	RESFCR	FFF8 0868 <sub>H</sub>
	Software reset control register		
	Software reset register	SWRESA	FFF8 0A04 <sub>H</sub>

#### NOTES

1. For the LVI related, RAM store related, and CVM related registers, see **Section 11A, Supply Voltage Monitor of RH850/F1KH-D8**.
2. As for the protection registers, see **Section 5, Write-Protected Registers**.

## 9A.3.2 Details of Reset Flag Registers

### 9A.3.2.1 RESF — Reset Factor Register

This register contains information about which type of resets occurred after the last power-on clear reset. This register is initialized by a power-up reset PURES.

Each reset condition sets the corresponding flag in the register.

For example, if a clock monitor reset  $\overline{\text{CLMA0RES}}$  occurs after a watchdog timer reset  $\text{WDTA0RES}$ , RESF reads  $0000\ 000A_{\text{H}}$ .

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 0760<sub>H</sub>

**Value after reset:** 0000 0200<sub>H</sub> / 0000 0300<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. For details, see **Figure 9A.4, When RESET is Released before the Flash Sequence is Completed, When RESET is released before Execution of Flash Sequence.**

Table 9A.6 RESF Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is returned.
14	RESF14	CLMA3 reset flag 0: No reset occurred 1: Reset has occurred
13, 12	Reserved	When read, the value after reset is returned.
11	RESF11	WDTA2 reset flag 0: No reset occurred 1: Reset has occurred
10	RESF10	Reset flag by DeepSTOP mode 0: No reset occurred 1: Reset has occurred
9	RESF9	Power-up reset flag 0: No reset occurred 1: Reset has occurred
8	RESF8	External reset flag 0: No reset occurred 1: Reset has occurred
7	RESF7	CVM reset flag 0: No reset occurred 1: Reset has occurred

Table 9A.6 RESF Register Contents

Bit Position	Bit Name	Function
6	RESF6	LVI reset flag 0: No reset occurred 1: Reset has occurred
5	RESF5	CLMA2 reset flag 0: No reset occurred 1: Reset has occurred
4	RESF4	CLMA1 reset flag 0: No reset occurred 1: Reset has occurred
3	RESF3	CLMA0 reset flag 0: No reset occurred 1: Reset has occurred
2	RESF2	WDTA1 reset flag 0: No reset occurred 1: Reset has occurred
1	RESF1	WDTA0 reset flag 0: No reset occurred 1: Reset has occurred
0	RESF0	Software reset flag 0: No reset occurred 1: Reset has occurred

### 9A.3.2.2 RESFC — Reset Factor Clear Register

This register clears the reset flags of the RESF register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFF8 0768<sub>H</sub>

**Value after reset:** Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 9A.3.2.3 RESFR — Redundant Reset Factor Register

This register is a duplication of the reset factor register. This register is initialized by a power-up reset PURES.

In accordance with the setting conditions for each bit in the reset factor register, the same bits are set in this register.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 0860<sub>H</sub>

**Value after reset:** 0000 0200<sub>H</sub> / 0000 0300<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 9A.3.3 Details of Software Reset Control Register

#### 9A.3.3.1 SWRESA — Software Reset Register

This register is used to generate a software reset SWRES. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFF8 0A04<sub>H</sub>

**Value after reset:** Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## 9A.4 Functional Description

### 9A.4.1 Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) provide reset flags for each reset source.

If a reset has occurred, the corresponding flag is set. According to this, the source of the reset is evaluated.

RESF and RESFR are initialized by a power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$ ) (though bits RESF9 and RESFR9 are set to 1 after initialization). In addition, flags in RESF and RESFR can be cleared by the reset factor clear register (RESFC) and the redundant reset factor clear register (RESFCR).

Each reset source can set the corresponding flag independently from other reset sources.

### 9A.4.2 Power-On Clear (POC) Reset

The power-on clear circuit (POC) constantly compares the power supply voltage REG0VCC and REG1VCC with the internal reference voltage VPOC. It ensures that the microcontroller only operates as long as the power supply exceeds a certain level.

If REG0VCC or REG1VCC falls below the internal reference voltage ( $\text{REG0VCC} < \text{VPOC}$  or  $\text{REG1VCC} < \text{VPOC}$ ), the internal reset signal POCRES and a power-up reset PURES are generated.

For details on the specification of the internal voltage reference level VPOC, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**.

The reset factor register (RESF) and the redundant reset factor register (RESFR) are cleared by the power-on clear reset. RESF9 and RESFR9 are set to 1 after initialization.

The power-on clear function holds the microcontroller in reset state as long as the power supply voltage does not exceed the threshold level VPOC.

The following figure illustrates the timing of a POCRES.

Figure 9A.3 POC Reset Timing

(1) Overview of CPU System Startup after Power-On Clear

Figure 9A.4 When  $\overline{\text{RESET}}$  is Released before the Flash Sequence is Completed

Figure 9A.5 When  $\overline{\text{RESET}}$  is Released after the Flash Sequence is Completed

### 9A.4.3 Low-Voltage Indicator (LVI) Reset

The low-voltage indicator (LVI) constantly compares the power supply voltage REG0VCC with the LVI internal reference voltage VLVIIn.

When setting the LVI detection voltage and releasing the  $\overline{\text{LVIRESMK}}$ , if REG0VCC falls below the internal reference voltage ( $\text{REG0VCC} < \text{VLVIIn}$ ), the internal reset signal  $\overline{\text{LVIRES}}$  is generated.

Additionally, the  $\overline{\text{LVIRES}}$  flags (bits RESF.RESF6 and RESFR.RESFR6) are set.

After that, even if REG0VCC exceeds VLVIIn, bits RESF.RESF6 and RESFR.RESFR6 are not cleared automatically. They are cleared as described below.

- Setting the RESFC.RESFC6 bit to 1 clears the RESF.RESF6 bit.  
Setting the RESFCR.RESFCR6 bit to 1 clears the RESFR.RESFR6 bit.
- Power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$  )

For details on the LVI functions, see **Section 11A, Supply Voltage Monitor of RH850/F1KH-D8**.

The following figure illustrates the timing of a  $\overline{\text{LVIRES}}$  and bits RESF.RESF6 and RESFR.RESFR6.

Figure 9A.6 LVI Reset Timing

### 9A.4.4 Core Voltage Monitor (CVM) Reset

Core voltage monitor is used to monitor the core voltage inside the microcontroller.

The reset  $\overline{\text{CVMRES}}$  is generated if the core voltage is not in the specified voltage range while CVM is enabled. Moreover, the  $\overline{\text{CVMRES}}$  flags (RESF.RESF7 and RESFR.RESFR7) are set.

After that, the RESF.RESF7 and RESFR.RESFR7 bits are not automatically cleared even if the core voltage returns to the specified voltage range. The RESF.RESF7 and RESFR.RESFR7 bits are cleared as described below.

- Setting the RESFC.RESFC7 bit to 1 clears the RESF.RESF7 bit.  
Setting the RESFCR.RESFCR7 bit to 1 clears the RESFR.RESFR7 bit.
- Power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$ )

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off. Once  $\overline{\text{CVMRES}}$  is generated upon high voltage detection, the microcontroller stays in the reset state. To cancel this state, it is mandatory to use the external reset ( $\overline{\text{RESET}}$ ) input. Release the external reset ( $\overline{\text{RESET}}$ ) after the voltage level becomes lower than the high detection voltage.

For details on the CVM function, see **Section 11A, Supply Voltage Monitor of RH850/F1KH-D8**.

Figure 9A.7 CVM Reset Timing

### 9A.4.5 External Reset ( $\overline{\text{RESET}}$ )

When a low level input is applied to the  $\overline{\text{RESET}}$  pin, a reset is asserted and the RESF.RESF8 and RESFR.RESFR8 bits are set.

After that, bits RESF.RESF8 and RESFR.RESFR8 are not cleared automatically, even if the low-level input to the  $\overline{\text{RESET}}$  pin is released. Bits RESF.RESF8 and RESFR.RESFR8 are cleared as described below.

- Setting the RESFC.RESFC8 bit to 1 clears the RESF.RESF8 bit.  
Setting the RESFCR.RESFCR8 bit to 1 clears the RESFR.RESFR8 bit.
- Power-up reset PURES (POCRES or DBRES )

The  $\overline{\text{RESET}}$  pin includes an analog noise filter to prevent erroneous resets due to noise.

The following figure shows the timing when AWORES and ISORES are generated by the external reset. This figure also shows the effect of the noise filter.

Figure 9A.8 External Reset (  $\overline{\text{RESET}}$  )

### 9A.4.6 Watchdog Timer (WDTA) Reset

The watchdog timers can be configured to generate a reset if the overflow time is exceeded. After a watchdog timer reset is asserted, the corresponding watchdog timer reset flags (the RESF.RESF1 and RESFR.RESFR1 bits for WDTA0RES, and the RESF.RESF2 and RESFR.RESFR2 bits for WDTA1RES, and the RESF.RESF11 and RESFR.RESFR11 bits for WDTA2RES) are set.

After that, bits RESF.RESF1 and RESFR.RESFR1 (or bits RESF.RESF2 and RESFR.RESFR2 or bits RESF.RESF11 and RESFR.RESFR11) are not cleared automatically, even if WDTA0RES (or WDTA1RES or WDTA2RES) is released.

Bits RESF.RESF1 and RESFR.RESFR1, and bits RESF.RESF2 and RESFR.RESFR2 and bits RESF.RESF11 and RESFR.RESFR11 are cleared as described below.

- WDTA0RES:
  - Setting the RESFC.RESFC1 bit to 1 clears the RESF.RESF1 bit.
  - Setting the RESFCR.RESFCR1 bit to 1 clears the RESFR.RESFR1 bit.
- WDTA1RES:
  - Setting the RESFC.RESFC2 bit to 1 clears the RESF.RESF2 bit.
  - Setting the RESFCR.RESFCR2 bit to 1 clears the RESFR.RESFR2 bit.
- WDTA2RES:
  - Setting the RESFC.RESFC11 bit to 1 clears the RESF.RESF11 bit.
  - Setting the RESFCR.RESFCR11 bit to 1 clears the RESFR.RESFR11 bit.
- Power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$  )

### 9A.4.7 Software Reset

The software reset SWRES can be asserted by setting SWRESA.SWRESA to 1.

SWRES sets the reset flag RESF.RESF0 and the RESFR.RESFR0 bit.

RESF.RESF0 and RESFR.RESFR0 are not cleared automatically. RESF.RESF0 and RESFR.RESFR0 are cleared as described below.

- Setting the RESFC.RESFC0 bit to 1 clears the RESF.RESF0 bit.
  - Setting the RESFCR.RESFCR0 bit to 1 clears the RESFR.RESFR0 bit.
- Power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$  )

### 9A.4.8 Clock Monitor (CLMA) Reset

The clock monitors can generate the following resets:

- $\overline{\text{CLMA0RES}}$  , if a frequency abnormality in HS IntOSC is detected
- $\overline{\text{CLMA1RES}}$  , if a frequency abnormality in MainOSC is detected
- $\overline{\text{CLMA2RES}}$  , if a frequency abnormality in PLL0 is detected
- $\overline{\text{CLMA3RES}}$  , if a frequency abnormality in PLL1 is detected

When the Clock Monitor detects frequency abnormality of the respective clocks, resets  $\overline{\text{CLMA0RES}}$  ,  $\overline{\text{CLMA1RES}}$  ,  $\overline{\text{CLMA2RES}}$  , and  $\overline{\text{CLMA3RES}}$  are generated.

In addition, flags  $\overline{\text{CLMA0RES}}$  ,  $\overline{\text{CLMA1RES}}$  ,  $\overline{\text{CLMA2RES}}$  , and  $\overline{\text{CLMA3RES}}$  (RESF.RESF3, RESFR.RESFR3, RESF.RESF4, RESFR.RESFR4, RESF.RESF5, RESFR.RESFR5, RESF.RESF14, and RESFR.RESFR14) are set.

These flags are not cleared automatically. They are cleared as described below.

- $\overline{\text{CLMA0RES}}$  :  
Setting the RESFC.RESFC3 bit to 1 clears the RESF.RESF3 bit.  
Setting the RESFCR.RESFCR3 bit to 1 clears the RESFR.RESFR3 bit.
- $\overline{\text{CLMA1RES}}$  :  
Setting the RESFC.RESFC4 bit to 1 clears the RESF.RESF4 bit.  
Setting the RESFCR.RESFCR4 bit to 1 clears the RESFR.RESFR4 bit.
- $\overline{\text{CLMA2RES}}$  :  
Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.  
Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.
- $\overline{\text{CLMA3RES}}$  :  
Setting the RESFC.RESFC14 bit to 1 clears the RESF.RESF14 bit.  
Setting the RESFCR.RESFCR14 bit to 1 clears the RESFR.RESFR14 bit
- Power-up reset PURES (POCRES or  $\overline{\text{DBRES}}$  )

### 9A.4.9 Debugger Reset

Debugger reset (  $\overline{\text{DBRES}}$  ) is generated via a debugger command.  $\overline{\text{DBRES}}$  activates PURES, and therefore operates in the same way as the power-on clear reset POCRES:

- The clock generators are reset and stop operating. The clock generators should be restarted after release from the reset state.
- The reset factor register RESF and the redundant reset factor register RESFR are cleared (Bits RESF9 and RESFR9 are set to 1 after initialization).

## Section 9BC Reset Controller of RH850/F1KM

### 9BC.1 Overview

Several system reset functions are provided in order to initialize CPU core and peripheral functions as well as their associated registers.

A reset can be caused by the following events:

Table 9BC.1 Reset Sources and Reset Targets (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Reset Source	Symbol	RH850/F1KM-S4, RH850/F1KM-S2	RH850/F1KM-S1
External reset	$\overline{\text{RESET}}$	✓	✓
Power-On Clear	POCRES	✓	✓

	WDTA1RES	✓	✓
Clock monitor reset	$\overline{\text{CLMA0RES}}$	✓	✓
	$\overline{\text{CLMA1RES}}$	✓	✓
	$\overline{\text{CLMA2RES}}$	✓	—
	$\overline{\text{CLMA3RES}}$	✓	✓
Low-voltage indicator reset	$\overline{\text{LVIRES}}$	✓	✓
Software reset	SWRES	✓	✓
Debugger reset	$\overline{\text{DBRES}}$	✓	✓
Core voltage monitor reset	$\overline{\text{CVMRES}}$	✓	✓
Transition to DeepSTOP mode		✓	✓

### 9BC.1.1 Reset Sources

Reset levels and reset sources are shown below.

Various reset sources are assigned to the different levels of the reset.

Table 9BC.2 Reset Sources and Reset Targets

Reset Level	Reset Source	Clock Generation (except PLL)/Real-Time Clock/CVM/LVI	Always-On area (AWO area) Modules*1	Isolated area (ISO area) Modules*2
1	Power-On Clear (POCRES) Debugger reset ( $\overline{\text{DBRES}}$ )	Reset	Reset	Reset
2	External reset ( $\overline{\text{RESET}}$ ) Watchdog timer reset (WDTA0RES, WDTA1RES) Clock monitor reset ( $\overline{\text{CLMA0RES}}$ , $\overline{\text{CLMA1RES}}$ , $\overline{\text{CLMA2RES}}$ , $\overline{\text{CLMA3RES}}$ ) Core voltage monitor reset ( $\overline{\text{CVMRES}}$ ) Low voltage indicator reset ( $\overline{\text{LVIRES}}$ ) Software reset (SWRES)	Not reset target*3	Reset	Reset
3	Reset by DeepSTOP mode	Not reset target	Not reset target	Reset

Note 1. Clock generator, real-time clock, CVM, and LVI are excluded.

Note 2. PLL is included.

Note 3. In clock monitor reset, oscillator-related registers for clock monitoring are initialized.

Reset level 1: Initializes the entire microcontroller.

Reset level 2: For a quick return to normal operating mode by eliminating the oscillator stabilization time, initializes the entire microcontroller except for the clock generator and the real-time clock.

Reset level 3: At the transition to DeepSTOP mode, initializes all the Isolated area (ISO area).

If each reset is generated, local RAM data and global RAM data\*1 are not guaranteed to retain.

If each reset is generated, retention RAM data can be retained as long as the power-supply voltage (REGVCC) does not fall below the RAM retention voltage (VVLVI).

In this case, data value writing to retention RAM address will be before or after writing.

**Note 1.** The global RAM is not supported in RH850/F1KM-S1.

## 9BC.1.2 Reset Controller Redundancy

The reset controller of the microcontroller has a redundant configuration, and includes duplicated reset generation circuits. Such configuration enables initialization of the reset targeted area without failure even if one of the two reset generation circuits fails.

The configuration of the reset generation circuits is shown in the figure below.

Figure 9BC.1 Reset Controller Redundancy

At the generation of a reset, the same reset source signal is input to two reset generation circuits.

According to the reset source, the two reset generation circuits output the Always-On area (AWO area) reset signal (AWORES), Isolated area (ISO area) reset signal (ISORES), clock generator/real-time clock reset signal (CLKRTRES), and RESETOUT signal.

The AWORES, ISORES, CLKRTRES, and RESETOUT signals are generated by executing the logical OR of the signals output from two reset generation circuits. Thus, a reset signal is generated normally even if one of the two reset generation circuits fails.

Whether a reset generation circuit operates normally can be checked by reading and comparing the reset factor registers of the respective reset generation circuits.

### 9BC.1.3 Reset Output ( $\overline{\text{RESETOUT}}$ )

When a reset source of reset level 1 or 2 is generated, a reset output signal (  $\overline{\text{RESETOUT}}$  ) is output to the outside. Reset output is used to reset external devices at the same time as a reset is generated inside the microcontroller.

For details, see **Section 2B.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  and **Section 2C.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$** .

### 9BC.1.4 Reset Flag

To identify a reset source, two registers with a flag for each reset source are provided. The main elements of the reset controller are shown in **Figure 9BC.2, Block Diagram of the Reset Controller (RH850/F1KM-S4, RH850/F1KM-S2)** and **Figure 9BC.3, Block Diagram of the Reset Controller (RH850/F1KM-S1)**.

### 9BC.1.5 Clock Supply

The clock supply to the reset controller is shown in the following table.

Table 9BC.3 Clock Supply (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
Reset	Register access clock	CPUCLK_UL

## 9BC.2 Configuration

### 9BC.2.1 Block Diagram

Block diagram of reset circuits are shown below.

Figure 9BC.2 Block Diagram of the Reset Controller (RH850/F1KM-S4, RH850/F1KM-S2)

Figure 9BC.3 Block Diagram of the Reset Controller (RH850/F1KM-S1)

## (1) Reset Signals

The reset controller manages the generation of three reset signals upon occurrence of reset signals from various reset sources:

- Always-On area (AWO area) reset (AWORES)  
AWORES is generated by all reset sources except the transition to DeepSTOP mode.  
AWORES resets all modules in the Always-On area (AWO area) except clock generation circuit, real-time clock, core voltage monitor, and low-voltage detection circuit.
- Isolated area (ISO area) reset (ISORES)  
ISORES is generated by all reset sources.  
ISORES resets all modules (including PLL) in the Isolated area (ISO area).
- CLKRTRES  
CLKRTRES is generated by the power-on clear or debugger reset sources.  
CLKRTRES resets the clock generation circuit (excluding PLL) and real-time clock.

The power-up reset (PURES) is caused by the power-on clear and debugger reset sources.

Following the generation of an AWORES reset, with the exception of the PLL, all clock-generation circuits that were operating at the time (LS IntOSC, HS IntOSC, MainOSC, SubOSC) continue to operate. On the generation of a CLMA0RES reset, the HS IntOSC that was the target for CLMA0 monitoring is reset. On the generation of a CLMA1RES reset, the MainOSC that was the target for CLMA1 monitoring is reset.

The PURES initializes all of the clock generation circuits. It is necessary to restart the clock generation circuit after recovery from the PURES.

The CPU reset is the Isolated area (ISO area) reset (ISORES) to the CPU sub system.

## (2) Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) hold a flag for each reset source, and this flag is set when the corresponding reset is asserted.

All reset flags except RESF9 and RESFR9 are initialized by a power-up reset (PURES). (Bits RESF9 and RESFR9 are set to 1 after initialization.) In addition, all the bits can be cleared by software.

For details, see **Section 9BC.1.4, Reset Flag**.

## (3) On-Chip Module Resets

### (a) Watchdog Timer Resets

The watchdog timers can generate two types of resets: WDTA0RES and WDTA1RES.

For details, see **Section 9BC.4.6, Watchdog Timer (WDTA) Reset**.

### (b) Clock Monitor Resets

The clock monitors can generate four resets: CLMA0RES , CLMA1RES , CLMA2RES , and CLMA3RES .

For details, see **Section 9BC.4.8, Clock Monitor (CLMA) Reset**.

### (c) Debugger Reset

A reset is generated by a command from a debugger. This leads to a generation of power-up reset PURES.

For details, see **Section 9BC.4.9, Debugger Reset**.

**(4) Software Controlled Reset (SWRES)**

A software reset SWRES can be generated by use of the software reset register SWRESA.

For details, see **Section 9BC.4.7, Software Reset.**

**(5) Reset Output Signal**

During reset and after release from the reset, port P8\_6 outputs low level as  $\overline{\text{RESETOUT}}$  function.

For details, see **Section 2B.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  and **Section 2C.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$** .

**(6) Power Supply Monitoring**

The following power supply detection circuits observe the level of the external power supply REGVCC.

**(a) Low-Voltage Indicator**

The low-voltage indicator (LVI) generates the  $\overline{\text{LVIRES}}$  reset, if the voltage level of REGVCC drops below a certain level. The level can be adjusted and the  $\overline{\text{LVIRES}}$  can be masked.

For details, see **Section 9BC.4.3, Low-Voltage Indicator (LVI) Reset.**

**(b) Power-On Clear**

The power-on clear circuit (POC) continuously compares the power supply voltage REGVCC with an internal reference voltage. Thus, a reset is generated when the power supply voltage goes below a certain level.

For details, see **Section 9BC.4.2, Power-On Clear (POC) Reset.**

**(c) Core Voltage Monitor**

A reset can be generated when the core voltage monitor (CVM) detects over- or undervoltage in core voltage. (Output/not output can be set by option byte.)

For details, see **Section 9BC.4.4, Core Voltage Monitor (CVM) Reset.**

**(7) Masking of Reset Sources in Debugging Mode**

The following reset sources can be masked during debugging:

Table 9BC.4 Reset Sources to be Masked during Debugging

Reset Source	Maskable/Non-maskable
Power-on clear (POCRES)	—
Debugger reset ( $\overline{\text{DBRES}}$ )	—
External reset ( $\overline{\text{RESET}}$ )	✓
Low-voltage indicator reset ( $\overline{\text{LVIRES}}$ )	✓
Clock monitor reset ( $\overline{\text{CLMA0RES}}$ , $\overline{\text{CLMA1RES}}$ , $\overline{\text{CLMA2RES}}$ , $\overline{\text{CLMA3RES}}$ )	✓
Watchdog timer reset (WDTA0RES, WDTA1RES)	✓
Core voltage monitor reset ( $\overline{\text{CVMRES}}$ )	✓
Software reset (SWRES)	✓
Reset by DeepSTOP mode	—

## 9BC.3 Registers

This section contains a description of all registers of the reset controller.

### 9BC.3.1 Reset Controller Registers Overview

The reset controller is controlled and operated by the following registers:

Table 9BC.5 Reset Controller Registers Overview (RH850/F1KM-S4, RH850/F1KM-S2)

Module Name	Register Name	Symbol	Address
RESCTL	Reset flag registers		
	Reset factor register	RESF	FFF8 0760 <sub>H</sub>
	Reset factor clear register	RESFC	FFF8 0768 <sub>H</sub>
	Redundant reset factor register	RESFR	FFF8 0860 <sub>H</sub>
	Redundant reset factor clear register	RESFCR	FFF8 0868 <sub>H</sub>
	Software reset control register		
	Software reset register	SWRESA	FFF8 0A04 <sub>H</sub>

Table 9BC.6 Reset Controller Registers Overview (RH850/F1KM-S1)

Module Name	Register Name	Symbol	Address
RESCTL	Reset flag registers		
	Reset factor register	RESF	FFF8 0760 <sub>H</sub>
	Reset factor clear register	RESFC	FFF8 0768 <sub>H</sub>
	Redundant reset factor register	RESFR	FFF8 0860 <sub>H</sub>
	Redundant reset factor clear register	RESFCR	FFF8 0868 <sub>H</sub>
	Software reset control register		
	Software reset register	SWRESA	FFF8 0A04 <sub>H</sub>
	Cyclic RUN mode reset vector address register		
	Cyclic RUN mode RBASE register	CYCRBASE	FFF8 3600 <sub>H</sub>

#### NOTES

- For the LVI related, RAM store related, and CVM related registers, see **Section 11BC, Supply Voltage Monitor of RH850/F1KM**.
- As for the protection registers, see **Section 5, Write-Protected Registers**.

## 9BC.3.2 Details of Reset Flag Registers

### 9BC.3.2.1 RESF — Reset Factor Register

This register contains information about which type of resets occurred after the last power-on clear reset. This register is initialized by a power-up reset PURES.

Each reset condition sets the corresponding flag in the register.

For example, if a clock monitor reset  $\overline{\text{CLMA0RES}}$  occurs after a watchdog timer reset  $\text{WDTA0RES}$ , RESF reads  $0000\ 000A_{\text{H}}$ .

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 0760<sub>H</sub>

**Value after reset:** 0000 0200<sub>H</sub> / 0000 0300<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. For details, see **Figure 9BC.5, When RESET is Released before the Flash Sequence is Completed, When RESET is released before Execution of Flash Sequence.**

Table 9BC.7 RESF Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is returned.
14	RESF14	RH850/F1KM-S4, RH850/F1KM-S2: CLMA3 reset flag 0: No reset occurred 1: Reset has occurred RH850/F1KM-S1: When read, the value after reset is returned.
13 to 11	Reserved	When read, the value after reset is returned.
10	RESF10	Reset flag by DeepSTOP mode 0: No reset occurred 1: Reset has occurred
9	RESF9	Power-up reset flag 0: No reset occurred 1: Reset has occurred
8	RESF8	External reset flag 0: No reset occurred 1: Reset has occurred
7	RESF7	CVM reset flag 0: No reset occurred 1: Reset has occurred

Table 9BC.7 RESF Register Contents

Bit Position	Bit Name	Function
6	RESF6	LVI reset flag 0: No reset occurred 1: Reset has occurred
5	RESF5	RH850/F1KM-S4, RH850/F1KM-S2: CLMA2 reset flag 0: No reset occurred 1: Reset has occurred RH850/F1KM-S1: CLMA3 reset flag 0: No reset occurred 1: Reset has occurred
4	RESF4	CLMA1 reset flag 0: No reset occurred 1: Reset has occurred
3	RESF3	CLMA0 reset flag 0: No reset occurred 1: Reset has occurred
2	RESF2	WDTA1 reset flag 0: No reset occurred 1: Reset has occurred
1	RESF1	WDTA0 reset flag 0: No reset occurred 1: Reset has occurred
0	RESF0	Software reset flag 0: No reset occurred 1: Reset has occurred

### 9BC.3.2.2 RESFC — Reset Factor Clear Register

This register clears the reset flags of the RESF register.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFF8 0768<sub>H</sub>

**Value after reset:** Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	W	R	R	R	W	W	W	W	W	W	W	W	W	W	W

Table 9BC.8 RESFC Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When writing, write "0".
14	RESFC14	RH850/F1KM-S4, RH850/F1KM-S2: CLMA3 reset flag clear 0: Do not clear flag 1: Clear flag RH850/F1KM-S1: When writing, write "0".
13 to 11	Reserved	When writing, write "0".
10	RESFC10	Reset flag clear by DeepSTOP mode 0: Do not clear flag 1: Clear flag
9	RESFC9	Power-up reset flag clear 0: Do not clear flag 1: Clear flag
8	RESFC8	External reset flag clear 0: Do not clear flag 1: Clear flag
7	RESFC7	CVM reset flag clear 0: Do not clear flag 1: Clear flag
6	RESFC6	LVI reset flag clear 0: Do not clear flag 1: Clear flag
5	RESFC5	RH850/F1KM-S4, RH850/F1KM-S2: CLMA2 reset flag clear 0: Do not clear flag 1: Clear flag RH850/F1KM-S1: CLMA3 reset flag clear 0: Do not clear flag 1: Clear flag

Table 9BC.8 RESFC Register Contents

Bit Position	Bit Name	Function
4	RESFC4	CLMA1 reset flag clear 0: Do not clear flag 1: Clear flag
3	RESFC3	CLMA0 reset flag clear 0: Do not clear flag 1: Clear flag
2	RESFC2	WDTA1 reset flag clear 0: Do not clear flag 1: Clear flag
1	RESFC1	WDTA0 reset flag clear 0: Do not clear flag 1: Clear flag
0	RESFC0	Software reset flag clear 0: Do not clear flag 1: Clear flag

### 9BC.3.2.3 RESFR — Redundant Reset Factor Register

This register is a duplication of the reset factor register. This register is initialized by a power-up reset PURES.

In accordance with the setting conditions for each bit in the reset factor register, the same bits are set in this register.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** FFF8 0860<sub>H</sub>

**Value after reset:** 0000 0200<sub>H</sub> / 0000 0300<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	RESFR 14	—	—	—	RESFR 10	RESFR 9	RESFR 8	RESFR 7	RESFR 6	RESFR 5	RESFR 4	RESFR 3	RESFR 2	RESFR 1	RESFR 0
Value after reset	0	0	0	0	0	0	1	1/0*1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. For details, see **Figure 9BC.5, When RESET is Released before the Flash Sequence is Completed, When RESET is released before Execution of Flash Sequence.**

Table 9BC.9 RESFR Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is returned.
14	RESFR14	RH850/F1KM-S4, RH850/F1KM-S2: CLMA3 reset flag 0: No reset occurred 1: Reset has occurred RH850/F1KM-S1: When read, the value after reset is returned.
13 to 11	Reserved	When read, the value after reset is returned.
10	RESFR10	Reset flag by DeepSTOP mode 0: No reset occurred 1: Reset has occurred
9	RESFR9	Power-up reset flag 0: No reset occurred 1: Reset has occurred
8	RESFR8	External reset flag 0: No reset occurred 1: Reset has occurred
7	RESFR7	CVM reset flag 0: No reset occurred 1: Reset has occurred
6	RESFR6	LVI reset flag 0: No reset occurred 1: Reset has occurred

Table 9BC.9 RESFR Register Contents

Bit Position	Bit Name	Function
5	RESFR5	RH850/F1KM-S4, RH850/F1KM-S2: CLMA2 reset flag 0: No reset occurred 1: Reset has occurred RH850/F1KM-S1: CLMA3 reset flag 0: No reset occurred 1: Reset has occurred
4	RESFR4	CLMA1 reset flag 0: No reset occurred 1: Reset has occurred
3	RESFR3	CLMA0 reset flag 0: No reset occurred 1: Reset has occurred
2	RESFR2	WDTA1 reset flag 0: No reset occurred 1: Reset has occurred
1	RESFR1	WDTA0 reset flag 0: No reset occurred 1: Reset has occurred
0	RESFR0	Software reset flag 0: No reset occurred 1: Reset has occurred

### 9BC.3.2.4 RESFCR — Redundant Reset Factor Clear Register

This register clears the reset flags of the RESFR.

**Access:** This register is a write-only register that can be written in 32-bit units.

**Address:** FFF8 0868<sub>H</sub>

**Value after reset:** Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
