Reading FLXAnFRSUCC1.CMD shows whether the last CHI command was accepted. The actual POC state is monitored by FLXAnFRCCSV.POCS.

- command\_not\_accepted

FLXAnFRSUCC1.CMD is reset to “0000<sub>B</sub>” due to one of the following conditions:

- Illegal command applied by the Host
- Host applied command to leave CONFIG state without preceding config lock key
- Host applied new command while execution of the previous Host command has not completed
- Host writes command\_not\_accepted

When FLXAnFRSUCC1.CMD is cleared to “0000<sub>B</sub>”, FLXAnFREIR.CNA is set to 1, and if enabled an interrupt is generated.

Commands which are not accepted are not executed.

**CONFIG Command**

Go to POC state CONFIG when called in POC states DEFAULT\_CONFIG, or READY. When called in HALT state the CC transits to POC state DEFAULT\_CONFIG. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to “0000<sub>B</sub>” = command\_not\_accepted.

**READY Command**

Go to POC state READY when called in POC states CONFIG, NORMAL\_ACTIVE, NORMAL\_PASSIVE, STARTUP, or WAKEUP. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to “0000<sub>B</sub>” = command\_not\_accepted.

**WAKEUP Command**

Go to POC state WAKEUP when called in POC state READY. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to “0000<sub>B</sub>” = command\_not\_accepted.

**RUN Command**

Go to POC state STARTUP when called in POC state READY. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to “0000<sub>B</sub>” = command\_not\_accepted.

**ALL\_SLOTS Command**

Leave SINGLE slot mode and go to ALL-SLOTS mode after successful startup/integration at the next end of cycle when called in POC states NORMAL\_ACTIVE or NORMAL\_PASSIVE. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to “0000<sub>B</sub>” = command\_not\_accepted.

**HALT Command**

Set halt request FLXAnFRCCSV.HRQ to 1 and go to POC state HALT at the next end of cycle when called in POC states NORMAL\_ACTIVE or NORMAL\_PASSIVE. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to “0000<sub>B</sub>” = command\_not\_accepted.

**FREEZE Command**

Set the freeze status indicator FLXAnFRCCSV.FSI to 1 and go to POC state HALT immediately. Can be called from any state.

**SEND\_MTS Command**

Send single MTS symbol during the next following symbol window on the channel configured by FLXAnFRSUCC1.MTSA, FLXAnFRSUCC1.MTSB, when called in POC state NORMAL\_ACTIVE after CC entered ALL slot mode (FLXAnFRCCSV.SLM = “11<sub>B</sub>”). When called in any other state, or when called while a previously requested MTS has not yet been transmitted, FLXAnFRSUCC1.CMD will be reset to “0000<sub>B</sub>” = command\_not\_accepted.

**ALLOW\_COLDSTART Command**

The command clears FLXAnFRCCSV.CSI to enable the coldstart of the node. When called in states DEFAULT\_CONFIG, CONFIG, or HALT, FLXAnFRSUCC1.CMD will be cleared to “0000<sub>B</sub>” = command\_not\_accepted. To enable the coldstart it is also required that both FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set.

**RESET\_STATUS\_INDICATORS Command**

Clears status flags FLXAnFRCCSV.CSNI, FLXAnFRCCSV.CSAI, and FLXAnFRCCSV.WSV to their values after reset. May be called in POC states READY and STARTUP. When called in any other state, FLXAnFRSUCC1.CMD will be reset to “0000<sub>B</sub>” = command\_not\_accepted.

### CLEAR\_RAMs Command

Sets FLXAnFRMHDS.CRAM to 1 when called in DEFAULT\_CONFIG or CONFIG state. When called in any other state, FLXAnFRSUCC1.CMD will be reset to “0000<sub>B</sub>” = command\_not\_accepted. FLXAnFRMHDS.CRAM is also set to 1 after reset. By setting FLXAnFRMHDS.CRAM all internal RAM blocks are initialized to zero. During the initialization of the RAMs, FLXAnFRSUCC1.PBSY will show POC busy. Access to the configuration and status registers is possible during execution of CHI command CLEAR\_RAMs.

The initialization of the internal message RAM requires 2048 peripheral bus clock cycles. There should be no Host access to IBF or OBF during initialization of the internal RAM blocks after reset or after assertion of CHI command CLEAR\_RAMs.

Before asserting CHI command CLEAR\_RAMs, make sure that no transfer between Message RAM and IBF/OBF or Message RAM and Temporary Buffer RAM is ongoing and that the data transfer handler has no effect (FLXAnFRITS.ITS = 0 and FLXAnFROTS.OTS = 0). This command also clears the Message Buffer Status registers FLXAnFRMHDS, FLXAnFRLDTS, FLXAnFRFSR, FLXAnFRMHDF, FLXAnFRTRQ1/2/3/4, FLXAnFRNDAT1/2/3/4, and FLXAnFRMBSC1/2/3/4.

### CAUTIONS

- All accepted commands with exception of CLEAR\_RAMs and SEND\_MTS will cause a change of the POC state in the FlexRay sample clock domain after at most 8 cycles of the slower of the two clocks “bus clock” and “FlexRay sample clock”, assuming that POC was not busy when the command was applied and that no POC state change was forced by bus activity in that time frame. Reading register FLXAnFRCCSV will show data that is additionally delayed by synchronization from the FlexRay sample clock domain to the bus clock domain. The maximum additional delay is 12 cycles of the slower of the two clocks “bus clock” and “FlexRay sample clock”.
- When the communication is stopped by the FREEZE or READY command and the communication is restarted as Leading Coldstart node, the startup frame may not be transmitted on cycle 0 depending on the internal condition of the FlexRay module. This case occurs when the Startup frame is set in one of slot 1 to slot 7. This does not occur in ColdStart after a hardware reset. Even if this occurs, the second trial of ColdStart will succeed. ColdStart time becomes longer, but ColdStart will not be affected by the occurrence. To avoid this, allocate the Startup/Sync frame in the static slot 8 or higher.

**Table 25.41, Reference to CHI Host Command Summary from FlexRay Protocol Specification** below references the CHI commands from *the FlexRay Protocol Specification (Section 2.1.1.1, Table 2.2)* to the FlexRay CHI command vector FLXAnFRSUCC1.CMD.

Table 25.41 Reference to CHI Host Command Summary from FlexRay Protocol Specification

CHI Command	Where Processed (POC States)	CHI Command Vector CMD
ALL_SLOTS	POC: normal active, POC: normal passive	ALL_SLOTS
ALLOW_COLDSTART	All except POC: default config, POC: config, POC: halt	ALLOW_COLDSTART
CONFIG	POC: default config, POC: ready	CONFIG
CONFIG_COMPLETE	POC: config	Unlock sequence & READY
DEFAULT_CONFIG	POC: halt	CONFIG
FREEZE	All	FREEZE
HALT	POC: normal active, POC: normal passive	HALT
READY	All except POC: default config, POC: config, POC: ready, POC: halt	READY
RUN	POC: ready	RUN
WAKEUP	POC: ready	WAKEUP

### 25.2.6.2 FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2

**Access:** FLXAnFRSUCC2 can be read or written in 32-bit units.

FLXAnFRSUCC2L and FLXAnFRSUCC2H can be read or written in 16-bit units.

FLXAnFRSUCC2LL, FLXAnFRSUCC2LH, FLXAnFRSUCC2HL, and FLXAnFRSUCC2HH can be read or written in 8-bit units.

**Address:** FLXAnFRSUCC2: <FLXAn\_base> + 0084<sub>H</sub>

FLXAnFRSUCC2L: <FLXAn\_base> + 0084<sub>H</sub>, FLXAnFRSUCC2H: <FLXAn\_base> + 0086<sub>H</sub>,

FLXAnFRSUCC2LL: <FLXAn\_base> + 0084<sub>H</sub>, FLXAnFRSUCC2LH: <FLXAn\_base> + 0085<sub>H</sub>,

FLXAnFRSUCC2HL: <FLXAn\_base> + 0086<sub>H</sub>, FLXAnFRSUCC2HH: <FLXAn\_base> + 0087<sub>H</sub>

**Value after reset:** 0100 0504<sub>H</sub>

Table 25.42 FLXAnFRSUCC2 Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27 to 24	LTN[3:0]	Listen Timeout Noise Bit Configures (gListenNoise – 1)
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 0	LT[20:0]	Listen Timeout Bit Configures pdListenTimeout

#### (1) FLXAnFRSUCC2.LTN

Listen Timeout Noise Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

The range for gListenNoise is 2 to 16.

FLXAnFRSUCC2.LTN must be configured identical in all nodes of a cluster.

Configures the upper limit for startup and wakeup listen timeout in the presence of noise expressed as a multiple of pdListenTimeout.

#### CAUTION

The wakeup/startup noise timeout is calculated as follows:

$$\text{pdListenTimeout} \times \text{gListenNoise} = \text{FLXAnFRSUCC2.LT} \times (\text{FLXAnFRSUCC2.LTN} + 1)$$

#### (2) FLXAnFRSUCC2.LT

Listen Timeout Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

The range for pdListenTimeout is 1284 to 1283846  $\mu\text{T}$ . Configures wakeup/startup listen time out in  $\mu\text{T}$ .

### 25.2.6.3 FLXAnFRSUCC3 — FlexRay SUC Configuration Register 3

**Access:** FLXAnFRSUCC3 can be read or written in 32-bit units.  
 FLXAnFRSUCC3L can be read or written in 16-bit units.  
 FLXAnFRSUCC3LL can be read or written in 8-bit units.

**Address:** FLXAnFRSUCC3: <FLXAn\_base> + 0088<sub>H</sub>,  
 FLXAnFRSUCC3L: <FLXAn\_base> + 0088<sub>H</sub>,  
 FLXAnFRSUCC3LL: <FLXAn\_base> + 0088<sub>H</sub>

**Value after reset:** 0000 0011<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.43 FLXAnFRSUCC3 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 4	WCF[3:0]	Maximum Without Clock Correction Fatal Bit (transition to HALT state) Configures gMaxWithoutClockCorrectionFatal
3 to 0	WCP[3:0]	Maximum Without Clock Correction Passive Bit (transition to NORMAL_PASSIVE state) Configures gMaxWithoutClockCorrectionPassive

#### (1) FLXAnFRSUCC3.WCF

Maximum Without Clock Correction Fatal Bit (transition to HALT state)

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 1 to 15.

Must be identical in all nodes of a cluster.

Defines the number of consecutive even/odd cycle pairs with missing clock correction conditions that will cause a transition from NORMAL\_ACTIVE or NORMAL\_PASSIVE to HALT state.

#### CAUTION

The transition to HALT state is prevented if FLXAnFRSUCC1.HCSE is not set.

#### (2) FLXAnFRSUCC3.WCP

Maximum Without Clock Correction Passive Bit (transition to NORMAL\_PASSIVE state)

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 1 to 15.

Must be identical in all nodes of a cluster.

Defines the number of consecutive even/odd cycle pairs with missing clock correction conditions that will cause a transition from NORMAL\_ACTIVE to NORMAL\_PASSIVE state.

### 25.2.6.4 FLXAnFRNEMC — FlexRay NEM Configuration Register

**Access:** FLXAnFRNEMC can be read or written in 32-bit units.  
 FLXAnFRNEMCL can be read or written in 16-bit units.  
 FLXAnFRNEMCCLL can be read or written in 8-bit units.

**Address:** FLXAnFRNEMC: <FLXAn\_base> + 008C<sub>H</sub>,  
 FLXAnFRNEMCL: <FLXAn\_base> + 008C<sub>H</sub>,  
 FLXAnFRNEMCCLL: <FLXAn\_base> + 008C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.44 FLXAnFRNEMC Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	NML[3:0]	Network Management Vector Length Bit Configures gNetworkManagementVectorLength

#### (1) FLXAnFRNEMC.NML

##### Network Management Vector Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 12 bytes.

The configured length must be identical in all nodes of a cluster. These bits configure the length of the NM vector in bytes.

### 25.2.6.5 FLXAnFRPRTC1 — FlexRay PRT Configuration Register 1

**Access:** FLXAnFRPRTC1 can be read or written in 32-bit units.

FLXAnFRPRTC1L and FLXAnFRPRTC1H can be read or written in 16-bit units.

FLXAnFRPRTC1LL, FLXAnFRPRTC1LH, FLXAnFRPRTC1HL, and FLXAnFRPRTC1HH can be read or written in 8-bit units.

**Address:** FLXAnFRPRTC1: <FLXAn\_base> + 0090<sub>H</sub>,

FLXAnFRPRTC1L: <FLXAn\_base> + 0090<sub>H</sub>, FLXAnFRPRTC1H: <FLXAn\_base> + 0092<sub>H</sub>,

FLXAnFRPRTC1LL: <FLXAn\_base> + 0090<sub>H</sub>, FLXAnFRPRTC1LH: <FLXAn\_base> + 0091<sub>H</sub>,

FLXAnFRPRTC1HL: <FLXAn\_base> + 0092<sub>H</sub>, FLXAnFRPRTC1HH: <FLXAn\_base> + 0093<sub>H</sub>

**Value after reset:** 084C 0633<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.45 FLXAnFRPRTC1 Register Contents

Bit Position	Bit Name	Function
31 to 26	RWP[5:0]	Repetitions of Tx Wakeup Pattern Bit Configures pWakeupPattern
25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24 to 16	RXW[8:0]	Wakeup Symbol Receive Window Length Bit Configures gdWakeupSymbolRxWindow
15, 14	BRP[1:0]	Baud Rate Prescaler Bit Configures gdSampleClockPeriod and pSamplesPerMicrotick 00 <sub>B</sub> = 10 Mbps 01 <sub>B</sub> = 5 Mbps 10 <sub>B</sub> = 2.5 Mbps 11 <sub>B</sub> = 2.5 Mbps
13, 12	SPP[1:0]	Strobe Point Position Bit Configures Strobe point position 00 <sub>B</sub> = Sample 5 01 <sub>B</sub> = Sample 4 10 <sub>B</sub> = Sample 6 11 <sub>B</sub> = Sample 5
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 4	CASM[6:0]	Collision Avoidance Symbol Max Bit Configures gdCASRxLowMax
3 to 0	TSST[3:0]	Transmission Start Sequence Transmitter Bit Configures gdTSSTransmitter

**(1) FLXAnFRPRTC1.RWP**

Repetitions of Tx Wakeup Pattern Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 2 to 63.

Configures the number of repetitions (sequences) of the Tx wakeup symbol.

**(2) FLXAnFRPRTC1.RXW**

Wakeup Symbol Receive Window Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 76 to 301.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the received wakeup pattern.

**(3) FLXAnFRPRTC1.BRP**

Baud Rate Prescaler Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

The Baud Rate Prescaler configures the baud rate on the FlexRay bus. The baud rates listed below are valid with a sample clock set to 80 MHz. One bit time always consists of 8 samples independent of the configured baud rate.

- 00<sub>B</sub> = 10 MBit/s  
 $gdSampleClockPeriod = 12.5 \text{ ns} = 1 \times \text{“sample clock”}$   
 $pSamplesPerMicrotick = 2 (1 \mu\text{T} = 25 \text{ ns})$
- 01<sub>B</sub> = 5 MBit/s  
 $gdSampleClockPeriod = 25 \text{ ns} = 2 \times \text{“sample clock”}$   
 $pSamplesPerMicrotick = 1 (1 \mu\text{T} = 25 \text{ ns})$
- 10<sub>B</sub>, 11<sub>B</sub> = 2.5 MBit/s  
 $gdSampleClockPeriod = 50 \text{ ns} = 4 \times \text{“sample clock”}$   
 $pSamplesPerMicrotick = 1 (1 \mu\text{T} = 50 \text{ ns})$

**(4) FLXAnFRPRTC1.SPP**

Strobe Point Position Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Defines the sample count value for strobing. The strobed bit value is set to the voted value when the sample count is incremented to the value configured by FLXAnFRPRTC1.SPP.

**CAUTION**

The current revision 2.1 of the FlexRay protocol requires that FLXAnFRPRTC1.SPP = “00<sub>B</sub>”.

The alternate strobe point positions could be used to compensate for asymmetries in the physical layer.

**(5) FLXAnFRPRTC1.CASM**

Collision Avoidance Symbol Max Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

CASM[6] is fixed to 1. Valid values are 67 to 99.

Configures the upper limit of the acceptance window for a collision avoidance symbol (CAS).

**(6) FLXAnFRPRTC1.TSST**

Transmission Start Sequence Transmitter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 3 to 15.

Must be identical in all nodes of a cluster.

Configures the duration of the Transmission Start Sequence (TSS) in terms of bit times (1 bit time = 4  $\mu$ T = 100ns @ 10 Mbps).

### 25.2.6.6 FLXAnFRPRTC2 — FlexRay PRT Configuration Register 2

**Access:** FLXAnFRPRTC2 can be read or written in 32-bit units.

FLXAnFRPRTC2L and FLXAnFRPRTC2H can be read or written in 16-bit units.

FLXAnFRPRTC2LL, FLXAnFRPRTC2LH, FLXAnFRPRTC2HL, and FLXAnFRPRTC2HH can be read or written in 8-bit units.

**Address:** FLXAnFRPRTC2: <FLXAn\_base> + 0094<sub>H</sub>,

FLXAnFRPRTC2L: <FLXAn\_base> + 0094<sub>H</sub>, FLXAnFRPRTC2H: <FLXAn\_base> + 0096<sub>H</sub>,

FLXAnFRPRTC2LL: <FLXAn\_base> + 0094<sub>H</sub>, FLXAnFRPRTC2LH: <FLXAn\_base> + 0095<sub>H</sub>,

FLXAnFRPRTC2HL: <FLXAn\_base> + 0096<sub>H</sub>, FLXAnFRPRTC2HH: <FLXAn\_base> + 0097<sub>H</sub>

**Value after reset:** 0F2D 0A0E<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.46 FLXAnFRPRTC2 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 24	TXL[5:0]	Wakeup Symbol Transmit Low Bit Configures gdWakeupSymbolTxLow
23 to 16	TXI[7:0]	Wakeup Symbol Transmit Idle Bit Configures gdWakeupSymbolTxIdle
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	RXL[5:0]	Wakeup Symbol Receive Low Bit Configures gdWakeupSymbolRxLow
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RXI[5:0]	Wakeup Symbol Rx Idle Bit Configures gdWakeupSymbolRxIdle

#### (1) FLXAnFRPRTC2.TXL

Wakeup Symbol Transmit Low Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 15 to 60.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to transmit the low phase of the wakeup symbol.

**(2) FLXAnFRPRTC2.TXI**

Wakeup Symbol Transmit Idle Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 45 to 180.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to transmit the idle phase of the wakeup symbol.

**(3) FLXAnFRPRTC2.RXL**

Wakeup Symbol Receive Low Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 10 to 55.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the low phase of the received wakeup symbol.

**(4) FLXAnFRPRTC2.RXI**

Wakeup Symbol Rx Idle Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 14 to 59.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the idle phase of the received wakeup symbol.

### 25.2.6.7 FLXAnFRMHDC — FlexRay MHD Configuration Register

**Access:** FLXAnFRMHDC can be read or written in 32-bit units.  
 FLXAnFRMHDCCL and FLXAnFRMHDCCH can be read or written in 16-bit units.  
 FLXAnFRMHDCCLL, FLXAnFRMHDCCHL, and FLXAnFRMHDCCHH can be read or written in 8-bit units.

**Address:** FLXAnFRMHDC: <FLXAn\_base> + 0098<sub>H</sub>,  
 FLXAnFRMHDCCL: <FLXAn\_base> + 0098<sub>H</sub>, FLXAnFRMHDCCH: <FLXAn\_base> + 009A<sub>H</sub>,

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28 to 16	SLT[12:0]	Start of Latest Transmit Bit Configures pLatestTx
15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	SFDL[6:0]	Static Frame Data Length Bit Configures gPayloadLengthStatic

#### (1) FLXAnFRMHDC.SLT

##### Start of Latest Transmit Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 7981.

Configures the latest maximum minislot value allowed before inhibiting frame transmission in the dynamic segment of the cycle. There is no transmission in dynamic segment if FLXAnFRMHDC.SLT is set to zero.

#### (2) FLXAnFRMHDC.SFDL

##### Static Frame Data Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 127.

The payload length must be identical in all nodes of a cluster.

Configures the cluster-wide payload length for all frames sent in the static segment in double bytes.

### 25.2.6.8 FLXAnFRGTUC1 — FlexRay GTU Configuration Register 1

**Access:** FLXAnFRGTUC1 can be read or written in 32-bit units.

FLXAnFRGTUC1L and FLXAnFRGTUC1H can be read or written in 16-bit units.

FLXAnFRGTUC1LL, FLXAnFRGTUC1LH, and FLXAnFRGTUC1HL can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC1: <FLXAn\_base> + 00A0<sub>H</sub>,

FLXAnFRGTUC1L: <FLXAn\_base> + 00A0<sub>H</sub>, FLXAnFRGTUC1H: <FLXAn\_base> + 00A2<sub>H</sub>,

FLXAnFRGTUC1LL: <FLXAn\_base> + 00A0<sub>H</sub>, FLXAnFRGTUC1LH: <FLXAn\_base> + 00A1<sub>H</sub>,

FLXAnFRGTUC1HL: <FLXAn\_base> + 00A2<sub>H</sub>

**Value after reset:** 0000 0280<sub>H</sub>

Table 25.48 FLXAnFRGTUC1 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 0	UT[19:0]	Setting of Communication Cycle in Microticks Bit Configures pMicroPerCycle

#### (1) FLXAnFRGTUC1.UT

Setting of Communication Cycle in Microticks Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 640 to 640000  $\mu$ T.

Configures the duration of the communication cycle in microticks.

### 25.2.6.9 FLXAnFRGTUC2 — FlexRay GTU Configuration Register 2

**Access:** FLXAnFRGTUC2 can be read or written in 32-bit units.

FLXAnFRGTUC2L and FLXAnFRGTUC2H can be read or written in 16-bit units.

FLXAnFRGTUC2LL, FLXAnFRGTUC2LH, and FLXAnFRGTUC2HL can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC2: <FLXAn\_base> + 00A4<sub>H</sub>,

FLXAnFRGTUC2L: <FLXAn\_base> + 00A4<sub>H</sub>, FLXAnFRGTUC2H: <FLXAn\_base> + 00A6<sub>H</sub>,

FLXAnFRGTUC2LL: <FLXAn\_base> + 00A4<sub>H</sub>, FLXAnFRGTUC2LH: <FLXAn\_base> + 00A5<sub>H</sub>,

FLXAnFRGTUC2HL: <FLXAn\_base> + 00A6<sub>H</sub>

**Value after reset:** 0002 000A<sub>H</sub>

Table 25.49 FLXAnFRGTUC2 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 16	SNM[3:0]	Sync Node Max Bit
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 0	MPC[13:0]	Setting of Communication Cycle in MacroTICK Bit Configures gMacroPerCycle

#### (1) FLXAnFRGTUC2.SNM

Sync Node Max Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 2 to 15.

Must be identical in all nodes of a cluster.

Indicates the maximum number of frames with sync frame indicator bit SYN set to 1.

#### (2) FLXAnFRGTUC2.MPC

Setting of Communication Cycle in MacroTICK Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 10 to 16000 MT.

The cycle length must be identical in all nodes of a cluster. Configures the duration of one communication cycle in macroTICKs.

### 25.2.6.10 FLXAnFRGTUC3 — FlexRay GTU Configuration Register 3

**Access:** FLXAnFRGTUC3 can be read or written in 32-bit units.

FLXAnFRGTUC3L and FLXAnFRGTUC3H can be read or written in 16-bit units.

FLXAnFRGTUC3LL, FLXAnFRGTUC3LH, FLXAnFRGTUC3HL, and FLXAnFRGTUC3HH can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC3: <FLXAn\_base> + 00A8<sub>H</sub>,

FLXAnFRGTUC3L: <FLXAn\_base> + 00A8<sub>H</sub>, FLXAnFRGTUC3H: <FLXAn\_base> + 00AA<sub>H</sub>,

FLXAnFRGTUC3LL: <FLXAn\_base> + 00A8<sub>H</sub>, FLXAnFRGTUC3LH: <FLXAn\_base> + 00A9<sub>H</sub>,

FLXAnFRGTUC3HL: <FLXAn\_base> + 00AA<sub>H</sub>, FLXAnFRGTUC3HH: <FLXAn\_base> + 00AB<sub>H</sub>

**Value after reset:** 0202 0000<sub>H</sub>

Table 25.50 FLXAnFRGTUC3 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 24	MIOB[6:0]	Macrotick Initial Offset Channel B Bit Configures pMacroInitialOffset[B]
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	MIOA[6:0]	Macrotick Initial Offset Channel A Bit Configures pMacroInitialOffset[A]
15 to 8	UIOB[7:0]	Microtick Initial Offset Channel B Bit Configures pMicroInitialOffset[B]
7 to 0	UIOA[7:0]	Microtick Initial Offset Channel A Bit Configures pMicroInitialOffset[A]

#### (1) FLXAnFRGTUC3.MIOB

Macrotick Initial Offset Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 2 to 72 MT.

Must be identical in all nodes of a cluster.

Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

**(2) FLXAnFRGTUC3.MIOA**

Macrotick Initial Offset Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 2 to 72 MT.

Must be identical in all nodes of a cluster.

Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

**(3) FLXAnFRGTUC3.UIOB**

Microtick Initial Offset Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 240  $\mu$ T.

Configures the number of microticks between the actual time reference point on channel B and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [B] and therefore has to be set for each channel independently.

**(4) FLXAnFRGTUC3.UIOA**

Microtick Initial Offset Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 240  $\mu$ T.

Configures the number of microticks between the actual time reference point on channel A and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [A] and therefore has to be set for each channel independently.

### 25.2.6.11 FLXAnFRGTUC4 — FlexRay GTU Configuration Register 4

For details about configuration of FLXAnFRGTUC4.NIT and FLXAnFRGTUC4.OCS see **Section 25.3.2.5, Configuration of NIT Start and Offset Correction Start.**

**Access:** FLXAnFRGTUC4 can be read or written in 32-bit units.

FLXAnFRGTUC4L and FLXAnFRGTUC4H can be read or written in 16-bit units.

FLXAnFRGTUC4LL, FLXAnFRGTUC4LH, FLXAnFRGTUC4HL, and FLXAnFRGTUC4HH can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC4: <FLXAn\_base> + 00AC<sub>H</sub>,

FLXAnFRGTUC4L: <FLXAn\_base> + 00AC<sub>H</sub>, FLXAnFRGTUC4H: <FLXAn\_base> + 00AE<sub>H</sub>,

FLXAnFRGTUC4LL: <FLXAn\_base> + 00AC<sub>H</sub>, FLXAnFRGTUC4LH: <FLXAn\_base> + 00AD<sub>H</sub>,

FLXAnFRGTUC4HL: <FLXAn\_base> + 00AE<sub>H</sub>, FLXAnFRGTUC4HH: <FLXAn\_base> + 00AF<sub>H</sub>

**Value after reset:** 0008 0007<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.51 FLXAnFRGTUC4 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 16	OCS[13:0]	Offset Correction Start Bit Configures (gOffsetCorrectionStart – 1)
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 0	NIT[13:0]	Network Idle Time Start Bit Configures (gMacroPerCycle - gdNIT – 1)

#### (1) FLXAnFRGTUC4.OCS

##### Offset Correction Start Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 8 to 15998 MT.

For cluster consisting of E-Ray implementations only, it is sufficient to program FLXAnFRGTUC4.OCS = FLXAnFRGTUC4.NIT + 1.

Must be identical in all nodes of a cluster.

Determines the start position of the offset correction within the NIT phase, calculated from start of cycle.

**(2) FLXAnFRGTUC4.NIT**

Network Idle Time Start Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 7 to 15997 MT.

Must be identical in all nodes of a cluster.

Configures the starting point of the Network Idle Time NIT from the beginning of the communication cycle expressed in terms of macroticks from the beginning of the cycle. The start of NIT is recognized if  $\text{Macrotick} = \text{gMacroPerCycle} - \text{gdNIT} - 1$  and the increment pulse of Macrotick is set.

### 25.2.6.12 FLXAnFRGTUC5 — FlexRay GTU Configuration Register 5

**Access:** FLXAnFRGTUC5 can be read or written in 32-bit units.

FLXAnFRGTUC5L and FLXAnFRGTUC5H can be read or written in 16-bit units.

FLXAnFRGTUC5LL, FLXAnFRGTUC5LH, FLXAnFRGTUC5HL, and FLXAnFRGTUC5HH can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC5: <FLXAn\_base> + 00B0<sub>H</sub>,

FLXAnFRGTUC5L: <FLXAn\_base> + 00B0<sub>H</sub>, FLXAnFRGTUC5H: <FLXAn\_base> + 00B2<sub>H</sub>,

FLXAnFRGTUC5LL: <FLXAn\_base> + 00B0<sub>H</sub>, FLXAnFRGTUC5LH: <FLXAn\_base> + 00B1<sub>H</sub>,

FLXAnFRGTUC5HL: <FLXAn\_base> + 00B2<sub>H</sub>, FLXAnFRGTUC5HH: <FLXAn\_base> + 00B3<sub>H</sub>

**Value after reset:** 0E00 0000<sub>H</sub>

Table 25.52 FLXAnFRGTUC5 Register Contents

Bit Position	Bit Name	Function
31 to 24	DEC[7:0]	Decoding Correction Bit Configures pDecodingCorrection
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 16	CDD[4:0]	Cluster Drift Damping Bit Configures pClusterDriftDamping
15 to 8	DCB[7:0]	Delay Compensation Channel B Bit Configures pDelayCompensation[B]
7 to 0	DCA[7:0]	Delay Compensation Channel A Bit Configures pDelayCompensation[A]

#### (1) FLXAnFRGTUC5.DEC

Decoding Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 14 to 143  $\mu$ T.

Configures the decoding correction value in microticks used to determine the primary time reference point.

#### (2) FLXAnFRGTUC5.CDD

Cluster Drift Damping Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 20  $\mu$ T.

Configures the cluster drift damping value in microticks used in clock synchronization to minimize accumulation of rounding errors.

**(3) FLXAnFRGTUC5.DCB**

Delay Compensation Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 200  $\mu$ T.

Used to compensate for reception delays on channel B. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05  $\mu$ s. In practice, the minimum of the propagation delays of all sync nodes should be applied.

**(4) FLXAnFRGTUC5.DCA**

Delay Compensation Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 200  $\mu$ T.

Used to compensate for reception delays on channel A. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05  $\mu$ s. In practice, the minimum of the propagation delays of all sync nodes should be applied.

### 25.2.6.13 FLXAnFRGTUC6 — FlexRay GTU Configuration Register 6

**Access:** FLXAnFRGTUC6 can be read or written in 32-bit units.

FLXAnFRGTUC6L and FLXAnFRGTUC6H can be read or written in 16-bit units.

FLXAnFRGTUC6LL, FLXAnFRGTUC6LH, FLXAnFRGTUC6HL, and FLXAnFRGTUC6HH can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC6: <FLXAn\_base> + 00B4<sub>H</sub>,

FLXAnFRGTUC6L: <FLXAn\_base> + 00B4<sub>H</sub>, FLXAnFRGTUC6H: <FLXAn\_base> + 00B6<sub>H</sub>,

FLXAnFRGTUC6LL: <FLXAn\_base> + 00B4<sub>H</sub>, FLXAnFRGTUC6LH: <FLXAn\_base> + 00B5<sub>H</sub>,

FLXAnFRGTUC6HL: <FLXAn\_base> + 00B6<sub>H</sub>, FLXAnFRGTUC6HH: <FLXAn\_base> + 00B7<sub>H</sub>

**Value after reset:** 0002 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.53 FLXAnFRGTUC6 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26 to 16	MOD[10:0]	Maximum Oscillator Drift Bit Configures pdMaxDrift
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	ASR[10:0]	Accepted Startup Range Bit Configures pdAcceptedStartupRange

#### (1) FLXAnFRGTUC6.MOD

##### Maximum Oscillator Drift Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 2 to 1923  $\mu$ T.

Configures the maximum drift offset between two nodes that operate with unsynchronized clocks over one communication cycle in  $\mu$ T.

#### (2) FLXAnFRGTUC6.ASR

##### Accepted Startup Range Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 1875  $\mu$ T.

Configures the number of microticks constituting the expanded range of measured deviation for startup frames during integration.

### 25.2.6.14 FLXAnFRGTUC7 — FlexRay GTU Configuration Register 7

**Access:** FLXAnFRGTUC7 can be read or written in 32-bit units.

FLXAnFRGTUC7L and FLXAnFRGTUC7H can be read or written in 16-bit units.

FLXAnFRGTUC7LL, FLXAnFRGTUC7LH, FLXAnFRGTUC7HL, and FLXAnFRGTUC7HH can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC7: <FLXAn\_base> + 00B8<sub>H</sub>,

FLXAnFRGTUC7L: <FLXAn\_base> + 00B8<sub>H</sub>, FLXAnFRGTUC7H: <FLXAn\_base> + 00BA<sub>H</sub>,

FLXAnFRGTUC7LL: <FLXAn\_base> + 00B8<sub>H</sub>, FLXAnFRGTUC7LH: <FLXAn\_base> + 00B9<sub>H</sub>,

FLXAnFRGTUC7HL: <FLXAn\_base> + 00BA<sub>H</sub>, FLXAnFRGTUC7HH: <FLXAn\_base> + 00BB<sub>H</sub>

**Value after reset:** 0002 0004<sub>H</sub>

Table 25.54 FLXAnFRGTUC7 Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25 to 16	NSS[9:0]	Number of Static Slots Bit Configures gNumberOfStaticSlots
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 0	SSL[9:0]	Static Slot Length Bit Configures gdStaticSlot

#### (1) FLXAnFRGTUC7.NSS

Number of Static Slots Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 2 to 1023.

The number of static slots must be identical in all nodes of a cluster. Configures the number of static slots in a cycle.

#### (2) FLXAnFRGTUC7.SSL

Static Slot Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 4 to 659 MT.

The static slot length must be identical in all nodes of a cluster. Configures the length of a static slot in macroticks.

### 25.2.6.15 FLXAnFRGTUC8 — FlexRay GTU Configuration Register 8

**Access:** FLXAnFRGTUC8 can be read or written in 32-bit units.

FLXAnFRGTUC8L and FLXAnFRGTUC8H can be read or written in 16-bit units.

FLXAnFRGTUC8LL, FLXAnFRGTUC8HL, and FLXAnFRGTUC8HH can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC8: <FLXAn\_base> + 00BC<sub>H</sub>,

FLXAnFRGTUC8L: <FLXAn\_base> + 00BC<sub>H</sub>, FLXAnFRGTUC8H: <FLXAn\_base> + 00BE<sub>H</sub>,

FLXAnFRGTUC8LL: <FLXAn\_base> + 00BC<sub>H</sub>, FLXAnFRGTUC8HL: <FLXAn\_base> + 00BE<sub>H</sub>,

FLXAnFRGTUC8HH: <FLXAn\_base> + 00BF<sub>H</sub>

**Value after reset:** 0000 0002<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.55 FLXAnFRGTUC8 Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28 to 16	NMS[12:0]	Number of Minislots Bit Configures gNumberOfMinislots
15 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	MSL[5:0]	Minislot Length Bit Configures gdMinislot

#### (1) FLXAnFRGTUC8.NMS

Number of Minislots Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 7986.

The number of minislots must be identical in all nodes of a cluster. Configures the number of minislots within the dynamic segment of a cycle.

#### (2) FLXAnFRGTUC8.MSL

Minislot Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 2 to 63 MT.

The minislot length must be identical in all nodes of a cluster. Configures the length of a minislot in macroticks.

### 25.2.6.16 FLXAnFRGTUC9 — FlexRay GTU Configuration Register 9

**Access:** FLXAnFRGTUC9 can be read or written in 32-bit units.

FLXAnFRGTUC9L and FLXAnFRGTUC9H can be read or written in 16-bit units.

FLXAnFRGTUC9LL, FLXAnFRGTUC9LH, and FLXAnFRGTUC9HL can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC9: <FLXAn\_base> + 00C0<sub>H</sub>,

FLXAnFRGTUC9L: <FLXAn\_base> + 00C0<sub>H</sub>, FLXAnFRGTUC9H: <FLXAn\_base> + 00C2<sub>H</sub>,

FLXAnFRGTUC9LL: <FLXAn\_base> + 00C0<sub>H</sub>, FLXAnFRGTUC9LH: <FLXAn\_base> + 00C1<sub>H</sub>,

FLXAnFRGTUC9HL: <FLXAn\_base> + 00C2<sub>H</sub>

**Value after reset:** 0000 0101<sub>H</sub>

Table 25.56 FLXAnFRGTUC9 Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	DSI[1:0]	Dynamic Slot Idle Phase Bit Configures gdDynamicSlotIdlePhase
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	MAPO[4:0]	Minislot Action Point Offset Bit Configures gdMinislotActionPointOffset
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	APO[5:0]	Action Point Offset Bit Configures gdActionPointOffset

#### (1) FLXAnFRGTUC9.DSI

Dynamic Slot Idle Phase Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 2.

Must be identical in all nodes of a cluster.

Configures the duration of the dynamic slot idle phase in the number of minislots. The duration has to be greater or equal than the idle detection time.

#### (2) FLXAnFRGTUC9.MAPO

Minislot Action Point Offset Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 1 to 31 MT.

Must be identical in all nodes of a cluster.

Configures the action point offset in macroticks within the minislots of the dynamic segment.

**(3) FLXAnFRGTUC9.APO**

Action Point Offset Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 1 to 63 MT.

Must be identical in all nodes of a cluster.

Configures the action point offset in macroticks within static slots and symbol window.

### 25.2.6.17 FLXAnFRGTUC10 — FlexRay GTU Configuration Register 10

**Access:** FLXAnFRGTUC10 can be read or written in 32-bit units.

FLXAnFRGTUC10L and FLXAnFRGTUC10H can be read or written in 16-bit units.

FLXAnFRGTUC10LL, FLXAnFRGTUC10LH, FLXAnFRGTUC10HL, and FLXAnFRGTUC10HH can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC10: <FLXAn\_base> + 00C4<sub>H</sub>,

FLXAnFRGTUC10L: <FLXAn\_base> + 00C4<sub>H</sub>, FLXAnFRGTUC10H: <FLXAn\_base> + 00C6<sub>H</sub>,

FLXAnFRGTUC10LL: <FLXAn\_base> + 00C4<sub>H</sub>, FLXAnFRGTUC10LH: <FLXAn\_base> + 00C5<sub>H</sub>,

FLXAnFRGTUC10HL: <FLXAn\_base> + 00C6<sub>H</sub>, FLXAnFRGTUC10HH: <FLXAn\_base> + 00C7<sub>H</sub>

**Value after reset:** 0002 0005<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.57 FLXAnFRGTUC10 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26 to 16	MRC[10:0]	Maximum Rate Correction Bit Configures pRateCorrectionOut
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 0	MOC[13:0]	Maximum Offset Correction Bit Configures pOffsetCorrectionOut

#### (1) FLXAnFRGTUC10.MRC

Maximum Rate Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 2 to 1923  $\mu$ T.

Configures the maximum permitted rate correction value to be applied by the internal clock synchronization algorithm.

The CC checks the internal rate correction value against the maximum rate correction value (absolute value).

#### (2) FLXAnFRGTUC10.MOC

Maximum Offset Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 5 to 15266  $\mu$ T.

Configures the maximum permitted offset correction value (absolute value) to be applied by the internal clock synchronization algorithm (absolute value). The CC checks the internal offset correction value against the maximum offset correction value.

### 25.2.6.18 FLXAnFRGTUC11 — FlexRay GTU Configuration Register 11

**Access:** FLXAnFRGTUC11 can be read or written in 32-bit units.

FLXAnFRGTUC11L and FLXAnFRGTUC11H can be read or written in 16-bit units.

FLXAnFRGTUC11LL, FLXAnFRGTUC11LH, FLXAnFRGTUC11HL, and FLXAnFRGTUC11HH can be read or written in 8-bit units.

**Address:** FLXAnFRGTUC11: <FLXAn\_base> + 00C8<sub>H</sub>,

FLXAnFRGTUC11L: <FLXAn\_base> + 00C8<sub>H</sub>, FLXAnFRGTUC11H: <FLXAn\_base> + 00CA<sub>H</sub>,

FLXAnFRGTUC11LL: <FLXAn\_base> + 00C8<sub>H</sub>, FLXAnFRGTUC11LH: <FLXAn\_base> + 00C9<sub>H</sub>,

FLXAnFRGTUC11HL: <FLXAn\_base> + 00CA<sub>H</sub>, FLXAnFRGTUC11HH: <FLXAn\_base> + 00CB<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 25.58 FLXAnFRGTUC11 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26 to 24	ERC[2:0]	External Rate Correction Bit Configures pExternRateCorrection
23 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18 to 16	EOC[2:0]	External Offset Correction Bit Configures pExternOffsetCorrection
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	ERCC[1:0]	External Rate Correction Control Bit Configures vExternRateControl 00 <sub>B</sub> : External rate correction is prohibited. 01 <sub>B</sub> : External rate correction is prohibited. 10 <sub>B</sub> : Subtract 11 <sub>B</sub> : Add
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	EOCC[1:0]	External Offset Correction Control Bit Configures vExternOffsetControl 00 <sub>B</sub> : External offset correction is prohibited. 01 <sub>B</sub> : External offset correction is prohibited. 10 <sub>B</sub> : Subtract 11 <sub>B</sub> : Add

**(1) FLXAnFRGTUC11.ERC**

External Rate Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 7  $\mu$ T.

Configures the external rate correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted/added from/to the calculated rate correction value. The value is applied during NIT.

**(2) FLXAnFRGTUC11.EOC**

External Offset Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Valid values are 0 to 7  $\mu$ T.

Configures the external offset correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted/added from/to the calculated offset correction value. The value is applied during NIT.

**(3) FLXAnFRGTUC11.ERCC**

External Rate Correction Control Bit

Should be modified only outside NIT (Network Idle Time).

By writing to FLXAnFRGTUC11.ERCC the external rate correction is enabled as specified below.

- 00<sub>B</sub> = External rate correction is prohibited.
- 01<sub>B</sub> = External rate correction is prohibited.
- 10<sub>B</sub> = Subtract  
External rate correction value subtracted from calculated rate correction value
- 11<sub>B</sub> = Add  
External rate correction value added to calculated rate correction value

**(4) FLXAnFRGTUC11.EOCC**

External Offset Correction Control Bit

Should be modified only outside NIT (Network Idle Time).

By writing to FLXAnFRGTUC11.EOCC the external offset correction is enabled as specified below.

- 00<sub>B</sub> = External offset correction is prohibited.
- 01<sub>B</sub> = External offset correction is prohibited.
- 10<sub>B</sub> = Subtract  
External offset correction value subtracted from calculated offset correction value
- 11<sub>B</sub> = Add  
External offset correction value added to calculated offset correction value

## 25.2.7 CC Status Registers

During 8/16-bit accesses to status variables coded with more than 8/16-bit, the variable might be updated by the CC between two accesses (non-atomic read accesses).

### 25.2.7.1 FLXAnFRCCSV — FlexRay CC Status Vector Register

**Access:** FLXAnFRCCSV is a read-only register that can be read in 32-bit units.

FLXAnFRCCSVL and FLXAnFRCCSVH are the read-only registers that can be read in 16-bit units.

FLXAnFRCCSVLL, FLXAnFRCCSVLH, FLXAnFRCCSVHL, and FLXAnFRCCSVHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRCCSV: <FLXAn\_base> + 0100<sub>H</sub>,

FLXAnFRCCSVL: <FLXAn\_base> + 0100<sub>H</sub>, FLXAnFRCCSVH: <FLXAn\_base> + 0102<sub>H</sub>,

FLXAnFRCCSVLL: <FLXAn\_base> + 0100<sub>H</sub>, FLXAnFRCCSVLH: <FLXAn\_base> + 0101<sub>H</sub>,

FLXAnFRCCSVHL: <FLXAn\_base> + 0102<sub>H</sub>, FLXAnFRCCSVHH: <FLXAn\_base> + 0103<sub>H</sub>

**Value after reset:** 0010 4000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.59 FLXAnFRCCSV Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned.
29 to 24	PSL[5:0]	POC Status Log Flag Status of FLXAnFRCCSV.POCS immediately before entering HALT state.
23 to 19	RCA[4:0]	Remaining Coldstart Attempts Flag Indicates vRemainingColdstartAttempts
18 to 16	WSV[2:0]	Wakeup Status Flag Indicates vPOC!WakeupStatus 000 <sub>B</sub> : UNDEFINED 001 <sub>B</sub> : RECEIVED_HEADER 010 <sub>B</sub> : RECEIVED_WUP 011 <sub>B</sub> : COLLISION_HEADER 100 <sub>B</sub> : COLLISION_WUP 101 <sub>B</sub> : COLLISION_UNKNOWN 110 <sub>B</sub> : TRANSMITTED 111 <sub>B</sub> : Reserved
15	Reserved	When read, the value after reset is returned.
14	CSI	Cold Start Inhibit Flag Indicates vColdStartInhibit 0: Cold starting of node enabled 1: Cold starting of node disabled
13	CSAI	Coldstart Abort Indicator Flag

Table 25.59 FLXAnFRCCSV Register Contents

Bit Position	Bit Name	Function
12	CSNI	Coldstart Noise Indicator Flag Indicates vPOC!ColdstartNoise
11, 10	Reserved	When read, the value after reset is returned.
9, 8	SLM[1:0]	Slot Mode Flag Indicates vPOC!SlotMode 00 <sub>B</sub> : SINGLE 01 <sub>B</sub> : reserved 10 <sub>B</sub> : ALL_PENDING 11 <sub>B</sub> : ALL
7	HRQ	Halt Request Flag Indicates vPOC!CHI!HaltRequest
6	FSI	Freeze Status Indicator Flag Indicates vPOC!Freeze
5 to 0	POCS[5:0]	Protocol Operation Control Status Flag

**(1) FLXAnFRCCSV.PSL**

POC Status Log Flag

Set the value of FLXAnFRCCSV.POCS immediately before entering HALT state.

Set to HALT when FREEZE command is applied during HALT state and FLXAnFRCCSV.FSI is not already set i.e. the HALT state was not reached by FREEZE command.

Reset to “000000<sub>B</sub>” when leaving HALT state.

**(2) FLXAnFRCCSV.RCA**

Remaining Coldstart Attempts Flag

Indicates the number of remaining coldstart attempts (vRemainingColdstartAttempts).

The value after a reset of FLXAnFRCCSV.RCA during CONFIG and DEFAULT\_CONFIG state is also FLXAnFRSUCC1.CSA.

The RUN command resets this counter to the maximum number of coldstart attempts as configured by FLXAnFRSUCC1.CSA.

**(3) FLXAnFRCCSV.WSV**

Wakeup Status Flag

Indicates the status of the current wakeup attempt (vPOC!WakeupStatus).

Reset to 0 when entering Wakeup state, by CHI command RESET\_STATUS\_INDICATORS, or by transition from DEFAULT\_CONFIG to CONFIG state.

- 000<sub>B</sub> = UNDEFINED  
Wakeup not yet executed by the CC.
- 001<sub>B</sub> = RECEIVED\_HEADER  
Set when the CC finishes wakeup due to the reception of a frame header without coding violation on either channel in WAKEUP\_LISTEN state.
- 010<sub>B</sub> = RECEIVED\_WUP  
Set when the CC finishes wakeup due to the reception of a valid wakeup pattern on the configured wakeup channel in WAKEUP\_LISTEN state.

- 011<sub>B</sub> = COLLISION\_HEADER  
Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid header on either channel.
- 100<sub>B</sub> = COLLISION\_WUP  
Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid wakeup pattern on the configured wakeup channel.
- 101<sub>B</sub> = COLLISION\_UNKNOWN  
Set when the CC stops wakeup by leaving WAKEUP\_DETECT state after expiration of the wakeup timer without receiving a valid wakeup pattern or a valid frame header.
- 110<sub>B</sub> = TRANSMITTED  
Set when the CC has successfully completed the transmission of the wakeup pattern.
- 111<sub>B</sub> = reserved

#### (4) FLXAnFRCCSV.CSI

Cold Start Inhibit Flag

Indicates whether the node is disabled from cold starting (vColdStartInhibit).

The flag is set to 1 whenever the POC enters READY state due to CHI command READY.

The flag has to be cleared under control of the Host by CHI command ALLOW\_COLDSTART (FLXAnFRSUCC1.CMD = "1001<sub>B</sub>").

#### (5) FLXAnFRCCSV.CSAI

Coldstart Abort Indicator Flag

Indicates that coldstart was aborted.

Cleared by CHI command RESET\_STATUS\_INDICATORS or by transition from HALT to DEFAULT\_CONFIG state or from READY to STARTUP state.

#### (6) FLXAnFRCCSV.CSNI

Coldstart Noise Indicator Flag

Indicates that the cold start procedure occurred under noisy conditions (vPOC!ColdstartNoise).

Cleared by CHI command RESET\_STATUS\_INDICATORS or by transition from HALT to DEFAULT\_CONFIG state or from READY to STARTUP state.

#### (7) FLXAnFRCCSV.SLM

Slot Mode Flag

Indicates the actual slot mode of the POC (vPOC!SlotMode) in states READY, WAKEUP, STARTUP, NORMAL\_ACTIVE, and NORMAL\_PASSIVE.

Default value is SINGLE. Changes to ALL, depending on FLXAnFRSUCC1.TSM.

In NORMAL\_ACTIVE or NORMAL\_PASSIVE state the CHI command ALL\_SLOTS will change the slot mode from SINGLE over ALL\_PENDING to ALL.

Set FLXAnFRSUCC1.TSM to SINGLE except for NORMAL\_ACTIVE or NORMAL\_PASSIVE.

**(8) FLXAnFRCCSV.HRQ**

Halt Request Flag

Indicates that a request from the Host has been received to halt the POC at the end of the communication cycle (vPOC!CHIHaltRequest).

Cleared by transition from HALT to DEFAULT\_CONFIG state or when entering READY state.

**(9) FLXAnFRCCSV.FSI**

Freeze Status Indicator Flag

Indicates that the POC has entered the HALT state due to CHI command FREEZE (CMD = 0111<sub>B</sub>) or due to an error condition requiring an immediate POC halt (vPOC!Freeze).

Reset by transition from HALT to DEFAULT\_CONFIG state.

**(10) FLXAnFRCCSV.POCS**

Protocol Operation Control Status Flag

Indicates the current state of operation of the CC Protocol Operation Control

00 0000<sub>B</sub> = DEFAULT\_CONFIG state

00 0001<sub>B</sub> = READY state

00 0010<sub>B</sub> = NORMAL\_ACTIVE state

00 0011<sub>B</sub> = NORMAL\_PASSIVE state

00 0100<sub>B</sub> = HALT state

00 1111<sub>B</sub> = CONFIG state

Indicates the current state of operation of the POC in the wakeup path

01 0000<sub>B</sub> = WAKEUP\_STANDBY state

01 0001<sub>B</sub> = WAKEUP\_LISTEN state

01 0010<sub>B</sub> = WAKEUP\_SEND state

01 0011<sub>B</sub> = WAKEUP\_DETECT state

Indicates the current state of operation of the POC in the startup path

10 0000<sub>B</sub> = STARTUP\_PREPARE state

10 0001<sub>B</sub> = COLDSTART\_LISTEN state

10 0010<sub>B</sub> = COLDSTART\_COLLISION\_RESOLUTION state

10 0011<sub>B</sub> = COLDSTART\_CONSISTENCY\_CHECK state

10 0100<sub>B</sub> = COLDSTART\_GAP state

10 0101<sub>B</sub> = COLDSTART\_JOIN State

10 0110<sub>B</sub> = INTEGRATION\_COLDSTART\_CHECK state

10 0111<sub>B</sub> = INTEGRATION\_LISTEN state

10 1000<sub>B</sub> = INTEGRATION\_CONSISTENCY\_CHECK state

10 1001<sub>B</sub> = INITIALIZE\_SCHEDULE state

10 1010<sub>B</sub> = ABORT\_STARTUP state

10 1011<sub>B</sub> = STARTUP\_SUCCESS state

Others = reserved

### 25.2.7.2 FLXAnFRCCEV — FlexRay CC Error Vector Register

**Access:** FLXAnFRCCEV is a read-only register that can be read in 32-bit units.  
 FLXAnFRCCEVL is a read-only register that can be read in 16-bit units.  
 FLXAnFRCCEVLL and FLXAnFRCCEVLH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRCCEV: <FLXAn\_base> + 0104<sub>H</sub>,  
 FLXAnFRCCEVL: <FLXAn\_base> + 0104<sub>H</sub>,  
 FLXAnFRCCEVLL: <FLXAn\_base> + 0104<sub>H</sub>, FLXAnFRCCEVLH: <FLXAn\_base> + 0105<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.60 FLXAnFRCCEV Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned.
12 to 8	PTAC[4:0]	Passive to Active Count Flag Indicates vAllowPassiveToActive
7, 6	ERRM[1:0]	Error Mode Flag Indicates vPOC!ErrorMode 00 <sub>B</sub> : ACTIVE 01 <sub>B</sub> : PASSIVE 10 <sub>B</sub> : COMM_HALT 11 <sub>B</sub> : reserved
5, 4	Reserved	When read, the value after reset is returned.
3 to 0	CCFC[3:0]	Clock Correction Failed Counter Indicates vClockCorrectionFailed

#### (1) FLXAnFRCCEV.PTAC

Passive to Active Count Flag

Indicates the number of consecutive even/odd cycle pairs that have passed with valid rate and offset correction terms, while the node is waiting to transit from NORMAL\_PASSIVE state to NORMAL\_ACTIVE state. The transition takes place when FLXAnFRCCEV.PTAC equals FLXAnFRSUCC1.PTA - 1.

Cleared by transition from HALT to DEFAULT\_CONFIG state or when entering READY state.

#### (2) FLXAnFRCCEV.ERRM

Error Mode Flag

Indicates the current error mode of the POC (vPOC!ErrorMode).

Cleared by transition from HALT to DEFAULT\_CONFIG state or when entering READY state.

**(3) FLXAnFRCCEV.CCFC**

Clock Correction Failed Counter

Indicates the clock correction failed counter value of the POC (vClockCorrectionFailed).

The Clock Correction Failed Counter is incremented by one at the end of any odd communication cycle where either the missing offset correction error or missing rate correction error are active.

The Clock Correction Failed Counter is reset to 0 at the end of an odd communication cycle if neither the offset correction failed nor the rate correction failed errors are active.

The Clock Correction Failed Counter stops at 15.

Cleared by transition from HALT to DEFAULT\_CONFIG state or when entering READY state.

### 25.2.7.3 FLXAnFRSCV — FlexRay Slot Counter Value Register

**Access:** FLXAnFRSCV is a read-only register that can be read in 32-bit units.

FLXAnFRSCVL and FLXAnFRSCVH are the read-only registers that can be read in 16-bit units.

FLXAnFRSCVLL, FLXAnFRSCVLH, FLXAnFRSCVHL, and FLXAnFRSCVHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRSCV: <FLXAn\_base> + 0110<sub>H</sub>,

FLXAnFRSCVL: <FLXAn\_base> + 0110<sub>H</sub>, FLXAnFRSCVH: <FLXAn\_base> + 0112<sub>H</sub>,

FLXAnFRSCVLL: <FLXAn\_base> + 0110<sub>H</sub>, FLXAnFRSCVLH: <FLXAn\_base> + 0111<sub>H</sub>,

FLXAnFRSCVHL: <FLXAn\_base> + 0112<sub>H</sub>, FLXAnFRSCVHH: <FLXAn\_base> + 0113<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SCCB[10:0]

Table 25.61 FLXAnFRSCV Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned.
26 to 16	SCCB[10:0]	Slot Counter Channel B Indicates vSlotCounter[B]
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	SCCA[10:0]	Slot Counter Channel A Indicates vSlotCounter[A]

#### (1) FLXAnFRSCV.SCCB

Slot Counter Channel B

Indicates the current slot counter value on channel B (vSlotCounter[B]). The value is incremented by the CC and initialized at the start of a communication cycle.

Cleared when leaving CONFIG state or when entering STARTUP state.

#### (2) FLXAnFRSCV.SCCA

Slot Counter Channel A

Indicates the current slot counter value on channel A (vSlotCounter[A]). The value is incremented by the CC and initialized at the start of a communication cycle.

Cleared when leaving CONFIG state or when entering STARTUP state.

### 25.2.7.4 FLXAnFRMTCCV — FlexRay Macrotick and Cycle Counter Value Register

**Access:** FLXAnFRMTCCV is a read-only register that can be read in 32-bit units.

FLXAnFRMTCCVL and FLXAnFRMTCCVH are the read-only registers that can be read in 16-bit units.

FLXAnFRMTCCVLL, FLXAnFRMTCCVLH, and FLXAnFRMTCCVHL are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRMTCCV: <FLXAn\_base> + 0114<sub>H</sub>,

FLXAnFRMTCCVL: <FLXAn\_base> + 0114<sub>H</sub>, FLXAnFRMTCCVH: <FLXAn\_base> + 0116<sub>H</sub>,

FLXAnFRMTCCVLL: <FLXAn\_base> + 0114<sub>H</sub>, FLXAnFRMTCCVLH: <FLXAn\_base> + 0115<sub>H</sub>,

FLXAnFRMTCCVHL: <FLXAn\_base> + 0116<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	CCV[5:0]

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	MTV[13:0]													
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.62 FLXAnFRMTCCV Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 16	CCV[5:0]	Cycle Counter Value Indicates vCycleCounter
15, 14	Reserved	When read, the value after reset is returned.
13 to 0	MTV[13:0]	Macrotick Value Indicates vMacrotick

#### (1) FLXAnFRMTCCV.CCV

Cycle Counter Value

Indicates the current cycle counter value (vCycleCounter). The value is incremented by the CC at the start of a communication cycle.

Cleared when leaving CONFIG state or when entering STARTUP state.

#### (2) FLXAnFRMTCCV.MTV

Macrotick Value

Indicates the current macrotick value (vMacrotick). The value is incremented by the CC and reset at the start of a communication cycle.

Cleared when leaving CONFIG state or when entering STARTUP state.

### 25.2.7.5 FLXAnFRRCV — FlexRay Rate Correction Value Register

**Access:** FLXAnFRRCV is a read-only register that can be read in 32-bit units.  
 FLXAnFRRCVL is a read-only register that can be read in 16-bit units.  
 FLXAnFRRCVLL and FLXAnFRRCVLH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRRCV: <FLXAn\_base> + 0118<sub>H</sub>,  
 FLXAnFRRCVL: <FLXAn\_base> + 0118<sub>H</sub>,  
 FLXAnFRRCVLL: <FLXAn\_base> + 0118<sub>H</sub>, FLXAnFRRCVLH: <FLXAn\_base> + 0119<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.63 FLXAnFRRCV Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11 to 0	RCV[11:0]	Rate Correction Value Flag Indicates vRateCorrection

#### (1) FLXAnFRRCV.RCV

##### Rate Correction Value Flag

Indicates internal rate correction value (vRateCorrection/ two's complement) before limitation. If the FLXAnFRRCV.RCV value exceeds the limits defined by FLXAnFRGTUC10.MRC, flag FLXAnFRSFS.RCLR is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

#### CAUTION

The amount by which this value exceeded the limits is added to the external rate correction value.

### 25.2.7.6 FLXAnFROCV — FlexRay Offset Correction Value Register

**Access:** FLXAnFROCV is a read-only register that can be read in 32-bit units.

FLXAnFROCVL and FLXAnFROCVH are the read-only registers that can be read in 16-bit units.

FLXAnFROCVLL, FLXAnFROCVLH, and FLXAnFROCVHL are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFROCV: <FLXAn\_base> + 011C<sub>H</sub>,

FLXAnFROCVL: <FLXAn\_base> + 011C<sub>H</sub>, FLXAnFROCVH: <FLXAn\_base> + 011E<sub>H</sub>,

FLXAnFROCVLL: <FLXAn\_base> + 011C<sub>H</sub>, FLXAnFROCVLH: <FLXAn\_base> + 011D<sub>H</sub>,

FLXAnFROCVHL: <FLXAn\_base> + 011E<sub>H</sub>,

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	OCV[18:16]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OCV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.64 FLXAnFROCV Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned.
18 to 0	OCV[18:0]	Offset Correction Value Flag Indicates vOffsetCorrection

#### (1) FLXAnFROCV.OCV

##### Offset Correction Value Flag

Indicates the internal offset correction value (vOffsetCorrection/ two's complement) before limitation. If the FLXAnFROCV.OCV value exceeds the limits defined by FLXAnFRGTUC10.MOC, flag FLXAnFRSFS.OCLR is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

#### CAUTION

The amount by which this value exceeded the limits is added to the external offset correction value.

### 25.2.7.7 FLXAnFRSFS — FlexRay Sync Frame Status Register

**Access:** FLXAnFRSFS is a read-only register that can be read in 32-bit units.

FLXAnFRSFSL and FLXAnFRSFSH are the read-only registers that can be read in 16-bit units.

FLXAnFRSFSLL, FLXAnFRSFSLLH, and FLXAnFRSFSHL are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRSFS: <FLXAn\_base> + 0120<sub>H</sub>

FLXAnFRSFSL: <FLXAn\_base> + 0120<sub>H</sub>, FLXAnFRSFSH: <FLXAn\_base> + 0122<sub>H</sub>

FLXAnFRSFSLL: <FLXAn\_base> + 0120<sub>H</sub>, FLXAnFRSFSLLH: <FLXAn\_base> + 0121<sub>H</sub>,

FLXAnFRSFSHL: <FLXAn\_base> + 0122<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	RCLR	MRCS	OCLR	MOCS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VSBO[3:0]				VSBE[3:0]				VSAO[3:0]				VSAE[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.65 FLXAnFRSFS Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19	RCLR	Rate Correction Limit Reached Flag 0: Rate correction below limit 1: Rate correction limit reached
18	MRCS	Missing Rate Correction Signal Flag 0: Rate correction signal valid 1: Missing rate correction signal
17	OCLR	Offset Correction Limit Reached Flag 0: Offset correction below limit 1: Offset correction limit reached
16	MOCS	Missing Offset Correction Signal Flag 0: Offset correction signal valid 1: Missing offset correction signal
15 to 12	VSBO[3:0]	Valid Sync Frames Channel B, odd communication cycle
11 to 8	VSBE[3:0]	Valid Sync Frames Channel B, even communication cycle
7 to 4	VSAO[3:0]	Valid Sync Frames Channel A, odd communication cycle
3 to 0	VSAE[3:0]	Valid Sync Frames Channel A, even communication cycle

#### (1) FLXAnFRSFS.RCLR

##### Rate Correction Limit Reached Flag

The Rate Correction Limit Reached flag indicates that the rate correction value has exceeded its limit as defined by FLXAnFRGTUC10.MRC10 - MRC0. The flag is updated by the CC at start of offset correction phase.

Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION\_COLDSTART\_CHECK state or INTEGRATION\_CONSISTENCY\_CHECK state.

**(2) FLXAnFRSFS.MRCS**

Missing Rate Correction Signal Flag

The Missing Rate Correction flag indicates that no rate correction calculation can be performed because no pairs of even/odd sync frames were received. The flag is updated by the CC at start of offset correction phase.

Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION\_COLDSTART\_CHECK state or INTEGRATION\_CONSISTENCY\_CHECK state.

**(3) FLXAnFRSFS.OCLR**

Offset Correction Limit Reached Flag

The Offset Correction Limit Reached flag indicates that the offset correction value has exceeded its limit as defined by FLXAnFRGTUC10.MOC. The flag is updated by the CC at start of offset correction phase.

Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION\_COLDSTART\_CHECK state or INTEGRATION\_CONSISTENCY\_CHECK state.

**(4) FLXAnFRSFS.MOCS**

Missing Offset Correction Signal Flag

The Missing Offset Correction flag indicates that no offset correction calculation can be performed because no sync frames were received. The flag is updated by the CC at start of offset correction phase.

Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION\_COLDSTART\_CHECK state or INTEGRATION\_CONSISTENCY\_CHECK state.

**(5) FLXAnFRSFS.VSBO**

Valid Sync Frames Channel B, odd communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHB is 1.

Indicates the number of valid sync frames received on channel B in the odd communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each odd communication cycle.

Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION\_COLDSTART\_CHECK state or INTEGRATION\_CONSISTENCY\_CHECK state.

**(6) FLXAnFRSFS.VSBE**

Valid Sync Frames Channel B, even communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHB is 1.

Indicates the number of valid sync frames received on channel B in the even communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each even communication cycle.

Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION\_COLDSTART\_CHECK state or INTEGRATION\_CONSISTENCY\_CHECK state.

**(7) FLXAnFRSFS.VSAO**

Valid Sync Frames Channel A, odd communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHA is 1.

Indicates the number of valid sync frames received on channel A in the odd communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each odd communication cycle.

Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION\_COLDSTART\_CHECK state or INTEGRATION\_CONSISTENCY\_CHECK state.

**(8) FLXAnFRSFS.VSAE**

Valid Sync Frames Channel A, even communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHA is 1.

Indicates the number of valid sync frames received on channel A in the even communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each even communication cycle.

Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION\_COLDSTART\_CHECK state or INTEGRATION\_CONSISTENCY\_CHECK state.

### 25.2.7.8 FLXAnFRSWNIT — FlexRay Symbol Window and NIT Status Register

Indicates the symbol windows related status. Symbol window related status information is updated by the CC at the end of the symbol window for each channel. NIT related status information is updated by the CC at the end of the NIT for each channel.

During startup the status data is not updated.

**Access:** FLXAnFRSWNIT is a read-only register that can be read in 32-bit units.

FLXAnFRSWNITL is a read-only register that can be read in 16-bit units.

FLXAnFRSWNITLL and FLXAnFRSWNITLH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRSWNIT: <FLXAn\_base> + 0124<sub>H</sub>,

FLXAnFRSWNITL: <FLXAn\_base> + 0124<sub>H</sub>,

FLXAnFRSWNITLL: <FLXAn\_base> + 0124<sub>H</sub>, FLXAnFRSWNITLH: <FLXAn\_base> + 0125<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.66 FLXAnFRSWNIT Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11	SBNB	Slot Boundary Violation during NIT Channel B Flag 0: No slot boundary violation detected 1: Slot boundary violation during NIT detected on channel B
10	SENB	Syntax Error during NIT Channel B Flag 0: No syntax error detected 1: Syntax error during NIT detected on channel B
9	SBNA	Slot Boundary Violation during NIT Channel A Flag 0: No slot boundary violation detected 1: Slot boundary violation during NIT detected on channel A
8	SENA	Syntax Error during NIT Channel A Flag 0: No syntax error detected 1: Syntax error during NIT detected on channel A
7	MTSB	MTS Received on Channel B Flag 0: No MTS symbol received on channel B 1: MTS symbol received on channel B
6	MTSA	MTS Received on Channel A Flag 0: No MTS symbol received on channel A 1: MTS symbol received on channel A
5	TCSB	Transmission Conflict in Symbol Window Channel B Flag 0: No transmission conflict detected 1: Transmission conflict in symbol window detected on channel B

Table 25.66 FLXAnFRSWNIT Register Contents

Bit Position	Bit Name	Function
4	SBSB	Slot Boundary Violation in Symbol Window Channel B Flag 0: No slot boundary violation detected 1: Slot boundary violation during symbol window detected on channel B
3	SESB	Syntax Error in Symbol Window Channel B Flag 0: No syntax error detected 1: Syntax error during symbol window detected on channel B
2	TCSA	Transmission Conflict in Symbol Window Channel A Flag 0: No transmission conflict detected 1: Transmission conflict in symbol window detected on channel A
1	SBSA	Slot Boundary Violation in Symbol Window Channel A Flag 0: No slot boundary violation detected 1: Slot boundary violation during symbol window detected on channel A
0	SESA	Syntax Error in Symbol Window Channel A Flag 0: No syntax error detected 1: Syntax error during symbol window detected on channel A

**(1) FLXAnFRSWNIT.SBNB**

Indicates a Slot Boundary Violation during NIT Channel B Flag (vSS!BViolationB).

Cleared when leaving CONFIG state or when entering STARTUP state.

**(2) FLXAnFRSWNIT.SENB**

Indicates a Syntax Error during NIT Channel B Flag (vSS!SyntaxErrorB).

Cleared when leaving CONFIG state or when entering STARTUP state.

**(3) FLXAnFRSWNIT.SBNA**

Indicates a Slot Boundary Violation during NIT Channel A Flag (vSS!BViolationA).

Cleared when leaving CONFIG state or when entering STARTUP state.

**(4) FLXAnFRSWNIT.SENA**

Indicates a Syntax Error during NIT Channel A Flag (vSS!SyntaxErrorA).

Cleared when leaving CONFIG state or when entering STARTUP state.

**(5) FLXAnFRSWNIT.MTSB**

Indicates a MTS Received on Channel B Flag (vSS!ValidMTSB).

Media Access Test Symbol received on channel B during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.

When this bit is set to 1, also interrupt flag FLXAnFRSIR.MTSB is set to 1. Cleared when leaving CONFIG state or when entering STARTUP state.

**(6) FLXAnFRSWNIT.MTSA**

Indicates a MTS Received on Channel A Flag (vSS!ValidMTSA).

Media Access Test Symbol received on channel A during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.

When this bit is set to 1, also interrupt flag FLXAnFRSIR.MTSA is set to 1. Cleared when leaving CONFIG state or when entering STARTUP state.

**(7) FLXAnFRSWNIT.TCSB**

Indicates a Transmission Conflict in Symbol Window Channel B Flag (vSS!TxConflictB).

Cleared when leaving CONFIG state or when entering STARTUP state.

**(8) FLXAnFRSWNIT.SBSB**

Indicates a Slot Boundary Violation in Symbol Window Channel B Flag (vSS!BViolationB).

Cleared when leaving CONFIG state or when entering STARTUP state.

**(9) FLXAnFRSWNIT.SESB**

Indicates a Syntax Error in Symbol Window Channel B Flag (vSS!SyntaxErrorB).

Cleared when leaving CONFIG state or when entering STARTUP state.

**(10) FLXAnFRSWNIT.TCSA**

Indicates a Transmission Conflict in Symbol Window Channel A Flag (vSS!TxConflictA).

Cleared when leaving CONFIG state or when entering STARTUP state.

**(11) FLXAnFRSWNIT.SBSA**

Indicates a Slot Boundary Violation in Symbol Window Channel A Flag (vSS!BViolationA).

Cleared when leaving CONFIG state or when entering STARTUP state.

**(12) FLXAnFRSWNIT.SESA**

Indicates a Syntax Error in Symbol Window Channel A Flag (vSS!SyntaxErrorA).

Cleared when leaving CONFIG state or when entering STARTUP state.

### 25.2.7.9 FLXAnFRACS — FlexRay Aggregated Channel Status Register

The aggregated channel status provides the Host with an accrued status of channel activity for all communication slots regardless of whether they are assigned for transmission or subscribed for reception.

The aggregated channel status also includes status data from the symbol window and the network idle time.

The status data is updated (set) after each slot and aggregated until it is cleared by the Host. During startup the status data is not updated.

**Access:** FLXAnFRACS can be read or written in 32-bit units.  
 FLXAnFRACSL can be read or written in 16-bit units.  
 FLXAnFRACSLL and FLXAnFRACSLH can be read or written in 8-bit units.

**Address:** FLXAnFRACS: <FLXAn\_base> + 0128<sub>H</sub>,  
 FLXAnFRACSL: <FLXAn\_base> + 0128<sub>H</sub>,

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	SBVB	Slot Boundary Violation on Channel B Flag 0: No slot boundary violation observed 1: Slot boundary violation(s) observed on channel B
11	CIB	Communication Indicator Channel B Flag 0: No valid frame(s) received in slots containing any additional communication 1: Valid frame(s) received on channel B in slots containing any additional communication
10	CEDB	Content Error Detected on Channel B Flag 0: No frame with content error received 1: Frame(s) with content error received on channel B
9	SEDB	Syntax Error Detected on Channel B Flag 0: No syntax error observed 1: Syntax error(s) observed on channel B
8	VFRB	Valid Frame Received on Channel B Flag 0: No valid frame received 1: Valid frame(s) received on channel B
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	SBVA	Slot Boundary Violation on Channel A Flag 0: No slot boundary violation observed 1: Slot boundary violation(s) observed on channel A

Table 25.67 FLXAnFRACS Register Contents

Bit Position	Bit Name	Function
3	CIA	Communication Indicator Channel A Flag 0: No valid frame(s) received in slots containing any additional communication 1: Valid frame(s) received on channel A in slots containing any additional communication
2	CEDA	Content Error Detected on Channel A Flag 0: No frame with content error received 1: Frame(s) with content error received on channel A
1	SEDA	Syntax Error Detected on Channel A Flag 0: No syntax error observed 1: Syntax error(s) observed on channel A
0	VFRA	Valid Frame Received on Channel A Flag 0: No valid frame received 1: Valid frame(s) received on channel A

**(1) FLXAnFRACS.SBVB**

Slot Boundary Violation on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

One or more slot boundary violations were observed on channel B at any time during the observation period (static or dynamic slots, symbol window, and NIT).

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(2) FLXAnFRACS.CIB**

Communication Indicator Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

Indicates that one or more valid frames were received on channel B in slots that also contained additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.

**CAUTION**

The set condition of the flag FLXAnFRACS.CIB is also fulfilled if there is only one single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(3) FLXAnFRACS.CEDB**

Content Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

Indicates that one or more frames with a content error were received on channel B in any static or dynamic slot during the observation period.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(4) FLXAnFRACS.SEDB**

Syntax Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel B.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(5) FLXAnFRACS.VFRB**

Valid Frame Received on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

One or more valid frames were received on channel B in any static or dynamic slot during the observation period.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(6) FLXAnFRACS.SBVA**

Slot Boundary Violation on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

Slot boundary violations were observed on channel A at any time during the observation period (static or dynamic slots, symbol window, and NIT).

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(7) FLXAnFRACS.CIA**

Communication Indicator Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

One or more valid frames were received on channel A in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.

**CAUTION**

---

The set condition of the flag FLXAnFRACS.CIA is also fulfilled if there is only one single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

---

**(8) FLXAnFRACS.CEDA**

Content Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

One or more frames with a content error were received on channel A in any static or dynamic slot during the observation period.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(9) FLXAnFRACS.SEDA**

Syntax Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel A.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(10) FLXAnFRACS.VFRA**

Valid Frame Received on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

One or more valid frames were received on channel A in any static or dynamic slot during the observation period.

Cleared when leaving CONFIG state or when entering STARTUP state.

### 25.2.7.10 FLXAnFRESIDm — FlexRay Even Sync ID Register m (m = 1 to 15)

Registers FLXAnFRESID1 to FLXAnFRESID15 hold the frame IDs of the sync frames received in even communication cycles used for clock synchronization up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFRESID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an even communication cycle, register FLXAnFRESID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFRESID1.RXEA, FLXAnFRESID1.RXEB are set. The value is updated during the NIT of each even communication cycle.

**Access:** FLXAnFRESIDm is a read-only register that can be read in 32-bit units.  
 FLXAnFRESIDmL is a read-only register that can be read in 16-bit units.  
 FLXAnFRESIDmLL and FLXAnFRESIDmLH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRESIDm: <FLXAn\_base> + 0130<sub>H</sub> + (m - 1) × 4<sub>H</sub>,  
 FLXAnFRESIDmL: <FLXAn\_base> + 0130<sub>H</sub> + (m - 1) × 4<sub>H</sub>,  
 FLXAnFRESIDmLL: <FLXAn\_base> + 0130<sub>H</sub> + (m - 1) × 4<sub>H</sub>,  
 FLXAnFRESIDmLH: <FLXAn\_base> + 0130<sub>H</sub> + (m - 1) × 4<sub>H</sub> + 1<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	RXEB	RXEA	—	—	—	—	EID[9:0]									
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.68 FLXAnFRESIDm Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15	RXEB	Received/Configured Even Sync ID on Channel B Flag 0: No sync frame received on channel B/node not configured to transmit sync frames 1: Sync frame received on channel B/node configured to transmit sync frames
14	RXEA	Received/Configured Even Sync ID on Channel A Flag 0: No sync frame received on channel A/node not configured to transmit sync frames 1: Sync frame received on channel A/node configured to transmit sync frames
13 to 10	Reserved	When read, the value after reset is returned.
9 to 0	EID[9:0]	Even Sync ID (vsSyncIDListA,B even Flag)

#### (1) FLXAnFRESIDm.RXEB

Received/Configured Even Sync ID on Channel B Flag

Signals that a sync frame corresponding to the stored even sync ID was received on channel B or that the node is configured to be a sync node with key slot = FLXAnFRESID1.EID.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(2) FLXAnFRESIDm.RXEA**

Received/Configured Even Sync ID on Channel A Flag

Signals that a sync frame corresponding to the stored even sync ID was received on channel A or that the node is configured to be a sync node with key slot = FLXAnFRESID1.EID.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(3) FLXAnFRESIDm.EID**

Even Sync ID Flag (vsSyncIDListA,B even)

Indicates the sync frame ID received in an even communication cycle. Cleared when leaving CONFIG state or when entering STARTUP state.

### 25.2.7.11 FLXAnFROSIDm — FlexRay Odd Sync ID Register m (m = 1 to 15)

Registers FLXAnFROSID1 to FLXAnFROSID15 hold the frame IDs of the sync frames received in odd communication cycles used for clock synchronization up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFROSID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an odd communication cycle, register FLXAnFROSID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFROSID1.RXOA, FLXAnFROSID1.RXOB are set. The value is updated during the NIT of each odd communication cycle.

**Access:** FLXAnFROSIDm is a read-only register that can be read in 32-bit units.  
 FLXAnFROSIDmL is a read-only register that can be read in 16-bit units.  
 FLXAnFROSIDmLL and FLXAnFROSIDmLH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFROSIDm: <FLXAn\_base> + 0170<sub>H</sub> + (m – 1) × 4<sub>H</sub>,  
 FLXAnFROSIDmL: <FLXAn\_base> + 0170<sub>H</sub> + (m – 1) × 4<sub>H</sub>,  
 FLXAnFROSIDmLL: <FLXAn\_base> + 0170<sub>H</sub> + (m – 1) × 4<sub>H</sub>,  
 FLXAnFROSIDmLH: <FLXAn\_base> + 0170<sub>H</sub> + (m – 1) × 4<sub>H</sub> + 1<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RXOB	RXOA	—	—	—	—	OID[9:0]

Table 25.69 FLXAnFROSIDm Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15	RXOB	Received/Configured Odd Sync ID on Channel B Flag 0: No sync frame received on channel B/node not configured to transmit sync frames 1: Sync frame received on channel B/node configured to transmit sync frames
14	RXOA	Received/Configured Odd Sync ID on Channel A Flag 0: No sync frame received on channel A/node not configured to transmit sync frames 1: Sync frame received on channel A/node configured to transmit sync frames
13 to 10	Reserved	When read, the value after reset is returned.
9 to 0	OID[9:0]	Odd Sync ID Flag (vsSyncIDListA,B odd)

#### (1) FLXAnFROSIDm.RXOB

Received/Configured Odd Sync ID on Channel B Flag

Signals that a sync frame corresponding to the stored odd sync ID was received on channel B or that the node is configured to be a sync node with key slot = FLXAnFROSID1.OID.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(2) FLXAnFROSIDm.RXOA**

Received/Configured Odd Sync ID on Channel A Flag

Signals that a sync frame corresponding to the stored odd sync ID was received on channel A or that the node is configured to be a sync node with key slot = FLXAnFROSID1.OID.

Cleared when leaving CONFIG state or when entering STARTUP state.

**(3) FLXAnFROSIDm.OID**

Odd Sync ID Flag (vsSyncIDListA,B odd)

Indicates the sync frame ID odd communication cycle.

Cleared when leaving CONFIG state or when entering STARTUP state.

### 25.2.7.12 FLXAnFRNMVm — FlexRay Network Management Vector Register m (m = 1 to 3)

The three network management registers hold the accrued NM vector (see **Section 25.3.7, Network Management**).

The CC updates the NM vector at the end of each communication cycle as long as the CC is either in NORMAL\_ACTIVE or NORMAL\_PASSIVE state.

NMVn-bytes exceeding the configured NM vector length are not valid.

For information about the byte alignment of the received NM vector in this register see **Section 25.3.17, Byte Alignment**.

**Access:** FLXAnFRNMVm is a read-only register that can be read in 32-bit units.

FLXAnFRNMVmL and FLXAnFRNMVmH are the read-only registers that can be read in 16-bit units.

FLXAnFRNMVmLL, FLXAnFRNMVmLH, FLXAnFRNMVmHL, and FLXAnFRNMVmHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRNMVm:  $\langle \text{FLXAn\_base} \rangle + 01\text{B}0_{\text{H}} + (m - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRNMVmL:  $\langle \text{FLXAn\_base} \rangle + 01\text{B}0_{\text{H}} + (m - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRNMVmH:  $\langle \text{FLXAn\_base} \rangle + 01\text{B}0_{\text{H}} + (m - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRNMVmLL:  $\langle \text{FLXAn\_base} \rangle + 01\text{B}0_{\text{H}} + (m - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRNMVmLH:  $\langle \text{FLXAn\_base} \rangle + 01\text{B}0_{\text{H}} + (m - 1) \times 4_{\text{H}} + 1_{\text{H}}$ ,  
 FLXAnFRNMVmHL:  $\langle \text{FLXAn\_base} \rangle + 01\text{B}0_{\text{H}} + (m - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRNMVmHH:  $\langle \text{FLXAn\_base} \rangle + 01\text{B}0_{\text{H}} + (m - 1) \times 4_{\text{H}} + 3_{\text{H}}$

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.70 FLXAnFRNMVm Register Contents

Bit Position	Bit Name	Function
31 to 0	NM[31:0]	<p>NM Vector</p> <p>The three network management vector registers hold the accrued NM vector (configurable 0 to 12 bytes). The NM vector to be held is generated by bit-wise logic OR for each NM vector received on each channel (valid static frames with PPI = 1) (see <b>Section 25.3.7, Network Management</b>).</p> <p>For information about the byte alignment of the received NM vector in this register see <b>Section 25.3.17, Byte Alignment</b>.</p> <p>NMVn-bytes exceeding the configured NM vector length are not valid.</p> <p>The Register Contents are updated at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state.</p> <p>These bits are cleared when leaving CONFIG state or when entering STARTUP state.</p>

## 25.2.8 Message Buffer Control Registers

### 25.2.8.1 FLXAnFRMRC — FlexRay Message RAM Configuration Register

The Message RAM Configuration register defines the number of message buffers assigned to the static segment, dynamic segment, and FIFO.

The Message RAM can be divided into up three different areas; Static Buffer area, Static and Dynamic Buffer area, FIFO area. If present, the Static Buffer area is starting at Message Buffer 0.

The start of the Static and Dynamic Buffer area is configured by FLXAnFRMRC.FDB. FLXAnFRMRC.FDB defines the end of the Static Buffer area. If no Static Buffer area is present, the Static and Dynamic Buffer area starts at Message Buffer 0.

The start of the FIFO area is configured by FLXAnFRMRC.FFB. FLXAnFRMRC.FFB defines the end of the previous area, which can be either the Static Buffer area or the Static and Dynamic Buffer area. If no Static Buffer area and no Static and Dynamic Buffer area is present, the FIFO area starts at Message Buffer 0.

The end of the last configured area, which can be the Static Buffer area, the Static and Dynamic buffer area, or the FIFO area, is configured by FLXAnFRMRC.LCB.

**Figure 25.2, Message RAM Organization** shows an example configuration of the Message RAM where all three areas are configured.

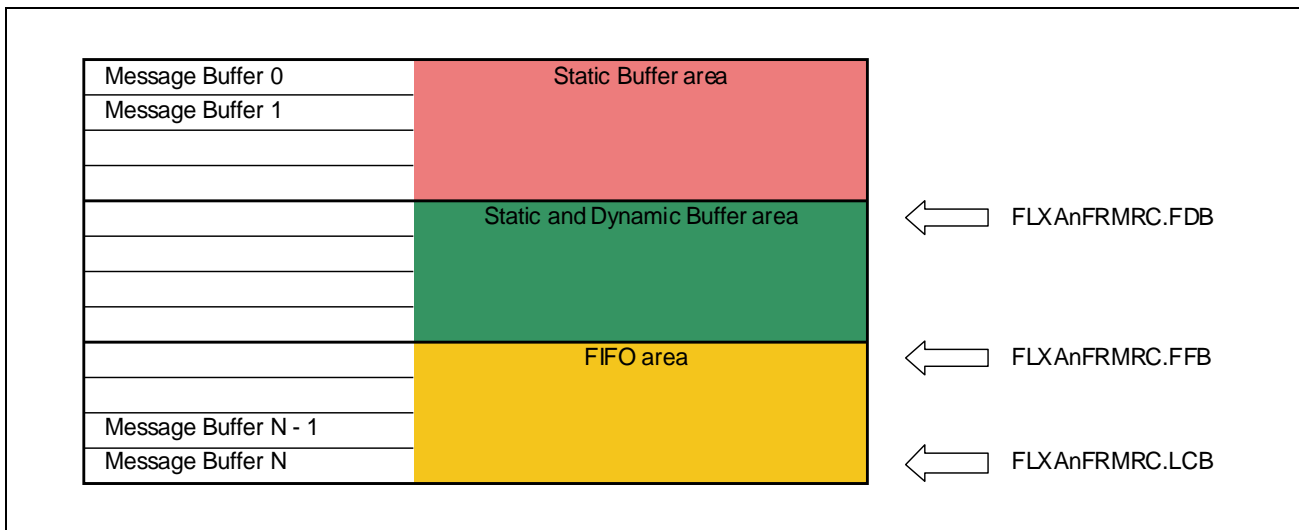

Figure 25.2 Message RAM Organization

#### CAUTIONS

1. If the node is configured as sync node (FLXAnFRSUCC1.TXSY = 1) or for single slot mode operation (FLXAnFRSUCC1.TSM = 1), message buffer 0 or 1 is reserved for sync frames or single slot frames and have to be configured with the node- specific key slot ID. In case the node is neither configured as sync node nor for single slot operation message buffer 0 or 1 is treated like all other message buffers.
2. The maximum number of header sections is 128. This means a maximum of 128 message buffers can be configured. The maximum length of a data section is 254 bytes. The length of the data section may be configured differently for each message buffer. For details see **Section 25.3.13, Message RAM**.
3. If two or more message buffers are assigned to slot 1 by use of cycle filtering, all of them must be located either in the “Static Buffers” or at the beginning of the “Static + Dynamic Buffers” section.

4. The FlexRay protocol specification requires that each node has to send a frame in its key slot. Therefore at least message buffer 0 is reserved for transmission in the key slot. Due to this requirement a maximum number of 127 message buffers can be assigned to the FIFO. Nevertheless, a non protocol conform configuration without a transmission slot in the static segment would still be operational.
5. The payload length configured and the length of the data section need to be configured identical for all message buffers belonging to the FIFO via FLXAnFRWRHS2.PL and FLXAnFRWRHS3.DP. When the CC is not in DEFAULT\_CONFIG or CONFIG state reconfiguration of message buffers belonging to the FIFO is locked.

**Access:** FLXAnFRMRC can be read or written in 32-bit units.

FLXAnFRMRCL and FLXAnFRMRCH can be read or written in 16-bit units.

FLXAnFRMRCLL, FLXAnFRMRCLH, FLXAnFRMRCHL and FLXAnFRMRCHH can be read or written in 8-bit units.

**Address:** FLXAnFRMRC: <FLXAn\_base> + 0300<sub>H</sub>,

FLXAnFRMRCL: <FLXAn\_base> + 0300<sub>H</sub>, FLXAnFRMRCH: <FLXAn\_base> + 0302<sub>H</sub>,

FLXAnFRMRCLL: <FLXAn\_base> + 0300<sub>H</sub>, FLXAnFRMRCLH: <FLXAn\_base> + 0301<sub>H</sub>,

FLXAnFRMRCHL: <FLXAn\_base> + 0302<sub>H</sub>, FLXAnFRMRCHH: <FLXAn\_base> + 0303<sub>H</sub>

**Value after reset:** 0180 0000<sub>H</sub>

Table 25.71 FLXAnFRMRC Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	SPLM	Sync Frame Payload Multiplex Bit 0: Only message buffer 0 locked against reconfiguration 1: Both message buffers 0 and 1 are locked against reconfiguration
25, 24	SEC[1:0]	Secure Buffers Bit 00 <sub>B</sub> : all buffers unlocked 01 <sub>B</sub> : static buffers locked, FIFO locked, limited transmission 10 <sub>B</sub> : all buffers locked 11 <sub>B</sub> : all buffers locked, limited transmission
23 to 16	LCB[7:0]	Last Configured Buffer Bit 0 to 127: Number of message buffers is FLXAnFRMRF.LCB + 1 128: No message buffer assigned to the FIFO
15 to 8	FFB[7:0]	First Buffer of FIFO Bit 0: All message buffers assigned to the FIFO 1 to 127: Message buffers from FLXAnFRMRC.FFB to FLXAnFRMRC.LCB assigned to the FIFO 128: No message buffer configured
7 to 0	FDB[7:0]	First Dynamic Buffer Bit 0: No group of message buffers exclusively for the static segment configured 1 to 127: Message buffers 0 to FLXAnFRMRC.FDB - 1 reserved for static segment 128: No dynamic message buffers configured

**(1) FLXAnFRMRC.SPLM**

Sync Frame Payload Multiplex Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

This bit is only evaluated if the node is configured as sync node (FLXAnFRSUCC1.TXSY = 1) or for single slot mode operation (FLXAnFRSUCC1.TSM = 1).

When this bit is set to 1 message buffers 0 and 1 are dedicated for sync frame transmission with different payload data on channel A and B.

When this bit is set to 0, sync frames are transmitted from message buffer 0 with the same payload data on all channels configured. Note that the channel filter configuration for message buffer 0 or message buffer 1 has to be chosen accordingly.

**(2) FLXAnFRMRC.SEC**

Secure Buffers Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

Not evaluated when the CC is in DEFAULT\_CONFIG or CONFIG state.

For temporary unlocking, see **Section 25.3.13.4, Host Handling of Access Errors**.

- 00<sub>B</sub> = all buffers unlocked  
Reconfiguration of message buffers enabled with numbers < FLXAnFRMRC.FFB enabled
  - Exception: In nodes configured for sync frame transmission or for single slot mode operation message buffer 0 (and if FLXAnFRMRC.SPLM = 1, also message buffer 1) is always locked
- 01<sub>B</sub> = static buffers locked, FIFO locked, limited transmission  
Reconfiguration of message buffers with numbers < FLXAnFRMRC.FDB and with numbers ≥ FLXAnFRMRC.FFB locked and transmission of message buffers for static segment with numbers ≥ FLXAnFRMRC.FDB disabled
- 10<sub>B</sub> = all buffers locked  
Reconfiguration of all message buffers locked
- 11<sub>B</sub> = all buffers locked, limited transmission  
Reconfiguration of all message buffers locked and transmission of message buffers for static segment with numbers ≥ FLXAnFRMRC.FDB disabled

**(3) FLXAnFRMRC.LCB**

Last Configured Buffer Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

When a Static and Dynamic Buffer area is configured (FLXAnFRMRC.FDB < 128), the user should configure FLXAnFRMRC.LCB ≥ FLXAnFRMRC.FDB.

When a FIFO area is configured (FLXAnFRMRC.FFB < 128), the user should configure FLXAnFRMRC.LCB ≥ FLXAnFRMRC.FFB.

**(4) FLXAnFRMRC.FFB**

First Buffer of FIFO Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

When a Static and Dynamic Buffer area is configured (FLXAnFRMRC.FDB < 128), the user should configure FLXAnFRMRC.FFB > FLXAnFRMRC.FDB.

**(5) FLXAnFRMRC.FDB**

First Dynamic Buffer Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

### 25.2.8.2 FLXAnFRFRF — FlexRay FIFO Rejection Filter Register

The FIFO Rejection Filter defines a user specified sequence of bits to which channel, frame ID, and cycle count of the incoming frames are compared. Together with the FIFO Rejection Filter Mask this register determines whether a message is rejected by the FIFO.

**Access:** FLXAnFRFRF can be read or written in 32-bit units.

FLXAnFRFRFL and FLXAnFRFRFH can be read or written in 16-bit units.

FLXAnFRFRFLL, FLXAnFRFRFLH, FLXAnFRFRFLH, FLXAnFRFRFHL, and FLXAnFRFRFHH can be read or written in 8-bit units.

**Address:** FLXAnFRFRF: <FLXAn\_base> + 0304<sub>H</sub>,

FLXAnFRFRFL: <FLXAn\_base> + 0304<sub>H</sub>, FLXAnFRFRFH: <FLXAn\_base> + 0306<sub>H</sub>,

FLXAnFRFRFLL: <FLXAn\_base> + 0304<sub>H</sub>, FLXAnFRFRFLH: <FLXAn\_base> + 0305<sub>H</sub>,

FLXAnFRFRFHL: <FLXAn\_base> + 0306<sub>H</sub>, FLXAnFRFRFHH: <FLXAn\_base> + 0307<sub>H</sub>

**Value after reset:** 0180 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	RNF	RSS	CYF[6:0]						
Value after reset	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FID[10:0]											CH[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.72 FLXAnFRFRF Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	RNF	Reject Null Frames Bit 0: Null frames are stored in the FIFO 1: Reject all null frames
23	RSS	Reject in Static Segment Bit 0: FIFO also used for static segment 1: Reject messages in static segment
22 to 16	CYF[6:0]	Cycle Counter Filter Bit Cycle Counter Filter
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 2	FID[10:0]	Frame ID Filter Bit 0 to 2047: Frame ID filter values
1, 0	CH[1:0]	Channel Filter Bit 00 <sub>B</sub> : receive on both channels 01 <sub>B</sub> : receive only on channel B 10 <sub>B</sub> : receive only on channel A 11 <sub>B</sub> : no reception

**(1) FLXAnFRFRF.RNF**

Reject Null Frames Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. If this bit is set to 1, received null frames are not stored in the FIFO.

**(2) FLXAnFRFRF.RSS**

Reject in Static Segment Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. If this bit is set to 1, the FIFO is used only for the dynamic segment.

**(3) FLXAnFRFRF.CYF**

Cycle Counter Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by FLXAnFRFRF.CYF, all frames are rejected. For details about the configuration of the cycle counter filter see **Section 25.3.8.2, Cycle Counter Filtering**.

**(4) FLXAnFRFRF.FID**

Frame ID Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. Determines the frame ID to be rejected by the FIFO. With the additional configuration of register FLXAnFRFRFM, the corresponding frame ID filter bits are ignored, which results in further rejected frame IDs. When FLXAnFRFRFM.MFID is zero, a frame ID filter value of zero means that no frame ID is rejected.

**(5) FLXAnFRFRF.CH**

Channel Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG. If reception on both channels is configured, also in static segment always both frames (from channel A and B) are stored in the FIFO, even if they are identical.

### 25.2.8.3 FLXAnFRFRFM — FlexRay FIFO Rejection Filter Mask Register

The FlexRay FIFO Rejection Filter Mask specifies which of the corresponding frame ID filter bits are relevant for rejection filtering. If a bit is set to 1, it indicates that the corresponding bit in the FLXAnFRFRF register will not be considered for rejection filtering.

**Access:** FLXAnFRFRFM can be read or written in 32-bit units.  
 FLXAnFRFRFML can be read or written in 16-bit units.  
 FLXAnFRFRFMML and FLXAnFRFRFMLH can be read or written in 8-bit units.

**Address:** FLXAnFRFRFM: <FLXAn\_base> + 0308<sub>H</sub>,  
 FLXAnFRFRFML: <FLXAn\_base> + 0308<sub>H</sub>,  
 FLXAnFRFRFMML: <FLXAn\_base> + 0308<sub>H</sub>, FLXAnFRFRFMLH: <FLXAn\_base> + 0309<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.73 FLXAnFRFRFM Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 2	MFID[10:0]	Mask Frame ID Filter Bit 0: Corresponding frame ID filter bit is used for rejection filtering 1: Ignore corresponding frame ID filter bit.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### (1) FLXAnFRFRFM.MFID

##### Mask Frame ID Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.

### 25.2.8.4 FLXAnFRFCL — FlexRay FIFO Critical Level Register

**Access:** FLXAnFRFCL can be read or written in 32-bit units.  
 FLXAnFRFCLL can be read or written in 16-bit units.  
 FLXAnFRFCLLL can be read or written in 8-bit units.

**Address:** FLXAnFRFCL: <FLXAn\_base> + 030C<sub>H</sub>,  
 FLXAnFRFCLL: <FLXAn\_base> + 030C<sub>H</sub>,  
 FLXAnFRFCLLL: <FLXAn\_base> + 030C<sub>H</sub>

**Value after reset:** 0000 0080<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	CL[7:0]							
Value after reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.74 FLXAnFRFCL Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	CL[7:0]	Critical Level Bit Critical Level

#### (1) FLXAnFRFCL.CL

##### Critical Level Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT\_CONFIG or CONFIG.  
 When the receive FIFO fill level (FLXAnFRFSR.RFFL) is equal or greater than the critical level configured by FLXAnFRFCL.CL, the receive FIFO critical level flag FLXAnFRFSR.RFCL is set to 1.  
 If FLXAnFRFCL.CL is programmed to values > 128, bit FLXAnFRFSR.RFCL is never set to 1.

## 25.2.9 Message Buffer Status Registers

### 25.2.9.1 FLXAnFRMHDS — FlexRay Message Handler Status Register

**Access:** FLXAnFRMHDS can be read or written in 32-bit units.

FLXAnFRMHDSL can be read or written in 16-bit units.

FLXAnFRMHDSH is a read-only register that can be read in 16-bit units.

FLXAnFRMHDSLH can be read or written in 8-bit units.

FLXAnFRMHDSLH, FLXAnFRMHDSLH, and FLXAnFRMHDSHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRMHDS: <FLXAn\_base> + 0310<sub>H</sub>,

FLXAnFRMHDSL: <FLXAn\_base> + 0310<sub>H</sub>, FLXAnFRMHDSH: <FLXAn\_base> + 0312<sub>H</sub>,

FLXAnFRMHDSLH: <FLXAn\_base> + 0310<sub>H</sub>, FLXAnFRMHDSLH: <FLXAn\_base> + 0311<sub>H</sub>,

FLXAnFRMHDSLH: <FLXAn\_base> + 0312<sub>H</sub>, FLXAnFRMHDSHH: <FLXAn\_base> + 0313<sub>H</sub>

**Value after reset:** 0000 0080<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	MBU[6:0]						—	MBT[6:0]

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R

Table 25.75 FLXAnFRMHDS Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 24	MBU[6:0]	Message Buffer Updated Flag
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	MBT[6:0]	Message Buffer Transmitted Flag
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 8	FMB[6:0]	Faulty Message Buffer Number Flag
7	CRAM	Clear all internal RAM's Flag 0: No execution of the CHI command CLEAR_RAMs 1: Execution of the CHI command CLEAR_RAMs ongoing
6	MFMB	Multiple Faulty Message Buffer Detection Flag 0: No additional faulty message buffer. 1: Additional faulty message buffer was detected while the FLXAnFRMHDS.FMBD flag is set to 1.
5	FMBD	Faulty Message Buffer Detection Flag 0: No faulty message buffer. 1: Message buffer referenced by FLXAnFRMHDS.FMBD holds faulty data with a parity error.
4	ATBF2	Nonresident Buffer RAM B Access Error Flag 0: No access error 1: Access error occurred when reading the RAM B.

Table 25.75 FLXAnFRMHDS Register Contents

Bit Position	Bit Name	Function
3	ATBF1	Nonresident Buffer RAM A Access Error Flag 0: No access error. 1: Access error occurred when reading the RAM A.
2	AMR	Message RAM Access Error Flag 0 = No access error 1 = Access error occurred when reading the Message RAM.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

**(1) FLXAnFRMHDS.MBU**

Message Buffer Updated Flag

Number of message buffer that was updated last by the CC. For this message buffer the respective ND and/or MBC flag in the FLXAnFRNDAT1/2/3/4 registers and the FLXAnFRMBSC1/2/3/4 registers are also set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(2) FLXAnFRMHDS.MBT**

Message Buffer Transmitted Flag

Number of last successfully transmitted message buffer.

If the message buffer is configured for single-shot mode, the respective TXR flag in the FLXAnFRTXRQ1/2/3/4 registers was reset to 0.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(3) FLXAnFRMHDS.FMB**

Faulty Message Buffer Number Flag

This flag indicates that an access error occurred when reading from the message buffer referenced by FLXAnFRMHDS.FMB.

The value of this flag is only valid when FLXAnFRMHDS.AMR and flag FLXAnFRMHDS.FMBD are set to 1.

This flag is not updated while the FLXAnFRMHDS.FMBD flag is 1.

This flag is cleared by the CHI command CLEAR\_RAMs.

**(4) FLXAnFRMHDS.CRAMP**

Internal RAM Clear Flag

This flag indicates that the CHI command CLEAR\_RAMs is ongoing (all bits of the message RAM, input buffer, output buffer and nonresident buffer are written to 0).

This flag is set by the CHI command CLEAR\_RAMs.

**(5) FLXAnFRMHDS.MFMB**

Multiple Faulty Message Buffer Detection Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This bit indicates that an additional faulty message buffer was detected while the FMBD flag is set.

This bit is cleared by the CHI command CLEAR\_RAMs.

**(6) FLXAnFRMHDS.FMBD**

Faulty Message Buffer Detection Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This bit indicates that the message buffer holds faulty data due to an access error.

This bit is cleared by the CHI command CLEAR\_RAMs.

**(7) FLXAnFRMHD.ATBF2**

Nonresident Buffer RAM B Access Error Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This flag indicates that an access error occurred when reading the RAM B.

**CAUTION**

---

When this flag changes from 0 to 1, the AERR bit in the FLXAnFREIR register is set to 1.

This flag can be reset by the CHI command CLEAR\_RAMs.

---

**(8) FLXAnFRMHD.ATBF1**

Nonresident Buffer RAM A Access Error Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This flag indicates that an access error occurred when reading the RAM A.

**CAUTION**

---

When this flag changes from 0 to 1, the AERR bit in the FLXAnFREIR register is set to 1.

This flag can be reset by the CHI command CLEAR\_RAMs.

---

**(9) FLXAnFRMHDS.AMR**

Message RAM Access Error Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This flag indicates that an access error occurred when reading the Message RAM.

**CAUTION**

---

When this flag changes from 0 to 1, the AERR bit in the FLXAnFREIR register is set to 1.

This flag can be reset by the CHI command CLEAR\_RAMs.

---

### 25.2.9.2 FLXAnFRLDTS — FlexRay Last Dynamic Transmit Slot Register

**Access:** FLXAnFRLDTS is a read-only register that can be read in 32-bit units.

FLXAnFRLDTS\_L and FLXAnFRLDTS\_H are the read-only registers that can be read in 16-bit units.

FLXAnFRLDTS\_LL, FLXAnFRLDTS\_LH, FLXAnFRLDTS\_SL, and FLXAnFRLDTS\_SH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRLDTS: <FLXAn\_base> + 0314<sub>H</sub>,

FLXAnFRLDTS\_L: <FLXAn\_base> + 0314<sub>H</sub>, FLXAnFRLDTS\_H: <FLXAn\_base> + 0316<sub>H</sub>,

FLXAnFRLDTS\_LL: <FLXAn\_base> + 0314<sub>H</sub>, FLXAnFRLDTS\_LH: <FLXAn\_base> + 0315<sub>H</sub>,

FLXAnFRLDTS\_SL: <FLXAn\_base> + 0316<sub>H</sub>, FLXAnFRLDTS\_SH: <FLXAn\_base> + 0317<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	LDTB[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	LDTA[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.76 FLXAnFRLDTS Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned.
26 to 16	LDTB[10:0]	Last Dynamic Transmission Channel B Flag
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	LDTA[10:0]	Last Dynamic Transmission Channel A Flag

#### (1) FLXAnFRLDTS.LDTB

Last Dynamic Transmission Channel B Flag

Stores the value of vSlotCounter[B] at the time of the last frame transmission on channel B in the dynamic segment of this node.

It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs of channel B.

#### (2) FLXAnFRLDTS.LDTA

Last Dynamic Transmission Channel A Flag

Stores the value of vSlotCounter[A] at the time of the last frame transmission on channel A in the dynamic segment of this node.

It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs of channel A.

### 25.2.9.3 FLXAnFRFSR — FlexRay FIFO Status Register

**Access:** FLXAnFRFSR is a read-only register that can be read in 32-bit units.  
 FLXAnFRFSRL is a read-only register that can be read in 16-bit units.  
 FLXAnFRFSRLL and FLXAnFRFSRLH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRFSR: <FLXAn\_base> + 0318<sub>H</sub>,  
 FLXAnFRFSRL: <FLXAn\_base> + 0318<sub>H</sub>,  
 FLXAnFRFSRLL: <FLXAn\_base> + 0318<sub>H</sub>, FLXAnFRFSRLH: <FLXAn\_base> + 0319<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	RFFL[7:0]							—	—	—	—	—	—	RFO	RFCL	RFNE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.77 FLXAnFRFSR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 8	RFFL[7:0]	Receive FIFO Fill Level Flag
7 to 3	Reserved	When read, the value after reset is returned.
2	RFO	Receive FIFO Overrun Flag 0: No receive FIFO overrun detected 1: A receive FIFO overrun has been detected
1	RFCL	Receive FIFO Critical Level Flag 0: Receive FIFO below critical level 1: Receive FIFO critical level reached
0	RFNE	Receive FIFO Not Empty Flag 0: Receive FIFO is empty 1: Receive FIFO is not empty

#### (1) FLXAnFRFSR.RFFL

Receive FIFO Fill Level Flag

Indicates the number of FIFO buffers filled with new data not yet read by the Host. Maximum value is 128.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(2) FLXAnFRFSR.RFO**

Receive FIFO Overrun Flag

The flag is set to 1 by the CC when a receive FIFO overrun is detected.

When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. In addition, interrupt flag FLXAnFREIR.RFO is set to 1.

The flag is cleared by the next FIFO read access issued by the Host.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(3) FLXAnFRFSR.RFCL**

Receive FIFO Critical Level Flag

This flag is set to 1 when the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level as configured by FLXAnFRFCL.CL.

When FLXAnFRFSR.RFCL changes from 0 to 1 bit FLXAnFRSIR.RFCL is set to 1, and if enabled, an interrupt is generated.

The flag is cleared by the CC as soon as FLXAnFRFSR.RFFL drops below FLXAnFRFCL.CL.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(4) FLXAnFRFSR.RFNE**

Receive FIFO Not Empty Flag

This flag is set to 1 by the CC when a received valid frame (data or null frame depending on rejection mask) was stored in the FIFO. In addition, interrupt flag FLXAnFRSIR.RFNE is set to 1.

The bit is reset to 0 after the Host has read all messages from the FIFO.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

### 25.2.9.4 FLXAnFRMHDF — FlexRay Message Handler Constraints Flags Register

Some constraints exist for the Message Handler regarding bus clock frequency, Message RAM configuration, and FlexRay bus traffic. To simplify software development, constraints violations are reported by setting flags in the FLXAnFRMHDF.

**Access:** FLXAnFRMHDF can be read or written in 32-bit units.  
 FLXAnFRMHDFL can be read or written in 16-bit units.  
 FLXAnFRMHDFLL and FLXAnFRMHDFLH can be read or written in 8-bit units.

**Address:** FLXAnFRMHDF: <FLXAn\_base> + 031C<sub>H</sub>,  
 FLXAnFRMHDFL: <FLXAn\_base> + 031C<sub>H</sub>,  
 FLXAnFRMHDFLL: <FLXAn\_base> + 031C<sub>H</sub>, FLXAnFRMHDFLH: <FLXAn\_base> + 031D<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.78 FLXAnFRMHDF Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	WAHP	Write Attempt to Header Partition Flag 0: No write attempt to header partition 1: Write attempt to header partition
7	TNSB	Transmission Not Started Channel B Flag 0: No transmission not started on channel B 1: Transmission not started on channel B
6	TNSA	Transmission Not Started Channel A Flag 0: No transmission not started on channel A 1: Transmission not started on channel A
5	TBFB	Temporary buffer Access Failure B Flag 0: No TBF B access failure 1: TBF B access failure
4	TBFA	Temporary buffer Access Failure A Flag 0: No TBF A access failure 1: TBF A access failure
3	FNFB	Find Sequence Not Finished Channel B Flag 0: No find sequence not finished for channel B 1: Find sequence not finished for channel B
2	FNFA	Find Sequence Not Finished Channel A Flag 0: No find sequence not finished for channel A 1: Find sequence not finished for channel A
1	SNUB	Status Not Updated Channel B Flag 0: No overload condition occurred when updating MBS for channel B 1: MBS for channel B not updated

Table 25.78 FLXAnFRMHDF Register Contents

Bit Position	Bit Name	Function
0	SNUA	Status Not Updated Channel A Flag 0: No overload condition occurred when updating MBS for channel A 1: MBS for channel A not updated

**(1) FLXAnFRMHDF.WAHP**

Write Attempt to Header Partition Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

Outside DEFAULT\_CONFIG and CONFIG state this flag is set to 1 by the CC when the message handler tries to write message data into the header partition of the Message RAM due to faulty configuration of a message buffer. The write attempt is not executed, to protect the header partition from unintended write accesses.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(2) FLXAnFRMHDF.TNSB**

Transmission Not Started Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 by the CC when the Message Handler was not ready to start a scheduled transmission on channel B at the action point of the configured slot.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(3) FLXAnFRMHDF.TNSA**

Transmission Not Started Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set by the CC when the Message Handler was not ready to start a scheduled transmission on channel A at the action point of the configured slot.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(4) FLXAnFRMHDF.TBFB**

Temporary buffer Access Failure B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 by the CC when a read or write access to TBF B requested by PRT (Protocol controller) B could not complete within the available time.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(5) FLXAnFRMHDF.TBFA**

Temporary buffer Access Failure A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 by the CC when a read or write access to TBF A requested by PRT A could not complete within the available time.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(6) FLXAnFRMHDF.FNFB**

Find Sequence Not Finished Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer).

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(7) FLXAnFRMHDF.FNFA**

Find Sequence Not Finished Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer).

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(8) FLXAnFRMHDF.SNUB**

Status Not Updated Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer's status (FLXAnFRMBS).

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

**(9) FLXAnFRMHDF.SNUA**

Status Not Updated Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared by writing 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer's status (FLXAnFRMBS).

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Cleared when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR\_RAMs.

### 25.2.9.5 FLXAnFRTXRQi — FlexRay Transmission Request i (i = 1 to 4)

The four registers reflect the state of the TXR flags of all configured message buffers. The flags are valid for transmit buffers only. If the number of configured message buffers is less than 128, the unused TXR flags are invalid.

**Access:** FLXAnFRTXRQi is a read-only register that can be read in 32-bit units.

FLXAnFRTXRQiL and FLXAnFRTXRQiH are the read-only registers that can be read in 16-bit units.

FLXAnFRTXRQiLL, FLXAnFRTXRQiLH, FLXAnFRTXRQiHL, and FLXAnFRTXRQiHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRTXRQi:  $\langle \text{FLXAn\_base} \rangle + 0320_{\text{H}} + (i - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRTXRQiL:  $\langle \text{FLXAn\_base} \rangle + 0320_{\text{H}} + (i - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRTXRQiH:  $\langle \text{FLXAn\_base} \rangle + 0320_{\text{H}} + (i - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRTXRQiLL:  $\langle \text{FLXAn\_base} \rangle + 0320_{\text{H}} + (i - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRTXRQiLH:  $\langle \text{FLXAn\_base} \rangle + 0320_{\text{H}} + (i - 1) \times 4_{\text{H}} + 1_{\text{H}}$ ,  
 FLXAnFRTXRQiHL:  $\langle \text{FLXAn\_base} \rangle + 0320_{\text{H}} + (i - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRTXRQiHH:  $\langle \text{FLXAn\_base} \rangle + 0320_{\text{H}} + (i - 1) \times 4_{\text{H}} + 3_{\text{H}}$ .

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.79 FLXAnFRTXRQi Register Contents

Bit Position	Bit Name	Function
31 to 0	TXRo	Transmission Request Flag o

#### (1) FLXAnFRTXRQi.TXRo (o = (i - 1) × 32 to i × 32 - 1)

Transmission Request Flag o

If the flag is set to 1, the respective message buffer is ready for transmission or transmission of this message buffer is in progress.

In single-shot mode the flags are reset to 0 after transmission has completed.

This bit is cleared by the CHI command CLEAR\_RAMs.

### 25.2.9.6 FLXAnFRNDATi — FlexRay New Data Register i (i = 1 to 4)

The four registers reflect the state of the ND flags of all configured message buffers. ND flags belonging to transmit buffers have no meaning. If the number of configured message buffers is less than 128, unused ND flags are invalid.

**Access:** FLXAnFRNDATi is a read-only register that can be read in 32-bit units.

FLXAnFRNDATiL and FLXAnFRNDATiH are the read-only registers that can be read in 16-bit units.

FLXAnFRNDATiLL, FLXAnFRNDATiLH, FLXAnFRNDATiHL, and FLXAnFRNDATiHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRNDATi:  $\langle \text{FLXAn\_base} \rangle + 0330_{\text{H}} + (i - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRNDATiL:  $\langle \text{FLXAn\_base} \rangle + 0330_{\text{H}} + (i - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRNDATiH:  $\langle \text{FLXAn\_base} \rangle + 0330_{\text{H}} + (i - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRNDATiLL:  $\langle \text{FLXAn\_base} \rangle + 0330_{\text{H}} + (i - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRNDATiLH:  $\langle \text{FLXAn\_base} \rangle + 0330_{\text{H}} + (i - 1) \times 4_{\text{H}} + 1_{\text{H}}$ ,  
 FLXAnFRNDATiHL:  $\langle \text{FLXAn\_base} \rangle + 0330_{\text{H}} + (i - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRNDATiHH:  $\langle \text{FLXAn\_base} \rangle + 0330_{\text{H}} + (i - 1) \times 4_{\text{H}} + 3_{\text{H}}$

**Value after reset:** 0000 0000<sub>H</sub>

Table 25.80 FLXAnFRNDATi Register Contents

Bit Position	Bit Name	Function
31 to 0	NDm	New Data Flag m

#### (1) FLXAnFRNDATi.NDm (m = (i - 1) × 32 to i × 32 - 1)

New Data Flag m

The flags are set to 1 when a valid received data frame matches the message buffer's filter configuration, independent of the payload length received or the payload length configured for that message buffer.

The flags are not set to 1 after reception of null frames except for message buffers belonging to the receive FIFO.

An ND flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when the data section has been transferred to the Output Buffer.

Cleared when leaving CONFIG state or when entering STARTUP state.

This bit is cleared by the CHI command CLEAR\_RAMs.

### 25.2.9.7 FLXAnFRMBSCi — FlexRay Message Buffer Status Changed Register i (i = 1 to 4)

The four registers reflect the state of the MBC flags of all configured message buffers. If the number of configured message buffers is less than 128, unused MBC flags are invalid.

**Access:** FLXAnFRMBSCi is a read-only register that can be read in 32-bit units.  
FLXAnFRMBSCiL and FLXAnFRMBSCiH are the read-only registers that can be read in 16-bit units.  
FLXAnFRMBSCiLL, FLXAnFRMBSCiLH, FLXAnFRMBSCiHL, and FLXAnFRMBSCiHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRMBSCi:  $\langle \text{FLXAn\_base} \rangle + 0340_{\text{H}} + (i - 1) \times 4_{\text{H}}$ ,  
FLXAnFRMBSCiL:  $\langle \text{FLXAn\_base} \rangle + 0340_{\text{H}} + (i - 1) \times 4_{\text{H}}$ ,  
FLXAnFRMBSCiH:  $\langle \text{FLXAn\_base} \rangle + 0340_{\text{H}} + (i - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
FLXAnFRMBSCiLL:  $\langle \text{FLXAn\_base} \rangle + 0340_{\text{H}} + (i - 1) \times 4_{\text{H}}$ ,  
FLXAnFRMBSCiLH:  $\langle \text{FLXAn\_base} \rangle + 0340_{\text{H}} + (i - 1) \times 4_{\text{H}} + 1_{\text{H}}$ ,  
FLXAnFRMBSCiHL:  $\langle \text{FLXAn\_base} \rangle + 0340_{\text{H}} + (i - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
FLXAnFRMBSCiHH:  $\langle \text{FLXAn\_base} \rangle + 0340_{\text{H}} + (i - 1) \times 4_{\text{H}} + 3_{\text{H}}$

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MBCm (m = (i - 1) × 32 + 31 to (i - 1) × 32 + 16)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MBCm (m = (i - 1) × 32 + 15 to (i - 1) × 32 + 0)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.81 FLXAnFRMBSCi Register Contents

Bit Position	Bit Name	Function
31 to 0	MBCm	Message Buffer Status Changed Flag m

#### (1) FLXAnFRMBSCi.MBCm (m = (i - 1) × 32 to i × 32 - 1)

Message Buffer Status Changed Flag m

Indicates whether the Message Handler has changed one of the status flags VFRA, VFRB, SEOA, SEOB, CEOA, CEOB, SVOA, SVOB, TCIA, TCIB, ESA, ESB, MLST, FTA, FTB in the header section (see **Section 25.2.11.5, FLXAnFRMBS — FlexRay Message Buffer Status Register** and **Section 25.3.13.1, Header Partition**) of the respective message buffer.

An MBC flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when it has been transferred to the Output Buffer.

Cleared when leaving CONFIG state or when entering STARTUP state.

This bit is cleared by the CHI command CLEAR\_RAMs.

### 25.2.10 Input Buffer

Double buffer structure consisting of Input Buffer Host and Input Buffer Shadow. While the Host can write to Input Buffer Host, the transfer to the Message RAM is done from Input Buffer Shadow. The Input Buffer holds the header and data sections to be transferred to the selected message buffer in the Message RAM. It is used to configure the message buffers in the Message RAM and to update the data sections of transmit buffers.

When updating the header section of a message buffer in the Message RAM from the Input Buffer, the Message Buffer Status as described in **Section 25.2.11.5, FLXAnFRMBS — FlexRay Message Buffer Status Register** is automatically reset to zero.

The header sections of message buffers belonging to the receive FIFO can only be (re)configured when the CC is in DEFAULT\_CONFIG or CONFIG state. For those message buffers only the payload length configured and the data pointer need to be configured via FLXAnFRWRHS2.PLC and FLXAnFRWRHS3.DP. All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask.

The data transfer between Input Buffer (IBF) and Message RAM is described in detail in **Section 25.3.12.1, Reconfiguration of Message Buffers**.

These registers cannot be written when the input data transfer function shown in **Section 25.3.16.1, Input Data Transfer** is used and the FLXAnFRITS.ITS bit is 1.

### 25.2.10.1 FLXAnFRWRDSx — FlexRay Write Data Section Register x (x = 1 to 64)

This register holds the data words to be transferred to the data section of the specified message buffer. The number of data words written to the Message RAM is defined by the payload length configured in FLXAnFRWRHS2.PLC bit.

**Access:** FLXAnFRWRDSx can be read or written in 32-bit units.  
 FLXAnFRWRDSxL and FLXAnFRWRDSxH can be read or written in 16-bit units.  
 FLXAnFRWRDSxLL, FLXAnFRWRDSxLH, FLXAnFRWRDSxHL, and FLXAnFRWRDSxHH can be read or written in 8-bit units.

**Address:** FLXAnFRWRDSx:  $\langle \text{FLXAn\_base} \rangle + 0400_{\text{H}} + (x - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRWRDSxL:  $\langle \text{FLXAn\_base} \rangle + 0400_{\text{H}} + (x - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRWRDSxH:  $\langle \text{FLXAn\_base} \rangle + 0400_{\text{H}} + (x - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRWRDSxLL:  $\langle \text{FLXAn\_base} \rangle + 0400_{\text{H}} + (x - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRWRDSxLH:  $\langle \text{FLXAn\_base} \rangle + 0400_{\text{H}} + (x - 1) \times 4_{\text{H}} + 1_{\text{H}}$ ,  
 FLXAnFRWRDSxHL:  $\langle \text{FLXAn\_base} \rangle + 0400_{\text{H}} + (x - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRWRDSxHH:  $\langle \text{FLXAn\_base} \rangle + 0400_{\text{H}} + (x - 1) \times 4_{\text{H}} + 3_{\text{H}}$

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.82 FLXAnFRWRDSx Register Contents

Bit Position	Bit Name	Function
31 to 0	MD[31:0]	Message Data Bit

#### (1) FLXAnFRWRDSx.MD

Message Data Bit

For information about the byte alignment of the message data in this register see **Section 25.3.17, Byte Alignment**.

#### CAUTIONS

- In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused.
- When writing to FLXAnFRWRDSx, each 32-bit word has to be filled up by one 32-bit access OR two consecutive 16-bit accesses OR four consecutive 8-bit accesses before the transfer from the Input Buffer to the Message RAM is started. If not all bytes of a 32-bit word have been written by the Host (8/16-bit access only), FLXAnFRWRDSx holds partly undefined data.  
Reset by the CHI command CLEAR\_RAMs.

### 25.2.10.2 FLXAnFRWRHS1 — FlexRay Write Header Section Register 1

**Access:** FLXAnFRWRHS1 can be read or written in 32-bit units.

FLXAnFRWRHS1L and FLXAnFRWRHS1H can be read or written in 16-bit units.

FLXAnFRWRHS1LL, FLXAnFRWRHS1LH, FLXAnFRWRHS1HL, and FLXAnFRWRHS1HH can be read or written in 8-bit units.

**Address:** FLXAnFRWRHS1: <FLXAn\_base> + 0500<sub>H</sub>,

FLXAnFRWRHS1L: <FLXAn\_base> + 0500<sub>H</sub>, FLXAnFRWRHS1H: <FLXAn\_base> + 0502<sub>H</sub>,

FLXAnFRWRHS1LL: <FLXAn\_base> + 0500<sub>H</sub>, FLXAnFRWRHS1LH: <FLXAn\_base> + 0501<sub>H</sub>,

23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	CYC[6:0]	Cycle Code Bit
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	FID[10:0]	Frame ID Bit

**(1) FLXAnFRWRHS1.MBI**

Message Buffer Interrupt Enable Bit

This bit enables the message buffer interrupt.

After a dedicated receive buffer has been updated by the Message Handler, flag FLXAnFRSIR.RXI and /or FLXAnFRSIR.MBSI are set to 1. After a transmission has completed flag FLXAnFRSIR.TXI is set to 1.

**(2) FLXAnFRWRHS1.TXM**

Transmission Mode Setting Bit

This bit selects transmit mode of the corresponding message buffer. For transmit mode, see **Section 25.3.9.3, Transmit Buffers**.

**(3) FLXAnFRWRHS1.PPIT**

Payload Preamble Indicator Transmit Bit

This bit is used to control the state of the Payload Preamble Indicator in transmit frames in transmit frames of the corresponding message buffer.

If the bit is set to 1 in a static message buffer, the respective message buffer holds network management information.

If the bit is set to 1 in a dynamic message buffer the first two bytes of the payload segment may be used for message ID filtering by the receiver. Message ID filtering of received FlexRay frames is not supported by the FlexRay module, but can be done by the Host.

**(4) FLXAnFRWRHS1.CFG**

Message Buffer Direction Configuration Bit

This bit is used to configure the corresponding buffer as transmit buffer or as receive buffer. For message buffers belonging to the receive FIFO the bit is not evaluated.

When not allocating an unused area of at least 32 bits at the start of the data partition, set this bit to 1 in the data section of the message buffer allocated immediately after the (last buffer of the) header partition so that the message buffer is specified as a transmit buffer.

**(5) FLXAnFRWRHS1.CH**

Channel Filter Control Bit

The 2-bit channel filtering field associated with each buffer serves as a filter for receive buffers, and as a control field for transmit buffers.

CH[1:0]	Transmit Buffer Transmit Frame on	Receive Buffer Store Frame Received from
00 <sub>B</sub>	No transmission	Ignore frame
01 <sub>B</sub>	Channel A	Channel A
10 <sub>B</sub>	Channel B	Channel B
11 <sub>B</sub>	Both channels (static segment only)	Channel A or B (store first semantically valid frame; static segment only)

**CAUTION**

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to 1, no frames are transmitted and received frames are ignored (same function as CH = "00<sub>B</sub>")

**(6) FLXAnFRWRHS1.CYC**

Cycle Code Bit

The 7-bit cycle code determines the cycle set used for cycle counter filtering.

For details about the configuration of the cycle code **Section 25.3.8.2, Cycle Counter Filtering**.

**(7) FLXAnFRWRHS1.FID**

Frame ID Bit

Configures the frame ID of the selected message buffer. The frame ID defines the slot number for transmission/reception of the respective message.

Message buffers with frame ID = 0 are considered as not valid.

### 25.2.10.3 FLXAnFRWRHS2 — FlexRay Write Header Section Register 2

**Access:** FLXAnFRWRHS2 can be read or written in 32-bit units.

FLXAnFRWRHS2L and FLXAnFRWRHS2H can be read or written in 16-bit units.

FLXAnFRWRHS2LL, FLXAnFRWRHS2LH, and FLXAnFRWRHS2HL can be read or written in 8-bit units.

**Address:** FLXAnFRWRHS2: <FLXAn\_base> + 0504<sub>H</sub>,

FLXAnFRWRHS2L: <FLXAn\_base> + 0504<sub>H</sub>, FLXAnFRWRHS2H: <FLXAn\_base> + 0506<sub>H</sub>,

FLXAnFRWRHS2LL: <FLXAn\_base> + 0504<sub>H</sub>, FLXAnFRWRHS2LH: <FLXAn\_base> + 0505<sub>H</sub>,

FLXAnFRWRHS2HL: <FLXAn\_base> + 0506<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	PLC[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 25.84 FLXAnFRWRHS2 Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	PLC[6:0]	Payload Length Configured Bit
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	CRC[10:0]	Header CRC Bit (vRF!Header!HeaderCRC) Receive Buffer: Configuration not required Transmit Buffer: Header CRC is configured

#### (1) FLXAnFRWRHS2.PLC

##### Payload Length Configured Bit

Length of data section (number of 2-byte words) as configured by the Host.

During static segment the static frame payload length as configured by FLXAnFRMHDC.SFDL defines the payload length for all static frames. If the payload length configured by FLXAnFRWRHS2.PLC is shorter than this value padding bytes are inserted to ensure that frames have proper physical length. The padding pattern is “0000<sub>H</sub>” (see **Section 25.3.9.3, Transmit Buffers**).

#### (2) FLXAnFRWRHS2.CRC

##### Header CRC Bit (vRF!Header!HeaderCRC)

Setting of the receive buffer is not required.

Transmitting of the message buffer needs the header CRC calculation and setting.

For calculation of the header CRC the payload length of the frame send on the bus has to be considered. In static segment the payload length of all frames is configured by FLXAnFRMHDC.SFDL.

### 25.2.10.4 FLXAnFRWRHS3 — FlexRay Write Header Section Register 3

**Access:** FLXAnFRWRHS3 can be read or written in 32-bit units.  
 FLXAnFRWRHS3L can be read or written in 16-bit units.  
 FLXAnFRWRHS3LL and FLXAnFRWRHS3LH can be read or written in 8-bit units.

**Address:** FLXAnFRWRHS3: <FLXAn\_base> + 0508<sub>H</sub>,  
 FLXAnFRWRHS3L: <FLXAn\_base> + 0508<sub>H</sub>,  
 FLXAnFRWRHS3LL: <FLXAn\_base> + 0508<sub>H</sub>, FLXAnFRWRHS3LH: <FLXAn\_base> + 0509<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

31 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	DP[10:0]	Data Pointer Bit

#### (1) FLXAnFRWRHS3.DP

Data Pointer Bit

Configures the pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

### 25.2.10.5 FLXAnFRIBCM — FlexRay Input Buffer Command Mask Register

Configures how the message buffer in the Message RAM selected by register FLXAnFRIBCR is updated. When IBF Host and IBF Shadow are swapped, also mask bits FLXAnFRIBCM.LHSH, FLXAnFRIBCM.LDSH, and FLXAnFRIBCM.STXRH are swapped with bits FLXAnFRIBCM.LHSS, FLXAnFRIBCM.LDSS, and FLXAnFRIBCM.STXRS.

**Access:** FLXAnFRIBCM can be read or written in 32-bit units.  
 FLXAnFRIBCMML can be read or written in 16-bit units.  
 FLXAnFRIBCMH is a read-only register that can be read in 16-bit units.  
 FLXAnFRIBCMMLL can be read or written in 8-bit units.  
 FLXAnFRIBCMHL is a read-only register that can be read in 8-bit units.

**Address:** FLXAnFRIBCM: <FLXAn\_base> + 0510<sub>H</sub>,  
 FLXAnFRIBCMML: <FLXAn\_base> + 0510<sub>H</sub>, FLXAnFRIBCMH: <FLXAn\_base> + 0512<sub>H</sub>,  
 FLXAnFRIBCMMLL: <FLXAn\_base> + 0510<sub>H</sub>, FLXAnFRIBCMHL: <FLXAn\_base> + 0512<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	STXRS	LDSS	LHSS

	—	—	—	—	—	—	—	—	—	—	—	—	—	STXRH	LDSH	LHSH
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 25.86 FLXAnFRIBCM Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	STXRS	Set Transmission Request Shadow Flag 0: Reset TXR flag 1: Set TXR flag, transmit buffer released for transmission (operation ongoing or finished)
17	LDSS	Load Data Section Shadow Flag 0: Data section is not updated 1: Data section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished)
16	LHSS	Load Header Section Shadow Flag 0: Header section is not updated 1: Header section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished)
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	STXRH	Set Transmission Request Host Bit 0: Reset TXR flag 1: Set TXR flag, transmit buffer released for transmission
1	LDSH	Load Data Section Host Bit 0: Data section is not updated 1: Data section selected for transfer from Input Buffer to the Message RAM
0	LHSH	Load Header Section Host Bit 0: Header section is not updated 1: Header section selected for transfer from Input Buffer to the Message RAM

**(1) FLXAnFRIBCM.STXRS**

Set Transmission Request Shadow Flag

**(2) FLXAnFRIBCM.LDSS**

Load Data Section Shadow Flag

**(3) FLXAnFRIBCM.LHSS**

Load Header Section Shadow Flag

**(4) FLXAnFRIBCM.STXRH**

Set Transmission Request Host Bit

If this bit is set to 1, the TXR flag for the selected message buffer is set in the FLXAnFRTXRQ1/2/3/4 registers to release the message buffer for transmission. In single-shot mode the flag is cleared by the CC after transmission has completed.

TXR is evaluated for transmit buffers only.

**(5) FLXAnFRIBCM.LDSH**

Set Load Data Section Host Bit

**(6) FLXAnFRIBCM.LHSH**

Set Load Header Section Host Bit

### 25.2.10.6 FLXAnFRIBCR — FlexRay Input Buffer Command Request Register

When the Host writes the number of the target message buffer in the Message RAM to FLXAnFRIBCR.IBRH, IBF Host and IBF Shadow are swapped. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also swapped (see **Section 25.3.12.2(1), Data Transfer from Input Buffer to Message RAM**).

With this write operation the FLXAnFRIBCR.IBSYS is set to 1. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by FLXAnFRIBCR.IBRS.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message into the IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, FLXAnFRIBCR.IBSYS is set back to 0 and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.

If a write access to FLXAnFRIBCR.IBRH occurs while FLXAnFRIBCR.IBSYS is 1, FLXAnFRIBCR.IBSYH is set to 1. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, FLXAnFRIBCR.IBSYH is reset to 0.

FLXAnFRIBCR.IBSYS remains set to 1, and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also swapped.

Any write access to an Input Buffer register while both FLXAnFRIBCR.IBSYS and FLXAnFRIBCR.IBSYH are set to 1 will cause the error flag FLXAnFREIR.IIBA to be set to 1.

**Access:** FLXAnFRIBCR can be read or written in 32-bit units.  
 FLXAnFRIBCR.L can be read or written in 16-bit units.  
 FLXAnFRIBCR.H is a read-only register that can be read in 16-bit units.  
 FLXAnFRIBCR.LL can be read or written in 8-bit units.  
 FLXAnFRIBCR.LH, FLXAnFRIBCR.HL, and FLXAnFRIBCR.HH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRIBCR: <FLXAn\_base> + 0514<sub>H</sub>,  
 FLXAnFRIBCR.L: <FLXAn\_base> + 0514<sub>H</sub>, FLXAnFRIBCR.H: <FLXAn\_base> + 0516<sub>H</sub>,  
 FLXAnFRIBCR.LL: <FLXAn\_base> + 0514<sub>H</sub>, FLXAnFRIBCR.LH: <FLXAn\_base> + 0515<sub>H</sub>,  
 FLXAnFRIBCR.HL: <FLXAn\_base> + 0516<sub>H</sub>, FLXAnFRIBCR.HH: <FLXAn\_base> + 0517<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IBSYS	—	—	—	—	—	—	—	—	IBRS[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.87 FLXAnFRIBCR Register Contents

Bit Position	Bit Name	Function
31	IBSYS	Input Buffer Busy Shadow Flag 0: Transfer between IBF Shadow and Message RAM completed 1: Transfer between IBF Shadow and Message RAM in progress
30 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	IBRS[6:0]	Input Buffer Request Shadow Flag
15	IBSYH	Input Buffer Busy Host Flag 0: No request pending 1: Request while transfer between IBF Shadow and Message RAM in progress
14 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	IBRH[6:0]	Input Buffer Request Host Bit

**(1) FLXAnFRIBCR.IBSYS**

Input Buffer Busy Shadow Flag

Set to 1 after writing FLXAnFRIBCR.IBRH.

This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.

When the transfer between IBF Shadow and the Message RAM has completed, FLXAnFRIBCR.IBSYS is set back to 0.

**(2) FLXAnFRIBCR.IBRS**

Input Buffer Request Shadow Flag

Number of the target message buffer actually updated/lately updated.

**(3) FLXAnFRIBCR.IBSYH**

Input Buffer Busy Host Flag

Set to 1 by writing FLXAnFRIBCR.IBRH while FLXAnFRIBCR.IBSYS is still 1.

This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.

After the ongoing transfer between IBF Shadow and the Message RAM has completed, the FLXAnFRIBCR.IBSYH is set back to 0.

**(4) FLXAnFRIBCR.IBRH**

Input Buffer Request Host Bit

Selects the target message buffer in the Message RAM for data transfer from Input Buffer.

## 25.2.11 Output Buffer

Double buffer structure consisting of Output Buffer Host and Output Buffer Shadow. Used to read out message buffers from the Message RAM. While the Host can read from Output Buffer Host, the Message Handler transfers the selected message buffer from Message RAM to Output Buffer Shadow. The data transfer between Message RAM and Output Buffer (OBF) is described in **Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer**.

These registers cannot be written when the output data transfer function shown in **Section 25.3.16.2, Output Data Transfer**, in Output Data Transfer is used and the FLXAnFROTS.OTS bit is 1.

### 25.2.11.1 FLXAnFRRDDSx — FlexRay Read Data Section Register x (x = 1 to 64)

Holds the data words read from the data section of the addressed message buffer. This register holds the data words to be transferred to the data section of the specified message buffer. The number of data words (D<sub>Wn</sub>) read from the Message RAM is defined by the payload length configured in FLXAnFRRDHS2.PLC bit.

**Access:** FLXAnFRRDDSx is a read-only register that can be read in 32-bit units.  
 FLXAnFRRDDSxL and FLXAnFRRDDSxH are the read-only registers that can be read in 16-bit units.  
 FLXAnFRRDDSxLL, FLXAnFRRDDSxLH, FLXAnFRRDDSxHL, and FLXAnFRRDDSxHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRRDDSx:  $\langle \text{FLXAn\_base} \rangle + 0600_{\text{H}} + (x - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRRDDSxL:  $\langle \text{FLXAn\_base} \rangle + 0600_{\text{H}} + (x - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRRDDSxH:  $\langle \text{FLXAn\_base} \rangle + 0600_{\text{H}} + (x - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRRDDSxLL:  $\langle \text{FLXAn\_base} \rangle + 0600_{\text{H}} + (x - 1) \times 4_{\text{H}}$ ,  
 FLXAnFRRDDSxLH:  $\langle \text{FLXAn\_base} \rangle + 0600_{\text{H}} + (x - 1) \times 4_{\text{H}} + 1_{\text{H}}$ ,  
 FLXAnFRRDDSxHL:  $\langle \text{FLXAn\_base} \rangle + 0600_{\text{H}} + (x - 1) \times 4_{\text{H}} + 2_{\text{H}}$ ,  
 FLXAnFRRDDSxHH:  $\langle \text{FLXAn\_base} \rangle + 0600_{\text{H}} + (x - 1) \times 4_{\text{H}} + 3_{\text{H}}$ .

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.88 FLXAnFRRDDSx Register Contents

Bit Position	Bit Name	Function
31 to 0	MD[31:0]	Message Data

**(1) FLXAnFRRDDSx.MD**

Message Data Flag

For information about the byte alignment of the data words in this register see **Section 25.3.17, Byte Alignment**.

**CAUTION**

---

In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused.  
Reset by the CHI command CLEAR\_RAMs.

---

### 25.2.11.2 FLXAnFRRDHS1 — FlexRay Read Header Section Register 1

**Access:** FLXAnFRRDHS1 is a read-only register that can be read in 32-bit units.

FLXAnFRRDHS1L and FLXAnFRRDHS1H are the read-only registers that can be read in 16-bit units.

FLXAnFRRDHS1LL, FLXAnFRRDHS1LH, FLXAnFRRDHS1HL, and FLXAnFRRDHS1HH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRRDHS1: <FLXAn\_base> + 0700<sub>H</sub>,

FLXAnFRRDHS1L: <FLXAn\_base> + 0700<sub>H</sub>, FLXAnFRRDHS1H: <FLXAn\_base> + 0702<sub>H</sub>,

FLXAnFRRDHS1LL: <FLXAn\_base> + 0700<sub>H</sub>, FLXAnFRRDHS1LH: <FLXAn\_base> + 0701<sub>H</sub>,

FLXAnFRRDHS1HL: <FLXAn\_base> + 0702<sub>H</sub>, FLXAnFRRDHS1HH: <FLXAn\_base> + 0703<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 25.89 FLXAnFRRDHS1 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned.
29	MBI	Message Buffer Interrupt Flag
28	TXM	Transmission Mode Flag
27	PPIT	Payload Preamble Indicator Transmit Flag
26	CFG	Message Buffer Direction Configuration Flag
25, 24	CH[1:0]	Channel Filter Control Flag
23	Reserved	When read, the value after reset is returned.
22 to 16	CYC[6:0]	Cycle Code
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	FID[10:0]	Frame ID

#### (1) FLXAnFRRDHS1.MBI

Message Buffer Interrupt Flag

Values as configured by the Host via FLXAnFRWRHS1.MBI.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

#### (2) FLXAnFRRDHS1.TXM

Transmission Mode Flag

Values as configured by the Host via FLXAnFRWRHS1.TXM.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

**(3) FLXAnFRRDHS1.PPIT**

Payload Preamble Indicator Transmit Flag

Values as configured by the Host via FLXAnFRWRHS1.PPIT.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

**(4) FLXAnFRRDHS1.CFG**

Message Buffer Direction Configuration Flag

Values as configured by the Host via FLXAnFRWRHS1.CFG.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

**(5) FLXAnFRRDHS1.CH**

Channel Filter Control Flag

Values as configured by the Host via FLXAnFRWRHS1.CH.

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0.

**(6) FLXAnFRRDHS1.CYC**

Cycle Code

Values as configured by the Host via FLXAnFRWRHS1.CYC.

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0.

**(7) FLXAnFRRDHS1.FID**

Frame ID

Values as configured by the Host via FLXAnFRWRHS1.FID

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are holding the received frame ID.

### 25.2.11.3 FLXAnFRRDHS2 — FlexRay Read Header Section Register 2

#### CAUTION

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRRDHS2 is updated from data frames only.

**Access:** FLXAnFRRDHS2 is a read-only register that can be read in 32-bit units.

FLXAnFRRDHS2L and FLXAnFRRDHS2H are the read-only registers that can be read in 16-bit units.

FLXAnFRRDHS2LL, FLXAnFRRDHS2LH, FLXAnFRRDHS2HL, and FLXAnFRRDHS2HH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRRDHS2: <FLXAn\_base> + 0704<sub>H</sub>,

FLXAnFRRDHS2L: <FLXAn\_base> + 0704<sub>H</sub>, FLXAnFRRDHS2H: <FLXAn\_base> + 0706<sub>H</sub>,

FLXAnFRRDHS2LL: <FLXAn\_base> + 0704<sub>H</sub>, FLXAnFRRDHS2LH: <FLXAn\_base> + 0705<sub>H</sub>,

FLXAnFRRDHS2HL: <FLXAn\_base> + 0706<sub>H</sub>, FLXAnFRRDHS2HH: <FLXAn\_base> + 0707<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.90 FLXAnFRRDHS2 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 24	PLR[6:0]	Payload Length Received Flag (vRF!Header!Length)
23	Reserved	When read, the value after reset is returned.
22 to 16	PLC[6:0]	Payload Length Configured Flag
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	CRC[10:0]	Header CRC Flag (vRF!Header!HeaderCRC)

#### (1) FLXAnFRRDHS2.PLR

Payload Length Received Flag (vRF!Header!Length)

Payload length (vRF!Header!Length) value updated from received data frames (exception: if message buffer belongs to the receive FIFO FLXAnFRRDHS2.PLR is also updated from received null frames).

#### (2) FLXAnFRRDHS2.PLC

Payload Length Configured Flag

Length of data section (number of 2-byte words) as configured by the Host.

### (3) FLXAnFRRDHS2.CRC

Header CRC Flag (vRF!Header!HeaderCRC)

Receive Buffer: Header CRC (vRF!Header!HeaderCRC) updated from received data frames

Transmit Buffer: Header CRC configured by the Host

### (4) Data Storage

When a message is stored into a message buffer the following behavior with respect to payload length received and payload length configured is implemented:

- $FLXAnFRRDHS2.PLR > FLXAnFRRDHS2.PLC$ :  
The payload data stored in the message buffer is truncated to the payload length configured if  $FLXAnFRRDHS2.PLC$  even or else truncated to  $FLXAnFRRDHS2.PLC + 1$ .
- $FLXAnFRRDHS2.PLR \leq FLXAnFRRDHS2.PLC$ :  
The received payload data is stored into the message buffers data section. The remaining data bytes of the data section as configured by  $FLXAnFRRDHS2.PLC$  are filled with undefined data.
- $FLXAnFRRDHS2.PLR = \text{zero}$ :  
The message buffer's data section is filled with undefined data
- $FLXAnFRRDHS2.PLC = \text{zero}$ :  
Message buffer has no data section configured. No data is stored into the message buffer's data section.

### CAUTIONS

1. The Message RAM is organized in 4-byte words. When received data is stored into a message buffer's data section, the number of 2-byte data words written into the message buffer is  $FLXAnFRRDHS2.PLC$  rounded to the next even value.
2.  $FLXAnFRRDHS2.PLC$  should be configured identical for all message buffers belonging to the receive FIFO. Header 2 is updated from data frames only.  
For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area  $FLXAnFRRDHS2$  is updated from data frames only.

### 25.2.11.4 FLXAnFRRDHS3 — FlexRay Read Header Section Register 3

#### CAUTION

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRRDHS3 is updated from data frames only.

**Access:** FLXAnFRRDHS3 is a read-only register that can be read in 32-bit units.

FLXAnFRRDHS3L and FLXAnFRRDHS3H are the read-only registers that can be read in 16-bit units.

FLXAnFRRDHS3LL, FLXAnFRRDHS3LH, FLXAnFRRDHS3HL, and FLXAnFRRDHS3HH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRRDHS3: <FLXAn\_base> + 0708<sub>H</sub>,

FLXAnFRRDHS3L: <FLXAn\_base> + 0708<sub>H</sub>, FLXAnFRRDHS3H: <FLXAn\_base> + 070A<sub>H</sub>,

FLXAnFRRDHS3LL: <FLXAn\_base> + 0708<sub>H</sub>, FLXAnFRRDHS3LH: <FLXAn\_base> + 0709<sub>H</sub>,

FLXAnFRRDHS3HL: <FLXAn\_base> + 070A<sub>H</sub>, FLXAnFRRDHS3HH: <FLXAn\_base> + 070B<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 25.91 FLXAnFRRDHS3 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned.
29	RES	Reserved Bit Indicator Flag (vRF!Header!Reserved)
28	PPI	Payload Preamble Indicator (vRF!Header!PPIndicator)
27	NFI	Null Frame Indicator Flag (vRF!Header!NFIndicator) 0: Up to now no data frame has been stored into the respective message buffer 1: At least one data frame has been stored into the respective message buffer
26	SYN	Sync Frame Indicator Flag (vRF!Header!SyFIndicator) 0: The received frame is not a sync frame 1: The received frame is a sync frame
25	SFI	Startup Frame Indicator Flag (vRF!Header!SuFIndicator) 0: The received frame is not a startup frame 1: The received frame is a startup frame
24	RCI	Received on Channel Indicator Flag (vSS!Channel) 0: Frame received on channel B 1: Frame received on channel A
23, 22	Reserved	When read, the value after reset is returned.
21 to 16	RCC[5:0]	Receive Cycle Counter (vRF!Header!CycleCount)
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	DP[10:0]	Data Pointer Flag

**(1) FLXAnFRRDHS3.RES**

Reserved Bit Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit. The reserved bit is transmitted as 0.

**(2) FLXAnFRRDHS3.PPI**

Payload Preamble Indicator Flag (vRF!Header!PPIIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.

- 0 = The payload segment of the received frame does not contain a network management vector nor a message ID
- 1 = Static segment: Network management vector in the first part of the payload  
Dynamic segment: Message ID in the first part of the payload

**(3) FLXAnFRRDHS3.NFI**

Null Frame Indicator Flag (vRF!Header!NFIndicator)

Is set to 1 after storage of the first received data frame.

**(4) FLXAnFRRDHS3.SYN**

Sync Frame Indicator Flag (vRF!Header!SyFIndicator)

A sync frame is marked by the sync frame indicator.

**(5) FLXAnFRRDHS3.SFI**

Startup Frame Indicator Flag (vRF!Header!SuFIndicator)

A startup frame is marked by the startup frame indicator.

**(6) FLXAnFRRDHS3.RCI**

Received on Channel Indicator Flag (vSS!Channel)

Indicates the channel from which the received data frame was taken to update the respective receive buffer.

**(7) FLXAnFRRDHS3.RCC**

Receive Cycle Counter (vRF!Header!CycleCount)

Cycle counter value updated from received data frame.

**(8) FLXAnFRRDHS3.DP**

Data Pointer Flag

Pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

The bit value is the same as that set in the FLXAnFRWRHS3.DP bit.

### 25.2.11.5 FLXAnFRMBS — FlexRay Message Buffer Status Register

The message buffer status is updated by the CC with respect to the assigned channel(s) latest at the end of the slot following the slot assigned to the message buffer.

The flags are updated only when the CC is in NORMAL\_ACTIVE or NORMAL\_PASSIVE state.

If only one channel (A or B) is assigned to a message buffer, the channel-specific status flags of the other channel are written to zero. If both channels are assigned to a message buffer, the channel-specific status flags of both channels are updated.

The message buffer status is updated only when the slot counter reached the configured frame ID and when the cycle counter filter matched. When the Host updates a message buffer via Input Buffer, all FLXAnFRMBS flags are reset to zero independent of which FLXAnFRIBCM bits are set or not.

For details about receive/transmit filtering see **Section 25.3.8, Filtering and Masking**, **Section 25.3.9, Transmit Process** and **Section 25.3.10, Receive Process**.

Whenever the Message Handler changes one of the flags FLXAnFRMBS.VFRA, FLXAnFRMBS.VFRB, FLXAnFRMBS.SEOA, FLXAnFRMBS.SEOB, FLXAnFRMBS.CEOA, FLXAnFRMBS.CEOB, FLXAnFRMBS.SVOA, FLXAnFRMBS.SVOB, FLXAnFRMBS.TCIA, FLXAnFRMBS.TCIB, FLXAnFRMBS.ESA, FLXAnFRMBS.ESB, FLXAnFRMBS.MLST, FLXAnFRMBS.FTA, FLXAnFRMBS.FTB the respective message buffer's MBC flag in registers FLXAnFRMBS1/2/3/4 is set.

**Access:** FLXAnFRMBS is a read-only register that can be read in 32-bit units.  
FLXAnFRMBSL and FLXAnFRMBSH are the read-only registers that can be read in 16-bit units.  
FLXAnFRMBSLL, FLXAnFRMBSLH, FLXAnFRMBSHL, and FLXAnFRMBSHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRMBS: <FLXAn\_base> + 070C<sub>H</sub>,  
FLXAnFRMBSL: <FLXAn\_base> + 070C<sub>H</sub>, FLXAnFRMBSH: <FLXAn\_base> + 070E<sub>H</sub>,  
FLXAnFRMBSLL: <FLXAn\_base> + 070C<sub>H</sub>, FLXAnFRMBSLH: <FLXAn\_base> + 070D<sub>H</sub>,  
FLXAnFRMBSHL: <FLXAn\_base> + 070E<sub>H</sub>, FLXAnFRMBSHH: <FLXAn\_base> + 070F<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

29	RESS	Reserved Bit Status Flag (vRF!Header!Reserved)
28	PPIS	Payload Preamble Indicator Status Flag (vRF!Header!PPIndicator) 0: PPI indicator set to 0 1: PPI indicator set to 1

Table 25.92 FLXAnFRMBS Register Contents

Bit Position	Bit Name	Function
27	NFIS	Null Frame Indicator Status Flag (vRF!Header!NFIndicator) 0: Received frame is a null frame 1: Received frame is not a null frame
26	SYNS	Sync Frame Indicator Status Flag (vRF!Header!SyFIndicator) 0: No sync frame received 1: The received frame is a sync frame
25	SFIS	Startup Frame Indicator Status Flag (vRF!Header!SuFIndicator) 0: No startup frame received 1: The received frame is a startup frame
24	RCIS	Received on Channel Indicator Status Flag (vSS!Channel) 0: Frame received on channel B 1: Frame received on channel A
23, 22	Reserved	When read, the value after reset is returned.
21 to 16	CCS[5:0]	Cycle Count Status Flag
15	FTB	Frame Transmitted on Channel B Flag 0: No data frame transmitted on channel B 1: Data frame transmitted on channel B
14	FTA	Frame Transmitted on Channel A Flag 0: No data frame transmitted on channel A 1: Data frame transmitted on channel A
13	Reserved	When read, the value after reset is returned.
12	MLST	Message Lost Flag 0: No message lost 1: Unprocessed message was overwritten
11	ESB	Empty Slot Channel B Flag 0: Bus activity detected in the assigned slot on channel B 1: No bus activity detected in the assigned slot on channel B
10	ESA	Empty Slot Channel A Flag 0: Bus activity detected in the assigned slot on channel A 1: No bus activity detected in the assigned slot on channel A
9	TCIB	Transmission Conflict Indication Channel B Flag (vSS!TxConflictB) 0: No transmission conflict occurred on channel B 1: Transmission conflict occurred on channel B
8	TCIA	Transmission Conflict Indication Channel A Flag (vSS!TxConflictA) 0: No transmission conflict occurred on channel A 1: Transmission conflict occurred on channel A
7	SVOB	Slot Boundary Violation Observed on Channel B Flag (vSS!BViolationB) 0: No slot boundary violation observed on channel B 1: Slot boundary violation observed on channel B
6	SVOA	Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA) 0: No slot boundary violation observed on channel A 1: Slot boundary violation observed on channel A
5	CEOB	Content Error Observed on Channel B Flag (vSS!ContentErrorB) 0: No content error observed on channel B 1: Content error observed on channel B
4	CEOA	Content Error Observed on Channel A Flag (vSS!ContentErrorA) 0: No content error observed on channel A 1: Content error observed on channel A
3	SEOB	Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB) 0: No syntax error observed on channel B 1: Syntax error observed on channel B

Table 25.92 FLXAnFRMBS Register Contents

Bit Position	Bit Name	Function
2	SEOA	Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA) 0: No syntax error observed on channel A 1: Syntax error observed on channel A
1	VFRB	Valid Frame Received on Channel B (vSS!ValidFrameB) 0: No valid frame received on channel B 1: Valid frame received on channel B
0	VFRA	Valid Frame Received on Channel A Flag (vSS!ValidFrameA) 0: No valid frame received on channel A 1: Valid frame received on channel A

**(1) FLXAnFRMBS.RESS**

Reserved Bit Status Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit.

The reserved bit is transmitted as 0.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

**(2) FLXAnFRMBS.PPIS**

Payload Preamble Indicator Status Flag (vRF!Header!PPIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

- 0 = PPI indicator set to 0

The payload segment of the received frame does not contain a network management vector or a message ID

- 1 = PPI indicator set to 1

Static segment: Network management vector at the beginning of the payload

Dynamic segment: Message ID at the beginning of the payload

**(3) FLXAnFRMBS.NFIS**

Null Frame Indicator Status Flag (vRF!Header!NFIndicator)

If set to 0 the payload segment of the received frame contains no usable data.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

**(4) FLXAnFRMBS.SYNS**

Sync Frame Indicator Status Flag (vRF!Header!SyFIndicator)

A sync frame is marked by the sync frame indicator.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

**(5) FLXAnFRMBS.SFIS**

Startup Frame Indicator Status Flag (vRF!Header!SuFIndicator)

The startup frame indicator specifies a startup frame.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

**(6) FLXAnFRMBS.RCIS**

Received on Channel Indicator Status Flag (vSS!Channel)

Indicates the channel on which the frame was received.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

**(7) FLXAnFRMBS.CCS**

Cycle Count Status Flag

Actual cycle count when status was updated.

**(8) FLXAnFRMBS.FTB**

Frame Transmitted on Channel B Flag

Indicates that this node has transmitted a data frame in the configured slot on channel B.

**CAUTION**

---

The FlexRay protocol specification requires that FLXAnFRMBS.FTB can only be reset by the Host. Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where the bit is set to 1.

---

**(9) FLXAnFRMBS.FTA**

Frame Transmitted on Channel A Flag

Indicates that this node has transmitted a data frame in the configured slot on channel A.

**CAUTION**

---

The FlexRay protocol specification requires that FLXAnFRMBS.FTA can only be reset by the Host. Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where this bit is set to 1.

---

**(10) FLXAnFRMBS.MLST**

Message Lost Flag

The flag is set in case the Host did not read the message before the message buffer was updated from a received data frame.

Not affected by reception of null frames except for message buffers belonging to the receive FIFO. The flag is reset to 0 by a Host write to the message buffer via IBF or when a new message is stored into the message buffer after the message buffers ND flag was reset to 0 by reading out the message buffer via OBF.

**(11) FLXAnFRMBS.ESB**

Empty Slot Channel B Flag

In an empty slot, there is no activity on the bus. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

**(12) FLXAnFRMBS.ESA**

Empty Slot Channel A Flag

In an empty slot, there is no activity on the bus. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

**(13) FLXAnFRMBS.TCIB**

Transmission Conflict Indication Channel B Flag (vSS!TxConflictB)

A transmission conflict indication is set to 1 if a transmission conflict has occurred on channel B.

**(14) FLXAnFRMBS.TCIA**

Transmission Conflict Indication Channel A Flag (vSS!TxConflictA)

A transmission conflict indication is set if a transmission conflict has occurred on channel A.

**(15) FLXAnFRMBS.SVOB**

Slot Boundary Violation Observed on Channel B Flag (vSS!BViolationB)

A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on the slot assigned to channel B.

**(16) FLXAnFRMBS.SVOA**

Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA)

A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on the slot assigned to channel A.

**(17) FLXAnFRMBS.CEOB**

Content Error Observed on Channel B Flag (vSS!ContentErrorB)

A content error was observed in the slot assigned to channel B.

**(18) FLXAnFRMBS.CEOA**

Content Error Observed on Channel A Flag (vSS!ContentErrorA)

A content error was observed in the slot assigned to channel A.

**(19) FLXAnFRMBS.SEOB**

Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB)

A syntax error was observed in the assigned slot on channel B.

**(20) FLXAnFRMBS.SEOA**

Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA)

A syntax error was observed in the assigned slot on channel A.

**(21) FLXAnFRMBS.VFRB**

Valid Frame Received on Channel B Flag (vSS!ValidFrameB)

A valid frame indication is set if a valid frame was received on channel B.

**(22) FLXAnFRMBS.VFRA**

Valid Frame Received on Channel A Flag (vSS!ValidFrameA)

A valid frame indication is set if a valid frame was received on channel A.

### 25.2.11.6 FLXAnFROBCM — FlexRay Output Buffer Command Mask Register

Configures how the Output Buffer is updated from the message buffer in the Message RAM selected by FLXAnFROBCR.OBRS.

Mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to the register internal storage when a Message RAM transfer is requested by FLXAnFROBCR.REQ.

When OBF Host and OBF Shadow are swapped, mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the register internal storage to keep them attached to the respective Output Buffer transfer.

The data transfer between Output Buffer and Message RAM is described in detail in **Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer**.

#### CAUTION

After the transfer of the header section from the Message RAM to OBF Shadow has completed, the message buffer status changed flag MBC of the selected message buffer in the FLXAnFRMBSC1/2/3/4 registers is cleared. After the transfer of the data section from the Message RAM to OBF Shadow has completed, the new data flag ND of the selected message buffer in the FLXAnFRNDAT1/2/3/4 registers is cleared.

**Access:** FLXAnFROBCM can be read or written in 32-bit units.  
 FLXAnFROBCML can be read or written in 16-bit units.  
 FLXAnFROBCMH is a read-only register that can be read in 16-bit units.  
 FLXAnFROBCMLL can be read or written in 8-bit units.  
 FLXAnFROBCMHL is a read-only register that can be read in 8-bit units.

**Address:** FLXAnFROBCM: <FLXAn\_base> + 0710<sub>H</sub>,  
 FLXAnFROBCML: <FLXAn\_base> + 0710<sub>H</sub>, FLXAnFROBCMH: <FLXAn\_base> + 0712<sub>H</sub>,  
 FLXAnFROBCMLL: <FLXAn\_base> + 0710<sub>H</sub>, FLXAnFROBCMHL: <FLXAn\_base> + 0712<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.93 FLXAnFROBCM Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	RDSH	Read Data Section Host Flag 0: Data section is not read 1: Data section selected for transfer from Message RAM to Output Buffer
16	RHSH	Read Header Section Host Flag 0: Header section is not read 1: Header section selected for transfer from Message RAM to Output Buffer
15 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 25.93 FLXAnFROBCM Register Contents

Bit Position	Bit Name	Function
1	RDSS	Read Data Section Shadow Bit 0: Data section is not read 1: Data section selected for transfer from Message RAM to Output Buffer
0	RHSS	Read Header Section Shadow Bit 0: Header section is not read 1: Header section selected for transfer from Message RAM to Output Buffer

**(1) FLXAnFROBCM.RDSH**

Read Data Section Host Flag

**(2) FLXAnFROBCM.RHSH**

Read Header Section Host Flag

**(3) FLXAnFROBCM.RDSS**

Read Data Section Shadow Bit

**(4) FLXAnFROBCM.RHSS**

Read Header Section Shadow Bit

### 25.2.11.7 FLXAnFROBCR — FlexRay Output Buffer Command Request Register

After setting bit FLXAnFROBCR.REQ to 1 while FLXAnFROBCR.OBSYS is 0, FLXAnFROBCR.OBSYS is automatically set to 1, FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal storage, and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the Message RAM to OBF Shadow is started. When the transfer between the Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCM.OBSYS back to 0.

By setting bit FLXAnFROBCR.VIEW to 1 while FLXAnFROBCR.OBSYS is 0, OBF Host and OBF Shadow are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the register FLXAnFROBCM internal storage to keep them attached to the respective Output Buffer transfer. FLXAnFROBCR.OBRH signals the number of the message buffer currently accessible by the Host.

If bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are set to 1 with the same write access while FLXAnFROBCR.OBSYS is 0, FLXAnFROBCR.OBSYS is automatically set to 1 and OBF Shadow and OBF Host are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host. When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCR.OBSYS back to 0.

Any write access to FLXAnFROBCR[15:8] while FLXAnFROBCR.OBSYS is set to 1 will cause the error flag FLXAnFREIR.IOBA to be set to 1. In this case, this write access has no effect and the Output Buffer will not be changed.

The data transfer between Output Buffer and Message RAM is described in detail in **Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer.**

**Access:** FLXAnFROBCR can be read or written in 32-bit units.  
 FLXAnFROBCRL can be read or written in 16-bit units.  
 FLXAnFROBCRH is a read-only register that can be read in 16-bit units.  
 FLXAnFROBCRLL and FLXAnFROBCRLH can be read or written in 8-bit units.  
 FLXAnFROBCRHL is a read-only register that can be read in 8-bit units.

**Address:** FLXAnFROBCR: <FLXAn\_base> + 0714<sub>H</sub>,  
 FLXAnFROBCRL: <FLXAn\_base> + 0714<sub>H</sub>, FLXAnFROBCRH: <FLXAn\_base> + 0716<sub>H</sub>,  
 FLXAnFROBCRLL: <FLXAn\_base> + 0714<sub>H</sub>, FLXAnFROBCRLH: <FLXAn\_base> + 0715<sub>H</sub>,  
 FLXAnFROBCRHL: <FLXAn\_base> + 0716<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.94 FLXAnFROBCR Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	OBRH[6:0]	Output Buffer Request Host Flag
15	OBSYS	Output Buffer Busy Shadow Flag 0: No transfer in progress 1: Transfer between Message RAM and OBF Shadow in progress
14 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	REQ	Request Message RAM Transfer Bit 0: No request 1: Transfer to OBF Shadow requested
8	VIEW	View Shadow Buffer Bit 0: No action 1: Swap OBF Shadow and OBF Host
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	OBRS[6:0]	Output Buffer Request Shadow Bit

**(1) FLXAnFROBCR.OBRH**

Output Buffer Request Host Flag

Number of message buffer currently accessible by the Host via FLXAnFRRDHS1 to FLXAnFRRDHS3, FLXAnFRMBS, and FLXAnFRRDDS1 to FLXAnFRRDDS64.

By writing FLXAnFROBCR.VIEW to 1 OBF Shadow and OBF Host are swapped and the transferred message buffer is accessible by the Host.

**(2) FLXAnFROBCR.OBSYS**

Output Buffer Busy Shadow Flag

Set to 1 after setting bit FLXAnFROBCR.REQ. When the transfer between the Message RAM and OBF Shadow has completed, FLXAnFROBCR.OBSYS is set back to 0.

**(3) FLXAnFROBCR.REQ**

Request Message RAM Transfer Bit

Only writeable while FLXAnFROBCR.OBSYS = 0.

Requests transfer of message buffer addressed by FLXAnFROBCR.OBRS from Message RAM to OBF Shadow.

**(4) FLXAnFROBCR.VIEW**

View Shadow Buffer Bit

Only writeable while FLXAnFROBCR.OBSYS = 0.

Toggles between OBF Shadow and OBF Host.

**(5) FLXAnFROBCR.OBRS**

Output Buffer Request Shadow Bit

Only writeable while FLXAnFROBCR.OBSYS = 0.

Number of source message buffer to be transferred from the Message RAM to OBF Shadow.

If the number of the first message buffer of the receive FIFO is written to this register the Message Handler transfers the message buffer addressed by the GET Index (GIDX, see **Section 25.3.11, FIFO Function**) to OBF Shadow.

## 25.2.12 Data Transfer Control Register

### 25.2.12.1 FLXAnFRITC — FlexRay Input Transfer Configuration Register

**Access:** FLXAnFRITC can be read or written in 32-bit units.

FLXAnFRITCL and FLXAnFRITCH can be read or written in 16-bit units.

FLXAnFRITCLL, FLXAnFRITCLH, and FLXAnFRITCHL can be read or written in 8-bit units.

**Address:** FLXAnFRITC: <FLXAn\_base> + 0800<sub>H</sub>,

FLXAnFRITCL: <FLXAn\_base> + 0800<sub>H</sub>, FLXAnFRITCH: <FLXAn\_base> + 0802<sub>H</sub>,

FLXAnFRITCLL: <FLXAn\_base> + 0800<sub>H</sub>, FLXAnFRITCLH: <FLXAn\_base> + 0801<sub>H</sub>,

FLXAnFRITCHL: <FLXAn\_base> + 0802<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	ITM[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Table 25.95 FLXAnFRITC Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	ITM[6:0]	Input queue Table Max Bit These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue.
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	IQEIE	Input Queue Empty Interrupt Enable Bit 0: Disabled 1: Enabled
8	IQFIE	Input Queue Full Interrupt Enable Bit 0: Disabled 1: Enabled
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	IQHR	Input Queue Halt Request Bit 0: Input queue run request 1: Input queue halt request
0	ITE	Input Transfer Enable Bit 0: Operation Disable request 1: Operation Enable request

**(1) FLXAnFRITC.ITM**

Input queue Table Max Bit

The user can only write to this bit when FLXAnFRITS.ITS is 0.

These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue.

Valid values are 00<sub>H</sub> (1 queue entry) to 7F<sub>H</sub> (128 queue entries).

Note that each entry requires two long words in the input pointer table.

**(2) FLXAnFRITC.IQEIE**

Input Queue Empty Interrupt Enable Bit

This bit controls the input queue empty interrupt.

- 0: Disabled  
No interrupt will be requested and the input queue empty interrupt line will be released.
- 1: Enabled  
Input queue empty interrupt will be asserted when FLXAnFRITS.IQEIS is 1.

**(3) FLXAnFRITC.IQFIE**

Input Queue Full Interrupt Enable Bit

This bit controls the input queue full interrupt.

- 0: Disabled  
No interrupt will be requested and the input queue full interrupt line will be released.
- 1: Enabled  
Input queue full interrupt will be asserted when FLXAnFRITS.IQFIS is 1.

**(4) FLXAnFRITC.IQHR**

Input Queue Halt Request Bit

The IQHR bit should not be set to 1 when FLXAnFRITS.ITS is 0.

This bit requests a halt of the input queue.

The status of the halt request is shown in the FLXAnFRITS.IQH register.

Refer to **Section 25.3.16.1(5), Halting the Input Queue** about usage of this bit.

- 0: Input queue run request  
The input queue resumes their operation.
- 1: Input queue halt request  
The input queue gets halted. An active input transfer will be completed but no further transfer request will start.

**(5) FLXAnFRITC.ITE**

Input Transfer Enable Bit

The user should only set this bit to 1 when FLXAnFRIBCR.IBSYS is 0.

The user should only set this bit to 0 when FLXAnFRITC.IQHR 0. Otherwise committed input transfers get lost.

This bit controls the operation mode of the input transfer queue.

The operation status of the input transfer queue function is shown in FLXAnFRITS.ITS.

Refer to **Section 25.3.16.1(1), Activation and Deactivation** about usage of this bit.

- 0: Operation Disable request

The input transfer queue gets disabled when it becomes empty.

- 1: Operation Enable request

The input transfer queue gets enabled. Input data structures are transferred to the FlexRay internal message RAM.

### 25.2.12.2 FLXAnFROTC — FlexRay Output Transfer Configuration Register

**Access:** FLXAnFROTC can be read or written in 32-bit units.

FLXAnFROTCL and FLXAnFROTCH can be read or written in 16-bit units.

FLXAnFROTCLL, FLXAnFROTCLH, and FLXAnFROTCHL can be read or written in 8-bit units.

**Address:** FLXAnFROTC: <FLXAn\_base> + 0804<sub>H</sub>,

FLXAnFROTCL: <FLXAn\_base> + 0804<sub>H</sub>, FLXAnFROTCH: <FLXAn\_base> + 0806<sub>H</sub>

FLXAnFROTCLL: <FLXAn\_base> + 0804<sub>H</sub>, FLXAnFROTCLH: <FLXAn\_base> + 0805<sub>H</sub>,

FLXAnFROTCHL: <FLXAn\_base> + 0806<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Table 25.96 FLXAnFROTC Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 16	FTM[4:0]	FIFO Table Max Bit Configures the number of FIFO entries the output transfer handler is capable to maintain in the local RAM/global RAM.
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	FWIE	FIFO transfer Warning Interrupt Enable Bit 0: Disabled 1: Enabled
10	OWIE	Output transfer Warning Interrupt Enable Bit 0: Disabled 1: Enabled
9	FIE	FIFO transfer Interrupt Enable Bit 0: Disabled 1: Enabled
8	OIE	Output transfer Interrupt Enable Bit 0: Disabled 1: Enabled
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OTCS	Output Transfer Condition Select Bit 0: New data only mode 1: New data and status changed mode
0	OTE	Output Transfer Enable Bit 0: Operation Disable request 1: Operation Enable request

**(1) FLXAnFROTC.FTM**

FIFO Table Max Bit

The user can only write to these bits when FLXAnFROTS.OTS is 0.

Configures the number of FIFO entries the output transfer handler is capable to maintain in the local RAM/global RAM.

Valid values are 00<sub>H</sub> (1 FIFO entry) to 1F<sub>H</sub> (32 FIFO entries).

**(2) FLXAnFROTC.FWIE**

FIFO transfer Warning Interrupt Enable Bit

This bit controls the FIFO transfer warning interrupt.

- 0: Disabled  
No interrupt will be requested and the FIFO transfer warning interrupt line will be released.
- 1: Enabled  
FIFO transfer warning interrupt will be asserted when FLXAnFROTS.FWIS is 1.

**(3) FLXAnFROTC.OWIE**

Output transfer Warning Interrupt Enable Bit

This bit controls the output transfer warning interrupt.

- 0: Disabled  
No interrupt will be requested and the output transfer warning interrupt line will be released.
- 1: Enabled  
Output transfer warning interrupt will be asserted when FLXAnFROTS.OWIS is 1.

**(4) FLXAnFROTC.FIE**

FIFO transfer Interrupt Enable Bit

This bit controls the FIFO transfer interrupt.

- 0: Disabled  
No interrupt will be requested and the FIFO transfer interrupt line will be released.
- 1: Enabled  
FIFO transfer interrupt will be asserted when FLXAnFROTS.FIS is 1.

**(5) FLXAnFROTC.OIE**

Output transfer Interrupt Enable Bit

This bit controls the output transfer interrupt.

- 0: Disabled  
No interrupt will be requested and the output transfer interrupt line will be released.
- 1: Enabled  
Output transfer interrupt will be asserted when FLXAnFROTS.OTIS is 1.

## (6) FLXAnFROTC.OTCS

Output Transfer Condition Select Bit

The user can only write to this bit when FLXAnFROTS.OTS is 0. This bit controls the output transfer condition.

- 0: New data only mode

The ND bits in the FLXAnFRNDATi registers are used to detect a transfer condition for dedicated receive buffer

- 1: New data and status changed mode

The ND bits in the FLXAnFRNDATi registers and the MBC bits in the FLXAnFRMBSCi register are used to detect a transfer condition for dedicated transmit and receive buffer

## (7) FLXAnFROTC.OTE

Output Transfer Enable Bit

The user should only set this bit to 1 when FLXAnFROBCR.OBSYS is 0.

This bit controls the operation mode of the output transfer function.

The operation status of the output buffer transfer function is shown in FLXAnFROTS.OTS.

Refer to **Section 25.3.16.2(2), Output Transfer Data Structure** about usage of this bit.

- 0: Operation Disable request

The output buffer transfer gets disabled.

An active message buffer transfer will be completed but no further transfer will start.

- 1: Operation Enable request

The output buffer transfer gets enabled. Message buffers are transferred from the FlexRay internal message RAM to output data structures.

The user cannot change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.

### 25.2.12.3 FLXAnFRIBA — FlexRay Input Pointer Table Base Address Register

**Access:** FLXAnFRIBA can be read or written in 32-bit units.

FLXAnFRIBAL and FLXAnFRIBAH can be read or written in 16-bit units.

FLXAnFRIBALL, FLXAnFRIBALH, FLXAnFRIB AHL, and FLXAnFRIB AHH can be read or written in 8-bit units.

**Address:** FLXAnFRIBA: <FLXAn\_base> + 0808<sub>H</sub>,

FLXAnFRIBAL: <FLXAn\_base> + 0808<sub>H</sub>, FLXAnFRIBAH: <FLXAn\_base> + 080A<sub>H</sub>,

FLXAnFRIBALL: <FLXAn\_base> + 0808<sub>H</sub>, FLXAnFRIBALH: <FLXAn\_base> + 0809<sub>H</sub>,

FLXAnFRIB AHL: <FLXAn\_base> + 080A<sub>H</sub>, FLXAnFRIB AHH: <FLXAn\_base> + 080B<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ITA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Table 25.97 FLXAnFRIBA Register Contents

Bit Position	Bit Name	Function
31 to 0	ITA[31:0]	Input Table Address Bit These bits configure the base address of the input pointer table.

#### (1) FLXAnFRIBA.ITA

##### Input Table Address Bit

The user can only write to this bit when FLXAnFRITS.ITS is 0.

The address should be 32 bit aligned, thus the bits FLXAnFRIBA.ITA[1:0] are always 0.

These bits configure the base address of the input pointer table.

The table is used for the input transfer queue transferring message buffers from the local RAM/global RAM into the FlexRay internal message RAM.

The size of the input queue is configured in FLXAnFRITC.ITM.

Note that each entry requires two long words in the input pointer table.

### 25.2.12.4 FLXAnFRFBA — FlexRay FIFO Pointer Table Base Address Register

**Access:** FLXAnFRFBA can be read or written in 32-bit units.

FLXAnFRFBAL and FLXAnFRFBAH can be read or written in 16-bit units.

FLXAnFRFBALL, FLXAnFRFBALH, FLXAnFRFBAHL, and FLXAnFRFBAHH can be read or written in 8-bit units.

**Address:** FLXAnFRFBA: <FLXAn\_base> + 080C<sub>H</sub>,

FLXAnFRFBAL: <FLXAn\_base> + 080C<sub>H</sub>, FLXAnFRFBAH: <FLXAn\_base> + 080E<sub>H</sub>,

FLXAnFRFBALL: <FLXAn\_base> + 080C<sub>H</sub>, FLXAnFRFBALH: <FLXAn\_base> + 080D<sub>H</sub>,

FLXAnFRFBAHL: <FLXAn\_base> + 080E<sub>H</sub>, FLXAnFRFBAHH: <FLXAn\_base> + 080F<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Table 25.98 FLXAnFRFBA Register Contents

Bit Position	Bit Name	Function
31 to 0	FTA[31:0]	FIFO pointer Table Address Bit These bits configure the base address of the FIFO pointer table.

#### (1) FLXAnFRFBA.FTA

##### FIFO pointer Table Address Bit

The user can only write to this bit when FLXAnFROTS.OTS is 0.

The address should be 32 bit aligned, thus the bits FLXAnFRFBA.FTA[1:0] are always 0.

These bits configure the base address of the FIFO pointer table.

The table is used for message buffers transferred from the FlexRay internal FIFO to the local RAM/global RAM.

The size of the FIFO is configured in FLXAnFROTC.FTM.

### 25.2.12.5 FLXAnFROBA — FlexRay Output Pointer Table Base Address Register

**Access:** FLXAnFROBA can be read or written in 32-bit units.

FLXAnFROBAL and FLXAnFROBAH can be read or written in 16-bit units.

FLXAnFROBALL, FLXAnFROBALH, FLXAnFROBAHL, and FLXAnFROBAHH can be read or written in 8-bit units.

**Address:** FLXAnFROBA: <FLXAn\_base> + 0810<sub>H</sub>,

FLXAnFROBAL: <FLXAn\_base> + 0810<sub>H</sub>, FLXAnFROBAH: <FLXAn\_base> + 0812<sub>H</sub>,

FLXAnFROBALL: <FLXAn\_base> + 0810<sub>H</sub>, FLXAnFROBALH: <FLXAn\_base> + 0811<sub>H</sub>,

FLXAnFROBAHL: <FLXAn\_base> + 0812<sub>H</sub>, FLXAnFROBAHH: <FLXAn\_base> + 0813<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Table 25.99 FLXAnFROBA Register Contents

Bit Position	Bit Name	Function
31 to 0	OTA[31:0]	Output pointer Table Address Bit These bits configure the base address of the output pointer table.

#### (1) FLXAnFROBA.OTA

##### Output pointer Table Address Bit

The user can only write to this bit when FLXAnFROTS.OTS is 0.

The address should be 32 bit aligned, thus the bits FLXAnFROBA.OTA[1:0] are always 0.

These bits configure the base address of the output pointer table.

The table is used for message buffers transferred from the FlexRay internal message RAM to the local RAM/global RAM.

The size of the table depends on the utilization of the FlexRay internal message RAM and can have up to 128 entries.

### 25.2.12.6 FLXAnFRIQC — FlexRay Input Queue Control Register

**Access:** FLXAnFRIQC is a write-only register that can be written in 32-bit units.  
 FLXAnFRIQCL is a write-only register that can be written in 16-bit units.  
 FLXAnFRIQCLL is a write-only register that can be written in 8-bit units.

**Address:** FLXAnFRIQC: <FLXAn\_base> + 0814<sub>H</sub>,  
 FLXAnFRIQCL: <FLXAn\_base> + 0814<sub>H</sub>,  
 FLXAnFRIQCLL: <FLXAn\_base> + 0814<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	IMBNR[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W

Table 25.100 FLXAnFRIQC Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When writing, write the value after reset.
6 to 0	IMBNR[6:0]	Input Message Buffer Number Bit Message buffer number added to the input queue

#### (1) FLXAnFRIQC.IMBNR

##### Input Message Buffer Number Bit

The user can only write to this bit when FLXAnFRITS.IQFP is 0.

The user cannot write to this register when FLXAnFRITS.ITS is 0 or when FLXAnFRITC.ITE is 0.

These bits are read as 0.

This value specifies the message buffer added to the input queue.

The number has to be identical to FLXAnFRWRHS4.IMBNR (see **Section 25.3.16.1(3), Input Pointer Table**) of the input pointer table.

The address to the input data structure has to be provided in the input pointer table at the put index (FLXAnFRITS.IPIDX) before writing to this register.

Writing to this register increments the input put index (FLXAnFRITS.IPIDX).

### 25.2.12.7 FLXAnFRUIR — FlexRay User Input Transfer Request Register

**Access:** FLXAnFRUIR can be read or written in 32-bit units.  
 FLXAnFRUIRL can be read or written in 16-bit units.  
 FLXAnFRUIRLL can be read or written in 8-bit units.

**Address:** FLXAnFRUIR: <FLXAn\_base> + 0818<sub>H</sub>,  
 FLXAnFRUIRL: <FLXAn\_base> + 0818<sub>H</sub>,  
 FLXAnFRUIRLL: <FLXAn\_base> + 0818<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	UIDX[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.101 FLXAnFRUIR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	UIDX[7:0]	User requested Input index Bit Input pointer table index requested for input transfer

#### (1) FLXAnFRUIR.UIDX

User requested Input index Bit

The user can only write to this bit when FLXAnFRITS.UIRP is 0.

The user should not write to this register when FLXAnFRITS.ITS is 0.

The user should not write to this register when FLXAnFRITS.UIRP is 1.

The user should not write to this register when FLXAnFRITS.IQH is 1.

The user should only write FLXAnFRITC.ITM + 1 to this register.

This value specifies the input pointer table index for the user requested input transfer.

The address to the input data structure has to be provided in the input pointer table at the index UIDX before writing to this register.

When writing to this register, the requested input data structure will be transferred from input data structure position to the FlexRay internal message RAM.

In opposite to queued input transfers the related DA flag in the FLXAnFRDA register is not influenced by the user input transfer.

### 25.2.12.8 FLXAnFRUOR — FlexRay User Output Transfer Request Register

**Access:** FLXAnFRUOR can be read or written in 32-bit units.  
 FLXAnFRUORL can be read or written in 16-bit units.  
 FLXAnFRUORLL and FLXAnFRUORLH can be read or written in 8-bit units.

**Address:** FLXAnFRUOR: <FLXAn\_base> + 081C<sub>H</sub>,  
 FLXAnFRUORL: <FLXAn\_base> + 081C<sub>H</sub>,  
 FLXAnFRUORLL: <FLXAn\_base> + 081C<sub>H</sub>, FLXAnFRUORLH: <FLXAn\_base> + 081D<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	URDS	—	—	UMBNR[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.102 FLXAnFRUOR Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	URDS	User request Read Data Section Bit 0: Data section is not transferred 1: Data section is transferred
8, 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	UMBNR[6:0]	User requested output Message Buffer Number Bit Message buffer number requested for output transfer

#### (1) FLXAnFRUOR.URDS

User request Read Data Section Bit

The user can only write to this bit when FLXAnFROTS.UORP is 0.

The user should not write to this register when FLXAnFROTS.OTS is 0.

The user should not write to this register when FLXAnFROTS.UORP is 1.

- 0: Data section is not transferred  
The data section of the message buffer selected by the bits UMBNR is not requested
- 1: Data section is transferred  
The data section of the message buffer selected by the bits UMBNR is requested

**(2) FLXAnFRUOR.UMBNR**

User requested output Message Buffer Number Bit

The user can only write to this bit when FLXAnFROTS.UORP is 0.

The user should not write to this register when FLXAnFROTS.OTS is 0.

The user should not write to this register when FLXAnFROTS.UORP is 1.

The user should restrict UMBNR to dedicated receive and transmit buffers when the FlexRay module is not in the CONFIG state.

When writing to this register, the header sections and optionally the data section (configurable by URDS) of the requested message buffer will be transferred from the FlexRay internal message RAM to the output data structure position defined by the output structure data pointer in the output pointer table.

### 25.2.12.9 FLXAnFRAHBC — FlexRay H-Bus Configuration Register

In this product, this register is not used because FLXAnFRAHBC.HPROT[3:0] has no function.

**Access:** FLXAnFRAHBC can be read or written in 32-bit units.  
 FLXAnFRAHBCL can be read or written in 16-bit units.  
 FLXAnFRAHBCLL can be read or written in 8-bit units.

**Address:** FLXAnFRAHBC: <FLXAn\_base> + 0840<sub>H</sub>,  
 FLXAnFRAHBCL: <FLXAn\_base> + 0840<sub>H</sub>,  
 FLXAnFRAHBCLL: <FLXAn\_base> + 0840<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	HPROT[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.103 FLXAnFRAHBC Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	HPROT[3:0]	No function

## 25.2.13 Data Transfer Status Register

### 25.2.13.1 FLXAnFRITS — FlexRay Input Transfer Status Register

**Access:** FLXAnFRITS can be read or written in 32-bit units.

FLXAnFRITSL can be read or written in 16-bit units.

FLXAnFRITSH is a read-only register that can be read in 16-bit units.

FLXAnFRITSLL, FLXAnFRITSHL, and FLXAnFRITSHH are the read-only registers that can be read in 8-bit units.

FLXAnFRITSLH can be read or written in 8-bit units.

**Address:** FLXAnFRITS: <FLXAn\_base> + 0820<sub>H</sub>,

FLXAnFRITSL: <FLXAn\_base> + 0820<sub>H</sub>, FLXAnFRITSH: <FLXAn\_base> + 0822<sub>H</sub>,

FLXAnFRITSLL: <FLXAn\_base> + 0820<sub>H</sub>, FLXAnFRITSLH: <FLXAn\_base> + 0821<sub>H</sub>,

FLXAnFRITSHL: <FLXAn\_base> + 0822<sub>H</sub>, FLXAnFRITSHH: <FLXAn\_base> + 0823<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	IGIDX[6:0]						—	IPIDX[6:0]

	—	—	—	IQFP	—	—	IQEIS	IQFIS	—	—	—	—	—	UIRP	IQH	ITS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Table 25.104 FLXAnFRITS Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 24	IGIDX[6:0]	Input queue Get Index Bit Represents the get index of the input pointer table
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	IPIDX[6:0]	Input queue Put Index Bit Represents the put index of the input pointer table
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	IQFP	Input Queue Full condition Pending Bit 0: Entries in the input queue are available 1: All entries in the input queue are occupied
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	IQEIS	Input Queue Empty Interrupt Status Bit 0: No input queue empty condition detected 1: Input queue empty condition detected
8	IQFIS	Input Queue Full Interrupt Status Bit 0: No input queue full condition detected 1: Input queue full condition detected
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	UIRP	User Input transfer Request Pending Bit 0: No user input transfer request pending 1: User input transfer request pending

Table 25.104 FLXAnFRITS Register Contents

Bit Position	Bit Name	Function
1	IQH	Input Queue Halted Bit 0: Input queue not halted 1: Input queue halted
0	ITS	Input Transfer Status Bit 0: Disabled 1: Enabled

**(1) FLXAnFRITS.IGIDX**

Input queue Get Index Bit

These bits are only valid when FLXAnFRITS.IQH is 1.

These bits indicate the input pointer index the input queue handler will transfer next.

Valid values are 00<sub>H</sub> to FLXAnFRITC.ITM.

The get index is incremented when the input data structure has been transferred from the local RAM/global RAM and the related DA flag in the FLXAnFRDA register is cleared.

The index is set to 00<sub>H</sub> when FLXAnFRITS.ITS changes from 0 to 1.

**(2) FLXAnFRITS.IPIDX**

Input queue Put Index Bit

These bits indicate the index where the next input data structure pointer in the input pointer table should be stored.

Valid values are 00<sub>H</sub> to FLXAnFRITC.ITM.

After reaching the maximum value the put index continues from 00<sub>H</sub>.

The index is incremented when writing to FLXAnFRIQC.IMBNR.

The index is set to 00<sub>H</sub> when FLXAnFRITS.ITS changes from 0 to 1.

**(3) FLXAnFRITS.IQFP**

Input Queue Full condition Pending Bit

This bit indicates that the input queue is full.

There should be no further input transfer requests, by writing to FLXAnFRIQC.IMBNR, as long as FLXAnFRITS.IQFP is 1.

[Clearing condition]

This bit is cleared when there is one free entry in the input queue.

[Setting condition]

This bit is set when all entries in the input queue are occupied.

**(4) FLXAnFRITS.IQEIS**

Input Queue Empty Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFRITC.IQEIE the input queue empty interrupt is generated when FLXAnFRITS.IQEIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRITS.IQEIS.

This bit is cleared when FLXAnFRITS.ITS changes from 0 to 1.

[Setting condition]

This bit is set when all pending input transfers have been processed and consequently the input queue becomes empty.

**(5) FLXAnFRITS.IQFIS**

Input Queue Full Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFRITC.IQFIE the input queue full interrupt is generated when FLXAnFRITS.IQFIS is 1.

This flag is intended as interrupt status flag. It does not indicate the current input queue status; for this status refer to FLXAnFRITS.IQFP.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRITS.IQFIS.

This bit is cleared when FLXAnFRITS.ITS changes from 0 to 1.

[Setting condition]

This bit is set when all entries in the input queue are occupied.

**(6) FLXAnFRITS.UIRP**

User Input transfer Request Pending Bit

This bit indicates that a user input transfer is still pending.

There should be no further write access to FLXAnFRUIR.UIDX when this bit is 1.

[Clearing condition]

This bit is cleared when the user input transfer request is processed by the input transfer handler.

[Setting condition]

This bit is set when writing to FLXAnFRUIR.UIDX.

**(7) FLXAnFRITS.IQH**

Input Queue Halted Bit

This bit indicates the status of the input queue.

There should be no further write access to FLXAnFRUIR.UIDX when this bit is 1.

[Clearing condition]

This bit is cleared when FLXAnFRITC.IQHR is set to 0.

[Setting condition]

This bit is set immediately when the FLXAnFRITC.IQHR is set to 1 and there is no ongoing input transfer.

This bit is set only after an ongoing input transfer has been completed and FLXAnFRITC.IQHR is set to 1.

**(8) FLXAnFRITS.ITS**

## Input Transfer Status Bit

This bit indicates the status of the input queue handler.

While this bit is 1, there can be no read or write access to the address area  $\langle \text{FLXAn\_base} \rangle + 0400_{\text{H}}$  to  $\langle \text{FLXAn\_base} \rangle + 05FF_{\text{H}}$  and there should be no CLEAR\_RAM command applied to FLXAnFRSUCC1.CMD register.

The input transfer queue indices and related status flags are set to 0 when FLXAnFRITS.ITS changes from 0 to 1.

## [Clearing condition]

This bit is cleared immediately when FLXAnFRITC.ITE is set to 0 and there are no pending input transfers.

This bit is cleared after all pending requests have been processed and FLXAnFRITC.ITE is 0.

## [Setting condition]

This bit is set when FLXAnFRITC.ITE is set to 1.

### 25.2.13.2 FLXAnFROTS — FlexRay Output Transfer Status Register

**Access:** FLXAnFROTS can be read or written in 32-bit units.

FLXAnFROTSL can be read or written in 16-bit units.

FLXAnFROTSH is a read-only register that can be read in 16-bit units.

FLXAnFROTSLL, FLXAnFROTSHL, and FLXAnFROTSHH are the read-only registers that can be read in 8-bit units.

FLXAnFROTSLSH can be read or written in 8-bit units.

**Address:** FLXAnFROTS: <FLXAn\_base> + 0824<sub>H</sub>,

FLXAnFROTSL: <FLXAn\_base> + 0824<sub>H</sub>, FLXAnFROTSH: <FLXAn\_base> + 0826<sub>H</sub>,

FLXAnFROTSLL: <FLXAn\_base> + 0824<sub>H</sub>, FLXAnFROTSLSH: <FLXAn\_base> + 0825<sub>H</sub>,

FLXAnFROTSHL: <FLXAn\_base> + 0826<sub>H</sub>, FLXAnFROTSHH: <FLXAn\_base> + 0827<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	FFL[5:0]						—	—	—	FGIDX[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	FWP	OWP	FDA	—	FWIS	OWIS	FIS	OTIS	—	—	—	—	—	UORP	—	OTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 25.105 FLXAnFROTS Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 24	FFL[5:0]	FIFO Fill Level Bit Represent the number of unprocessed output FIFO structures
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 16	FGIDX[4:0]	FIFO Get Index Bit Represent the get index in the FIFO pointer table
15	FWP	FIFO transfer Warning condition Pending Bit 0: No FIFO transfer warning condition pending 1: FIFO transfer warning condition pending
14	OWP	Output transfer Warning condition Pending 0: No output transfer warning condition pending 1: Output transfer warning condition pending
13	FDA	FIFO Data Available Bit 0: No available FIFO structures 1: FIFO structures available at current FLXAnFROTS.FGIDX index
12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	FWIS	FIFO transfer Warning Interrupt Status Bit 0: No FIFO transfer warning condition detected 1: FIFO transfer warning condition detected
10	OWIS	Output transfer Warning Interrupt Status Bit 0: No output transfer warning condition detected 1: Output transfer warning condition detected
9	FIS	FIFO transfer Interrupt Status Bit 0: No FIFO structure updated in local RAM/global RAM 1: FIFO structure updated in local RAM/global RAM

Table 25.105 FLXAnFROTS Register Contents

Bit Position	Bit Name	Function
8	OTIS	Output transfer Interrupt Status Bit 0: No output structure updated in local RAM/global RAM 1: Output structure updated in local RAM/global RAM
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	UORP	User Output transfer Request Pending Bit 0: No user output transfer request pending 1: User output transfer request pending
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	OTS	Output Transfer Status Bit 0: Disabled 1: Enabled

**(1) FLXAnFROTS.FFL**

## FIFO Fill Level Bit

These bits indicate the number of available output FIFO structures in the local RAM/global RAM. Valid values are 00<sub>H</sub> to FLXAnFROTC.FTM + 1.

The value 00<sub>H</sub> indicates that the FIFO is empty.

The value FLXAnFROTC.FTM + 1 indicates that the FIFO is full and no further FIFO transfers will be done.

The FIFO fill level is incremented when a FIFO data structure has been transferred from the FlexRay internal FIFO into the local RAM/global RAM.

The FIFO fill level is decremented when the user releases a FIFO data structure in the local RAM/global RAM by writing 1 to FLXAnFROTS.FDA.

The FIFO fill level is set to 00<sub>H</sub> when the bit FLXAnFROTS.OTS changes from 0 to 1.

**(2) FLXAnFROTS.FGIDX**

## FIFO Get Index Bit

These bits indicate the index where the current output data structure pointer in the FIFO pointer table is available for reading.

Valid values are 00<sub>H</sub> to FLXAnFROTC.FTM.

After reaching the maximum value the get index continues from 00<sub>H</sub>.

The index is incremented when a FIFO data structure is released by writing 1 to FLXAnFROTS.FDA.

The index is set to 00<sub>H</sub> when FLXAnFROTS.OTS changes from 0 to 1.

**(3) FLXAnFROTS.FWP**

## FIFO transfer Warning condition Pending Bit

This bit indicates the FIFO transfer warning condition.

## [Clearing condition]

This bit is cleared when there are free output data structures ( $FLXAnFROTS.FFL \leq FLXAnFROTC.FTM$ ).

This bit is cleared when the FLXAnFROTS.OTS changes from 0 to 1.

## [Setting condition]

This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures ( $FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1$ ).

#### (4) FLXAnFROTS.OWP

Output transfer Warning condition Pending Bit

This bit indicates the output transfer warning condition.

[Clearing condition]

This bit is cleared, when all output structure pointers that have a pending output handler transfer condition detected are released (for dedicated transmit and receive message buffers or a user output transfer request).

[Setting condition]

This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to 1).

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to 1 due to the input transfer request).

#### (5) FLXAnFROTS.FDA

FIFO Data Available Bit

Writing 0 has no effect on the bit value.

When this bit is 1, the next valid output data structure is available.

The related data structure pointer is in the FIFO pointer table at FLXAnFROTS.FGIDX.

Writing 1 to FLXAnFROTS.FDA

- increments FLXAnFROTS.FGIDX and
- decrements the FIFO fill level (FLXAnFROTS.FFL)

If there are still unprocessed data structures FLXAnFROTS.FDA remains 1.

[Clearing condition]

This bit is cleared when writing 1 to FLXAnFROTS.FDA and the FIFO fill level becomes 00<sub>H</sub>.

This bit is cleared when the FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when there is at least one FIFO data structure available in the local RAM/global RAM.

#### (6) FLXAnFROTS.FWIS

FIFO transfer Warning Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFROTC.FWIE the FIFO transfer warning interrupt is generated when FLXAnFROTS.FWIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFROTS.FWIS.

This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1).

**(7) FLXAnFROTS.OWIS**

Output transfer Warning Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFROTC.OWIE the FIFO transfer warning interrupt is generated when FLXAnFROTS.OWIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFROTS.OWIS.

This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to 1).

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to 1 due to the input transfer request).

**(8) FLXAnFROTS.FIS**

FIFO transfer Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFROTC.FIE the FIFO transfer interrupt is generated when FLXAnFROTS.FIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFROTS.FIS.

This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when a FIFO data structure is updated by the transfer handler or the FFL bit changes from 00<sub>H</sub> to 01<sub>H</sub>.

**(9) FLXAnFROTS.OTIS**

Output transfer Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFROTC.OIE the output transfer interrupt is generated when FLXAnFROTS.OTIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFROTS.OTIS.

This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when an output data structure is updated by the transfer handler (from a dedicated transmit or receive message buffer or by a user output transfer request).

**(10) FLXAnFROTS.UORP**

User Output transfer Request Pending Bit

This bit indicates that a user output transfer is still pending.

There should be no further write access to FLXAnFRUOR.UMBNR when this bit is 1.

[Clearing condition]

This bit is cleared when the user output transfer request is processed by the output transfer handler.

This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when writing to FLXAnFRUOR.UMBNR.

**(11) FLXAnFROTS.OTS**

Output Transfer Status Bit

This bit indicates the status of the output transfer handler.

While this bit is 1, there should be no read or write access to the address area <FLXAn\_base> + 0600<sub>H</sub> to <FLXAn\_base> + 07FF<sub>H</sub> and there should be no CLEAR\_RAM command applied to FLXAnFRSUCC1.CMD register.

While this bit is 1, the user cannot change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.

The output transfer indices and related status flags are set to 0 when FLXAnFROTS.OTS changes from 0 to 1.

[Clearing condition]

This bit is cleared immediately when FLXAnFROTC.OTE is set to 0 and there are no ongoing output transfers.

This bit is cleared after an ongoing transfer has been completed and FLXAnFROTC.OTE is 0.

[Setting condition]

This bit is set when FLXAnFROTC.OTE is set to 1.

### 25.2.13.3 FLXAnFRAES — FlexRay Access Error Status Register

**Access:** FLXAnFRAES can be read or written in 32-bit units.  
 FLXAnFRAESL can be read or written in 16-bit units.  
 FLXAnFRAESLL is a read-only register that can be read in 8-bit units.  
 FLXAnFRAESLH can be read or written in 8-bit units.

**Address:** FLXAnFRAES: <FLXAn\_base> + 0828<sub>H</sub>,  
 FLXAnFRAESL: <FLXAn\_base> + 0828<sub>H</sub>,  
 FLXAnFRAESLL: <FLXAn\_base> + 0828<sub>H</sub>, FLXAnFRAESLH: <FLXAn\_base> + 0829<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MAE	FAE	OAE	IAE	EIDX[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 25.106 FLXAnFRAES Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	MAE	Multiple Access Errors Bit 0: No multiple access errors occurred 1: Multiple access errors occurred
10	FAE	FIFO transfer Access Error Bit 0: No access error occurred during FIFO transfer 1: Access error occurred during FIFO transfer
9	OAE	Output transfer Access Error Bit 0: No access error occurred during output transfer 1: Access error occurred during output transfer
8	IAE	Input transfer Access Error Bit 0: No access error occurred during input transfer 1: Access error occurred during input transfer
7 to 0	EIDX[7:0]	Error Index Bit Data structure pointer index number

**(1) FLXAnFRAES.MAE**

Multiple Access Errors Bit

Writing 0 has no effect on the bit value.

This bit indicates that there were multiple access errors during a data transfer.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRAES.MAE.

[Setting condition]

This bit is set when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE are set and

- an access to an protected address occurred during a FIFO data transfer or
- an access to an protected address occurred during an output data transfer or
- an access to an protected address occurred during an input data transfer

**(2) FLXAnFRAES.FAE**

FIFO transfer Access Error Bit

Writing 0 has no effect on the bit value.

This bit indicates that there was an access error during a FIFO data transfer.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRAES.FAE.

[Setting condition]

This bit is set when a local RAM/global RAM access error was detected during a FIFO transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are 0.

**(3) FLXAnFRAES.OAE**

Output transfer Access Error Bit

Writing 0 has no effect on the bit value.

This bit indicates that there was an access error during a output data transfer.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRAES.OAE.

[Setting condition]

This bit is set when a local RAM/global RAM access error was detected during an output transfer and the bits FLXAnFRAES.FAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are 0.

**(4) FLXAnFRAES.IAE**

Input transfer Access Error Bit

Writing 0 has no effect on the bit value.

This bit indicates that there was an access error during an input data transfer.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRAES.IAE.

[Setting condition]

This bit is set when a local RAM/global RAM access error was detected during an output transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.FAE and FLXAnFRAES.MAE are 0.

**(5) FLXAnFRAES.EIDX**

Error Index Bit

This value is only valid when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is 1.

When the bit FLXAnFRAES.FAE is 1, FLXAnFRAES.EIDX holds the used FIFO put index when the access error has occurred.

When the bit FLXAnFRAES.OAE is 1, FLXAnFRAES.EIDX holds the input pointer table get index used when an access error occurred during an input transfer or when the user request an input transfer.

When the bit FLXAnFRAES.IAE is 1, FLXAnFRAES.EIDX holds the used input pointer table get index when the access error has occurred.

These bits are updated when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is changed from 0 to 1.

### 25.2.13.4 FLXAnFRAEA — FlexRay Access Error Address Register

**Access:** FLXAnFRAEA is a read-only register that can be read in 32-bit units.

FLXAnFRAEAL and FLXAnFRAEAH are the read-only registers that can be read in 16-bit units.

FLXAnFRAEALL, FLXAnFRAEALH, FLXAnFRAEAHL, and FLXAnFRAEAHH are the read-only registers that can be read in 8-bit units.

**Address:** FLXAnFRAEA: <FLXAn\_base> + 082C<sub>H</sub>,

FLXAnFRAEAL: <FLXAn\_base> + 082C<sub>H</sub>, FLXAnFRAEAH: <FLXAn\_base> + 082E<sub>H</sub>,

FLXAnFRAEALL: <FLXAn\_base> + 082C<sub>H</sub>, FLXAnFRAEALH: <FLXAn\_base> + 082D<sub>H</sub>,

FLXAnFRAEAHL: <FLXAn\_base> + 082E<sub>H</sub>, FLXAnFRAEAHH: <FLXAn\_base> + 082F<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.107 FLXAnFRAEA Register Contents

Bit Position	Bit Name	Function
31 to 0	AEA[31:0]	Access Error Address Bit Address in the local RAM/global RAM when an access error has occurred

#### (1) FLXAnFRAEA.AEA

##### Access Error Address Bit

This value is only valid when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is 1. These bits indicate the address of the access error indicated in the FLXAnFRAES register.

These bits are updated when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is changed from 0 to 1.

### 25.2.13.5 FLXAnFRDAi — FlexRay Message Data Available Register i (i = 0 to 3)

**Access:** FLXAnFRDAi can be read or written in 32-bit units.  
 FLXAnFRDAiL and FLXAnFRDAiH can be read or written in 16-bit units.  
 FLXAnFRDAiLL, FLXAnFRDAiLH, FLXAnFRDAiHL, and FLXAnFRDAiHH can be read or written in 8-bit units.

**Address:** FLXAnFRDAx: <FLXAn\_base> + 0830<sub>H</sub> + i × 4<sub>H</sub>,  
 FLXAnFRDAxL: <FLXAn\_base> + 0830<sub>H</sub> + i × 4<sub>H</sub>,  
 FLXAnFRDAxH: <FLXAn\_base> + 0830<sub>H</sub> + i × 4<sub>H</sub> + 2<sub>H</sub>,  
 FLXAnFRDAxLL: <FLXAn\_base> + 0830<sub>H</sub> + i × 4<sub>H</sub>,  
 FLXAnFRDAxLH: <FLXAn\_base> + 0830<sub>H</sub> + i × 4<sub>H</sub> + 1<sub>H</sub>,  
 FLXAnFRDAxHL: <FLXAn\_base> + 0830<sub>H</sub> + i × 4<sub>H</sub> + 2<sub>H</sub>,  
 FLXAnFRDAxHH: <FLXAn\_base> + 0830<sub>H</sub> + i × 4<sub>H</sub> + 3<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.108 FLXAnFRDAi Register Contents

Bit Position	Bit Name	Function
31 to 0	DAb	Data Available Bit 0: No data available for destination 1: Data available for destination

#### (1) FLXAnFRDAi.DAb (b = i × 32 to (i + 1) × 32 – 1)

Data Available Bit b

The user should not write a 1 to bits that are 0.

To maintain the status of input transfers, the user cannot clear bits related to input transfers.

This register is used for input and output transfers.

Each flag corresponds to a FlexRay message buffer.

[Clearing condition]

Input transfer:

This bit is cleared when the input data structure has been transferred from the local RAM/global RAM. The data structure and the data structure pointer can be changed when the related flag is 0.

Output transfer:

This bit is cleared by writing 1 to it.

[Setting condition]

Input transfer:

This bit is set when the corresponding message buffer number has been written to FLXAnFRIQC.IMBNR.

As long as this bit is 1, the input data structure and the data structure pointer corresponding to this input transfer request cannot be changed.

**Output transfer:**

This bit is set when the output data structure corresponding to this message buffer has been updated. As long as this bit is 1, the data structure is stable; no further update of the data structure will be done by the output handler. While this bit is 1, the application is allowed to change the output data structure pointer in the output pointer table for this message buffer number.

## 25.3 Functional Description

This chapter describes the FlexRay implementation together with the related FlexRay protocol features. More information about the FlexRay protocol itself can be found in the FlexRay protocol specification.

### 25.3.1 FlexRay Module Operation Control

#### 25.3.1.1 FlexRay Module Enable

After hardware reset or after the FlexRay module has been disabled (following **Section 25.3.1.2, FlexRay Module Disable**) the FlexRay module is in the reset state (FLXAnFROS.OS is 0) and the clocks of the FlexRay core module are disabled.

Figure 25.3 FlexRay Enable Flow

### 25.3.1.2 FlexRay Module Disable

The FlexRay module can be disabled at any time. However, it is recommended to disable the FlexRay module using the FLXAnFROC.OE register only when the FlexRay module is in HALT, CONFIG or DEFAULT\_CONFIG state. Resetting the FlexRay module in any other state will terminate any ongoing FlexRay communication.

If the data transfer function is used, it is also required to disable this function before disabling the FlexRay module (see **Section 25.3.16.1(1), Activation and Deactivation** for suspending input transfer function and **Section 25.3.16.2(2), Output Transfer Data Structure** for suspending output transfer).

The following flow should be executed to disable the FlexRay module.

Figure 25.4 FlexRay Disable Flow

## 25.3.2 Communication Cycle

Communication on FlexRay networks is based on frames and symbols. The wakeup symbol (WUS) and the collision avoidance symbol (CAS) are transmitted outside the communication cycle to setup the time schedule. Frames and media access test symbols (MTS) are transmitted inside the communication cycle.

A FlexRay communication cycle consists of the following elements:

- Static Segment
- Dynamic Segment (optional)
- Symbol Window (optional)
- Network Idle Time (NIT)

Static segment, dynamic segment, and symbol window form the Network Communication Time (NCT). For each communication channel the slot counter starts at 1 and counts up until the end of the dynamic segment is reached. Both channels share the same arbitration grid which means that they use the same synchronized macrotick.

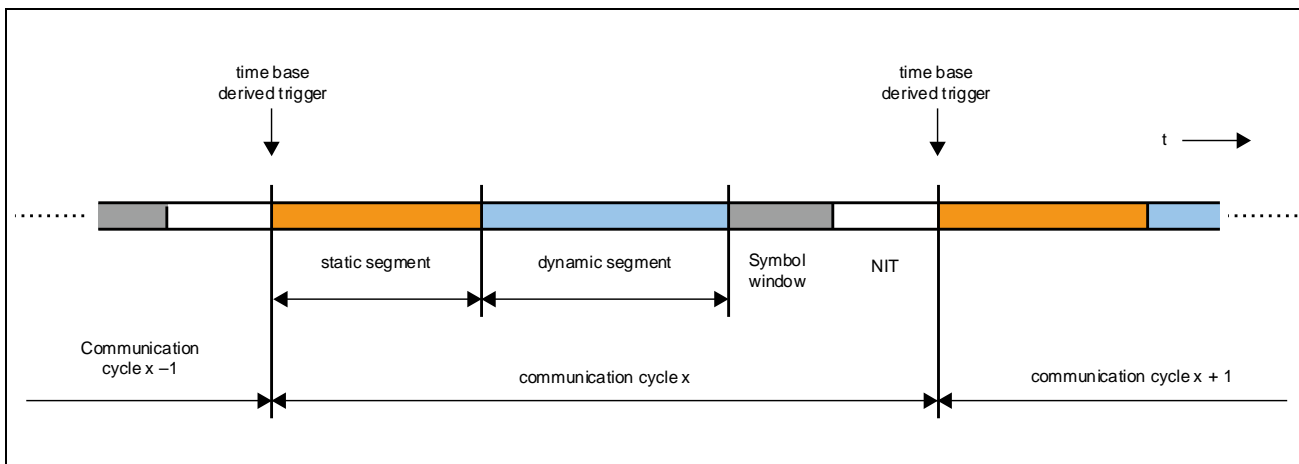

Figure 25.5 Structure of Communication Cycle

### 25.3.2.1 Static Segment

The Static Segment is characterized by the following features:

- Time slots of fixed length (optionally protected by bus guardian)
- Start of frame transmission at action point of the respective static slot
- Payload length same for all frames on both channels

#### Parameters:

Number of Static Slots (FLXAnFRGTUC7.NSS)

Static Slot Length (FLXAnFRGTUC7.SSL)

Payload Length Static (FLXAnFRMHDC.SFDL)

Action Point Offset (FLXAnFRGTUC9.APO)

### 25.3.2.2 Dynamic Segment

The Dynamic Segment is characterized by the following features:

- All controllers have bus access (no bus guardian protection possible)
- Variable payload length and duration of slots, different for both channels
- Start of transmission at minislot action point

#### Parameters:

Number of Minislots (FLXAnFRGTUC8.NMS) Minislot Length (FLXAnFRGTUC8.MSL)

Minislot Action Point Offset (FLXAnFRGTUC9.MAPO)

Start of Latest Transmit (last minislot) (FLXAnFRMHDC.SLT)

### 25.3.2.3 Symbol Window

During the symbol window only one media access test symbol (MTS) may be transmitted per channel. MTS symbols are sent in NORMAL\_ACTIVE state to test the bus guardian.

The symbol window is characterized by the following features:

- Send single symbol
- Transmission of the MTS symbol starts at the symbol windows action point

#### Parameters:

Symbol Window Action Point Offset (FLXAnFRGTUC9.APO) (same as for static slots)

Network Idle Time Start Position (FLXAnFRGTUC4.NIT)

### 25.3.2.4 Network Idle Time (NIT)

During network idle time the CC performs the following tasks:

- Calculate clock correction terms (offset and rate)
- Distribute offset correction over multiple macroticks after offset correction start
- Perform cluster cycle related tasks

#### Parameters:

Network idle time start position configuration bit (FLXAnFRGTUC4.NIT)

Offset correction start position configuration bit (FLXAnFRGTUC4.OCS)

### 25.3.2.5 Configuration of NIT Start and Offset Correction Start

Figure 25.6 Configuration of NIT Start and Offset Correction Start

The number of macroticks per cycle  $gMacroPerCycle$  is assumed to be  $m$ . It is configured by programming  $FLXAnFRGTUC2.MPC = m$ .

The static/dynamic segment starts with macrotick 0 and ends with macrotick  $n$ :

$$n = \text{static segment length} + \text{dynamic segment offset} + \text{dynamic segment length} - 1MT$$

$$n = gNumberOfStaticSlots \cdot gStaticSlot + \text{dynamic segment offset} + gNumberOfMinislots \cdot gMinislot - 1MT$$

The static segment length is configured by  $FLXAnFRGTUC7.SSL$  and  $FLXAnFRGTUC7.NSS$ .

The dynamic segment length is configured by  $FLXAnFRGTUC8.MSL$  and  $FLXAnFRGTUC8.NMS$ . The dynamic segment offset is:

If  $gdActionPointOffset \leq gdMinislotActionPointOffset$ : dynamic segment offset = 0 MT

Else if  $gdActionPointOffset > gdMinislotActionPointOffset$ :

$$\text{dynamic segment offset} = gdActionPointOffset - gdMinislotActionPointOffset$$

The NIT starts with macrotick  $k + 1$  and ends with the last macrotick of cycle  $m - 1$ . It has to be configured by setting  $FLXAnFRGTUC4.NIT = k$ .

For the FlexRay module the offset correction start is required to be  $FLXAnFRGTUC4.OCS \geq FLXAnFRGTUC4.NIT + 1 = k + 1$ .

The length of symbol window results from the number of macroticks between the end of the static/dynamic segment and the beginning of the NIT. It can be calculated by the number of macroticks  $(k - n)$ .

### 25.3.3 Communication Modes

The FlexRay Protocol Specification defines the Time-Triggered Distributed (TT-D) mode.

#### 25.3.3.1 Time-Triggered Distributed (TT-D)

In TT-D mode the following configurations are possible:

- Pure static: Minimum 2 static slots + symbol window (optional)
- Mixed static/dynamic: Minimum 2 static slots + dynamic segment + symbol window (optional)

A minimum of two coldstart nodes needs to be configured for distributed time-triggered operation. Two fault-free coldstart nodes are necessary for the cluster startup. Each startup frame must be a sync frame, therefore all coldstart nodes are sync nodes.

### 25.3.4 Clock Synchronization

In TT-D mode, distributed clock synchronization is used. Each node individually synchronizes itself to the cluster by observing the timing of received sync frames from other nodes.

#### 25.3.4.1 Global Time

Activities in a FlexRay node, including communication, are based on the concept of a global time. It is the clock synchronization mechanism that differentiates the FlexRay cluster from other node collections with independent clock mechanisms. The global time is a vector of two values: the cycle (cycle counter) and the cycle time (macrotick counter).

Cluster definitions:

- Macrotime (MT) = basic unit of time measurement in a FlexRay network, a macrotime consists of an integer number of microtimes ( $\mu T$ )
- Cycle length = duration of a communication cycle in units of macrotimes (MT)

#### 25.3.4.2 Local Time

Internally, nodes time their behavior with microtime resolution. Microtimes are time units derived from the oscillator clock tick of the specific node. Therefore microtimes are controller-specific units. They may have different duration in different controllers. The precision of a node's local time difference measurements is a microtime ( $\mu T$ ).

Node definitions:

- Oscillator clock  $\rightarrow$  prescaler  $\rightarrow$  microtime ( $\mu T$ )
- $\mu T$  = basic unit of time measurement in a CC, clock correction is done in units of  $\rightarrow \mu T$
- Cycle counter + macrotime counter = nodes local view of the global time

#### 25.3.4.3 Synchronization Process

Clock synchronization is performed by means of sync frames. Only preconfigured nodes (sync nodes) are allowed to send sync frames. In a two-channel cluster a sync node has to send its sync frame on both channels.

For synchronization in FlexRay the following constraints have to be considered:

- Max. one sync frame per node in one communication cycle
- Max. 15 sync frames per cluster in one communication cycle
- Every node has to use a preconfigured number of sync frames (FLXAnFRGTUC2.SNM) for clock synchronization
- Minimum of two sync nodes required for clock synchronization and startup

For clock synchronization the time difference between expected and observed arrival time of sync frames received during the static segment is measured. In a two channel cluster the sync node has to be configured to send sync frames on both channels. The calculation of correction terms is done during NIT (offset: every cycle, rate: every odd cycle) by using an FTM algorithm. For details see *the FlexRay protocol specification v2.1, chapter 8*.

### (1) Offset (Phase) Correction

- Only deviation values measured and stored in the current cycle used
- For a two channel node the smaller value will be taken
- Calculation during NIT of every communication cycle
- Offset correction value calculated in even cycles used for error checking only
- Checked against limit values
- Correction value is a signed integer number of  $\mu$ Ts
- Correction done in odd numbered cycles, distributed over the macroticks beginning at offset correction start up to cycle end (end of NIT) to shift nodes next start of cycle (MTs lengthened/shortened)

### (2) Rate (Frequency) Correction

- Pairs of deviation values measured and stored in even/odd cycle pair used
- For a two channel node the average of the differences from the two channels is used
- Calculated during NIT of odd numbered cycles
- Cluster drift damping is performed using global damping value
- Checked against limit values
- Correction value is a signed integer number of  $\mu$ Ts
- Distributed over macroticks comprising the next even/odd cycle pair (MTs lengthened/shortened)

### (3) Sync Frame Transmission

Sync frame transmission is only possible from buffer 0 and 1. Message buffer 1 may be used for sync frame transmission in case that sync frames should have different payloads on the two channels. In this case bit FLXAnFRMRC.SPLM has to be programmed to 1.

Message buffers used for sync frame transmission have to be configured with the key slot ID and can be (re)configured in DEFAULT\_CONFIG or CONFIG state only. For nodes transmitting sync frames FLXAnFRSUCC1.TXSY must be set to 1.

### (4) External Clock Synchronization

During normal operation, independent clusters can drift significantly. If synchronous operation across independent clusters is desired, external synchronization is necessary; even though the nodes within each cluster are synchronized. This can be accomplished with synchronous application of host-deduced rate and offset correction terms to the clusters.

- External offset/rate correction value is a signed integer
- External offset/rate correction value is added to calculated offset/rate correction value
- Aggregated offset/rate correction term (external + internal) is not checked against configured limits

### 25.3.5 Error Handling

The implemented error handling concept is intended to ensure that, in case of a lower layer protocol error in one single node, communication between non-affected nodes can be maintained. In some cases, higher layer program activity is required for the CC to resume normal operation. A change of the error handling state will set FLXAnFREIR.PEMC to 1 and may trigger an interrupt to the Host if enabled. The actual error mode is signaled by FLXAnFRCCEV.ERRM.

Table 25.109 Error Modes of the POC (Degradation Model)

Error Mode	Activity
ACTIVE	Full operation, State: NORMAL_ACTIVE The CC is fully synchronized and supports the cluster wide clock synchronization. The host is informed of any error condition(s) or status change by interrupt (if enabled) or by reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR.
PASSIVE	Reduced operation, State: NORMAL_PASSIVE, CC self rescue allowed The CC stops transmitting frames and symbols, but received frames are still processed. Clock synchronization mechanisms are continued based on received frames. No active contribution to the cluster wide clock synchronization. The host is informed of any error condition(s) or status change by interrupt (if enabled) or by reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR.
COMM_HALT	Operation halted, State: HALT, CC self rescue not allowed The CC stops frame and symbol processing, clock synchronization processing, and the macrotick generation. The host has still access to error and status information by reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR. The bus drivers are disabled.

#### 25.3.5.1 Clock Correction Failed Counter

When the Clock Correction Failed Counter reaches the “maximum without clock correction passive” limit defined by FLXAnFRSUCC3.WCP, the POC transits from NORMAL\_ACTIVE to NORMAL\_PASSIVE state. When it reaches the “maximum without clock correction fatal” limit defined by FLXAnFRSUCC3.WCF, it transits from NORMAL\_ACTIVE or NORMAL\_PASSIVE to HALT state.

The Clock Correction Failed Counter FLXAnFRCCEV.CCFC allows the Host to monitor the duration of the inability of a node to compute clock correction terms after the CC passed protocol startup phase. It will be incremented by one at the end of any odd communication cycle during which either the missing offset correction FLXAnFRSFS.MOCS or the missing rate correction FLXAnFRSFS.MRCS flag is set to 1.

The Clock Correction Failed Counter is reset to zero at the end of an odd communication cycle if neither the missing offset correction FLXAnFRSFS.MOCS nor the missing rate correction FLXAnFRSFS.MRCS flag is set to 1.

The Clock Correction Failed Counter stops incrementing when the “maximum without clock correction fatal” value FLXAnFRSUCC3.WCF is reached (i.e. incrementing the counter at its maximum value will not cause it to wrap around back to zero). The Clock Correction Failed Counter is initialized to zero when the CC enters READY state or when NORMAL\_ACTIVE state is entered.

#### CAUTION

The transition to HALT state is prevented if FLXAnFRSUCC1.HCSE is not set to 1.

### 25.3.5.2 Passive to Active Counter

The passive to active counter controls the transition of the POC from NORMAL\_PASSIVE to NORMAL\_ACTIVE state. FLXAnFRSUCC1.PTA defines the number of consecutive even/odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL\_PASSIVE to NORMAL\_ACTIVE state. If FLXAnFRSUCC1.PTA is set to zero the CC is not allowed to transit from NORMAL\_PASSIVE to NORMAL\_ACTIVE state.

### 25.3.5.3 HALT Command

If the Host wants to stop FlexRay communication of the local node it can bring the CC into HALT state by asserting the HALT command. This can be done by writing FLXAnFRSUCC1.CMD = "0110<sub>B</sub>". In order to shut down communication on an entire FlexRay network, a higher layer protocol is required to confirm that all nodes apply the HALT command at the same time.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

When called in NORMAL\_ACTIVE or NORMAL\_PASSIVE state the POC transits to HALT state at the end of the current cycle. When called in any other state FLXAnFRSUCC1.CMD will be reset to "0000<sub>B</sub>" = command\_not\_accepted and bit FLXAnFREIR.CNA is set to 1. If enabled an interrupt to the Host is generated.

### 25.3.5.4 FREEZE Command

In case the Host detects a severe error condition it can bring the CC into HALT state by asserting the FREEZE command. This can be done by writing FLXAnFRSUCC1.CMD = "0111<sub>B</sub>". The FREEZE command triggers the entry of the HALT state immediately regardless of the actual POC state.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

#### CAUTION

When the communication is stopped by the FREEZE or READY command and the communication is restarted as Leading ColdStart, the startup frame is not transmitted on cycle0 depending on the internal condition of the FlexRay module. This case occurs when the Startup frame is set in one of the slot 1 to slot 7.

This does not occur in ColdStart after a hardware reset.

Even if this occurs, the second trial of ColdStart will succeed. ColdStart time becomes longer, but ColdStart will not be affected by the occurrence.

To avoid this, allocate the Startup/Sync frame in the static slot 8 or higher.

### 25.3.6 Communication Controller States

#### 25.3.6.1 Communication Controller State Diagram

Figure 25.7 Overall State Diagram of FlexRay Communication Controller

State transitions are controlled by reset, FLXAnFR0RXDA, FLXAnFR0RXDB, by the POC state machine, and by the CHI Command Vector FLXAnFRSUCC1.CMD.

The CC transits from all states to HALT state after application of the FREEZE command (FLXAnFRSUCC1.CMD = “0111<sub>B</sub>”).

Table 25.110 State Transitions of FlexRay Overall State Machine

T#	Condition	From	To
1	Reset	All States	DEFAULT_CONFIG
2	Command CONFIG, FLXAnFRSUCC1.CMD = "0001 <sub>B</sub> "	DEFAULT_CONFIG	CONFIG
3	Unlock sequence followed by command READY, FLXAnFRSUCC1.CMD = "0010 <sub>B</sub> "	CONFIG	READY
4	Command CONFIG, FLXAnFRSUCC1.CMD = "0001 <sub>B</sub> "	READY	CONFIG
5	Command WAKEUP, FLXAnFRSUCC1.CMD = "0011 <sub>B</sub> "	READY	WAKEUP
6	Complete transmission of wakeup pattern or received WUP or received frame header or wakeup collision detection or command READY, FLXAnFRSUCC1.CMD = "0010 <sub>B</sub> "	WAKEUP	READY
7	Command RUN, FLXAnFRSUCC1.CMD = "0100 <sub>B</sub> "	READY	STARTUP
8	Successful STARTUP	STARTUP	NORMAL_ACTIVE
9	Clock Correction Failed counter reached Maximum Without Clock Correction Passive limit configured by FLXAnFRSUCC3.WCP	NORMAL_ACTIVE	NORMAL_PASSIVE
10	Number of valid correction terms reached the Passive to Active limit configured by FLXAnFRSUCC1.PTA	NORMAL_PASSIVE	NORMAL_ACTIVE
11	Command READY, FLXAnFRSUCC1.CMD = "0010 <sub>B</sub> "	STARTUP, NORMAL_ACTIVE, NORMAL_PASSIVE	READY
12	Clock Correction Failed counter reached Maximum Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF when bit FLXAnFRSUCC1.HCSE set to 1 or command HALT, FLXAnFRSUCC1.CMD = "0110 <sub>B</sub> "	NORMAL_ACTIVE	HALT
13	Clock Correction Failed counter reached Maximum Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF when bit FLXAnFRSUCC1.HCSE set to 1 or command HALT, FLXAnFRSUCC1.CMD = "0110 <sub>B</sub> "	NORMAL_PASSIVE	HALT
14	Command FREEZE, FLXAnFRSUCC1.CMD = "0111 <sub>B</sub> "	All States	HALT
15	Command CONFIG, FLXAnFRSUCC1.CMD = "0001 <sub>B</sub> "	HALT	DEFAULT_CONFIG

### 25.3.6.2 DEFAULT\_CONFIG State

In DEFAULT\_CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state.

The CC enters this state

- When the reset is applied (HW reset or SW reset)
- When exiting from HALT state

To leave DEFAULT\_CONFIG state the Host has to write FLXAnFRSUCC1.CMD = "0001<sub>B</sub>". The CC then transits to CONFIG state.

### 25.3.6.3 CONFIG State

In CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state. This state is used to initialize the CC configuration.

The CC enters this state

- When exiting from DEFAULT\_CONFIG state
- When exiting from READY state

When the state has been entered via HALT and DEFAULT\_CONFIG state, the Host can analyze status information and configuration. Before leaving CONFIG state the Host has to confirm that the configuration is fault-free.

To leave CONFIG state, the Host has to perform the unlock sequence as described in **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**. Directly after unlocking the CONFIG state the Host has to write FLXAnFRSUCC1.CMD to enter the next state.

#### CAUTION

---

Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the Message RAM are not affected by the transition of the POC from CONFIG to READY state.

---

When the CC is in CONFIG state it is also possible to bring the CC into a power saving mode by halting the module clocks (bus clock and sample clock). To do this the Host has to confirm that all Message RAM transfers have finished before turning off the clocks.

### 25.3.6.4 READY State

After unlocking CONFIG state and writing FLXAnFRSUCC1.CMD = “0010<sub>B</sub>”, the CC enters READY state. From this state the CC can transit to WAKEUP state and perform a cluster wakeup or to STARTUP state to perform a coldstart or to integrate into a running cluster.

The CC enters this state

- When exiting from CONFIG, WAKEUP, STARTUP, NORMAL\_ACTIVE, or NORMAL\_PASSIVE state by writing FLXAnFRSUCC1.CMD = “0010<sub>B</sub>” (READY command).

The CC exits from this state

- To CONFIG state by writing FLXAnFRSUCC1.CMD = “0001<sub>B</sub>” (CONFIG command)
- To WAKEUP state by writing FLXAnFRSUCC1.CMD = “0011<sub>B</sub>” (WAKEUP command)
- To STARTUP state by writing FLXAnFRSUCC1.CMD = “0100<sub>B</sub>” (RUN command)

Internal counters and the CC status flags are reset when the CC enters STARTUP state.

#### CAUTION

---

Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the Message RAM are not affected by the transition of the POC from READY to STARTUP state.

---

### 25.3.6.5 WAKEUP State

The description below is intended to help configuring wakeup for the FlexRay IP-module. A detailed description of the wakeup procedure together with the respective SDL diagrams can be found in *the FlexRay protocol specification v2.1, section 7.1*.

The CC enters this state

- When exiting from READY state by writing `FLXAnFRSUCC1.CMD = "0011B"` (WAKEUP command).

The CC exits from this state to READY state

- After complete non-aborted transmission of wakeup pattern (WUP)
- After WUP reception
- After detecting a WUP collision
- After reception of a frame header
- By writing `FLXAnFRSUCC1.CMD = "0010B"` (READY command)

The cluster wakeup must precede the communication startup in order to ensure that all nodes in a cluster are awake. The minimum requirement for a cluster wakeup is that all bus drivers are supplied with power. A bus driver has the ability to wake up the other components of its node when it receives a wakeup pattern on its channel. At least one node in the cluster needs an external wakeup source.

The Host completely controls the wakeup procedure. It is informed about the state of the cluster by the bus driver and the CC and configures bus guardian (if available) and CC to perform the cluster wakeup. The CC provides to the Host the ability to transmit a special wakeup pattern on each of its available channels separately. The CC needs to recognize the wakeup pattern only during WAKEUP state.

Wakeup may be performed on only one channel at a time. The Host has to configure the wakeup channel while the CC is in CONFIG state by writing `FLXAnFRSUCC1.WUCS`. The CC ensures that ongoing communication on this channel is not disturbed. The CC cannot guarantee that all nodes connected to the configured channel awake upon the transmission of the wakeup pattern, since these nodes cannot give feedback until the startup phase. The wakeup procedure enables single-channel devices in a two-channel system to trigger the wakeup, by only transmitting the wakeup pattern on the single channel to which they are connected. Any coldstart node that deems a system startup necessary will then wake the remaining channel before initiating communication startup.

The wakeup procedure tolerates any number of nodes simultaneously trying to wakeup a single channel and resolves this situation such that only one node transmits the pattern. Additionally the wakeup pattern is collision resilient, so even in the presence of a fault causing two nodes to simultaneously transmit a wakeup pattern, the resulting collided signal can still wake the other nodes.

After wakeup the CC returns to READY state and signals the change of the wakeup status to the Host by setting flag `FLXAnFRSIR.WST`. The wakeup status vector can be read from `FLXAnFRCCSV.WSV`. If a valid wakeup pattern was received also either flag `FLXAnFRSIR.WUPA` or flag `FLXAnFRSIR.WUPB` is set to 1.

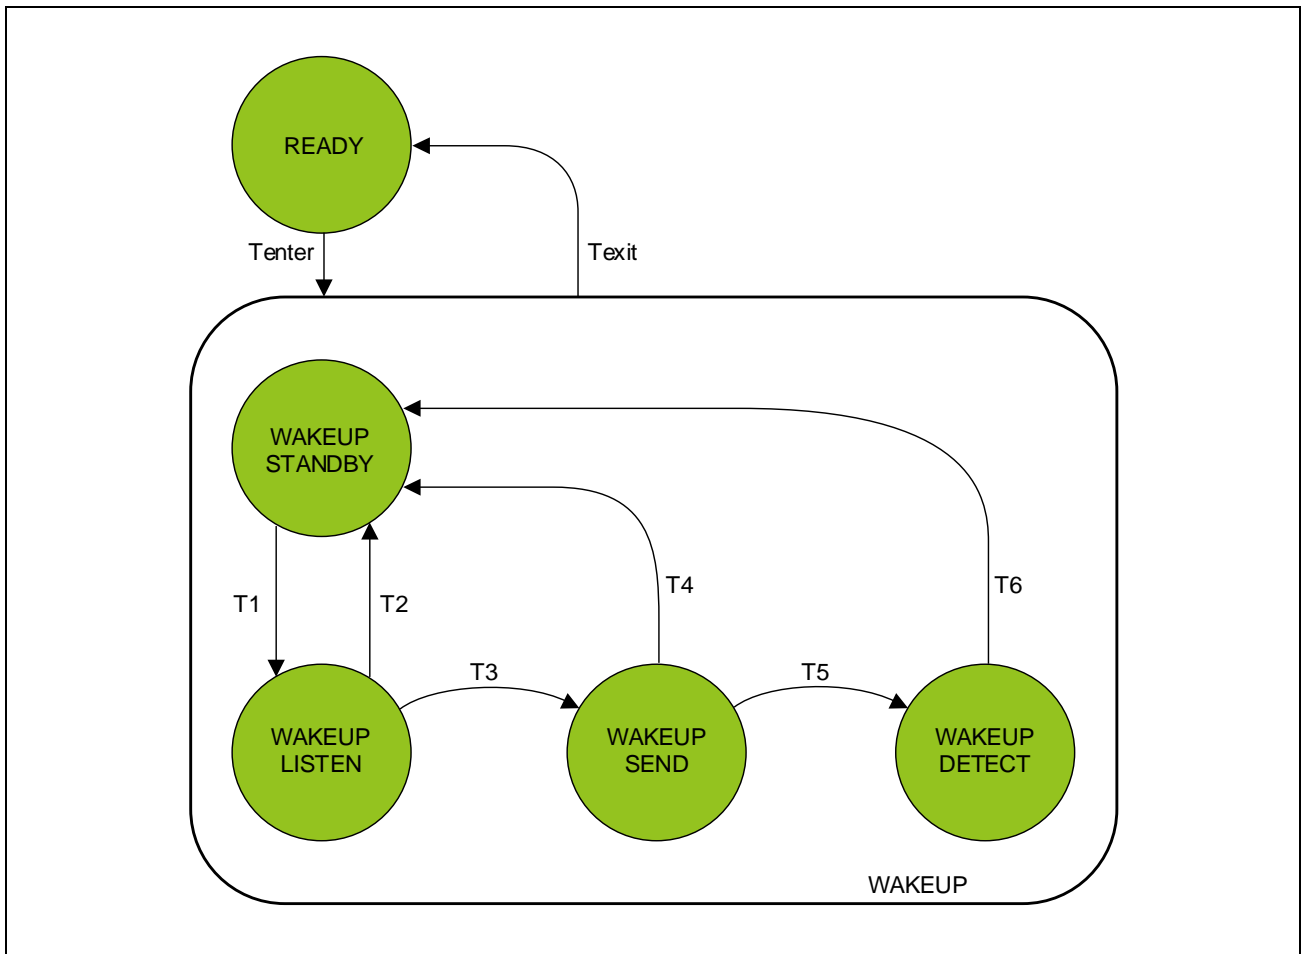

Figure 25.8 Structure of POC State WAKEUP

Table 25.111 State Transitions WAKEUP

T#	Condition	From	To
enter	Host commands change to WAKEUP state by writing FLXAnFRSUCC1.CMD = "0011 <sub>B</sub> " (WAKEUP command)	READY	WAKEUP
1	CHI command WAKEUP triggers wakeup FSM to transit to WAKEUP_LISTEN state	WAKEUP_STANDBY	WAKEUP_LISTEN
2	Received WUP on wakeup channel selected by bit FLXAnFRSUCC1.WUCS or frame header on either available channel	WAKEUP_LISTEN	WAKEUP_STANDBY
3	Timer event	WAKEUP_LISTEN	WAKEUP_SEND
4	Complete, non-aborted transmission of wakeup pattern	WAKEUP_SEND	WAKEUP_STANDBY
5	Collision detected	WAKEUP_SEND	WAKEUP_DETECT
6	Wakeup timer expired or WUP detected on wakeup channel selected by bit FLXAnFRSUCC1.WUCS or frame header received on either available	WAKEUP_DETECT	WAKEUP_STANDBY
exit	Wakeup completed (after T2 or T4 or T6) or Host commands change to READY state by writing FLXAnFRSUCC1.CMD = "0010 <sub>B</sub> " (READY command). This command also resets the wakeup FSM to WAKEUP_STANDBY state	WAKEUP	READY

The WAKEUP\_LISTEN state is controlled by the wakeup timer and the wakeup noise timer. The two timers are controlled by the ListenTimeout (FLXAnFRSUCC2.LT bit) and ListenTimeoutNoise (FLXAnFRSUCC2.LTN bit) values. ListenTimeout enables a fast cluster wakeup in case of a noise free environment, while ListenTimeoutNoise enables wakeup under more difficult conditions regarding noise interference.

In WAKEUP\_SEND state the CC transmits the wakeup pattern on the configured channel and checks for collisions. After return from wakeup the Host has to bring the CC into STARTUP state by CHI command RUN.

In WAKEUP\_DETECT state the CC attempts to identify the reason for the wakeup collision detected in WAKEUP\_SEND state. The monitoring is bounded by the expiration of listen timeout as configured by FLXAnFRSUCC2.LT. Either the detection of a wakeup pattern indicating a wakeup attempt by another node or the reception of a frame header indicating ongoing communication, causes the direct transition to READY state. Otherwise WAKEUP\_DETECT is left after expiration of listen timeout; in this case the reason for wakeup collision is unknown.

The Host has to be aware of possible failures of the wakeup and act accordingly. It is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal time it takes another coldstart node to become awake and to be configured.

The FlexRay Protocol Specification recommends that two different CCs shall awake the two channels.

### (1) Host Activities

The host must coordinate the wakeup of the two channels and must decide whether, or not, to wake a specific channel. The sending of the wakeup pattern is initiated by the Host. The wakeup pattern is detected by the remote BDs and signaled to their local Host.

#### Wakeup procedure controlled by Host (single-channel wakeup):

- Configure the CC in CONFIG state
  - Select wakeup channel by programming FLXAnFRSUCC1.WUCS
- Check local BDs whether a WUP was received
- Activate BD of selected wakeup channel
- Command CC to enter READY state
- Command CC to start wakeup on the configured channel by writing FLXAnFRSUCC1.CMD = “0011<sub>B</sub>”
  - CC enters WAKEUP
  - CC returns to READY state and signals status of wakeup attempt to the Host
- Wait predefined time to allow the other nodes to wakeup and configure themselves
- Coldstart node:
  - In a dual channel cluster wait for WUP on the other channel
  - Reset coldstart inhibit flag FLXAnFRCCSV.CSI by writing FLXAnFRSUCC1.CMD = “1001<sub>B</sub>” (ALLOW\_COLDSTART command)
- Command CC to enter startup by writing FLXAnFRSUCC1.CMD = “0100<sub>B</sub>” (RUN command)

**Wakeup procedure triggered by BD:**

- Wakeup recognized by BD
- BD triggers power-up of Host (if required)
- BD signals wakeup event to Host
- Host configures its local CC
- If necessary, Host commands wakeup of second channel and waits predefined time to allow the other nodes to wakeup and configure themselves
- Host commands CC to enter STARTUP state by writing FLXAnFRSUCC1.CMD = “0100<sub>B</sub>” (RUN command)

**(2) Wakeup Pattern (WUP)**

The wakeup pattern (WUP) is composed of at least two wakeup symbols (WUS). Wakeup symbol and wakeup pattern are configured by registers FLXAnFRPRTC1 and FLXAnFRPRTC2.

- Single channel wakeup, wakeup symbol may not be sent on both channels at the same time
- Wakeup symbol collision resilient for at least two sending nodes (two overlapping wakeup symbols always recognizable)
- Wakeup symbol must be configured identical in all nodes of a cluster
- Wakeup symbol transmit low time configured by FLXAnFRPRTC2.TXL
- Wakeup symbol idle time used to listen for activity on the bus, configured by FLXAnFRPRTC2.TXI
- A wakeup pattern composed of at least two Tx-wakeup symbols needed for wakeup
- Number of repetitions configurable by FLXAnFRPRTC1.RWP (2 to 63 repetitions)
- Wakeup symbol receive window length configured by FLXAnFRPRTC1.RXW
- Wakeup symbol receive low time configured by FLXAnFRPRTC2.RXL
- Wakeup symbol receive idle time configured by FLXAnFRPRTC2.RXI

Figure 25.9 Timing of Wakeup Pattern

### 25.3.6.6 STARTUP State

The description below is intended to help configuring startup for the FlexRay module. A detailed description of the startup procedure together with the respective SDL diagrams can be found in *the FlexRay protocol specification v2.1, section 7.2*.

Any node entering STARTUP state that has coldstart capability should confirm that both channels attached have been awakened before initiating coldstart.

It cannot be assumed that all nodes and stars need the same amount of time to become completely awake and to be configured. Since at least two nodes are necessary to start up the cluster communication, it is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal amount of time it takes another coldstart node to become awake, to be configured and to enter startup. It may require several hundred milliseconds (depending on the hardware used) before all nodes and stars are completely awakened and configured.

Startup is performed on all channels synchronously. During startup, a node only transmits startup frames. Startup frames are both sync frames and null frames during startup.

A fault-tolerant, distributed startup strategy is used to ensure that all nodes are synchronized initially. In general, a node may enter NORMAL\_ACTIVE state via (see **Figure 25.10, State Diagram Time — Triggered Startup**):

- Coldstart path initiating the schedule synchronization (LeadingColdstart node)
- Coldstart path joining other coldstart nodes (FollowingColdstart node)
- Integration path integrating into an existing communication schedule (all other nodes)

A coldstart attempt begins with the transmission of a collision avoidance symbol (CAS). Only a coldstart node that had transmitted the CAS transmits frames in the first four cycles after the CAS, it is then joined firstly by the other coldstart nodes and afterwards by all other nodes.

A coldstart node has bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY set to 1. Message buffer 0 holds the key slot ID which defines the slot number where the startup frame is send. In the frame header of the startup frame the startup frame indicator bit is set to 1.

In clusters consisting of three or more nodes, at least three nodes shall be configured to be coldstart nodes. In clusters consisting of two nodes, both nodes must be coldstart nodes. At least two fault-free coldstart nodes are necessary for the cluster to startup.

Each startup frame must also be a sync frame; therefore each coldstart node will also be a sync node. The number of coldstart attempts is configured by FLXAnFRSUCC1.CSA.

A non-coldstart node requires at least two startup frames from distinct nodes for integration. It may start integration before the coldstart nodes have finished their startup. It will not finish its startup until at least two coldstart nodes have finished their startup.

Both non-coldstart nodes and coldstart nodes start passive integration via the integration path as soon as they receive sync frames from which to derive the TDMA schedule information. During integration, the node has to adapt its own clock to the global clock (rate and offset) and has to make its cycle time consistent with the global schedule observable at the network. Afterwards, these settings are checked for consistency with all available network nodes. The node can only leave the integration phase and actively participate in communication when these checks are passed.

Figure 25.10 State Diagram Time — Triggered Startup

### (1) Coldstart Inhibit Mode

In coldstart inhibit mode the node is prevented from initializing the TDMA communication schedule. If bit FLXAnFRCCSV.CSI is set to 1, the node is not allowed to initialize the cluster communication, i.e. entering the coldstart path is prohibited. The node is allowed to integrate to a running cluster or to transmit startup frames after another coldstart node started the initialization of the cluster communication.

The coldstart inhibit bit FLXAnFRCCSV.CSI is set to 1 whenever the POC enters READY state. The bit has to be cleared under control of the Host by CHI command ALLOW\_COLDSTART (FLXAnFRSUCC1.CMD = “1001<sub>B</sub>”)

### (2) Startup Timeouts

The CC supplies two different  $\mu$ T timers supporting two timeout values, startup timeout and startup noise timeout. The two timers are started when the CC enters the COLDSTART\_LISTEN state. The expiration of either of these timers causes the node to leave the initial sensing phase (COLDSTART\_LISTEN state) with the intention of starting up communication.

#### CAUTION

The startup and startup noise timers are identical with the wakeup and wakeup noise timers and use the same configuration values FLXAnFRSUCC2.LT and FLXAnFRSUCC2.LTN.

#### (a) Startup Timeout

The startup timeout limits the listen time used by a node to determine if there is already communication between other nodes or at least one coldstart node actively requesting the integration of others. The startup timer is configured by programming FLXAnFRSUCC2.LT (see **Section 25.2.6.2, FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2**).

The startup timeout is:

$pdListenTimeout = FLXAnFRSUCC2.LT$

The startup timer is restarted upon:

- Entering the COLDSTART\_LISTEN state
- Both channels reaching idle state while in COLDSTART\_LISTEN state

The startup timer is stopped:

- If communication channel activity is detected on one of the configured channels while the node is in the COLDSTART\_LISTEN state
- When the COLDSTART\_LISTEN state is left

Once the startup timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The timer status is kept for further processing by the startup state machine.

**(b) Startup Noise Timeout**

At the same time the startup timer is started for the first time (transition from STARTUP\_PREPARE state to COLDSTART\_LISTEN state), the startup noise timer is started. This additional timeout is used to improve reliability of the startup procedure in the presence of noise. The startup noise timeout is configured by programming FLXAnFRSUCC2.LTN

(see **Section 25.2.6.2, FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2**).

The startup noise timeout is:

$$\text{pdListenTimeout} \times \text{gListenNoise} = \text{FLXAnFRSUCC2.LT} \times (\text{FLXAnFRSUCC2.LTN} + 1)$$

The startup noise timer is restarted upon:

- Entering the COLDSTART\_LISTEN state
- Reception of correctly decoded headers or CAS symbols while the node is in COLDSTART\_LISTEN state

The startup noise timer is stopped when the COLDSTART\_LISTEN state is left.

Once the startup noise timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The status is kept for further processing by the startup state machine. Since the startup noise timer won't be restarted when random channel activity is sensed, this timeout defines the fall-back solution that guarantees that a node will try to start up the communication cluster even in the presence of noise.

**(3) Path of Leading Coldstart Node (Initiating Coldstart)**

When a coldstart node enters COLDSTART\_LISTEN, it listens to its attached channels.

If no communication is detected, the node enters the COLDSTART\_COLLISION\_RESOLUTION state and commences a coldstart attempt. The initial transmission of a CAS symbol is succeeded by the first regular cycle. This cycle has the number zero.

From cycle zero on, the node transmits its startup frame. Since each coldstart node may perform a coldstart attempt, it may occur that several nodes simultaneously transmit the CAS symbol and enter the coldstart path. This situation is resolved during the first four cycles after CAS transmission.

As soon as a node that initiates a coldstart attempt receives a CAS symbol or a frame header during these four cycles, it re-enters the COLDSTART\_LISTEN state. Thereby, only one node remains in this path. In cycle four, other coldstart nodes begin to transmit their startup frames.

After four cycles in COLDSTART\_COLLISION\_RESOLUTION state, the node that initiated the coldstart enters the COLDSTART\_CONSISTENCY\_CHECK state. It collects all startup frames from cycle four and five and performs the clock correction. If the clock correction does not deliver any errors and it has received at least one valid startup frame pair, the node leaves COLDSTART\_CONSISTENCY\_CHECK and enters NORMAL\_ACTIVE state.

The number of coldstart attempts that a node is allowed to perform is configured by FLXAnFRSUCC1.CSA. The number of remaining coldstarts attempts can be read from FLXAnFRCCSV.RCA. The number of remaining coldstart attempts is reduced by one for each attempted coldstart. A node may enter the COLDSTART\_LISTEN state only if this value is larger than one and it may enter the COLDSTART\_COLLISION\_RESOLUTION state only if this value is larger than zero. If the number of coldstart attempts is one, coldstart is inhibited but integration is still possible.

#### (4) Path of Following Coldstart Node (Responding to Leading Coldstart Node)

When a coldstart node enters the COLDSTART\_LISTEN state, it tries to receive a valid pair of startup frames to derive its schedule and clock correction from the leading coldstart node.

As soon as a valid startup frame has been received the INITIALIZE\_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION\_COLDSTART\_CHECK state is entered.

In INTEGRATION\_COLDSTART\_CHECK state it is confirmed that the clock correction can be performed correctly and that the coldstart node from which this node has initialized its schedule is still valid. The node collects all sync frames and performs clock correction in the following double-cycle. If clock correction does not signal any errors and if the node continues to receive sufficient frames from the same node it has integrated on, the COLDSTART\_JOIN state is entered.

In COLDSTART\_JOIN state following coldstart nodes begin to transmit their own startup frames and continue to do so in subsequent cycles. Thereby, the leading coldstart node and the nodes joining it can check if their schedules agree with each other. If the clock correction signals any error, the node aborts the integration attempt. If a node in this state sees at least one valid startup frame during all even cycles in this state and at least one valid startup frame pair during all double cycles in this state, the node leaves COLDSTART\_JOIN state and enters NORMAL\_ACTIVE state. Thereby it leaves STARTUP at least one cycle after the node that initiated the coldstart.

#### (5) Path of Non-Coldstart Node

When a non-coldstart node enters the INTEGRATION\_LISTEN state, it listens to its attached channels.

As soon as a valid startup frame has been received, the INITIALIZE\_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION\_CONSISTENCY\_CHECK state is entered.

In INTEGRATION\_CONSISTENCY\_CHECK state the node verifies that the clock correction can be performed correctly and that enough coldstart nodes (at least 2) are sending startup frames that agree with the node's own schedule. Clock correction is activated, and if any errors are signaled, the integration attempt is aborted.

During the first even cycle in this state, either two valid startup frames or the startup frame of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

During the first double-cycle in this state, either two valid startup frame pairs or the startup frame pair of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

If after the first double-cycle less than two valid startup frames are received within an even cycle, or less than two valid startup frame pairs are received within a double-cycle, the startup attempt is aborted.

Nodes in this state need to see two valid startup frame pairs for two consecutive double-cycles each to be allowed to leave STARTUP and enter NORMAL\_OPERATION. Consequently, they leave startup at least one double-cycle after the node that initiated the coldstart and only at the end of a cycle with an odd cycle number.

### 25.3.6.7 NORMAL\_ACTIVE State

As soon as the node that transmitted the first CAS symbol (resolving the potential access conflict and entering STARTUP via coldstart path) and one additional node have entered the NORMAL\_ACTIVE state, the startup phase for the cluster has finished. In the NORMAL\_ACTIVE state, all configured messages are scheduled for transmission. This includes all data frames as well as the sync frames. Rate and offset measurement is started in all even cycles (even/odd cycle pairs required).

In NORMAL\_ACTIVE state the CC supports regular communication functions

- The CC performs transmissions and reception on the FlexRay bus as configured
- Clock synchronization is running
- The Host interface is operational

The CC exits from that state to

- HALT state by writing FLXAnFRSUCC1.CMD = "0110<sub>B</sub>" (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD = "0111<sub>B</sub>" (FREEZE command, immediately)
- HALT state due to change of the error state from ACTIVE to COMM\_HALT
- NORMAL\_PASSIVE state due to change of the error state from ACTIVE to PASSIVE
- READY state by writing FLXAnFRSUCC1.CMD = "0010<sub>B</sub>" (READY command)

### 25.3.6.8 NORMAL\_PASSIVE State

NORMAL\_PASSIVE state is entered from NORMAL\_ACTIVE state when the error state changes from ACTIVE to PASSIVE.

In NORMAL\_PASSIVE state, the node is able to receive all frames (node is fully synchronized and performs clock synchronization). Contrary to the NORMAL\_ACTIVE state, the node does not actively participate in communication, i.e. neither symbols nor frames are transmitted.

In NORMAL\_PASSIVE state

- The CC performs reception on the FlexRay bus
- The CC does not transmit any frames or symbols on the FlexRay bus
- Clock synchronization is running
- The Host interface is operational

The CC exits from this state to

- HALT state by writing FLXAnFRSUCC1.CMD = "0110<sub>B</sub>" (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD = "0111<sub>B</sub>" (FREEZE command, immediately)
- HALT state due to change of the error state from PASSIVE to COMM\_HALT
- NORMAL\_ACTIVE state due to change of the error state from PASSIVE to ACTIVE. The transition takes place when FLXAnFRCCEV.PTAC equals FLXAnFRSUCC1.PTA – 1
- To READY state by writing FLXAnFRSUCC1.CMD = "0010<sub>B</sub>" (READY command)

### 25.3.6.9 HALT State

In this state all communication (reception and transmission) is stopped.

The CC enters this state

- By writing FLXAnFRSUCC1.CMD = “0110<sub>B</sub>” (HALT command) while the CC is in NORMAL\_ACTIVE or NORMAL\_PASSIVE state
- By writing FLXAnFRSUCC1.CMD = “0111<sub>B</sub>” (FREEZE command) from all states
- When exiting from NORMAL\_ACTIVE state because the clock correction failed counter reached the “maximum without clock correction fatal” limit and FLXAnFRSUCC1.HCSE is set to 1
- When exiting from NORMAL\_PASSIVE state because the clock correction failed counter reached the “maximum without clock correction fatal” limit and FLXAnFRSUCC1.HCSE is set to 1

The CC exits from this state to DEFAULT\_CONFIG state

- By writing FLXAnFRSUCC1.CMD = “0001<sub>B</sub>” (CONFIG command)

When the CC enters HALT state, all configuration and status data is maintained for analyzing purposes.

When the Host writes FLXAnFRSUCC1.CMD = “0110<sub>B</sub>” (HALT command), the CC sets bit FLXAnFRCCSV.HRQ to 1 and enters HALT state at the next end of cycle.

When the Host writes FLXAnFRSUCC1.CMD = “0111<sub>B</sub>” (FREEZE command), the CC enters HALT state immediately and sets bit FLXAnFRCCSV.FSI to 1.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

### 25.3.7 Network Management

The accrued Network Management (NM) vector can be read from registers FLXAnFRNMV1 to FLXAnFRNMV3. The CC performs a bit-wise OR operation over all NM vectors out of all received valid NM frames with the Payload Preamble Indicator (PPI) bit set. Only static frames may be configured to hold NM information. The CC updates the NM vector at the end of each cycle.

The length of the NM vector can be configured from 0 to 12 bytes by FLXAnFRNEMC.NML. The NM vector length must be configured identically in all nodes of a cluster.

To configure a transmit buffer to send FlexRay frames with the PPI bit set as 1, bit PPIT in the header section of the respective transmit buffer has to be set to 1 via FLXAnFRWRHS1.PPIT. In addition the Host has to write the NM information to the data section of the respective transmit buffer.

The evaluation of the NM vector has to be done by the application running on the Host.

**Section 25.3.17, Byte Alignment**, for byte alignment of the received NM vector in registers FLXAnFRNMV1 to FLXAnFRNMV3.

#### CAUTIONS

---

1. In case a message buffer is configured for transmission/reception of network management frames, the payload length configured in header 2 of that message buffer should be equal or greater than the length of the NM vector configured by FLXAnFRNEMC.NML.
  2. When the CC transits to HALT state, the cycle count is not incremented and therefore the NM vector is not updated. In this case FLXAnFRNMV1 to FLXAnFRNMV3 holds the value from the cycle before.
-

### 25.3.8 Filtering and Masking

Filtering is done by comparison of the configuration of assigned message buffers against actual slot and cycle counter values and channel ID (channel A, B). A message buffer is only updated/transmitted if the required matches occur.

Filtering is done on:

- Slot Counter
- Cycle Counter
- Channel ID

The following filter combinations for acceptance/transmit filtering are allowed:

- Slot Counter + Channel ID
- Slot Counter + Cycle Counter + Channel ID

All configured filters must match in order to store a received message in a message buffer.

#### CAUTION

---

For the FIFO the acceptance filter is configured by the FIFO Rejection Filter (FLXAnFRFRF) and the FIFO Rejection Filter Mask (FLXAnFRFRFM).

---

A message will be transmitted in the time slot corresponding to the configured frame ID on the configured channel(s). If cycle counter filtering is enabled the configured cycle filter value must also match.

#### 25.3.8.1 Slot Counter Filtering

Every transmit and receive buffer contains a frame ID stored in the header section. This frame ID is compared against the actual slot counter value in order to assign receive and transmit buffers to the corresponding slot.

If two or more message buffers are configured with the same frame ID and channel ID, and if they have a matching cycle counter filter value for the same slot, then the message buffer with the lowest message buffer number is used.

### 25.3.8.2 Cycle Counter Filtering

Cycle counter filtering is based on the notion of a cycle set. For filtering purposes, a match is detected if any one of the elements of the cycle set is matched. The cycle set is defined by the cycle code field in header section 1 of each message buffer.

If message buffer 0 or 1 is configured to hold the startup/sync frame or the single slot frame by bits FLXAnFRSUCC1.TXST, FLXAnFRSUCC1.TXSY, and FLXAnFRSUCC1.TSM, cycle counter filtering for message buffer 0 or 1 shall be disabled.

#### CAUTION

Sharing of a static time slot via cycle counter filtering between different nodes of a FlexRay network is not allowed.

The set of cycle numbers belonging to a cycle set is determined as described in **Table 25.112, Definition of Cycle Set**.

Table 25.112 Definition of Cycle Set

Cycle Code	Matching Cycle Counter Values
0b000000x	all Cycles
0b000001c	every second Cycle at (Cycle Count) mod2 = c
0b00001cc	every fourth Cycle at (Cycle Count) mod4 = cc
0b0001ccc	every eighth Cycle at (Cycle Count) mod8 = ccc
0b001cccc	every sixteenth Cycle at (Cycle Count) mod16 = cccc
0b01ccccc	every thirty-second Cycle at (Cycle Count) mod32 = ccccc
0b1cccccc	every sixty-fourth Cycle at (Cycle Count) mod64 = ccccccc

**Table 25.113, Examples for Valid Cycle Sets** below gives some examples for valid cycle sets to be used for cycle counter filtering.

Table 25.113 Examples for Valid Cycle Sets

Cycle Code	Matching Cycle Counter Values
0b0000011	1-3-5-7-.....-63
0b0000100	0-4-8-12-.....-60
0b0001110	6-14-22-30-.....-62
0b0011000	8-24-40-56
0b0100011	3-35
0b1001001	9

The received message is stored only if the cycle counter value of the cycle during which the message is received matches an element of the receive buffer's cycle set. Channel ID and frame ID must also be met.

The content of a transmit buffer is transmitted on the configured channel(s) when an element of the cycle set matches the current cycle counter value. Channel ID and frame ID must also match.

### 25.3.8.3 Channel ID Filtering

There is a 2-bit channel filtering field (CH) located in the header section of each message buffer in the Message RAM. It serves as a filter for receive buffers, and as a control field for transmit buffers (see **Table 25.114, Channel Filtering Configuration**).

Table 25.114 Channel Filtering Configuration

CH[1:0]	Transmit Buffer Transmit Frame	Receive Buffer Store Valid Receive Frame
00 <sub>B</sub>	no transmission	ignore frame
01 <sub>B</sub>	on channel A	received on channel A
10 <sub>B</sub>	on channel B	received on channel B
11 <sub>B</sub>	on both channels (static segment only)	received on channel A or B (store first semantically valid frame, static segment only)

The contents of a transmit buffer is transmitted on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a transmit buffer may be set up for transmission on both channels (CH = “11<sub>B</sub>”).

Valid received frames are stored if they are received on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a receive buffer may be setup for reception on both channels (CH = “11<sub>B</sub>”).

#### CAUTION

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to 1, no frames are transmitted and received frames are ignored (same function as CH = “00<sub>B</sub>”).

### 25.3.8.4 FIFO Filtering

For FIFO filtering registers FLXAnFRFRF and FLXAnFRFRFM are used. The FIFO filter consists of channel filter FLXAnFRFRF.CH, frame ID filter FLXAnFRFRF.FID, and cycle counter filter FLXAnFRFRF.CYF. Registers FLXAnFRFRF and FLXAnFRFRFM can be configured in DEFAULT\_CONFIG or CONFIG state only. The filter configuration in the header section of message buffers belonging to the FIFO is ignored.

The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by FLXAnFRFRF.CYF, all frames are rejected.

A valid received frame is stored in the FIFO if channel ID, frame ID, and cycle counter are not rejected by the configured rejection filter and rejection filter mask, and if there is no matching dedicated receive buffer.

## 25.3.9 Transmit Process

### 25.3.9.1 Static Segment

For the static segment, if there are several messages pending for transmission, the message with the frame ID corresponding to the next sending slot is selected for transmission.

The data section of transmit buffers assigned to the static segment can be updated until the end of the preceding time slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

### 25.3.9.2 Dynamic Segment

In the dynamic segment, if several messages are pending, the message with the highest priority (lowest frame ID) is selected next. In the dynamic segment different slot counter sequences on channel A and channel B are possible (concurrent sending of different frame IDs on both channels).

The data section of transmit buffers assigned to the dynamic segment can be updated until the end of the preceding slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

The start of latest transmit configured by `FLXAnFRMHDC.SLT` defines the maximum minislot value allowed before inhibiting new frame transmission in the dynamic segment of the current cycle.

### 25.3.9.3 Transmit Buffers

FlexRay message buffers can be configured as transmit buffers by programming bit CFG in the header section of the respective message buffer to 1 via `FLXAnFRWRHS1`.

There exist the following possibilities to assign a transmit buffer to the CC channels:

- Static segment: channel A or channel B,  
channel A and channel B
- Dynamic segment: channel A or channel B

Message buffers 0 and 1 are dedicated to holding the startup frame, the sync frame, or the designated single slot frame as configured by `FLXAnFRSUCC1.TXST`, `FLXAnFRSUCC1.TXSY`, and `FLXAnFRSUCC1.TSM`. In this case, it can be reconfigured in `DEFAULT_CONFIG` or `CONFIG` state only. This ensures that any node transmits at most one startup/sync frame per communication cycle. Transmission of startup/sync frames from other message buffers is not possible.

All other message buffers configured for transmission in static or dynamic segment are reconfigurable during runtime depending on the configuration of `FLXAnFRMRC.SEC` (see **Section 25.3.12.1, Reconfiguration of Message Buffers**). Due to the organization of the data partition in the Message RAM (reference by data pointer), reconfiguration of the configured payload length and the data pointer in the header section of a message buffer may lead to erroneous configurations.

If a message buffer is reconfigured (header section updated) during runtime, it may happen that this message buffer is not send out in the respective communication cycle.

The CC does not have the capability to calculate the header CRC. The Host is supposed to provide the header CRCs for all transmit buffers. If network management is required, the Host has to set the PPIT bit in the header section of the respective message buffer to 1 and write the network management information to the data section of the message buffer (see **Section 25.3.7, Network Management**).

The payload length field configures the payload length in 2-byte words. If the configured payload length of a static transmit buffer is shorter than the payload length configured for the static segment by FLXAnFRMHDC.SFDL, the CC generates padding bytes to ensure that frames have proper physical length. The padding pattern is “0000<sub>H</sub>”.

**CAUTION**

In case of an odd payload length (PLC = 1, 3, 5, ...) the application has to write zero to the last 16 bit of the message buffers data section to ensure that the padding pattern is “0000<sub>H</sub>”.

Each transmit buffer provides a transmission mode flag TXM that allows the Host to configure the transmission mode for the transmit buffer. If this bit is set, the transmitter operates in the single-shot mode. If this bit is cleared, the transmitter operates in the continuous mode.

In single-shot mode the CC resets the respective TXR flag to 0 after transmission has completed. Now the Host may update the transmit buffer.

In continuous mode, the CC does not reset the respective transmission request flag TXR to 0 after successful transmission. In this case a frame is sent out each time the filter criteria match. The TXR flag can be reset to 0 by the Host by writing the respective message buffer number to the FLXAnFRIBCR register while bit FLXAnFRIBCM.STXRH is set to 0.

If two or more transmit buffers meet the filter criteria simultaneously, the transmit buffer with the lowest message buffer number will be transmitted in the respective slot.

**25.3.9.4 Frame Transmission**

The following steps are required to prepare a message buffer for transmission:

- Configure the transmit buffer in the Message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Write the data section of the transmit buffer via FLXAnFRWRDSx
- Transfer the configuration and message data from Input Buffer to the Message RAM by writing the number of the target message buffer to register FLXAnFRIBCR
- If configured in register FLXAnFRIBCM, the transmission request flag TXR for the respective message buffer will be set as soon as the transfer has completed, and the message buffer is ready for transmission.
- Check whether the message buffer has been transmitted by checking the respective TXR bit (TXR = 0) in the FLXAnFRITXRQ1/2/3/4 registers (single-shot mode only).

After transmission has completed, the respective TXR flag in the FLXAnFRITXRQ1/2/3/4 register is reset to 0 (single-shot mode), and, if bit MBI in the header section of the message buffer is set to 1, flag FLXAnFRSIR.TXI is set to 1. If enabled, an interrupt is generated.

### 25.3.9.5 Null Frame Transmission

If in static segment the Host does not set the transmission request flag to 1 before transmit time, the CC transmits a null frame with the null frame indication bit set to 0 and the payload data set to zero.

In the following cases the CC transmits a null frame:

- If the message buffer with the lowest message buffer number matching the filter criteria does not have its transmission request flag set (TXR = 0) to 1.
- No transmit buffer configured for the slot has a cycle counter filter that matches the current cycle. In this case, no message buffer status FLXAnFRMBS is updated.

Null frames are not transmitted in the dynamic segment.

## 25.3.10 Receive Process

### 25.3.10.1 Dedicated Receive Buffers

A portion of the FlexRay message buffers can be configured as dedicated receive buffers by programming bit CFG in the header section of the respective message buffer to 0 via FLXAnFRWRHS1.

The following possibilities exist to assign a receive buffer to the CC channels:

- Static segment: channel A or channel B,  
channel A and channel B (the CC stores the first semantically valid frame)
- Dynamic segment: channel A or channel B

The CC transfers the payload data of valid received messages from the shift register of the FlexRay channel protocol controller (channel A or B) to the receive buffer with the matching filter configuration. A receive buffer stores all frame elements except the frame CRC.

All message buffers configured for reception in static or dynamic segment are reconfigurable during runtime depending on the configuration of FLXAnFRMRC.SEC (see **Section 25.3.12.1, Reconfiguration of Message Buffers**). If a message buffer is reconfigured (header section updated) during runtime it may happen that in the respective communication cycle a received message is lost.

If two or more receive buffers meet the filter criteria simultaneously, the receive buffer with the lowest message buffer number is updated with the received message.

### 25.3.10.2 Frame Reception

The following steps are required to prepare a dedicated message buffer for reception:

- Configure the receive buffer in the Message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Transfer the configuration from Input Buffer to the Message RAM by writing the number of the target message buffer to register FLXAnFRIBCR

Once these steps are performed, the message buffer functions as an active receive buffer and participates in the internal acceptance filtering process which takes place every time the CC receives a message. The first matching receive buffer is updated from the received message.

If a valid payload segment was stored in the data section of a message buffer, the respective ND flag in the FLXAnFRNDAT1/2/3/4 registers is set to 1, and, if bit MBI in the header section of that message buffer is set to 1, flag FLXAnFRSIR.RXI is set to 1. If enabled, an interrupt is generated.

In case that bit ND was already set to 1 when the Message Handler updates the message buffer, bit FLXAnFRMBS.MLST of the respective message buffer is set to 1 and the unprocessed message data is lost.

If no frame, a null frame, or a corrupted frame was received in a slot, the data section of the message buffer configured for this slot is not updated. In this case only the respective message buffer status FLXAnFRMBS is updated.

When the Message Handler changed the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 registers is set to 1, and if bit MBI in the header section of that message buffer is set, flag FLXAnFRSIR.MBSI is set to 1. If enabled an interrupt is generated.

If the payload length of a received frame PLR is longer than the value programmed by PLC in the header section of the respective message buffer, the data field stored in the message buffer is truncated to that length.

To read a receive buffer from the Message RAM via the Output Buffer, proceed as described in **Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer**.

**CAUTION**

---

The ND and MBC flags are automatically cleared by the Message Handler when the payload data and the header of a received message have been transferred to the Output Buffer, respectively.

---

**25.3.10.3 Null Frame Reception**

The payload segment of a received null frame is not copied into the matching dedicated receive buffer. If a null frame has been received, only the message buffer status FLXAnFRMBS of the matching message buffer is updated from the received null frame. All bits in header 2 and 3 of the matching message buffer remain unchanged. They are updated from received data frames only.

When the Message Handler changed the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 register is set to 1, and if bit MBI in the header section of that message buffer is set to 1, flag FLXAnFRSIR.MBSI is set to 1. If enabled, an interrupt is generated.

## 25.3.11 FIFO Function

### 25.3.11.1 Description

A portion of the message buffers can be configured as a cyclic First-In-First-Out (FIFO) buffer. The group of message buffers belonging to the FIFO is contiguous in the register map starting with the message buffer referenced by FLXAnFRMRC.FFB and ending with the message buffer referenced by FLXAnFRMRC.LCB. Up to 127 message buffers can be assigned to the FIFO.

Every valid incoming message not matching with any dedicated receive buffer but passing the programmable FIFO filter is stored into the FIFO. In this case frame ID, payload length, receive cycle count, and the message buffer status FLXAnFRMBS of the addressed FIFO message buffer are overwritten with frame ID, payload length, receive cycle count, and the status from the received frame. Bit FLXAnFRSIR.RFNE shows that the FIFO is not empty, bit FLXAnFRSIR.RFCL is set to 1 when the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level as configured by FLXAnFRSIR.RFCL, bit FLXAnFREIR.RFO shows that a FIFO overrun has been detected. If enabled, interrupts are generated.

If null frames are not rejected by the FIFO rejection filter, the null frames will be treated like data frames when they are stored into the FIFO.

There are two index registers associated with the FIFO. The PUT Index Register (PIDX) is an index to the next available location in the FIFO. When a new message has been received it is written into the message buffer addressed by the PIDX register. The PIDX register is then incremented and addresses the next available message buffer. If the PIDX register is incremented past the highest numbered message buffer of the FIFO, the PIDX register is loaded with the number of the first (lowest numbered) message buffer in the FIFO chain. The GET Index Register (GIDX) is used to address the next message buffer of the FIFO to be read. The GIDX register is incremented after transfer of the contents of a message buffer belonging to the FIFO to the Output Buffer. The PUT Index Register and the GET Index Register are not accessible by the Host.

The FIFO is completely filled when the PUT index (PIDX) reaches the value of the GET index (GIDX). When the next message is written to the FIFO before the oldest message has been read, both PUT index and GET index are incremented and the new message overwrites the oldest message in the FIFO. This will set FIFO overrun flag FLXAnFREIR.RFO to 1.

A FIFO non empty status is detected when the PUT index (PIDX) differs from the GET index (GIDX). In this case flag FLXAnFRSIR.RFNE is set to 1. This indicates that there is at least one received message in the FIFO. The FIFO empty, FIFO not empty, and the FIFO overrun states are explained in **Figure 25.11, FIFO Status: Empty, Not Empty, Overrun** for a three message buffer FIFO.

The programmable FlexRay FIFO Rejection Filter (FLXAnFRFRF) defines a filter pattern for messages to be rejected. The FIFO filter consists of channel filter, frame ID filter, and cycle counter filter. If bit FLXAnFRFRF.RSS is set to 1, all messages received in the static segment are rejected by the FIFO. If bit FLXAnFRFRF.RNF is set to 1, received null frames are not stored in the FIFO.

The FlexRay FIFO Rejection Filter Mask (FLXAnFRFRFM) specifies which bits of the frame ID filter in the FIFO Rejection Filter register are marked “don’t care” for rejection filtering.

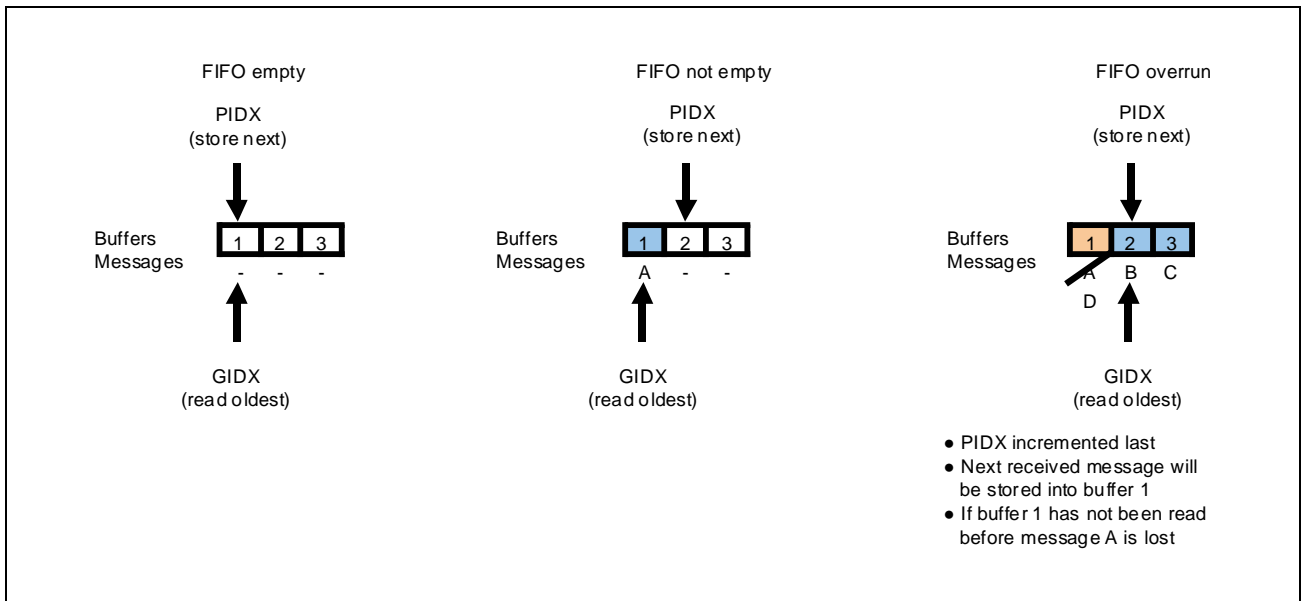

Figure 25.11 FIFO Status: Empty, Not Empty, Overrun

### 25.3.11.2 Configuration of the FIFO

(Re)configuration of message buffers belonging to the FIFO is only possible when the CC is in DEFAULT\_CONFIG or CONFIG state. While the CC is in DEFAULT\_CONFIG or CONFIG state, the FIFO function is not available.

For all message buffers belonging to the FIFO the payload length configured should be programmed to the same value via FLXAnFRWRHS2.PLC. The data pointer to the first 32-bit word of the data section of the respective message buffer in the Message RAM has to be configured via FLXAnFRWRHS3.DP.

All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask. The values configured in the header sections of the message buffers belonging to the FIFO are, with exception of DP and PLC, irrelevant.

#### CAUTIONS

---

1. It is recommended to program the MBI bits of the message buffers belonging to the FIFO to 0 via FLXAnFRWRHS1.MBI to avoid generation of interrupts.
  2. If the payload length of a received frame is longer than the value programmed by FLXAnFRWRHS2.PLC in the header section of the respective message buffer, the data field stored in a message buffer of the FIFO is truncated to that length.
- 

### 25.3.11.3 Access to the FIFO

#### (1) When the Output Buffer is Used:

For FIFO access outside DEFAULT\_CONFIG and CONFIG state, the Host has to trigger a transfer from the Message RAM to the Output Buffer by writing the number of the first message buffer of the FIFO (referenced by FLXAnFRMRC.FFB) to the register FLXAnFROBCR. The Message Handler then transfers the message buffer addressed by the GET Index Register (GIDX) to the Output Buffer. After this transfer the GET Index Register (GIDX) is incremented.

#### (2) When the Data Transfer Function is Used:

The message received in FIFO can be transferred to the local RAM/global RAM by using the output data transfer function. For the output data transfer function, see **Section 25.3.16.2, Output Data Transfer**.

### 25.3.12 Message Handling

The Message Handler controls data transfers between the Input/Output Buffer and the Message RAM and between the Message RAM and the two Temporary buffers.

Access to the message buffers stored in the Message RAM is done under control of the Message Handler state machine. This avoids conflicts between accesses of the two FlexRay channel protocol controllers and the Host to the Message RAM.

Frame IDs of message buffers assigned to the static segment have to be in the range from 1 to FLXAnFRGTUC7.NSS. Frame IDs of message buffers assigned to the dynamic segment have to be in the range from FLXAnFRGTUC7.NSS + 1 to 2047.

Received messages with no matching dedicated receive buffer (static or dynamic segment) are stored in the receive FIFO (if configured) if they pass the FIFO rejection filter.

Access of the Host to the message buffer contents using the input or output buffer function is described in this subsection. Access to the message buffer contents using the data transfer function is mentioned in **Section 25.3.16, Usage of Data Transfer**.

#### 25.3.12.1 Reconfiguration of Message Buffers

In case that an application needs to operate with more than 128 different messages, static and dynamic message buffers may be reconfigured during FlexRay operation. This is done by updating the header section of the respective message buffer via Input Buffer registers FLXAnFRWRHS1 to FLXAnFRWRHS3.

Reconfiguration has to be enabled via control bits FLXAnFRMRC.SEC in the Message RAM Configuration register.

If a message buffer has not been transmitted/updated from a received frame before reconfiguration starts, the respective message is lost.

The point in time when a reconfigured message buffer is ready for transmission/reception according to the reconfigured frame ID depends on the actual state of the slot counter when the update of the header section has completed. Therefore it may happen that a reconfigured message buffer is not transmitted/updated from a received frame in the cycle where it was reconfigured.

The Message RAM is scanned according to **Table 25.115, Scan of Message RAM** below.

Table 25.115 Scan of Message RAM

Start of Scan in Slot	Scan for Slots
1	2 ... 15, 1 (next cycle)
8	16 ... 23, 1 (next cycle)
16	24 ... 31, 1 (next cycle)
24	32 ... 39, 1 (next cycle)
...	...

A Message RAM scan is terminated with the start of NIT regardless whether it has completed or not. The scan of the Message RAM for slots 2 to 15 starts at the beginning of slot 1 of the actual cycle. The scan of the Message RAM for slot 1 is done in the cycle before by checking in parallel to each scan of the Message RAM whether there is a message buffer configured for slot 1 of the next cycle.

The number of the first dynamic message buffer is configured by FLXAnFRMRC.FDB. In case a Message RAM scan starts while the CC is in dynamic segment, the scan starts with the message buffer number configured by FLXAnFRMRC.FDB.

In case a message buffer should be reconfigured to be used in slot 1 of the next cycle, the following has to be considered:

- If the message buffer to be reconfigured for slot 1 is part of the “Static Buffers”, it will only be found if it is reconfigured before the last Message RAM scan in the static segment of the actual cycle evaluates this message buffer.
- If the message buffer to be reconfigured for slot 1 is part of the “Static + Dynamic Buffers”, it will be found if it is reconfigured before the last Message RAM scan in the actual cycle evaluates this message buffer.
- The start of NIT terminates the Message RAM scan. In case the Message RAM scan has not evaluated the reconfigured message buffer until this point in time, the message buffer will not be considered for the next cycle.

**CAUTION**

---

Reconfiguration of message buffers may lead to the loss of messages and therefore has to be used very carefully. In worst case (reconfiguration in consecutive cycles) it may happen that a message buffer is never transmitted/updated from a received frame.

---

### 25.3.12.2 Host Access to Message RAM

The message transfer between Input Buffer and Message RAM as well as between Message RAM and Output Buffer is triggered by the Host by writing the number of the target/source message buffer to be accessed to FLXAnFRIBCR or FLXAnFROBCR register.

The FLXAnFRIBCM and FLXAnFROBCM registers can be used to write/read header and data section of the selected message buffer separately.

If bit FLXAnFRIBCM.STXR is set to 1, the transmission request flag TXR of the selected message buffer is automatically set to 1 after the message buffer has been updated. If bit FLXAnFRIBCM.STXR is reset to 0, the transmission request flag TXR of the selected message buffer is reset. This can be used to stop transmission from message buffers operated in continuous mode.

Input Buffer (IBF) and Output Buffer (OBF) are configured as a double buffer structure. One half of this double buffer structure is accessible by the Host (IBF Host/OBF Host), while the other half (IBF Shadow/OBF Shadow) is accessed by the Message Handler for data transfers between IBF/OBF and Message RAM.

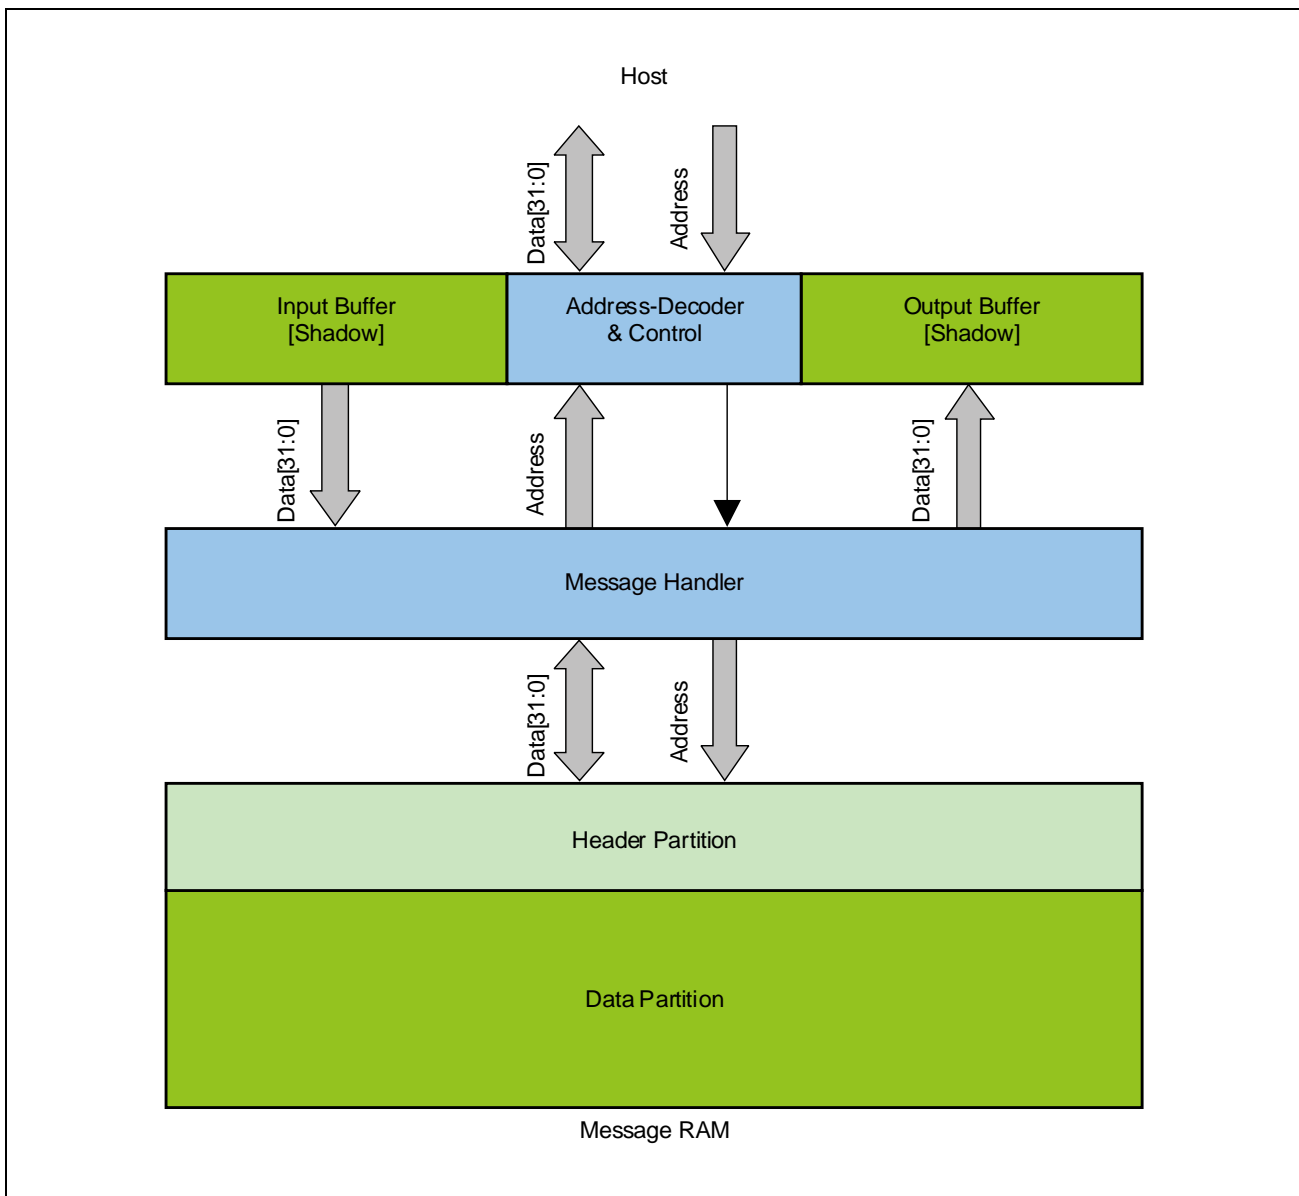

Figure 25.12 Host Access to Message RAM

**(1) Data Transfer from Input Buffer to Message RAM**

To configure/update a message buffer in the Message RAM, the Host has to write the data to FLXAnFRWRDSx and the header to FLXAnFRWRHS1 to FLXAnFRWRHS3. The specific action is selected by configuring the FlexRay Input Buffer Command Mask FLXAnFRIBCM.

When the Host writes the number of the target message buffer in the Message RAM to FLXAnFRIBCR.IBRH, IBF Host and IBF Shadow are swapped (see **Figure 25.13, Double Buffer Structure Input Buffer**).

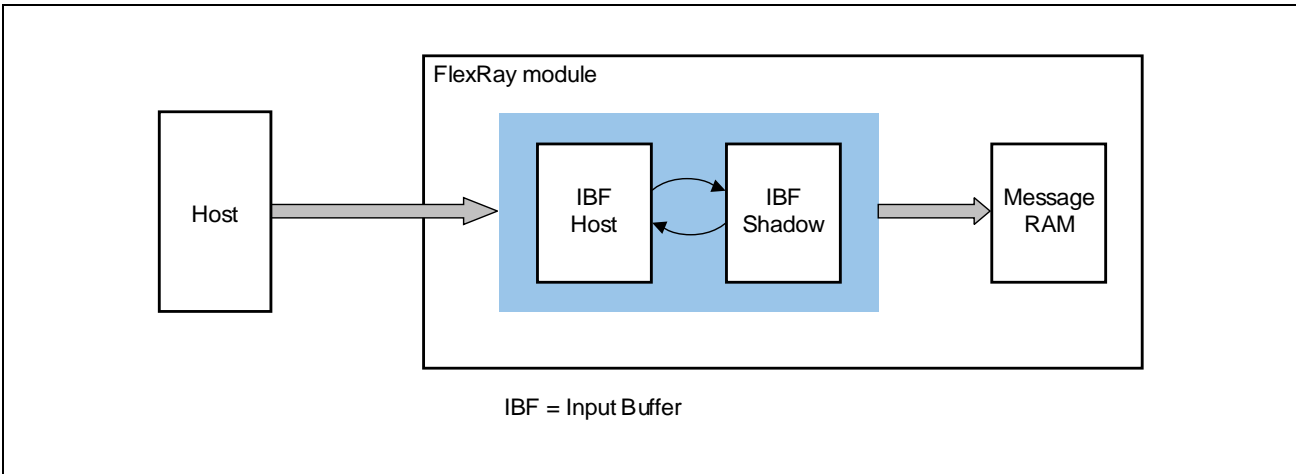

Figure 25.13 Double Buffer Structure Input Buffer

In addition the bits in the FLXAnFRIBCM and FLXAnFRIBCR registers are also swapped to keep them attached to the respective IBF section (see **Figure 25.14, Swapping of FLXAnFRIBCM and FLXAnFRIBCR Bits**).

Figure 25.14 Swapping of FLXAnFRIBCM and FLXAnFRIBCR Bits

With this write operation bit FLXAnFRIBCR.IBSYS is set to 1. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by FLXAnFRIBCR.IBRS.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message to IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, bit FLXAnFRIBCR.IBSYS is set back to 0 and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.

If a write access to FLXAnFRIBCR.IBRH occurs while FLXAnFRIBCR.IBSYS is 1, FLXAnFRIBCR.IBSYH is set to 1. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, FLXAnFRIBCR.IBSYH is reset to 0, FLXAnFRIBCR.IBSYS remains set to 1, and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS and the command mask flags are also swapped.

**Example of 8/16/32-bit Host Access Sequence:**

Configure/update n-th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSx
- Write header section to FLXAnFRWRHS1 to FLXAnFRWRHS3
- Write Command Mask: write FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

Configure/update (n + 1)th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSx
- Write header section to FLXAnFRWRHS1 to FLXAnFRWRHS3
- Write Command Mask: write FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

**CAUTION**

Any write access to IBF while FLXAnFRIBCR.IBSYH is 1 will set error flag FLXAnFREIR.IIBA to 1. In this case the write access has no effect.

Table 25.116 Assignment of FLXAnFRIBCM Bits

Pos.	Access	Bit	Function
18	r	STXRS	Set Transmission Request Shadow ongoing or finished
17	r	LDSS	Load Data Section Shadow ongoing or finished
16	r	LHSS	Load Header Section Shadow ongoing or finished
2	r/w	STXRH	Set Transmission Request Host
1	r/w	LDSH	Load Data Section Host
0	r/w	LHSH	Load Header Section Host

Table 25.117 Assignment of FLXAnFRIBCR Bits

Pos.	Access	Bit	Function
31	r	IBSYS	IBF Busy Shadow, signals ongoing transfer from IBF Shadow to Message RAM
22 to 16	r	IBRS	IBF Request Shadow, number of message buffer from which a message is currently being transferred or was last transferred
15	r	IBSYH	IBF Busy Host, transfer request pending for message buffer referenced by IBRH
6 to 0	r/w	IBRH	IBF Request Host, number of message buffer from which a message is to be transferred next

**(2) Data Transfer from Message RAM to Output Buffer**

To read a message buffer from the Message RAM, the Host has to write to register FLXAnFROBCR to trigger the data transfer as configured in FLXAnFROBCM. After the transfer has completed, the Host can read the transferred data from FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS.

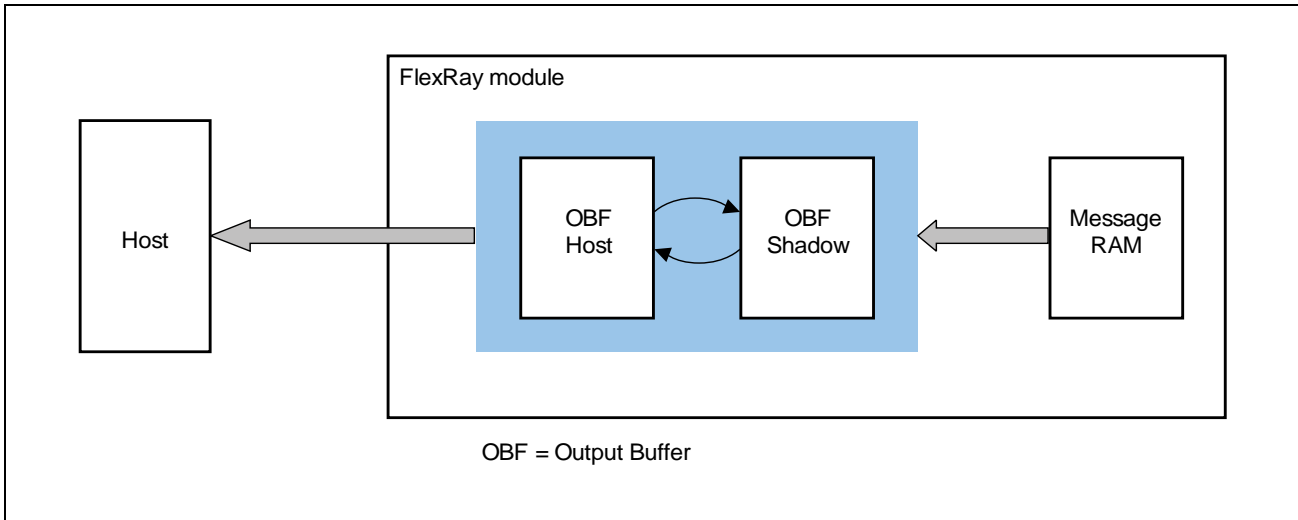

Figure 25.15 Double Buffer Structure Output Buffer

OBF Host and OBF Shadow as well as bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS, FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH and bits FLXAnFROBCR.OBRS, FLXAnFROBCR.OBRH are swapped under control of bits FLXAnFROBCR.VIEW and FLXAnFROBCR.REQ.

Writing bit FLXAnFROBCR.REQ to 1 copies bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS and bits FLXAnFROBCR.OBRS to an internal storage (see **Figure 25.16, Swapping of FLXAnFROBCM and FLXAnFROBCR Bits**).

After setting FLXAnFROBCR.REQ to 1, FLXAnFROBCR.OBSYS is set to 1, and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the Message RAM to OBF Shadow is started. After the transfer between the Message RAM and OBF Shadow has completed, the FLXAnFROBCR.OBSYS bit is set back to 0. Bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW can only be set to 1 while FLXAnFROBCR.OBSYS is 0.

Figure 25.16 Swapping of FLXAnFROBCM and FLXAnFROBCR Bits

OBF Host and OBF Shadow are swapped by setting bit FLXAnFROBCR.VIEW to 1 while bit FLXAnFROBCR.OBSYS is 0 (see **Figure 25.15, Double Buffer Structure Output Buffer**).

In addition bits FLXAnFROBCR.OBRH and bits FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH are swapped with the registers internal storage thus assuring that the message buffer number stored in FLXAnFROBCR.OBRH and the mask configuration stored in FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH matches the transferred data stored in OBF Host (see **Figure 25.16, Swapping of FLXAnFROBCM and FLXAnFROBCR Bits**).

Now the Host can read the transferred message buffer from OBF Host while the Message Handler may transfer the next message from the Message RAM to OBF Shadow.

If bits REQ and VIEW are set to 1 with the same write access while FLXAnFROBSYS is 0, FLXAnFROBSYS is automatically set to 1 and OBF Shadow and OBF Host are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host.

When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCR.OBSYS back to 0.

#### Example of an 8/16/32-bit Host Access to a Single Message Buffer:

If a single message buffer has to be read out, two separate write accesses to FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are necessary:

- Wait until FLXAnFROBCR.OBSYS is reset
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS
- Request transfer of message buffer to OBF Shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of an 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).
- Wait until FLXAnFROBCR.OBSYS is reset
- Toggle OBF Shadow and OBF Host by writing FLXAnFROBCR.VIEW = 1
- Read out transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS

#### Example of an 8/16/32-bit Host Access Sequence:

Request transfer of 1st message buffer to OBF Shadow

- Wait until FLXAnFROBCR.OBSYS is reset
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 1st message buffer
- Request transfer of 1st message buffer to OBF Shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of an 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).

Toggle OBF Shadow and OBF Host to read out 1st transferred message buffer and request transfer of 2nd message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to 0
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 2nd message buffer

- Toggle OBF Shadow and OBF Host and start transfer of 2nd message buffer to OBF Shadow simultaneously by writing FLXAnFROBCR.OBRS of 2nd message buffer, FLXAnFROBCR.REQ, and FLXAnFROBCR.VIEW (in case of an 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW).
- Read out 1st transferred message buffer by reading FLXAnFRRDDSt, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS

Demand access to last requested message buffer without request of another message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to 0
- Demand access to last transferred message buffer by writing FLXAnFROBCR.VIEW
- Read out last transferred message buffer by reading FLXAnFRRDDSt, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS

Table 25.118 Assignment of FLXAnFROBCM Bits

Pos.	Access	Bit	Function
17	r	RDSH	Data Section available for Host access
16	r	RHSH	Header Section available for Host access
1	r/w	RDSS	Read Data Section Shadow
0	r/w	RHSS	Read Header Section Shadow

Table 25.119 Assignment of FLXAnFROBCR Bits

Pos.	Access	Bit	Function
22 to 16	r	OBRH	OBF Request Host, number of message buffer available for Host access
15	r	OBSYS	OBF Busy Shadow, signals ongoing transfer from Message RAM to OBF Shadow
9	r/w	REQ	Request Transfer from Message RAM to OBF Shadow
8	r/w	VIEW	View OBF Shadow, swap OBF Shadow and OBF Host
6 to 0	r/w	OBRS	OBF Request Shadow, number of message buffer from which a message is to be transferred next

### 25.3.12.3 FlexRay Protocol Controller Access to Message RAM

The two Temporary buffers (TBF A, B) are used to buffer the data for transfer between the two FlexRay Protocol Controllers and the Message RAM.

Each Temporary buffer is build up as a double buffer, able to store two complete FlexRay messages. There is always one buffer assigned to the corresponding Protocol Controller while the other one is accessible by the Message Handler.

If, for example, the Message Handler writes the next message to be sent to Temporary buffer Tx, the FlexRay Channel Protocol Controller can access Temporary buffer Rx to store the message it is actually receiving. During transmission of the message stored in Temporary buffer Tx, the Message Handler transfers the last received message stored in Temporary buffer Rx to the Message RAM (if it passes acceptance filtering) and updates the respective message buffer.

Data transfers between the Temporary buffers and the shift registers of the FlexRay Channel Protocol Controllers are done in words of 32 bit. This enables the use of a 32 bit shift register independent of the length of the FlexRay messages.

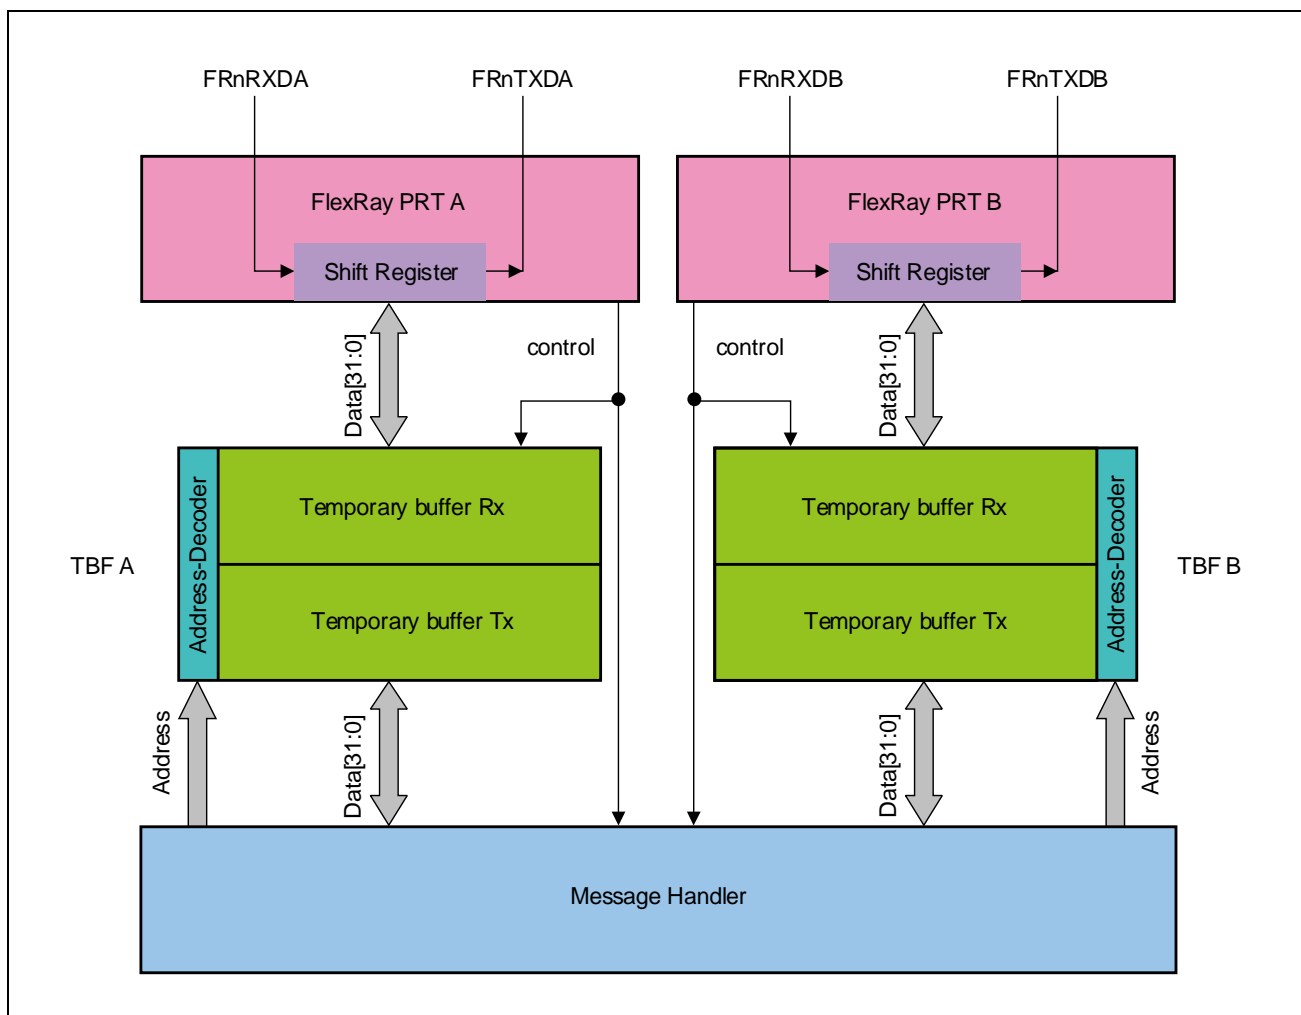

Figure 25.17 Access to Temporary Buffers

### 25.3.13 Message RAM

To avoid conflicts between Host access to the Message RAM and FlexRay message reception/transmission, the Host cannot directly access the message buffers in the Message RAM. These accesses are handled via the Input and Output Buffers. The Message RAM is able to store up to 128 message buffers depending on the configured payload length.

The Message RAM is able to store up to 2048 32-bit words. To achieve the required flexibility with respect to different numbers of data bytes per FlexRay frame (0 to 254), the Message RAM has a structure as shown in **Figure 25.18, Configuration Example of Message Buffers in the Message RAM.**

When specifying in the data section of the message buffer allocated immediately after the header partition that the message buffer is a receive buffer (FLXAnFRWRHS1.CFG bit = 0) or a receive FIFO buffer, configure an unused area of at least 32 bits at the start of the data partition. This means that the data partition can start from the message RAM word No. calculated by  $((\text{Value set by FLXAnFRMRC.LCB}[7:0] \text{ bits} + 1) \times 4) + 1$ .

When specifying in the data section of the message buffer allocated immediately after the header partition that the message buffer is a transmit buffer (FLXAnFRWRHS1.CFG bit = 1), the data partition can start from the message RAM word No. calculated by  $((\text{Value set by FLXAnFRMRC.LCB}[7:0] \text{ bits} + 1) \times 4)$ .

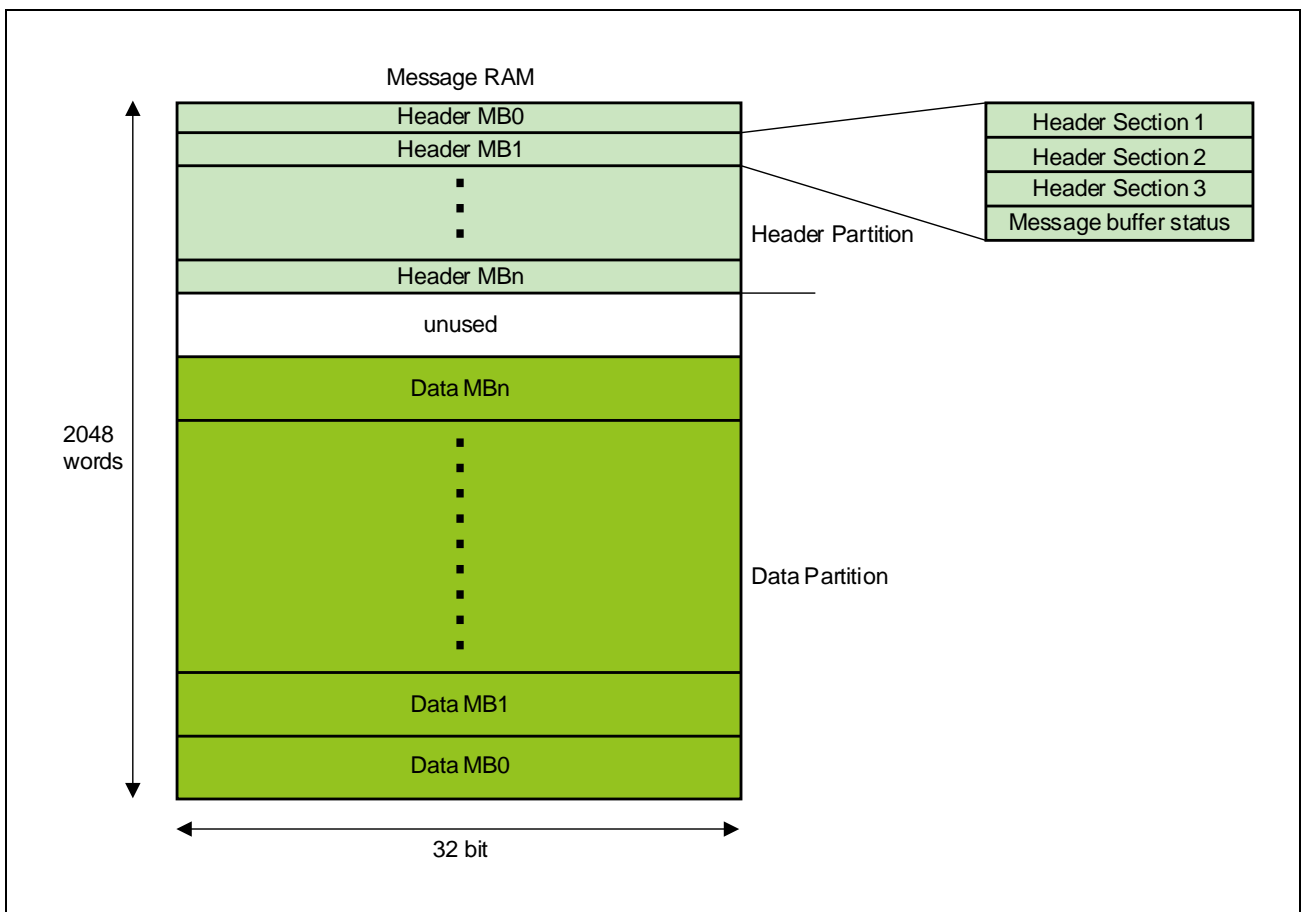

Figure 25.18 Configuration Example of Message Buffers in the Message RAM

#### Header Partition

Stores header sections of the configured message buffers:

- Supports a maximum of 128 message buffers
- Each message buffer has a header section of four 32 bit words
- Header 3 of each message buffer holds the 11-bit data pointer to the respective data section in the data partition

**Data Partition**

Flexible storage of data sections with different length. Some maximum values are:

- 30 message buffers with 254 byte data section each
- Or 56 message buffers with 128 byte data section each
- Or 128 message buffers with 48 byte data section each

**CAUTION**

---

Header partition + data partition may not occupy more than 2048 32-bit words.

---

### 25.3.13.1 Header Partition

The elements used for configuration of a message buffer as well as the actual message buffer status are stored in the header partition of the Message RAM as listed in **Table 25.120, Header Section of a Message Buffer in the Message RAM** below. Configuration of the header sections of the message buffers is done via IBF (FLXAnFRWRHS1 to FLXAnFRWRHS3). Read access to the header sections is done via OBF (FLXAnFRRDHS1 to FLXAnFRRDHS3 + FLXAnFRMBS). The data pointer has to be calculated by the user to define the starting point of the data section for the respective message buffer in the data partition of the Message RAM. The data pointer should not be modified during runtime. For message buffers belonging to the receive FIFO (re)configuration is possible in DEFAULT\_CONFIG or CONFIG state only.

The header section of each message buffer occupies four 32-bit words in the header partition of the Message RAM. The header of message buffer 0 starts with the first word in the Message RAM.

For transmit buffers the Header CRC has to be calculated by the Host.

Payload Length Received PLR, Receive Cycle Count RCC, Received on Channel Indicator RCI, Startup Frame Indicator SFI, Sync Frame Indicator SYN, Null Frame Indicator NFI, Payload Preamble Indicator PPI, and Reserved Bit RES are updated from received valid data frames only.

Table 25.120 Header Section of a Message Buffer in the Message RAM

Bit Word	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	Frame Configuration
	Filter Configuration
	Message Buffer Control
	Message RAM Configuration
	Updated from received Data Frame
	Message Buffer Status (MBS)
	unused

**(1) Header Section 1 (Word 0)**

Write access via FLXAnFRWRHS1, read access via FLXAnFRRDHS1:

- Frame ID
  - Slot counter filtering configuration
- Cycle Code
  - Cycle counter filtering configuration
- CH
  - Channel filtering configuration
- CFG
  - Message buffer direction configuration: receive/transmit
- PPIT
  - Payload Preamble Indicator Transmit
- TXM
  - Transmit mode configuration: single-shot/continuous
- MBI
  - Message buffer receive/transmit interrupt enable

**(2) Header Section 2 (Word 1)**

Write access via FLXAnFRWRHS2, read access via FLXAnFRRDHS2:

- Header CRC
  - Transmit Buffer: Configured by the Host (calculated from frame header)
  - Receive Buffer: Updated from received frame
- Payload Length Configured
  - Length of data section (2-byte words) as configured by the Host
- Payload Length Received
  - Length of payload segment (2-byte words) stored from received frame

**(3) Header Section 3 (Word 2)**

Write access via FLXAnFRWRHS3, read access via FLXAnFRRDHS3:

- Data Pointer
  - Pointer to the beginning of the corresponding data section in the data partition

Read access via FLXAnFRRDHS3, valid for receive buffers only, updated from received frames:

- Receive Cycle Count
  - Cycle count from received frame
- RCI
  - Received on Channel Indicator
- SFI
  - Startup Frame Indicator
- SYN
  - Sync Frame Indicator
- NFI
  - Null Frame Indicator
- PPI
  - Payload Preamble Indicator
- RES
  - Reserved bit

**(4) Message Buffer Status FLXAnFRMBS (Word 3)**

Read access via FLXAnFRMBS, updated by the CC at the end of the configured slot.

- VFRA
  - Valid Frame Received on channel A
- VFRB
  - Valid Frame Received on channel B
- SEOA
  - Syntax Error Observed on channel A
- SEOB
  - Syntax Error Observed on channel B
- CEOA
  - Content Error Observed on channel A

  - Sync Frame Indicator Status
- NFIS
  - Null Frame Indicator Status
- PPIS
  - Payload Preamble Indicator Status
- RESS
  - Reserved bit Status

### 25.3.13.2 Data Partition

The data partition of the Message RAM stores the data sections of the message buffers configured for reception/transmission as defined in the header partition. The number of data bytes for each message buffer can vary from 0 to 254. To optimize the data transfer between the shift registers of the two FlexRay Protocol Controllers and the Message RAM as well as between the Host interface and the Message RAM, the physical width of the Message RAM is set to 4 bytes.

The data partition starts after the last word of the header partition. When configuring the message buffers in the Message RAM the user has to confirm that the data pointers point to addresses within the data partition.

**Table 25.121, Example for Structure of the Data Partition in the Message RAM** below shows an example how the data sections of the configured message buffers can be stored in the data partition of the Message RAM.

The beginning and the end of a message buffer's data section is determined by the data pointer and the payload length configured in the message buffer's header section, respectively. This enables a flexible usage of the available RAM space for storage of message buffers with different data length.

If the size of the data section is an odd number of 2-byte words, the remaining 16 bits in the last 32-bit word are unused (see **Table 25.121, Example for Structure of the Data Partition in the Message RAM** below).

Table 25.121 Example for Structure of the Data Partition in the Message RAM

Bit Word	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 25.3.13.3 Message Data Integrity Check

There is a data integrity checking mechanism implemented in the FlexRay core to ensure the integrity of the data stored in the related RAM. Each RAM has a checksum generator/checker attached as shown in **Figure 25.19, Checksum Generation and Check**.

When data is written to a RAM, the local checksum generator generates the checksum. The checksum is stored together with the respective data word. The checksum is checked each time a data word is read from a RAM.

If a checksum error is detected, the respective access error flag is set. The access error flags FLXAnFRMHDS.AMR, FLXAnFRMHDS.ATBF1, FLXAnFRMHDS.ATBF2 and the faulty message buffer indicators FLXAnFRMHDS.FMBD, FLXAnFRMHDS.MFMB, FLXAnFRMHDS.FMB are located in the FlexRay Message Handler Status register. These single access error flags control the error interrupt flag FLXAnFREIR.AERR.

**Figure 25.19, Checksum Generation and Check** shows the data paths between the Input Buffer, Temporary Buffer and Message RAM.

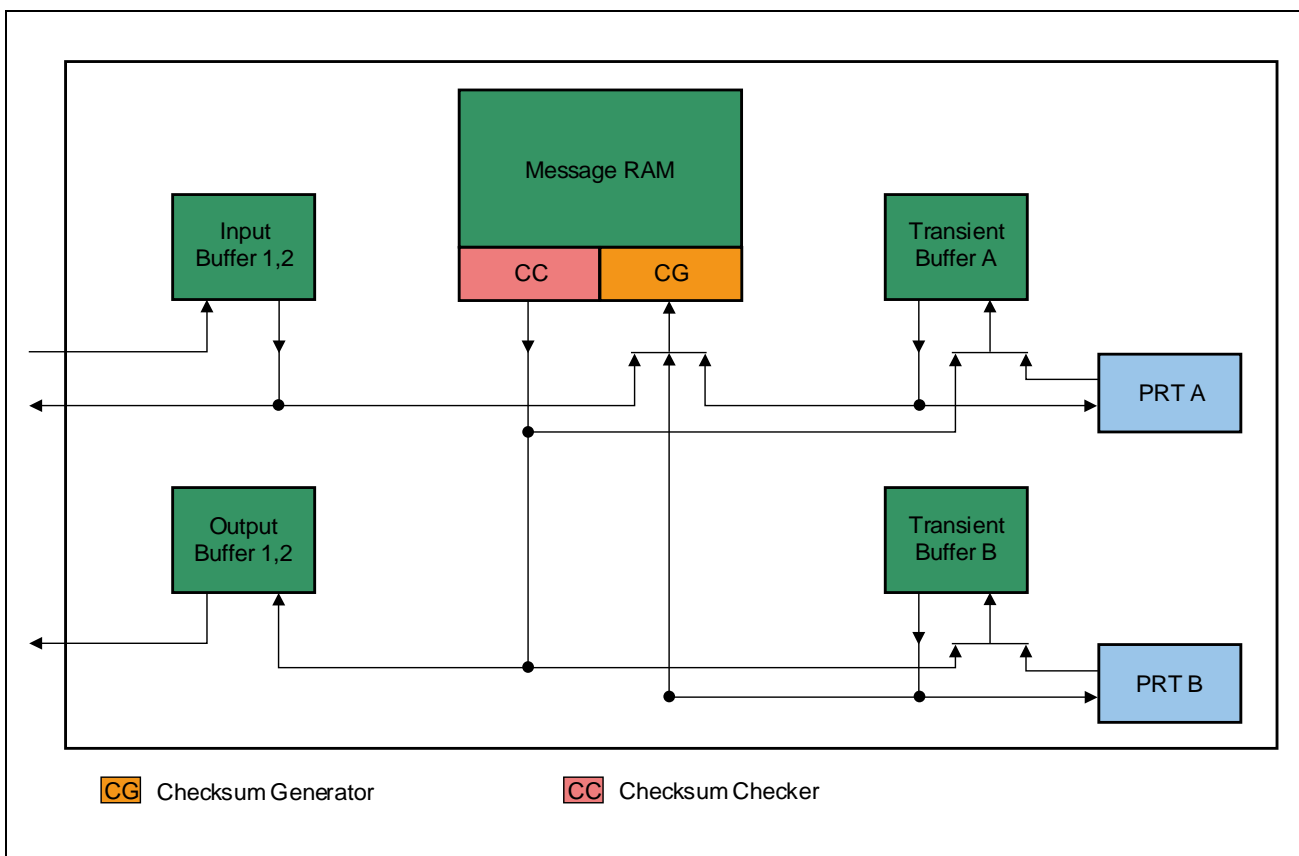

Figure 25.19 Checksum Generation and Check

When an access error has been detected the following actions will be performed:

#### In all cases:

- The respective access error flag in FLXAnFRMHDS register is set
- The access error flag FLXAnFREIR.AERR is set and, if enabled, a module interrupt to the Host will be generated.

**Additionally in specific cases:****(1) Access Error during Data Transfer from Input Buffer 1, 2 to Message RAM When Reading Header Section of Respective Message Buffer from Message RAM:**

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- The data section of the respective message buffer is not updated.
- Transmit buffer: Transmission request for the respective message buffer is not set.

**(2) Access Error during Scan of Header Sections in Message RAM:**

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- Ignore message buffer (message buffer is skipped).

**(3) Access Error during Data Transfer from Message RAM to Temporary Buffer 1, 2:**

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- Frame not transmitted, frames already in transmission are invalidated by setting the frame CRC to zero.

**(4) Access Error during Data Transfer from Temporary Buffer 1, 2 to Message RAM When Reading Header Section of Respective Message Buffer from Message RAM:**

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- The data section of the respective message buffer is not updated.

**(5) Access Error during Data Transfer from Message RAM to Output Buffer:**

- The access error flag FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.

**(6) Access Error during a Data Transfer from Temporary Buffer 1, 2 to Protocol Controller 1, 2:**

- FLXAnFRMHDS.ATBF1, 2 bit is set.
- Frames already in transmission are invalidated by setting the frame CRC to zero.

**(7) Access Error during Data Transfer from Temporary Buffer 1, 2 to Message RAM When Reading Temporary Buffer RAM 1, 2:**

- FLXAnFRMHDS.ATBF1, 2 bit is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.

**(8) Access Error during Data Read of Temporary Buffer RAM 1, 2:**

- When an access error occurs while the Message Handler read a frame with network management information (PPI = 1) from the Temporary Buffer RAM 1, 2, the corresponding network management vector registers FLXAnFRNMV1 to 3 are not updated from this frame.

**25.3.13.4 Host Handling of Access Errors**

Access error caused by temporary bit flips can be fixed by:

**(1) Self-Healing**

Access errors located in the Data Section of Message RAM, Temporary Buffer RAM A or Temporary Buffer RAM B are overwritten with the next write access to the disturbed bit(s) caused by Host access or by FlexRay communication.

**(2) CLEAR\_RAM Command**

The POC command CLEAR\_RAM initializes the message RAM to zero, when called in the DEFAULT\_CONFIG or CONFIG state.

**(3) Temporary Unlocking of Header Section**

An access error in the header section of a locked message buffer can be fixed by a transfer from the Input Buffer to the locked buffer Header Section. For this transfer, the write access to the FLXAnFRIBCR (specifying the message buffer number) must be immediately preceded by the unlock sequence normally used to leave CONFIG state (see **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**).

For that single transfer the respective message buffer header is unlocked, regardless whether it belongs to the FIFO or whether its locking is controlled by FLXAnFRMRC.SEC, and will be updated with new data.

### 25.3.14 Module Interrupt

In general, interrupts provide a close link to the protocol timing as they are triggered almost immediately when an error or status change is detected by the CC, a frame is received or transmitted, a configured timer interrupt is activated, or a stop watch event occurred. This enables the Host to react very quickly on specific error conditions, status changes, or timer events. On the other hand too many interrupts can cause the Host to miss deadlines required for the application. Therefore the CC supports enable/disable controls for each individual interrupt source separately.

An interrupt request may be triggered when

- An error was detected
- A status flag is set to 1
- A timer reaches a preconfigured value
- A message transfer from Input Buffer to Message RAM or from Message RAM to Output Buffer has completed
- A message transfer from the local RAM/global RAM to Message RAM or from Message RAM to local RAM/global RAM has completed
- A stop watch event occurred

Tracking status and generating interrupts when a status change or an error occurs are two independent tasks. Regardless of whether an interrupt is enabled or not, the corresponding status is tracked and indicated by the CC. The Host has access to the actual status and error information by reading registers FLXAnFREIR, FLXAnFRSIR, FLXAnFROS, FLXAnFROTS and FLXAnFRITS.

The general purpose interrupt lines to the Host, FlexRay Interrupt 0, FlexRay Interrupt 1, are controlled by the enabled interrupts in FLXAnFREIES and FLXAnFRSIES. In addition each of the two interrupt lines can be enabled/disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

The input data transfer interrupt lines to the Host, FlexRay input queue empty interrupt, FlexRay input queue full interrupt, are controlled by the enabled interrupts in FLXAnFRITS. In addition each of the input data transfer interrupts can be enabled/disabled separately by programming the related bits in FLXAnFRITC.

The output data transfer interrupt lines to the Host, FlexRay FIFO transfer warning interrupt, FlexRay output transfer warning interrupt, FlexRay FIFO transfer interrupt, FlexRay output transfer interrupt, are controlled by the enabled interrupts in FLXAnFROTS. In addition each of the output data transfer interrupts can be enabled/disabled separately by programming the related bits in FLXAnFROTC.

The three timer interrupts lines to the Host are controlled by the enabled interrupts in FLXAnFROS. In addition each of the interrupt lines can be enabled/disabled separately by programming bit FLXAnFROC.T0IE, FLXAnFROC.T1IE and FLXAnFROC.T2IE.

When a transfer between IBF/OBF and the Message RAM has completed bit FLXAnFRSIR.TIBC or FLXAnFRSIR.TOBC is set to 1.

A stop watch event may be triggered via input pin FLXAnSTPWT.

### 25.3.16 Usage of Data Transfer

A mechanism is implemented to allow storage of FlexRay messages directly into the local RAM/global RAM (user RAM) and have transfers between the FlexRay internal message RAM and the local RAM/global RAM and vice versa with minimum CPU support. The data in the local RAM/global RAM should be indexed by data structure pointers located in data pointer tables stored in the local RAM/global RAM.

Data transfer from the local RAM/global RAM to the FlexRay internal message RAM (input transfer) needs to be initiated by the application. These transfers can be used to configure message buffers or to update transmit data.

A data transfer from the FlexRay internal message RAM to the local RAM/global RAM (output transfer) is initiated automatically by a reception into a receive message buffer or FlexRay internal FIFO or by a change in the slot status. It can be initiated also by a specific user transfer request.

The input and output data transfer can be activated independently. When the input data transfer is activated the application should not directly access message buffers using the FlexRay input buffer. When the output data transfer is activated the application should not directly access message buffers using the FlexRay output buffer.

### 25.3.16.1 Input Data Transfer

When the automatic input data transfer function is enabled, committed input data structures are transferred from the local RAM/global RAM to the FlexRay internal message RAM with minimum CPU support.

#### (1) Activation and Deactivation

The input data transfer function should be activated before usage. The activation of the input transfer handler initializes the input queue put index (FLXAnFRITS.IPIDX) and get index (FLXAnFRITS.IGIDX) to 0. Also the interrupt status flags in the FLXAnFRITS register (IQEIS and IQFIS) are set to 0.

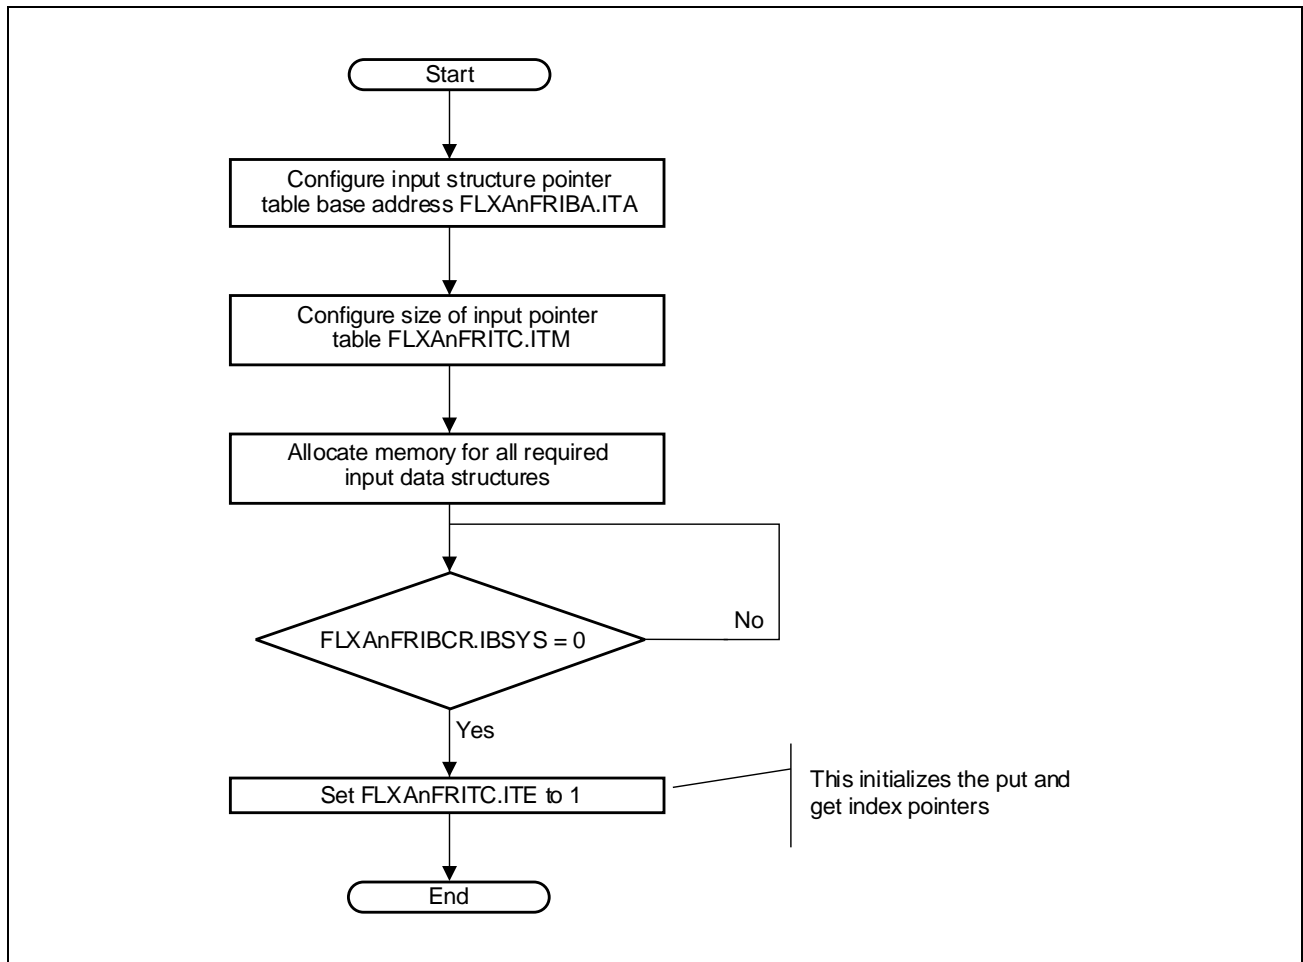

Figure 25.20 Input Transfer Enable Flow

A deactivation request of the input transfer function can be made at any time. The input queue put index and the input queue status are maintained independently from the input transfer function state.

Before the transfer function gets disabled (status indicated by FLXAnFRITS.ITS), user requested input transfers and all committed input transfers will be completed.

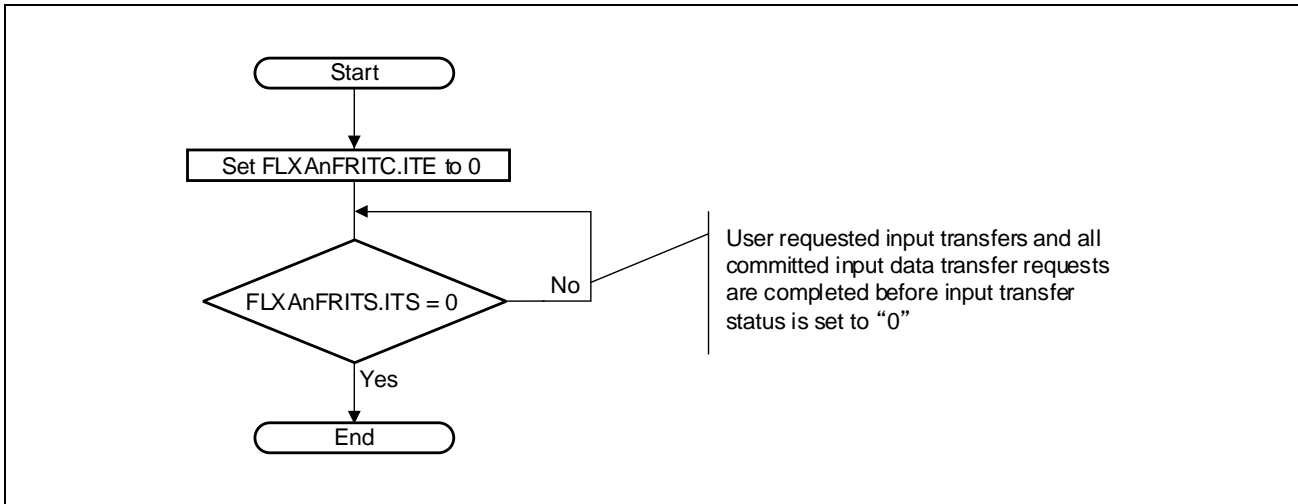

Figure 25.21 Input Transfer Disable Flow

**(2) Input Data Structure**

The application has to reserve a location in the local RAM/global RAM to provide the content for message buffer configuration (input data structure).

The location of this input data structure needs to be defined by an input data structure pointer also located in the local RAM/global RAM.

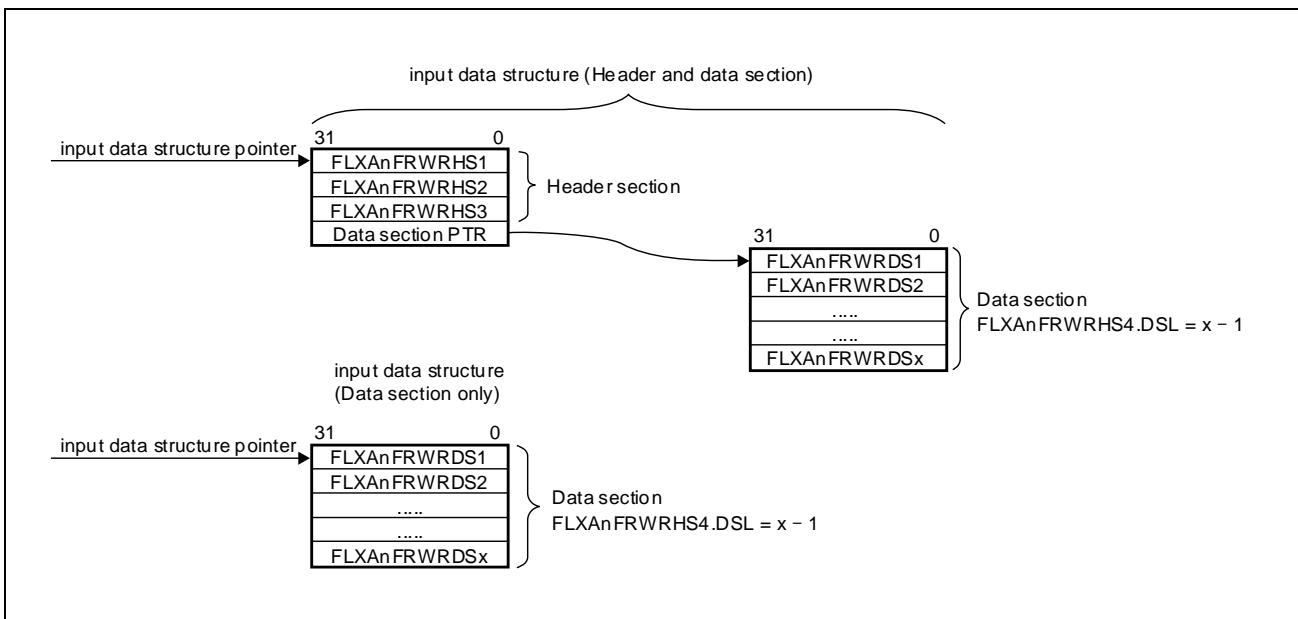

Figure 25.22 Input Data Structure

In general the input data structure consists of two sections, the header and the data section.

The header section consists of FLXAnFRWRHS1, FLXAnFRWRHS2, FLXAnFRWRHS3 and the data section pointer.

For bit alignment and bit function in the header section, see **Section 25.3.13.1, Header Partition**.

Depending on the settings in the control field (FLXAnFRWRHS4) located in the input pointer table, the data structure pointer is a reference to the address of FLXAnFRWRHS1 or FLXAnFRWRDS1. The data structure pointer has to be aligned to a 32 bit address.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to 1 it is required to provide a valid header section. In this case FLXAnFRWRDS1 is the first element of the data structure.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to 0 a header section is not required. In this case FLXAnFRWRDS1 is the first element of the data structure.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to 1 it is required to provide a valid data section. The pointer to the data section is a reference to the address of the first payload long word (FLXAnFRWRDS1) and has to be aligned to a 32 bit address.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to 0 a data section is not required. The data section pointer is not evaluated by the input handler.

The byte order for the FlexRay payload data in the input data structure is determined by FLXAnFROC.BEC. For information about the payload data alignment within the data section refer to **Section 25.3.13.2, Data Partition** and **Section 25.3.17, Byte Alignment**.

The length of the data section and the size to be allocated in the local RAM/global RAM depends on the configuration of the bits DSL in the address related to FLXAnFRWRHS4.

For the transfer into the FlexRay core internal message RAM the number of 16 bit words configured by FLXAnFRWRHS2.PLC is used. The application has to ensure, that a proper number of data words is provided in the local RAM/global RAM. In case the buffer is configured by FLXAnFRWRHS2.PLC to hold an odd payload length, the application has to write zero to the last 16 bit of the payload section to ensure that the padding data is all zero.

### (3) Input Pointer Table

To transfer data from the input data structures located in the local RAM/global RAM to the FlexRay internal message RAM the related input data structure pointer and control field needs to be added to the input pointer table which is located in the local RAM/global RAM.

The location of the first element of this table is identified by the input pointer table base address (FLXAnFRIBA.ITA). This base address has to be aligned to a 32 bit address.

The maximum number of input requests that can be queued is defined by the Input queue Table Max register (FLXAnFRITC.ITM).

Each Input pointer table entry requires two long words. The required address range of the input pointer table for the queued transfer requests can be calculated by

Input pointer table size (byte) =  $((\text{FLXAnFRITC.ITM} + 1) \times 2) \times 4$

#### Equation 1

The input pointer entry for the user requested input transfer should be added after the end of the input pointer table.

The pointer table index related to this entry and hence the number to be written to FLXAnFRUIR.UIDX, is FLXAnFRITC.ITM+1. The address in the input pointer table related to the user requested input transfer (user input address) can be calculated by

User input address = FLXAnFRIBA.ITA + Input pointer table size

#### Equation 2

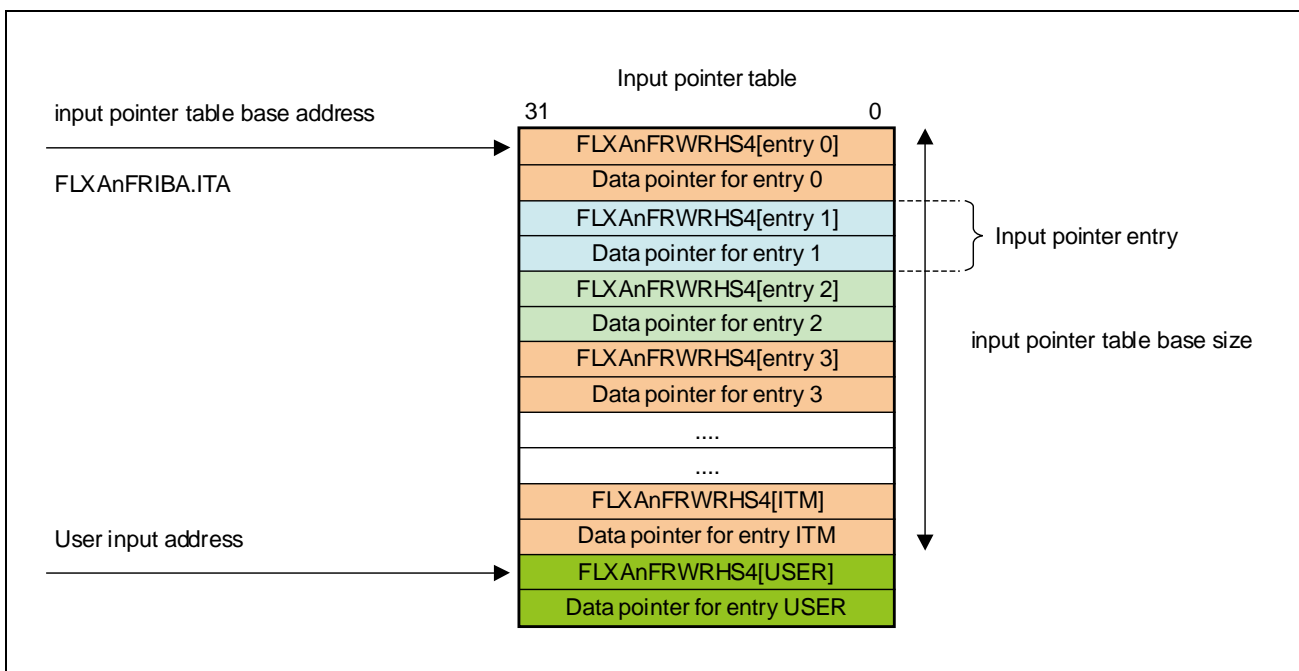

Figure 25.23 Input Pointer Table

The input pointer table holds the control field FLXAnFRWRHS4 and the pointers to the local RAM/global RAM location where the message buffer content (header section and/or data section) is stored.

The application has to write FLXAnFRWRHS4 and the input data structure pointer at the addresses in the input pointer table related to the put index position before a transfer request is initiated.

**FLXAnFRWRHS4:**

Bit	31	30	29	28	27	26	25	24	23	22	DSL[5:0]					
	—	—	—	—	—	—	—	—	—	—						
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	INV	STR	LDS	LHS	—	IMBNR[6:0]						

Table 25.123 FLXAnFRWRHS4 Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, an undefined value is read. When writing, always write 0.
21 to 16	DSL[5:0]	Data Section Length Bit Specifies the length of the data section in terms of 32 bit values.
15 to 12	Reserved	When read, an undefined value is read. When writing, always write 0.
11	INV	Invalidate entry Bit 0: The data structure is valid and will be transferred to the FlexRay internal message RAM. 1: The data structure is invalid. FlexRay internal message RAM is not updated using this input pointer entry.
10	STR	Set transmission request Bit 0: The bit FLXAnFRTXRQx.TXR for the message buffer selected by the bits IMBNR is set to 0. No data from this message buffer is transmitted. 1: The bit FLXAnFRTXRQx.TXR for the message buffer selected by the bits IMBNR is set to 1 to release the message buffer for transmission The application should not set the STR to 1 for receive buffers.
9	LDS	Load data section Bit 0: No update of data section. 1: Data section for the message buffer selected by the bits IMBNR is updated.
8	LHS	Load header section Bit 0: No update of header section. 1: Header section for the message buffer selected by the bits IMBNR is updated.
7	Reserved	When read, an undefined value is read. When writing, always write 0.
6 to 0	IMBNR[6:0]	Message buffer number to be updated Bit Selects the target message buffer number in the FlexRay internal message RAM for transfer

Note that the LHS bit should not be set for protected message buffers.

The bit LDS defines if the data section of the message buffer selected by the bits IMBNR should be updated.

If LDS is set to 1 (DSL + 1) 32 bit words of payload data are transferred from the local RAM/global RAM to the message buffer selected by the bits IMBNR.

If LDS is set to 0 no payload data is transferred from the local RAM/global RAM.

Note that the payload transferred is independent from the configured payload length (bits PLC in the address related to FLXAnFRWRHS2).

The bit INV can be used to invalidate a committed data structure. This bit should be only used to cancel the transfer of committed data structures when the input queue is halted (see **Section 25.3.16.2(5), Transfer Function of Dedicated Message Buffers**).

When this bit is set to 1 the message buffer number IMBNR is not updated. When the bit is set to 0 the message buffer number IMBNR is updated.

#### (4) Transfer Function of Input Data Structure

To use the input data structure transfer function the input transfer has to be activated (see **Section 25.3.16.1(1), Activation and Deactivation**). The activation process requires the setup of the input pointer table (see **Section 25.3.16.1(3), Input Pointer Table**) in order to specify the source location (input data structures) for the data structures to be transferred. When the input transfer gets enabled the get index pointer is initialized to zero.

All FlexRay internal message buffers can be updated using the input transfer queue which is built in the input pointer table. The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. For that purpose the application has to maintain a put index for the input pointer table that indicates where the pointer has to be written to.

To commit this table entry to the input handler, the application has to write the target message buffer number to the input queue control register (FLXAnFRIQC.IMBNR). Afterwards the application has to increment the application internal put index.

By writing to the input queue control register the data available flag (FLXAnFRDAi.DA[IMBNR]) is automatically set to 1. The input transfer handler also maintains the put index pointer in the status register (FLXAnFRITS.IPIDX).

In case the input queue gets full (number of queued input transfer requests is equal to the input queue table size) FLXAnFRITS.IQFP and FLXAnFRITS.IQFIS are set to 1. The input queue full condition pending flag (FLXAnFRITS.IQFP) changes from 1 to 0 when there are entries in the input queue available, whereby the input queue full interrupt status flag (FLXAnFRITS.IQFIS) needs to be cleared by the application.

The application cannot make any further write access to the bit IMBNR in the FLXAnFRIQC register as long as the bit IQFP in the FLXAnFRITS register is 1.

In case the input queue gets empty (number of queued input transfer requests changes to zero) FLXAnFRITS.IQEIS is set to 1. The input queue empty interrupt status flag (FLXAnFRITS.IQEIS) needs to be cleared by the application.

The transfer of the input data structures to the FlexRay message RAM is controlled by a get index pointer which is handled inside the FlexRay module and flagged in FLXAnFRITS.IGIDX. Note that the index is referring to the input entry and not the address offset in the input pointer table.

If the input queue is not empty, the transfer handler reads out the input pointer table entry of the transfer queue and starts the transfer of the input data structure from the address the input pointer is referring to. When all required data words are transferred to the FlexRay module, the data available flag for the transferred message buffer number is set to 0 and the get index in the transfer handler is incremented by one.

In case of an invalidated data structure (see **Section 25.3.16.1(5), Halting the Input Queue**) no FlexRay internal message buffer is updated and the related data available flag is automatically set to 0. The change of the data available flag can be used to confirm the cancellation a transmit request.

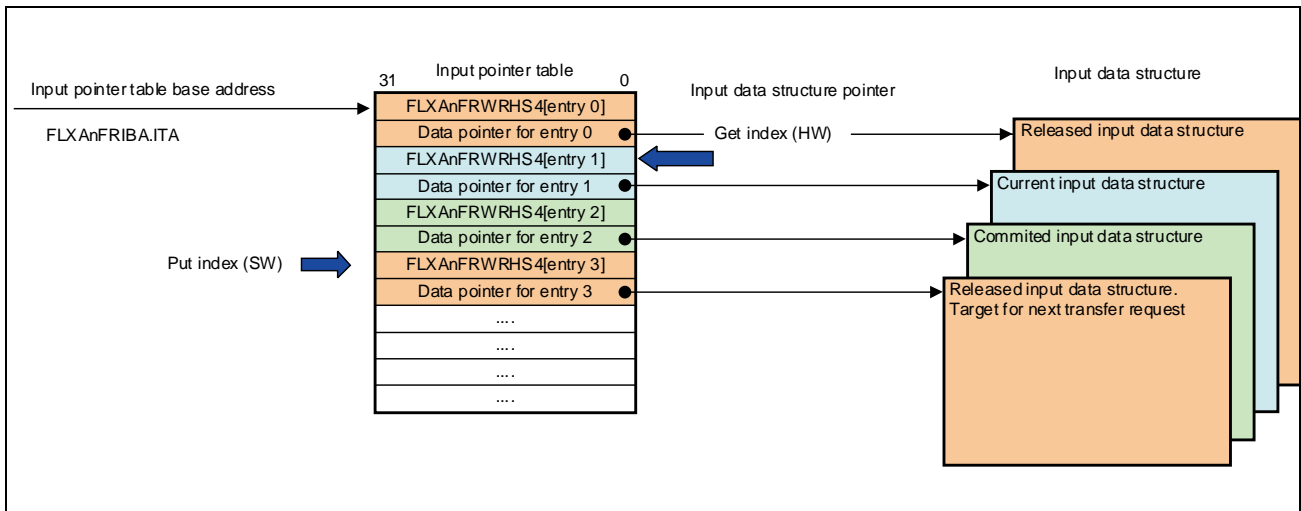

Figure 25.24 Input Pointer Table

Receive message buffers can be also configured using the input data transfer by setting up the required header sections and mark only the header section (`FLXAnFRWRHS4.LDS = 0`, `FLXAnFRWRHS4.LHS = 1`) to be updated in the FlexRay module.

### (5) Halting the Input Queue

Committed data structures cannot be removed, but can be invalidated or updated when the input queue is halted.

To cancel data structures already committed to the input queue, the queue can be halted by writing a 1 to FLXAnFRITC.IQHR.

After the ongoing input transfer has been completed the queue is halted and FLXAnFRITS.IQH changes from 0 to 1.

To invalidate an entry of the input queue FLXAnFRWRHS4.INV has to be set to 1. All other bits in FWRHS4 should be unchanged.

Following flow shall be used to analyze whether a committed message has been already transferred to the FlexRay internal message RAM or not.

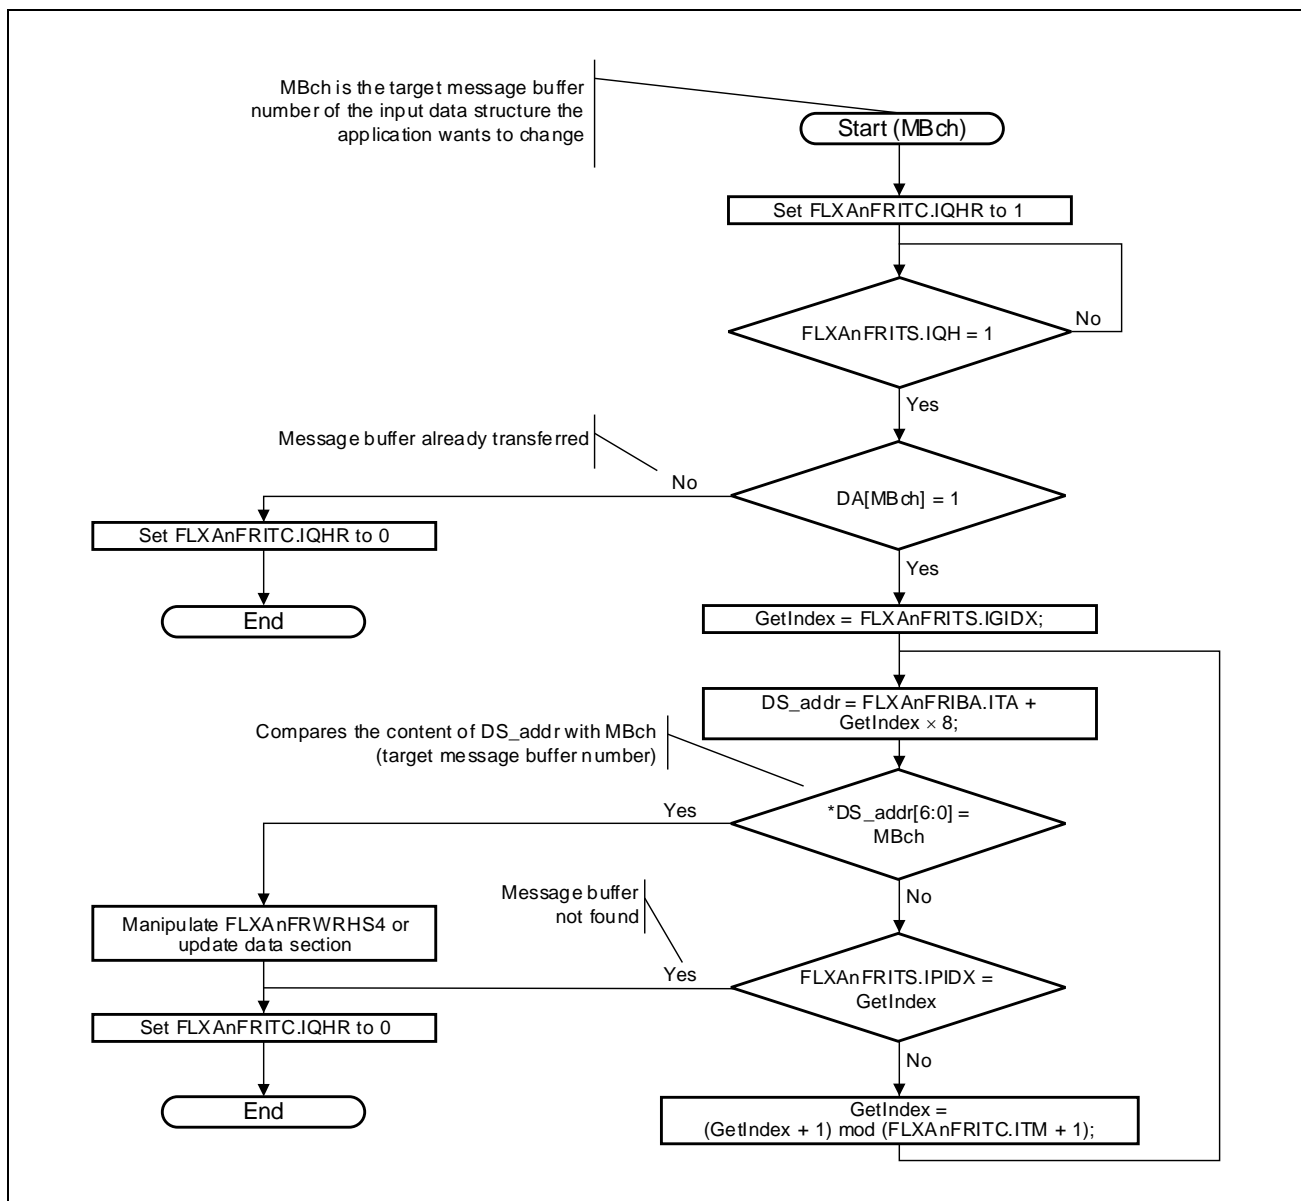

Figure 25.25 Input Table Analysis

In case the message buffer was already transferred to the FlexRay internal message RAM, the user input transfer request can be used to bypass the actual queue and update the required message buffer (see **Section 25.3.16.1(6), Transfer Function of User Requested Input Transfers**).

## (6) Transfer Function of User Requested Input Transfers

To use this function the input transfer has to be activated (see **Section 25.3.16.1(1), Activation and Deactivation**).

The application is capable, by using FLXAnFRUIR.UIDX, to request a transfer of an input data structure. The user input transfer request is serviced first.

The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. The table entry for the user input transfer request should be added after the end of the input pointer table (see **Section 25.3.16.1(3), Input Pointer Table**).

To commit this table entry to the input handler, the application has to write the index (FLXAnFRITC.ITM + 1) to the user input transfer request register (FLXAnFRUIR.UIDX).

By writing to the user input transfer request register, the user input transfer request pending flag (FLXAnFRITS.UIRP) is automatically set to 1.

As long this flag is 1 the application should not make any further user input transfer requests.

The user input transfer request pending flag (FLXAnFRITS.UIRP) changes from 1 to 0 when the requested input transfer is completed. As next the pending transfers are processed.

### 25.3.16.2 Output Data Transfer

When the output data transfer function is enabled, received messages (either in dedicated message buffers or in the FlexRay receive FIFO) are transferred to the local RAM/global RAM by the output data handler. The output data handler can also transfer the message buffer content to the local RAM/global RAM on application request. When enabled the output handler is also capable to initiate a transfer when the message buffer status has changed.

#### (1) Activation and Deactivation

The output data transfer function should be activated before usage. The activation of the output transfer handler will initialize the FIFO put and get index pointer and FIFO fill level (FLXAnFROTS.FGIDX and FLXAnFROTS.FFL) to zero, set the bits FLXAnFROTS.FDA, FLXAnFROTS.OWP, FLXAnFROTS.FWP and FLXAnFROTS.UORP to 0. Also the interrupt status flags (FLXAnFROTS.OTIS, FLXAnFROTS.FIS, FLXAnFROTS.OWIS and FLXAnFROTS.FWIS) are set to 0.

The activation has no influence to the data available flags (FLXAnFRDAi.DA) which are related to the dedicated buffers; these flags have to be cleared by the application.

Figure 25.26 Output Transfer Enable Flow

A deactivation request of the output data transfer function can be made at any time. An ongoing transfer will be completed and the completion of this transfer will be flagged. During this time FLXAnFROTS.OTS remains 1.

When FLXAnFROTS.OTS changes from 1 to 0, the output transfer function is deactivated. The data available status flags and the FIFO get index are still maintained when the output transfer function is disabled.

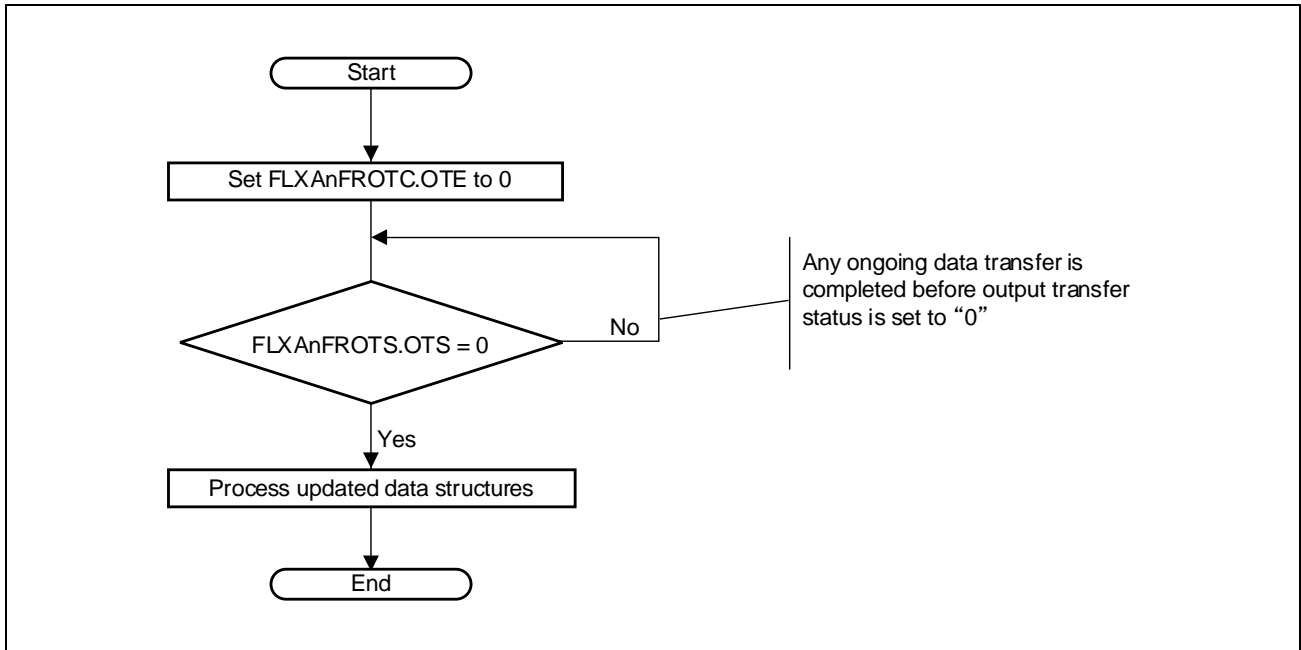

Figure 25.27 Output Transfer Disable Flow

## (2) Output Transfer Data Structure

The data in the local RAM/global RAM is stored in an output data structure. The location of the output data structures are determined by output data structure pointers also located in the local RAM/global RAM. The output data structure and indexing is visualized in **Figure 25.28, Output Data Structure**.

Figure 25.28 Output Data Structure

The output data structure consists of two sections, the header and data section. The header section consists of FLXAnFRRDHS1, FLXAnFRRDHS2, FLXAnFRRDHS3, FLXAnFRMBS and the data section pointer. FLXAnFRRDHS1 is the first element of the structure and has to be aligned to a 32 bit address. The data structure pointer is a reference to the address of FLXAnFRRDHS1. For information about the bit alignment and bit function within the header section refer to **Section 25.3.13.1, Header Partition**.

FLXAnFRRDDS1 is the first element of the data section. The data section pointer is a reference to the address of FLXAnFRRDDS1 and has to be aligned to a 32 bit address. The byte order for the FlexRay payload data in the output data structure is determined by the bit BEC in the FLXAnFROC register. For information about the payload data alignment within the data section refer to **Section 25.3.13.2, Data Partition**.

The length of the data section as well as the total structure size to be allocated in the local RAM/global RAM depends on the configured payload length (FLXAnFRRDHS2.PLC) of the related message buffer. In case the configured payload length is an odd number of words or the received payload length (FLXAnFRRDHS2.PLR) is smaller than the configured payload length, the remaining data words in the local RAM/global RAM are unused and cannot be used by the application.

The output data structure is identical for all three kinds of output transfers. In case only the header section is transferred the data section pointer is not evaluated by the output handler and the data section remains unchanged.

### (3) Output Pointer Table

For the output data transfer function the application needs to set up an output pointer table in the local RAM/global RAM. The location of the first element of this table should be programmed into the output pointer table base address (FLXAnFROBA.OTA). This base address has to be aligned to a 32 bit address.

The size of the output pointer table is defined by the maximum of: the last configured dedicated message buffer and the highest message buffer number which will be used for the user output transfer request.

The output pointer table holds pointers (output data structure pointers) to the local RAM/global RAM location where a memory space is reserved for the target message buffer content (header section and data section).

There is a fixed linear relationship between the address of the entries in the output pointer table and the number of the related message buffers (see **Figure 25.29, Output Data Structure and Indexing**): the output pointer table starts with the entry for message buffer number 0 at the address configured in FLXAnFROBA.OTA and continues in ascending order for each following message buffer number, by 32 bit aligned address (e.g. message buffer 1 at address OTA + 4, message buffer 2 at address OTA + 8, etc.) for all possible message buffers.

When a set ND bit is the only transfer condition (FLXAnFROTC.OTCS is set to 0) only message buffers configured as a dedicated receive buffer or that will be used for user output transfer requests need have valid pointer entries.

When a set ND bit or a set MBC bit is the transfer condition (FLXAnFROTC.OTCS is set to 1) all dedicated receive buffer and dedicated transmit buffers need to have valid pointer entries.

### (4) FIFO Output Pointer Table

The FlexRay module internal FIFO can be extended by a queued buffer structure in the local RAM/global RAM.

If the FlexRay module internal FIFO is used the application needs to setup the FIFO output pointer table. The location of the first element of this table is identified by the FIFO pointer table base address (FLXAnFRFBA.FTA). This base address has to be aligned to a 32 bit address.

The size of the FIFO pointer table and hence the maximum number of messages that can be added to the queue, is defined by FIFO Table Max (FLXAnFROTC.FTM).

The FIFO pointer table holds pointers (output data structure pointers) to the local RAM/global RAM location where a memory space is reserved the target message buffer content (header section and data section). For each table entry a data pointer shall be configured in this table.

### (5) Transfer Function of Dedicated Message Buffers

To use this transfer function the output transfer has to be activated (see **Section 25.3.16.2(1), Activation and Deactivation**). The activation process requires to setup the output pointer table (see **Section 25.3.16.2(3), Output Pointer Table**) in order to specify the destination location (output data structures) for the data to transfer.

**Figure 25.29, Output Data Structure and Indexing** shows how the output pointer table references the output data structures.

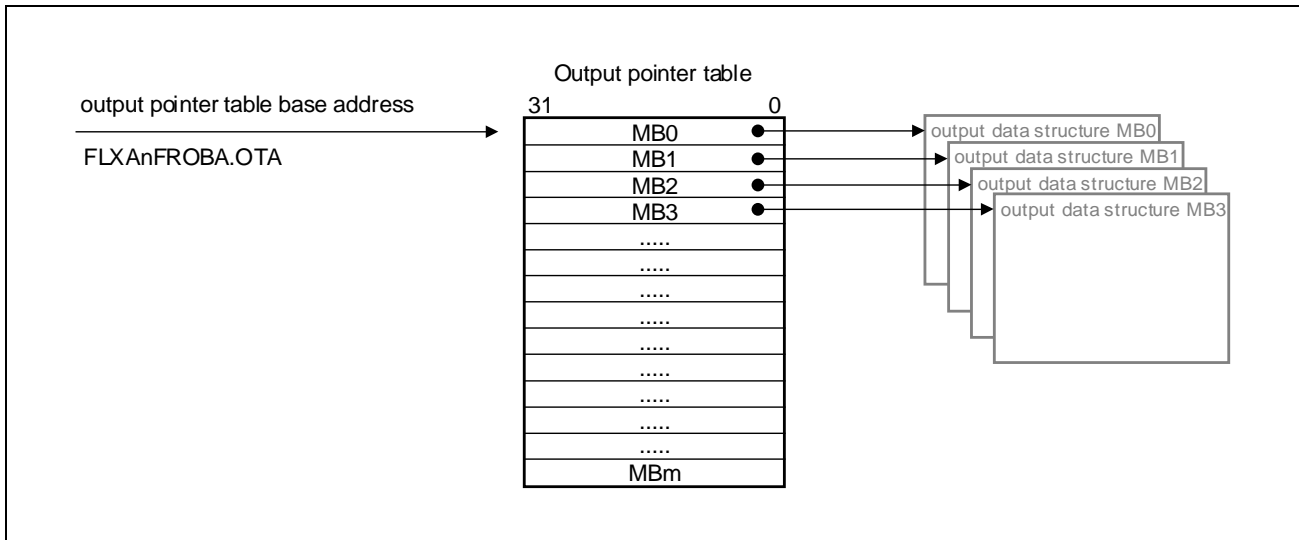

Figure 25.29 Output Data Structure and Indexing

With FLXAnFROTC.OTCS the output transfer condition can be selected between the “New data only mode” and the “New data and status changed mode”.

In the “New data only mode” an output data transfer is initiated when a valid FlexRay data frame has been stored into a dedicated receive buffer which causes the related ND flag in the FLXAnFRNDATi register to set. The ND flag in the FLXAnFRNDATi register is automatically set to 0 during the transfer procedure. The header section is also transferred and hence the MBC flag in the FLXAnFRMBSCi register is set to 0.

In the “New data and status changed mode” an output data transfer is initiated as described in the “New data only mode”. In addition an output data transfer is initiated when only the message buffer status has been changed which causes the related MBC flag in the FLXAnFRMBSCi register to be set. In this case only the header section is transferred. The MBC flag in the FLXAnFRMBSCi register is automatically set to 0 during the transfer procedure.

After transferring the message buffer data from the FlexRay internal message RAM to the output data structure the corresponding data available flag in the FLXAnFRDAi ( $i = 0$  to 3) registers is set to 1. The update of the output data structure is also flagged by the setting of the output transfer interrupt status flag (FLXAnFROTS.OTIS).

As long as the data available flag remains 1 the corresponding output data structure will not be updated. In the case

- the data available flag is 1 and a valid received message was stored or
- when FLXAnFROTC.OTCS is 1 and the message buffer status was updated,

the output transfer warning interrupt flag (FLXAnFROTS.OWIS) is set to 1 notifying the application that new data is available but the output data structure transfer cannot be processed. In addition FLXAnFROTS.OWP is set to 1 that continuously flags that status of the output transfer warning condition.

If a valid receive message in the FlexRay internal message RAM is overwritten by an additional receive message, the message lost flag (FLXAnFRMBS.MLST) is set to 1. This flag can be evaluated after the message buffer has been transferred into an output data structure.

Following sections are giving a guidance how output data structures can be handled.

**(a) Data Section Copy Method**

One option is to copy the information from the output data structure to a different location of the local RAM/global RAM and then release the output data structure by clearing the related data available flag. The application should use the copied information for further processing.

**(b) Data Structure Pointer Method**

A different option is to modify the output data structure pointer in the output pointer table and to release the output data structure by clearing the related data available flag. The changed output data pointer should refer to a free data structure. The application should use the old data structure for further processing.

**(c) Data Section Pointer Method**

A third option is to modify the data section pointer in the output data structure and to release the output data structure by clearing the related data available flag. The changed data section pointer should refer to a free memory area. The application should use the old data section for further processing by forwarding the data section pointer.

## (6) Transfer Function of FIFO Message Buffers

To use this buffer transfer function the output transfer has to be activated (see **Section 25.3.16.2(1), Activation and Deactivation**). The activation process requires the set up of the FIFO pointer table (see **Section 25.3.16.2(4), FIFO Output Pointer Table**) in order to specify a location in the local RAM/global RAM reserved for the storage of the required output data structures.

A FIFO data transfer is initiated when a valid FlexRay data frame has been stored in the FlexRay internal FIFO.

After transfers from the internal FIFO to the output data structure, the FIFO interrupt status flag (FLXAnFROTS.FIS) and FLXAnFROTS.FDA are set to 1. The bit FLXAnFROTS.FIS can be used as an interrupt source. The bit FLXAnFROTS.FDA indicates that the FIFO is not empty.

Up to FLXAnFROTS.FTM output structures configured in the FLXAnFROTC register can be queued.

The transfer to the extended FIFO buffer structure is controlled by index pointers. This put index is controlled by the FIFO transfer handler and is incremented after transferring a message to the output data structure.

The FIFO reception handler also maintains a get index which is flagged in FLXAnFROTS.FGIDX. The value of this get index is known by the application by either reading the status or maintaining a software variable. The get index (the value after a reset is zero) is incremented by one when the application releases the oldest entry of the FIFO queue by writing 1 to FLXAnFROTS.FDA. By comparing the put index and the get index the FIFO handler knows about the current fill level of the queued buffer structure.

The current FIFO fill level is flagged in FLXAnFROTS.FFL. When FLXAnFROTS.FDA is 1, there is at least one entry in the FIFO queue.

In case the queued buffer structure in the local RAM/global RAM is full (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1), no further transfers are initialized, new messages remain in the FlexRay internal FIFO and the FIFO transfer warning interrupt status flag (FLXAnFROTS.FWIS) is set to 1.

In case the FlexRay internal FIFO structure becomes full, messages in the FlexRay internal FIFO structure may get overwritten. The related status flags and configuration registers of the FlexRay core module can be used to generate desired warning notifications.

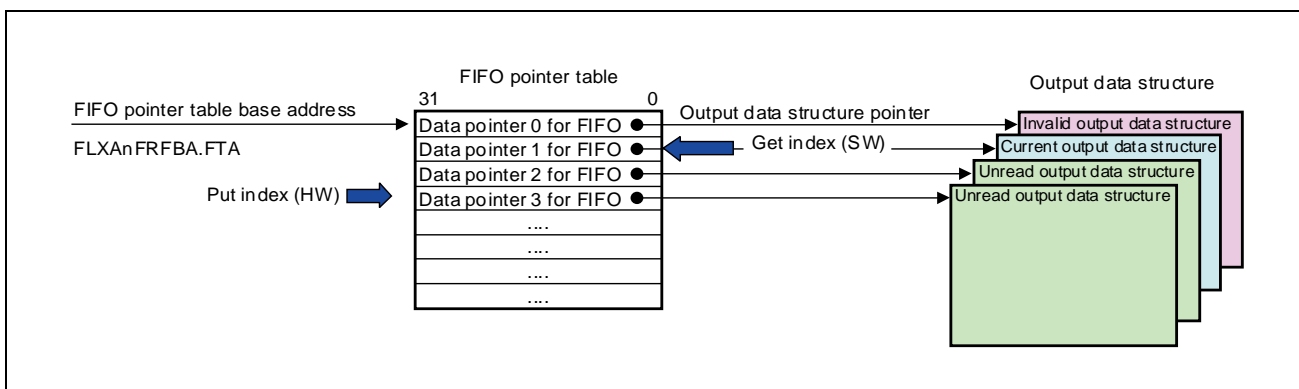

Figure 25.30 FIFO Pointer Table

## (7) Transfer Function of User Output Transfer Requests

To use this transfer function the output transfer has to be activated (see **Section 25.3.16.2(1), Activation and Deactivation**). The activation process requires to setup the output pointer table (see **Section 25.3.16.2(3), Output Pointer Table**) in order to specify the location in the local RAM/global RAM reserved for the transfer of the data (output data structures).

The application is capable, by using `FLXAnFRUOR.UMBNR`, to request a transfer of dedicated message buffer to an output data structure. Except in CONFIG state, message buffers which are part of the FlexRay internal FIFO should not be requested.

The header section is always transferred to the output data structure. The transfer of the data section can be enabled by setting `FLXAnFRUOR.URDS` to 1. The selected message buffer content is stored in the output data structure location determined by the pointers in the output pointer table.

The data available status and transfer blocking by the DA bits in the `FLXAnFRDAi` register is also used for the user requested transfers. Therefore the DA bit in the `FLXAnFRDAi` register related to the requested buffer number (`FLXAnFRUOR.UMBNR`) should be released before making the transfer request.

After writing to `FLXAnFRUOR.UMBNR`, the bit `FLXAnFROTS.UORP` is set to 1 to indicate that there is a pending user transfer request. When the transfer has been processed the bit `FLXAnFROTS.UORP` is set to 0, the bit `FLXAnFROTS.OTIS` is set to 1 and the DA bit in the `FLXAnFRDAi` register related to the requested buffer number (`FLXAnFRUOR.UMBNR`) is set to 1.

User output transfer requests cannot be queued. The application should check the bit `FLXAnFROTS.UORP` before writing to `FLXAnFRUOR.UMBNR`.

User output transfer requests should not be made for message buffers which are pending in the input transfer queue.

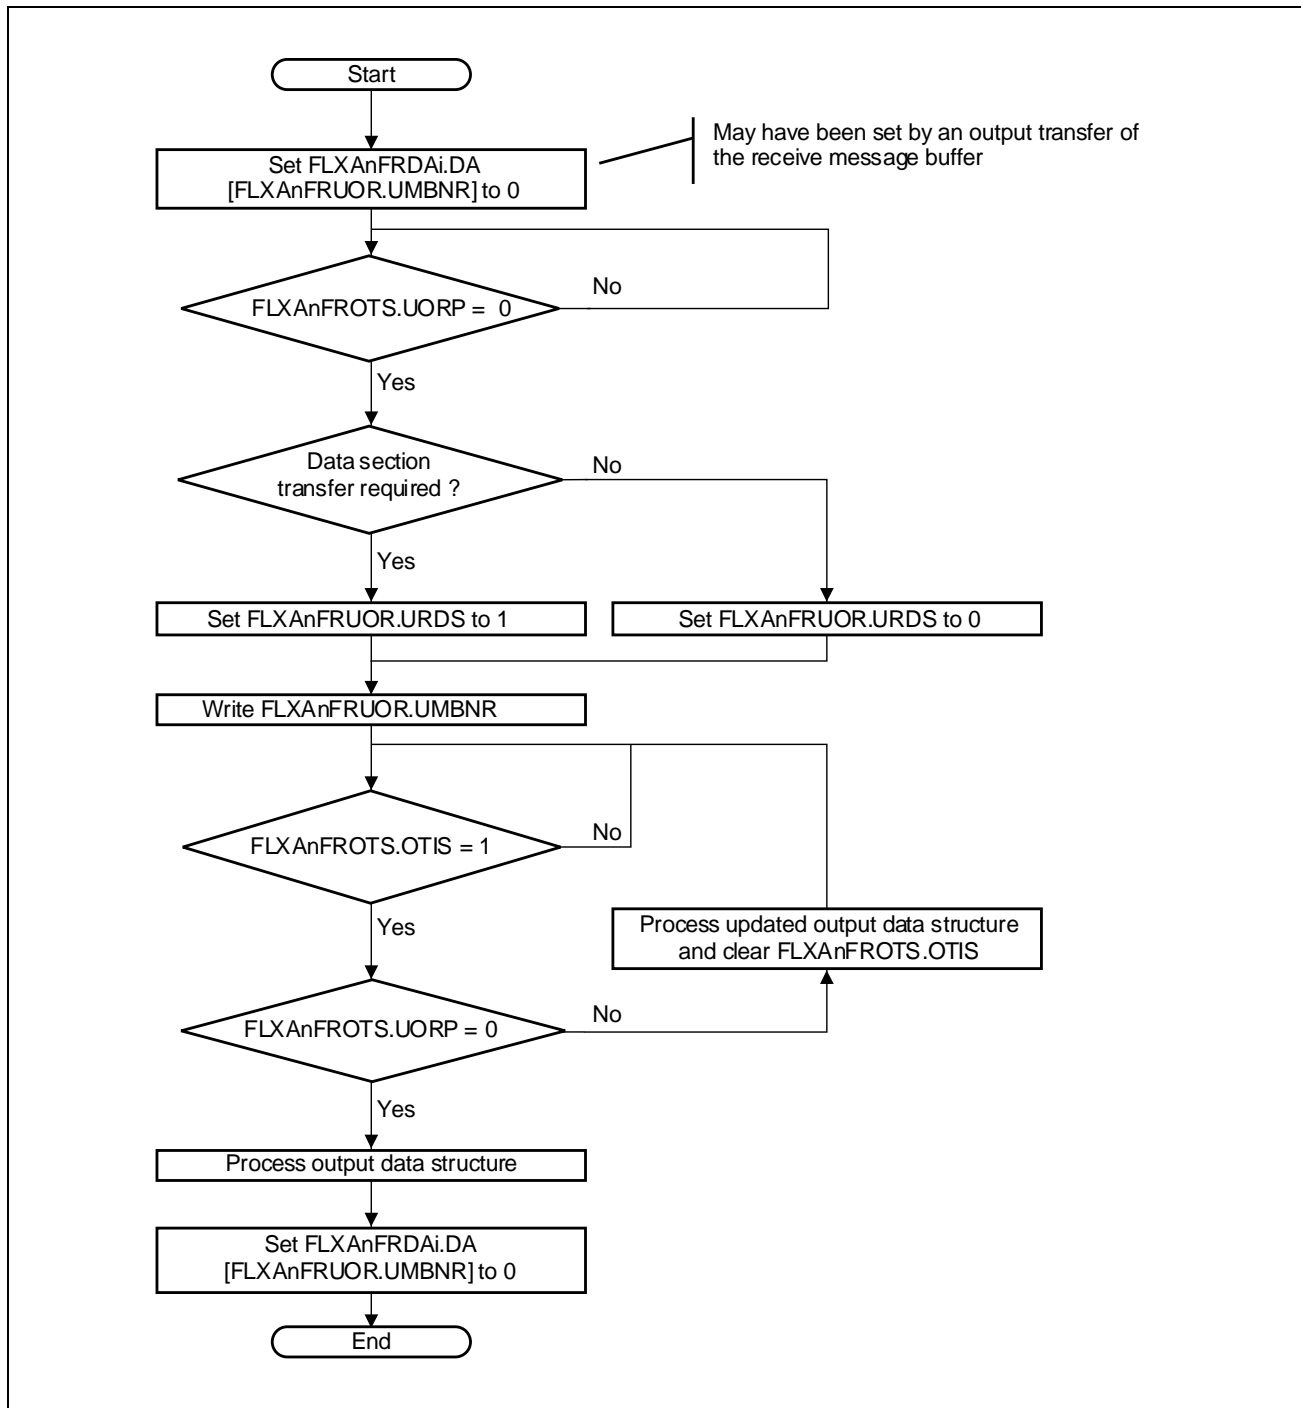

Figure 25.31 User Output Transfer Request Flow

Note that it may be possible that the data structure addressed by a user request is being updated due to a receive message buffer update (which causes the bit DA in the FLXAnFRDAi register being set).

This set DA flags inhibits the user output transfer request. Therefore polling FLXAnFROTS.UORP is not a secure method to identify when the transfer of a requested message buffer has been completed. The bits FLXAnFROTS.OTIS or the DA bit in the FLXAnFRDAi register can be used instead. The exact flow depends on the software architecture.

### 25.3.16.3 Data Structure Transfer Scheduling

Cyclically the different types of transfer requests are checked. In order to guarantee a certain transfer time the different types of transfers have different priorities.

Use requested input transfers have highest priority followed by the transfer of data structures committed into the active input transfer queue. No new output transfer will be started as long as there is a pending input transfer request.

The three output transfer request types are checked in a specific order:

#### (1) All Dedicated Message Buffers in Ascending Order

When FLXAnFROTC.OTCS is set to 0, set flags in the FLXAnFRNDATi register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is 0).

When FLXAnFROTC.OTCS is set to 1, set flags in the FLXAnFRNDATi register or set flags in the FLXAnFRMBSCi register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is 0).

#### (2) FlexRay Internal FIFO

When the FlexRay internal FIFO is not empty and there is a free destination area, one FIFO message is transferred into the output data structure addressed by the FIFO pointer table.

#### (3) User Output Request

If there is a pending user output transfer request, one message buffer is transferred into the corresponding output data structure.

The check sequence is suspended when an input transfer occurs.

#### 25.3.16.4 Behavior in Case of Data Transfer Access Error

The memory areas accessed by the data transfer function may be protected by a memory protection unit (MPU). When the MPU flags an access to a protected address caused by an input or output transfer, an access error event is generated and the related bit in the FLXAnFRAES register is set.

The ongoing transfer is immediately terminated but succeeding transfers are processed and may generate further access errors. Any following access errors are only flagged in FLXAnFRAES.MAE. The other status flags are not updated.

##### (1) Access Error during Input Transfer

When an access error occurs during an input transfer:

- The ongoing transfer is immediately terminated. The FlexRay internal message RAM will not be updated
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.IAE is set to 1
- The input pointer table index is flagged in FLXAnFRAES.EIDX
- In case of a normal input transfer, the related DA flag in the FLXAnFRDAi register is set to 0
- In case of a user input transfer, request FLXAnFRITS.UIRP is set to 0

With the given status information the application is able to identify and correct the faulty data structure. In addition the application needs to clear the input access error flag (FLXAnFRAES.IAE).

##### (2) Access Error during Output Transfer

When an access error occurs during an output transfer:

- The ongoing transfer is immediately terminated but the update of the data structure may have started.
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.OAE is set to 1
- The output pointer table index is flagged in FLXAnFRAES.EIDX
- In case of a normal output transfer, the related DA flag in the FLXAnFRDAi register remains 0 and no output transfer, interrupt is generated
- In case of a user output transfer request FLXAnFROTS.UORP is set to 0

With the given status information the application is able to identify and correct the faulty data structure. The data structure in the local RAM/global RAM cannot be treated as valid.

In addition the application needs to clear the output access error flag (FLXAnFRAES.OAE).

The FlexRay module internal transfer of the message buffer is completed before the local RAM/global RAM access error is detected. The output transfer will not be re-initiated. To avoid loss of data, the application can perform a user output transfer request of this message buffer to a correct local RAM/global RAM location.

**(3) Access Error during FIFO Transfer**

When an access error occurs during an FIFO transfer:

- The ongoing transfer is immediately terminated
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.FAE is set to 1
- The FIFO pointer table index is flagged in FLXAnFRAES.EIDX
- The FIFO index pointer are not changed and hence the FIFO status flags are unchanged

With the given status information the application is able to identify and correct the faulty data structure. In addition the application needs to clear the FIFO access error flag (FLXAnFRAES.FAE).

The data in the local RAM/global RAM cannot be treated as valid and is not released to the application. The message cannot be recovered.

### 25.3.16.5 Behaviors in Case of RAM Read Errors

The FlexRay internal message RAM has an ECC checking mechanism. In case an uncorrectable RAM read error occurs, the application has to analyze the status in the FLXAnFRMHDS register and react as described in **Section 25.3.16.3, Data Structure Transfer Scheduling**. The input and output transfer handler reacts also on these errors detected in the message RAM when the error is related to an active transfer.

In addition, the Temporary Buffer RAM A and Temporary Buffer RAM B have an ECC checking mechanism as well. An uncorrectable RAM read errors does not impact the data transfer functionality but have to be handled as described in **Section 25.3.13.1(4), Message Buffer Status FLXAnFRMBS (Word 3)**.

In all cases, data causing a read error is never transferred to the local RAM/global RAM. If there is no recovery available in the application, the message is lost.

#### (1) Read Error during Transfer from TBF to MBF

This internal transfer is done for each valid FlexRay message received.

A read error can only occur when reading the header section in the FlexRay Message RAM (see read error flags in FLXAnFRMHDS). In this case, the message buffer needs to be re-configured.

For dedicated receive message buffers, the related ND flag in the FLXAnFRNDATi register will not get set. Consequently the affected message buffer will not be transferred to the output data structure.

For the FlexRay internal FIFO buffers, the ND flag in the FLXAnFRNDATi register is not set but the FlexRay internal FIFO put index is incremented. Due to this, a transfer procedure from the FlexRay internal FIFO buffer to the output buffer is started. However, if the read error is still present in the header section, updating of the output data structure will not start (see **Section 25.3.16.5(2), Read Error during Transfer from MBF to OBF**); thus the data in the local RAM/global RAM remains correct.

Note that the correction or any other reconfiguration of FIFO related to message buffers while there are pending FIFO transfers may result in incorrect data in the local RAM/global RAM. It is strongly recommended to deactivate the output data transfer before starting the reconfiguration and flush the FlexRay internal FIFO before reactivation of the output data transfer.

#### (2) Read Error during Transfer from MBF to OBF

This internal transfer is done for every output data transfer (dedicated reception, FIFO, user requested).

A read error can occur in the header and data section (see read error flags in FLXAnFRMHDS). In both cases the message gets lost. If the error is located in the header section, the message buffer needs to be re-configured. If the error is located in the data section, the error is corrected with the next data section update.

When a read error occurs during the transfer from the message RAM to the output buffer, the output data structure will not be updated and the data available will not be set to 1. The FIFO put index and the FIFO fill level are not changed also.

In case of user output transfer request, FLXAnFROTS.UORP is set to 0 even if there was no update of the output data structure.

#### (3) Read Error during Transfer from IBF to MBF

This internal transfer is done for every input data transfer.

A read error can occur only when there is no update of the header section requested (the bit LHS in FLXAnFRWRHS4 is set to 0) due to the reading of the header section from the message RAM (see read error flags in FLXAnFRMHDS). In this case, the message buffer needs to be re-configured.

When a read error occurs during the input data transfer, the actually transferred message in the input queue gets lost.

**(4) Message RAM Read Errors**

Read errors when reading the header section are flagged in the FLXAnFRMHDS register.

Depending on the buffer type and set buffer protection, a reconfiguration of the message buffer may not be possible.

The input transfer function cannot be used to reconfigure a locked message buffer using the method described in **Section 25.3.13.4(3), Temporary Unlocking of Header Section.**

Before reconfiguring a locked buffer, the user should disable the input transfer function and the output transfer function.

### 25.3.16.6 Data Transfer Timings

The transfer timing between the local RAM/global RAM and the FlexRay internal message buffers is composed of two elements. The first element is the FlexRay core internal transfer time between the interface buffer and the message RAM. The second element is the transfer time required between the local RAM/global RAM and the interface buffer.

The concept of the input- and output handler allows only one active transfer between the local RAM/global RAM and input buffer as well as only one active transfer between the input buffer and the message RAM. In case two requests are made at the same time, the input transfer task is handled at first.

Due to this concept constrains the calculation of transfer times does not consider a parallel transfer but the worst case scenario whereby an output transfer is started only after all input transfers are completed.

#### (1) FlexRay Core Internal Transfer Time

The number of clock cycles required for a transfer is given in FlexRay core module clock cycles (bus clock). The transfer time differs between the input and output transfer.

The time required for a transfer between the interface buffer and the FlexRay internal message RAM is given by [ERAY\_ADD]

$$cycles_{req\_MHD[PL]} = (numberOfConcurrentTasks) \times (setupTime + (DataWords_{req[PL]} + 75))$$

#### Equation 3

The number of data words (32 bit) can be calculated by

$$DataWords_{req[PL]} = 4 + floor\left(\frac{PLC + 1}{2}\right)$$

#### Equation 4

Whereby 4 is the number of header section words (32 bit) which needs to be always accessed even if the header section is not updated.

As there can be in total three parallel tasks in the FlexRay internal message handler but the number of concurrent tasks is unknown, not only for a worst case consideration the number of concurrent tasks must be set to 3. Beside the setup time and the number of words to be transferred a message handler internal delay time of 75 bus clock cycles must be added. The maximum number of payload to be transferred is in worst case 64.

The worst case for an input transfer is different from the worst case for an output transfer. For an input transfer the setup time required is 6 bus clock cycles and therefore

$$cycles_{req\_MHD\ input[64]} = 3 \times (6 + 68 + 75) = 447$$

#### Equation 5 Message Handler Internal Input Transfer Time (Worst Case)

For an output transfer the setup time required is 2 bus clock cycles and therefore

$$cycles_{req\_MHD\ output[64]} = 3 \times (2 + 68 + 75) = 435$$

#### Equation 6 Message Handler Internal Output Transfer Time (Worst Case)

## (2) System Bus Transfer Time

The number of bus clock cycles required for a transfer is given in bus clock cycles and is identical for all kind of transfers between the local RAM/global RAM and the FlexRay module.

The time required by the transfer handler for a transfer between the local RAM/global RAM and the FlexRay interface buffer is given by

$$cycles_{req\_SB[PL]} = throughput \times (systemTime + (DataWords_{req[PL]}) + setupTime)$$

### Equation 7 General System Bus Transfer Time Formula

The number of payload words (32 bit) can be calculated by using Equation 4.

The throughput depends on the utilization of the system bus and depends on the application. However, the data transfer handler has the highest priority for accessing the local RAM/global RAM and the data throughput factor can be assumed as XXXX even in worst case scenarios. The system time (read of the data pointer from local RAM/global RAM) can be set to 1 in all cases. The transfer setup time can be set to 3 in all cases.

Therefore the system bus transfer time (given in bus clock cycles) is given by

$$cycles_{req\_SB[64]} = throughput \times (2 + 68) + 3 = XXXX \times (2 + 68) + 3$$

### Equation 8 System Bus Transfer Time (Worst Case)

In addition to the system bus transfer time a FlexRay module internal processing time needs to be taken into account. The number of clock cycles required for the internal processing time required is given in FlexRay core module clock cycles (bus clock) and is different between input transfers and output transfers but can be treated as constants.

$$cycles_{req\_THD\ input} = 2 + 4 = 6$$

### Equation 9

Whereby 2 cycles are required to initiate the FlexRay module internal transfer from the input buffer to the message RAM. In addition 4 internal processing cycles are required.

$$cycles_{req\_THD\ output} = 3 + 4 = 7$$

### Equation 10

Whereby 3 cycles are required to initiate the FlexRay module internal transfer from the input buffer to the message RAM. In addition 4 internal processing cycles are required.

**(3) Summary Required Input Transfer Time**

The worst case time (as a function of the transferred payload) required to transfer data between the local RAM/global RAM to the FlexRay internal message buffer can be calculated by

$$t_{input}_{[PL]} = t_{chi} \times (cycles_{req\_THD\_input} + cycles_{req\_MHD\_input}_{[PL]}) + t_{sys} \times (cycles_{req\_SB}_{[PL]})$$

$$t_{input}_{[PL]} = t_{chi} \times (6 + 3 \times [81 + DataWords_{[PL]}]) + t_{sys} \times (throughput \times [2 + DataWords_{[PL]}] + 3)$$

**Equation 11 Input transfer time**

With

$$t_{sys} = (f(sysclk))^{-1}$$

and.

$$t_{chi} = (f(clkp2\_flx))^{-1}$$

**(4) Summary Required Output Transfer Time**

The worst case time (as a function of the transferred payload) required to transfer data from the FlexRay internal message buffer to the local RAM/global RAM can be calculated by

$$t_{output}_{[PL]} = t_{chi} \times (cycles_{req\_THD\_output} + cycles_{req\_MHD\_output}_{[PL]}) + t_{sys} \times (cycles_{req\_SB}_{[PL]})$$

$$t_{output}_{[PL]} = t_{chi} \times (7 + 3 \times [77 + DataWords_{[PL]}]) + t_{sys} \times (throughput \times [2 + DataWords_{[PL]}] + 3)$$

**Equation 12 Output Transfer Time**

With

$$t_{sys} = (f(sysclk))^{-1}$$

and.

$$t_{chi} = (f(clkp2\_flx))^{-1}$$

### 25.3.17 Byte Alignment

The alignment of the bytes received by the FlexRay protocol and the alignment of the bytes required by the application may be different. The FlexRay module provides with FLXAnFROC.BEC a byte alignment function to support different byte ordering styles.

**Figure 25.32, Byte Alignment on the FlexRay Bus** shows the payload byte alignment in a FlexRay frame.

Figure 25.32 Byte Alignment on the FlexRay Bus

#### 25.3.17.1 Little Endian Alignment

When FLXAnFROC.BEC is 0, the byte alignment is set to Little Endian.

##### (1) FLXAnFRNMV $m$ ( $m = 1$ to 3)

The byte alignment of the NMV bytes is as below.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FLXAnFRN MV1	Data 3								Data 2								Data 1								Data 0							
FLXAnFRN MV2	Data 7								Data 6								Data 5								Data 4							
FLXAnFRN MV3	Data 11								Data 10								Data 9								Data 8							

##### (2) FLXAnFRWRDS $x$ ( $x = 1$ to 64)

The byte alignment for the message payload in the FlexRay input buffer and the input data structure is as below.

$FLXAnFRWRDSx.MD[7:0] = Data_{4x-4}$   
 $FLXAnFRWRDSx.MD[15:8] = Data_{4x-3}$   
 $FLXAnFRWRDSx.MD[23:16] = Data_{4x-2}$   
 $FLXAnFRWRDSx.MD[31:24] = Data_{4x-1}$

Transmission order on the FlexRay bus is  $FLXAnFRWRDSx.MD[7:0]$ ,  $FLXAnFRWRDSx.MD [15:8]$ ,  $FLXAnFRWRDSx.MD [23:16]$ ,  $FLXAnFRWRDSx.MD [31:24]$  with the most significant bit (MSB) transmitted first.

##### (3) FLXAnFRRDDS $x$ ( $x = 1$ to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure is as below.

$FLXAnFRRDDSx.MD[7:0] = Data_{4x-4}$   
 $FLXAnFRRDDSx.MD[15:8] = Data_{4x-3}$   
 $FLXAnFRRDDSx.MD[23:16] = Data_{4x-2}$   
 $FLXAnFRRDDSx.MD[31:24] = Data_{4x-1}$

Reception order on the FlexRay bus is  $FLXAnFRRDDSx.MD[7:0]$ ,  $FLXAnFRRDDSx.MD [15:8]$ ,  $FLXAnFRRDDSx.MD [23:16]$ ,  $FLXAnFRRDDSx.MD [31:24]$  with the most significant bit (MSB) received first.

### 25.3.17.2 Big Endian Alignment

When FLXAnFROC.BEC is 1, the byte alignment is set to Big Endian.

#### (1) FLXAnFRNMV $m$ ( $m = 1$ to 3)

The byte alignment of the NMV bytes is as below.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FLXAnFRN MV1	Data 0								Data 1								Data 2								Data 3							
FLXAnFRN MV2	Data 4								Data 5								Data 6								Data 7							
FLXAnFRN MV3	Data 8								Data 9								Data 10								Data 11							

#### (2) FLXAnFRWRDS $x$ ( $x = 1$ to 64)

The byte alignment for the message payload in the FlexRay input buffer and the input data structure is as below.

$FLXAnFRWRDS_x.MD[7:0] = Data_{4x-1}$   
 $FLXAnFRWRDS_x.MD[15:8] = Data_{4x-2}$   
 $FLXAnFRWRDS_x.MD[23:16] = Data_{4x-3}$   
 $FLXAnFRWRDS_x.MD[31:24] = Data_{4x-4}$

Transmission order on the FlexRay bus is  $FLXAnFRWRDS_x.MD[31:24]$ ,  $FLXAnFRWRDS_x.MD[23:16]$ ,  $FLXAnFRWRDS_x.MD[15:8]$ ,  $FLXAnFRWRDS_x.MD[7:0]$  with the most significant bit (MSB) transmitted first.

#### (3) FLXAnFRRDDS $x$ ( $x = 1$ to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure is as below.

$FLXAnFRRDDS_x.MD[7:0] = Data_{4x-1}$   
 $FLXAnFRRDDS_x.MD[15:8] = Data_{4x-2}$   
 $FLXAnFRRDDS_x.MD[23:16] = Data_{4x-3}$   
 $FLXAnFRRDDS_x.MD[31:24] = Data_{4x-4}$

Reception order on the FlexRay bus is  $FLXAnFRRDDS_x.MD[31:24]$ ,  $FLXAnFRRDDS_x.MD[23:16]$ ,  $FLXAnFRRDDS_x.MD[15:8]$ ,  $FLXAnFRRDDS_x.MD[7:0]$  with the most significant bit (MSB) received first.

## 25.4 Detection and Correction of Errors in FlexRay RAM

For details of ECC, see **Section 40A.2.6, ECC for Peripheral RAM, Section 40B.2.6, ECC for Peripheral RAM, Section 40C.2.5, ECC for Peripheral RAM.**

## Section 26 Ethernet AVB (ETNB)

This section contains a generic description of the Ethernet AVB (ETNB).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of ETNB.

### CAUTION

Read URAM in this manual as local RAM/global RAM/retention RAM.

Read AXI BUS in this manual as H-Bus.

## 26.1 Features of RH850/F1KH, RH850/F1KM ETNB

### 26.1.1 Number of Units

This microcontroller has the following number of ETNB units.

Each ETNB unit has single channel interface.

Table 26.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	2
Name	ETNBn (n = 0)	ETNBn (n = 0)	ETNBn (n = 0,1)

Table 26.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	—	—	1	1	1
Name	—	—	ETNBn (n = 0)	ETNBn (n = 0)	ETNBn (n = 0)

Table 26.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	—	—	—
Name	—	—	—

Table 26.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	—	—
Name	—	—	—	—

Table 26.5 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual ETNB units are identified by the index "n"; for example, ETNBnCCC (n = 0, 1) is the AVB-DMAC mode register.

Table 26.6 Index (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual ETNB units are identified by the index "n"; for example, ETNBnCCC (n = 0) is the AVB-DMAC mode register.

### 26.1.2 Register Base Addresses

ETNB base addresses are listed in the following table.

ETNB register addresses are given as an offset from the base addresses.

Table 26.7 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<ETNB0_base>	FFD6 E000 <sub>H</sub>
<ETNB1_base>	FFD6 E800 <sub>H</sub>

Table 26.8 Register Base Address (RH850/F1KM-S4)

Base Address Name	Base Address
<ETNB0_base>	FFD6 E000 <sub>H</sub>

### 26.1.3 Clock Supply

The ETNB clock supply is shown in the following table.

Table 26.9 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name
ETNBn	clk_chi <sup>*1,*2</sup>	CPUCLK_L
	Register access clock <sup>*1,*2</sup>	CPUCLK_L

Note 1. ETNB clocks can be stopped by OPBT0.ETNBnEN, refer to **Section 44.9.2, OPBT0 — Option Byte 0**.

Note 2. ETNB clocks is more than 15 MHz.

Table 26.10 Clock Supply (RH850/F1KM-S4)

Unit Name	Unit Clock Name	Supply Clock Name
ETNBn	clk_chi <sup>*1,*2</sup>	CPUCLK_L
	Register access clock <sup>*1,*2</sup>	CPUCLK_L

Note 1. ETNB clocks can be stopped by OPBT0.ETNBnEN, refer to **Section 44.9.2, OPBT0 — Option Byte 0**.

Note 2. ETNB clocks is more than 15 MHz.

### 26.1.4 Interrupt Requests

ETNB interrupt requests are listed in the following table.

Table 26.11 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
ETNB0			
INTETNB0DATA	Data related interrupt	315	—
INTETNB0ERR	Error related interrupt	316	—
INTETNB0MNG	Management related interrupt	317	—
INTETNB0MAC	MAC interrupt	318	—
ETNB1			
INTETNB1DATA	Data related interrupt	377	—
INTETNB1ERR	Error related interrupt	378	—
INTETNB1MNG	Management related interrupt	379	—
INTETNB1MAC	MAC interrupt	380	—

Table 26.12 Interrupt Requests (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
ETNB0			
INTETNB0DATA	Data related interrupt	315	—
INTETNB0ERR	Error related interrupt	316	—
INTETNB0MNG	Management related interrupt	317	—
INTETNB0MAC	MAC interrupt	318	—

### 26.1.5 Reset Sources

ETNB reset sources are listed in the following table. ETNB is initialized by these reset sources.

Table 26.13 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
ETNBn	All reset sources (ISORES)

Table 26.14 Reset Sources (RH850/F1KM-S4)

Unit Name	Reset Source
ETNBn	All reset sources (ISORES)

## 26.1.6 External Input/Output Signals

External input/output signals of ETNB are listed below.

Table 26.15 ETNBn Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
ETNB0		
AVB_TX_CLK	MII transmit clock signal	ETNB0TXCLK
AVB_RX_CLK	MII receive clock signal	ETNB0RXCLK
AVB_TX_EN	MII transmit data enable signal	ETNB0TXEN
AVB_TXD[3:0]	MII transmit data signal	ETNB0TXD[3:0]
AVB_RX_DV	MII receive data valid signal	ETNB0RXDV
AVB_RXD[3:0]	MII receive data signal	ETNB0RXD[3:0]
AVB_RX_ER	MII receive error signal	ETNB0RXERR
AVB_MDC	PHY management clock signal	ETNB0MDC
AVB_MDIO	PHY management transfer data signal	ETNB0MDIO
AVB_LINK	PHY link status signal	ETNB0LINK
ETNB1		
AVB_TX_CLK	MII transmit clock signal	ETNB1TXCLK
AVB_RX_CLK	MII receive clock signal	ETNB1RXCLK
AVB_TX_EN	MII transmit data enable signal	ETNB1TXEN
AVB_TXD[3:0]	MII transmit data signal	ETNB1TXD[3:0]
AVB_RX_DV	MII receive data valid signal	ETNB1RXDV
AVB_RXD[3:0]	MII receive data signal	ETNB1RXD[3:0]
AVB_RX_ER	MII receive error signal	ETNB1RXERR
AVB_MDC	PHY management clock signal	ETNB1MDC
AVB_MDIO	PHY management transfer data signal	ETNB1MDIO
AVB_LINK	PHY link status signal	ETNB1LINK

**Note:** In RH850/F1KH, there is no TXERR pin. It is recommended to connect to EVSS or BVSS via a resistor for TXERR of PHY.

Table 26.16 ETNBn Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
ETNB0		
AVB_TX_CLK	MII transmit clock signal	ETNB0TXCLK
AVB_RX_CLK	MII receive clock signal	ETNB0RXCLK
AVB_TX_EN	MII transmit data enable signal	ETNB0TXEN
AVB_TXD[3:0]	MII transmit data signal	ETNB0TXD[3:0]
AVB_RX_DV	MII receive data valid signal	ETNB0RXDV
AVB_RXD[3:0]	MII receive data signal	ETNB0RXD[3:0]
AVB_RX_ER	MII receive error signal	ETNB0RXERR
AVB_MDC	PHY management clock signal	ETNB0MDC
AVB_MDIO	PHY management transfer data signal	ETNB0MDIO
AVB_LINK	PHY link status signal	ETNB0LINK

**Note:** In RH850/F1KM, there is no TXERR pin. It is recommended to connect to EVSS or BVSS via a resistor for TXERR of PHY.

## 26.2 Overview

### 26.2.1 Functional Overview

**Table 26.17, Specifications of ETNB** lists the specifications of the ETNB.

Table 26.17 Specifications of ETNB

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
Communication interface	MII
Transfer speed	<ul style="list-style-type: none"> <li>• 100 Mbps</li> <li>• 10 Mbps*<sup>1</sup></li> </ul>
Transfer mode	<ul style="list-style-type: none"> <li>• Full-duplex mode</li> </ul>
AVB function	<ul style="list-style-type: none"> <li>• Conforming with the following standards stipulated for IEEE 802.1BA.               <ul style="list-style-type: none"> <li>– IEEE 802.1AS (time synchronization protocol)</li> <li>– IEEE 802.1Qav (real-time transfer)</li> <li>* IEEE 802.1Qat should be supported by software.</li> </ul> </li> <li>• Descriptor management system</li> <li>• IEEE 1722 (AVTP presentation timestamp)</li> </ul>

Note 1. Not available for the AVB function.

### 26.2.2 Block Diagram

Figure 26.1, Block Diagram of ETNB is a block diagram of the ETNB.

Figure 26.1 Block Diagram of ETNB

## 26.3 Registers

### 26.3.1 List of Registers

The following table lists the ETNB registers.

For details about <ETNBn\_base>, see **Section 26.1.2, Register Base Address**.

Table 26.18 List of Registers

Module Name	Register Name	Abbreviation	Address
ETNBn	AVB-DMAC mode register	ETNBnCCC	<ETNBn_base> + 0000 <sub>H</sub>
	Descriptor base address table register	ETNBnDBAT	<ETNBn_base> + 0004 <sub>H</sub>
	Descriptor base address load request register	ETNBnDLR	<ETNBn_base> + 0008 <sub>H</sub>
	AVB-DMAC status register	ETNBnCSR	<ETNBn_base> + 000C <sub>H</sub>
	Current descriptor address register q (q = 0 to 21)	ETNBnCDARq	<ETNBn_base> + 0010 <sub>H</sub> + q × 4 <sub>H</sub>
	Error status register	ETNBnESR	<ETNBn_base> + 0088 <sub>H</sub>
	Receive configuration register	ETNBnRCR	<ETNBn_base> + 0090 <sub>H</sub>
	Receive queue configuration register i (i = 0 to 4)	ETNBnRQCi	<ETNBn_base> + 0094 <sub>H</sub> + i × 4 <sub>H</sub>
	Receive padding configuration register	ETNBnRPC	<ETNBn_base> + 00B0 <sub>H</sub>
	Unread frame counter stop level configuration register	ETNBnUFCS	<ETNBn_base> + 00C0 <sub>H</sub>
	Unread frame counter register i (i = 0 to 4)	ETNBnUFVi	<ETNBn_base> + 00C4 <sub>H</sub> + i × 4 <sub>H</sub>
	Unread frame counter decrement register i (i = 0 to 4)	ETNBnUFCDi	<ETNBn_base> + 00E0 <sub>H</sub> + i × 4 <sub>H</sub>
	Separation filter offset register	ETNBnSFO	<ETNBn_base> + 00FC <sub>H</sub>
	Separation filter pattern register i (i = 0 to 31)	ETNBnSFPi	<ETNBn_base> + 0100 <sub>H</sub> + i × 4 <sub>H</sub>
	Separation filter mask register i (i = 0, 1)	ETNBnSFMi	<ETNBn_base> + 01C0 <sub>H</sub> + i × 4 <sub>H</sub>
	Transmit configuration register	ETNBnTGC	<ETNBn_base> + 0300 <sub>H</sub>
	Transmit configuration control register	ETNBnTCCR	<ETNBn_base> + 0304 <sub>H</sub>
	Transmit status register	ETNBnTSR	<ETNBn_base> + 0308 <sub>H</sub>
	Timestamp FIFO access register 0	ETNBnTFA0	<ETNBn_base> + 0310 <sub>H</sub>
	Timestamp FIFO access register 1	ETNBnTFA1	<ETNBn_base> + 0314 <sub>H</sub>
	Timestamp FIFO access register 2	ETNBnTFA2	<ETNBn_base> + 0318 <sub>H</sub>
	CBS increment value register c (c = 0, 1)	ETNBnCIVRc	<ETNBn_base> + 0320 <sub>H</sub> + c × 4 <sub>H</sub>
	CBS decrement value register c (c = 0, 1)	ETNBnCDVRC	<ETNBn_base> + 0328 <sub>H</sub> + c × 4 <sub>H</sub>
	CBS upper limit register c (c = 0, 1)	ETNBnCULc	<ETNBn_base> + 0330 <sub>H</sub> + c × 4 <sub>H</sub>
	CBS lower limit register c (c = 0, 1)	ETNBnCLLc	<ETNBn_base> + 0338 <sub>H</sub> + c × 4 <sub>H</sub>
	Descriptor interrupt control register	ETNBnDIC	<ETNBn_base> + 0350 <sub>H</sub>
	Descriptor interrupt status register	ETNBnDIS	<ETNBn_base> + 0354 <sub>H</sub>
	Error interrupt control register	ETNBnEIC	<ETNBn_base> + 0358 <sub>H</sub>
	Error interrupt status register	ETNBnEIS	<ETNBn_base> + 035C <sub>H</sub>
	Receive interrupt control register 0	ETNBnRIC0	<ETNBn_base> + 0360 <sub>H</sub>
	Receive interrupt status register 0	ETNBnRIS0	<ETNBn_base> + 0364 <sub>H</sub>
	Receive interrupt control register 1	ETNBnRIC1	<ETNBn_base> + 0368 <sub>H</sub>
	Receive interrupt status register 1	ETNBnRIS1	<ETNBn_base> + 036C <sub>H</sub>
	Receive interrupt control register 2	ETNBnRIC2	<ETNBn_base> + 0370 <sub>H</sub>
	Receive interrupt status register 2	ETNBnRIS2	<ETNBn_base> + 0374 <sub>H</sub>
	Transmit interrupt control register	ETNBnTIC	<ETNBn_base> + 0378 <sub>H</sub>
	Transmit interrupt status register	ETNBnTIS	<ETNBn_base> + 037C <sub>H</sub>
	Interrupt summary status register	ETNBnISS	<ETNBn_base> + 0380 <sub>H</sub>
	gPTP configuration control register	ETNBnGCCR	<ETNBn_base> + 0390 <sub>H</sub>

Table 26.18 List of Registers

Module Name	Register Name	Abbreviation	Address
ETNBn	gPTP maximum transit time register	ETNBnGMTT	<ETNBn_base> + 0394 <sub>H</sub>
	gPTP presentation time comparison register	ETNBnGPTC	<ETNBn_base> + 0398 <sub>H</sub>
	gPTP timer increment register	ETNBnGTI	<ETNBn_base> + 039C <sub>H</sub>
	gPTP timer offset register i (i = 0 to 2)	ETNBnGTOi	<ETNBn_base> + 03A0 <sub>H</sub> + i × 4 <sub>H</sub>
	gPTP interrupt control register	ETNBnGIC	<ETNBn_base> + 03AC <sub>H</sub>
	gPTP interrupt status register	ETNBnGIS	<ETNBn_base> + 03B0 <sub>H</sub>
	gPTP timer capture register i (i = 0 to 2)	ETNBnGCTi	<ETNBn_base> + 03B8 <sub>H</sub> + i × 4 <sub>H</sub>
	E-MAC mode register	ETNBnECMR	<ETNBn_base> + 0500 <sub>H</sub>

	Transmit retry over counter register	ETNBnTROCR	<ETNBn_base> + 0700 <sub>H</sub>
	Late collision detect counter register	ETNBnCDCR	<ETNBn_base> + 0708 <sub>H</sub>
	Lost carrier counter register	ETNBnLCCR	<ETNBn_base> + 0710 <sub>H</sub>
	CRC error frame receive counter register	ETNBnCEFCR	<ETNBn_base> + 0740 <sub>H</sub>
	Frame receive error counter register	ETNBnFRECR	<ETNBn_base> + 0748 <sub>H</sub>
	Too-short frame receive counter register	ETNBnTSFRCR	<ETNBn_base> + 0750 <sub>H</sub>
	Too-long frame receive counter register	ETNBnTLFRCR	<ETNBn_base> + 0758 <sub>H</sub>
	Residual-bit frame receive counter register	ETNBnRFCR	<ETNBn_base> + 0760 <sub>H</sub>
	Multicast address frame receive counter register	ETNBnMAFCR	<ETNBn_base> + 0778 <sub>H</sub>
	Communication interface control register	ETNBnIFCTL	<ETNBn_base> + 1000 <sub>H</sub>

### 26.3.2 ETNBnCCC — AVB-DMAC Mode Register

The ETNBnCCC register specifies the operating mode of the AVB-DMAC.

**Access:** ETNBnCCC can be read or written in 32-bit units.

ETNBnCCCL and ETNBnCCCH can be read or written in 16-bit units.

ETNBnCCCLL, ETNBnCCCLH, ETNBnCCCHL, ETNBnCCCHH can be read or written in 8-bit units.

**Address:** ETNBnCCC: <ETNBn\_base> + 0000<sub>H</sub>

ETNBnCCCL: <ETNBn\_base> + 0000<sub>H</sub>

ETNBnCCCH: <ETNBn\_base> + 0002<sub>H</sub>

ETNBnCCCLL: <ETNBn\_base> + 0000<sub>H</sub>

ETNBnCCCLH: <ETNBn\_base> + 0001<sub>H</sub>

ETNBnCCCHL: <ETNBn\_base> + 0002<sub>H</sub>

ETNBnCCCHH: <ETNBn\_base> + 0003<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	OPC[1:0]	Operating Mode Configuration 00 <sub>B</sub> : Reset mode 01 <sub>B</sub> : Configuration mode 10 <sub>B</sub> : Operation mode 11 <sub>B</sub> : Standby mode

### FCE (Flow Control Enable) Bit

This bit enables the flow control support of MAC.

When flow control is enabled, the MAC gets informed about the Rx-FIFO level (Rx-FIFO fill level reached ETNBnRCR.RFCL).

### LBME (Loopback Mode Enable) Bit

This bit enables loopback mode.

In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the MII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode.

#### CAUTION

Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data. For details about the pin control, see **Section 2A, Pin Function of RH850/F1KH-D8**, **Section 2B, Pin Function of RH850/F1KM-S4, RH850/F1KM-S2**.

### BOC (Byte Order Configuration) Bit

This bit specifies the assignment of the first byte of received Ethernet frames when it is allocated to the URAM.

This setting of this register does not affect the descriptor format and filter parameters of the URAM. Writing to this bit is only possible when the current operating mode is configuration mode.

**Figure 26.2, Data of Ethernet Frame Received to Figure 26.4, When ETNBnCCC.BOC = 1** show how data from frames received via the Ethernet connection are stored in the URAM.

Figure 26.2 Data of Ethernet Frame Received

DPTR+8	Data8							Data9							Data10							Data11										

Figure 26.4 When ETNBnCCC.BOC = 1

**CSEL[1:0] (gPTP Clock Select) Bits**

These bits select the clock source for the gPTP timer.

Writing to these bits is only possible when the current operating mode is configuration mode.

**DTSR (Data Transmission Suspend Request) Bit**

This bit can suspend access to the URAM.

The access is suspended on completion of the transfer of the frame currently being transferred.

This function disables access to the URAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the URAM is necessary, for example, in checking its integrity.

**CAUTION**

The transmission and reception queues are not processed while access is suspended. Change neither the AVB-DMAC settings nor the mode until the suspend request is given by ETNBnCCC.DTSR and later the value of ETNBnCSR.DTS is updated.

**OPC[1:0] (Operating Mode Configuration) Bits**

These bits specify the operating mode.

For the operating modes, see **Section 26.4.1.1, Operating Modes**.

Writing to this bit is possible in any of the operating modes, but should not be done after the application system has issued a Power Off request.

### 26.3.3 ETNBnDBAT — Descriptor Base Address Table Register

The ETNBnDBAT register is used to set the base address of the descriptor table.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0004<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.20 ETNBnDBAT Register Contents

Bit Position	Bit Name	Function
31 to 0	TA[31:0]	Descriptor Base Table Address Base address of the descriptor table in the URAM

#### CAUTION

The setting of this bit must be a multiple of four (Bit 0 and bit 1 must be set to “0”).

#### TA[31:0] (Descriptor Base Table Address) Bits

These bits specify the base address of the descriptor table in the URAM.

For the structure of the descriptor base address table, see **Section 26.4.3, Descriptors**.

Writing to this bit is only possible when the current operating mode is configuration mode.

### 26.3.4 ETNBnDLR — Descriptor Base Address Load Request Register

The ETNBnDLR register is used to issue a request to load the values from the descriptor base address table register (ETNBnDBAT) for each queue to the current descriptor address register q (ETNBnCDARq).

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0008<sub>H</sub>

**Value after reset:** 003F FFFF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.21 ETNBnDLR Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	LBA21	Base Address Load Request (Rx17: Stream 15) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
20	LBA20	Base Address Load Request (Rx16: Stream 14) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
19	LBA19	Base Address Load Request (Rx15: Stream 13) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
18	LBA18	Base Address Load Request (Rx14: Stream 12) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
17	LBA17	Base Address Load Request (Rx13: Stream 11) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
16	LBA16	Base Address Load Request (Rx12: Stream 10) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
15	LBA15	Base Address Load Request (Rx11: Stream 9) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

Table 26.21 ETNBnDLR Register Contents

Bit Position	Bit Name	Function
14	LBA14	Base Address Load Request (Rx10: Stream 8) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
13	LBA13	Base Address Load Request (Rx9: Stream 7) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
12	LBA12	Base Address Load Request (Rx8: Stream 6) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
11	LBA11	Base Address Load Request (Rx7: Stream 5) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
10	LBA10	Base Address Load Request (Rx6: Stream 4) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
9	LBA9	Base Address Load Request (Rx5: Stream 3) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
8	LBA8	Base Address Load Request (Rx4: Stream 2) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
7	LBA7	Base Address Load Request (Rx3: Stream 1) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
6	LBA6	Base Address Load Request (Rx2: Stream 0) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
5	LBA5	Base Address Load Request (Rx1: Network Control) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
4	LBA4	Base Address Load Request (Rx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
3	LBA3	Base Address Load Request (Tx3: Stream Class A) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
2	LBA2	Base Address Load Request (Tx2: Stream Class B) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

Table 26.21 ETNBnDLR Register Contents

Bit Position	Bit Name	Function
1	LBA1	Base Address Load Request (Tx1: Network Control) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
0	LBA0	Base Address Load Request (Tx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

### LBA<sub>q</sub> (q = 0 to 21) (Base Address Load Request) Bits

Each bit is used to issue requests to load base addresses and to indicate that a base address is currently being loaded.

Setting this bit to 1 issues a request for loading the descriptor base address for the queue q.

If transfer is currently in progress, loading is executed on completion of transfer for the current frame. Completion of loading leads to automatic setting of the corresponding bit to 0.

For transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is operation mode. Only 1 can be written to this bit.

### 26.3.5 ETNBnCSR — AVB-DMAC Status Register

The ETNBnCSR register is used to indicate the operating mode in which the AVB-DMAC is running and communications states.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 000C<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.22 ETNBnCSR Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned.
20	RPO	Receive Process Status 0: Normal operation 1: Reception is in progress.
19	TPO3	Transmit Process Status 3 (Stream Class A) 0: Normal operation 1: Transmission is in progress.
18	TPO2	Transmit Process Status 2 (Stream Class B) 0: Normal operation 1: Transmission is in progress.
17	TPO1	Transmit Process Status 1 (Network Control) 0: Normal operation 1: Transmission is in progress.
16	TPO0	Transmit Process Status 0 (Best Effort) 0: Normal operation 1: Transmission is in progress.
15 to 9	Reserved	When read, the value after reset is returned.
8	DTS	Data Transmission Suspended Status 0: Normal operation 1: Transmission is suspended.
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	OPS[3:0]	Operating Mode Status 0001 <sub>B</sub> : Reset 0010 <sub>B</sub> : Configuration mode 0100 <sub>B</sub> : Operation mode 1000 <sub>B</sub> : Standby mode Other settings are prohibited.

**RPO (Receive Process Status) Bit**

This bit indicates whether a reception queue contains an unread received frame.

This bit being set to 1 indicates that a received frame is yet to be stored in the URAM.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Received frames in the reception FIFO all being stored in the URAM.

[Setting condition]

- A received frame being stored in the reception FIFO (but not yet in the URAM)

**TPO3 (Transmit Process Status 3) Bit**

This bit indicates whether a class A stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ3) is set to 0)

[Setting condition]

- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ3))

**TPO2 (Transmit Process Status 2) Bit**

This bit indicates whether a class B stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ2) is set to 0)

[Setting condition]

- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ2))

**TPO1 (Transmit Process Status 1) Bit**

This bit indicates whether a network control is being transmitted.

When this bit is set to 1, the AVB-DMAC is fetching data in the URAM or E-MAC is transmitting data.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ1) is set to 0)

[Setting condition]

- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ1))

**TPO0 (Transmit Process Status 0) Bit**

This bit indicates whether a best effort is being transmitted.

When this bit is set to 1, the AVB-DMAC is fetching data in the URAM or E-MAC is transmitting data.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ0) is set to 0)

[Setting condition]

- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ0))

**DTS (Data Transmission Suspend Status) Bit**

This bit indicates whether access to the URAM is enabled.

[Clearing conditions]

- The current operating mode is not operating mode.
- The data transmission suspend request bit in the AVB-DMAC mode register (ETNBnCCC.DTSR) being 0.

[Setting condition]

- Access to the URAM not proceeding while the data transmission suspend request bit (ETNBnCCC.DTSR) in the AVB-DMAC mode register is 1 (if the URAM is being accessed, this bit is set to 1 on completion of access).

**OPS[3:0] (Operating Mode Status) Bits**

These bits indicate the current operating mode.

For the operating modes, see **Section 26.4.1.1, Operating Modes**.

### 26.3.6 ETNBnCDARq — Current Descriptor Address Register q (q = 0 to 21)

The ETNBnCDARq register indicates the current descriptor address.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 0010<sub>H</sub> + q × 4<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.23 ETNBnCDARq Register Contents

Bit Position	Bit Name	Function
31 to 0	CDA[31:0]	Current Descriptor Address The address of the current descriptors for the transmission queues

#### CDA[31:0] (Current Descriptor Address) Bits

ETNBnCDAR0 to ETNBnCDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while ETNBnCDAR4 to ETNBnCDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, contents of this bits are changed to (ETNBnDBAT + q × 8).

Also, when the descriptor base address load request register (ETNBnDLR) issues a load request, the contents of the corresponding register are changed to the descriptor base address table register (ETNBnDBAT).

[Conditions for Updating]

- These bits are set to 0 when the operating mode is not operation mode.
- This register is updated when a descriptor to a queue is processed.

### 26.3.7 ETNBnESR — Error Status Register

The ETNBnESR register indicates the state of error by the AVB-DMAC.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 0088<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EIL	ET[3:0]			—	—	—	EQN[4:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.24 ETNBnESR Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned.
12	EIL	Error Information Lost 0: No loss of error information 1: Lost of error information detected
11 to 8	ET[3:0]	Error Type 0000 <sub>B</sub> : Read descriptor from URAM 0001 <sub>B</sub> : Write descriptor to URAM 0010 <sub>B</sub> : Interpret read descriptor 0011 <sub>B</sub> : Tx-Buffer is corrupted 0100 <sub>B</sub> : Read data from URAM 0101 <sub>B</sub> : Write data or timestamp to URAM 0110 <sub>B</sub> : Reading from received FIFO 0111 <sub>B</sub> : Received FIFO is corrupted 1000 <sub>B</sub> : Frame size error during reception detected 1001 <sub>B</sub> : Frame size error during transmission detected 1010 <sub>B</sub> : Tx-Buffer overflow
7 to 5	Reserved	When read, the value after reset is returned.
4 to 0	EQN[4:0]	Error Queue Number

#### EIL Error Information Lost Bit

This bit indicates that error information detected by Ethernet AVB is lost because the previous reported error has not been processed by CPU.

[Changing condition]

- This bit is set to 0 when leaving OPERATION mode.
- This bit is set to 0 when CPU writes 0 to the queue error flag (ETNBnEIS.QEF) of the error interrupt status register.
- This bit is set to 1 when the set condition of the queue error flag (ETNBnEIS.QEF) is fulfilled while the queue error flag (ETNBnEIS.QEF) is 1.

### ET[3:0] Error Type Bits

These bits indicate details about the transfer stage which was handled when Ethernet AVB has detected an error.

When a fault relates to the read descriptor (ETNBnESR.ET = 0000<sub>B</sub> or 0010<sub>B</sub>), the CPU needs to correct the faulty descriptor so that the related queues can continue processing. If a queue halts at a faulty descriptor, ETNBnCDARq.CDA (q = ETNBnESR.EQN) directly checks the faulty descriptor.

When the fault is related to descriptor writing (ETNBnESR.ET = 0001<sub>B</sub>), CPU needs recognize the not-updated or incorrectly updated descriptor in queue ETNBnESR.EQN. The write problem is not influencing how Ethernet AVB processes the descriptor chain.

When the fault is related to the Tx-Buffer (ETNBnESR.ET = 0011<sub>B</sub>) CPU needs to clean-up the Tx-Buffer to correct the buffer control configuration.

All other errors are transient in nature and may be corrected by continuation of HW or SW operation; so there is no strong demand on CPU interaction. For the details of the error processing, **Section 26.4.2.3, Checking Integrity**.

The CPU can only evaluate these bits when the queue error flag (ETNBnEIS.QEF) is 1.

[Changing condition]

These bits are updated when the queue error flag (ETNBnEIS.QEF) setting conditions are satisfied and ETNBnEIS.QEF is 0.

### EQN[4:0] Error Queue Number Bits

These bits indicate the queue number which was handled when Ethernet AVB has detected an error. A fault reported for ETNBnESR.EQN = 0 to 3 is related to transmit queue t = 0 to 3.

From ETNBnESR.EQN = 4 the fault is related to receive queue r = ETNBnESR.EQN – 4. The CPU can only evaluate these bits when the queue error flag (ETNBnEIS.QEF) is 1.

The CPU can not evaluate these bits when the error type bit (ETNBnESR.ET) of the error status register is 0011<sub>B</sub> or 0111<sub>B</sub>.

[Changing condition]

These bits are updated when the set condition of the queue error flag (ETNBnEIS.QEF) is fulfilled and the queue error flag (ETNBnEIS.QEF) is 0

### 26.3.8 ETNBnRCR — Receive Configuration Register

The ETNBnRCR register is used to configure receive-relating settings of the AVB-DMAC.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0090<sub>H</sub>

**Value after reset:** 1800 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	RFCL[12:0]												
Value after reset	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	ETS2	ETS0	ESF[1:0]	ENCF	EFFS	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.25 ETNBnRCR Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28 to 16	RFCL[12:0]	Receive FIFO Warning Level Recommended value: 1800 <sub>H</sub>
15 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	ETS2	Timestamp Enable (Stream) 0: Timestamp is disabled. 1: Timestamp is enabled. Recommended value: 0
4	ETS0	Timestamp Enable (Best Effort) 0: Timestamp is disabled. 1: Timestamp is enabled. Recommended value: 0
3, 2	ESF[1:0]	Stream Filtering Select Settings for reception queues 2 to 17 00 <sub>B</sub> : Filtering is disabled. Frames are processed in queue 0 (best effort). 01 <sub>B</sub> : The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching stream frames are processed in queue 0 (best effort). 10 <sub>B</sub> : The separation filter is enabled for AVB stream frames. Non-matching stream frames are discarded. 11 <sub>B</sub> : The separation filter is enabled for AVB stream frames. Non-matching stream frames are handled with queue 0 (best effort). Recommended value: 10 <sub>B</sub> or 11 <sub>B</sub>
1	ENCF	Network Control Filtering Enable Setting for reception queue 1 (network control) 0: Network control is disabled. 1: Network control is enabled.
0	EFFS	Error Frame Enable 0: Error frames are disabled. 1: Error frames are enabled. Recommended value: 0

**RFCL[12:0] (Receive FIFO Warning Level) Bits**

These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission.

If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending.

If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending.

Writing to this bit is only possible when the current operating mode is configuration mode.

**CAUTION**

---

In the case of this LSI chip, set these bits to 1800<sub>H</sub>.

---

**ETS2 (Timestamp Enable (Stream)) Bit**

This bit enables timestamp information included in reception queues 2 to 17.

Writing to this bit is only possible when the current operating mode is configuration mode. Set this bit to 1 when use the extended descriptor.

**ETS0 (Timestamp Enable (Best Effort)) Bit**

This bit enables timestamp information included in reception queue 0.

Writing to this bit is only possible when the current operating mode is configuration mode. Set this bit to 1 when use the extended descriptor.

**ESF[1:0] (Stream Filtering Select) Bits**

These bits select separation filtering to reception queues 2 to 17.

The queue-dependent separation filter can be used in combination with the identification of AVB stream frames.

When the value is 00<sub>B</sub>, filtering is disabled and frames from streams are processed in reception queue 0 (best effort).

When the value is 01<sub>B</sub>, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

When the value is 10<sub>B</sub>, the separation filter is enabled for AVB stream frames; frames from non-matching streams are discarded.

When the value is 11<sub>B</sub>, the separation filter is enabled for AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

For separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

Writing to this bit is only possible when the current operating mode is configuration mode.

**ENCF (Enable Network Control Filtering) Bit**

Enables the AVB network control frame for reception queue 1.

When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort). Writing to this bit is only possible when the current operating mode is configuration mode.

**EFFS (Enable Error Frame) Bit**

Enables or disables the reception of frames that have been classified as error frames by the E-MAC. Received error frames are stored in reception queue 0 (best effort).

An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MSC).

Writing to this bit is only possible when the current operating mode is configuration mode.

### 26.3.9 ETNBnRQCi — Receive Queue Configuration Register i (i = 0 to 4)

The ETNBnRQCi register configures the settings of receive queue ( $r = 0 + i \times 4$  to  $3 + i \times 4$ ).<sup>\*1</sup>

**Access:** ETNBnRQCi can be read or written in 32-bit units.

ETNBnRQCIL and ETNBnRQCIH can be read or written in 16-bit units.<sup>\*2</sup>

ETNBnRQCILL, ETNBnRQCILH, ETNBnRQCIHL, ETNBnRQCIHH can be read or written in 8-bit units.<sup>\*2</sup>

**Address:** ETNBnRQCi: <ETNBn\_base> + 0094<sub>H</sub> + i × 4<sub>H</sub>

ETNBnRQCIL: <ETNBn\_base> + 0094<sub>H</sub> + i × 4<sub>H</sub>

ETNBnRQCIH: <ETNBn\_base> + 0094<sub>H</sub> + i × 4<sub>H</sub> + 2<sub>H</sub>

ETNBnRQCILL: <ETNBn\_base> + 0094<sub>H</sub> + i × 4<sub>H</sub>

ETNBnRQCILH: <ETNBn\_base> + 0094<sub>H</sub> + i × 4<sub>H</sub> + 1<sub>H</sub>

ETNBnRQCIHL: <ETNBn\_base> + 0094<sub>H</sub> + i × 4<sub>H</sub> + 2<sub>H</sub>

ETNBnRQCIHH: <ETNBn\_base> + 0094<sub>H</sub> + i × 4<sub>H</sub> + 3<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	UFCCr[1:0] (r = 3 + i × 4) <sup>*3</sup>		—	—	RSMr[1:0] (r = 3 + i × 4) <sup>*3</sup>		—	—	UFCCr[1:0] (r = 2 + i × 4) <sup>*3</sup>		—	—	RSMr[1:0] (r = 2 + i × 4) <sup>*3</sup>	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

	—	—	UFCCr[1:0] (r = 1 + i × 4) <sup>*3</sup>		—	—	RSMr[1:0] (r = 1 + i × 4) <sup>*3</sup>		—	—	UFCCr[1:0] (r = 0 + i × 4) <sup>*3</sup>		—	—	RSMr[1:0] (r = 0 + i × 4) <sup>*3</sup>	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Note 1. The ETNBnRQC4 register corresponds to reception queues from 16 and 17.

Note 2. The ETNBnRQC4 register corresponds to ETNBnRQC4, ETNBnRQC4L, ETNBnRQC4LL, and ETNBnRQC4LH only.

Note 3. The ETNBnRQC4 register corresponds to RSM16[1:0], UFCC16[1:0], RSM17[1:0], and UFCC17[1:0] only and bits from 16 to 31 are reserved bits.

Table 26.26 ETNBnRQCi Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29, 28	UFCCr[1:0]	Unread Frame Counter Configuration (Receive Queue 3 + i × 4) These bits set the unread frame counter used in reception queue 3 + i × 4.
27, 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	RSMr[1:0]	Receive Synchronous Mode (Receive Queue 3 + i × 4) 00 <sub>B</sub> : Mode with write-back Other than 00 <sub>B</sub> : Setting prohibited
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21, 20	UFCCr[1:0]	Unread Frame Counter Configuration (Receive Queue 2 + i × 4) These bits set the unread frame counter used in reception queue 2 + i × 4.
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	RSMr[1:0]	Receive Synchronous Mode (Receive Queue 2 + i × 4) 00 <sub>B</sub> : Mode with write-back Other than 00 <sub>B</sub> : Setting prohibited
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13, 12	UFCCr[1:0]	Unread Frame Counter Configuration (Receive Queue 1 + i × 4) These bits set the unread frame counter used in reception queue 1 + i × 4.

Table 26.26 ETNBnRQCi Register Contents

Bit Position	Bit Name	Function
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	RSMr[1:0]	Receive Synchronous Mode (Receive Queue 1 + i × 4) 00 <sub>B</sub> : Mode with write-back Other than 00 <sub>B</sub> : Setting prohibited
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	UFCCr[1:0]	Unread Frame Counter Configuration (Receive Queue 0 + i × 4) These bits set the unread frame counter used in reception queue 0 + i × 4.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	RSMr[1:0]	Receive Synchronous Mode (Receive Queue 0 + i × 4) 00 <sub>B</sub> : Mode with write-back Other than 00 <sub>B</sub> : Setting prohibited

### UFCCr[1:0] (r = 0 to 17) Unread Frame Counter Configuration Bits

These bits set the unread frame counter for reception queue r.

With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter stop level configuration register (ETNBnUFCS) to set the warning level and stop level of the unread frame counter.

Set the pattern number (0 to 3) set in the unread frame counter stop level configuration register (ETNBnUFCS) in these bits.

When the value is 00<sub>B</sub>, the stop function is disabled.

Writing to the bits is only possible when the current operating mode is configuration mode.

### RSMr[1:0] (r = 0 to 17) Receive Synchronous Mode Bits

These bits set receive synchronous mode. Set 00<sub>B</sub> in these bits.

For receive synchronous mode, see **Section 26.4.4.3(3), Mode with Write-Back**.

Writing to the bits is only possible when the current operating mode is configuration mode.

### 26.3.10 ETNBnRPC — Receive Padding Configuration Register

The ETNBnRPC register is used to set padding for received frames.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 00B0<sub>H</sub>

**Value after reset:** 0000 0100<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	DCNT[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PCNT[2:0]		—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 26.27 ETNBnRPC Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	DCNT[7:0]	Stored Data Counter These bits specify the amount of data to be stored with the descriptor. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	PCNT[2:0]	Stored Padding Counter These bits indicate the amount of padding to be stored in data areas for descriptors. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### CAUTION

Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

#### DCNT[7:0] Stored Data Counter Bits

These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes).

When these bits are 0, all received data is stored following the initial padding.

Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see **Section 26.4.4.3(2)(c), Padding**.

#### PCNT[2:0] Stored Padding Counter Bits

These bits specify the amount of padding (1 to 7) to be appended to the URAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes).

Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see **Section 26.4.4.3(2)(c), Padding**.

### 26.3.11 ETNBnUFCS — Unread Frame Counter Stop Level Configuration Register

The ETNBnUFCS register sets the stop levels for unread frames.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 00C0<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SL3[5:0]						—	—	SL2[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SL1[5:0]						—	—	SL0[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 26.28 ETNBnUFCS Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 24	SL3[5:0]	Stop Level 3 Unread frame count stop level 3
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 16	SL2[5:0]	Stop Level 2 Unread frame count stop level 2
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	SL1[5:0]	Stop Level 1 Unread frame count stop level 1
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	SL0[5:0]	Stop Level 0 Unread frame count stop level 0 The write value should be 0.

#### SL0 to SL3[5:0] Stop Level 0 to 3 Bits

These bits set the stop levels for unread frames.

One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register *i* (ETNBnRQC<sub>i</sub>) (*i* = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

### 26.3.12 ETNBnUFCVi — Unread Frame Counter Register i (i = 0 to 4)

The ETNBnUFCVi register indicates the number of unread frames in reception queues  $r$  ( $r = 0 + i \times 4$  to  $3 + i \times 4$ ).<sup>\*1</sup>

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 00C4<sub>H</sub> +  $i \times 4$ <sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CVr[5:0]( $r = 3 + i \times 4$ ) <sup>*2</sup>						—	—	CVr[5:0]( $r = 2 + i \times 4$ ) <sup>*2</sup>					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CVr[5:0]( $r = 1 + i \times 4$ ) <sup>*2</sup>						—	—	CVr[5:0]( $r = 0 + i \times 4$ ) <sup>*2</sup>					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The ETNBnUFCV4 register corresponds to reception queues from 16 to 17.

Note 2. The ETNBnUFCV4 register corresponds to CV16[5:0] and CV17[5:0] only and bits from 16 to 31 are reserved bits.

Table 26.29 ETNBnUFCVi Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned.
29 to 24	CVr[5:0]	Unread Frame Count $3 + 4 \times i$ Number of unread frames in reception queue $3 + 4 \times i$
23, 22	Reserved	When read, the value after reset is returned.
21 to 16	CVr[5:0]	Unread Frame Count $2 + 4 \times i$ Number of unread frames in reception queue $2 + 4 \times i$
15, 14	Reserved	When read, the value after reset is returned.
13 to 8	CVr[5:0]	Unread Frame Count $1 + 4 \times i$ Number of unread frames in reception queue $1 + 4 \times i$
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	CVr[5:0]	Unread Frame Count $0 + 4 \times i$ Number of unread frames in reception queue $0 + 4 \times i$

#### CVr[5:0] (r = 0 to 17) Unread Frame Count r Bits

These bits indicate the number of unread frames in reception queue  $r$ .

The number of unread frames is decremented by the value that is written to the unread frame counter decrement register  $i$  (ETNBnUFCDi).

For a description of how to use unread frames, refer to **Section 26.4.4.4, Unread Frame Counters**.

[Conditions for Updating]

- The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (ETNBnDLR) issues a base address load request.
- The number is incremented when data received in reception queue  $r$  are stored normally. The maximum increment is 3F<sub>H</sub>. If the value exceeds 3F<sub>H</sub>, incrementation will not proceed.)
- The number is decremented by the value written to the unread frame counter decrement register  $i$  (ETNBnUFCDi).

### 26.3.13 ETNBnUFCDi — Unread Frame Counter Decrement Register i (i = 0 to 4)

The ETNBnUFCDi register is used to decrement unread counters of reception queues r ( $r = 0 + i \times 4$  to  $3 + i \times 4$ ).<sup>\*1</sup>

**Access:** ETNBnUFCDi can be read or written in 32-bit units.

ETNBnUFCDiL and ETNBnUFCDiH can be read or written in 16-bit units.<sup>\*2</sup>

ETNBnUFCDiLL, ETNBnUFCDiLH, ETNBnUFCDiHL, ETNBnUFCDiHH can be read or written in 8-bit units.<sup>\*2</sup>

**Address:** ETNBnUFCDi:  $\langle \text{ETNBn\_base} \rangle + 00\text{E}0_{\text{H}} + i \times 4_{\text{H}}$

ETNBnUFCDiL:  $\langle \text{ETNBn\_base} \rangle + 00\text{E}0_{\text{H}} + i \times 4_{\text{H}}$

ETNBnUFCDiH:  $\langle \text{ETNBn\_base} \rangle + 00\text{E}0_{\text{H}} + i \times 4_{\text{H}} + 2_{\text{H}}$

ETNBnUFCDiLL:  $\langle \text{ETNBn\_base} \rangle + 00\text{E}0_{\text{H}} + i \times 4_{\text{H}}$

ETNBnUFCDiLH:  $\langle \text{ETNBn\_base} \rangle + 00\text{E}0_{\text{H}} + i \times 4_{\text{H}} + 1_{\text{H}}$

ETNBnUFCDiHL:  $\langle \text{ETNBn\_base} \rangle + 00\text{E}0_{\text{H}} + i \times 4_{\text{H}} + 2_{\text{H}}$

ETNBnUFCDiHH:  $\langle \text{ETNBn\_base} \rangle + 00\text{E}0_{\text{H}} + i \times 4_{\text{H}} + 3_{\text{H}}$

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	DVR[5:0] ( $r = 3 + i \times 4$ ) <sup>*3</sup>						—	—	DVR[5:0] ( $r = 2 + i \times 4$ ) <sup>*3</sup>					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The ETNBnUFCD4 register corresponds to reception queues from 16 to 17.

Note 2. The ETNBnUFCD4 register corresponds to ETNBnUFCD4, ETNBnUFCD4L, ETNBnUFCD4LL, and ETNBnUFCD4LH only.

Note 3. The ETNBnUFCD4 register corresponds to DV16[5:0] and DV17[5:0] only and bits from 16 to 31 are reserved bits.

Table 26.30 ETNBnUFCDi Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 24	DVR[5:0]	Unread Frame Decrement Value $3 + 4 \times i$ Unread frame decrement value for reception queue $3 + 4 \times i$
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 16	DVR[5:0]	Unread Frame Decrement Value $2 + 4 \times i$ Unread frame decrement value for reception queue $2 + 4 \times i$
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	DVR[5:0]	Unread Frame Decrement Value $1 + 4 \times i$ Unread frame decrement value for reception queue $1 + 4 \times i$
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	DVR[5:0]	Unread Frame Decrement Value $0 + 4 \times i$ Unread frame decrement value for reception queue $0 + 4 \times i$

**DVr[5:0] (r = 0 to 17) Unread Frame Decrement Value r Bits**

These bits set the decrement value for unread frames in reception queue r. The value of an unread frame counter register i (ETNBnUFCVi) (i = 0 to 4) is decremented by the value set in the corresponding bits of this register.

Write 3F<sub>H</sub> to these bits to reset the unread counters in reception queue r. These bits are always read as 0.

### 26.3.14 ETNBnSFO — Separation Filter Offset Register

The ETNBnSFO register sets an offset into frames for use by the separation filter.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 00FC<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	FBP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.31 ETNBnSFO Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	FBP[5:0]	First Byte Position Position of the first byte of Ethernet frames in the separation filter

#### FBP[5:0] First Byte Position Bits

These bits set the position of the first byte of Ethernet frames in the separation filter.

When these bits are 0, the separation filter starts from the top of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see **Figure 26.2, Data of Ethernet Frame Received**, in **Section 26.3.2, ETNBnCCC — AVB-DMAC Mode Register**.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

#### CAUTION

Received frames having fewer bytes than the setting of these bits + 8 bytes do not match the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (ETNBnRCR.ESF).

### 26.3.15 ETNBnSFPi — Separation Filter Pattern Register i (i = 0 to 31)

The ETNBnSFPi register configures the pattern of the separation filter used for reception queues 2 to 17.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0100<sub>H</sub> + i × 4<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FPs[31:16]*2 (s = reception queue r – 2)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FPs[15:0]*1 (s = reception queue r – 2)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. In this case, i is an even number. When i is an odd number, FPs[47:32]

Note 2. In this case, i is an even number. When i is an odd number, FPs[63:48]

Table 26.32 ETNBnSFPi Register Contents

Bit Position	Bit Name	Function
31 to 0	FPs[63:0]	Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue.

#### FPs[63:0] (s = 0 to 15) Separation Filter Pattern Bits

These bits set the pattern for a separation filter to be used with reception queues 2 to 17 (for streams 0 to 15).

Each queue has space of 64-bit. Reception queue 2 (Stream 0) uses ETNBnSFP0 and ETNBnSFP1. Reception queue 17 (Stream 15) uses ETNBnSFP30 and ETNBnSFP31.

The separation filter passes a frame when, after masking by the mask value set in the separation filter mask register (ETNBnSFMi), data from received frames match the value defined in these bits.

ETNBnSFPi.FPs[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while ETNBnSFPi.FPs[63:56] (where i is the odd number) are used for the byte at the address specified by the separation filter offset register (ETNBnSFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

### 26.3.16 ETNBnSFMi — Separation Filter Mask Register i (i = 0 or 1)

The ETNBnSFMi register sets the mask value of the separation filter used for reception queue 2 to 17.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 01C0<sub>H</sub> + i × 4<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CFM[31 + 32 × i: 16 + 32 × i]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFM[15 + 32 × i: 0 + 32 × i]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.33 ETNBnSFMi Register Contents

Bit Position	Bit Name	Function
31 to 0	CFM[63:0]	Separation Filter Mask These bits set the mask value for the separation filter.

#### CFM[63:0] Separation Filter Mask Bits

These bits set the mask value for the separation filter for use with the corresponding reception queue 2 to 17 (stream 0 to 15).

ETNBnSFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while ETNBnSFM1.CFM[63:56] are used for the separation filter offset register (ETNBnSFO) + 7.

Frame data at the positions of mask bits that are set to 0 are masked; that is, they do not affect pattern- matching by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode. For separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

### 26.3.17 ETNBnTGC — Transmit Configuration Register

The ETNBnTGC register configures the transmission-relating settings of the AVB-DMAC.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0300<sub>H</sub>

**Value after reset:** 0022 2200<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TBD3[1:0]		—	—	TBD2[1:0]

Table 26.34 ETNBnTGC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21, 20	TBD3[1:0]	Transmit FIFO Size (Stream Class A) Number of frames to be fetched from transmission queue 3 (for stream class A) <b>CAUTION:</b> Write 2 to these bits.
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	TBD2[1:0]	Transmit FIFO Size (Stream Class B) Number of frames to be fetched from transmission queue 2 (for stream class B) <b>CAUTION:</b> Write 2 to these bits.
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13, 12	TBD1[1:0]	Transmit FIFO Size (Network Control) Number of frames to be fetched from transmission queue 1 (for network control) <b>CAUTION:</b> Write 2 to these bits.
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	TBD0[1:0]	Transmit FIFO Size (Best Effort) Number of frames to be fetched from transmission queue 0 (for best effort) <b>CAUTION:</b> Write 2 to these bits.
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	TQP[1:0]	Transmit Queue Priority 00: Non-AVB mode 01: AVB mode 1 10: Setting prohibited 11: AVB mode 2
3	TSM3	Transmit Synchronous Mode (Stream Class A) 0: With write-back 1: Setting prohibited
2	TSM2	Transmit Synchronous Mode (Stream Class B) 0: With write-back 1: Setting prohibited

Table 26.34 ETNBnTGC Register Contents

Bit Position	Bit Name	Function
1	TSM1	Transmit Synchronous Mode (Network Control) 0: With write-back 1: Setting prohibited
0	TSM0	Transmit Synchronous Mode (Best Effort) 0: With write-back 1: Setting prohibited

### TBDt[1:0] (t = 0 to 3) Transmit FIFO Size (Stream Class A/ Stream Class B/Network Control/Best Effort) Bits

These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queues. Writing to these bits is only possible when the current operating mode is configuration mode.

Set these bits to 2 (“10<sub>B</sub>”).

### TQP[1:0] Transmit Queue Priority Bits

These bits set the priority of the transmission queues.

00<sub>B</sub>: Non-AVB mode: Q3 → Q2 → Q1 → Q0

01<sub>B</sub>: AVB mode 1: Q3 (CBS) → Q2 (CBS) → Q1 → Q0

10<sub>B</sub>: Setting prohibited

11<sub>B</sub>: AVB mode 2: Q1 → Q3 (CBS) → Q2 (CBS) → Q0

For the credit-based shaping (CBS) algorithm, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

The CBS algorithm is invalidated in non-AVB mode (i.e. when the value is “00<sub>B</sub>”).

Writing to the bits is only possible when the current operating mode is configuration mode.

### TSM0 to TSM3 Transmit Synchronous Mode Bits

These bits set Transmit synchronous mode.

Writing to these bits is only possible when the current operating mode is configuration mode. Set these bits to 0.

### 26.3.18 ETNBnTCCR — Transmit Configuration Control Register

The ETNBnTCCR register controls transmission by the AVB-DMAC and is used to make related settings.

**Access:** ETNBnTCCR can be read or written in 32-bit units.

ETNBnTCCRL can be read or written in 16-bit units.

ETNBnTCCRL, ETNBnTCCRLH can be read or written in 8-bit units.

**Address:** ETNBnTCCR: <ETNBn\_base> + 0304<sub>H</sub>

ETNBnTCCRL: <ETNBn\_base> + 0304<sub>H</sub>

ETNBnTCCRL: <ETNBn\_base> + 0304<sub>H</sub>

ETNBnTCCRLH: <ETNBn\_base> + 0304<sub>H</sub> + 1<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 26.35 ETNBnTCCR Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	TFR	Timestamp FIFO Release 0: (Not operating) 1: Releases the oldest entry in the timestamp FIFO.
8	TFEN	Timestamp FIFO Enable 0: Recording of transmission timestamps in the timestamp FIFO is disabled. 1: Recording of transmission timestamps in the timestamp FIFO is enabled.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	TSRQ3	Transmit Start Request (Queue 3 (Stream Class A)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Wait for transmission process to fetch is performed.
2	TSRQ2	Transmit Start Request (Queue 2 (Stream Class B)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Wait for transmission process to fetch is performed.
1	TSRQ1	Transmit Start Request (Queue 1 (Network Control)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Wait for transmission process to fetch is performed.
0	TSRQ0	Transmit Start Request (Queue 0 (Best Effort)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Wait for transmission process to fetch is performed.

**TFR Timestamp FIFO Release Bit**

This bit makes the timestamp FIFO release the oldest entry.

For a description of how to use the timestamp FIFO, see **Section 26.4.5.4, Timestamping in Transmission**.

**TFEN Timestamp FIFO Enable Bit**

This bit enables storage in the timestamp FIFO.

When it is set, timestamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see **Section 26.4.5.2(2), Configuration of Transmission Frame Data Descriptors**).

When 0 is set in this bit, all timestamp FIFO entries are invalidated.

For a description of how to use the timestamp FIFO, see **Section 26.4.5.4, Timestamping in Transmission**.

**TSRQt (t = 0 to 3) Transmit Start Request (Queue t) Bit**

This bit issues a request to start transmission for transmission queue t.

When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO.

Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission.

For the scheduling of transmission queues, see **Section 26.4.5.1, Transmission Modes**.

Writing to this bit is only possible when the current operating mode is configuration mode.

Only 1 can be written to the bit. Writing 0 to the bit has no effect.

[Conditions for Updating]

The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, or when a descriptor with defective data is processed.

### 26.3.19 ETNBnTSR — Transmit Status Register

The ETNBnTSR register indicates the state of transmission by the AVB-DMAC.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 0308<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TFFL[2:0]		—	—	—	—	CCS1[1:0]		CCS0[1:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.36 ETNBnTSR Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned.
10 to 8	TFFL[2:0]	Timestamp FIFO Count Number of timestamp FIFOs
7 to 4	Reserved	When read, the value after reset is returned.
3, 2	CCS1[1:0]	CBS Counter Status 1 (Class A) 00 <sub>B</sub> : The current credit value is within the range. 01 <sub>B</sub> : The current credit value is less than or equal to the lower limit. 10 <sub>B</sub> : The current credit value is greater than or equal to the upper limit. 11 <sub>B</sub> : (Reserved)
1, 0	CCS0[1:0]	CBS Counter Status 0 (Class B) 00 <sub>B</sub> : The current credit value is within the range. 01 <sub>B</sub> : The current credit value is less than or equal to the lower limit. 10 <sub>B</sub> : The current credit value is greater than or equal to the upper limit. 11 <sub>B</sub> : (Reserved)

#### TFFL[2:0] Timestamp FIFO Count Bits

These bits indicate the number of timestamps in the timestamp FIFO.

The value 0 indicates it is empty and the value 2 indicates it is full (values 3 to 7 are reserved).

[Conditions for Updating]

- The bits are set to 0 when the operating mode is not operation mode or when the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) = 0.
- When the timestamp FIFO enable bit (ETNBnTCCR.TFEN) is 1 and these bits are not 2, the value of these bits is incremented after a frame with DESCR.TSR set has been transmitted by the E- MAC (for DESCR.TSR, see **Section 26.4.5.2(2), Configuration of Transmission Frame Data Descriptors**).

The value of these bits is decremented if it is not 0 when 1 is written to the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR).

**CCS0 and CCS1[1:0] CBS Counter Status 0 and 1 Bits**

These bits indicate the CBS (credit-based shaping) state of stream data transmission queues 0 and 1. If the calculated credit value is outside the range specified by CBS upper limit register c (ETNBnCULc) and CBS lower limit register c (ETNBnCLLc), it falls outside the range for CBS.

[Conditions for Updating]

- The bits are set to 00<sub>B</sub> when the operating mode is not operation mode.
- When the determined credit value is within the range, 00<sub>B</sub> is set.
- If the determined credit value is lower than the CBS lower limit register c (ETNBnCLLc), 01<sub>B</sub> is set.
- If the determined credit value is higher than the upper limit register c (ETNBnCULc), 10<sub>B</sub> is set.

### 26.3.20 ETNBnTFA0 — Timestamp FIFO Access Register 0

ETNBnTFA0 indicates the nano seconds portion of the timestamp value.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 0310<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.37 ETNBnTFA0 Register Contents

Bit Position	Bit Name	Function
31 to 0	TSV[31:0]	Timestamp Value

#### TSV[79:0] Timestamp Value Bits

These 80 bits consist of ETNBnTFA0.TSV[31:0], ETNBnTFA1.TSV[63:32], and ETNBnTFA2.TSV[79:64], which together indicate the oldest timestamp value stored in the timestamp FIFO.

Once the timestamp FIFO is full, no further timestamp values are stored.

[Conditions for Updating]

- The bits are set to 0000 0000<sub>H</sub> when the operating mode is not operation mode.
- The register is updated whenever a value is stored in the timestamp FIFO (when the timestamp FIFO count bit in the transmit status register (ETNBnTSR.TFFL) changes from 0 to 1).
- The register is updated when the oldest entry is released (when the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR) is set to 1).

### 26.3.21 ETNBnTFA1 — Timestamp FIFO Access Register 1

The ETNBnTFA1 register indicates the lower seconds portion of the timestamp value.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 0314<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSV[63:48]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.38 ETNBnTFA1 Register Contents

Bit Position	Bit Name	Function
31 to 0	TSV[63:32]	Timestamp Value

#### TSV[63:32] Timestamp Value Bits

For details, see **Section 26.3.20, ETNBnTFA0 — Timestamp FIFO Access Register 0.**

### 26.3.22 ETNBnTFA2 — Timestamp FIFO Access Register 2

The ETNBnTFA2 register indicates the timestamp tag and the higher seconds portion of the timestamp value.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 0318<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	TST[9:0]									
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSV[79:64]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.39 ETNBnTFA2 Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25 to 16	TST[9:0]	Timestamp Tag
15 to 0	TSV[79:64]	Timestamp Value

#### TST[9:0] Timestamp Tag Bits

These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the timestamp values (timestamp FIFO access register 0 to 2 (ETNBnTFA0 to 2)) which can be placed in the FIFO.

For transmit frame tagging, **Section 26.4.5.4, Timestamping in Transmission.**

[Conditions for Updating]

- The bits are set to 000<sub>H</sub> when the operating mode is not operation mode.
- The bits are updated when a value is stored in the timestamp FIFO (when the value of the timestamp FIFO count bit in the transmit status register (ETNBnTSR.TFFL) changes from 0 to 1).
- The bits are updated when the oldest entry has been released (1 is set in the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR)).

#### TSV[79:64] Timestamp Value Bits

For details, see **Section 26.3.20, ETNBnTFA0 — Timestamp FIFO Access Register 0.**

### 26.3.23 ETNBnCIVRc — CBS Increment Value Register c (c = 0 or 1)

The ETNBnCIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B) and the ETNBnCIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0320<sub>H</sub> + c × 4<sub>H</sub>

**Value after reset:** 0000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CIV[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 26.40 ETNBnCIVRc Register Contents

Bit Position	Bit Name	Function
31 to 0	CIV[31:0]	CBS Increment Value Setting value: 1 to 65535 (0000 0001 <sub>H</sub> to 0000 FFFF <sub>H</sub> )

#### CIV[31:0] CBS Increment Value Bits

These bits set the increment for the CBS algorithm.

Set a value in the range from 1 to 65535 (0000 0001<sub>H</sub> to 0000 FFFF<sub>H</sub>).

The value to be written to these bits depends on the Ethernet bit rate and clk\_chi (peripheral bus clock).

For details, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

### 26.3.24 ETNBnCDVRc — CBS Decrement Value Register c (c = 0 or 1)

The ETNBnCDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The ETNBnCDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0328<sub>H</sub> + c × 4<sub>H</sub>

**Value after reset:** FFFF FFFF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CDV[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Table 26.41 ETNBnCDVRc Register Contents

Bit Position	Bit Name	Function
31 to 0	CDV[31:0]	CBS Decrement Value Setting value: -1 to -65536 (FFFF FFFF <sub>H</sub> to FFFF 0000 <sub>H</sub> )

#### CDV[31:0] CBS Decrement Value Bits

These bits set the decrement for the CBS algorithm.

Set a negative value from -1 to -65536 (FFFF FFFF<sub>H</sub> to FFFF 0000<sub>H</sub>).

The value to be written to these bits depends on the Ethernet bit rate and clk\_chi (peripheral bus clock).

For details, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

### 26.3.25 ETNBnCULc — CBS Upper Limit Register c (c = 0 or 1)

The ETNBnCUL0 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The ETNBnCUL1 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0330<sub>H</sub> + c × 4<sub>H</sub>

**Value after reset:** 7FFF FFFF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULV[31:16]															
Value after reset	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Table 26.42 ETNBnCULc Register Contents

Bit Position	Bit Name	Function
31 to 0	ULV[31:0]	CBS Upper Limit Upper limit on CBS values

#### ULV[31:0] CBS Upper Limit Bits

These bits set the upper limit for credit values calculated by using the CBS algorithm.

The setting is a limiting value for error detection and does not normally affect operation of the algorithm.

Write a positive value to these bits.

For details, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

### 26.3.26 ETNBnCLLc — CBS Lower Limit Register c (c = 0 or 1)

The ETNBnCLL0 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The ETNBnCLL1 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0338<sub>H</sub> + c × 4<sub>H</sub>

**Value after reset:** 8000 0001<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.43 ETNBnCLLc Register Contents

Bit Position	Bit Name	Function
31 to 0	LLV[31:0]	CBS Lower Limit Lower limit on CBS values

#### LLV[31:0] CBS Lower Limit Bits

These bits set the lower limit for credit values calculated by using the CBS algorithm.

The setting is a limiting value for error detection and does not normally affect operation of the algorithm.

Write a negative value to these bits.

For details, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

### 26.3.27 ETNBnDIC — Descriptor Interrupt Control Register

The ETNBnDIC register is used to control descriptor interrupts 1 to 15.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0350<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

**DPE<sub>i</sub> (i = 1 to 15) Descriptor Interrupt Enable Bits**

When interrupts are allowed, and if an interrupt source occurs (descriptor interrupt status bit of the descriptor interrupt status register (ETNBnDIS 1 to 15) = 1), an interrupt is generated.

### 26.3.28 ETNBnDIS — Descriptor Interrupt Status Register

The ETNBnDIS register indicates the state of descriptor interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0354<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

6	DPF6	Descriptor Interrupt Status 6 0: The interrupt is not pending. 1: The interrupt is pending.

Table 26.45 ETNBnDIS Register Contents

Bit Position	Bit Name	Function
5	DPF5	Descriptor Interrupt Status 5 0: The interrupt is not pending. 1: The interrupt is pending.
4	DPF4	Descriptor Interrupt Status 4 0: The interrupt is not pending. 1: The interrupt is pending.
3	DPF3	Descriptor Interrupt Status 3 0: The interrupt is not pending. 1: The interrupt is pending.
2	DPF2	Descriptor Interrupt Status 2 0: The interrupt is not pending. 1: The interrupt is pending.
1	DPF1	Descriptor Interrupt Status 1 0: The interrupt is not pending. 1: The interrupt is pending.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### DPFi (i = 1 to 15) Descriptor Interrupt Status Bits

When DESC.R.DIE is 1 to 15 (0001<sub>B</sub> to 1111<sub>B</sub>), the corresponding bit indicates completion of the processing of a descriptor within the reception or transmission queue.

When DESC.R.DIE is 0, the descriptor interrupt is not generated. Only 0 can be written to these bits.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 after a descriptor with DESC.R.DIE set to the corresponding number from 1 to 15 (0001<sub>B</sub> to 1111<sub>B</sub>) is processed.

### 26.3.29 ETNBnEIC — Error Interrupt Control Register

The ETNBnEIC register controls the AVB-DMAC-related error interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0358<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 26.46 ETNBnEIC Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	TFFE	Timestamp FIFO Full-Error Interrupt Enable 0: Disabled 1: Enabled
7	CULE1	CBS Upper Limit Error Interrupt Enable (Class A) 0: Disabled 1: Enabled
6	CULE0	CBS Upper Limit Error Interrupt Enable (Class B) 0: Disabled 1: Enabled
5	CLLE1	CBS Lower Limit Error Interrupt Enable (Class A) 0: Disabled 1: Enabled
4	CLLE0	CBS Lower Limit Error Interrupt Enable (Class B) 0: Disabled 1: Enabled
3	SEE	Separation Error interrupt Enable 0: Disabled 1: Enabled
2	QEE	Queue Error interrupt Enable 0: Disabled 1: Enabled
1	MTEE	MAC Transmission Error interrupt Enable 0: Disabled 1: Enabled
0	MREE	MAC Reception Error interrupt Enable 0: Disabled 1: Enabled

**TFE Timestamp FIFO Full-Error Interrupt Enable Bits**

When the timestamp FIFO is full (the timestamp FIFO full error interrupt status bits of the error interrupt status register (ETNBnEIS.TFFF) = 1) and the interrupt is enabled, the interrupt is issued.

**CULE1 CBS Upper Limit Error Interrupt Enable Bit (Class A)**

When the CBS of Class A reached the upper limit value (CBS upper limit error interrupt status bit (Class A) (ETNBnEIS.CULF1) = 1) and the interrupt is enabled, an interrupt occurs.

**CULE0 CBS Upper Limit Error Interrupt Enable Bit (Class B)**

When the CBS of Class B reached the upper limit value (CBS upper limit error interrupt status bit (Class B) (ETNBnEIS.CULF0) = 1) and the interrupt is enabled, an interrupt occurs.

**CLLE1 CBS Lower Limit Error Interrupt Enable Bit (Class A)**

When the CBS of Class A reached the lower limit value (CBS lower limit error interrupt status bit (Class A) (ETNBnEIS.CLLF1) = 1) and the interrupt is enabled, an interrupt occurs.

**CLLE0 CBS Lower Limit Error Interrupt Enable Bit (Class B)**

When the CBS of Class B reached the lower limit value (CBS lower limit error interrupt status bit (Class B) (ETNBnEIS.CLLF0)=1) and the interrupt is enabled, an interrupt occurs.

**SEE Separation Error interrupt Enable Bit**

When the separation error flag (ETNBnEIS.SEF) is set to 1 and the interrupt is enabled, an interrupt occurs.

**QEE Queue Error interrupt Enable Bit**

When the queue error flag (ETNBnEIS.QEF) is set to 1 and the interrupt is enabled, an interrupt occurs.

**MTEE MAC Transmission Error interrupt Enable Bit**

When the MAC transmission error flag (ETNBnEIS.MTEF) is set to 1 and the interrupt is enabled, an interrupt occurs.

**MREE MAC Reception Error interrupt Enable Bit**

When the MAC reception error flag (ETNBnEIS.MREF) is set to 1 and the interrupt is enabled, an interrupt occurs.

### 26.3.30 ETNBnEIS — Error Interrupt Status Register

The ETNBnEIS register indicates the states of AVB-DMAC-related error interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 035C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFS

Table 26.47 ETNBnEIS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	QFS	Queue Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	TFFF	Timestamp FIFO Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
7	CULF1	CBS Upper Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
6	CULF0	CBS Upper Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
5	CLLF1	CBS Lower Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
4	CLLF0	CBS Lower Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
3	SEF	Separation Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.
2	QEF	Queue Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.
1	MTEF	MAC Transmission Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.

Table 26.47 ETNBnEIS Register Contents

Bit Position	Bit Name	Function
0	MREF	MAC Reception Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.

### QFS Queue Full Error Status Bit

With the interrupts enabled, this bit indicates that a queue is full (the receive queue r full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register 2 (ETNBnRIS2) = 1).

[Conditions for Changing]

- If the receive queue r full interrupt status bit (ETNBnRIS2.QFFr) and the receive queue r full interrupt enable bit in the receive interrupt control register 2 (ETNBnRIC2.QFEr) are updated, this bit is also updated.
- If the receive FIFO full interrupt status bit (ETNBnRIS2.RFFF) and the receive FIFO full interrupt enable bit (ETNBnRIC2.RFFE) are updated, this bit is also updated.

### TFFF Timestamp FIFO Full-Error Interrupt Status Bit

This bit indicates that a new transmission timestamp has been discarded due to the timestamp FIFO being full (i.e. has reached the overrun state).

Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) is set to 1 and the timestamp FIFO count bit in the transmit status register (ETNBnTSR.TFFL) is set to 2.

### CULF1 CBS Upper Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has exceeded the set upper limit (ETNBnCUL1.ULV in the CBS upper limit register c (ETNBnCULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

- This bit is set to 0 when the operating mode is not operation mode.
- This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (ETNBnTSR.CCS1) change from 00<sub>B</sub> (within the range) to 10<sub>B</sub> (indicating a value equal to or higher than the upper limit).

### CULF0 CBS Upper Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has exceeded the set upper limit (ETNBnCUL0.ULV in the CBS upper limit register c (ETNBnCULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the value of the CBS counter status 0 (Class B) (ETNBnTSR.CCS0) bit in the transmit status register changes from 00<sub>B</sub> (within the range) to 10<sub>B</sub> (indicating a value over the upper limit).

### CLLF1 CBS Lower Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has fallen below the set lower limit (ETNBnCLL1.LLV in CBS lower limit register c (ETNBnCLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the value of the CBS counter status 1 (Class A) bit in the transmit status register (ETNBnTSR.CCS1) changes from 00<sub>B</sub> (within the range) to 01<sub>B</sub> (indicating a value less than the lower limit).

### CLLF0 CBS Lower Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has fallen below the set lower limit (ETNBnCLL0.LLV in the CBS lower limit register c (ETNBnCLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register (ETNBnTSR.CCS0) changes from 00<sub>B</sub> (within the range) to 01<sub>B</sub> (indicating a value less than the lower limit).

### SEF Separation Error Flag

This bit indicates that a received frame was discarded because it has not matched any configured separation filter for AVB stream data frames.

The CPU can only write 0 to this bit.

[Changing condition]

- This bit is set to 0 when leaving OPERATION mode.
- This bit is set to 1 when a valid AVB stream data frame was received by MAC but discarded because the separation filter select bits in the receive configuration register (ETNBnRCR.ESF) are 10<sub>B</sub> and no separation filter has matched.

### QEF Queue Error Flag

This bit indicates that an error has been detected while processing reception or transmit queue. Detail about the detected error is indicated by the error status register (ETNBnESR).

For the details of the error processing, **Section 26.4.2.3, Checking Integrity**.

The CPU can only write 0 to this bit.

[Changing condition]

- This bit is set to 0 when the operating mode changes from operation mode.
- This bit is set to 1 when a state of error is detected.

**MTEF MAC Transmission Error Flag**

This bit indicates that the MAC has detected a fault during transmission. For detail the MAC registers have to be checked.

The CPU can only write 0 to this bit.

[Changing condition]

- This bit is set to 0 when the operating mode changes from operation mode.
- This bit is set to 1 when MAC detects an error during frame transmission.

**MREF MAC Reception Error Flag**

This bit indicates that the MAC has detected a fault during reception.

For detail the MAC registers have to be checked.

**NOTE**

---

When the storage of faulty received frames (ETNBnRCR.EFFS) is enabled, the MAC error code (DESCR.MSC) is stored in the descriptor. By evaluating this information CPU can identify corrupted frames in URAM.

---

The CPU can only write 0 to this bit.

[Changing condition]

- This bit is set to 0 when leaving OPERATION mode.
- This bit is set to 1 when E-MAC detects an error during frame reception.

### 26.3.31 ETNBnRIC0 — Receive Interrupt Control Register 0

The ETNBnRIC0 register controls the AVB-DMAC receive interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0360<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	FRE0	Receive Frame Interrupt Enable 0 (Best Effort) 0: Disabled 1: Enabled

### FREr (r = 0 to 17) Receive Frame Interrupt Enable Bits

When interrupts are allowed, and if an interrupt source occurs (receive interrupt status bit in the receive interrupt status register (ETNBnRIS0.FRFO to 17) = 1), an interrupt is generated.

### 26.3.32 ETNBnRIS0 — Receive Interrupt Status Register 0

The ETNBnRIS0 register indicates the states of the AVB-DMAC receive interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0364<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3	FRF3	Receive Frame Interrupt Status 3 (Stream 1) 0: The interrupt is not pending. 1: The interrupt is pending.
2	FRF2	Receive Frame Interrupt Status 2 (Stream 0) 0: The interrupt is not pending. 1: The interrupt is pending.
1	FRF1	Receive Frame Interrupt Status 1 (Network Control) 0: The interrupt is not pending. 1: The interrupt is pending.
0	FRF0	Receive Frame Interrupt Status 0 (Best Effort) 0: The interrupt is not pending. 1: The interrupt is pending.

### FRFr (r = 0 to 17) Receive Frame Interrupt Status Bits

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data is queued for CPU processing.

Only 0 can be written to the bit.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 0 when a value is written to the unread frame counter decrement register *i* (ETNBnUFCDi) (*i* = 0 to 4), and this decrements the value of unread frame counter register *i* (ETNBnUFCVi) (*i* = 0 to 4) to 0.
- When a frame is stored normally in a reception queue, the corresponding bit is set to 1.

### 26.3.33 ETNBnRIC1 — Receive Interrupt Control Register 1

The ETNBnRIC1 register controls AVB-DMAC receive interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0368<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 26.50 ETNBnRIC1 Register Contents

Bit Position	Bit Name	Function
31	RFWE	Receive FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
30 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### RFWE Receive FIFO Warning Interrupt Enable Bit

If the reception FIFO reaches the warning level (the value set in the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL)) with the corresponding interrupt enabled, an interrupt is issued.

### 26.3.34 ETNBnRIS1 — Receive Interrupt Status Register 1

The ETNBnRIS1 register indicates the states of AVB-DMAC receive interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 036C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWF	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.51 ETNBnRIS1 Register Contents

Bit Position	Bit Name	Function
31	RFWF	Receive FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
30 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### RFWF Receive FIFO Warning Interrupt Status Bit

This bit indicates that the reception FIFO has reached the set caution level (the value set in the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL)).

Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the reception FIFO reaches the set caution level (the value set in the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL)).

### 26.3.35 ETNBnRIC2 — Receive Interrupt Control Register 2

The ETNBnRIC2 register controls AVB-DMAC receive interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0370<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**RFFE Receive FIFO Full Interrupt Enable Bit**

When interrupts are allowed, and if the reception FIFO becomes full (the reception FIFO full interrupt status bit (ETNBnRIS2.RFFF) = 1 in receive interrupt status register 2), an interrupt is generated.

**QFE<sub>r</sub> (r = 0 to 17) Receive Queue r Full Interrupt Enable Bits**

When interrupts are allowed, and if a receive queue (0 to 17) becomes full (the receive queue r full interrupt status bit (ETNBnRIS2.QFF0 to 17) = 1 in receive interrupt status register 2), an interrupt is generated.

### 26.3.36 ETNBnRIS2 — Receive Interrupt Status Register 2

The ETNBnRIS2 register indicates the states of the AVB-DMAC receive interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0374<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.53 ETNBnRIS2 Register Contents

Bit Position	Bit Name	Function
8	QFF8	Receive Queue 8 (Stream 6) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
7	QFF7	Receive Queue 7 (Stream 5) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
6	QFF6	Receive Queue 6 (Stream 4) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
5	QFF5	Receive Queue 5 (Stream 3) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
4	QFF4	Receive Queue 4 (Stream 2) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
3	QFF3	Receive Queue 3 (Stream 1) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
2	QFF2	Receive Queue 2 (Stream 0) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
1	QFF1	Receive Queue 1 (Network Control) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
0	QFF0	Receive Queue 0 (Best Effort) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

### RFFF Receive FIFO Full Interrupt Status Bit

This bit indicates that a frame was received but storing it was not possible due to the reception FIFO being full.

When receiving a frame is not possible, the frame will be discarded.

Other information regarding discarded frames is not retained. Even if the frame is not discarded, this bit may also be set to 1 if the E-MAC determines that the frame is an error frame

Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the reception FIFO cannot hold received frame data.

### QFFr (r = 0 to 17) Receive r Full Interrupt Status Bits

When a received frame is dropped due to non-availability of empty descriptor, ETNBnRIS2.QFFr is correctly set to 1.

Additionally, when ETNBnUFCVi.CVr reached the configured stop level (ETNBnUFCS.SLj), the queue full flag (ETNBnRIS2.QFFr) is set to 1 even before any further received frame is dropped.

**CAUTION**

---

If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see **Section 26.4.4.3(1)(b), Storing Frame Data as Divided Frames**) an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

---

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 1 when reception queue r has no space available for storage.
- A bit is set to 1 when the unread frame counter (unread frame counter register i (ETNBnUFCVi) (i = 0 to 4)) reaches the set level for stopping.

### 26.3.37 ETNBnTIC — Transmit Interrupt Control Register

The ETNBnTIC register controls the AVB-DMAC transmit interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0378<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TFWE	TFUE	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Table 26.54 ETNBnTIC Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	TFWE	Timestamp FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
8	TFUE	Timestamp FIFO Update Interrupt Enable 0: Disabled 1: Enabled
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### TFWE Timestamp FIFO Warning Interrupt Enable Bit

When the timestamp FIFO reaches the warning level while the interrupt is enabled, the interrupt is issued.

#### TFUE Timestamp FIFO Update Interrupt Enable Bit

When the timestamp FIFO is updated while the interrupt is enabled, the interrupt is issued.

### 26.3.38 ETNBnTIS — Transmit Interrupt Status Register

The ETNBnTIS register indicates the states of the AVB-DMAC transmit interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 037C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Table 26.55 ETNBnTIS Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11, 10	Reserved	When read, an undefined value is returned. When writing, write the value after reset.
9	TFWF	Timestamp FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The timestamp FIFO has reached the warning level.
8	TFUF	Timestamp FIFO Update Interrupt Status 0: The interrupt is not pending. 1: The timestamp FIFO has been updated.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	Reserved	When read, an undefined value is returned. When writing, write the value after reset.

#### TFWF Timestamp FIFO Warning Interrupt Status Bit

This bit indicates that the transmission timestamp FIFO has reached the warning level.

Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode, when the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) is 0, or when 1 is written to the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR).
- The bits are set to “1” after a frame including DESCR.TSR set has been transmitted and one entry has already been stored (the transmit status register timestamp FIFO count bit (ETNBnTSR.TFFL) is set to “1”) in the timestamp FIFO.

**TFUF Timestamp FIFO Update Interrupt Status Bit**

This bit indicates that the transmission timestamp FIFO has been updated.

Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode, when the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) is 0, or when 1 is written to the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR).
- The bit is set to 1 when the timestamp FIFO enable bit (ETNBnTCCR.TFEN) is 1 after a frame including DESCR.TSR set has been transmitted.

### 26.3.39 ETNBnISS — Interrupt Summary Status Register

The ETNBnISS register gives a summary of the states of AVB-DMAC-related interrupts.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 0380<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DPS15	DPS14	DPS13	DPS12	DPS11	DPS10	DPS9	DPS8	DPS7	DPS6	DPS5	DPS4	DPS3	DPS2	DPS1	—

22	DPS6	Descriptor Interrupt 6 Summary 0: The interrupt is not pending. 1: The interrupt is pending.

Table 26.56 ETNBnISS Register Contents

Bit Position	Bit Name	Function
21	DPS5	Descriptor Interrupt 5 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
20	DPS4	Descriptor Interrupt 4 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
19	DPS3	Descriptor Interrupt 3 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
18	DPS2	Descriptor Interrupt 2 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
17	DPS1	Descriptor Interrupt 1 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
16 to 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13	CGIS	gPTP Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
12	RFWS	Receive FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
11, 10	Reserved	When read, an undefined value is returned. When writing, write the value after reset.
9	TFWS	Timestamp FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
8	TFUS	Timestamp FIFO Update Interrupt 0: The interrupt is not pending. 1: The interrupt is pending.
7	MS	E-MAC Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
6	ES	Error Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	Reserved	When read, an undefined value is returned. When writing, write the value after reset.

### DPS<sub>i</sub> (i = 1 to 15) Descriptor Interrupt 1 to 15 Summary Bits

These bits are set to 1 when the given descriptor interrupt enable bit (ETNBnDIC.DPE1 to ETNBnDIC.DPE15) and descriptor interrupt status flag (ETNBnDIS.DPF1 to ETNBnDIS.DPF15) are both 1.

### CGIS gPTP Interrupt Summary Bit

This bit is set to 1 when either interrupt-related bit in the two gPTP-related interrupt registers (ETNBnGIC and ETNBnGIS) is 1.

### RFWS Receive FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the receive FIFO warning interrupt enable bit (ETNBnRIC1.RFWE) and receive FIFO warning interrupt status flag (ETNBnRIS1.RFWF) are both 1.

**TFWS Timestamp FIFO Warning Interrupt Summary Bit**

This bit is set to 1 when the timestamp FIFO warning interrupt enable bit (ETNBnTIC.TFWE) and timestamp FIFO warning interrupt status flag (ETNBnTIS.TFWF) are both 1.

**TFUS Timestamp FIFO Update Interrupt Summary Bit**

This bit is set to 1 when the timestamp FIFO update interrupt enable bit (ETNBnTIC.TFUE) and timestamp FIFO update interrupt status flag (ETNBnTIS.TFUF) are both 1.

**MS E-MAC Interrupt Summary Bit**

This bit is set to 1 when an E-MAC interrupt is issued.

**ES Error Interrupt Summary Bit**

This bit is set to 1 when any of the valid bits in the error interrupt status register (ETNBnEIS) is 1 or the queue full error interrupt status bit (ETNBnEIS.QFS) in the error interrupt status register (ETNBnEIS) is 1.

### 26.3.40 ETNBnGCCR — gPTP Configuration Control Register

The ETNBnGCCR register is used to set and control the gPTP (generalized precision time protocol).

**Access:** ETNBnGCCR can be read or written in 32-bit units.

ETNBnGCCRLL can be read or written in 16-bit units.

ETNBnGCCRLL, ETNBnGCCRRLH can be read or written in 8-bit units.

**Address:** ETNBnGCCR: <ETNBn\_base> + 0390<sub>H</sub>

ETNBnGCCRLL: <ETNBn\_base> + 0390<sub>H</sub>

ETNBnGCCRLL: <ETNBn\_base> + 0390<sub>H</sub>

ETNBnGCCRRLH: <ETNBn\_base> + 0390<sub>H</sub> + 1<sub>H</sub>

**Value after reset:** 0000 003C<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 26.57 ETNBnGCCR Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	TCSS[1:0]	Timer Capture Source Select 00 <sub>B</sub> : gPTP timer value 01 <sub>B</sub> : Adjusted gPTP timer value 10 <sub>B</sub> : AVTP presentation time 11 <sub>B</sub> : Setting prohibited
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LMTT	Maximum Transit Time Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
4	LPTC	Presentation Time Compare Value Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
3	LTI	Timer Increment Value Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
2	LTO	Timer Offset Value Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.

Table 26.57 ETNBnGCCR Register Contents

Bit Position	Bit Name	Function
1, 0	TCR[1:0]	Timer Control Request 00 <sub>B</sub> : Timer control is not requested. 01 <sub>B</sub> : gPTP/AVTP presentation time reset 10 <sub>B</sub> : Setting prohibited 11 <sub>B</sub> : Captures the value set in the TCSS bit.

### TCSS[1:0] Timer Capture Source Select Bits

These bits select the source used for updating the captured timer register (gPTP timer capture register (ETNBnGCTi.CTV)).

These bits should still be controlled when timer control is not being requested (ETNBnGCCR.TCR = 00<sub>B</sub>).

### LMTT Maximum Transit Time Configuration Request Bit

This bit issues requests for configuring the gPTP maximum transit time configuration register (ETNBnGMTT). Only 1 can be written to the bit.

[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of the gPTP maximum transit time configuration register (ETNBnGMTT) is loaded.

### LPTC Presentation Time Compare Value Configuration Request Bit

This bit issues requests for configuring the gPTP presentation time comparison register (ETNBnGPTC). Only 1 can be written to the bit.

[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of the gPTP presentation time comparison register (ETNBnGPTC) is loaded.

### LTI Timer Increment Value Configuration Request Bit

This bit issues requests for configuring the gPTP timer increment configuration register (ETNBnGTI). Only 1 can be written to the bit.

[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of the gPTP timer increment configuration register (ETNBnGTI) is loaded.

### LTO Timer Offset Value Configuration Request Bit

This bit issues requests for configuring gPTP timer offset configuration register i (ETNBnGTOi). Only 1 can be written to the bit.

[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of gPTP timer offset configuration register i (ETNBnGTOi) is loaded.

**TCR[1:0] Timer Control Request Bits**

These bits issue requests for controlling the gPTP timer.

Writing to the bits is only possible when the current operating mode is operation mode.

Do not write to the bits when the gPTP timer clock select bit in the AVB-DMAC mode register is 00<sub>B</sub>.

[Conditions for Changing]

The bits are set to 00<sub>B</sub> when the operating mode is not operation mode and on completion of the requested processing.

### 26.3.41 ETNBnGMTT — gPTP Maximum Transit Time Configuration Register

The ETNBnGMTT register sets the maximum time for transitions of the gPTP timer.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0394<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MTTV[31:16]

Table 26.58 ETNBnGMTT Register Contents

Bit Position	Bit Name	Function
31 to 0	MTTV[31:0]	Maximum Transit Time The maximum transition time for addition to the presentation time

#### MTTV[31:0] Maximum Transit Time Bits

These bits set the maximum transition time for use in calculating AVTP presentation times.

Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (ETNBnGCCCR.LMTT) to 1.

#### CAUTION

Do not write a value to these bits when the operating mode is operation mode and the maximum transit time configuration request bit (ETNBnGCCCR.LMTT) is 1.

### 26.3.42 ETNBnGPTC — gPTP Presentation Time Comparison Register

The ETNBnGPTC register sets a value for comparison with presentation times in the gPTP timer.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0398<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.59 ETNBnGPTC Register Contents

Bit Position	Bit Name	Function
31 to 0	PTCV[31:0]	Presentation Time Comparison Value Value for comparison with the gPTP presentation times

#### PTCV[31:0] Presentation Time Comparison Value Bits

These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended.

Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (ETNBnGCCR.LPTC) to 1.

#### CAUTION

Do not write a value to these bits when the operating mode is operation mode and the presentation time comparison value configuration request bit (ETNBnGCCR.LPTC) is 1.

Do not write the range of “x – 1 to x + 1” to the bits. (x is a value of ETNBnGTI.TIV[27:0])

### 26.3.43 ETNBnGTI — gPTP Timer Increment Configuration Register

The ETNBnGTI register sets the increment for the gPTP timer.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 039CH

**Value after reset:** 0000 0001H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	TIV[27:16]

Table 26.60 ETNBnGTI Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27 to 0	TIV[27:0]	gPTP Timer Increment Value Increment for the gPTP timer

#### TIV[27:0] Bits (gPTP Timer Increment Value)

When the gPTP clock select bits in the AVB-DMAV mode register (ETNBnCCC.CSEL) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses.

Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (ETNBnGCCR.LTI) to 1.

#### CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer increment value configuration request bit (ETNBnGCCR.LTI) is 1.

Do not write 0 to all bits.

### 26.3.44 ETNBnGTOi — gPTP Timer Offset Configuration Register i (i = 0 to 2)

The ETNBnGTOi register sets an offset value for the gPTP timer.

The offset value is added to the combination of bits 0 to 31 in ETNBnGTO0, 32 to 63 in ETNBnGTO1, and 64 to 79 in ETNBnGTO2, which together make up the gPTP timer.

**Access:** This register can be read or written in 32-bit units.

**Address:** ETNBnGTO0: <ETNBn\_base> + 03A0<sub>H</sub>

ETNBnGTO1: <ETNBn\_base> + 03A4<sub>H</sub>

ETNBnGTO2: <ETNBn\_base> + 03A8<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TOV[31 + 32 × i:16 + 32 × i]*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TOV[15 + 32 × i:0 + 32 × i]*1															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. ETNBnGTO2 register corresponds to TOV[79:64] only and bits from 16 to 31 are reserved bits.

Table 26.61 ETNBnGTOi Register Contents

Bit Position	Bit Name	Function
31 to 0	TOV[95:0]	Timer Offset Value Offset value for the gPTP timer

#### TOV[79:0] Timer Offset Value Bits

This is an 80-bit value consisting of the settings in ETNBnGTO0.TOV[31:0], ETNBnGTO1.TOV[63:32], and ETNBnGTO2.TOV[79:64], and is used to set an offset for adding to the value of the gPTP timer.

Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCCR.LTO) to 1.

#### CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer offset value configuration request bit (ETNBnGCCCR.LTO) is 1.

Write 0000<sub>H</sub> to ETNBnGTO2.TOV[95:80].

Set a value in the range from 0 to 10<sup>9</sup>-1 (0000 0000<sub>H</sub> to 3B9A C9FF<sub>H</sub>) in ETNBnGTO0.TOV[31:0].

### 26.3.45 ETNBnGIC — gPTP Interrupt Control Register

The ETNBnGIC register is used to control gPTP-related interrupts.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 03AC<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PTME	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R

Table 26.62 ETNBnGIC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PTME	Presentation Time Match Interrupt Enable 0: Disabled 1: Enabled
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### PTME Presentation Time Match Interrupt Enable Bit

When this bit is 1, setting of the presentation time match interrupt flag in the gPTP interrupt status register (ETNBnGIS.PTMF) to 1 leads to generation of that interrupt.

### 26.3.46 ETNBnGIS — gPTP Interrupt Status Register

The ETNBnGIS register indicates the state of the gPTP-related interrupt.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 03B0<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R

Table 26.63 ETNBnGIS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PTMF	Presentation Time Match Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

#### PTMF Presentation Time Match Interrupt Flag Bit

This bit indicates that the value of the AVTP timer exceeds the value of the gPTP presentation time comparison register (ETNBnGPTC).

Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the AVTP timer value is greater than or equal to the value of the gPTP presentation time comparison register (ETNBnGPTC).

### 26.3.47 ETNBnGCTi — gPTP Timer Capture Register i (i = 0 to 2)

The ETNBnGCTi registers form an 80-bit register that captures the gPTP timer value.

**Access:** This register can be read or written in 32-bit units.

**Address:** ETNBnGCT0: <ETNBn\_base> + 03B8<sub>H</sub>  
 ETNBnGCT1: <ETNBn\_base> + 03BC<sub>H</sub>  
 ETNBnGCT2: <ETNBn\_base> + 03C0<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CTV[31 + 32 × i:16 + 32 × i]*1															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTV[15 + 32 × i:0 + 32 × i]*1															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. ETNBnGCT2 register corresponds to CTV[79:64] only and bits from 16 to 31 are reserved bits.

Table 26.64 ETNBnGCTi Register Contents

Bit Position	Bit Name	Function
31 to 0	CTV[95:0]	gPTP Timer Capture Value Captured timer value

#### CTV[79:0] gPTP Timer Capture Value Bits

These 80 bits consist of ETNBnGCT0.CTV[31:0], ETNBnGCT1.CTV[63:32] and ETNBnGCT2.CTV[79:64], which together indicate captured timer values.

When 00<sub>B</sub> (value of the gPTP timer) or 01<sub>B</sub> (adjusted gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register (ETNBnGCCR.TCSS), the corresponding 80-bit values are stored in these bits.

When 10<sub>B</sub> (AVTP presentation time) is selected by the timer capture source select bits (ETNBnGCCR.TCSS), the corresponding 32-bit values are stored in these bits (ETNBnGCT0.CTV[31:0]).

Actual writing of the timer value specified by the timer capture source select bits (ETNBnGCCR.TCSS) proceeds when 11<sub>B</sub> (timer capture request) is written to the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR).

Do not read the value while the value of the timer control request bits (ETNBnGCCR.TCR) is 11<sub>B</sub> because this indicates that storage is still in progress.

#### CAUTION

Write 0000<sub>H</sub> to ETNBnGCT2.CTV[95:80].

### 26.3.48 ETNBnECMR — E-MAC Mode Register

ETNBnECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while the transmission and reception functions are enabled (i.e. while the RE or TE bit in this register is 1).

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0500<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TRCCM	—	—	RCSC	—	DPAD	RZPF	ZPF	PFR	RXF	TXF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

	—	—	—	—	—	—	—	—	—	RE	TE	—	—	—	DM	PRM
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W

Table 26.65 ETNBnECMR Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	TRCCM	Counter Clear Mode 0: Writing to the counter register leads to the register being cleared to 0. 1: Reading from the counter register leads to the register being cleared to 0.
25, 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23	RCSC	Checksum Calculation 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated.
22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	DPAD	Data Padding 0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted. 1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.
20	RZPF	PAUSE Frame Reception with Time = 0 0: Reception of PAUSE frames with the TIME parameter value 0 is disabled. 1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.
19	ZPF	PAUSE Frame Usage with TIME = 0 Enable <ul style="list-style-type: none"> <li>PAUSE frame usage with TIME = 0 enable (in full-duplex mode)</li> </ul> 0: Control in response to and for the sending of PAUSE frames with the TIME parameter value 0 is disabled. 1: Control in response to and for the sending of PAUSE frames with the TIME parameter value is 0 is enabled.

Table 26.65 ETNBnECMR Register Contents

Bit Position	Bit Name	Function
18	PFR	PAUSE Frame Receive Mode 0: PAUSE frames are not transferred to the AVB-DMAC. 1: PAUSE frames are transferred to the AVB-DMAC.
17	RXF	Reception Flow Control Operation Mode 0: Flow control for the receiving port (reception of PAUSE frame) is disabled. 1: Flow control for the receiving port (reception of PAUSE frame) is enabled.
16	TXF	Transmission Flow Control Operation Mode 0: Flow control for the transmitting port is disabled (PAUSE frames are not automatically transmitted). 1: Flow control for the transmitting port is enabled (PAUSE frames are automatically transmitted as required).
15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	RE	Reception Enable 0: Reception is disabled. 1: Reception is enabled.
5	TE	Transmission Enable 0: Transmission is disabled. 1: Transmission is enabled.
4 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DM	When Ethernet AVB is used, this bit must be set to 1 (the value after reset is 0).
0	PRM	Promiscuous Mode 0: Normal operation 1: Promiscuous mode operation

**TRCCM Counter Clear Mode Bit**

This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers.

**RCSC Checksum Calculation Bit**

Setting this bit to 1 enables automatic calculation of checksums for the data field in received frames.

Only the data field of an Ethernet frame is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion.

**DPAD Data Padding Control Bit**

This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted.

When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission.

**RZPF (PAUSE Frame Reception with Time = 0) Bit**

This bit is set to 0, received PAUSE frames with the Timer value 0 are discarded.

This bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0.

**ZPF (PAUSE Frame Usage with TIME = 0 Enable) Bit**

- PAUSE frame usage with TIME = 0 enable (In full-duplex mode)

When this bit is set to 0, the next frame to be transmitted is not transmitted until the time specified by the Timer value has elapsed.

When this bit is set to “1”, if the amount of data in the reception FIFO becomes less than the setting of the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL) before the time specified by the Timer value elapses, a PAUSE frame with a Timer value of 0 is automatically transmitted. If the interface is in the transmission wait state, it is released from that state on receiving a PAUSE frame with a Timer value of 0.

**PFR PAUSE Frame Receive Mode Bit**

This bit specifies whether PAUSE frames are transferred to the AVB-DMAC.

**RXF (Operating Mode for Flow Control in Reception) Bit**

This bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see **Section 26.3.57, ETNBnPFRCR — PAUSE Frame Receive Counter**.

Setting this bit to 0 disables PAUSE frame detection.

**TXF (Operating Mode for Flow Control in Transmission) Bit**

This bit enables or disables flow control in transmission. Setting this bit to 0 disables PAUSE frame detection.

**RE Reception Enable Bit**

When this bit is switched from the receive function enabled (RE = 1) to the receive function disabled (RE = 0), and if there is a frame is being received, the receive function remains enabled until the reception of the frame finishes.

**TE Transmission Enable Bit**

When this bit is switched from the transmit function enabled (TE = 1) to the transmit function disabled (TE = 0), and if there is a frame being transmitted, the transmit function remains enabled until the transmission of the frame finishes.

**DM Duplex Mode Bit**

This bit selects full-duplex operation.

**PRM Promiscuous Mode Bit**

This bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.).

### 26.3.49 ETNBnRFLR — Receive Frame Length Register

The ETNBnRFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI.

This register must not be changed while reception is enabled (while the reception enable bit (ETNBnECMR.RE) in the E-MAC mode register is set to “1”).

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0508<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFL[17:16]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFL[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.66 ETNBnRFLR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17 to 0	RFL[17:0]	Receive Frame Length Setting value Check value 00000 <sub>H</sub> : 1,518 bytes : : 005EE <sub>H</sub> : 1,518 bytes 005EF <sub>H</sub> : 1,519 bytes 005F0 <sub>H</sub> : 1,520 bytes : : 1FFFF <sub>H</sub> : 131,071 bytes 20000 <sub>H</sub> : 131,072 bytes : : 3FFFF <sub>H</sub> : 131,072 bytes

#### RFL[17:0] Receive Frame Length Bits

Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value is discarded.

#### CAUTION

The prepared descriptor data size is just the specified value (ETNBnRFLR.RFL[17:0]).

Therefore descriptor data size must be more than ETNBnRFLR.RFL[17:0] + 8 if you will receive such the long frame.

### 26.3.50 ETNBnECSR — E-MAC Status Register

The ETNBnECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits that generate an interrupt, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ETNBnECSIPR) described in **Section 26.3.51, ETNBnECSIPR — E-MAC Interrupt Permission Register**.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0510<sub>H</sub>

**Value after reset:** 0000 000X<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LCHNG	—	ICD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	—	0	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 26.67 ETNBnECSR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LCHNG	Link signal change bit 0: Change of Link status signal (AVB_LINK) is not detected. 1: Change of Link status signal (AVB_LINK) is detected.
1	Reserved	When read, an undefined value is read. When writing, write the value after reset.
0	ICD	Illegal Carrier Detection 0: PHY-LSI has not detected an illegal carrier on the line. 1: PHY-LSI has detected an illegal carrier on the line.

#### LCHNG: Link Signal Change Bit

This bit indicates a transition of the link status signal (AVB\_LINK) input from the PHY-LSI from high to low or low to high.

However, signal changes may also be detected at times when the link status signal (AVB\_LINK) function is selected.

To check the current link state, refer to the link status pin state bit in the PHY status register (ETNBnPLSR.LINK).

Writing 1 to this bit clears it to 0.

#### ICD Illegal Carrier Detection Bit

This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.

Writing 1 to this bit clears it to 0.

### 26.3.51 ETNBnECSIPR — E-MAC Interrupt Permission Register

The ETNBnECSIPR register instructs permission of interrupt sources reported by the ETNBnECSR register. The bits can permit interrupts corresponding to the ETNBnECSR bits.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0518<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LINKIM	—	ICDIP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 26.68 ETNBnECSIPR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LINKIM	LINK Interrupt Mask 0: Interrupts by the LINKI setting prohibited. 1: Interrupts by the LINKI setting permitted.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ICDIP	False Carrier Detect Interrupt Enable 0: Interrupts by the ICD bit setting prohibited. 1: Interrupt by the ICD bit setting permitted.

#### LINKIM: Link Signal Change Interrupt Enable Bit

When this bit is set to “1” and the link signal change bit (ETNBnECSR.LCHNG) in the E-MAC status register is set to “1”, an interrupt occurs.

#### ICDIP Illegal Carrier Detect Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ETNBnECSR.ICD) in the E-MAC status register to 1.

### 26.3.52 ETNBnPIR — PHY Interface Register

The ETNBnPIR register provides a means of access to the PHY-LSI internal registers via the MII.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0520<sub>H</sub>

**Value after reset:** 0000 000X<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 26.69 ETNBnPIR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	MDI	MII Management Data-In Indicates the level of the ETNBnMDIO pin.
2	MDO	MII Management Data-Out Stores data to output from the ETNBnMDIO pin.
1	MMD	MII Management Mode 0: Read direction is specified. 1: Write direction is specified.
0	MDC	MII Management Data Clock The value set in this bit is output from the ETNBnMDC pin, which supplies the management data clock for the MII.

#### MDI MII Management Data-In Bit

This bit indicates the level of the ETNBnMDIO pin.

#### MDO MII Management Data-Out Bit

This bit stores data to output from the ETNBnMDIO pin.

The ETNBnMDIO pin outputs data when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).

#### MMD MII Management Mode Bit

This bit specifies the direction for data through MDIO (reading or writing).

#### MDC MII Management Data Clock Bit

Values set in this bit are output on the ETNBnMDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see **Section 26.4.12, Connection to PHY-LSI**.

### 26.3.53 ETNBnPLSR — PHY LINK Status Register

The ETNBnPLSR register is used to check the status of PHY LINK pins.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 0528<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 26.70 ETNBnPLSR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	LINK	When read, this bit returns the state of the ETNBnLINK pin.

### 26.3.54 ETNBnAPFTP — Auto PAUSE Frame Time Parameter Register

The ETNBnAPFTP register is used to set the value for the TIME parameter of automatically generated PAUSE frame.

When a PAUSE frame is automatically transmitted, the value set in this register is used as its TIME parameter.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0554<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	APFTP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 26.71 ETNBnAPFTP Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	APFTP[15:0]	Automatic PAUSE Frame Time Parameter Set a time parameter value of the Automatic PAUSE Frame.*1,*2 0000 <sub>H</sub> : Setting prohibited 0001 <sub>H</sub> : 1 × 512 bit-period 0002 <sub>H</sub> : 2 × 512 bit-period : : FFFF <sub>H</sub> : 65535 × 512 bit-period

Note 1. The bit-period changes relative to the transfer speed.

100 Mbps: 1 bit-period = 10 ns

10 Mbps: 1 bit-period = 100 ns

Note 2. When setting the Transmission flow control operation mode bit (ETNBnECMR.TXF) in the E-MAC mode register to “1”, set this register value other than 0000 0000<sub>H</sub>.

#### APFTP[15:0] Auto Pause Frame Time Parameter

These bit configure the time parameter value for the transmit of Auto Pause Frame. The unit of the setting value is 512 bit-period.

### 26.3.55 ETNBnMPR — Manual PAUSE Frame Register

The ETNBnMPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0558<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.72 ETNBnMPR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	MP[15:0]	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame.*1 0000 <sub>H</sub> : Setting prohibited 0001 <sub>H</sub> : 1 × 512 bit-period 0002 <sub>H</sub> : 2 × 512 bit-period : : FFFF <sub>H</sub> : 65535 × 512 bit-period

Note 1. The bit-period changes relative to the transfer speed.

100 Mbps: 1 bit-period = 10 ns

10 Mbps: 1 bit-period = 100 ns

#### MP[15:0] Manual PAUSE Bits

These bits set the value of the TIME parameter in manually generated PAUSE frames. The unit for the setting is 512 bit periods.

### 26.3.56 ETNBnPFTCR — PAUSE Frame Transmit Counter

The ETNBnPFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 055C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFTXC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.73 ETNBnPFTCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	PFTXC[15:0]	PAUSE Frame Transmit Counter These bits indicates the number of transmitted PAUSE frames.

#### PFTXC[15:0] PAUSE Frame Transmit Counter Bits

These bits indicate the total number of PAUSE frames that have been transmitted (both manually and automatically).

The bits are cleared to 0 when they are read.

If counting up and clearing of the counter coincide, clearing the counter takes priority.

### 26.3.57 ETNBnPFRCR — PAUSE Frame Receive Counter

The ETNBnPFRCR register is a counter that indicates the number of times PAUSE frames have been received.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <ETNBn\_base> + 0560<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFRXC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.74 ETNBnPFRCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	PFRXC[15:0]	PAUSE Frame Receive Counter Counter for counting the number of received PAUSE frames

#### PFRXC[15:0] PAUSE Frame Receive Counter Bits

These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ETNBnECMR = 1).

The bits are cleared to 0 when they are read.

If counting up and clearing the counter coincide, clearing the counter takes priority.

### 26.3.58 ETNBnMAHR — MAC Address High Register

The ETNBnMAHR register specifies the 32 higher-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

This register must not be changed while transmission or reception is enabled (E-MAC mode register reception enable bit (ETNBnECMR.RE) is set to “1” or transmission enable bit (ETNBnECMR.TE) is set to “1”).

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 05C0<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MA[47:32]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.75 ETNBnMAHR Register Contents

Bit Position	Bit Name	Function
31 to 0	MA[47:16]	MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the MAC address.

#### MA[47:16] MAC Address Bits 47 to 16

These bits are used to set the 32 higher-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set 0123 4567<sub>H</sub> in the this register.

### 26.3.59 ETNBnMALR — MAC Address Low Register

The ETNBnMALR register specifies the 16 lower-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

This register must not be changed while transmission or reception is enabled (E-MAC mode register reception enable bit (ETNBnECMR.RE) is set to “1” or transmission enable bit (ETNBnECMR.TE) is set to “1”).

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 05C8<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.76 ETNBnMALR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	MA[15:0]	MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the MAC address.

#### MA[15:0] MAC Address Bits 15 to 0

These bits are used to set the 16 lower-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set 89AB<sub>H</sub> in the ETNBnMALR register.

### 26.3.60 ETNBnTROCR — Transmit Retry Over Counter Register

In this product, this register is not used because a half-duplex mode is not supported.

It shall be retained the value after reset.

The ETNBnTROCR register is a counter that indicates the number of frames the module was unable to transmit in 16 attempts at transmission including the first attempt and retries. When 16 attempts to transmit a frame fail, this register is incremented by 1. Counting up stops when the value in this register reaches 0000 FFFF<sub>H</sub>.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0700<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TROCR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.77 ETNBnTROCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	TROCR[15:0]	Transmit Retry Over Counter These bits indicate the number of frames the module was unable to transmit in 16 attempts at transmission, including the first attempt and retries.

#### TROCR[15:0] Transmit Retry Over Counter Bits

These bits indicate the number of frames the module was unable to transmit in 16 attempts at transmission, including the first attempt and retries.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 26.3.61 ETNBnCDCR — Late Collision Detect Counter Register

In this product, this register is not used because a half-duplex mode is not supported.

It shall be retained the value after reset.

The ETNBnCDCR register is a counter that indicates the number of all late collisions that occurred on the line after the start of data transmission. Counting up stops when the value in this register reaches 0000 FFFF<sub>H</sub>.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0708<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COSDC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.78 ETNBnCDCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	COSDC[15:0]	Late Collision Detect Counter These bits indicate the number of all late collisions after the start of data transmission.

#### COSDC[15:0] Collision Detect Counter Bits

These bits indicate the number of all late collisions after the start of data transmission.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 26.3.62 ETNBnLCCR — Lost Carrier Counter Register

In this product, this register is not used because a half-duplex mode is not supported.

It shall be retained the value after reset.

The ETNBnLCCR register is a counter that indicates the number of times the carrier was lost during data transmission. Counting up stops when the value in this register reaches 0000 FFFF<sub>H</sub>.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0710<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 26.79 ETNBnLCCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	LCC[15:0]	Lost Carrier Counter These bits indicate the number of times the carrier was lost during data transmission.

#### LCC[15:0] Lost Carrier Counter Bits

These bits indicate the number of times the carrier was lost during data transmission.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 26.3.63 ETNBnCEFCR — CRC Error Frame Receive Counter Register

The ETNBnCEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches 0000 FFFF<sub>H</sub>.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0740<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 26.80 ETNBnCEFCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	CEFEC[15:0]	CRC Error Frame Counter These bits indicate the number of CRC error frames received.

#### CEFEC[15:0] CRC Error Frame Counter Bits

These bits indicate the number of received frames having CRC errors.

The bits are cleared to “0” when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to “1”.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 26.3.64 ETNBnFRECR — Frame Receive Error Counter Register

The ETNBnFRECR register is a counter that indicates the number of frame receive errors were generated by input on the ETNBnRXERR pin from the PHY-LSI. Counting up stops when the value in this register reaches 0000 FFFF<sub>H</sub>.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0748<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.81 ETNBnFRECR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	FRECR[15:0]	Frame Receive Error Counter These bits indicate the number of errors during frame reception.

#### FRECR[15:0] Frame Receive Error Counter Bits

These bits indicate the number of errors during frame reception.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 26.3.65 ETNBnTSFRCR — Too-Short Frame Receive Counter Register

The ETNBnTSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches 0000 FFFF<sub>H</sub>.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0750<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 26.82 ETNBnTSFRCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	TSFRC[15:0]	Too-Short Frame Receive Counter These bits indicate the number of frames received with a length of less than 64 bytes.

#### TSFRCR[15:0] Too-Short Frame Receive Counter Bits

These bits indicate the number of received frames that were fewer than 64 bytes in length.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 26.3.66 ETNBnTLFRCR — Too-Long Frame Receive Counter Register

The ETNBnTLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (ETNBnRFLR). Counting up stops when the value in this register reaches 0000 FFFF<sub>H</sub>.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0758<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 26.83 ETNBnTLFRCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	TLFC[15:0]	Too-Long Frame Receive Counter These bits indicate the number of frames received with a length exceeding the value in ETNBnRFLR.

#### TLFRCR[15:0] Too-Long Frame Receive Counter Bits

These bits indicate the number of received frames that were longer than the value in ETNBnRFLR.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 26.3.67 ETNBnRFCR — Residual-Bit Frame Receive Counter Register

The ETNBnRFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches 0000 FFFF<sub>H</sub>.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0760<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	RFC[15:0]	Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits.

#### RFC[15:0] Residual-Bit Frame Receive Counter Bits

These bits indicate the number of received frames containing residual bits.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 26.3.68 ETNBnMAFCR — Multicast Address Frame Receive Counter Register

The ETNBnMAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches 0000 FFFF<sub>H</sub>.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 0778<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	MAFC[15:0]	Multicast Address Frame Counter These bits indicate the number of multicast frames that have been received.

#### MAFC[15:0] Multicast Address Frame Counter Bits

These bits indicate the number of multicast frames that have been received.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

### 26.3.69 ETNBnIFCTL — Communication Interface Control Register

The ETNBnIFCTL register specifies the communication interface.

**Access:** This register can be read or written in 32-bit units.

**Address:** <ETNBn\_base> + 1000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	IFS	This bit selects the communication interface. 0: MII mode 1: Setting prohibited

## 26.4 Operation

The Ethernet AVB consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the MII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. The information is referred to as descriptors. The AVB-DMAC reads data for transmission from the storage area for data to be transmitted and writes received data to the storage area for received data according to the information described in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports a MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the MII. It also performs CRC checking of Ethernet frames received from the MII and writes the frames to the reception FIFO.

### 26.4.1 AVB-DMAC Operating Modes

**Figure 26.5, Operating Mode of AVB-DMAC** illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset)
- Configuration of the operating mode configuration bits (ETNBnCCC.OPC) in the AVB-DMAC mode register

The current operating mode can be determined by reading the operating mode status bits in the AVB-DMAC status register (ETNBnCSR.OPS).

Figure 26.5 Operating Mode of AVB-DMAC

### 26.4.1.1 Operating Modes

(1) Reset Mode

After a hardware reset, the AVB-DMAC enters reset mode.

In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

NOTE

---

When the operating mode transfers to reset mode all registers, except the ETNBnIFCTL register, are initialized to their reset values.

---

(2) Configuration Mode

In configuration mode, various settings for the AVB-DMAC can be made.

The operating functions are stopped and all status registers are initialized to their reset values. The E-MAC functions in this mode.

(3) Operation Mode

In operation mode, all functions of the AVB-DMAC can operate. Ethernet communications can only proceed in this mode.

In operation mode, do not set E-MAC again.

(4) Standby Mode

In standby mode, the E-MAC can only be used to control the operating mode. Other functions cannot be used.

### 26.4.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC mode register (ETNBnCCC.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (ETNBnCSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (ETNBnCCC.OPC) (**Figure 26.6, Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)**).

For transitions from operation mode to configuration mode, follow the procedure in **Figure 26.7, Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)** because any transmission and reception in progress will be executed before the transition to configuration mode.

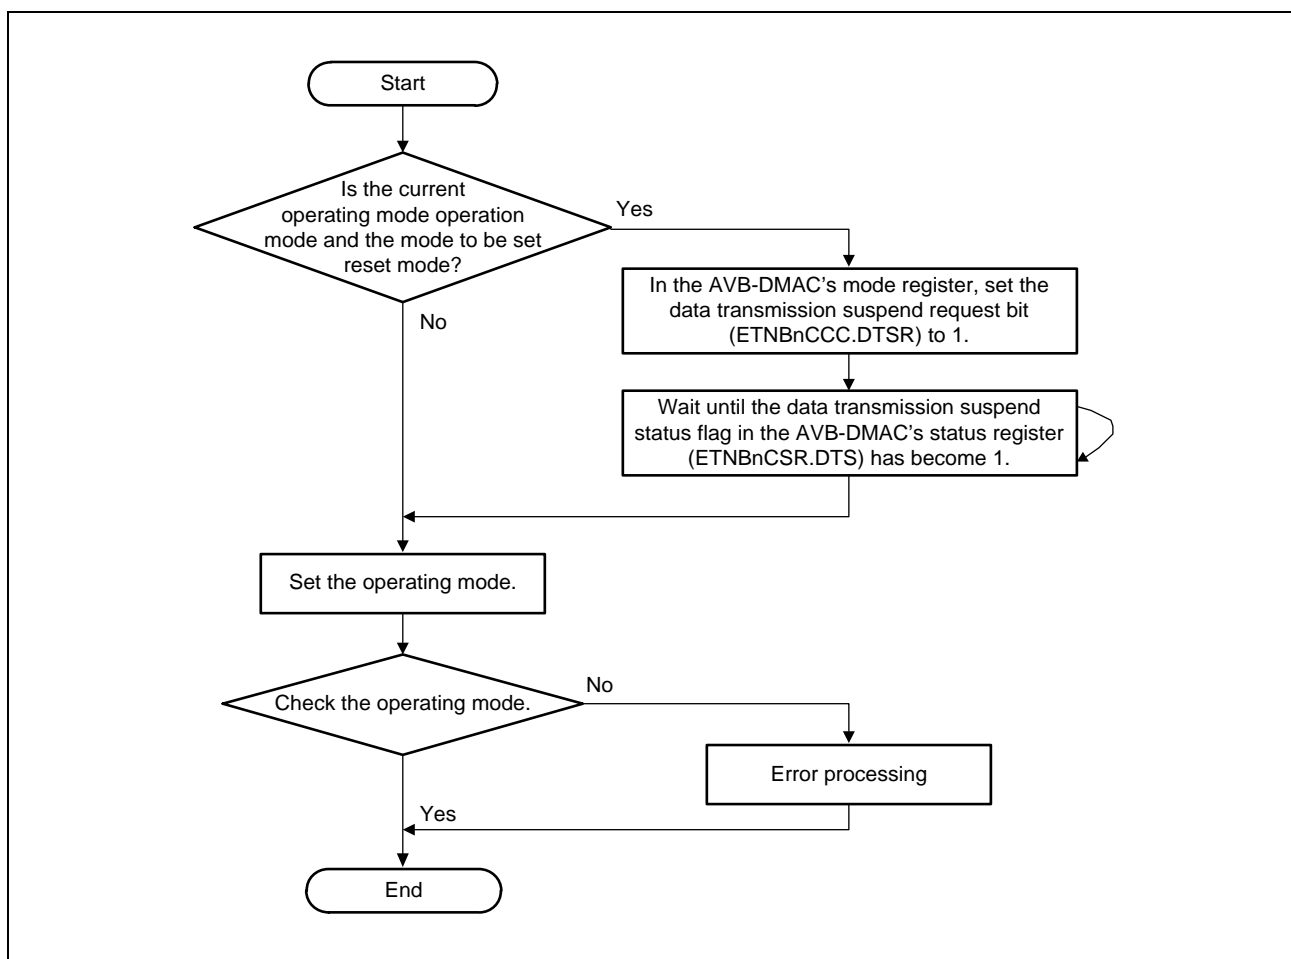

Figure 26.6 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

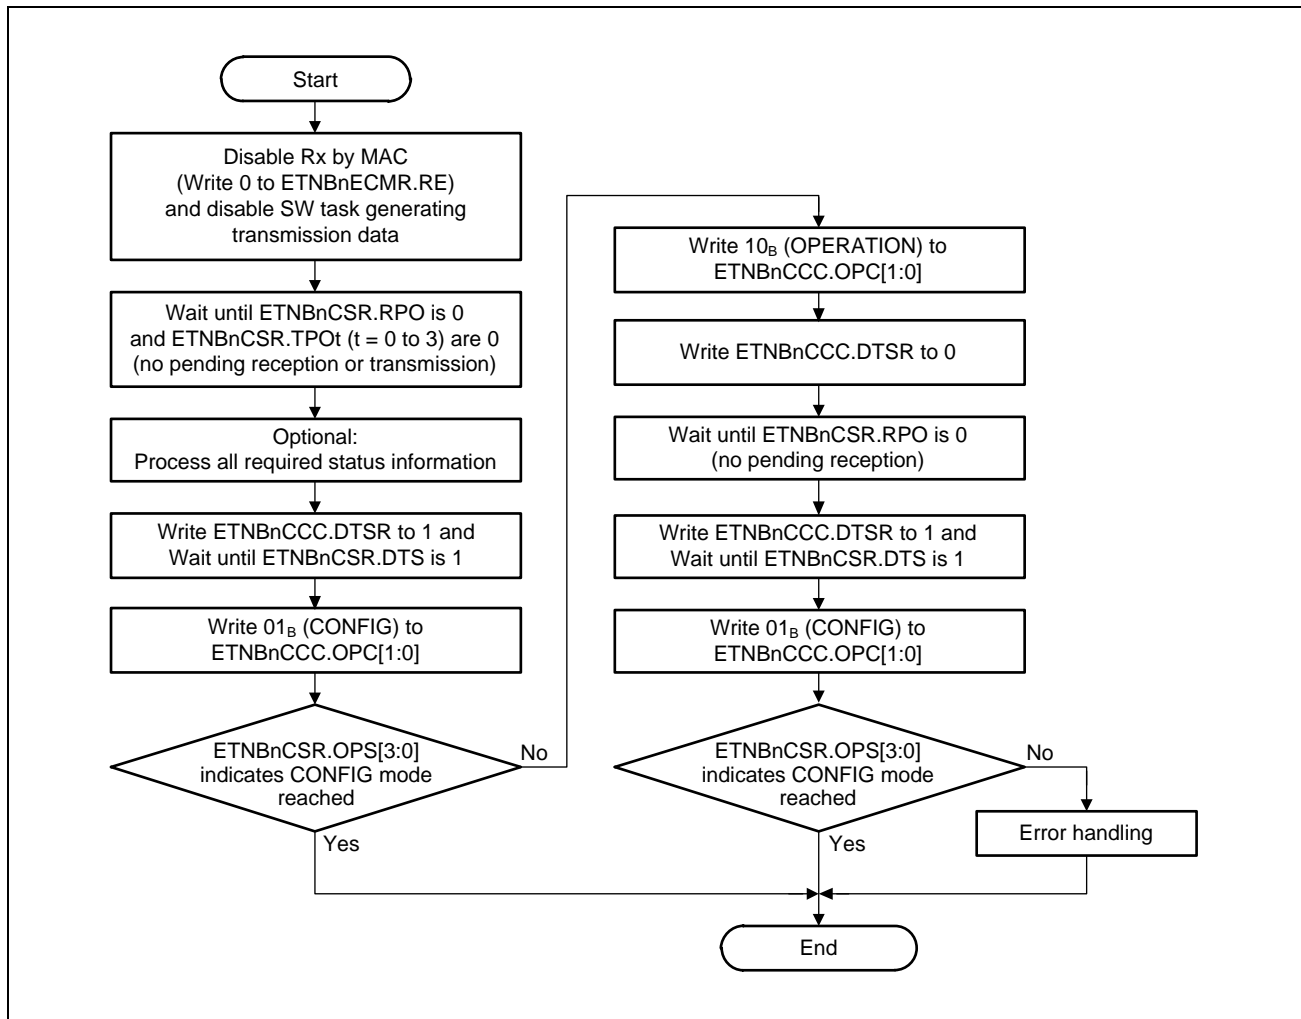

Figure 26.7 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (ETNBnCSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and URAM is in progress, this is completed (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and URAM, this is completed (frames for transmission remaining in the URAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

#### NOTES

When the operating mode shifts to configuration mode, all status registers are cleared. We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (ETNBnCSR.RPO) and the transmit process status bits (ETNBnCSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.

5. Capture all of the required status information.
  6. Set the operating mode configuration bits in the AVB-DMAC mode register (ETNBnCCC.OPC) to initiate the transition to configuration mode.
- 

### **26.4.1.3 Operating Mode Transitions Due to Hardware**

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

(1) **Hardware Reset**

Resetting of the LSI chip leads to resetting of the entire EthernetAVB module. The operating mode shifts to reset mode.

## 26.4.2 Common Control for Transmission and Reception

### 26.4.2.1 Initialization Procedure

Figure 26.8, Outline of the Initialization Procedure shows the overall initialization procedure in outline.

Figure 26.8 Outline of the Initialization Procedure

### (1) Initializing the Receiver Section

Before starting reception, follow the procedure below.

Set the operating mode to operation mode or standby mode, and do not enable reception until the settings for the AVB-DMAC are completed.

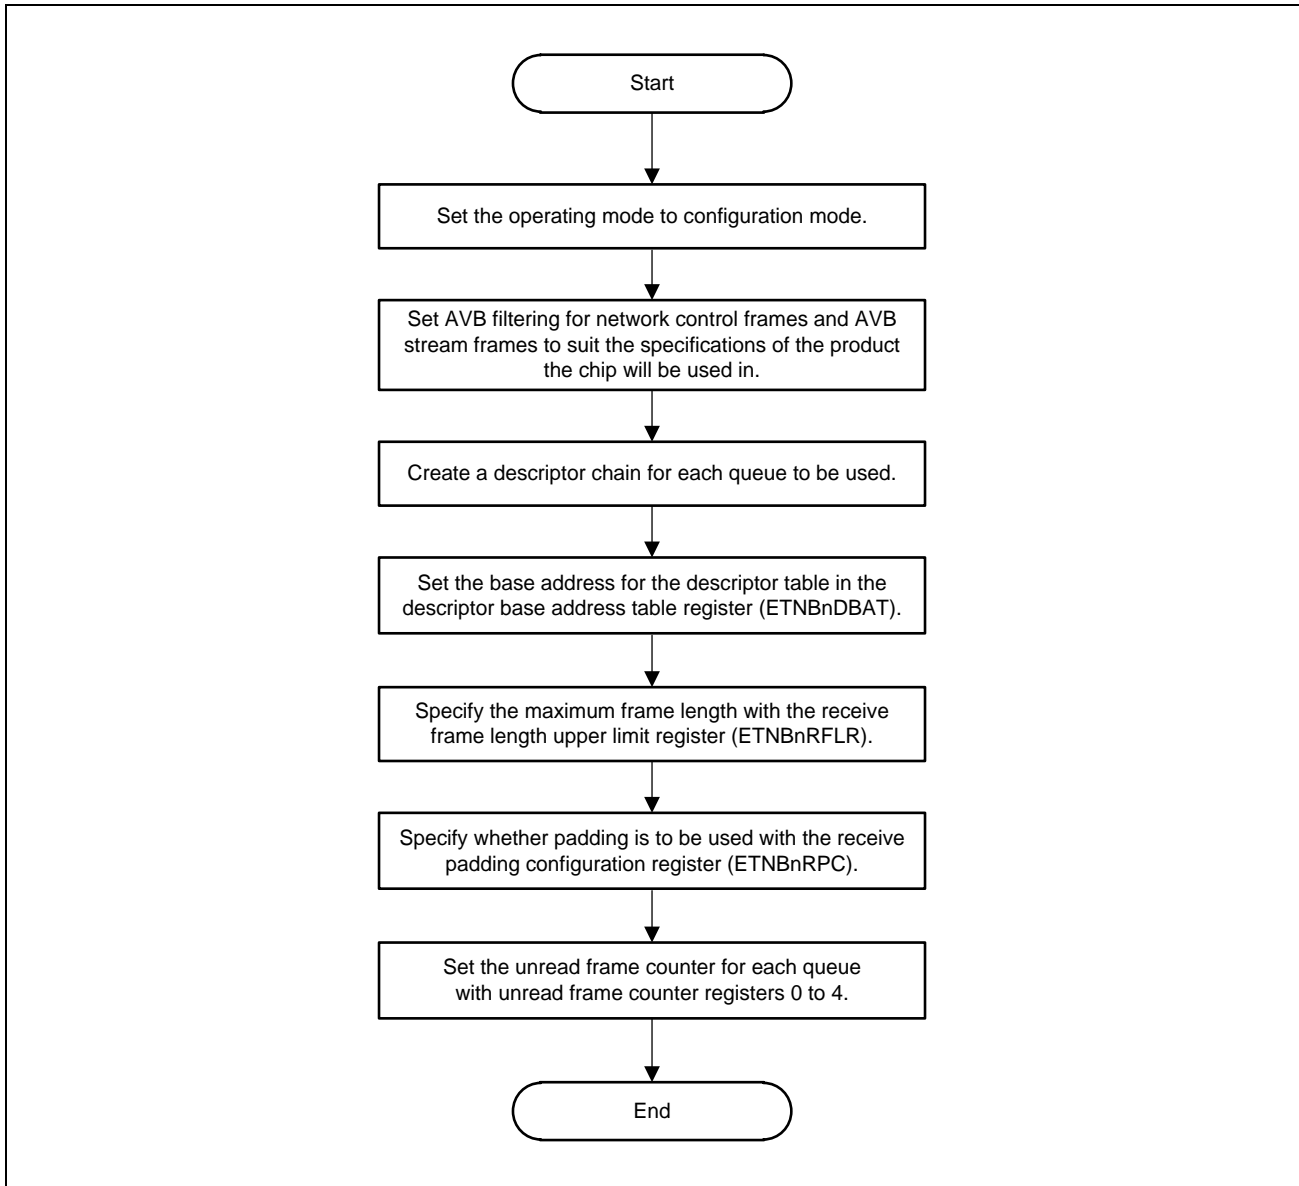

Figure 26.9 Procedure for Initializing the Receiver Section

## (2) Initializing the Transmitter Section

Figure 26.10, Procedure for Initializing the Transmitter Section illustrates initialization of the transmitter section.

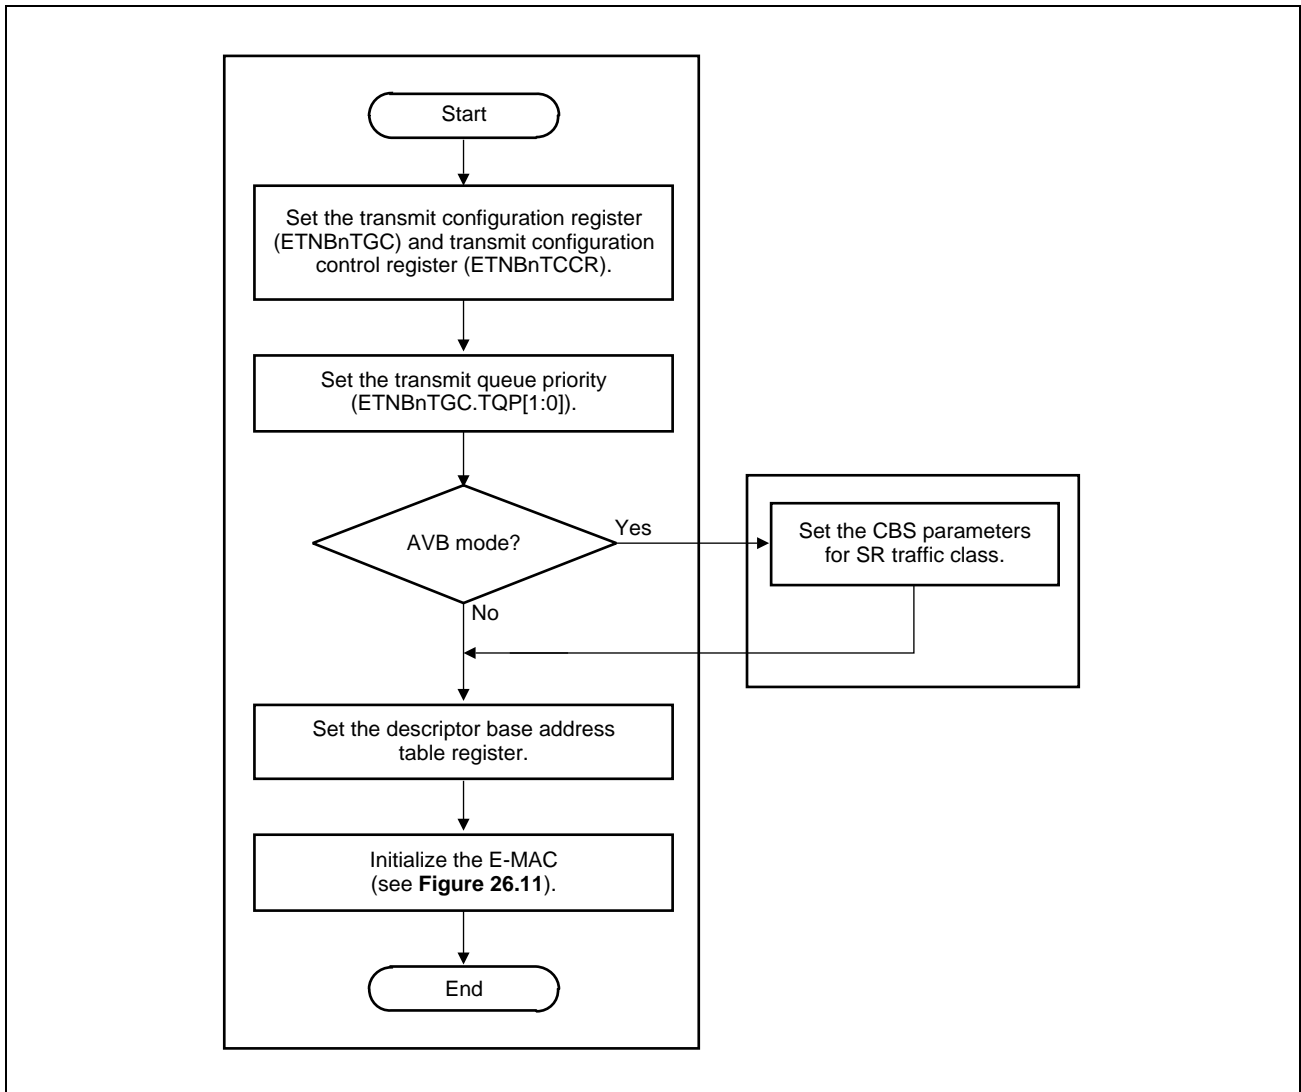

Figure 26.10 Procedure for Initializing the Transmitter Section

### (3) Configuration the E-MAC Block

Figure 26.11, Procedure for Configuration the E-MAC Block illustrates configuration of the E-MAC block.

Figure 26.11 Procedure for Configuration the E-MAC Block

#### (4) Configuration of the Message Handler Section

**Figure 26.12, Configuration of the Message Handler Section** illustrates configuration the message handler section.

For a description of how to set up the descriptors and the CBS traffic shaping parameters, see **Section 26.4.3, Descriptors**, and **Section 26.4.6, CBS (Credit-Based Shaping)**.

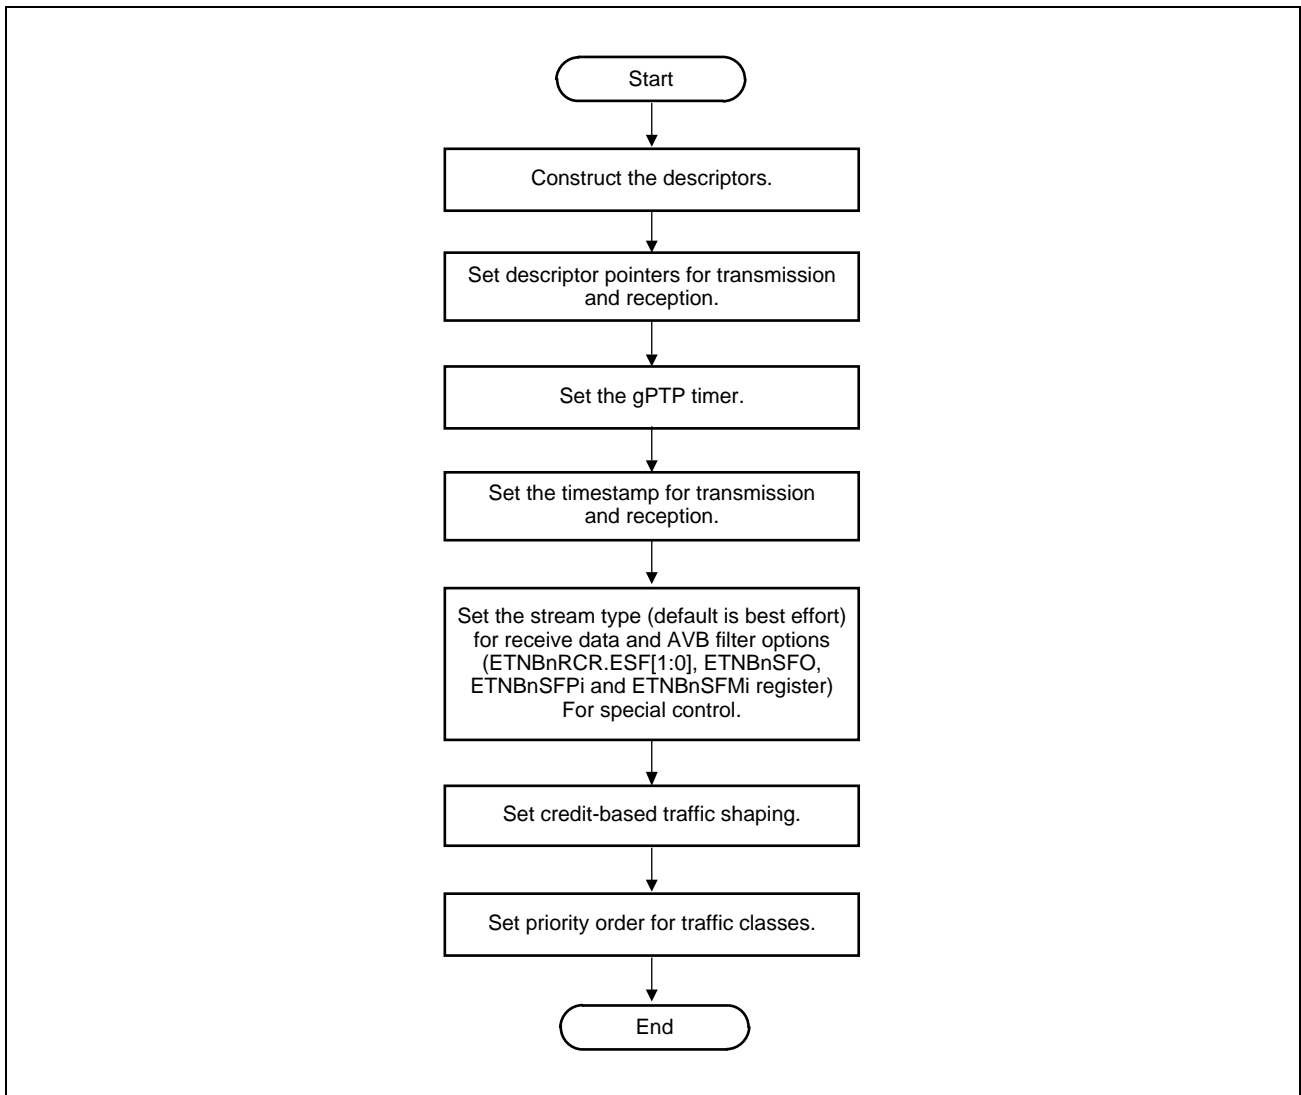

Figure 26.12 Configuration of the Message Handler Section

### 26.4.2.2 Scheduling Reception and Transmission

The AVB-DMAC normally has independent buses for transmission and reception. Furthermore, the four processes of fetching, storing, transmission and reception are basically independent of one another. Fetching and storing, however, share the same bus master so cannot be executed simultaneously. Access to the bus master is controlled by the scheduler.

**Figure 26.13, Schematic View of AVB-DMAC Operations in Transmission and Reception** is a schematic view of AVB-DMAC operations in transmission and reception.

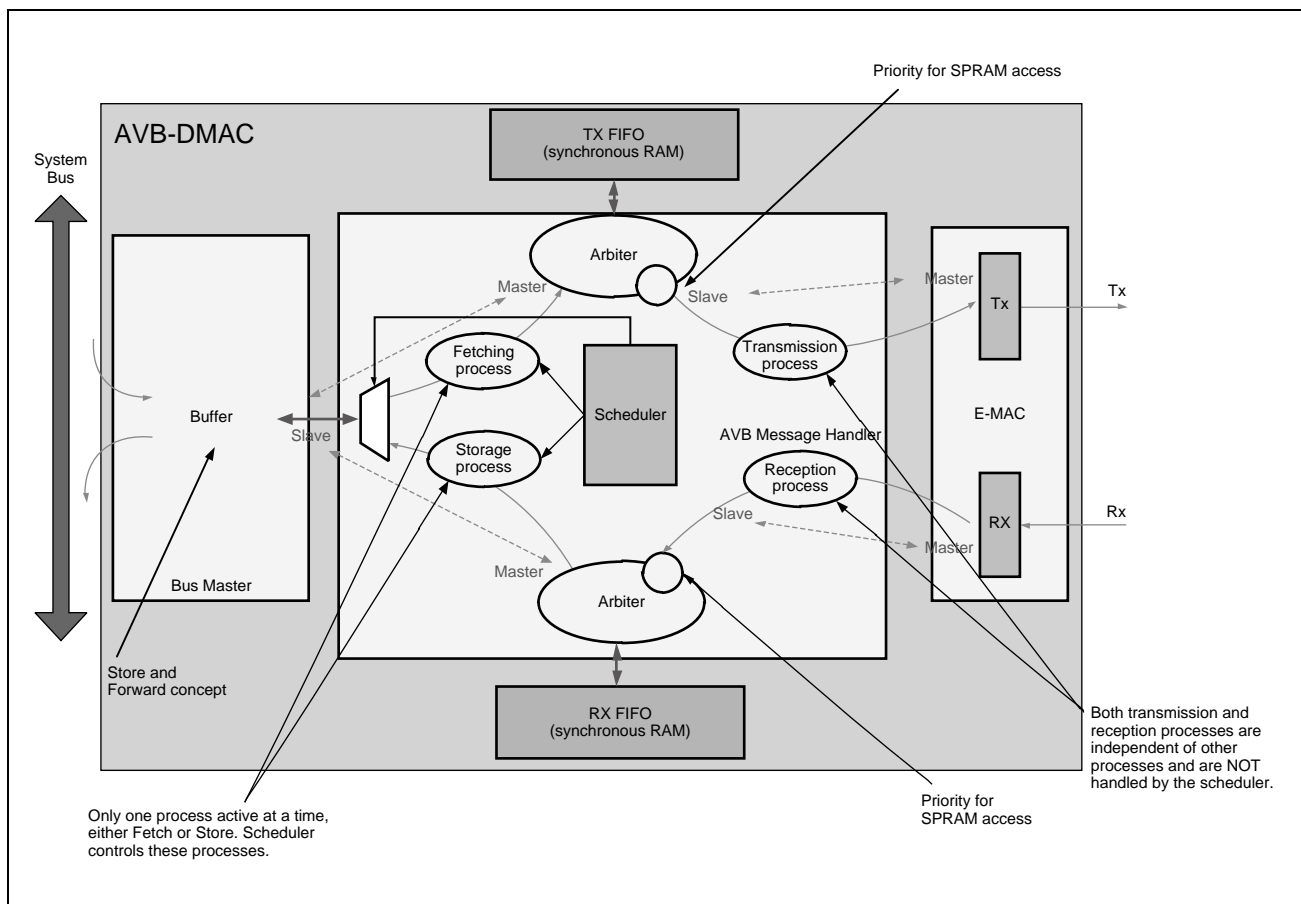

Figure 26.13 Schematic View of AVB-DMAC Operations in Transmission and Reception

Storing and fetching are alternately performed. When the number of frames held by the reception FIFO reaches the warning level, storing takes precedence over fetching.

### (1) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP) has no effect.

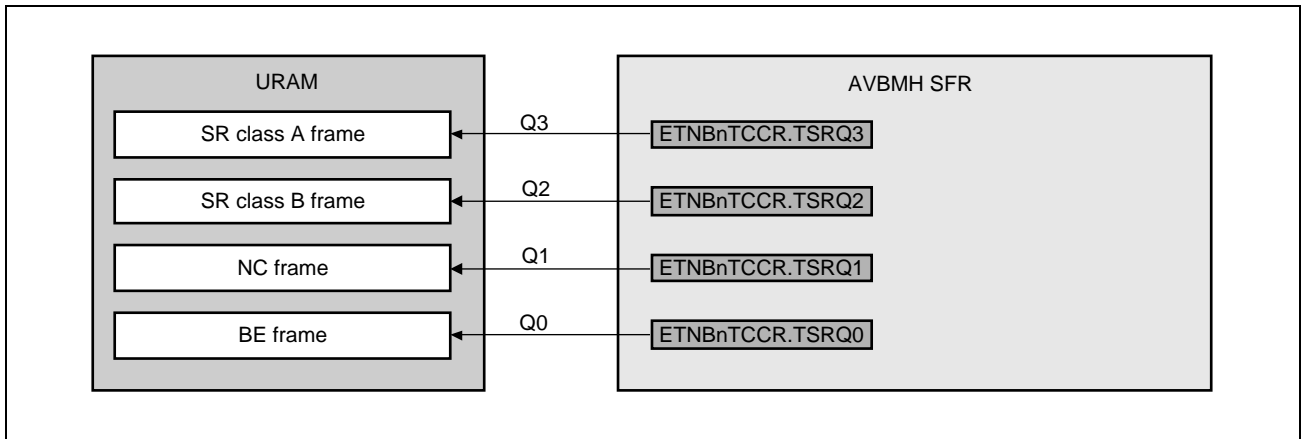

Figure 26.14 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (ETNBnTGC.TBDt) and on the frame size that can be fetched to the transmission FIFO.

When the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP) are  $00_B$  or  $01_B$ , the priority order is  $Q3 \rightarrow Q2 \rightarrow Q1 \rightarrow Q0$ .

When the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP) are  $11_B$ , the priority order is  $Q1 \rightarrow Q3 \rightarrow Q2 \rightarrow Q0$ .

### 26.4.2.3 Checking Integrity

The AVB-DMAC is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

#### (1) Concept of Integrity Checking in Reception

The purpose of receive integrity check is to prevent error frames from being stored in the URAM.

If an error frame is stored, information to identify the frame as an error frame is appended to the data from the frame in the URAM.

#### CAUTION

If a special descriptor chain is to be used for header/data separation on reception, an error that breaks the sequence may lead to storage space for synchronization running out. In such cases, software interaction or re-synchronization via the EOS descriptor is required.

#### (2) Concept of Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

#### (3) Items for Monitoring in Both Reception and Transmission

##### (a) Errors in Access to the URAM for Reading of Descriptors

The same descriptor may be processed again because the current descriptor address (ETNBnCDARq.CDA) is not changed.

If this problem occurs in a divided frame, the sequence may be broken.

- In reception
  - The received frame will be lost.
  - The same problem will occur for the next frame of data received for the same queue.
- In transmission
  - The transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is set to 0.
  - The frame will be lost from the transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI- Bus.

**(b) Illegal Configuration of a Descriptor by an Application**

The same descriptor may be processed again because the current descriptor address (ETNBnCDARq.CDA) is not changed.

If this problem occurs in a divided frame, the sequence may be broken.

- In reception
  - The received frame will be lost.
  - The same problem will occur for the next frame of data received for the same queue.
- In transmission
  - The transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is set to 0.
  - The frame will be lost from the transmission FIFO.

**(c) Errors in Access to the URAM for Writing of Descriptors**

As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been disengaged.

Errors in access to write descriptors to the URAM are detected from the response signal of the AXI- Bus.

**(4) Items for Monitoring in Reception****(a) Errors in Access to the URAM for Writing of Data or Timestamps**

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- When an access error occurs in a divided frame, the descriptor sequence may be damaged and queues may be unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.

**(b) Errors in Access for Reading from the Reception FIFO**

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- When an access error occurs in a divided frame, the descriptor sequence may be damaged and queues may be unusable.
- Errors of this type are detected by the ECC checker for the reception FIFO.

**(c) Damaged Data in the Reception FIFO**

- Received frames are all invalidated.
- All frames stored in reception FIFO are discarded. At this time, the number of frames and queue information cannot be captured.

If damaged data in the reception FIFO is an error due to the reception FIFO, this is detected by the AVB-DMAC.

## (5) Items for Monitoring in Transmission

### (a) Errors in Access for Reading Data from the URAM

- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:  
As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
  - The current descriptor address (ETNBnCDARq.CDA) is not updated.
  - The transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

### (b) Overflow of the Transmission FIFO

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

### (c) Errors in Access for Reading of the Transmission FIFO

The AVB-DMAC is incapable of detecting an error in reading of the transmission FIFO, resulting in the transmission of a broken frame.

Errors of this type are detected by the ECC checker for the transmission FIFO.

### (d) Frame size error during transmission

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is 1997 or more bytes. Such frames are cut out and transmitted.

### (e) Damaged Data in the Transmission FIFO

- Fetching is not affected by damaged data.
- Since damaged data from the FIFO is only detected during frame transmission, an unexpected frame data may be transmitted.

If damaged data in the transmission FIFO is an error due to the transmission FIFO, this is detected by the AVB-DMAC.

## 26.4.3 Descriptors

### 26.4.3.1 Data Representation in URAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the URAM.

The memory in the URAM for use by the AVB-DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without using the AVB-DMAC.

**Figure 26.15, Example of URAM Memory Map** shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Respective descriptors can generate interrupts after completion of processing. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see **Section 26.4.4.2, Setting Up Reception Descriptors**, and **Section 26.4.5.2, Setting Up Transmission Descriptors**.

Figure 26.15 Example of URAM Memory Map

The descriptor must be aligned with a 32-bit boundary in the URAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP timestamps is enabled.

The frame data must also be aligned with a 32-bit boundary in the URAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the residual bytes in the data area are set as unused bytes.

---

**CAUTION**

AVB-DMAC will store the data area pointed by descriptor for specified data size, even if there is no enough space.

---

### 26.4.3.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see **Section 26.4.3.6, Descriptor Type**.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

**Figure 26.16, Outline of the Basic Descriptor Chains** shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

Figure 26.16 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in **Section 26.4.4.2, Setting Up Reception Descriptors**, and **Section 26.4.5.2, Setting Up Transmission Descriptors**.

### 26.4.3.3 Descriptor Base Address Table

Concerning the base address table to be written in the URAM, set the address of the top descriptor of respective queues. Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. The link descriptor does not need to be updated because it does not change even after descriptor processing, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (ETNBnDBAT).

**Figure 26.17, Example of a Base Address Table for Reception and Transmission Queues** shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains of a topology.

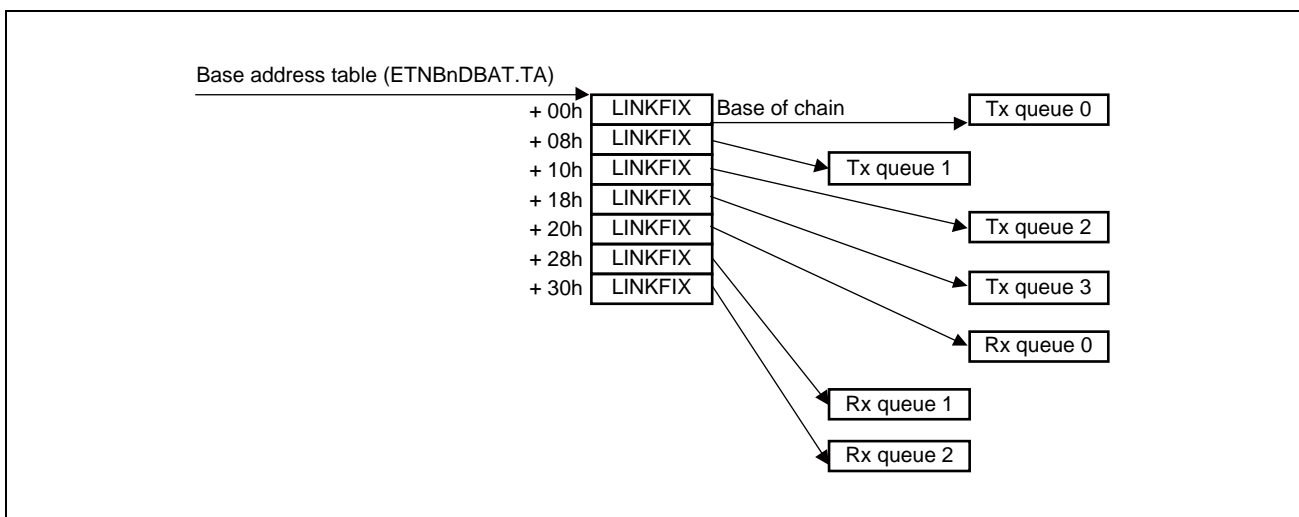

Figure 26.17 Example of a Base Address Table for Reception and Transmission Queues

#### CAUTION

The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

#### 26.4.3.4 Descriptor Chain Processing

When a descriptor is currently being processed or the queue for a descriptor is active, the current descriptor is a descriptor to be processed. The current descriptor address for use by a queue  $q$  can be checked in the current descriptor address register  $q$  (ETNBnCDAR $q$ ).

The current descriptor is stored in a register or descriptor as described below.

- In the descriptor base address table registers for all  $q$  queues (ETNBnDBAT) (ETNBnDBAT.TA +  $8 \times q$ ) when the operating mode shifts to operation mode.
- In the descriptor base address table register (ETNBnDBAT) (ETNBnDBAT.TA +  $8 \times q$ ) when a base address load request is issued for a queue  $q$  by setting the corresponding bit (ETNBnDLR.LBA $q$ ) in the descriptor base address load request register.
- It is set to DESCR.DPTR when a link descriptor (LINK, LINKFIX) is processed.

After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue (8 bytes for normal descriptors and 20 bytes for extended descriptors). The AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

### 26.4.3.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

**Figure 26.18, Method of Descriptor Interrupt Generation** illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (ETNBnDIS.DPFi)). Processing of a descriptor with the value *i* in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (ETNBnDIS.DPFi) being set.

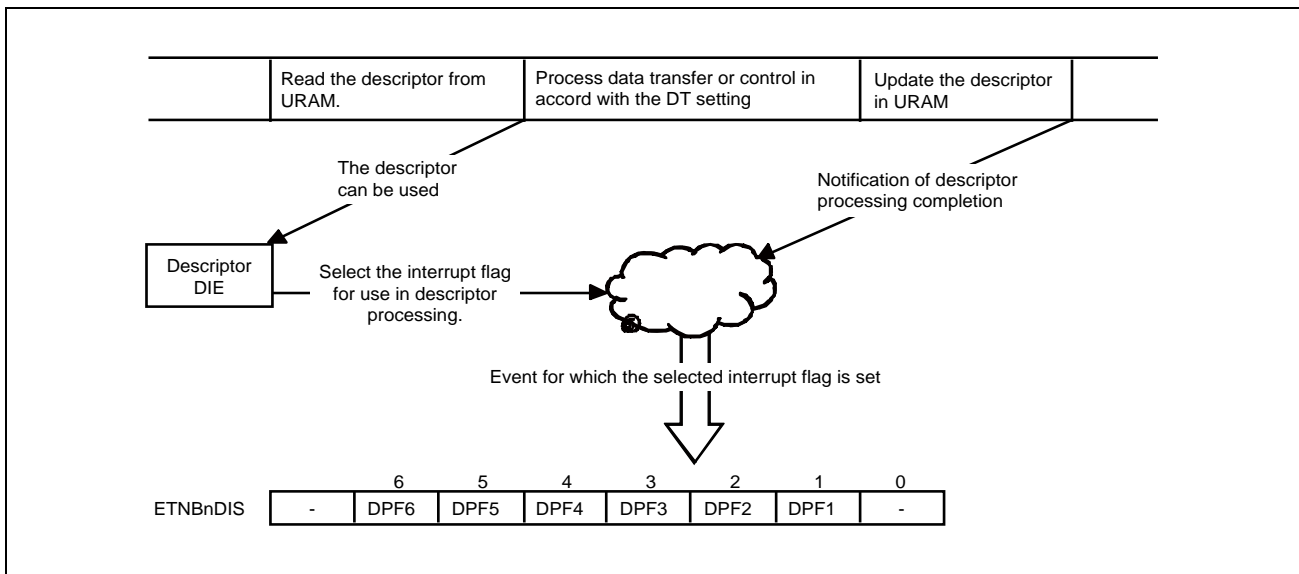

Figure 26.18 Method of Descriptor Interrupt Generation

### 26.4.3.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

**Table 26.87, Summary of Descriptor Types** is a summary of the descriptor types available for the AVB-DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

#### Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- The descriptor cannot be changed by hardware (AVB-DMAC).

#### Definition of HW:

- The descriptor is processed by hardware (AVB-DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (AVB-DMAC) processes the descriptor and subsequently changes the descriptor type.

#### Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception). Do not write the value to the descriptor type (DESCR.DT) field.

Hardware does not process the descriptor type. The current descriptor address (ETNBnCDARq.CDA) is not changed even when the queue is of a descriptor type of this setting.

Table 26.87 Summary of Descriptor Types

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the next descriptor in the chain.	HW	HW
LINKFIX	9	Fixed Link Defines the next descriptor in the chain, but not changed by AVB-DMAC after processing.	SW	SW
EOS	10	End Of Set Control element to split descriptor chain. Chain stops and waits for user interaction.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
FEMPTY_IS	13	Frame Empty Incremental Start A descriptor related to frame data but not containing valid data for a frame DESCR.DPTR sets the base address of an "incremental data area" in the URAM.	HW	Invalid
FEMPTY_IC	14	Frame Empty Incremental Continue A descriptor related to frame data but not containing valid data for a frame Data indicated by the pointer are for storage in an incremental data area in the URAM.	HW	Invalid
FEMPTY_ND	15	Frame Empty No Data Storage A descriptor related to frame data but not containing valid data for a frame The descriptor is processed in the same way as FEMPTY but data are not stored in the URAM.	HW	Invalid
LEMPY	2	Link Empty A link descriptor for processing by the AVB-DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the AVB-DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

## (1) Layout of General Descriptors in the URAM

The AVB-DMAC updates processed descriptors in the URAM. The field to be changed in a descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by “—” in the figure).

## (2) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)

- Extended descriptor (usable only in reception)

Table 26.88 Contents of Frame Data Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see <b>Section 26.4.4.2, Setting Up Reception Descriptors</b> , and <b>Section 26.4.5.2, Setting Up Transmission Descriptors</b> .
DIE[3:0]	Descriptor Interrupt Enable 0000 <sub>B</sub> : Descriptor interrupt is disabled. 0001 <sub>B</sub> to 1111 <sub>B</sub> : The corresponding descriptor interrupt is generated (ETNBnDIS.DPFi).
—	Content Control For details, see <b>Section 26.4.4.2, Setting Up Reception Descriptors</b> , and <b>Section 26.4.5.2, Setting Up Transmission Descriptors</b> .
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Timestamp Timestamp of the received frame (only available in extended descriptors)

### CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

The upper reserved bits of TS[79:0] are set to 0000<sub>H</sub> after the time stamp is stored.

### (3) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY\_IS, FEMPTY\_IC, and FEMPTY\_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

- Normal descriptor

- Extended descriptor (usable only in reception)

Table 26.89 Contents of Hardware/Software Arbitration Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 13: FEMPTY_IS 14: FEMPTY_IC 15: FEMPTY_ND For details, see <b>Table 26.87, Summary of Descriptor Types.</b>
DIE[3:0]	Descriptor Interrupt Enable 0000 <sub>B</sub> : Descriptor interrupt is disabled. 0001 <sub>B</sub> to 1111 <sub>B</sub> : The corresponding descriptor interrupt is generated (ETNBnDIS.DPFi).
—	Content Control For details, see <b>Section 26.4.4.2, Setting Up Reception Descriptors,</b> and <b>Section 26.4.5.2, Setting Up Transmission Descriptors.</b>
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Timestamp Timestamp of the received frame (only available in extended descriptors)

#### CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

When the descriptor is an extended descriptor, it has a 12-byte unused area.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY\_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY\_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.

In an FEMPTY\_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

#### (4) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

Table 26.90 Contents of Link Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see <b>Table 26.87, Summary of Descriptor Types</b> .
DIE[3:0]	Descriptor Interrupt Enable 0000 <sub>B</sub> : Descriptor interrupt is disabled. 0001 <sub>B</sub> to 1111 <sub>B</sub> : The corresponding descriptor interrupt is generated (ETNBnDIS.DPFI).
—	Content Control For details, see <b>Section 26.4.4.2, Setting Up Reception Descriptors</b> , and <b>Section 26.4.5.2, Setting Up Transmission Descriptors</b> .
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

#### CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

When the descriptor is an extended descriptor, it has a 12-byte unused area.

## (5) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
+0	DT[3:0]				DIE[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
+4	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 26.91 Contents of Other Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see <b>Table 26.87, Summary of Descriptor Types</b> .
DIE[3:0]	Descriptor Interrupt Enable 0000 <sub>B</sub> : Descriptor interrupt is disabled. 0001 <sub>B</sub> to 1111 <sub>B</sub> : The corresponding descriptor interrupt is generated (ETNBnDIS.DPFi).

### CAUTION

When the descriptor is an extended descriptor, it has a 12-byte unused area.

## (6) How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Frames divided based on a frame data structure can also be supported.

To handle both frames divided up into multiple data areas and descriptors for complete single frames, four types (DESCR.DT) FSTART, FEND, FMID, and FSINGLE are defined.

**Figure 26.19, Mapping of Frame Data** shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

Figure 26.19 Mapping of Frame Data

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVB-DMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the frame data size to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between frame data. In reception, an “incremental data area” can be used to prevent empty spaces. For incremental data areas, see **Section 26.4.4.3(2), Incremental Data Areas**.

As well as reducing the memory capacity taken up by the descriptor area in the URAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

## (7) How to Use Chain Control Descriptors

### (a) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see **Section 26.4.3.2, Using Descriptor Chains in Queues**)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). Take care, however, to check the current descriptor address register q (ETNBnCDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

### (b) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQq) is cleared.

In reception, when the frame currently received is one divided for storage (e.g., received data whose frames are the FMID type or FEND type for storage), the data is not fully stored and the receive queue full interrupt (ETNBnRIS2.QFFr) is generated.

## (8) How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

### (a) FEMPTY, FEMPTY\_IS, FEMPTY\_IC, and FEMPTY\_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission.

### (b) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

### (c) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

## (9) Synchronization between Descriptor Access by Hardware and Software

In primary HW/SW synchronization, the descriptor type (DESCR.DT) allocated to the URAM is usable. This makes it possible to minimize access by the AVB-DMAC to the SFR via the CPU, leading to higher performance.

Basic concepts of synchronization:

- Descriptor sets are allocated so that it is exclusively used by hardware or software, depending on the direction of transmission (see **Table 26.87, Summary of Descriptor Types**).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type assigned to hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

### 26.4.3.7 Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.

They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Make an access to frame data in units of 128-byte blocks maximum.
- Design the descriptor chains in ways that minimize parallelism of processing.  
This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

## 26.4.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and URAM without intervention by the CPU.

Create descriptors that define the amounts of frame data to be stored and the locations. After the E-MAC receives a frame, it stores the received frame data and the conditions of reception as the MAC state. If the descriptor is extended, the timestamp is also stored. For a description of how to set up descriptors for use in reception, see **Section 26.4.4.2, Setting Up Reception Descriptors**.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

**Figure 26.20, Mechanism of General Reception Queue Selection** shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. Appending of a reception flag depends on the storage of one frame among the reception queues in the URAM, and the unread frame counter (UFC) is also associated with frame storage.

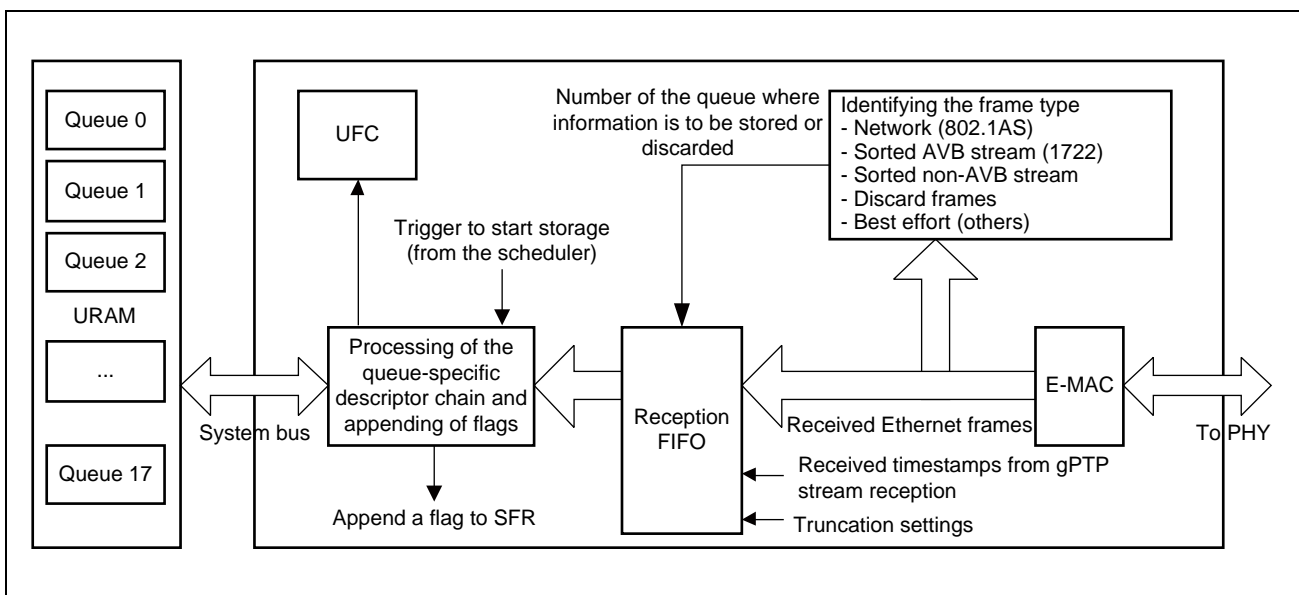

Figure 26.20 Mechanism of General Reception Queue Selection

### 26.4.4.1 Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the URAM.

There are two conditions for the AVB-DMAC to discard a received frame.

#### Detection of an Error During Reception by the E-MAC

- Whether error frames are discarded or stored in reception queue 0 (best effort) depends on the setting of the error frame enable bit in the receive configuration register (ETNBnRCR.EFFS). If error frames are to be stored (ETNBnRCR.EFFE = 1), they are always stored in queue 0 (best effort). In this case, characteristics specific to the queue (e.g. truncation) will vary. If the storage of timestamps for reception queue 0 (best effort) is enabled (the timestamp enable bit in the receive configuration register ETNBnRCR.ETS0 = 1), timestamps are stored even for error frames.
- The separation filter is unable to determine where the frame data should be stored.

#### Receive Frame Failure in the Separation Filter

- Whether discarding error frames or storing in reception queue 0 (best effort) depends on the stream filtering select bit (ETNBnRCR.ESF) in the receive configuration register.

The flowchart in **Figure 26.21, Mechanism of Reception Queue Selection** shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E- MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

Figure 26.21 Mechanism of Reception Queue Selection

### Notes on the Meanings of Entries in the Flowchart

- “Condition for determining network control frames”  
The Ethernet destination address (DA) is 01:80:C2:00:00:0E.  
The Ethernet type (ET) is 88:F7.
- “Condition for determining IEEE 1722 frames”  
The Ethernet destination address (DA) is within the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF.  
The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00. The Ethernet type (ET) is 22:F0.
- “Condition for separation filter determination”  
See **Section 26.4.4.1 (1), Separation Filtering**.

**Figure 26.22, Data Bytes of Ethernet Frames Used in Classification** shows the allocation of bits related to the network and stream types in Ethernet frames. The preambles of Ethernet frames are not taken into account.

Data bytes	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
Network type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	ET1	ET2	...	...	...	...	...	...
Stream type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	VL1	VL2	-	-	ET1	ET2	...	...

Figure 26.22 Data Bytes of Ethernet Frames Used in Classification

### (1) Separation Filtering

Separation filtering involves the checking of up to 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (ETNBnSFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (separation filter mask configuration register i(ETNBnSFMi.CFM)), which limits the separation filter processing to a bit mask that can be set to the lower number of bytes or can be set appropriately.

#### Examples

To use one byte in separation, set separation filter mask configuration register 0 (ETNBnSFM0.CFM) to 0000 00FF<sub>H</sub> and separation filter mask configuration register 1 (ETNBnSFM1.CFM) to 0000 0000<sub>H</sub>.

To use seven bytes in separation, set separation filter mask configuration register 0 (ETNBnSFM0.CFM) to FFFF FFFF<sub>H</sub> and separation filter mask configuration register 1 (ETNBnSFM1.CFM) to 00FF FFFF<sub>H</sub>.

#### CAUTION

If bits at some positions are set to 0b in the separation mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0b. Only those bits in which the separation filter pattern configuration register i (ETNBnSFPi.FPs) setting is equal to the separation filter mask configuration register i (ETNBnSFMi.CFM) are sorted by matching with received data.

**Figure 26.23, Separation Filtering** shows separation filtering. The selected data from a received frame (Rx\_Frame[63:0]) are masked by the common filter mask. As a result, the selected frame data can be obtained. This value is compared with all filter patterns. The separation filter circuit in the AVB-DMAC selects the filter pattern that matches the queue having the lowest index s or selects a flag to indicate that there is no matching separation pattern.

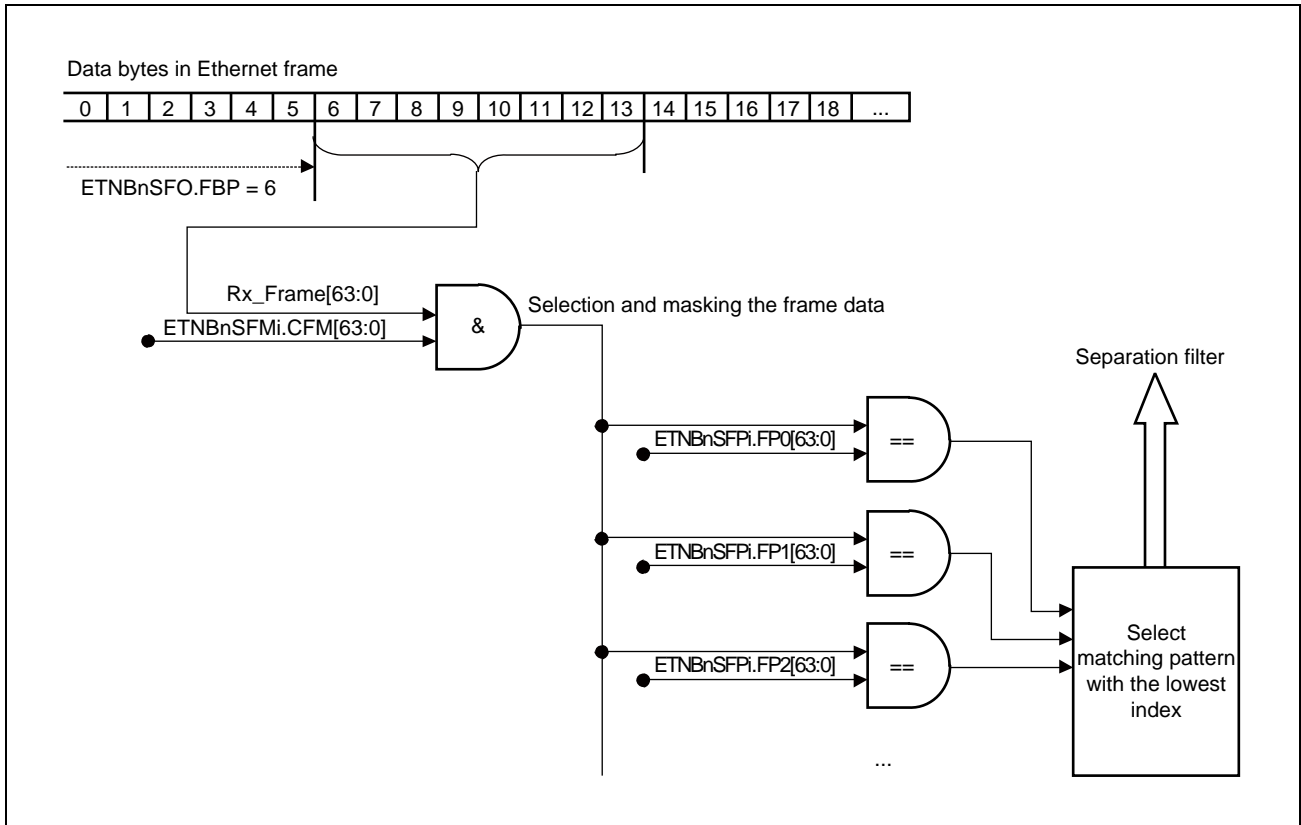

Figure 26.23 Separation Filtering

## (2) Stream Separation

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an AVB network and their roles differ with the application.

The stream ID is a general pattern of the AVB network for identifying one stream. **Figure 26.24, IEEE 1722 Frame Layout and Stream ID** shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

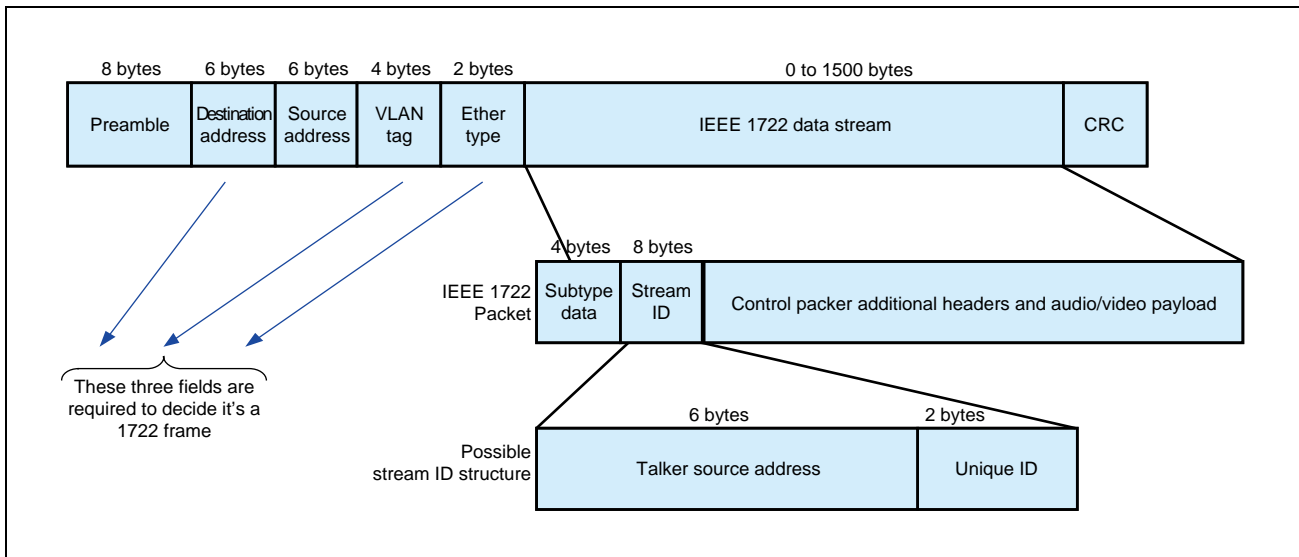

Figure 26.24 IEEE 1722 Frame Layout and Stream ID

The IEEE 1722 standard stipulates that the stream ID field starts from the 23rd byte (not counting the preamble). Accordingly, set the separation filter offset (ETNBnSFO.FBP) to 22 in operations on IEEE 1722 streams. Set the separation filter mask (ETNBnSFMi) and separation filter pattern (ETNBnSFPi) in accord with the specification of the product in which the chip is being used.

Example: In the example of a stream ID shown in **Figure 26.24, IEEE 1722 Frame Layout and Stream ID**, the current application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set ETNBnSFM0.CFM to FFFF FFFF<sub>H</sub> and ETNBnSFM1.CFM to FFFF FFFF<sub>H</sub>.
- To divide streams from respective talkers into individual queues, set ETNBnSFM0.CFM to FFFF FFFF<sub>H</sub> and ETNBnSFM1.CFM to 0000 FFFF<sub>H</sub>. This excludes the unique ID from the filter condition.

### 26.4.4.2 Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in **Section 26.4.3, Descriptors**.

This section describes memory operations that are especially required in handling reception queues.

#### (1) Reception Descriptor Types

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

**Table 26.92, Descriptor Types in Reception** shows the descriptor types used in reception.

Table 26.92 Descriptor Types in Reception

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	No data is stored in receive queues. The ETNBnRIS2.QFFr bit indicates that queue r is full and the received frame is not stored. This descriptor is used again for processing of the next reception, if any.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	A stop point defined by software has been reached. A frame of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. ETNBnRIS2.QFFr indicates that the frame has been lost. If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	The descriptor can be used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see <b>Section 26.4.4.3(1), Storing Frame Data in the Descriptor Data Area</b> .	FSTART, FMID, FEND, or FSINGLE
Frame Empty Incremental Start (FEMPTY_IS)	The descriptor can be used to store received data. All data for the frame are stored in the descriptor's data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see <b>Section 26.4.4.3(2), Incremental Data Areas</b> .	FEND or FSINGLE
Frame Empty Incremental Continue (FEMPTY_IC)	The descriptor can be used to store received data. The remaining bytes of frame data are stored in the descriptor's data area. DESCR.DPTR is undefined, but is written back at the start position within the incremental data area after processing. For details, see <b>Section 26.4.4.3(2), Incremental Data Areas</b> .	FEND or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	The descriptor can be used to store received data. Up to DESCR.DS bytes are captured from the reception FIFO but not stored. After processing, DESCR.DS is written back as 0. For details, see <b>Section 26.4.4.3(1)(c), No Data are Stored</b> .	FSTART, FMID, FEND or FSINGLE
Link Empty (LEMPY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

## (2) Configuration of Reception Frame Data Descriptors

**Figure 26.25, Configuration of Descriptor for a Received Frame** shows the configuration of descriptors for use with reception queues. The reception-specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TR) are described in **Table 26.93, Configuration of a Received Descriptor**.

For the other fields and the descriptor types, see **Section 26.4.3.6, Descriptor Type**.

Figure 26.25 Configuration of Descriptor for a Received Frame

Table 26.93 Configuration of a Received Descriptor

Bit Name	Function
MSC	<p>MAC Status Code</p> <p>These bits indicate errors in reception detected by the E-MAC.</p> <p>In the case of a divided frame, these bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows.</p> <p>MSC[7]: Received frame has a multicast address.</p> <p>MSC[6]: Fixed to 0</p> <p>MSC[5]: Fixed to 0</p> <p>MSC[4]: Received frame has residual bits.</p> <p>MSC[3]: Received frame is too long*<sup>1</sup></p> <p>MSC[2]: Received frame is too short</p> <p>MSC[1]: Error in frame reception*<sup>2</sup></p> <p>MSC[0]: Received frame has a CRC error.</p>
PS	<p>Padding Selection</p> <p>These bits specify whether frame data are to be padded when stored in the incremental data area. Insertion of padding data is in accord with the settings in the ETNBnRPC register.</p> <p>00<sub>b</sub>: Padding is not to be inserted.</p> <p>01<sub>b</sub>: Padding data may be inserted. This depends on the ETNBnRPC settings.</p> <p>Other settings are prohibited.</p>
EI	<p>Error Indication</p> <p>This bit indicates the detection of an error in frame data while a frame was being stored.</p> <p>The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted.</p> <p>0: No error</p> <p>1: Error is detected</p>
TR	<p>Truncation Indication</p> <p>This bit will be set if received data is more than 4092 bytes, and received data will be truncated to 4092 bytes. These bits are set to the same value within all frame data descriptors for a divided frame.</p> <p>0: Data have not been truncated.</p> <p>1: Data have been truncated.</p>

Note 1. "Received frame is too long" is set when MAC receive the frame that length is more than ETNBnRFLR configuration value.

Note 2. "Error in frame reception" is set when MAC detect AVB\_RX\_DV = 1 and AVB\_RX\_ER = 1 while reception.

### CAUTION

The ETNBnRCCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the URAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

### 26.4.4.3 Reception Processing

After initialization, the AVB-DMAC becomes able to select a proper reception queue and store it in the descriptor data area in the URAM. Received data is stored into the URAM as long as the descriptor data area capacity suffices.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in **Section 26.4.4.1(1), Separation Filtering**. The frames are sorted, truncated, or discarded by the separation filter on reception by the MAC before stored in the reception FIFO. The following data are stored in the reception FIFO.

- MAC status of received frames
- Length of received frames
- Timestamp of received frames
- Target reception queue
- Received frame data

If the reception FIFO contains even one frame, the scheduler executes storing in the reception queue (see **Section 26.4.2.2, Scheduling Reception and Transmission**).

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the UFC stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the storage of data in the other queues.

#### (1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

When normal synchronization mode is used, the CPU can write FEMPTYxxx directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

#### (a) Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FEMPTY or FEMPTY\_ND descriptor is stored in place of the FSINGLE descriptor after processing.

Also, the FEMPTY\_IS and FEMPTY\_IC descriptors, which always hold the full frame data for the reception FIFO, are stored in place of the FSINGLE descriptor after processing.

**(b) Storing Frame Data as Divided Frames**

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.TS are only valid in the last descriptor of the sequence for a divided frame.

**CAUTION**

---

If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, handle each storage element separately, and allocate the descriptor type, intending software, after processing.

Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

---

**(c) No Data are Stored**

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY\_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY\_ND descriptor is processed, DESCR.DS is set to 0. This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS = 0 is for the unique identification of the descriptor after writing.

**(2) Incremental Data Areas**

Secure space in the URAM for storing received data. Even when data are placed in the URAM area such that all descriptor data areas of a chain are contiguous, a received frame being shorter than the descriptor data area will lead to an empty space. **Figure 26.26, A Reception Queue Using Individual Descriptor Data Areas** shows an example of settings and the memory map.

Certain applications require that data areas be contiguous (e.g. when received data are to be processed other than by hardware as A/V codec modules). When the length of received frames differs (e.g. when payloads vary between having one or two A/V packages), the use of a static pointer in the descriptor produces empty spaces in the data area. This may necessitate direct additional processing to remove the empty spaces.

Accordingly, and to reduce the CPU load imposed by copying data, the AVB-DMAC supports an “incremental data area” function.

When incremental data areas are in use, all descriptors use a common data area for storage. One descriptor (FEMPTY\_IS) defines the base address of the incremental data area and the next descriptor (FEMPTY\_IC) in the descriptor chain to store receive data. **Figure 26.27, Reception Queue Using a Common Incremental Data Area** shows an example of settings and the memory map.

Use of an incremental data area does not reduce the memory space in the individual descriptor data areas.

The hardware and software synchronization strategy and performance are also not changed.

It is also possible to divide a frame up among various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

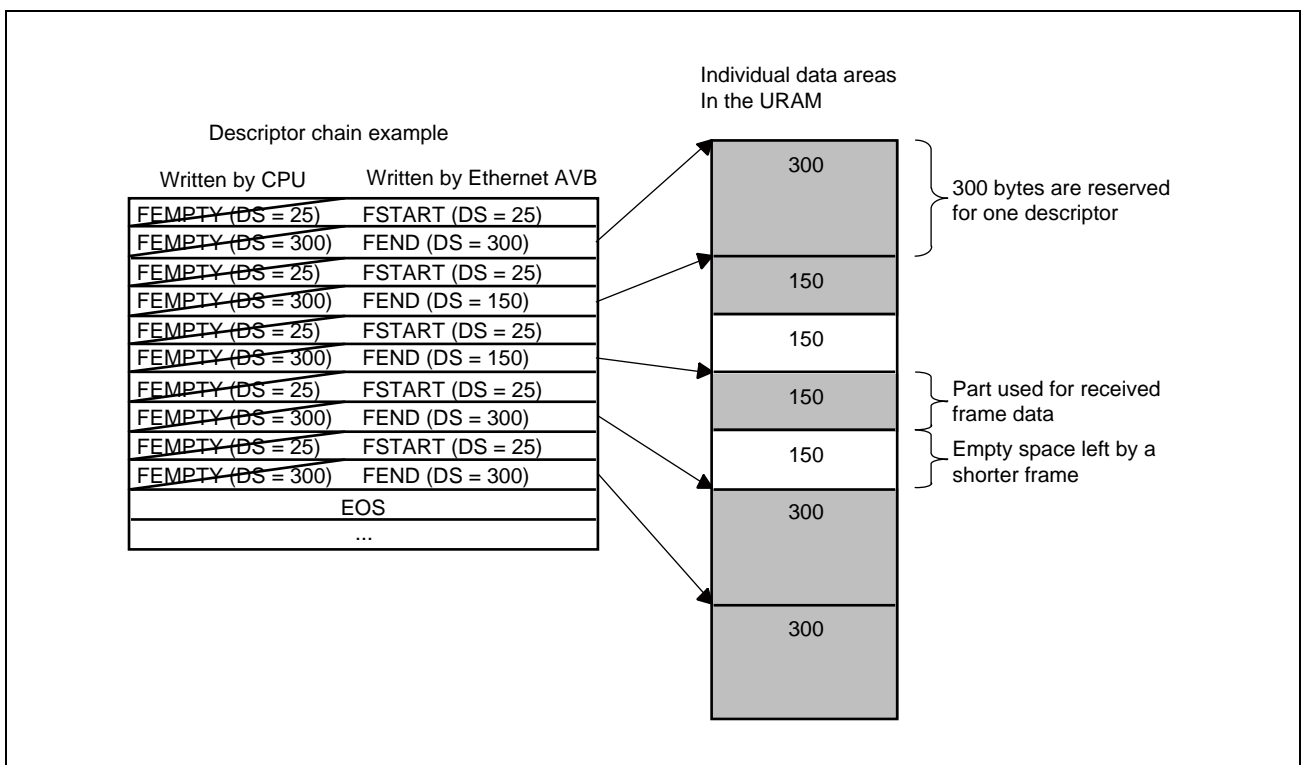

Figure 26.26 A Reception Queue Using Individual Descriptor Data Areas

**Figure 26.26, A Reception Queue Using Individual Descriptor Data Areas** and **Figure 26.27, Reception Queue Using a Common Incremental Data Area** show how control of the data storage areas by a descriptor chain varies according to whether individual or incremental data areas are in use. The chains are configured for storing received frames consisting of a 25-byte header ((which is treated as one descriptor outside of the range of this example) and a 150- or 300-byte payload (whether one or two 150-byte payload packages are transmitted with one Ethernet frame depends on the data source).

In **Figure 26.26, A Reception Queue Using Individual Descriptor Data Areas**, the EOS descriptor is added as an example of a re-synchronization point. If the frame source transmits a frame containing more than 325 bytes, the frame will be divided among three descriptors, meaning that synchronization of the header and data sequences is lost. Despite this, however, the frame is not divided across the EOS descriptor, so even if the synchronization is off before EOS, AVB-DMAC handles the next descriptor chain as normal. The EOS is not required because the incremental descriptor always stores all data being processed while an incremental data area is in use.

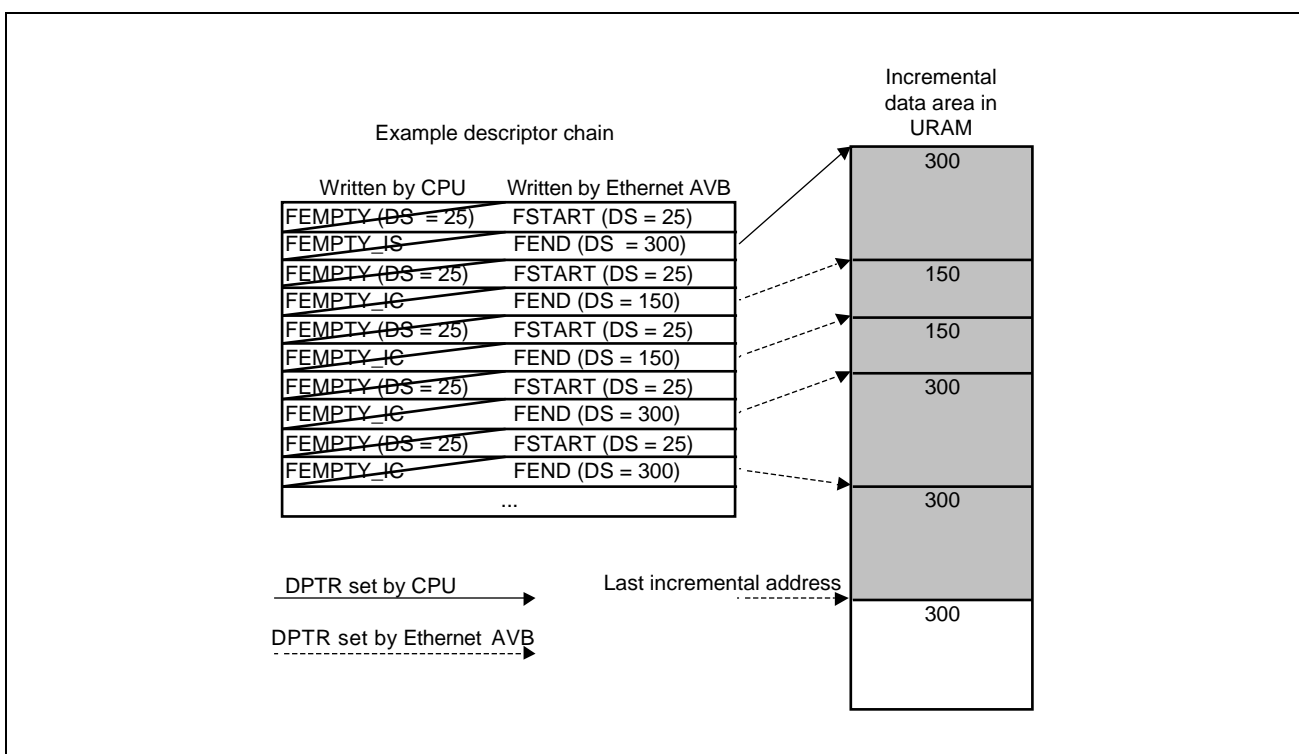

Figure 26.27 Reception Queue Using a Common Incremental Data Area

As **Figure 26.27, Reception Queue Using a Common Incremental Data Area** shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY\_IC descriptors (DESCR.DPTR) are updated. Accordingly, the resulting FEND or FSINGLE descriptor is in the same format as after writing to an FEMPTY descriptor.

Software captures received data from an incremental data area that has no empty storage areas between frame data. All empty spaces are allocated to the end of the incremental data areas. Incremental data areas are limited to multiples of four bytes. When the amount of data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space will be produced.

DESCR.DS can be read to check for such empty spaces.

It is not possible to directly control the amount of received data to be stored from the incremental descriptor (FEMPTY\_IS, FEMPTY\_IC) because other descriptors (FEMPTY and FEMPTY\_ND) are also applicable with DESCR.DS. All received data in the chain are always stored in an incremental descriptor.

### (a) Setting Up an Incremental Data Area

A descriptor chain in the incremental data area having N descriptors (one FEMPTY\_IS and N-1 FEMPTY\_IC) means that a storage area for the maximum of N times the capacity must be prepared.

As **Figure 26.27, Reception Queue Using a Common Incremental Data Area** shows, DESCR.DPTR of an FEMPTY\_IS descriptor indicates the base address of the incremental data area. The DPTR in FEMPTY\_IC descriptor indicates the address of next store data.

### (b) Processing an Incremental Data Area Based on Descriptors

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

### (c) Padding

Use padding for received frame data that are not aligned correctly in the specified memory structure. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be restricted to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to optimize system performance in an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries in the incremental data area), as well as to fulfill application-specific requirements for specified memory structures (e.g. formats required by other modules that will be processing the received data).

Padding can only be used in an incremental data area. The value 0000 0000<sub>H</sub> is always used in padding.

Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter in the receive padding configuration register (ETNBnRPC.PCNT). This padding is repeatedly inserted in accord with the value in the stored data counter (ETNBnRPC.DCN) (from one to 255 32-bit words). When the stored data counter (ETNBnRPC.DCNT) reaches 0, however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted at any byte position, and padding is handled on a 32-bit basis (e.g. an incremental data area where the first descriptor is for a 42-byte header data and the second descriptor holds padded payload data).

The next figure shows a general example of how padding is inserted and an example of setting up padding. A indicates frame data A received from the E-MAC, while B indicates frame data already stored in the descriptor data area (32-bit word units).

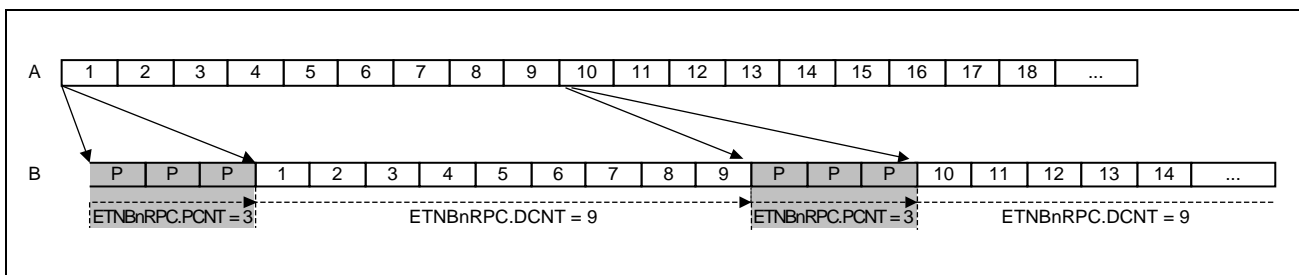

Figure 26.28 Example of a Padding Setting

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

### (3) Mode with Write-Back

Constructing a descriptor chain requires software (see **Figure 26.29, Flow of Reception Descriptor Processing (with Write-Back)**).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after operation mode is entered and a descriptor base address load request (ETNBnDLR.LBAq) is executed (condition for starting the flow of software operations).

The frame\_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

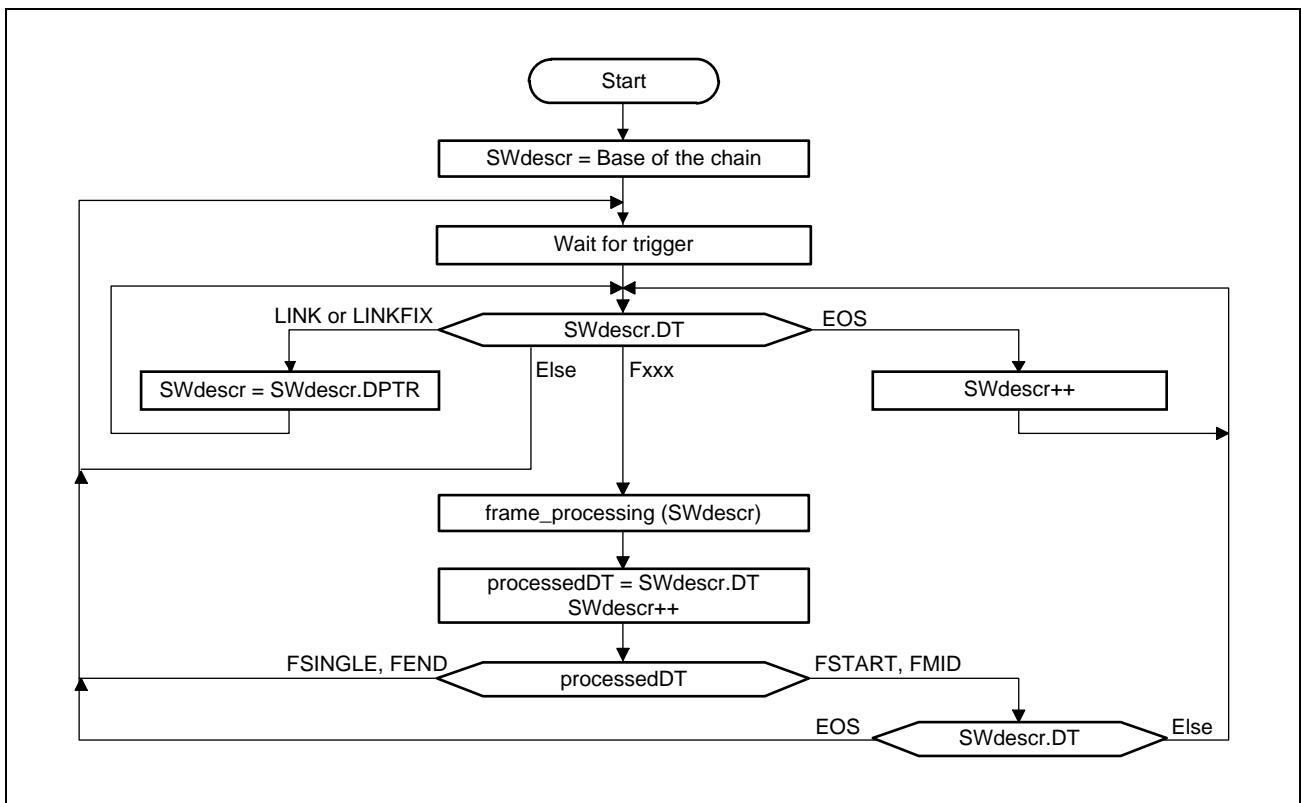

Figure 26.29 Flow of Reception Descriptor Processing (with Write-Back)

#### (4) Support for Reception Timestamps

Capturing reception timestamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception timestamp be appended; this depends on the application. The AVB-DMAC supports reception timestamps based on the gPTP timer by storing timestamps that have been captured when the frame delimiter (SDF) for a received frame starts in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see **Section 26.4.7.1, gPTP Timer**.

When timestamps are to be stored, use extended descriptors for the entire reception queue. Furthermore, timestamps are always stored for reception queue 1 (Network Control). Timestamps for reception queue 0 (best effort) and reception queue  $r$  ( $r \geq 2$ ; for stream data) can be selected by the timestamp enable bits in the receive configuration register (ETNBnRCR.ETS0 or ETNBnRCR.ETS2).

#### 26.4.4.4 Unread Frame Counters

Each reception queue has an unread frame counter (ETNBnUFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (ETNBnRQCi.UFCCr) to select from among the four stop levels for each unread frame counter. The 0 setting disables the stop functions. For how to set this up, see **Figure 26.30, Overview of an Unread Frame Counter**.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the URAM and is only incremented by one even when a received frame is divided into different descriptors. Failure in storing a descriptor chain requires care because this may unread frame counter may fail in synchronization as described in **Section 26.4.4.4(1), Unread Frame (UFC) Synchronization Failure**.

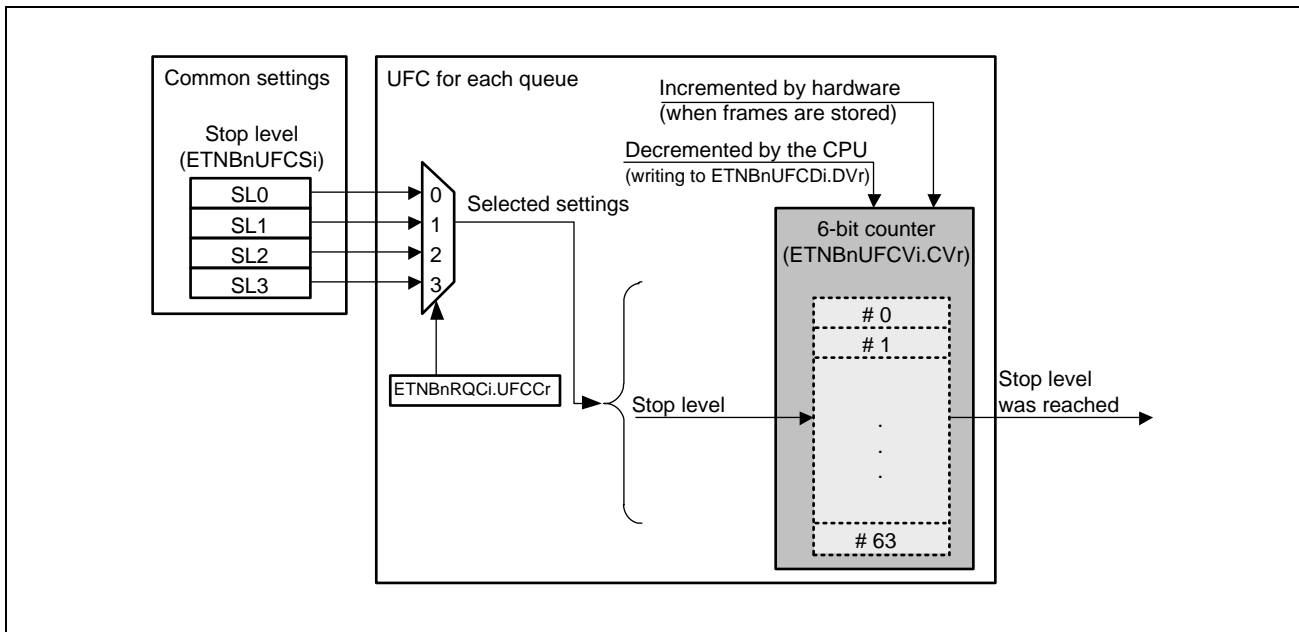

Figure 26.30 Overview of an Unread Frame Counter

Unless synchronization of hardware and software is not established, the current unread frame counter value (ETNBnUFCVi.CVr) indicates the number of unread frames in the queue.

The indicator that the stop level has been reached prevents the storage of further received frames in the descriptor chain. Selecting 0 as the stop level disables this function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. When the unread frame counter stop function activates, the receive queue full interrupt flag in the receive interrupt status register 2 (ETNBnRIS2.QFFr) is set.

Set the unread frame counter stop level configuration register (ETNBnUFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

### (1) Unread Frame (UFC) Synchronization Failure

The unread frame counters do not recognize failure to store a frame in the URAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software fails under the following conditions.

- An unread frame counter reaching its maximum value

When the value of a counter in an unread frame counter register  $i$  ( $ETNBnUFCVi$ ) ( $i = 0$  to  $4$ ) reaches  $63$ , synchronization can fail.

The CPU can only judge that a failure in synchronization has not occurred when the stop level is set to  $63$ .

- A queue not having enough space for a descriptor or the associated data

In this case, the corresponding receive queue full interrupt flag ( $ETNBnRIS2.QFFr$ ) in receive interrupt status register 2 is set.

If an unread frame counter reaches its stop level write-back mode ( $ETNBnRQCi.RSM[1:0] = 00_B$ ), the receive queue full interrupt flag ( $ETNBnRIS2.QFFr$ ) in the receive interrupt status register 2 is set. Software must respond to this.

- A problem occurring during access to memory

The unread frame counter may set flags to frames over the number of frames actually usable for a descriptor chain, and consequently, it causes synchronization to fail. To retrieve the correct starting point for operations, use the descriptor base address load request ( $ETNBnDLR.LBAq$ ) for the given queue.

## 26.4.5 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see **Section 26.4.3, Descriptors**).

The AVB-DMAC fetches data from the URAM in accord with the procedure the descriptor describes. Descriptors are retaining information about tags of transmit frames, too. The tag information is used to maintain the relationships between state information and timestamps for the software and the AVB-DMAC. After completion of transmission of frames, information about the statuses and timestamps of transmitted frames are accessible.

### 26.4.5.1 Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode

Selection of the transmit configuration register transmission queue priority (ETNBnTGC.TQP[1:0] bits set to 01<sub>B</sub> or 11<sub>B</sub>).

- Non-AVB transmission mode

Selection of the transmit configuration register transmission queue priority (ETNBnTGC.TQP[1:0] bits set to 00<sub>B</sub>).

#### (1) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

##### (a) Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and high-priority queues are reserved for SRP traffic.

The AVB-DMAC supports four traffic classes: SR Class A, SR Class B, Network Control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to Network Control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for Class A and Class B).
- Q1 is for low-bandwidth Network Control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU\*<sup>1</sup>, MVRPDU\*<sup>2</sup>, best effort (BE), etc.)

**Note 1.** MSRPDU: Multiple Stream Registration Protocol Data Unit

**Note 2.** MVRPDU: Multiple VLAN Registration Protocol Data Unit

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP[1:0]). In the default priority scheme, which is called AVB mode 1 (selected by ETNBnTGC.TQP[1:0] = 01<sub>B</sub>), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits (ETNBnTGC.TQP[1:0] = 11<sub>B</sub>) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care. The other setting (ETNBnTGC.TQP[1:0] = 00<sub>B</sub>) is for non-AVB-mode transmission.

Table 26.94 Default and Alternative Priority Orders in AVB Transmission Mode

Priority Schemes (AVB Mode)	Priority Order of Queues
AVB mode 1 (Default)	Q3 (SR Class A) > Q2 (SR Class B) > Q1 (NC) > Q0 (BE)
AVB mode 2 (Alternative)	Q1 (NC) > Q3 (SR Class A) > Q2 (SR Class B) > Q0 (BE)

### (b) Transmission Selecting Algorithm and CBS

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the specifications under *Section 8.6.8, Transmission selection, of the IEEE 802.1Q standard*. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the Class A and Class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues.

For the CBS algorithm, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

When all the following conditions are determined as True, an SR queue (Q3 or Q2) is selected and transmitted at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has available credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

**Figure 26.31, Flow of Selection for Transmission in AVB Mode 1 (Default)** and **Figure 26.32, Flow of Selection for Transmission in AVB Mode 2 (Alternative)** are flowcharts of selection for transmission in AVB mode 1 (default) and AVB mode 2 (alternative).

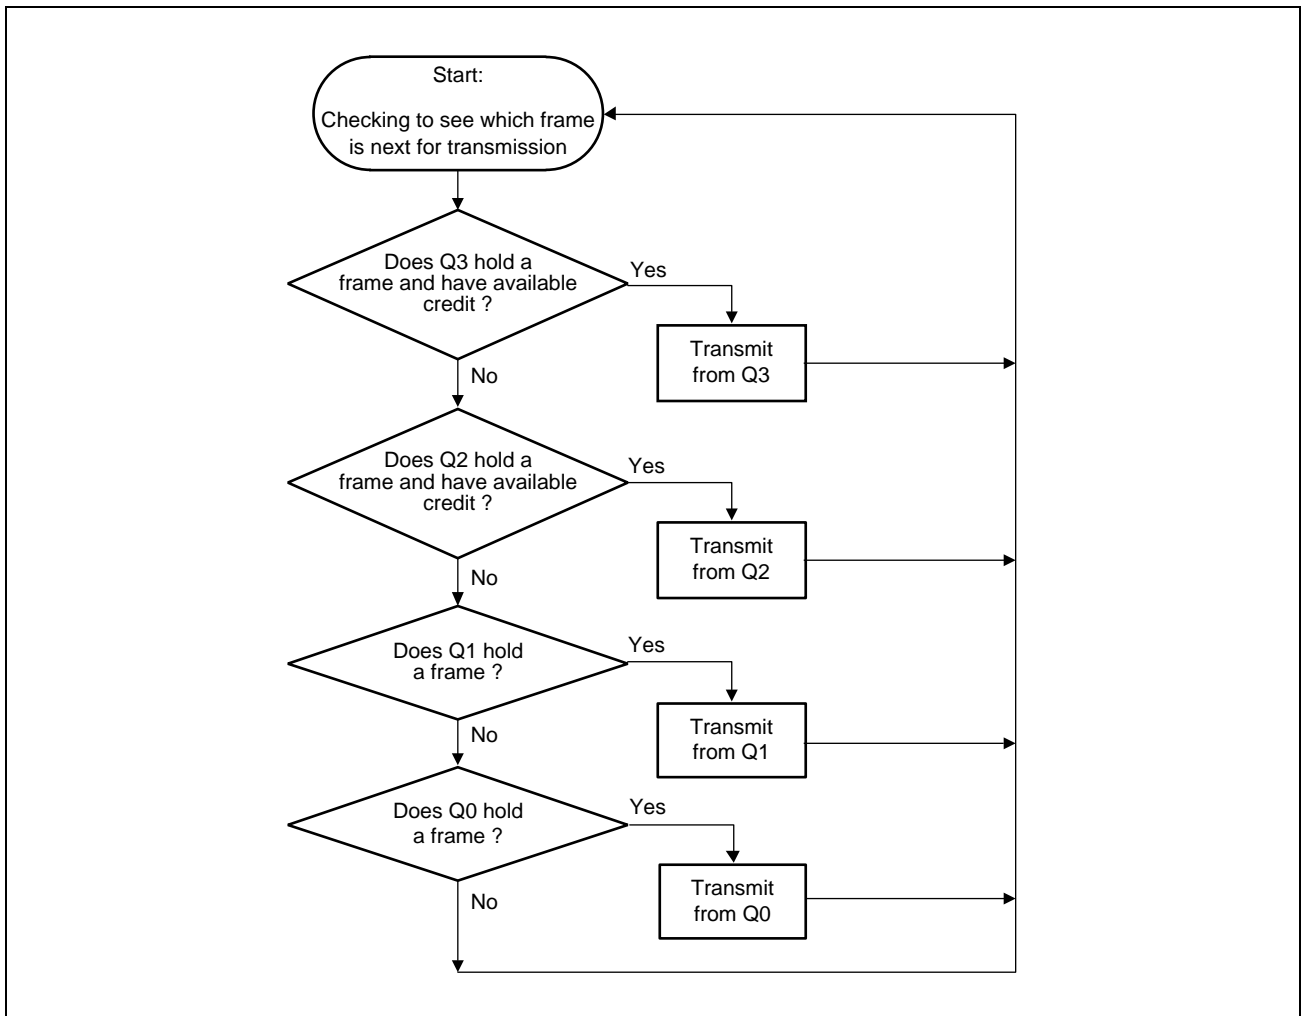

Figure 26.31 Flow of Selection for Transmission in AVB Mode 1 (Default)

Figure 26.32 Flow of Selection for Transmission in AVB Mode 2 (Alternative)

## (2) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR Class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP[1:0]) are 00<sub>B</sub>), data is fetched for transmission in a strict order of priority (Q3 > Q2 > Q1 > Q0).

**Figure 26.33, Flow of Selection for Transmission in Non-AVB Mode** shows the flow of selection in non-AVB transmission mode.

Figure 26.33 Flow of Selection for Transmission in Non-AVB Mode

### (3) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 124 clusters. Each cluster can hold up to 128 bytes.

The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration  $t$  bits in the transmit control register (ETNBnTGC.TBDt). The maximum number of clusters required can be determined from the maximum length of frames for transmission from the queue  $t$ .

#### General Usage Examples:

Q0: Frames containing up to 1500 bytes  $\rightarrow 1500/128 = 11.7 \rightarrow 12$  clusters

Q1: Frames containing up to 1024 bytes  $\rightarrow 1024/128 = 8.0 \rightarrow 8$  clusters

Q3: Frames containing up to 1996 bytes  $\rightarrow 1996/128 = 15.6 \rightarrow 16$  clusters

Q4: Frames containing up to 1996 bytes  $\rightarrow 1996/128 = 15.6 \rightarrow 16$  clusters

When the depth of all transmission queues is 2, the following number of clusters is required.

$$2 \times (12 + 8 + 16 + 16) + 16 = 2 \times 52 + 16 = 120$$

## 26.4.5.2 Setting Up Transmission Descriptors

### (1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

**Table 26.95, Descriptor Types in Transmission** shows the descriptor types used in transmission.

Table 26.95 Descriptor Types in Transmission

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The AVB-DMAC fetches the first of the data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame Middle (FMID)	The AVB-DMAC fetches the second or subsequent data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame End (FEND)	The AVB-DMAC fetches the last of the data for the divided frame. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The AVB-DMAC fetches the frame of data. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	This is a transmission stop point defined by software This leads to clearing of the transmit start request bit (ETNBnTCCR.TSRQt), which stops transmission. When the ETNBnTCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	No frame data are ready for transmission This leads to clearing of the transmit start request bit (ETNBnTCCR.TSRQt), which stops transmission. When the ETNBnTCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing starts at this descriptor.	Not changed
Link Empty (LEEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

## (2) Configuration of Transmission Frame Data Descriptors

**Figure 26.34, Configuration of Descriptor for a Transmitted Frame** shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR, and DESCR.TAG) are described in **Table 26.96, Configuration of a Transmission Descriptor**.

For the other fields and the descriptor types, see **Section 26.4.3.6, Descriptor Type**.

Figure 26.34 Configuration of Descriptor for a Transmitted Frame

Table 26.96 Configuration of a Transmission Descriptor

Bit Name	Function
TSR	<p>Timestamp Store Request</p> <p>This bit specifies whether the transmission timestamp is to be stored within the EthernetAVB module.</p> <p>0: The timestamp FIFO within the EthernetAVB module does not retain a transmission timestamp.</p> <p>1: The timestamp FIFO within the EthernetAVB module retains a transmission timestamp.</p> <p>Only control this bit while the current DESCR.DT is FEND or FSINGLE.</p>
TAG	<p>Frame Tag</p> <p>This TAG field is used to associate each frame data with a timestamp. Frame TAG is not required but is recommended.</p> <p>Only control this bit while the current DESCR.DT is FEND or FSINGLE.</p>

For the timestamp FIFO function, see **Section 26.4.5.4, Timestamping in Transmission**.

### 26.4.5.3 Transmission

#### (1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) starts the transfer of frames to the corresponding transmission queue.

The descriptor to the current descriptor address of the queue (ETNBnCDARq.CDA) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in **Section 26.4.3, Descriptors**).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue that is currently being processed in the descriptor base address load request register, ETNBnDLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

**Figure 26.35, Descriptor Processing During Transmission** shows descriptor processing during transmission.

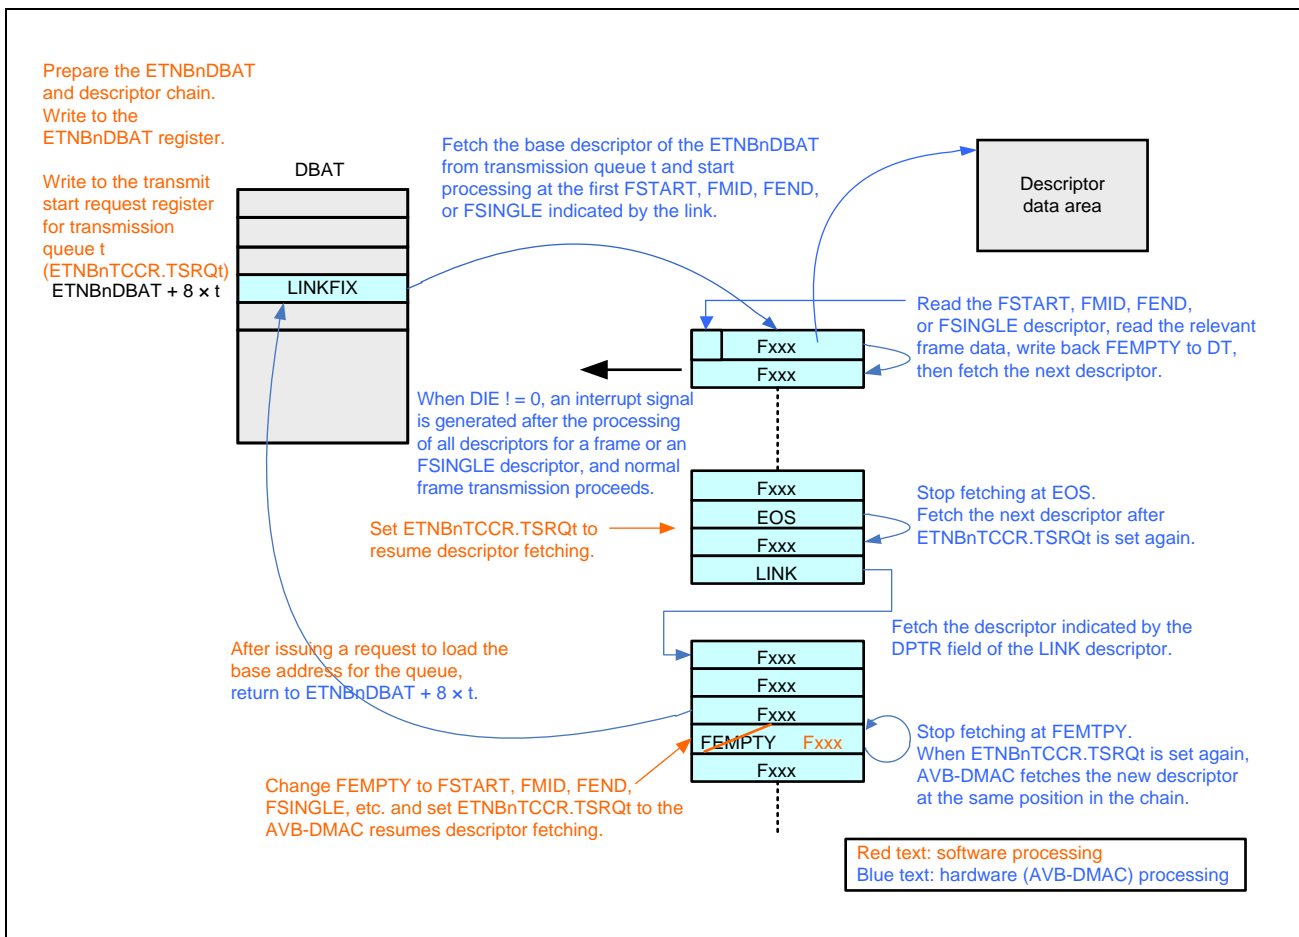

Figure 26.35 Descriptor Processing During Transmission

## (2) Examples of Descriptor Usage

### (a) Immediate Frame Transmission

Immediate frame transmission is a pattern in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as HW/SW synchronization stop points.

Create descriptor chains that have FEMPTY descriptors at the stop points.

**Figure 26.36, Software Flow for Immediate Frame Transmission** shows the flow for software implementing this pattern.

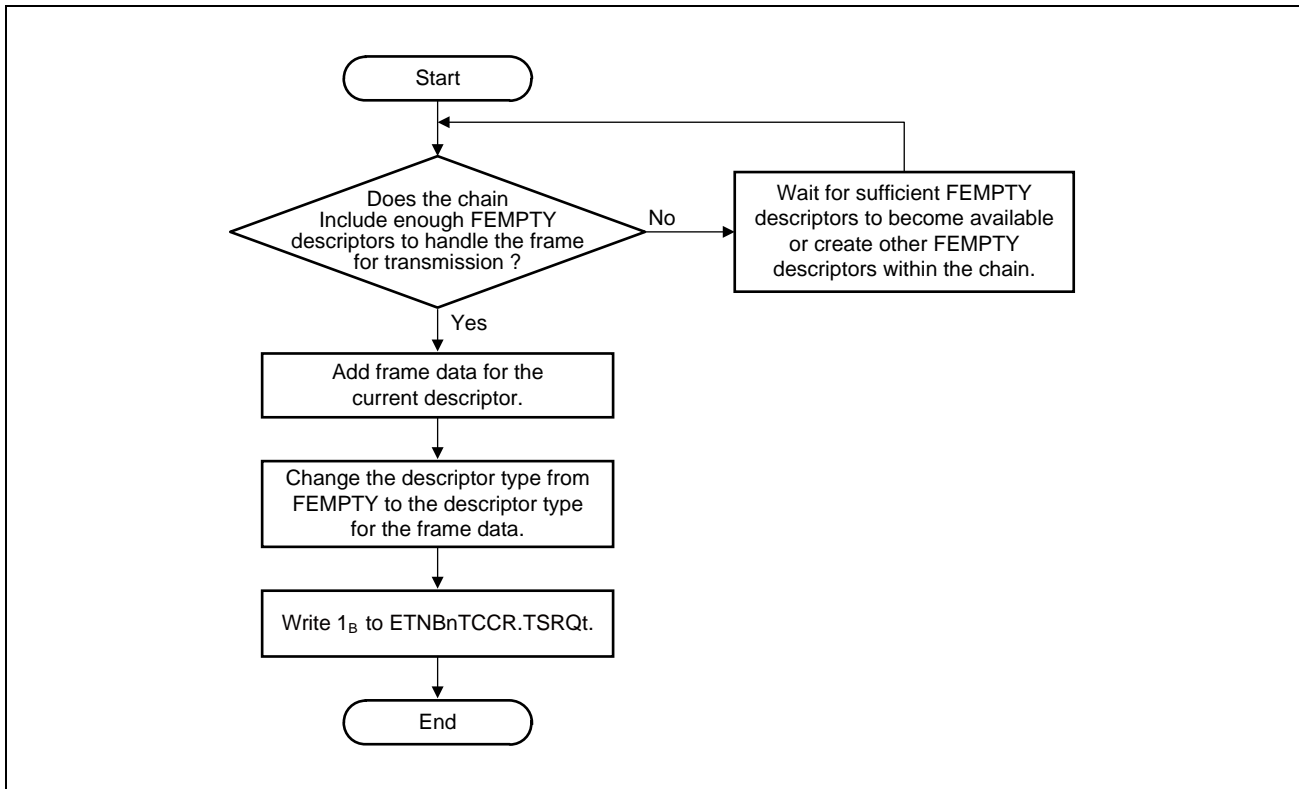

Figure 26.36 Software Flow for Immediate Frame Transmission

**Figure 26.37, Software and AVB-DMAC Operations for Immediate Frame Transmission** shows software and AVB-DMAC operations for immediate frame transmission.

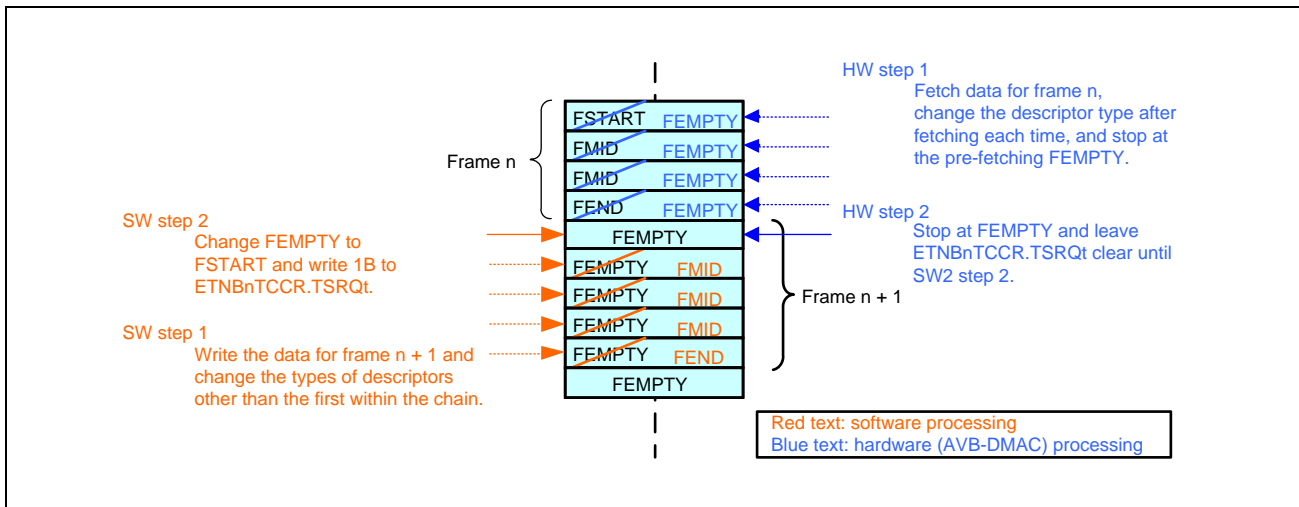

Figure 26.37 Software and AVB-DMAC Operations for Immediate Frame Transmission

**(b) Frame Set Transmission with Changing of the Active Descriptor Chain**

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points.

Start by creating a descriptor chain that has a FEMPTY descriptor at its stop point.

**Figure 26.38, Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain** shows the software flow in this pattern.

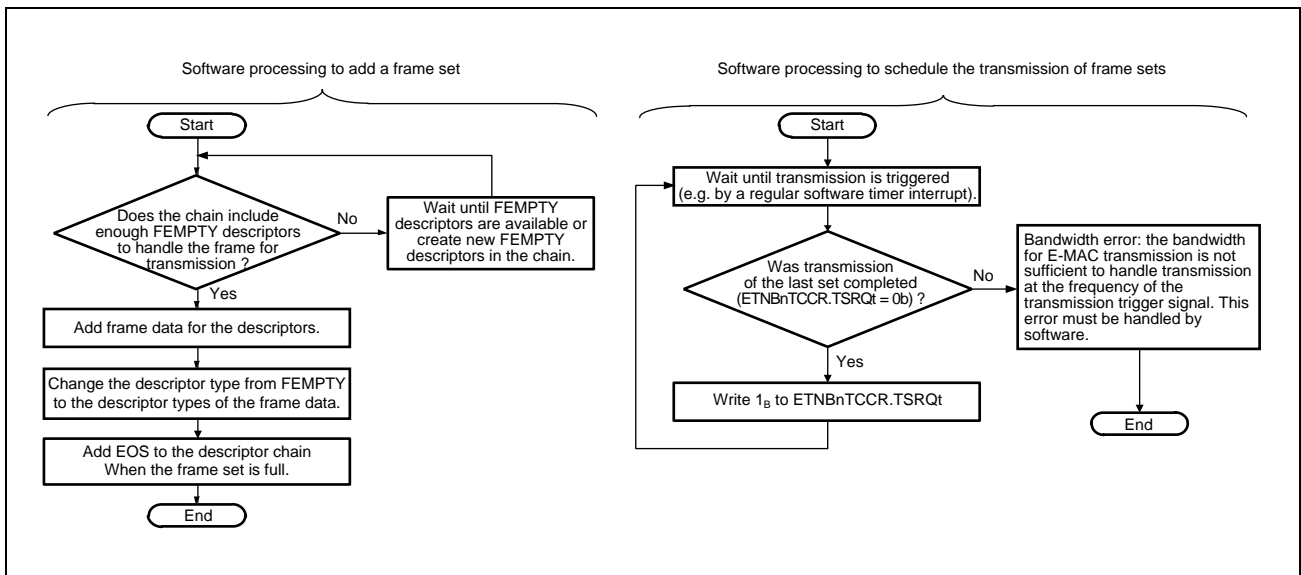

Figure 26.38 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain

**Figure 26.39, SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain** shows software and AVB-DMAC operations for frame set transmission.

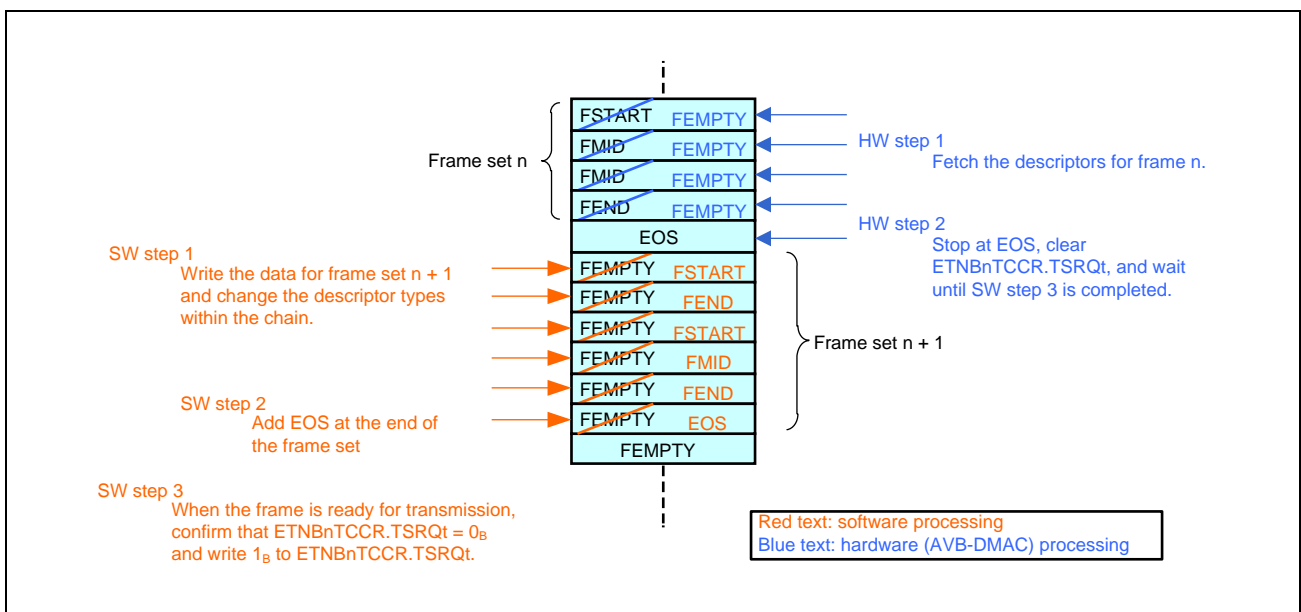

Figure 26.39 SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain

**(c) Frame Set Transmission Using a Shadow Descriptor Chain**

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified into the active chain and shadow chains. EOS descriptors are used for the stop points.

Create descriptor chains that have FEMPTY descriptors at the stop points.

**Figure 26.40, Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain** shows the flow for software implementing this pattern.

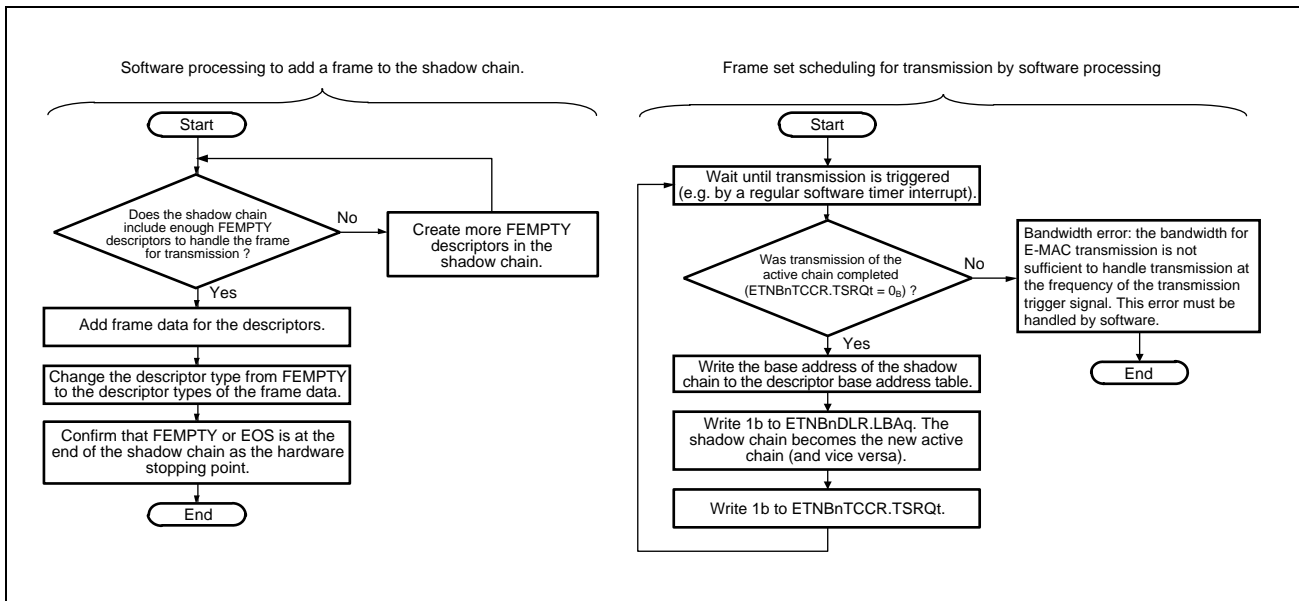

Figure 26.40 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

**Figure 26.41, SW and AVB-DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain** shows software and AVB-DMAC operations for frame set transmission.

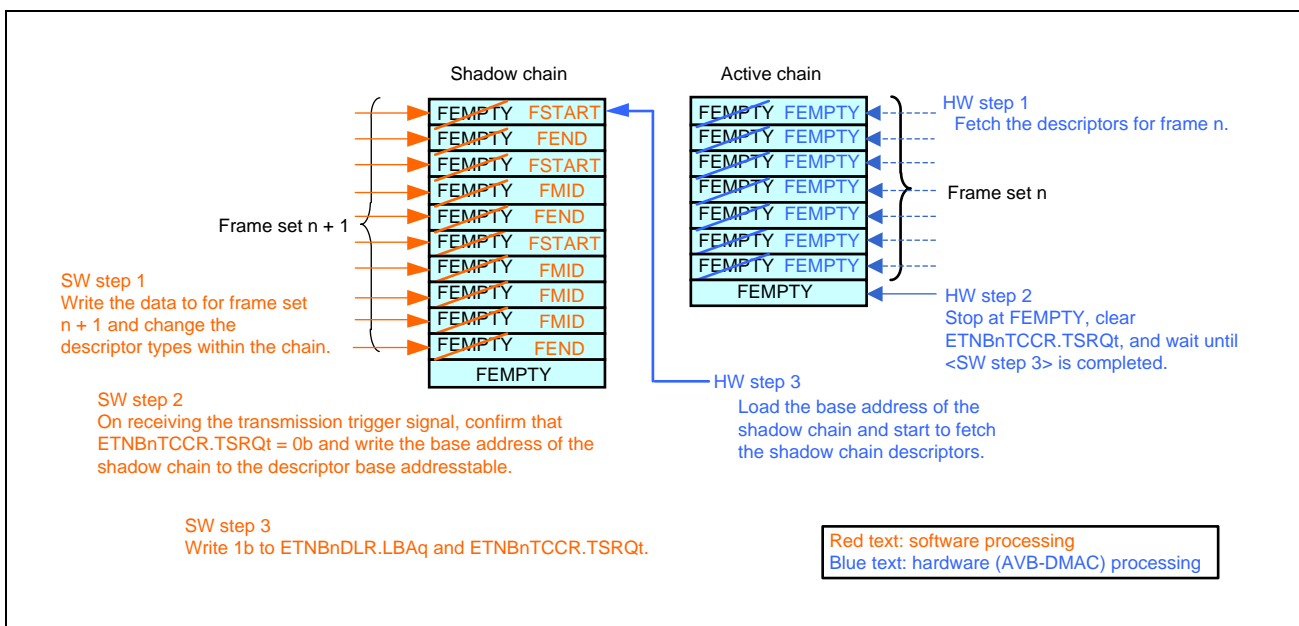

Figure 26.41 SW and AVB-DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain

### 26.4.5.4 Timestamping in Transmission

Transmission timestamps are important in satisfying the requirements for time synchronization of the IEEE 802.1AS standard. This information can also be useful to other applications and in testing. The AVB-DMAC supports the storage of timestamps for transmitted frames. The timestamp values are based on the gPTP timer and are captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the timestamp storage request field (DESCR.TSR) is set to 1, selecting storage of a timestamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor in a set (FEND) or of an FSINGLE descriptor for the frame being transmitted is stored with the timestamp. To make identification and association easy, the values of timestamp are stored together with tag numbers. The timestamp FIFO is accessible at any time.

**Figure 26.42, Mechanism to Support Transmission Timestamps** shows the mechanism supporting transmission timestamping.

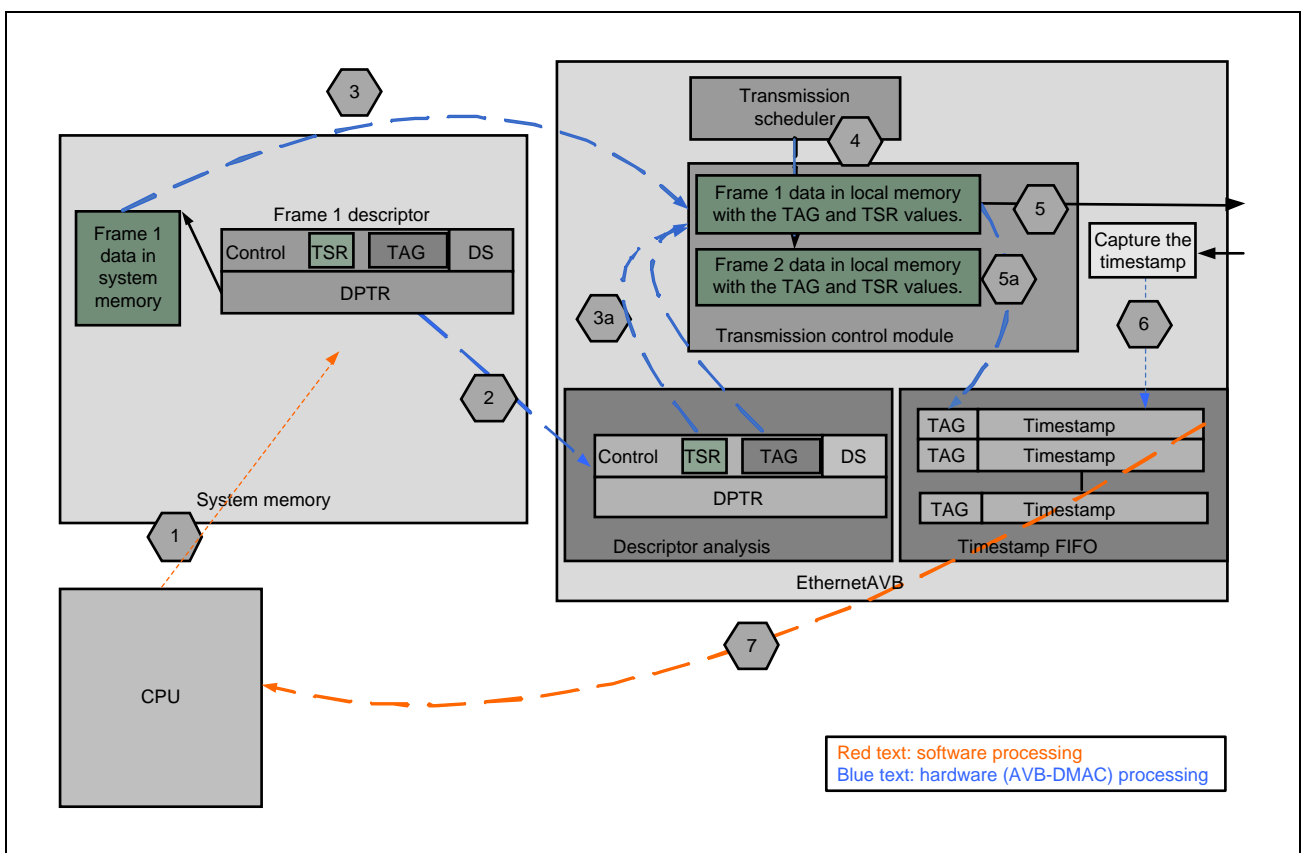

Figure 26.42 Mechanism to Support Transmission Timestamps

The method of using this function is described below:

1. Secure space in the URAM for the frame requiring timestamping.  
Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the timestamp storage request field (DESCR.TSR) to 1.
2. The AVB-DMAC fetches and analyzes the descriptor. The timestamp storage request field (DESCR.TSR) is 1, so it recognizes that transmitting this frame also requires storage of the timestamp.
3. The AVB-DMAC fetches the data for frame 1 and temporarily stores the frame in internal memory for scheduling.  
3a: The frame tag field (DESCR.TAG) and timestamp storage request field (DESCR.TSR) are stored with the fetched data.)
4. Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler determines the time to transmit frame 1.
5. Transmission of frame 1 starts.  
5a: The information relating to frame 1 is stored in the timestamp FIFO.
6. The gPTP timestamp is captured at the start of sending the frame delimiter (SFD) for transmission and stored with the tag in the timestamp FIFO. On completion of the transmission, an interrupt is generated. For this to happen, the descriptor interrupt control register (ETNBnDIC) must be set beforehand.
7. The entry can now be read from the timestamp FIFO.

Use the timestamp FIFO for the time synchronization of frames with IEEE 802.1AS compliance.

Timestamping can also be used with other frames, but take care not to allow the timestamp FIFO to overflow. When the FIFO is full, further timestamps supplied to it are lost.

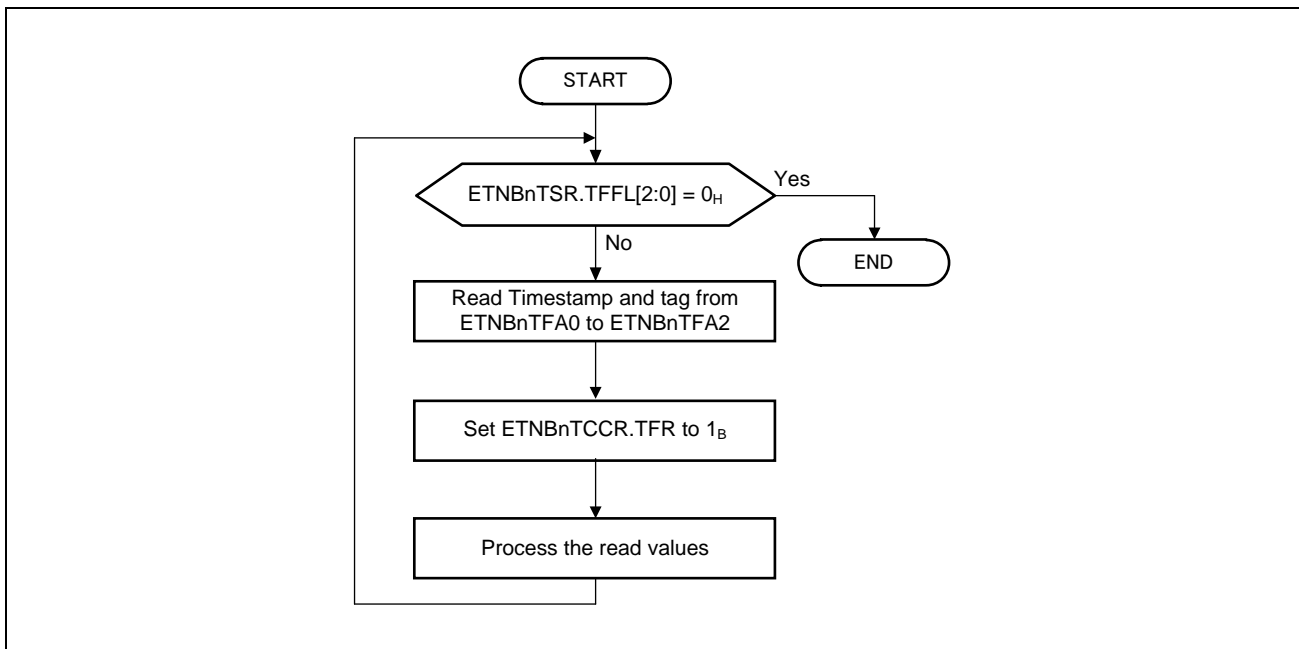

Figure 26.43 Flow of Transmission Timestamping

**(1) Ending Transmission**

**Figure 26.44, Procedures for Ending Transmission** shows the procedure for ending transmission.

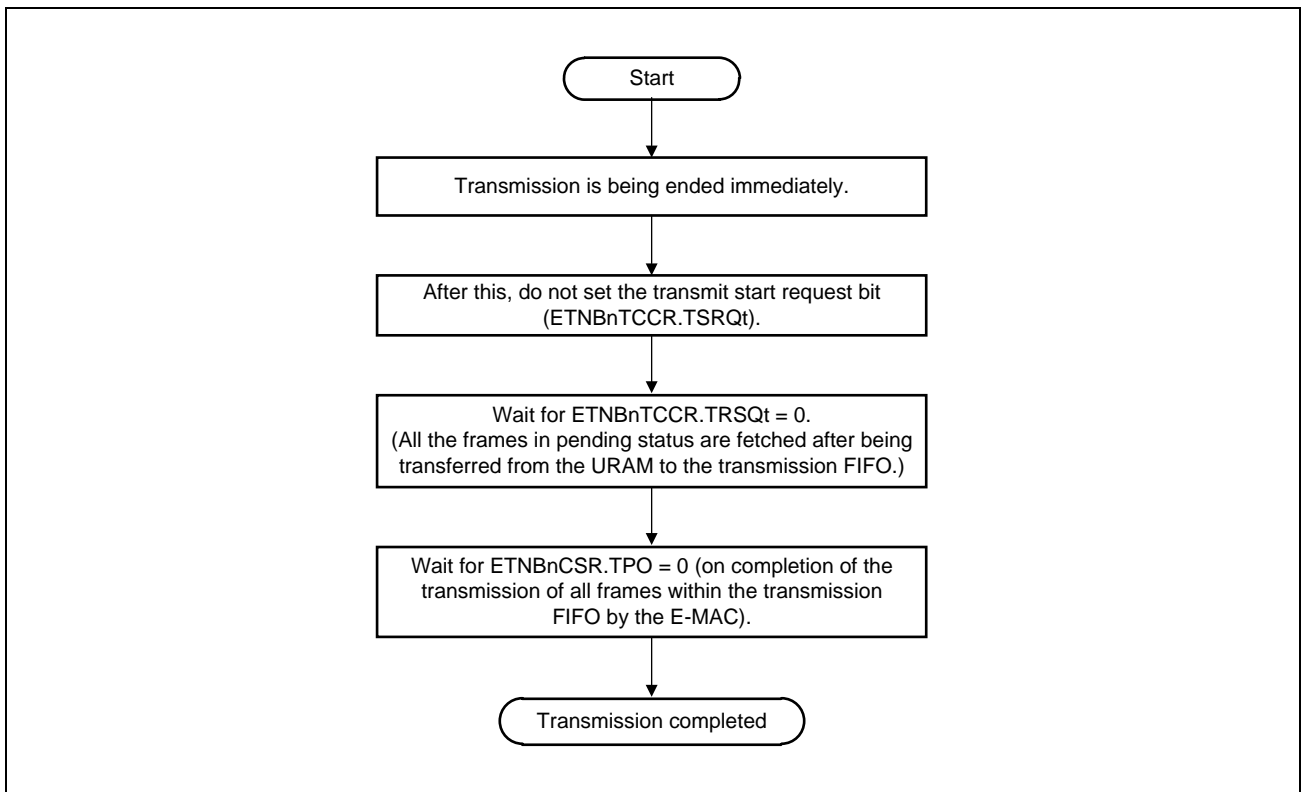

Figure 26.44 Procedures for Ending Transmission

### 26.4.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority field in the transmit configuration register (ETNBnTGC.TQP) is 01B or 11B), transmission queues Q3 and Q2 are respectively assigned to Class A and Class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see *Section 8.6.8* or *Section 34* in *IEEE 802.1Q*).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the “right” to transmit at a given time. Actually, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

- At least one frame is stored in the queue.
- The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue *t* in the AVB-DMAC status register (ETNBnCSR.TPOt) being clear (0). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the transmission of frames from the queues for each of the traffic classes does not exceed the specified maximum bandwidth.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

<b>portTransmitRate:</b>	Maximum transmission data rate of an external port. The E-MAC determines this parameter.
<b>bandwidthFraction:</b>	Maximum fraction of portTransmitRate that can be used for a queue.
<b>idleSlope:</b>	Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q. idleSlope = bandwidthFraction × portTransmitRate
<b>sendSlope:</b>	Rate of change of credit for a queue while transmission of a frame from the queue is in progress so the credit value is decreasing. (in bits per second). The value of sendSlope is defined as follows: sendSlope = idleSlope – portTransmitRate

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

<b>maxFrameSize:</b>	Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port
<b>maxInterferenceSize:</b>	Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed
<b>hiCredit:</b>	Maximum credit value (positive number). Can be calculated by using the following equation: hiCredit = maxInterferenceSize × (idleSlope / portTransmitRate)
<b>loCredit:</b>	Minimum credit value (negative number). Can be calculated by using the following equation: loCredit = maxFrameSize × (sendSlope / portTransmitRate)

**Figure 26.45, CBS (Credit-Based Shaping) Operation** shows how the CBS algorithm works and the meaning of the above parameters.

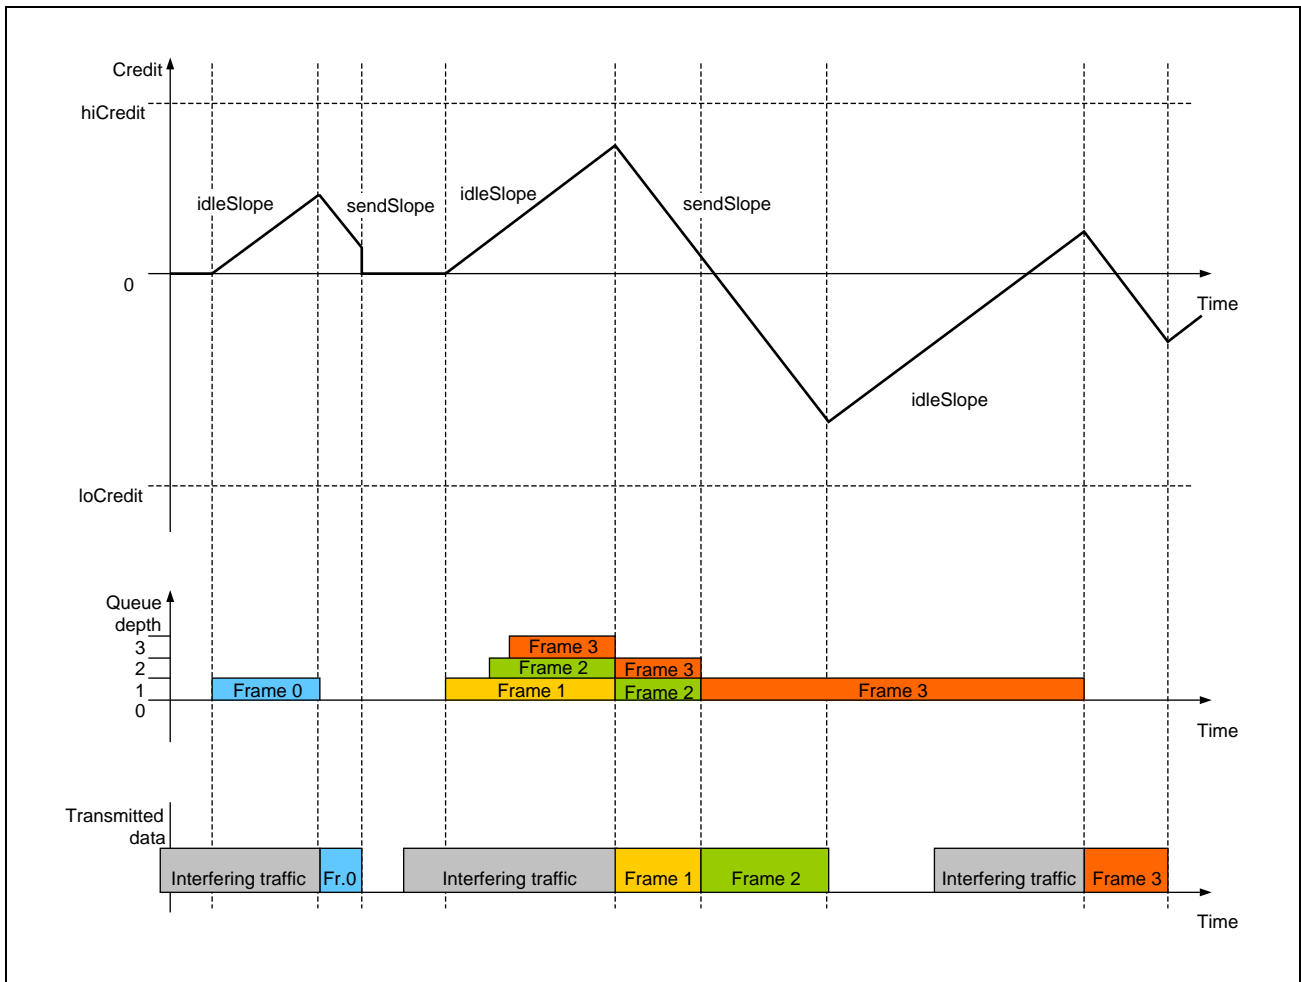

Figure 26.45 CBS (Credit-Based Shaping) Operation

**Figure 26.46, CBS (Credit-Based Shaping) Operation in the AVB-DMAC** shows the implementation of CBS in the AVB-DMAC.

Figure 26.46 CBS (Credit-Based Shaping) Operation in the AVB-DMAC

The above implementation is based on “credit counters” for the respective traffic classes (SR Class A and Class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number

The credit is incremented by this amount every peripheral bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).

CBS decrement value (CDV): Signed negative number

The credit is decremented by this amount every peripheral bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.

$$\text{CIV} = \text{idleSlope} \times \text{Mfactor}$$

$$\text{CDV} = \text{sendSlope} \times \text{Mfactor}$$

Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are calculated by using the following equations.

$$\text{CIV} = (\text{portTransmitRate}/\text{CHI\_freq}) \times \text{bwFraction} \times \text{Mfactor}$$

$$\text{CDV} = (\text{portTransmitRate}/\text{CHI\_freq}) \times (\text{bwFraction} - 1) \times \text{Mfactor}$$

CHI\_freq is the frequency of the peripheral bus clock. The credit counters are driven by the peripheral bus clock, so calculating the slope parameters for CBS requires  $(1/\text{CHI\_freq})$ .

Use software to prepare Mfactor for the CBS parameters. All queues for the same Class must have the same CBS parameters. Mfactor for a specified Class c can be changed during operation, unless transmission is pending for that Class (i.e. the transmit process status bit in the AVB-DMAC status register (ETNBnCSR.TPOt) = 0). At that time, the credit counter values for Class A and Class B are 0.

Note that the credit value will not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor is not present in the AVB-DMAC registers.

Set the CIV and CDV parameters in the CBS increment value registers  $c$  (ETNBnCIVRc) and the CBS decrement value registers  $c$  (ETNBnCDVRc). These are treated as dynamic settings since they should be updated when streams are registered or erased in accord with IEEE 802.1Qat.

The AVB-DMAC also has CBS upper limit registers  $c$  (ETNBnCULc) (the upper limit registers for Classes A and B) and CBS lower limit registers  $c$  (ETNBnCLLc) (the lower limit registers for Classes A and B). Set Mfactor to match the credit value and set the upper limit (hiCredit) and the lower limit (loCredit) for each class as defined above.

$$CUL = hiCredit \times Mfactor = maxInterferenceSize \times bwFraction \times Mfactor$$

$$CLL = loCredit \times Mfactor = maxFrameSize \times (bwFraction - 1) \times Mfactor$$

**Example:**

Assume that portTransmitRate = 100 Mbps, CHI\_freq = 60 MHz and bwFraction = 3 %.

Then idleSlope and sendSlope represented as one bit vs. cycles of the peripheral bus clock are as follows.

$$idleSlope = (portTransmitRate / CHI\_freq) \times bwFraction = 100 / 60 \text{ (Mbps/MHz)} \times 3 \% = 0.050 \text{ of a bit per peripheral bus clock cycle}$$

sendSlope = idleSlope – (portTransmitRate / CHI\_freq) = –1.616 bits per peripheral bus clock cycle Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

$$CIV = idleSlope \times Mfactor = 5.0$$

$$CDV = sendSlope \times Mfactor = -161.6$$

### 26.4.6.1 Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for Class A and Class B are calculated as follows.

#### <Conditions>

- Class A maximum value (hiCredit\_max\_classA)

classA bwFraction  $\cong$  100 %

Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum frame size.

hiCredit\_max\_classA  $\cong$  maxInterferenceSize for Class A = Interference due to one max. sized

frame = header + max. size payload + CRC (2000 bytes) + preamble (8 bytes) + IFG (12 bytes) + processing\_delay ( $\cong$  80 bytes)  $\cong$  2100 bytes

- Class B maximum value (hiCredit\_max\_classB)

classB bwFraction  $\cong$  100 %

Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum size of frames in the Class A transmission queue and other transmission queues.

hiCredit\_max\_classB  $\cong$  maxInterferenceSize for Class B = Interference due to two max-size

frames = 2 × hiCredit\_max\_classA  $\cong$  4200 bytes

hiCredit\_max\_classA = 16800

hiCredit\_max\_classB = 33600

The maximum values that can be selected with Mfactor for the 32-bit signed counter without overflow are:

Mfactor\_max\_classA =  $2^{31} - 1 / \text{hiCredit\_max\_classA} \cong 127826$  and

Mfactor\_max\_classB =  $2^{31} - 1 / \text{hiCredit\_max\_classB} \cong 63913$ .

A high degree of accuracy can be achieved even with a low bandwidth. In Class B, bandwidthFraction = 0.05 % and the bandwidth error < 0.1 %.

The maximum value of CIV is calculated from the following equation.

$\text{CIV} = \text{idleSlope} \times \text{Mfactor} = (\text{portTransmitRate} / \text{CHI\_freq}) \times \text{bandwidthFraction} \times \text{Mfactor}$

When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to 100 %):

$\text{CIV\_max\_classA} = (\text{portTransmitRate} / \text{CHI\_freq}) \times \text{Mfactor\_max\_classA}$  and

$\text{CIV\_max\_classB} = (\text{portTransmitRate} / \text{CHI\_freq}) \times \text{Mfactor\_max\_classB}$ .

**Table 26.97, Example of Maximum Values for Class A and Class B CIV Parameters** shows examples of values for portTransmitRate and peripheral clock frequency. Note that the values in the table are the limits of CIV up to which the 32-bit credit counter will not overflow. The CIV parameters are implemented as 16 bits + a sign bit, so a further limit of  $\text{CIV} \leq 65535$  applies to both Class A and Class B.

Table 26.97 Example of Maximum Values for Class A and Class B CIV Parameters

portTransmitRate	clk_chi[MHz]	CIV_max_classA	CIV_max_classB
100 Mbps	50	255652	127826
100 Mbps	60	213043	106521

### 26.4.6.2 Credit Incrementation During Inter-Frame Gaps (IFGs)

The inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission by the CSB credit counter. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit.

**Figure 26.47, Credit Operations during IFGs** illustrates credit operations during IFGs.

Figure 26.47 Credit Operations during IFGs

Accordingly, the IFG need not be included in calculation of the bandwidth requirements for the specified SR Class when deciding the idleSlope, sendSlope, and CIV and CDV parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR Classes does not exceed 100 % of portTransmitRate. This is described in *Section 35.2.2.8.4 of IEEE 802.1Q*.

### 26.4.6.3 Example

The case of a Class A 48-kHz stereo audio stream among Ethernet frames is described as an example.

After every Class A measurement interval (125  $\mu$ s), 80 octets consisting of two sets of six 32-bit samples plus a 32-octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific framing overhead (an 8-octet preamble, 14-octet IEEE 802.3 header, 4-octet IEEE 802.1Q priority/VID Tag, 4-octet CRC, and 12-octet IFG) are also added. Accordingly, the total frame size is 80 + 42 = 122, and one such frame is transmitted after every class measurement interval.

This represents a total bandwidth of about 7.8 Mbits per second (122 octets  $\times$  8 bits per octet  $\times$  8000 frames per second) for this class. If the E-MAC is assumed to run at 100 Mbps (portTransmitRate), this is equivalent to the allocation of about 7.8 % of the total bandwidth to each Class A queue. If other traffic classes are to share the total transmission bandwidth, checking that this 7.8 % allocation does not lead to the total allocation of bandwidth being greater than 100 % of portTransmitRate is required.

To obtain the CIV and CDV parameters for a given class, the IFG must not be taken into account in calculation of the frame size must not include the IFG. For this case, therefore, we obtain an 80-bit payload + 30-bit overhead = 110-octet measurement interval for the class  $\rightarrow$  the total bandwidth for the class = 7.04 Mbps = 7.04 % of portTransmitRate.

Figure 26.48 Example of CBS Settings

#### Given that:

- the E-MAC runs at 100 Mbps, so portTransmitRate = 100 Mbps and
- Peripheral bus clock (operating clock for the credit counter) frequency = 60 MHz,

securing a bandwidth of 7.04 Mbits/sec for Class A requires configuring the CBS parameters as follows.

- bandwidthFraction = 7.04 %
- idleSlope = (portTransmitRate / CHI\_freq)  $\times$  bandwidthFraction  $\cong$  0.1173 bits per peripheral bus clock cycle
- sendSlope = idleSlope – (portTransmitRate / CHI\_freq)  $\cong$  -1.5493 bits per peripheral bus clock cycle

When Mfactor = 100, the parameters are as follows.

- $CIV = \text{idleSlope} \times \text{Mfactor} = 11.7333$  bits per peripheral bus clock cycle
  - $CDV = \text{sendSlope} \times \text{Mfactor} = -154.9333$  bits per peripheral bus clock cycle
- These are the final values for setting in the ETNBnCIVR1 and ETNBnCDVR1 registers.

## 26.4.7 IEEE802.1: gPTP

### 26.4.7.1 gPTP Timer

An 84-bit timer is provided to support the gPTP function. **Figure 26.49, Definitions of gPTP Timer Bits and Related Bits** shows the definitions of bits for the timer and in related registers. gPTP timer will start after ETNBnCCC.CSEL configure and transit to operation mode.

Figure 26.49 Definitions of gPTP Timer Bits and Related Bits

The higher-order 32 bits indicate seconds. For the next 32 bits, counting by one corresponds to the passage of 1 ns. The lower-order 20 bits are a fractional value (less than 1 ns). Software can only read the 32 higher-order bits, indicating seconds, and the subsequent 32-bits, indicating nanoseconds. The 20 lower-order 20 bits, representing less than 1 ns, are not readable. They are only used within the AVB-DMAC to maintain accuracy in time measurement.

The timer can be reset by setting the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) to  $01_B$ . These bits are set to  $00_B$  on completion of normal resetting of the timer.

After the timer starts, the value in the gPTP timer increment register (ETNBnGTI.TIV) is added to the value of the gPTP timer every clock cycle.

After setting a value in the gPTP timer increment register (ETNBnGTI.TIV), set the timer increment value setting request bit in the gPTP configuration control register (ETNBnGCCR.LTI). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed.

An offset to the gPTP timer is also available. If this is required, set the value in the gPTP timer offset register (ETNBnGTOi.TOV). After setting a value in this register, set the timer offset value setting request bit in the gPTP configuration control register (ETNBnGCCR.LTO). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed. When adding an offset, take care that it does not exceed 80 bits.

The value of the gPTP timer can be read from the gPTP timer capture register (ETNBnGCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (ETNBnGCCR.TCSS) to select the timer value for capture as the value of the gPTP timer, the corrected value of the gPTP timer (value with the offset added), or the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) to 11<sub>B</sub> initiates the capture. Once normal capture of the timer is complete, the value of the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) returns to 00<sub>B</sub>.

The timer for gPTP operates as a free-running timer but can be synchronized with the Grandmaster clock.

### 26.4.7.2 Free-Running Operation

The IEEE 802.1 AS standard for timing and synchronization does not prescribe the physical adjustment of local clocks to the Grandmaster clock. To avoid negative effects from the correction procedure, we recommend the use of a free-running timer.

As a free-running timer, the timer counts the local time in seconds or nanoseconds. The gPTP timer increment register (ETNBnGTI.TIV) is set to 1 ns (the setting value = 0010 0000<sub>H</sub>) and the gPTP timer offset register (ETNBnGTOi.TOV) is set to 0. The ratio information captured at the time of the gPTP delay measurement and synchronization procedures is used to correct the frequency ratio to that of the Grandmaster clock. The Grandmaster clock can be calculated from the local clock by using the information collected during the gPTP measurement and synchronization procedures.

### 26.4.7.3 Synchronization with the Grandmaster Clock

In situations requiring physical synchronization of the local clock with the Grandmaster clock, the fractional nanoseconds value (the 20 lower-order bits of the gPTP timer) is used to make the adjustment. Specifically, the increment value is finely adjusted to correct for deviations of the clock frequency from that of the Grandmaster clock.

Use the timer offset value (in the gPTP timer offset registers, ETNBnGTOi.TOV) to correct for offsets from the theoretical value (at start-up, etc.). The sum of the timer value and the offset register is the “corrected timer” value.

Note that only the nanoseconds portion of the gPTP timer offset registers (ETNBnGTOi.TOV[31:0]) is valid.

The following equation gives a method of calculating the increment (ETNBnGTI.TIV) from the frequency of the gPTP clock and its deviation from that of the Grandmaster clock. Variable *d* is the deviation ( $d = 10^{-6}$  for 1 ppm).

$$ETNBnGTI.TIV = \text{round} \left( \frac{2^{20} \text{GHz}}{f_{GPTP}} \times (1 + d) \right)$$

After adjusting for the current deviation of clock frequency, re-set the gPTP timer increment register (ETNBnGTI.TIV).

After calculating the new offset value, re-set the gPTP timer offset register (ETNBnGTOi.TOV).

#### 26.4.7.4 Support Provided by the gPTP Timer in Transmission and Reception

The timer value described above is used in the timestamp values captured when start frame delimiters are detected in reception and generated in transmission.

Captured timestamp values for received frames are stored in the corresponding descriptors. Those for transmitted frames are stored with tag information in the timestamp FIFO. The timestamp values are thus correlated with both transmitted and received frames.

Note that the use of corrected timer values can introduce an error due to the offset correction in the gPTP synchronization procedure.

Errors due to the SDF notification and the asynchronous interface between the timer modules must also be taken into account.

#### 26.4.8 Support for IEEE 1722

For IEEE 1722, the following two functions are supported.

- Output and capture of values in the IEEE 1722 AVTP (Audio/Video Transport Protocol) presentation time format
- Comparison of IEEE 1722 AVTP presentation timestamps

The 32-bit AVTP timestamp field of IEEE 1722 frames holds the AVTP presentation time when the AVTP timestamp enable bit in the frame is 1. The AVTP timestamp field is generated from the pPTP timer and is given as seconds (gPTP\_seconds) and nanoseconds (gPTP\_nanoseconds) according to the following equation.

$$\text{AVTP timestamp} = (\text{gPTP\_seconds} \times 10^9 + \text{gPTP\_nanoseconds}) \text{ modulo } 2^{32}$$

The AVTP presentation time can be read from the gPTP timer capture register (ETNBnGCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (ETNBnGCCR.TCSS) to select the timer value for capture as the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) to 11<sub>B</sub> initiates the capture. The value is obtained by adding the maximum transit time defined in the gPTP maximum transit time register (ETNBnGMTT.MTTV) to the corrected timer value. The AVTP presentation time wraps around approximately every four seconds.

#### CAUTION

The AVTP presentation time captured in ETNBnGCTi.CTV is only valid when the corrected timer value is in synchronization with the Grandmaster clock. That is, the timer increment and timer offset values for the corrected timer value must be adjusted during the synchronization procedure so that the corrected gPTP clock is physically adjusted to match the time kept by the Grandmaster clock.

### 26.4.9 Flow Control

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.

(1) PAUSE Frame Transmission

PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (ETNBnMPPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.

(2) PAUSE Frame Reception

After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the operation mode for flow control in reception in the E-MAC mode register (ETNBnECMR.RXF) is set to "1". The number of received PAUSE frames is counted.

(3) PAUSE Frames with the Timer Value 0

The setting of the 0-time PAUSE frame enable bit (ETNBnECMR.ZPF) enables or disables the reception and transmission of PAUSE frames with the TIME parameter value 0.

- When control of PAUSE frames with the TIME parameter value 0 is enabled

A PAUSE frame with the TIME parameter value 0 is transmitted when the capacity of the reception FIFO is less than the value of the Receive FIFO Warning Level bits (ETNBnRCR.RFCL[12:0]) while the time indicated by the TIME parameter value has not elapsed.

Reception of a PAUSE frame with the TIME parameter value 0 leads to release from the transmission standby state.

- When control of PAUSE frames with the TIME parameter value 0 is disabled

PAUSE frames with the TIME parameter value 0 are not transmitted. Received PAUSE frames with the TIME parameter value 0 are discarded.

## 26.4.10 Interrupts

The EthernetAVB module has three EI level interrupts from the AVB-DMAC and one EI level interrupt from the E-MAC.

**Table 26.98, EthernetAVB Interrupts** lists interrupts.

Table 26.98 EthernetAVB Interrupts

Interrupt Source Name
Transmit/receive data management interrupt
Error management interrupt
Other management (FIFO caution level, etc.) interrupt
E-MAC interrupt

The AVB-DMAC related interrupts include descriptor interrupts (15 sources), error interrupts (5 sources), reception interrupts (38 sources), transmission interrupts (2 sources), and gPTP interrupts (3 sources). From the CPU's perspective, each appears as three of the above four interrupt sources.

The states of an AVB-DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (ETNBnDIS)
- Error interrupt status register (ETNBnEIS)
- Receive interrupt status register (ETNBnRIS0 to 2)
- Transmit interrupt status register (ETNBnTIS)
- gPTP interrupt status register (ETNBnGIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can only be checked by reading the interrupt summary status register (ETNBnISS) and the queue full error interrupt status bit in the error interrupt status register (ETNBnEIS.QFS). This reduces the load on the CPU.

### 26.4.10.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the following interrupt sources are generated:

- Receive frame interrupt in the receive interrupt status register 0 (ETNBnRIS0.FRFr)
- Descriptor interrupt in the descriptor interrupt status register (ETNBnDIS.DPFi)

The general error interrupt state can be checked by reading the descriptor interrupt summary bits in the interrupt summary status register (ETNBnISS.DPSi) or the receive FIFO warning interrupt summary bit (ETNBnISS.RFWS).

### 26.4.10.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Timestamp FIFO full error interrupt in the error interrupt status register (ETNBnEIS.TFFF)
- CBS limitation interrupts in the error interrupt status register (ETNBnEIS.CULF1, ETNBnEIS.CULF0, ETNBnEIS.CLLF1, ETNBnEIS.CLLF0)
- Separation Error in the error interrupt status register (ETNBnEIS.SEF)
- Queue Error in the error interrupt status register (ETNBnEIS.QEF)
- MAC Transmission Error in the error interrupt status register (ETNBnEIS.MTEF)
- MAC Reception Error in the error interrupt status register (ETNBnEIS.MREF)
- Receive FIFO full interrupt in the receive interrupt status register 2 (ETNBnRIS2.RFFF)
- Receive queue full interrupt in the receive interrupt status register 2 (ETNBnRIS2.QFFr)

The general error interrupt state can be checked by reading the error interrupt summary bit in the interrupt summary status register (ISS.ES).

### 26.4.10.3 Other Management (FIFO Warning, etc.) Interrupts

The other management (FIFO warning, etc.) interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- (1) Reception related interrupt  
Receive FIFO warning interrupt in the receive interrupt status register 1 (ETNBnRIS1.RFWF)
- (2) Transmission related interrupts  
Timestamp FIFO warning interrupt in the transmit interrupt status register (ETNBnTIS.TFWF) Timestamp FIFO update interrupt in the transmit interrupt status register (ETNBnTIS.TFUF)
- (3) gPTP related interrupts  
AVTP presentation time match interrupt in the gPTP interrupt status register (ETNBnGIS.PTMF)

The general error interrupt state can be checked by reading the receive FIFO warning error interrupt status bit in the interrupt summary status register (ETNBnISS.RFWS), the timestamp FIFO warning interrupt status bit (ETNBnISS.TFWS), the timestamp FIFO update interrupt status bit (ETNBnISS.TFUS), and the gPTP Interrupt Summary (ETNBnISS.CGIS).

### 26.4.10.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.

The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ETNBnISS.MS).

## 26.4.11 Flows of Operations

### 26.4.11.1 Flow of E-MAC Initialization

Figure 26.50, Flow of E-MAC Initialization (for AVB Mode and Full-Duplex Operation) shows the flow of E-MAC initialization (for AVB mode and full-duplex operation).

Figure 26.50 Flow of E-MAC Initialization (for AVB Mode and Full-Duplex Operation)

### 26.4.11.2 Flow of AVB-DMAC Initialization

Figure 26.51, Flow of AVB-DMAC Initialization (for AVB Mode and Full-Duplex Operation) shows the flow of AVB-DMAC initialization (for AVB mode and full-duplex operation).

26.4.11.7 Flow for Stopping and Resetting the AVB-DMAC

Figure 26.56, Flow for Stopping and Resetting the AVB-DMAC (Normal, Common to All Modes) shows the flow for stopping and resetting the AVB-DMAC (normal, common to all modes).

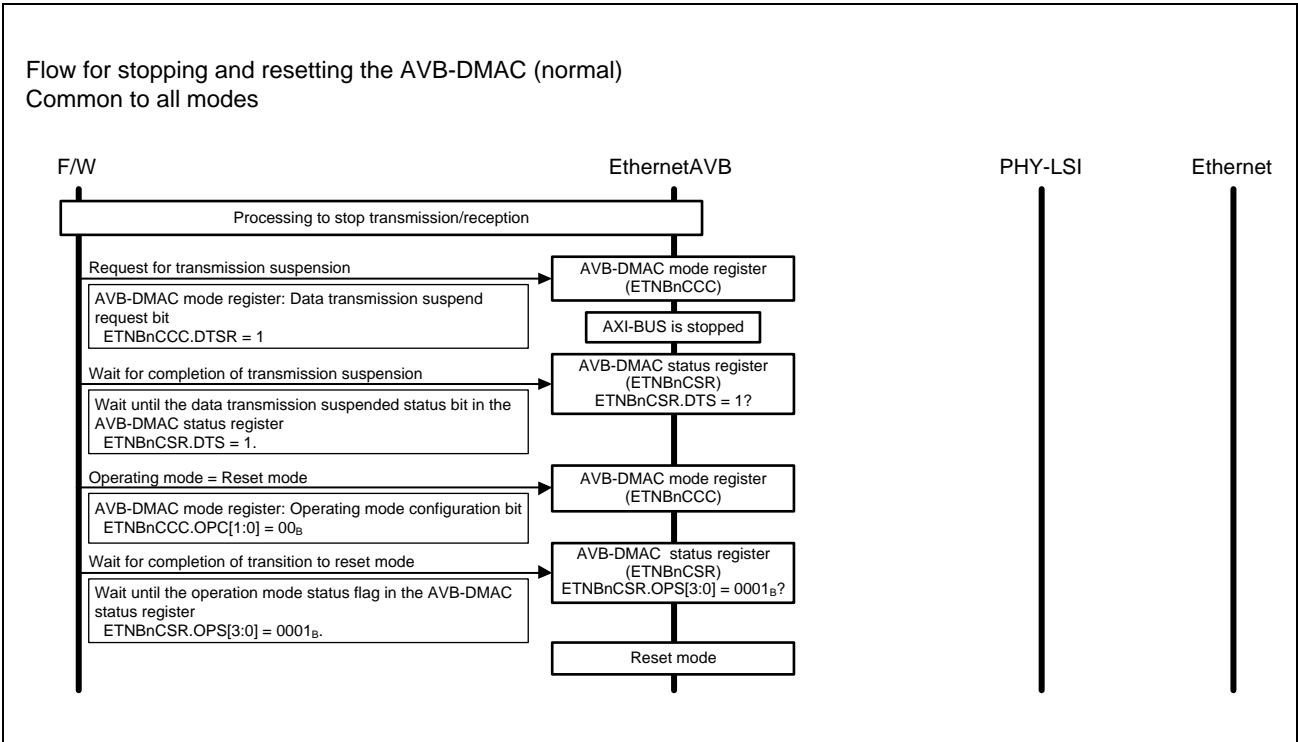

Figure 26.56 Flow for Stopping and Resetting the AVB-DMAC (Normal, Common to All Modes)

### 26.4.11.8 Flow for Emergency Stopping the AVB-DMAC

Figure 26.57, Flow for Emergency Stopping the AVB-DMAC (Normal, Common to All Modes) shows the flow for emergency stopping the AVB-DMAC (normal, common to all modes).

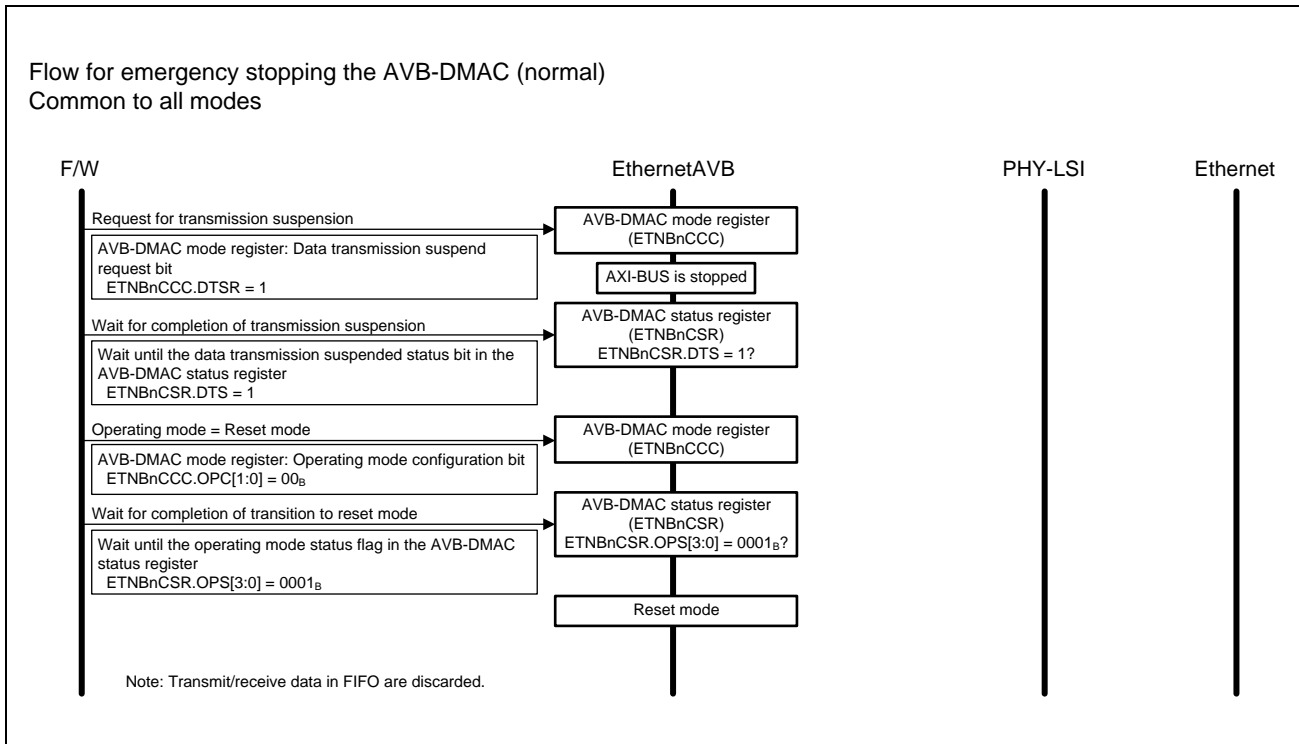

Figure 26.57 Flow for Emergency Stopping the AVB-DMAC (Normal, Common to All Modes)

### 26.4.11.9 Flow of gPTP Initialization

Figure 26.58, Flow of gPTP Initialization (Normal, Common to All Modes) shows the flow of gPTP initialization (normal, common to all modes).

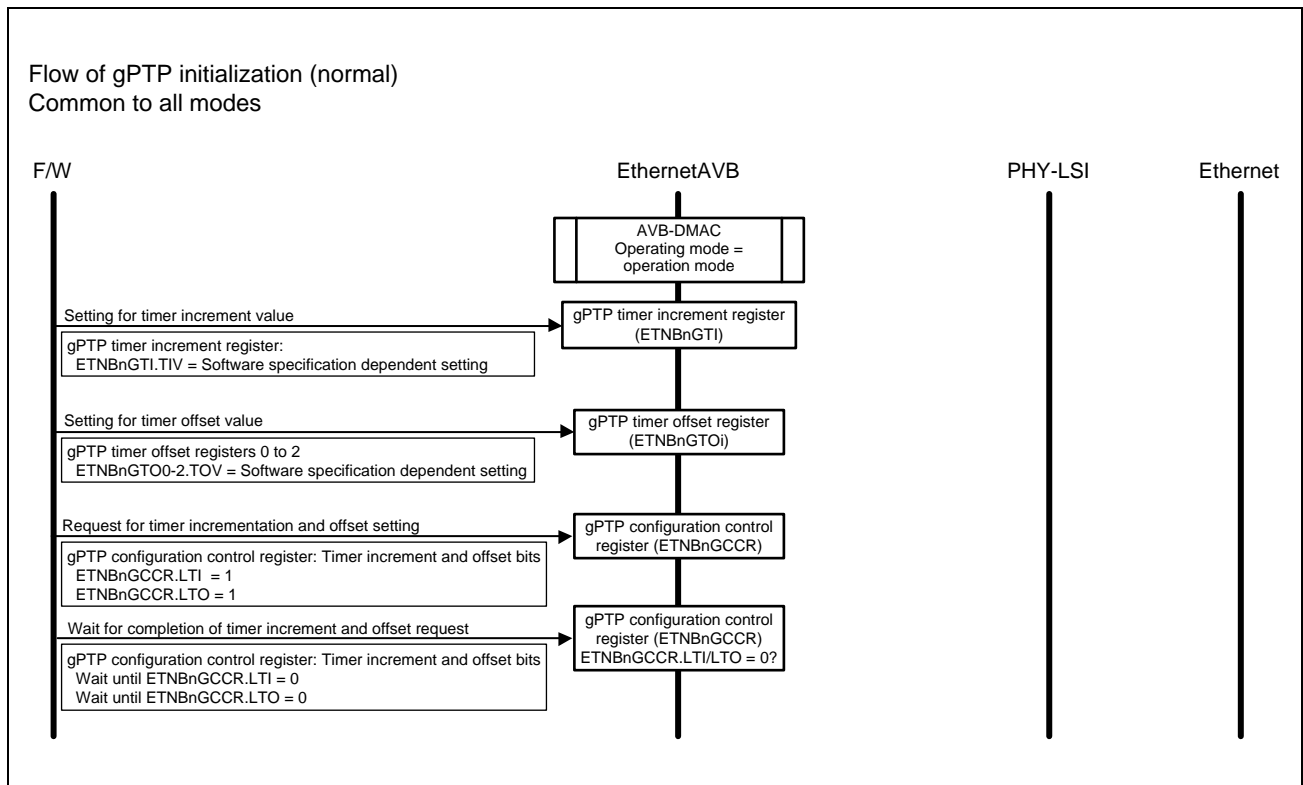

Figure 26.58 Flow of gPTP Initialization (Normal, Common to All Modes)

### 26.4.11.10 Flow of gPTP Timestamping in Transmission

Figure 26.59, Flow of gPTP Timestamping in Transmission (Normal, Common to All Modes) shows the flow of gPTP timestamping in transmission (normal, common to all modes).

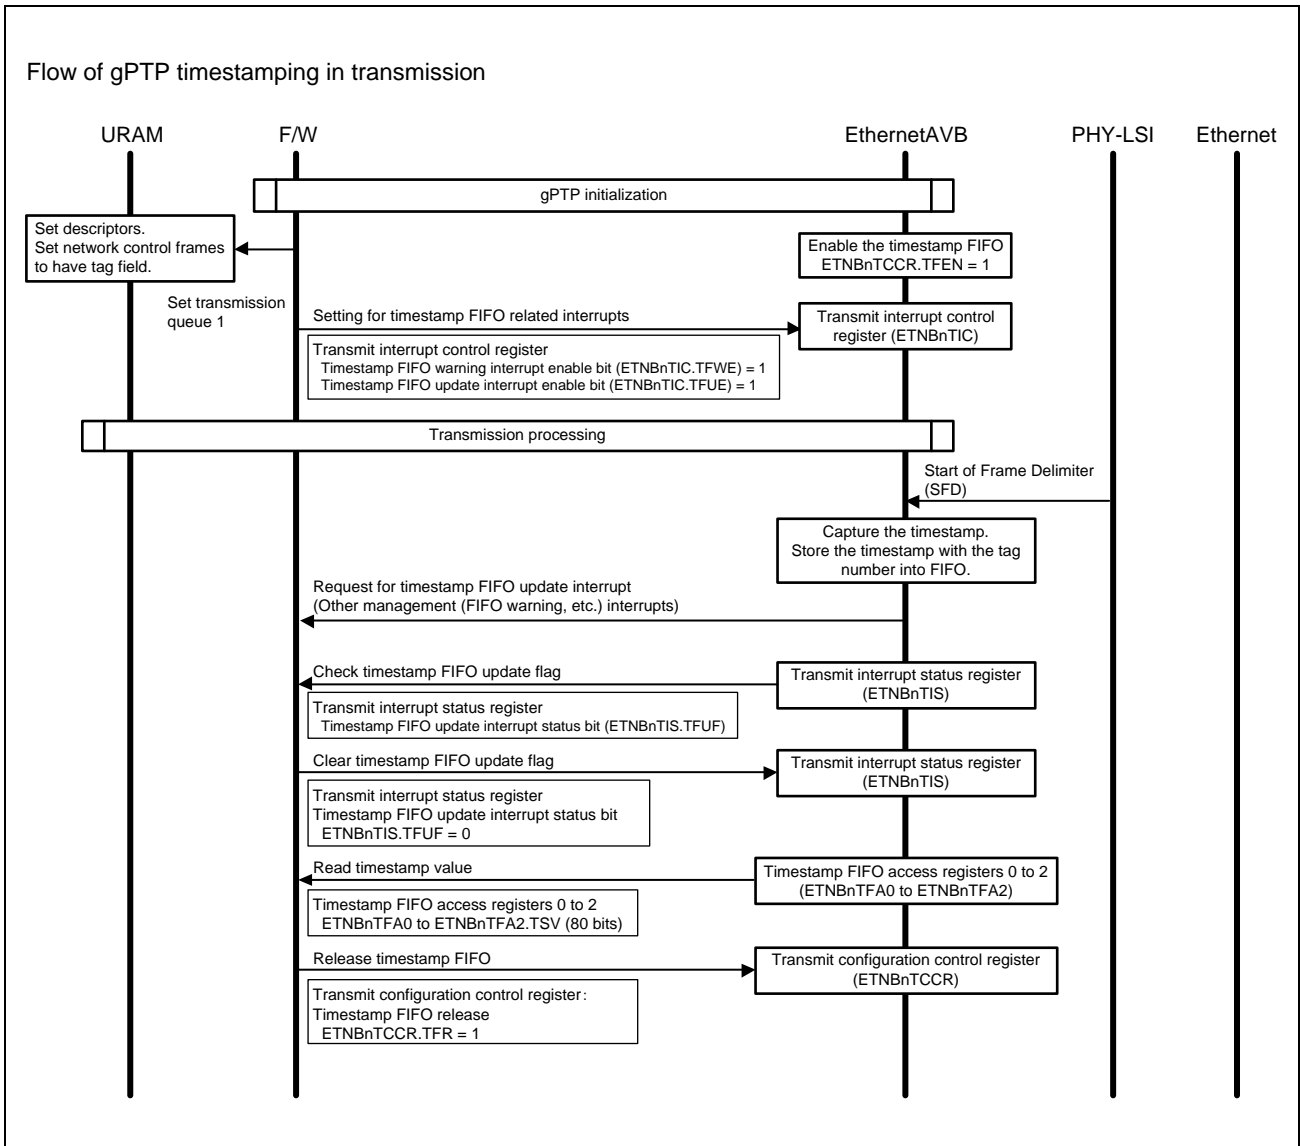

Figure 26.59 Flow of gPTP Timestamping in Transmission (Normal, Common to All Modes)

26.4.11.11 Flow of gPTP Timestamping and Synchronization in Reception

Figure 26.60, Flow of gPTP Timestamping and Synchronization in Reception (Normal, Common to All Modes) shows the flow of gPTP timestamping and synchronization in reception (normal, common to all modes).

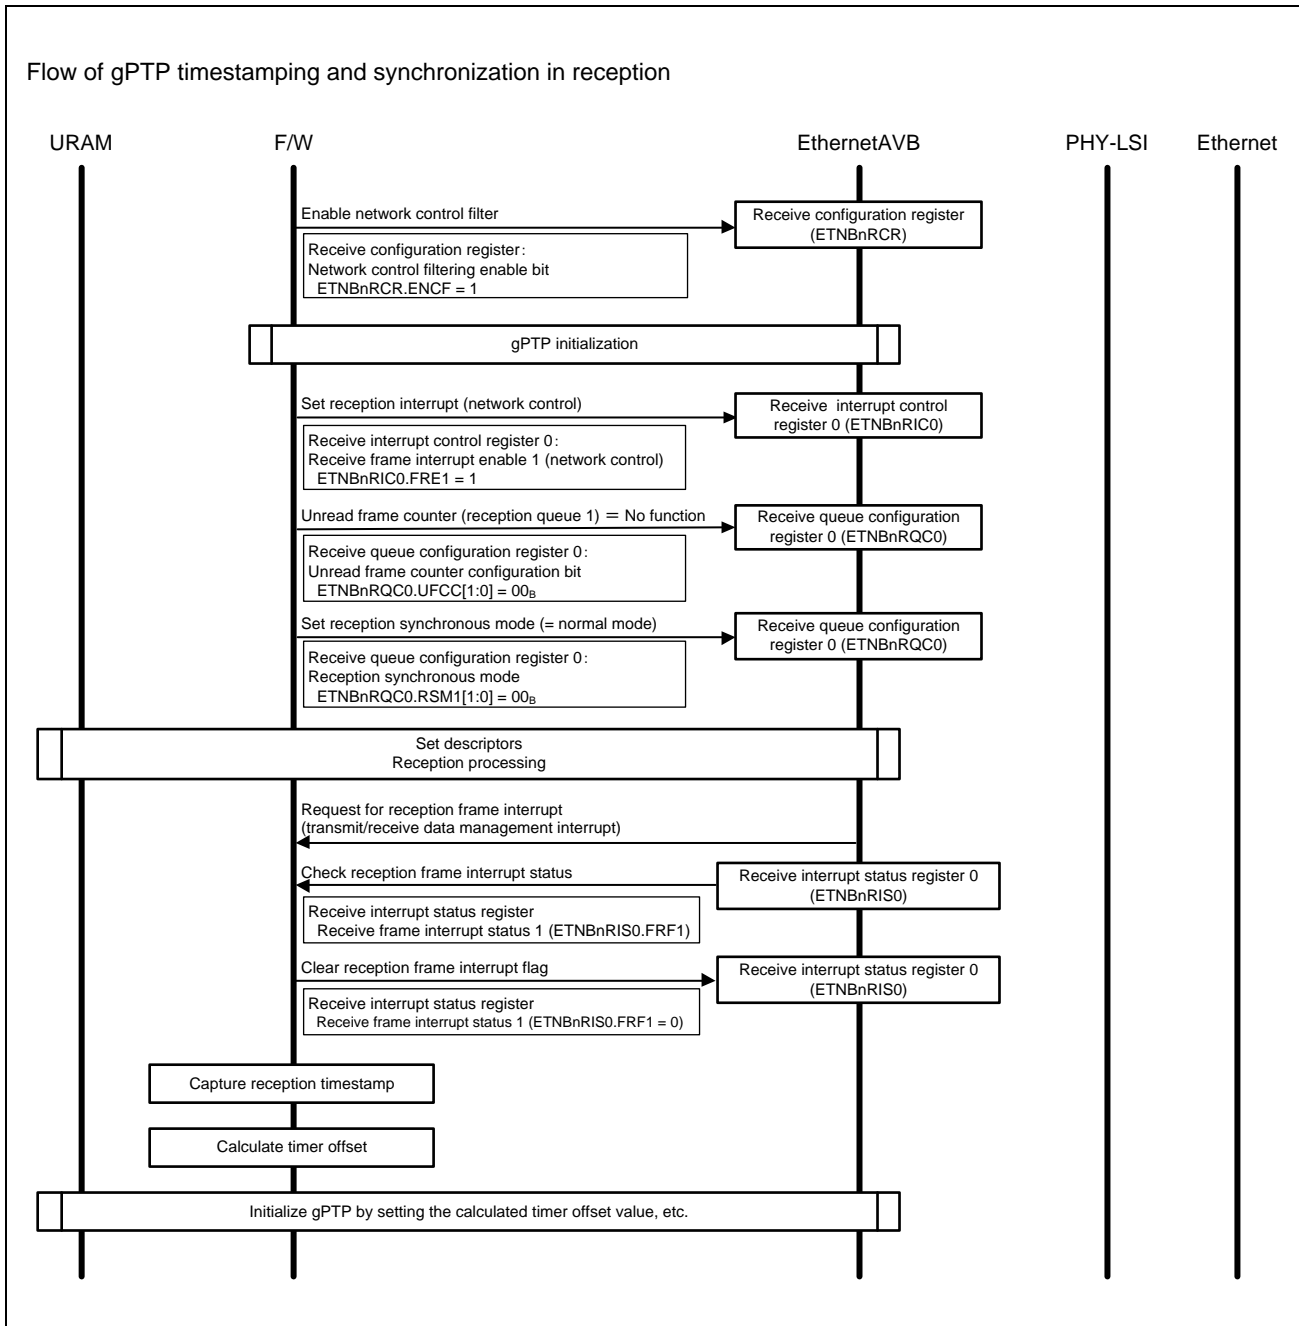

Figure 26.60 Flow of gPTP Timestamping and Synchronization in Reception (Normal, Common to All Modes)

### 26.4.11.12 Flow of Capturing gPTP Presentation Times

Figure 26.61, Flow of Capturing gPTP Presentation Times (Common to All Modes) shows the flow of capturing gPTP presentation times (common to all modes).

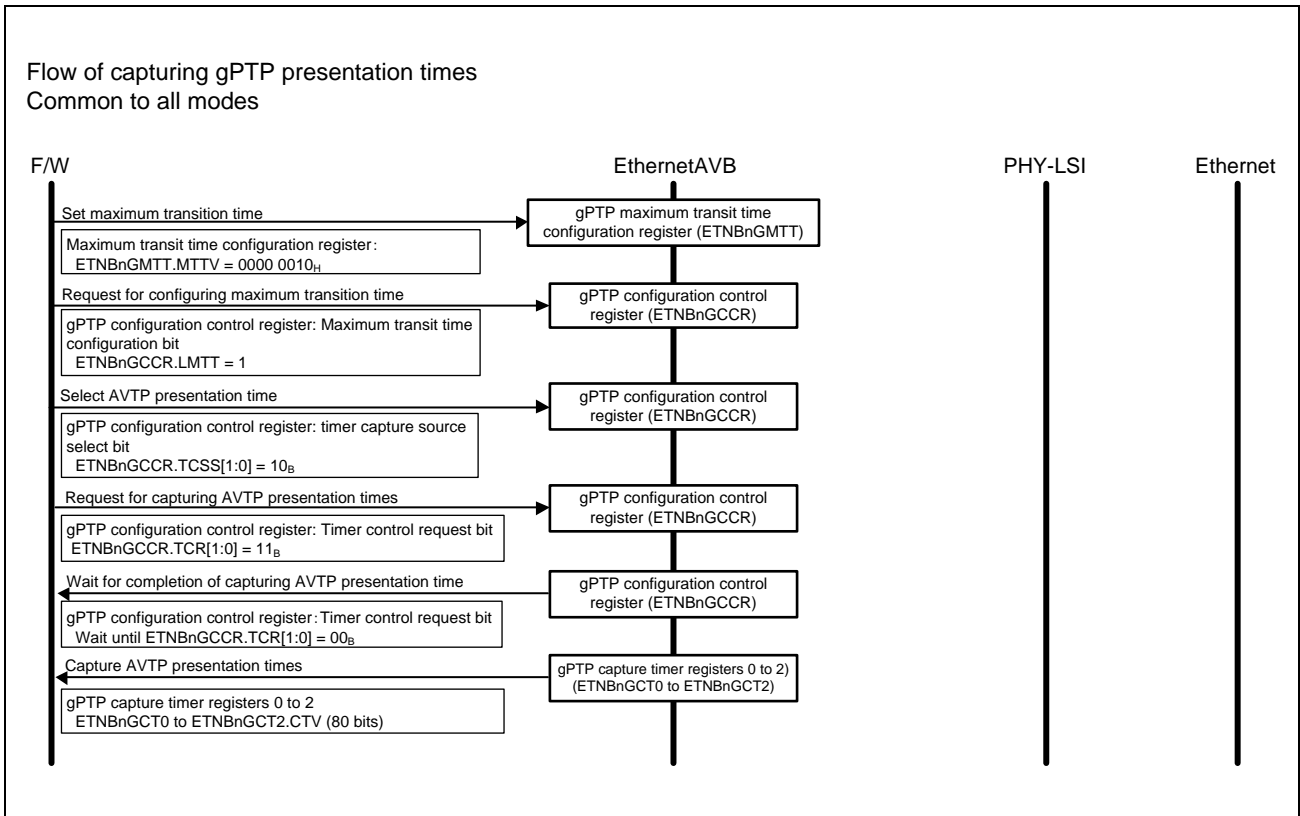

Figure 26.61 Flow of Capturing gPTP Presentation Times (Common to All Modes)

### 26.4.11.13 Flow of AVTP Presentation Time Comparison

Figure 26.62, Flow of AVTP Presentation Time Comparison (Common to All Modes) shows the flow of AVTP presentation time comparison (common to all modes).

Figure 26.62 Flow of AVTP Presentation Time Comparison (Common to All Modes)

### 26.4.11.14 Flow of Loopback Mode Operation

Figure 26.63, Flow of Loopback Mode Operation shows the flow of loopback mode operation.

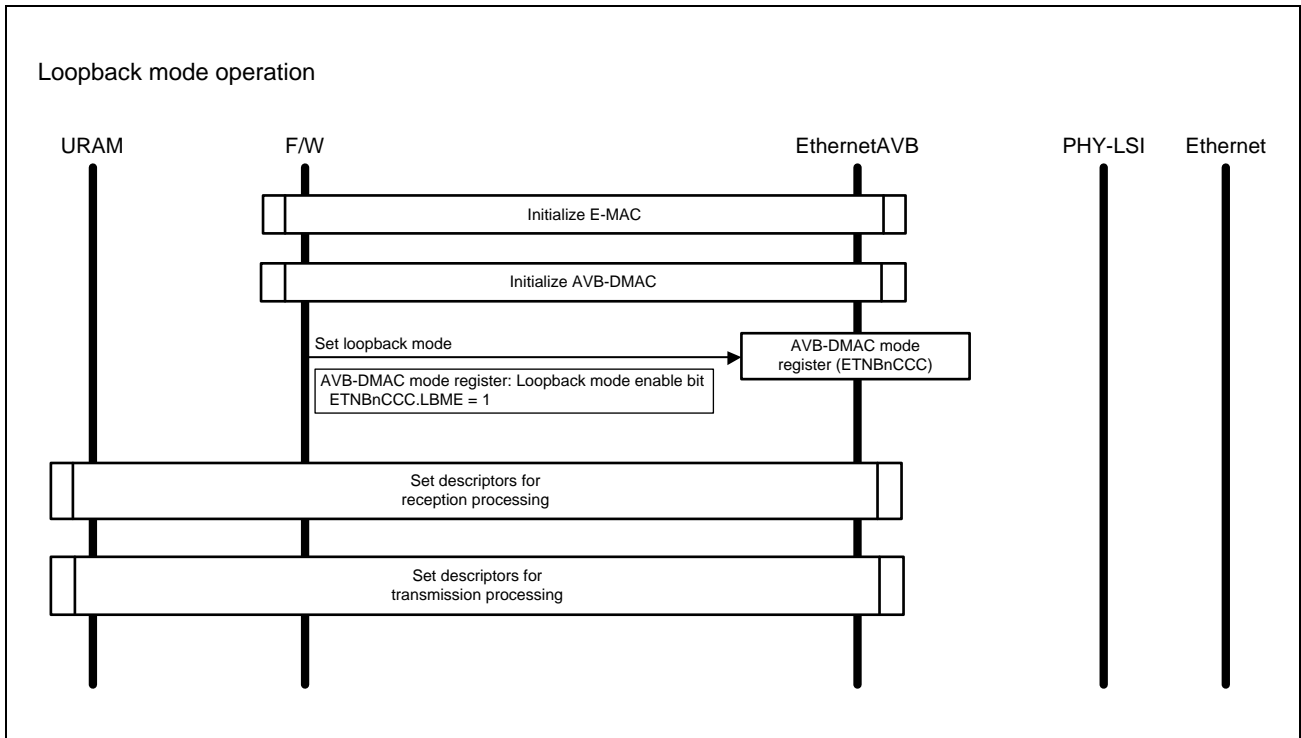

Figure 26.63 Flow of Loopback Mode Operation

## 26.4.12 Connection to PHY-LSI

### 26.4.12.1 MII Frame Transmission/Reception Timing

Each MII frame transmission/reception timing is shown in **Figure 26.64, MII Frame Transmit Timing (Normal Transmission)** to **Figure 26.68, MII Fame Receive Timing (Reception Error (2))**.

Figure 26.64 MII Frame Transmit Timing (Normal Transmission)

Figure 26.65 Reserved

Figure 26.66 MII Frame Receive Timing (Normal Reception)

Figure 26.67 MII Frame Receive Timing (Reception Error (1))

Figure 26.68 MII Fame Receive Timing (Reception Error (2))

### 26.4.12.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via ETNBnPIR in this LSI. ETNBnPIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3 $\mu$ .

#### (1) MII Management Frame Format

**Figure 26.69, MII Management Frame Format** shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in **(2), MII Register Access Procedure**.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0* <sup>1</sup>	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

**Remark:**

PRE: 32 consecutive 1s

ST: Write of 01<sub>B</sub> indicating start of frame

OP: Write of code indicating access type

PHYAD: Write of 00001<sub>B</sub> if the PHY-LSI address is 1 (sequential write starting with the MSB).

This bit changes depending on the PHY-LSI register address.

REGAD: Write of 0001<sub>B</sub> if the register address is 1 (sequential write starting with the MSB).

This bit changes depending on the PHY-LSI register address.

TA: Time for switching data transmission source on MII interface

(a) Write: 10<sub>B</sub> written

(b) Read: Bus release (notation: Z0) performed

DATA: 16-bit data. Sequential write or read from MSB

(a) Write: 16-bit data write

(b) Read: 16-bit data read

IDLE: Wait time until next MII management format input

(a) Write: Independent bus release (notation: X) performed

(d) Read: Bus already released in TA: control unnecessary

Note 1. The 2nd bit of TA only the ETNBnPIR.MDC bit should be written and ETNBnPIR.MMD should remain 0.

Figure 26.69 MII Management Frame Format

## (2) MII Register Access Procedure

The program accesses MII registers via ETNBnPIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. **Figure 26.70, 1-Bit Data Write Flowchart** to **Figure 26.73, Independent Bus Release Flowchart (IDLE in Write in Figure 26.69)** show the MII register access timing. The timing will differ depending on the PHY-LSI type.

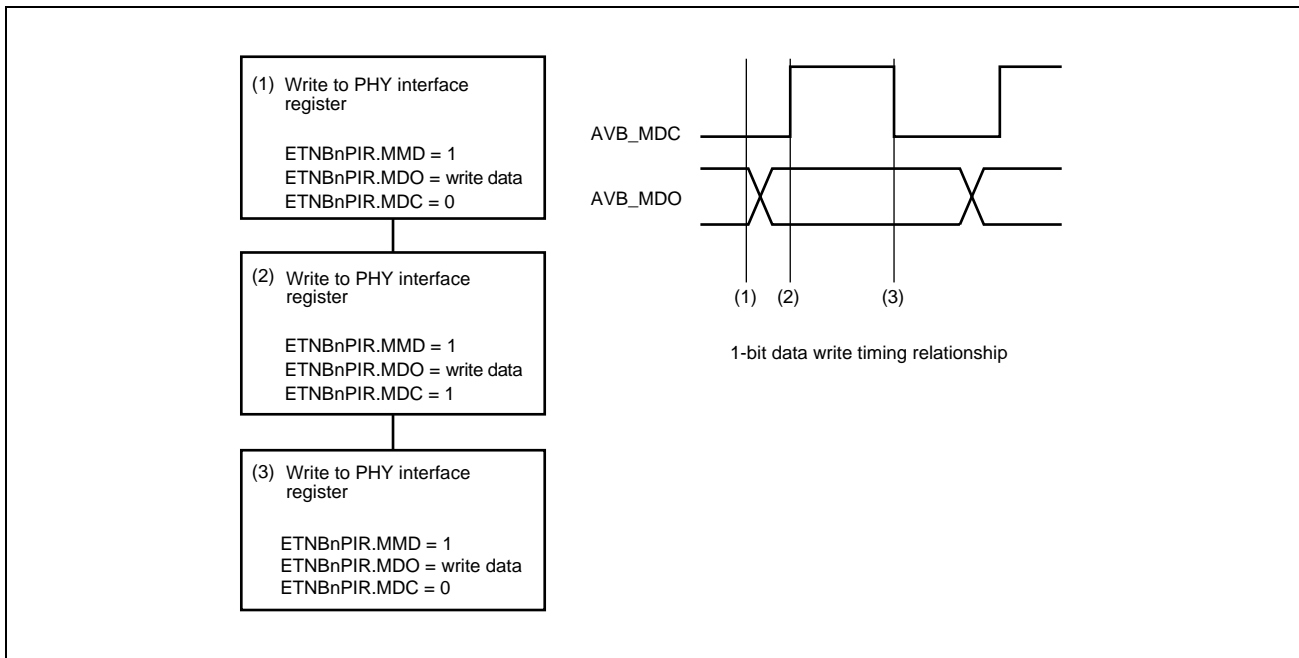

Figure 26.70 1-Bit Data Write Flowchart

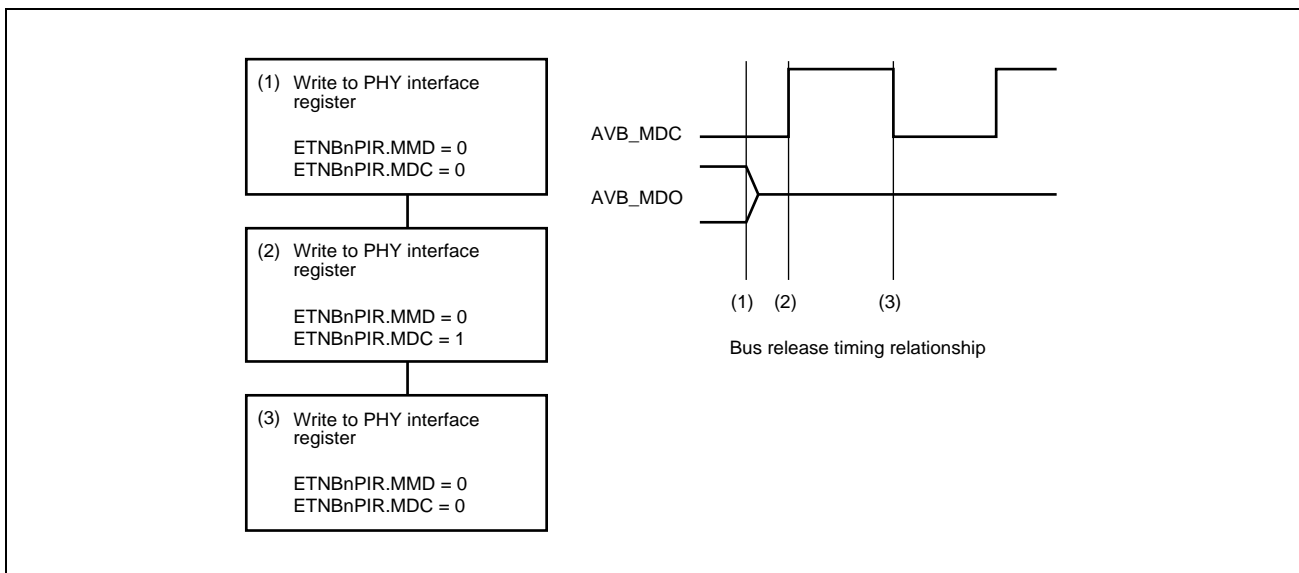

Figure 26.71 Bus Release Flowchart (TA in Read in Figure 26.69)

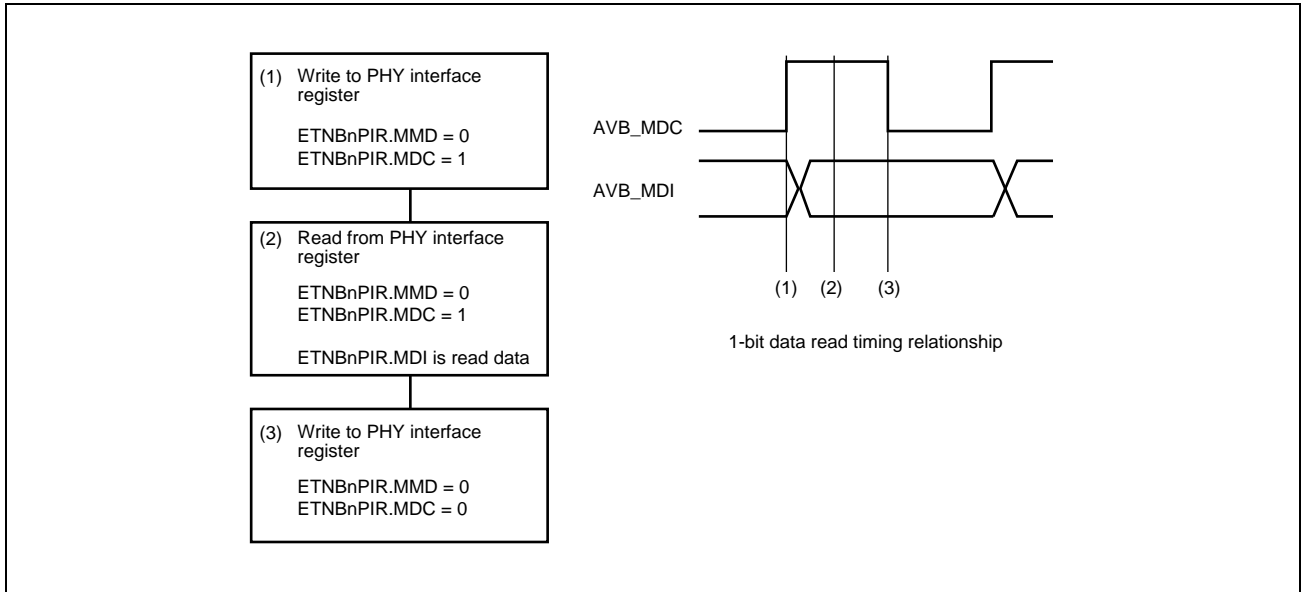

Figure 26.72 1-Bit Data Read Flowchart

Figure 26.73 Independent Bus Release Flowchart (IDLE in Write in **Figure 26.69**)

## 26.4.13 Usage Notes

### 26.4.13.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. **Figure 26.74, Data Subject to Checksum Calculation** shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. **Figure 26.75, Data after Checksum Data Addition** shows schematics of Ethernet frames to which the checksum data has been added.

#### CAUTION

Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

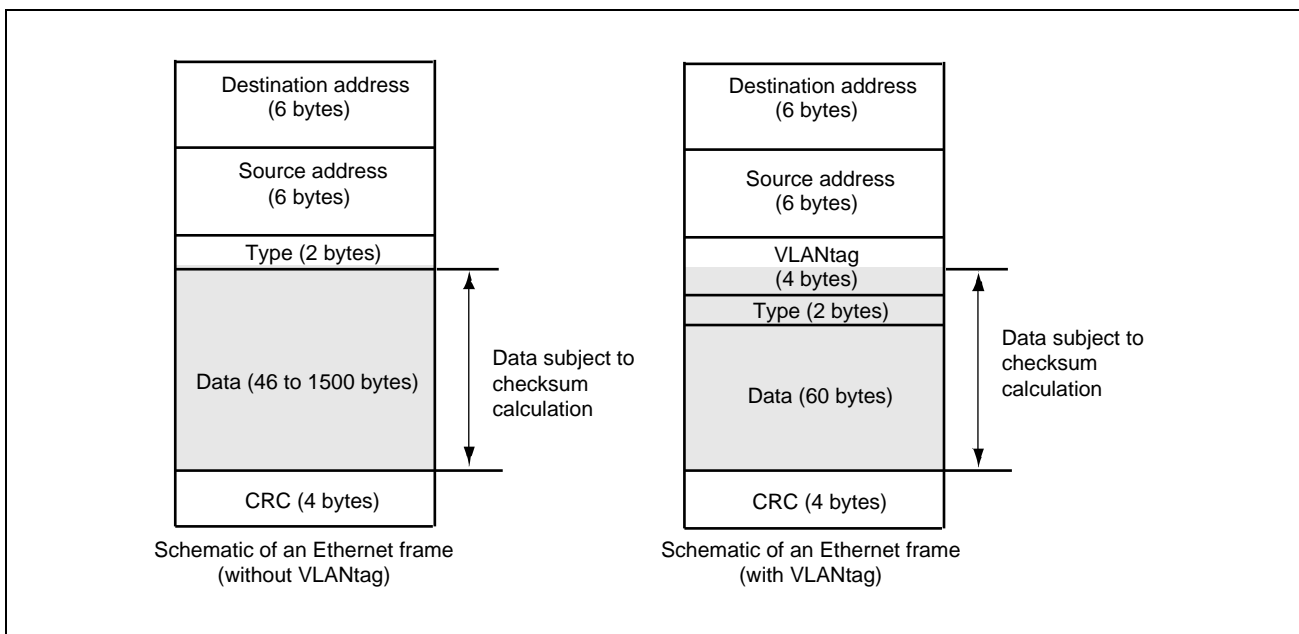

Figure 26.74 Data Subject to Checksum Calculation

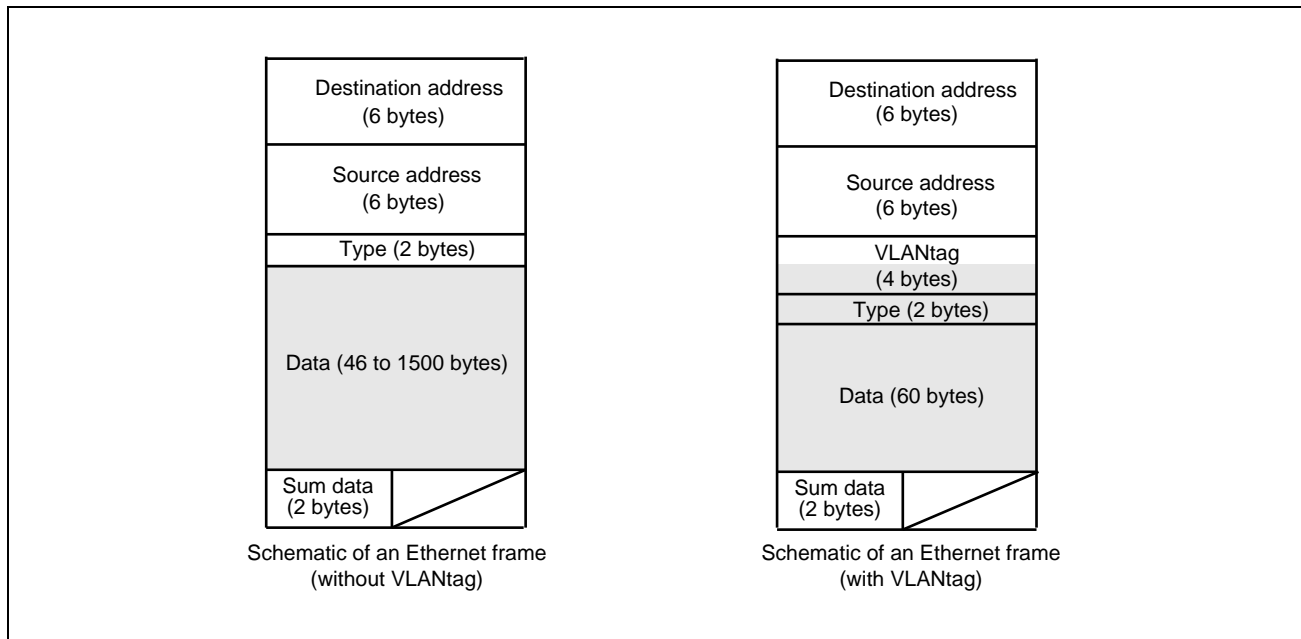

Figure 26.75 Data after Checksum Data Addition

### 26.4.13.2 Rx-FIFO Read Error May Not be Flagged when Using FEMPTY\_ND Descriptor

After reading the last byte targeted to the FEMPTY\_ND descriptor, there can be up to 3 bytes read from Rx-FIFO targeted to the next descriptor of the same frame. Rx-FIFO read errors of not stored data due to FEMPTY\_ND are neither flagged in DESCR.EI nor by ETNBnEIS.QEF as per target specification.

When external ECC logic flags detect Rx-FIFO read error related to last byte targeted to FEMPTY\_ND descriptor, data in the next descriptor may be corrupted without notification.

The issue is limited to implementations where Rx-FIFO error information is provided to Ethernet AVB and also to applications using FEMPTY\_ND descriptor.

The issue only occurs when the first byte saved in the descriptor following FEMPTY\_ND is not a multiple of 4 bytes inside the received frame.

Use a FEMPTY descriptor to store unwanted data if consistent error flagging is required.

### 26.4.13.3 When Trying to Release Non-Existing Timestamp FIFO Entry, New FIFO Update Flag May be Lost

When SW releases an entry of timestamp FIFO by writing ETNBnTCCR.TFR while this FIFO is empty (ETNBnTSR.TFFL is set to 0), flagging of next FIFO update may be inconsistent. The next timestamp is correctly stored in FIFO and the fill level is incremented to 1 but ETNBnTIS.TFUF is not set to 1.

The issue is limited to applications releasing FIFO entries without checking if there are entries available.

Do not release not existing FIFO entries.

#### 26.4.13.4 gPTP Compare May Fail for Range of Compare Values

When the comparison value (ETNBnGPTC.PTCV) is in the range of  $[x - 1 \text{ to } x + 1]$  ( $x$  is the configured increment value in ETNBnGTI.TIV), it may happen that a comparison match is not detected when Timer wraps around.

The issue is limited to applications using the AVTP comparison function. Do not configure comparison values inside the critical range.

#### 26.4.13.5 UFC Stop Level Triggers ETNBnRIS2.QFFr Even No Received Frame is Lost

When a received frame is dropped due to non-availability of empty descriptor, ETNBnRIS2.QFFr is correctly set to 1.

Additionally, when ETNBnUFCVi.CVr reached the configured stop level (ETNBnUFCS.SLj), the queue full flag (ETNBnRIS2.QFFr) is set to 1 even before any further received frame is dropped.

The issue is limited to applications using unread frame counter with stop level function.

Such application gets information about lost received frames which in fact might not have lost.

#### 26.4.13.6 ETNBnRIS0.FRFR may be lost when Data Processing Stops Close to or Below the Configured Warning Level.

When SW decrements UFC counter value (CV) to WL-1, resulting CV can still be WL due to recent new storage completion, ETNBnRIS0.FRFR is set to 0.

Any further reception will set ETNBnRIS0.FRFR as normal.

The issue is limited to applications using a single frame interrupt triggered by ETNBnRIS0.FRFR and not be able to process each interrupt in time.

The missing interrupt due to this effect is automatically recovered by the next frame reception as usual.

#### 26.4.13.7 Notes on Using the Intelligent Checksum Function

The checksum calculation using the intelligent checksum function is not affected by the padding insertion specified by the receive data padding configuration register (ETNBnRPC). This is because the checksum calculation is performed when transferring the receive data from E-MAC to AVB-DMAC, while the padding of the receive data is performed when transferring the receive data from AVB-DMAC to the receive buffer in memory.

#### 26.4.13.8 Receive Frame Interrupt and Descriptor Interrupt may be issued before Completion of Writing Data

When receive frame interrupt is issued, the software should check that the descriptor type is updated correctly before processing the frame data.

The descriptor type is shown in the descriptor field DESCR.DT (the address of the current descriptor is shown by the register ETNBnCDARq). If DESCR.DT is not yet updated by the DMA hardware (e.g. from FEMPTY to FEND), then the write of data to the memory is not completed. In that case the software should repeat checking the descriptor type until an update has happened.

Alternatively the software can use the Unread Frame Counter (UFC) value to compare with its processed descriptors to confirm there is no missing descriptor from the last received interrupt.

## 26.5 Detection and Correction of Errors in Ethernet AVB RAM

For details of ECC, see **Section 40A.2.6, ECC for Peripheral RAM, Section 40B.2.6, ECC for Peripheral RAM.**

## Section 27 Single Edge Nibble Transmission (RSENT)

This section contains a generic description of the Renesas single edge nibble transmission (RSENT).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RSENT.

### 27.1 Features of RH850/F1KH, RH850/F1KM RSENT

#### 27.1.1 Number of Units

This microcontroller has the following number of RSENT units.

Each RSENT unit has single channel interface.

Table 27.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	2	2	2
Name	RSENT <sub>n</sub> (n = 0, 1)	RSENT <sub>n</sub> (n = 0, 1)	RSENT <sub>n</sub> (n = 0, 1)

Table 27.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	2	2	2	2
Name	RSENT <sub>n</sub> (n = 1)	RSENT <sub>n</sub> (n = 0, 1)	RSENT <sub>n</sub> (n = 0, 1)	RSENT <sub>n</sub> (n = 0, 1)	RSENT <sub>n</sub> (n = 0, 1)

Table 27.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	1	2	2
Name	RSENT <sub>n</sub> (n = 1)	RSENT <sub>n</sub> (n = 0, 1)	RSENT <sub>n</sub> (n = 0, 1)

Table 27.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	2	2	2	2
Name	RSENT <sub>n</sub> (n = 0, 1)	RSENT <sub>n</sub> (n = 0, 1)	RSENT <sub>n</sub> (n = 0, 1)	RSENT <sub>n</sub> (n = 0, 1)

Table 27.5 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RSENT units are identified by the index "n"; for example, RSENT <sub>n</sub> TSPC (n = 0, 1) indicates the RSENT <sub>n</sub> time stamp register.

### 27.1.2 Register Base Addresses

RSENTn base addresses are listed in the following table.

RSENTn register addresses are given as offsets from the base addresses.

Table 27.6 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<RSENT0_base>	FFCF 0000 <sub>H</sub>
<RSENT1_base>	FFCF 0100 <sub>H</sub>

### 27.1.3 Clock Supply

The RSENTn clock supply is shown in the following table.

Table 27.7 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RSENTn	SENT Commutation Clock	CKSCLK_IPERI2	Commutation clock
	Register Access Clock (PCLK)	CPUCLK_L	Bus clock

**Note:** Commutation clock must be either 16 MHz or in the range of 32 MHz to 40 MHz and register access clock frequency can be in the range 16 MHz to 60 MHz.

### 27.1.4 Interrupt Requests

RSENTn interrupt requests are listed in the following table.

Table 27.8 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RSENT0			
INTSENT0SI	RSENT status interrupt	347	—
INTSENT0RI	RSENT receive interrupt	348	123
RSENT1			
INTSENT1SI	RSENT status interrupt	349	—
INTSENT1RI	RSENT receive interrupt	350	124

### 27.1.5 Reset Sources

RSENTn reset sources are listed in the following table. RSENTn is initialized by these reset sources.

Table 27.9 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
RSENTn	All reset sources (ISORES)

### 27.1.6 External Input/Output Signals

External input/output signals of RSENT are listed below.

Table 27.10 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RSENT0		
sent_rx	RSENT Receive Data Input	SENT0RX
sent_spc	RSENT SPC Extension Output	SENT0SPCO
RSENT1		
sent_rx	RSENT Receive Data Input	SENT1RX
sent_spc	RSENT SPC Extension Output	SENT1SPCO

## 27.2 Overview

### Overview of Functions

The RSENT interface supports the following standard specification (SAE J2716 version APR2016) functions (with extensions for support of 8 nibble data):

- Triple speed expansion Tick Time: Clock cycle (1  $\mu$ s to 90  $\mu$ s)
- Variable data transmission rate
  - up to 74.9 kbps (based on 8 nibble data at 3 $\mu$ s clock rate)
  - up to 224.7 kbps (based on 8 nibble data at 1 $\mu$ s clock rate)
- Unidirectional communication: Between the sensor and MCU
- Bidirectional communication: Between the sensor and MCU (supported in SPC mode)
- Single edge data transmission: Coded by the temporal distance of two serially-detected falling edges on a data line
- Transmission frame with up to 8 data nibbles and additionally status and communications nibbles
- Data transmission protected with CRC is available.
  - CRC data can be read with the RSENTnSRXD.SCRC and RSENTnFRXD.FCRC bits.
- Calibration phase in each data frame (RSENTnCPL.CPLV bits)
- Multiple sensors can connect to the RSENT channel that has the standard expansion function.  
Received data from sensors is detected by software or DMA.
- The timestamp function: Master or slave can be selected for the RSENT module. (RSENTnTSPC.TMS bit)
- The RSENT circuit consists of the following functions:
  - Data receive part
  - Clock recovery
  - Register group

### 27.2.1 Block Diagram

The following figure shows a block diagram of the RSENT module.

Figure 27.1 Block Diagram of RSENT

## 27.3 Registers

### 27.3.1 List of Registers

RSENT registers are listed in the following table.

For details about <RSENTn\_base>, see **Section 27.1.2, Register Base Addresses**.

Table 27.11 List of Registers

Module Name	Register Name	Abbreviation	Address
RSENTn	RSENT timestamp register	RSENTnTSPC	<RSENTn_base> + 0000 <sub>H</sub>
	RSENT timestamp counter	RSENTnTSC	<RSENTn_base> + 0004 <sub>H</sub>
	RSENT communication configuration register	RSENTnCC	<RSENTn_base> + 0010 <sub>H</sub>
	RSENT baud rate prescaler register	RSENTnBRP	<RSENTn_base> + 0014 <sub>H</sub>
	RSENT interrupt/DMA enable register	RSENTnIDE	<RSENTn_base> + 0018 <sub>H</sub>
	RSENT mode control register	RSENTnMDC	<RSENTn_base> + 001C <sub>H</sub>
	RSENT SPC transmission register	RSENTnSPCT	<RSENTn_base> + 0020 <sub>H</sub>
	RSENT mode status register	RSENTnMST	<RSENTn_base> + 0024 <sub>H</sub>
	RSENT communication status register	RSENTnCS	<RSENTn_base> + 0028 <sub>H</sub>
	RSENT communication status clear register	RSENTnCSC	<RSENTn_base> + 002C <sub>H</sub>
	RSENT slow channel receive timestamp register	RSENTnSRTS	<RSENTn_base> + 0030 <sub>H</sub>
	RSENT slow channel receive data register	RSENTnSRXD	<RSENTn_base> + 0034 <sub>H</sub>
	RSENT calibration pulse length register	RSENTnCPL	<RSENTn_base> + 0038 <sub>H</sub>
	RSENT message length register	RSENTnML	<RSENTn_base> + 003C <sub>H</sub>
	RSENT fast channel receive timestamp register	RSENTnFRTS	<RSENTn_base> + 0040 <sub>H</sub>
	RSENT fast channel receive data register	RSENTnFRXD	<RSENTn_base> + 0044 <sub>H</sub>
	RSENT calibration pulse length mirror register	RSENTnCPLM	<RSENTn_base> + 0050 <sub>H</sub>
	RSENT message length mirror register	RSENTnMLM	<RSENTn_base> + 0054 <sub>H</sub>
	RSENT fast channel receive timestamp mirror register	RSENTnFRTSM	<RSENTn_base> + 0058 <sub>H</sub>
	RSENT expanded fast channel receive data register 0	RSENTnEFRD0	<RSENTn_base> + 005C <sub>H</sub>
RSENT expanded fast channel receive data register 1	RSENTnEFRD1	<RSENTn_base> + 0060 <sub>H</sub>	

### 27.3.2 RSENTnTSPC — RSENT Timestamp Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <RSENTn\_base> + 0000<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TMS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	TTM[6:0]						—	TTPV[6:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.12 RSENTnTSPC Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
16	TMS	Timestamp Mode Selection 0: Master mode 1: Slave mode
15	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
14 to 8	TTM[6:0]	Timestamp Tick Multiplier 0000000 <sub>B</sub> : 1 0000001 <sub>B</sub> : 2 0000010 <sub>B</sub> : 3 : 1111111 <sub>B</sub> : 128
7	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
6 to 0	TTPV[6:0]	Timestamp Tick Prescaler Value 0000000 <sub>B</sub> : 1 0000001 <sub>B</sub> : 2 0000010 <sub>B</sub> : 3 : 1111111 <sub>B</sub> : 128

#### RSENTnTSPC.TMS (Timestamp Mode Selection)

This bit defines the timestamp counter synchronization mode.

For information about the timestamp clock settings, see **Section 27.4.2.1, Timestamp**.

When this bit is set to 0, the timestamp counter operates in master mode.

When writing 0000 0000<sub>H</sub> to RSENTnTSC, the timestamp counter is cleared. In addition all RSENT timestamp counters operating as slave of RSENT are also cleared. For master-slave interconnection, see **Section 27.4.2.1(2), Timestamp Counter Operation**.

When this bit is set to 1, the timestamp counter operates in slave mode.

The timestamp counter is only cleared when writing 0000 0000<sub>H</sub> to the timestamp counter of RSENT module that operates in master mode.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

The RSENT module operating in slave mode should have the same timestamp counter prescaler settings as the RSENT module that operates in master mode.

The CPU should not set this bit to 1 for RSENT module that operates in master mode.

#### **RSENTnTSPC.TTM (Timestamp Tick Multiplier)**

These bits define the multiplication value of the 1- $\mu$ s time tick used for the timestamp counter.

For timestamp clock configuration, see **Section 27.4.2.1, Timestamp**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

#### **RSENTnTSPC.TTPV (Timestamp Tick Prescaler Value)**

These bits define the prescaler value to generate a 1- $\mu$ s clock tick.

For timestamp clock configuration, see **Section 27.4.2.1, Timestamp**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

The CPU should configure this value in such a way that, based on the supplied communication clock, a 1- $\mu$ s clock tick is generated.

### 27.3.3 RSENTnTSC — RSENT Timestamp Counter

**Access:** This register can be read or written in 32-bit units.

**Address:** <RSENTn\_base> + 0004<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TS[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.13 RSENTnTSC Register Contents

Bit Position	Bit Name	Function
31 to 0	TS[31:0]	Timestamp counter value

#### RSENTnTSC.TS (Timestamp)

These bits indicate the current timestamp counter value.

The CPU can only write desired values to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

When the timestamp counter is configured to operate in slave mode (RSENTnTSPC.TMS = 1), writing to this register has no effect when the RSENT module is in either of the OPERATION IDLE or OPERATION ACTIVE modes (the RSENTnMST.OMS bits are either 011<sub>B</sub> or 101<sub>B</sub>).

The timestamp counter is incremented on every timestamp counter tick (as configured in the RSENTnTSPC.TTPV and RSENTnTSPC.TTM bits) when the RSENT module is in either of the OPERATION IDLE or OPERATION ACTIVE modes (the RSENTnMST.OMS bits are either 011<sub>B</sub> or 101<sub>B</sub>).

When the timestamp counter is configured to operate in master mode (RSENTnTSPC.TMS = 0), the CPU writes 0000 0000<sub>H</sub> to these bits and RSENTnTSC.TS is set to 0000 0000<sub>H</sub>.

When the slave mode setting is made for the timestamp counter of channel n (RSENTnTSPC.TMS = 1), writing to the timestamp counter of the channel that is the master for channel n leads to the RSENTnTSC.TS bits being set to 0000 0000<sub>H</sub>.

For timestamp mode selection, see **Section 27.4.2.1, Timestamp**.

### 27.3.4 RSENTnCC — RSENT Communication Configuration Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <RSENTn\_base> + 0010<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 27.14 RSENTnCC Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
12	SOPC	SPC Output Polarity Control 0: SPC pulse active high 1: SPC pulse active low
11	FCM	Frame Check Method 0: Check against next calibration pulse 1: Check against previous calibration pulse
10	SCCD	Slow Channel CRC Check 0: Slow channel CRC check enabled 1: Slow channel CRC check disabled
9	FCCD	Fast Channel CRC Check 0: Fast channel CRC check enabled 1: Fast channel CRC check disabled
8	DCF	Data nibble CRC Format 0: SAE J2716 2010/2016 format 1: pre SAE J2716 2010 format
7, 6	SMF[1:0]	Serial Message Format 00 <sub>b</sub> : No serial message extraction 01 <sub>b</sub> : Short serial message format 10 <sub>b</sub> : Enhanced serial message format 11 <sub>b</sub> : Setting prohibited
5	PPTC	Pause Pulse Type Configuration 0: Pause pulse for variable message length 1: Pause pulse for fixed message length
4	PPC	Pause Pulse Configuration 0: Pause pulse absent 1: Pause pulse present

Table 27.14 RSENTnCC Register Contents

Bit Position	Bit Name	Function
3 to 1	NDN[2:0]	Number of Data Nibbles 000 <sub>B</sub> : 1 data nibble 001 <sub>B</sub> : 2 data nibbles 010 <sub>B</sub> : 3 data nibbles 011 <sub>B</sub> : 4 data nibbles 100 <sub>B</sub> : 5 data nibbles 101 <sub>B</sub> : 6 data nibbles 110 <sub>B</sub> : 7 data nibbles 111 <sub>B</sub> : 8 data nibbles
0	SPCE	SPC Mode Enable 0: SPC mode disabled 1: SPC mode enabled

**RSENTnCC.SOPC (SPC Output Polarity Control)**

When this bit is set to 0, the SPC pulse is sent as an active high signal. The default output value is low level.

When this bit is set to 1, the SPC pulse is sent as an active low signal. The default output value is high level.

For SPC operation, see also **Section 27.4.4, SPC Function**.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

**NOTE**

Any change to this bit from the default value becomes effective on the output value when entering the OPERATION ACTIVE mode (the RSENTnMST.OMS bits are 101<sub>B</sub>). When entering RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>), the output level is set to the default value (low level).

**RSENTnCC.FCM (Frame Check Method)**

When this bit is set to 0, the current calibration pulse is compared to the next received calibration pulse.

The buffer update mechanism is operating according to the preferred option as described in SAE J2716 2016.

When this bit is set to 1, the current calibration pulse is compared to the previously received calibration pulse.

The buffer update mechanism is operating according to the second option as described in SAE J2716 2016 which should be only used if extra latency to process the second calibration pulse cannot be tolerated.

For buffer update timings, see also **Section 27.4.3.2(3), Fast Channel Message Reception**.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

**RSENTnCC.SCCD (Slow Channel CRC Check Disable)**

When this bit is set to 1, the CRC check for the slow channel is disabled. In this case, messages are stored in the slow channel message reception buffer with the received CRC.

When this bit is set to 1, the RSENTnCS.SCS bit is not set.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

**RSENTnCC.FCCD (Fast Channel CRC Check Disable)**

When this bit is set to 1, the CRC check for the fast channel is disabled. In this case, messages are stored in the fast channel message reception buffer with the received CRC.

When this bit is set to 1, the RSENTnCS.FCS bit is not set.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

**RSENTnCC.DCF (Data Nibble CRC Format)**

This bit selects between the SAE J2716 2016 data nibble CRC format and the legacy format.

When this bit is set to 0 the recommended CRC implementation according to SAE J2716 2016 *Section 5.4.2.2* is selected.

When this bit is set to 1 the legacy CRC implementation according to SAE J2716 2008 (refer to SAE J2716 2016 *Section 5.4.2.1*) is selected.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (RSENTnMST.OMS = 001<sub>B</sub>)

**RSENTnCC.SMF (Serial Message Format)**

These bits define the serial message format expected to be received for automatic extraction.

When these bits are set to 00<sub>B</sub>, no serial message is extracted and the status and communications nibbles are stored in the RSENTnSRXD register.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

The CPU shall set these bits to 00<sub>B</sub> when RSENTnCC.SPCE is set to 1 and more than one sensor is connected to the RSENT module.

**RSENTnCC.PPTC (Pause Pulse Type Configuration)**

This bit defines the pause pulse type.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

The CPU should not set this bit to 1 when the RSENTnCC.PPC bit is set to 0.

**RSENTnCC.PPC (Pause Pulse Configuration)**

This bit defines the presence or absence of the pause pulse.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

**RSENTnCC.NDN (Number of Data Nibbles)**

These bits define the number of data nibbles included in an SENT message.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

**RSENTnCC.SPCE (SPC Mode Enable)**

This bit enables the SPC mode.

For details about SPC mode operation, see also **Section 27.4.4, SPC Function**.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

### 27.3.5 RSENTnBRP — RSENT Baud Rate Prescaler Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <RSENTn\_base> + 0014<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	TTF[3:0]				—	TTI[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 27.15 RSENTnBRP Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
27 to 24	TTF[3:0]	Time Tick Decimal Fraction 0000 <sub>B</sub> : 0.0 μs 0001 <sub>B</sub> : 0.1 μs 0010 <sub>B</sub> : 0.2 μs : 1000 <sub>B</sub> : 0.8 μs 1001 <sub>B</sub> : 0.9 μs Other than above: Setting prohibited
23	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
22 to 16	TTI[6:0]	Time Tick Integer 0000000 <sub>B</sub> : 1 μs 0000001 <sub>B</sub> : 2 μs 0000010 <sub>B</sub> : 3 μs : 1011000 <sub>B</sub> : 89 μs 1011001 <sub>B</sub> : 90 μs Other than above: Setting prohibited
15	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
14 to 8	SCDV[6:0]	Sample Clock Division Value 0000000 <sub>B</sub> : 1 0000001 <sub>B</sub> : 2 0000010 <sub>B</sub> : 3 : 1111110 <sub>B</sub> : 127 1111111 <sub>B</sub> : 128
7 to 5	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.

Table 27.15 RSENTnBRP Register Contents

Bit Position	Bit Name	Function
4 to 0	SCMV[4:0]	Sample Clock Multiplication Value 0000 <sub>B</sub> : 1 00001 <sub>B</sub> : 2 00010 <sub>B</sub> : 3 : 11110 <sub>B</sub> : 31 11111 <sub>B</sub> : 32

**RSENTnBRP.TTF (Time Tick Decimal Fraction)**

These bits define the decimal part of the tick length in 0.1- $\mu$ s granularity.

For tick length configuration, see **Section 27.4.2.2(2), RX and SPC Tick Settings**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

**RSENTnBRP.TTI (Time Tick Integer)**

These bits define the integer part of the tick length.

For tick length configuration, see **Section 27.4.2.2(2), RX and SPC Tick Settings**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

**RSENTnBRP.SCDV (Sample Clock Division Value)**

These bits define the division value for the sample clock generation logic.

For RSENTnBRP settings, see **Section 27.4.2.2(1), RX BRP Setting**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

**RSENTnBRP.SCMV (Sample Clock Multiplication Value)**

These bits define the multiplication value for the sample clock generation logic.

For RSENTnBRP settings, see **Section 27.4.2.2(1), RX BRP Setting**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001<sub>B</sub>).

### 27.3.6 RSENTnIDE — RSENT Interrupt/DMA Enable Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <RSENTn\_base> + 0018<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 27.16 RSENTnIDE Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
10	SEIE	Slow Channel Encoding Error Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled
9	SMIE	Slow Channel Message Lost Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled
8	SCIE	Slow Channel CRC Error Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled
7	NRIE	No Response Error Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled
6	CVIE	Calibration Pulse Length Variation Error Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled
5	CLIE	Calibration Pulse Length Error Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled
4	FNIE	Fast Channel Nibble Count Error Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled
3	FEIE	Fast Channel Nibble Encoding Error Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled
2	FMIE	Fast Channel Message Lost Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled
1	FCIE	Fast Channel CRC Error Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled

Table 27.16 RSENTnIDE Register Contents

Bit Position	Bit Name	Function
0	FRIE	Fast Channel Receive Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled

**RSENTnIDE.SEIE (Slow Channel Encoding Error Interrupt Enable)**

This bit enables the generation of the slow channel encoding error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

**RSENTnIDE.SMIE (Slow Channel Message Lost Interrupt Enable)**

This bit enables the generation of the slow channel message lost interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

**RSENTnIDE.SCIE (Slow Channel CRC Error Interrupt Enable)**

This bit enables the generation of the slow channel CRC error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

**RSENTnIDE.NRIE (No Response Error Interrupt Enable)**

This bit enables the generation of the no response error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

The CPU should not set this bit when the SPC mode is disabled (RSENTnCC.SPCE set to 0).

**RSENTnIDE.CVIE (Calibration Pulse Length Variation Error Interrupt Enable)**

This bit enables the generation of the calibration pulse length variation error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

**RSENTnIDE.CLIE (Calibration Pulse Length Error Interrupt Enable)**

This bit enables the generation of the calibration pulse length error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

**RSENTnIDE.FNIE (Fast Channel Nibble Count Error Interrupt Enable)**

This bit enables the generation of the fast channel nibble count error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

**RSENTnIDE.FEIE (Fast Channel Nibble Encoding Error Interrupt Enable)**

This bit enables the generation of the fast channel nibble encoding error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

**RSENTnIDE.FMIE (Fast Channel Message Lost Interrupt Enable)**

This bit enables the generation of the fast channel message lost interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

**RSENTnIDE.FCIE (Fast Channel CRC Error Interrupt Enable)**

This bit enables the generation of the fast channel CRC error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

**RSENTnIDE.FRIE (Fast Channel Receive Interrupt Enable)**

This bit enables the generation of the fast channel receive interrupt.

The fast channel receive interrupt can be also used to notify a DMA request.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000<sub>B</sub>).

### 27.3.7 RSENTnMDC — RSENT Mode Control Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <RSENTn\_base> + 001C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	OMC[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 27.17 RSENTnMDC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
2 to 0	OMC[2:0]	Operation Mode Control 000 <sub>B</sub> : RESET 001 <sub>B</sub> : CONFIGURATION 011 <sub>B</sub> : OPERATION IDLE 101 <sub>B</sub> : OPERATION ACTIVE Other than above: Setting prohibited

#### RSENTnMDC.OMC (Operation Mode Control)

These bits are used to control the operation mode of the RSENT module.

- 000<sub>B</sub>: RESET

In RESET mode, the mode can only be changed to CONFIGURATION mode.

- 001<sub>B</sub>: CONFIGURATION

In CONFIGURATION mode, the mode can only be changed to RESET mode or OPERATION ACTIVE mode.

- 011<sub>B</sub>: OPERATION IDLE

In OPERATION IDLE mode, the mode can be changed to OPERATION ACTIVE mode, CONFIGURATION mode, or RESET mode.

- 101<sub>B</sub>: OPERATION ACTIVE

In OPERATION ACTIVE mode, the mode can be changed to OPERATION IDLE mode, CONFIGURATION mode, or RESET mode. However, it is recommended to process to the OPERATION IDLE mode first.

For the recommended methods to change between operation modes, see **Section 27.4.3.1, Changing Operation Modes**.

- Other than above: Setting prohibited

The CPU should not write any other value than listed above into this register.

The CPU should follow the mode change flows as shown in **Section 27.4.3.1, Changing Operation Modes**.

### 27.3.8 RSENTnSPCT — RSENT SPC Transmission Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <RSENTn\_base> + 0020<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	TLL[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.18 RSENTnSPCT Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
6 to 0	TLL[6:0]	Length of the Trigger Low Phase in Ticks 0000000 <sub>B</sub> : 1 tick 0000001 <sub>B</sub> : 2 ticks 0000010 <sub>B</sub> : 3 ticks : 1111110 <sub>B</sub> : 127 ticks 1111111 <sub>B</sub> : 128 ticks

#### RSENTnSPCT.TLL (Trigger Low Length)

These bits define the length of the SPC trigger pulse.

When the CPU writes to these bits, an SPC trigger pulse with the configured length is sent starting from the next SPC trigger tick. In case RSENTnCS.NRS is set by the RSENT module following a write to these bits, no SPC trigger pulse is sent.

For details about SPC communication, see **Section 27.4.4, SPC Function**.

The CPU can only write to these bits if the RSENT module is in the OPERATION ACTIVE mode (the RSENTnMST.OMS bits are 101<sub>B</sub>) and SPC communication is enabled (RSENTnCC.SPCE is 1<sub>B</sub>).

It is important to note that two consecutive write access might not cause a no response error as the previous request might not have started yet.

After writing to this register, the CPU should wait for at least one SPC trigger tick before writing again to this register.

### 27.3.9 RSENTnMST — RSENT Mode Status Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0024<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	OMS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.19 RSENTnMST Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read.
2 to 0	OMS[2:0]	Operation Mode 000 <sub>B</sub> : RESET 001 <sub>B</sub> : CONFIGURATION 011 <sub>B</sub> : OPERATION IDLE 101 <sub>B</sub> : OPERATION ACTIVE Other than above: Reserved

#### RSENTnMST.OMS (Operation Mode Status)

These bits indicate the current operation mode. These bits are read only.

These bits are updated after a mode change request is made in the RSENTnMDC.OMC register.

- 000<sub>B</sub>: RESET mode

When in RESET mode, all registers are set to their reset values and write access to all registers except the RSENTnMDC register is disabled.

When in RESET mode, SENT communication is disabled.

- 001<sub>B</sub>: CONFIGURATION mode

When in CONFIGURATION mode, write access to the timestamp registers (RSENTnTSPC and RSENTnTSC register), configuration registers (RSENTnCC and RSENTnBRP register), RSENTnIDE register, and mode control register (RSENTnMDC.OMC) is enabled.

When in CONFIGURATION mode, SENT communication is disabled.

When entering CONFIGURATION mode, all status registers and receive buffer registers are set to their reset values.

- 011<sub>B</sub>: OPERATION IDLE mode

In OPERATION IDLE mode, no reception or SPC trigger transmission is possible.

When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

- 101<sub>B</sub>: OPERATION ACTIVE mode

In OPERATION ACTIVE mode, reception and SPC trigger transmission are possible.

- Other than above: Reserved

### 27.3.10 RSENTnCS — RSENT Communication Status Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0028<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

4	FNS	Fast Channel Nibble Count Error Interrupt Status 0: Not detected 1: Detected
3	FES	Fast Channel Nibble Encoding Error Interrupt Status 0: Not detected 1: Detected
2	FMS	Fast Channel Message Lost Interrupt Status 0: Not detected 1: Detected
1	FCS	Fast Channel CRC Error Interrupt Status 0: Not detected 1: Detected

Table 27.20 RSENTnCS Register Contents

Bit Position	Bit Name	Function
0	FRS	Fast Channel Receive Interrupt Status 0: Not detected 1: Detected

### RSENTnCS.SES (Slow Channel Encoding Error Status)

This bit represents the slow channel encoding error status.

This bit is read only.

In the short serial message format (RSENTnCC.SMF = 01<sub>B</sub>), this bit is set when the sequence on serial start bit (bit #3) is different from “1000 0000 0000 0000<sub>B</sub>” (a single 1 and 15 0s).

In the enhanced serial message format (RSENTnCC.SMF = 10<sub>B</sub>), this bit is set when following the reception of a start sequence (“0111 1110<sub>B</sub>”) on the serial data bit 3, bit 13 or bit 18 are not received as “0”.

When this bit is set in the short serial message format the received communication and status nibble is used to assemble a serial message.

When this bit is set in the enhanced serial message format the RSENT module checks the presence of a new start sequence at the same time and uses the received communication and status nibble to assemble a serial message.

This bit is cleared when writing 1 to RSENTnCS.SEC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

### RSENTnCS.SMS (Slow Channel Message Lost Status)

This bit represents the slow channel message lost status.

This bit is read only.

This bit is set when there is an attempt to update the slow channel message reception buffer, but the previous message has not been read yet.

This bit is cleared when writing 1 to RSENTnCS.SEC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

### RSENTnCS.SCS (Slow Channel CRC Error Status)

This bit represents the slow channel CRC error status.

This bit is read only.

This bit is set when a CRC error is detected on the slow channel and the slow channel CRC detection is enabled (RSENTnCC.SCCD is set to 0).

This bit is cleared when writing 1 to RSENTnCS.SCC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

### RSENTnCS.NRS (No Response Error Status)

This bit represents the no response error status.

This bit is read only.

This bit is set when

- The CPU writes to the RSENTnSPCT.TLL bits and
- SPC mode enabled (RSENTnCC.SPCE set to 1) and
- No complete response was received from the sensor for the previous SPC trigger.

This bit is set after  $4 \text{ PCLK} + 5 \text{ clk}$  (Maximum time) from the CPU writes to the RSENTnSPCT.TLL.

This bit is cleared when writing 1 to RSENTnCSC.NRC.

This bit is cleared when the RSENTnMST.OMS bits are changed to  $001_B$  (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### **RSENTnCS.CVS (Calibration Pulse Length Variation Error Status)**

This bit represents the calibration pulse length variation error status.

This bit is read only.

When RSENTnCC.PPTC is 0, then this bit is set when two successive calibration pulses differ by more than 1.5625 %.

When RSENTnCC.PPTC is 1, this bit is never set. In this mode (pause pulse with fixed message length), the CPU needs to check the variation of the ratio of calibration pulse to message length by reading the RSENTnCPL and RSENTnML registers.

This bit is cleared when writing 1 to RSENTnCSC.CVC.

This bit is cleared when the RSENTnMST.OMS bits are changed to  $001_B$  (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### **RSENTnCS.CLS (Calibration Pulse Length Error Status)**

This bit represents the calibration pulse length error status.

This bit is read only.

This bit is set when the measured calibration pulse length is less than 42 clock ticks or more than 70 clock ticks (deviation of 25 % from nominal length).

This bit is cleared when writing 1 to RSENTnCSC.CLC.

This bit is cleared when the RSENTnMST.OMS bits are changed to  $001_B$  (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### **RSENTnCS.FNS (Fast Channel Nibble Count Error Status)**

This bit represents the fast channel nibble count error status.

This bit is read only.

This bit is set when there is an unexpected number of falling edges between two calibration pulses.

This bit is cleared when writing 1 to RSENTnCSC.FNC.

This bit is cleared when the RSENTnMST.OMS bits are changed to  $001_B$  (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### **RSENTnCS.FES (Fast Channel Nibble Encoding Error Status)**

This bit represents the fast channel nibble encoding error status.

This bit is read only.

This bit is set when on the fast channel a measured nibble period is less than 12 clock ticks or more than 27 clock ticks.

This bit is cleared when writing 1 to RSENTnCSC.FEC.

This bit is cleared when the RSENTnMST.OMS bits are changed to  $001_B$  (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### **RSENTnCS.FMS (Fast Channel Message Lost Status)**

This bit represents the fast channel message lost status.

This bit is read only.

This bit is set when the fast channel message reception buffer is updated, but the previous messages in the foreground and background buffer have not been read yet.

This bit is cleared when writing 1 to RSENTnCSC.FMC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).  
If the set condition occurs simultaneously with the clear condition, the bit is set.

**RSENTnCS.FCS (Fast Channel CRC Error Status)**

This bit represents the fast channel CRC error status.

This bit is read only.

This bit is set when a CRC error is detected on the fast channel and the fast channel CRC detection is enabled (RSENTnCC.FCCD is set to 0).

This bit is cleared when writing 1 to RSENTnCSC.FCC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

**RSENTnCS.FRS (Fast Channel Receive Status)**

This bit represents the fast channel receive status.

This bit is read only.

This bit is set when the fast channel message reception buffer was updated.

This bit is cleared when the CPU reads the RSENTnFRXD or RSENTnEFRD1 register.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

### 27.3.11 RSENTnCSC — RSENT Communication Status Clear Register

**Access:** This register can be read or written in 32-bit units.

**Address:** <RSENTn\_base> + 002C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SEC	SMC	SCC	NRC	CVC	CLC	FNC	FEC	FMC	FCC	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 27.21 RSENTnCSC Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
10	SEC	Slow Channel Encoding Error Clear 0: — 1: Clear
9	SMC	Slow Channel Message Lost Clear 0: — 1: Clear
8	SCC	Slow Channel CRC Error Clear 0: — 1: Clear
7	NRC	No Response Error Clear 0: — 1: Clear
6	CVC	Calibration Pulse Length Variation Error Clear 0: — 1: Clear
5	CLC	Calibration Pulse Length Error Clear 0: — 1: Clear
4	FNC	Fast Channel Nibble Count Error Clear 0: — 1: Clear
3	FEC	Fast Channel Nibble Encoding Error Clear 0: — 1: Clear
2	FMC	Fast Channel Message Lost Clear 0: — 1: Clear
1	FCC	Fast Channel CRC Error Clear 0: — 1: Clear
0	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.

**RSENTnCSC.SEC (Slow Channel Encoding Error Clear)**

Writing 1 sets RSENTnCS.SES to 0. Writing 0 has no effect. This bit is always read as 0.

**RSENTnCSC.SMC (Slow Channel Message Lost Clear)**

Writing 1 sets RSENTnCS.SMS to 0. Writing 0 has no effect. This bit is always read as 0.

**RSENTnCSC.SCC (Slow Channel CRC Error Clear)**

Writing 1 sets RSENTnCS.SCS to 0. Writing 0 has no effect. This bit is always read as 0.

**RSENTnCSC.NRC (No Response Error Clear)**

Writing 1 sets RSENTnCS.NRS to 0. Writing 0 has no effect. This bit is always read as 0.

**RSENTnCSC.CVC (Calibration Pulse Length Variation Error Clear)**

Writing 1 sets RSENTnCS.CVS to 0. Writing 0 has no effect. This bit is always read as 0.

**RSENTnCSC.CLC (Calibration Pulse Length Error Clear)**

Writing 1 sets RSENTnCS.CLS to 0. Writing 0 has no effect. This bit is always read as 0.

**RSENTnCSC.FNC (Fast Channel Nibble Count Error Clear)**

Writing 1 sets RSENTnCS.FNS to 0. Writing 0 has no effect. This bit is always read as 0.

**RSENTnCSC.FEC (Fast Channel Nibble Encoding Error Clear)**

Writing 1 sets RSENTnCS.FES to 0. Writing 0 has no effect. This bit is always read as 0.

**RSENTnCSC.FMC (Fast Channel Message Lost Clear)**

Writing 1 sets RSENTnCS.FMS to 0. Writing 0 has no effect. This bit is always read as 0.

**RSENTnCSC.FCC (Fast Channel CRC Error Clear)**

Writing 1 sets RSENTnCS.FCS to 0. Writing 0 has no effect. This bit is always read as 0.

### 27.3.12 RSENTnSRTS — RSENT Slow Channel Receive Timestamp Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0030<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STS[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.22 RSENTnSRTS Register Contents

Bit Position	Bit Name	Function
31 to 0	STS[31:0]	Slow Channel Receive Timestamp

#### RSENTnSRTS.STS (Slow Channel Timestamp)

These bits are read only.

These bits are updated when the slow channel message reception buffer is updated with the timestamp counter value of the last frame provided to the slow channel message.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.13 RSENTnSRXD — RSENT Slow Channel Receive Data Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0034<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SND	—	SCRC[5:0]					—	—	—	SMGC	IDD[19:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.23 RSENTnSRXD Register Contents

Bit Position	Bit Name	Function
31	SND	Slow Channel New Data 0: Slow channel frame data is not updated since last read. 1: Slow channel frame data is updated since last read.
30	Reserved	When read, the value after reset is read.
29 to 24	SCRC[5:0]	Slow Channel CRC Data
23 to 21	Reserved	When read, the value after reset is read.
20	SMGC	Slow Channel Configuration Bit Data
19 to 0	IDD[19:0]	Slow Channel Data / ID Information

#### RSENTnSRXD.SND (Slow Channel New Data)

This bit indicates that the slow channel message reception buffer is holding data that has not been read.

This bit is read only.

This bit is set when the slow channel message reception buffer is updated.

This bit is cleared automatically whenever it is read.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

#### RSENTnSRXD.SCRC (Slow Channel CRC)

These bits are representing the slow channel CRC data.

These bits are read only.

These bits are updated when the slow channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

#### RSENTnSRXD.SMGC (Slow Channel Configuration Bit)

This bit represents the slow channel configuration bit.

This bit is read only.

This bit is updated when the slow channel message reception buffer is updated.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

**RSENTnSRXD.IDD (ID/Data)**

These bits are representing the slow channel data and ID information.

The alignment within this register depends on the message format. For details, see **Section 27.4.3.2(5), Slow Channel Message Reception**.

These bits are read only.

These bits are updated when the slow channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.14 RSENTnCPL — RSENT Calibration Pulse Length Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0038<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPLV [16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CPLV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.24 RSENTnCPL Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is read.
16 to 0	CPLV[16:0]	Calibration Pulse Length Value of Received Message

#### RSENTnCPL.CPLV (Calibration Pulse Length Value)

These bits are used by the CPU to calculate the ratio of two consecutive calibration pulses or the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.

For details, refer to *Section 5.3.3* of the SAE J2716 2016 specification.

These bits are read only.

In modes other than pause pulse with fixed message length mode (RSENTnCC.PPTC = 1<sub>B</sub>) or SPC mode (RSENTnCC.SPCE = 1<sub>B</sub>), these bits are invalid and should not be used.

Updating of the fast channel message reception buffer is storage of the value counted over the calibration pulse length (one tick time × the number of ticks between calibration pulses) based on the sample clock (f<sub>SAMPLE</sub> = 16 MHz).

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.15 RSENTnML — RSENT Message Length Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 003C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	MLV[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MLV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.25 RSENTnML Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read.
20 to 0	MLV[20:0]	Message Length Value of Received Message

#### RSENTnML.MLV (Message Length Value)

These bits are used by the CPU to calculate the ratio of the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.

These bits are read only.

In modes other than pause pulse with fixed message length, these bits are invalid and should not be used.

These bits are updated with the measured message length in sample clock ticks when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.16 RSENTnFRTS — RSENT Fast Channel Receive Timestamp Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0040<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FTS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.26 RSENTnFRTS Register Contents

Bit Position	Bit Name	Function
31 to 0	FTS[31:0]	Fast Channel Receive Timestamp

#### RSENTnFRTS.FTS (Fast Channel Receive Timestamp)

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.17 RSENTnFRXD — RSENT Fast Channel Receive Data Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0044<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SNDM	FND	FCCN[1:0]		FCRC[3:0]			ND[23:16]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ND[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.27 RSENTnFRXD Register Contents

Bit Position	Bit Name	Function
31	SNDM	Slow Channel New Data Mirror 0: Slow channel frame data is not updated since last read. 1: Slow channel frame data is updated since last read.
30	FND	Fast Channel New Data 0: Fast channel frame data is not updated since last read. 1: Fast channel frame data is updated since last read.
29, 28	FCCN[1:0]	Fast Channel Communication Nibble
27 to 24	FCRC[3:0]	Fast Channel CRC Data
23 to 0	ND[23:0]	Fast Channel Nibble Data

#### RSENTnFRXD.SNDM (Slow Channel New Data Mirror)

This bit indicates that the slow channel message reception buffer is holding data that has not been read.

This bit is read only.

This bit is set when the slow channel message reception buffer is updated.

This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

#### RSENTnFRXD.FND (Fast Channel New Data)

This bit indicates that the fast channel message reception buffer is holding data that has not been read.

This bit is read only.

This bit is set when the fast channel message reception buffer is updated.

This bit is cleared automatically whenever RSENTnFRXD or RSENTnEFRD1 is read.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

#### RSENTnFRXD.FCCN (Fast Channel Communication Nibble)

These bits are representing the fast channel communication nibble bits [1:0].

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

**RSENTnFRXD.FCRC (Fast Channel CRC)**

These bits are representing the fast channel CRC data.

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

**RSENTnFRXD.ND (Fast Channel Nibble Data)**

These bits are representing the fast channel nibble data.

The alignment of the nibble data depends on nibble count. For details, see **Section 27.4.3.2(3), Fast Channel Message Reception**.

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.18 RSENTnCPLM — RSENT Calibration Pulse Length Mirror Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0050<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPLVM [16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CPLVM[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.28 RSENTnCPLM Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is read.
16 to 0	CPLVM[16:0]	Calibration Pulse Length Value (Mirror) of Received Message

#### RSENTnCPLM.CPLVM (Calibration Pulse Length Value (Mirror))

These bits are mirror bit of the RSENTnCPL.CPLV.

These bits are read only.

In modes other than pause pulse with fixed message length mode (RSENTnCC.PPTC = 1<sub>B</sub>) or SPC mode (RSENTnCC.SPCE = 1<sub>B</sub>), these bits are invalid and should not be used.

Updating of the fast channel message reception buffer is storage of the value counted over the calibration pulse length (one tick time × the number of ticks between calibration pulses) based on the sample clock ( $f_{\text{SAMPLE}} = 16 \text{ MHz}$ ).

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.19 RSENTnMLM — RSENT Message Length Mirror Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0054<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	MLVM[20:16]

20 to 0	MLVM[20:0]	Message Length Value (Mirror) of Received Message

#### RSENTnMLM.MLVM (Message Length Value (Mirror))

These bits are mirror bit of the RSENTnML.MLV.

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.20 RSENTnFRTSM — RSENT Fast Channel Receive Timestamp Mirror Register

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0058<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FTSM[31:16]

Table 27.30 RSENTnFRTSM Register Contents

Bit Position	Bit Name	Function
31 to 0	FTSM[31:0]	Fast Channel Receive Timestamp (Mirror)

#### RSENTnFRTSM.FTSM (Fast Channel Receive Timestamp (Mirror))

These bits are mirror bit of the RSENTnFRTS.FTS.

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.21 RSENTnEFRD0 — RSENT Expanded Fast Channel Receive Data Register 0

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 005C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.31 RSENTnEFRD0 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read.
7	SNDM	Slow Channel New Data (Mirror) 0: Slow channel frame data is not updated since last read. 1: Slow channel frame data is updated since last read.
6	FND	Fast Channel New Data 0: Fast channel frame data is not updated since last read. 1: Fast channel frame data is updated since last read.
5 to 4	FCCN[1:0]	Fast Channel Communication Nibble Bits [1:0]
3 to 0	FCRC[3:0]	Fast Channel CRC Data

#### RSENTnEFRD0.SNDM (Slow Channel New Data (Mirror))

This bit indicates that the slow channel message reception buffer is holding data that has not been read.

This bit is read only.

This bit is set when the slow channel message reception buffer is updated.

This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

#### RSENTnEFRD0.FND (Fast Channel New Data)

This bit indicates that the fast channel message reception buffer is holding data that has not been read.

This bit is read only.

This bit is set when the fast channel message reception buffer is updated.

This bit is cleared automatically whenever RSENTnFRXD or RSENTnEFRD1 is read.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

#### RSENTnEFRD0.FCCN (Fast Channel Communication Nibble)

These bits are representing the fast channel communication nibble bits [1:0].

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

**RSENTnEFRD0.FCRC (Fast Channel CRC)**

These bits are representing the fast channel CRC data.

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

### 27.3.22 RSENTnEFRD1 — RSENT Expanded Fast Channel Receive Data Register 1

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RSENTn\_base> + 0060<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 27.32 RSENTnEFRD1 Register Contents

Bit Position	Bit Name	Function
31 to 0	ND[31:0]	Fast Channel Nibble Data

#### RSENTnEFRD1.ND (Nibble Data)

These bits are representing the fast channel nibble data.

The alignment of the nibble data depends on nibble count. For details, see **Section 27.4.3.2(3), Fast Channel Message Reception**.

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001<sub>B</sub> (CONFIGURATION).

## 27.4 Operation

### 27.4.1 Modes of Operation

The RSENT module can be in one of the following modes:

- RESET mode
- CONFIGURATION mode
- OPERATION IDLE mode
- OPERATION ACTIVE mode

The CPU should follow the mode change flows as shown in **Section 27.4.3.1, Changing Operation Modes**.

The current operation mode status can be seen in the RSENTnMST.OMS bits.

**Figure 27.2, Transition between Operation Modes** shows the possible transitions between the channel modes:

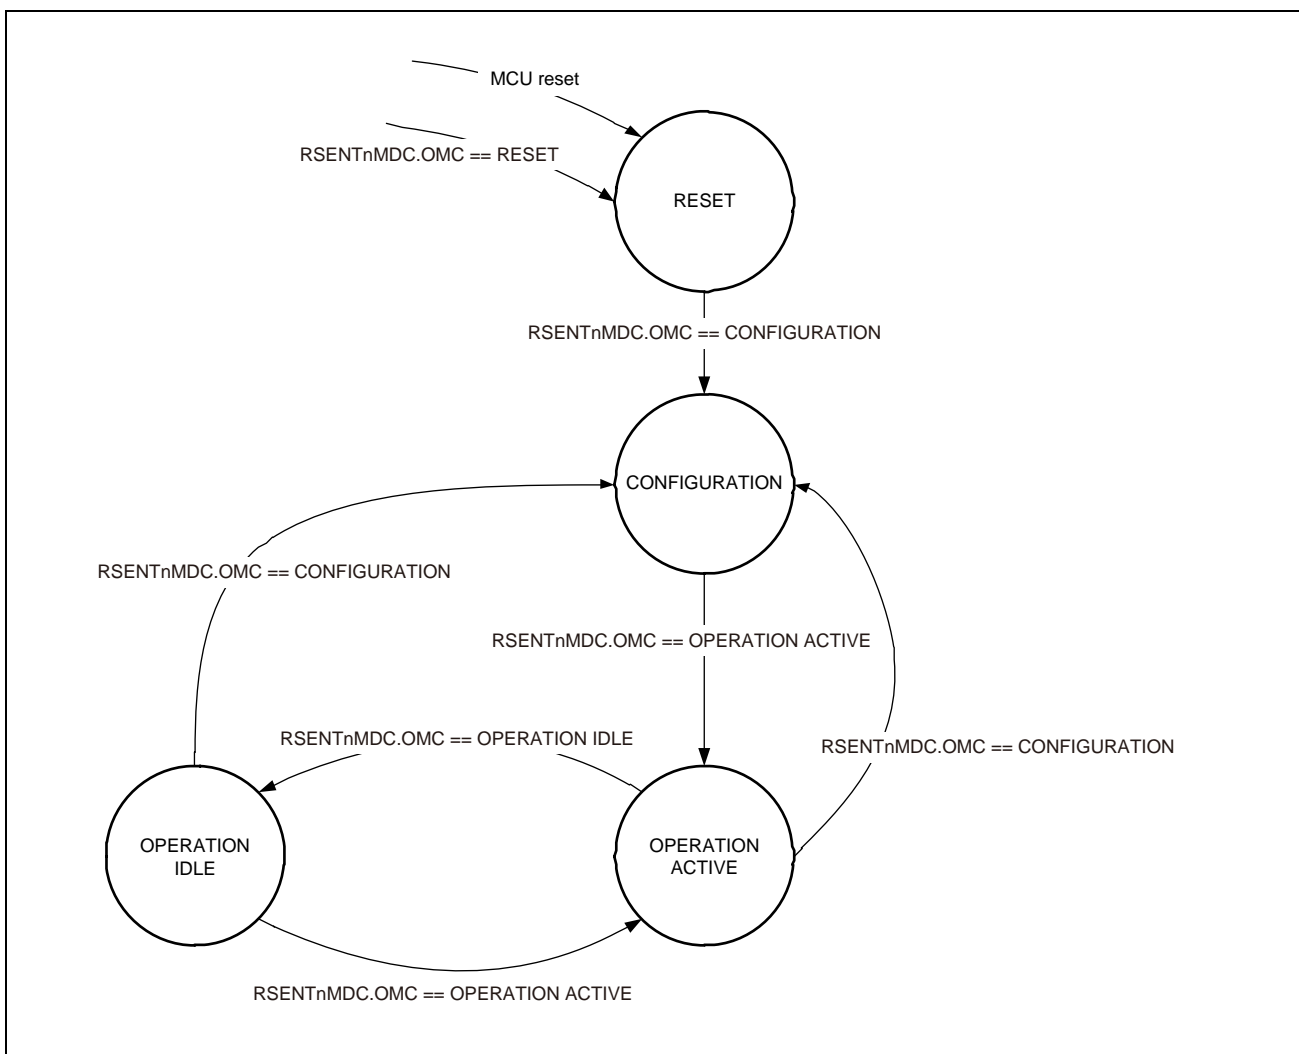

Figure 27.2 Transition between Operation Modes

### 27.4.1.1 RESET Mode

This mode is the initial mode that the RSENT module automatically enters after the hardware reset (MCU reset) is cleared. Its purpose is to provide a clean reset of the registers in the RSENT module.

The RESET mode is also entered after the RSENTnMDC.OMC bits have been set to 000<sub>B</sub>. In this state, all, configuration, control (except RSENTnMDC.OMC bits), and status registers are set to their reset value. Any on-going transmission or reception process is stopped immediately and the interface pins of the RSENT module are set to their default values.

Read access to all registers is possible in this state. Write access is limited to the RSENTnMDC register.

### 27.4.1.2 CONFIGURATION Mode

The CONFIGURATION mode is entered after the RSENTnMDC.OMC bits have been set to 001<sub>B</sub>.

The interface pins of the RSENT module are set to their default values.

Regarding the output polarity setting of SENTnSPCO pin and the timing that becomes effective, please refer to the explanation of “RSENTnCC.SOPC (SPC Output Polarity Control)” in **Section 27.3.4, RSENTnCC — RSENT Communication Configuration Register**.

In this state, all status registers (RSENTnCS) and the receive buffer registers (RSENTnSRTS, RSENTnSRXD, RSENTnCPL, RSENTnML, RSENTnFRTS, and RSENTnFRXD) are set to their default value.

Read access to all registers is possible in this state.

Write access is limited to both timestamp registers (RSENTnTSPC and RSENTnTSC) and configuration registers (RSENTnCC, RSENTnBRP, RSENTnIDE, RSENTnMDC, and RSENTnCSC).

### 27.4.1.3 OPERATION IDLE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to 011<sub>B</sub>.

In OPERATION IDLE mode, no reception and transmission are done.

When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

Read access to all registers is possible in this state.

Write access is granted only to RSENTnTSC, RSENTnIDE, RSENTnMDC, and RSENTnCSC.

### 27.4.1.4 OPERATION ACTIVE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to 101<sub>B</sub>.

In OPERATION ACTIVE mode, transmission and reception can take place.

Frame reception and status flagging starts after a valid calibration pulse (including the falling edge at the beginning) was detected.

Read access to all registers is possible in this state.

Write access is granted only to RSENTnTSC, RSENTnIDE, RSENTnMDC, RSENTnSPCT, and RSENTnCSC.

### 27.4.1.5 Register Behavior in Operation Modes

**Table 27.33, Register Behavior in Operation Modes** shows the register behavior when the RSENT module transitions to the indicated operation modes. The table also gives an overview about the access restriction in each operation mode.

Table 27.33 Register Behavior in Operation Modes

Register Name	Symbol	MCU Reset	RESET		CONFIGURATION		OPERATION IDLE		OPERATION ACTIVE	
		Change	Change	R/W	Change	R/W	Change	R/W	Change	R/W
Timestamp register	RSENTnTSPC	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	Unchanged	R/W	Unchanged	R	Unchanged	R

Communication status register	RSENTnCS	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Communication status clear register	RSENTnCSC	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	Unchanged	R/W	Unchanged	R/W	Unchanged	R/W
Slow channel receive timestamp register	RSENTnSRTS	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Slow channel receive data register	RSENTnSRXD	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Calibration pulse length register	RSENTnCPL	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Message length register	RSENTnML	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Fast channel receive timestamp register	RSENTnFRTS	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Fast channel receive data register	RSENTnFRXD	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Calibration pulse length mirror register	RSENTnCPLM	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Message length mirror register	RSENTnMLM	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Fast channel receive timestamp mirror register	RSENTnFRTSM	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Expanded fast channel receive data register 0	RSENTnEFRD0	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R
Expanded fast channel receive data register 1	RSENTnEFRD1	0000 0000 <sub>H</sub>	0000 0000 <sub>H</sub>	R	0000 0000 <sub>H</sub>	R	Unchanged	R	Unchanged	R

Note 1. Means write restriction exists.

## 27.4.2 Clock Configuration

### 27.4.2.1 Timestamp

#### (1) Timestamp Clock Configuration

RSENT incorporates the timestamp counter.

The minimum required resolution of the timestamp is 1  $\mu$ s. Depending on the applied communication frequency (clk), the user should configure the RSENTnTSPC.TTPV bits to achieve the 1- $\mu$ s resolution. The input frequency is divided by the configured timestamp prescaler value RSENTnTSPC.TTPV.

Depending on the configured tick lengths, the resolution can be decreased by configuring the RSENTnTSPC.TTM bits. The already divided input frequency is divided further by the value of the RSENTnTSPC.TTM bits.

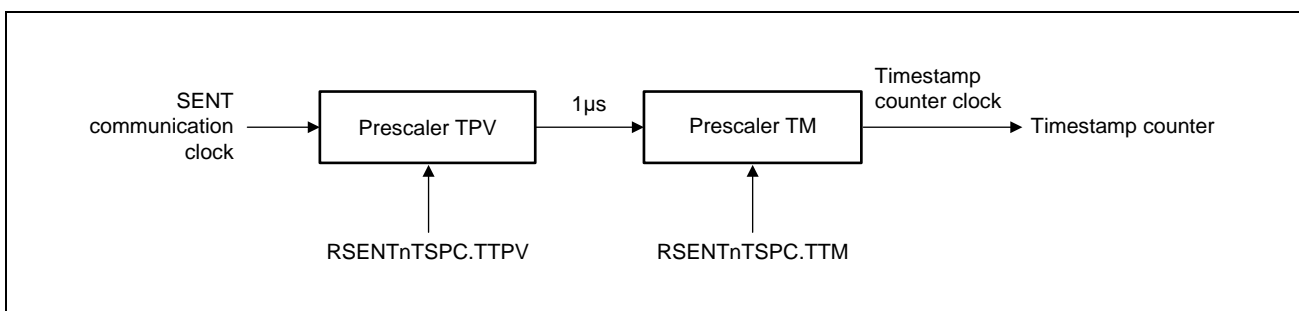

Figure 27.3 Timestamp Counter Clock Generation

#### (2) Timestamp Counter Operation

The timestamp counter value can be initialized to any value by writing to the RSENTnTSC.TS bits only when the RSENT module is in CONFIGURATION mode.

When timestamp counters are configured to operate in master mode (RSENTnTSPC.TMS = 0), the CPU can reset the timestamp counter by writing 0000 0000<sub>H</sub> to the RSENTnTSC.TS bits when the RSENT module is in OPERATION IDLE or OPERATION ACTIVE mode.

When timestamp counters are configured to operate in slave mode (RSENTnTSPC.TMS = 1), the timestamp counter is cleared when the CPU writes 0000 0000<sub>H</sub> to the RSENTnTSC.TS bits of the channel set in the master when the RSENT module is in OPERATION IDLE or OPERATION ACTIVE mode. The RSENT module operating in slave mode should have the same timestamp counter prescaler settings as master RSENT module. When timestamp counter synchronization occurs, the internal timestamp counter prescalers are also synchronized.

The current timestamp counter value can be read from the RSENTnTSC.TS bits.

When the RSENT module is in OPERATION ACTIVE mode, each received message is stored with its related timestamp. Timestamp values are taken for fast channel and slow channel data.

The timestamp value is captured when the calibration pulse is detected.

The timestamp value for the fast channel is stored in the RSENTnFRS.FTS or RSENTnFRS.FTSM register field when the fast channel message reception buffer is updated.

The timestamp value for the slow channel is stored in the RSENTnSRS.STS bits. The timestamp value for the slow channel is identical to the timestamp value of the last fast channel message contributing to the slow channel message.

In case timestamp counter synchronization is required, the following flow should be used.

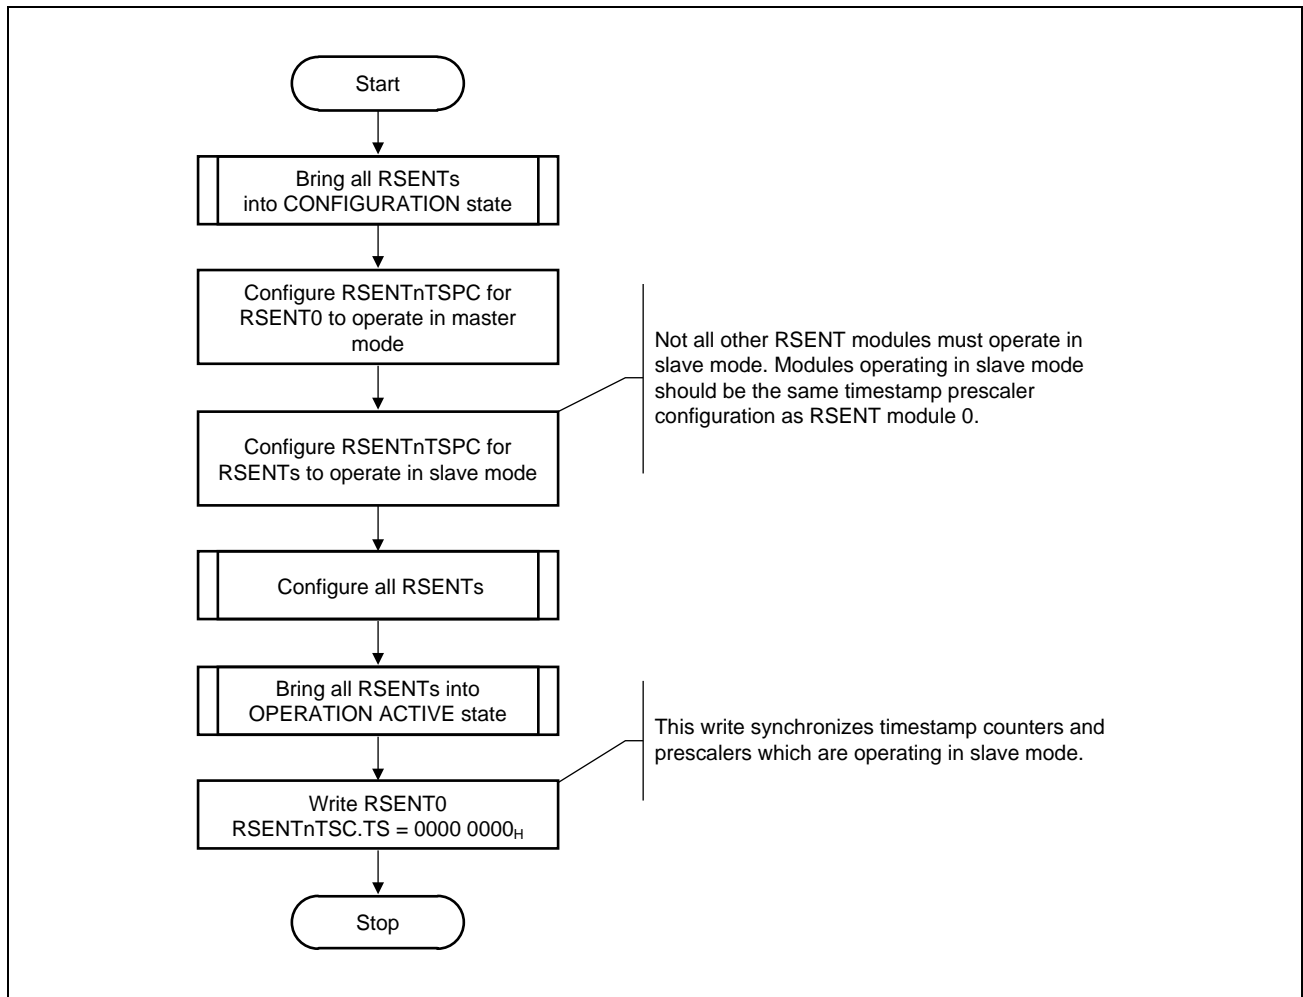

Figure 27.4 Timestamp Counter Synchronization

Further synchronization can be done as long as master RSENT module is in either OPERATION ACTIVE or OPERATION IDLE state.

### 27.4.2.2 Communication Clock Configuration

#### (1) RX BRP Setting

Use the formula below to obtain the settings for RSENTnBRP.SCDV and RSENTnBRP.SCMV in accord with  $f_{COMMUNICATION}$  to be used (the frequency of the clk clock) so that the sample clock frequency is 16 MHz (for example, if the settings are for RSENTnBRP.SCDV = 4/RSENTnBRP.SCMV = 6, replace this with RSENTnBRP.SCDV = 2/RSENTnBRP.SCMV = 3). The input clock (clk clock) is frequency-divided according to the settings of RSENTnBRP.SCDV and RSENTnBRP.SCM to generate the sample clock.

Set  $f_{COMMUNICATION}$  (the frequency of the clk clock) so that it falls within the range from 32 to 40 MHz (or at precisely 16 MHz). Use the formula below to obtain the values for RSENTnBRP.SCDV and RSENTnBRP.SCM such that the sample clock frequency becomes 16 MHz.

$$f_{SAMPLE} = 16 \text{ MHz} = f_{COMMUNICATION} \times \frac{\text{Sample Clock Multiplication Value (RSENTnBRP.SCMV + 1)}}{\text{Sample Clock Division Value (RSENTnBRP.SCDV + 1)}}$$

Where Sample Clock Multiplication Value = 2 (RSENTnBRP.SCMV = 5'd1),

Sample Clock Division Value = 5 (RSENTnBRP.SCDV = 7'd4),

$f_{COMMUNICATION} = 40\text{MHz}$

$f_{SAMPLE} = 40 \times 2/5 = 16\text{MHz}$

#### (2) RX and SPC Tick Settings

The used tick length in RX and SPC function can be configured with the RSENTnBRP.TTI and RSENTnBRP.TTF bits. Tick lengths from 1.0  $\mu\text{s}$  to 90.0  $\mu\text{s}$  with a resolution of 0.1  $\mu\text{s}$  can be configured.

The RSENTnBRP.TTI holds the integer part of the tick length and the RSENTnBRP.TTF bits hold the fractional part of the tick length. The tick length is then calculated by:

$$T_{TICK} = T_{RSENTnBRP.TTI} + T_{RSENTnBRP.TTF}$$

Where RSENTnBRP.TTI = 0, RSENTnBRP.TTF = 3

$$T_{TICK} = 1 + 0.3 = 1.3 \mu\text{s}$$

## 27.4.3 RSENT Operation

### 27.4.3.1 Changing Operation Modes

Once initialization has been completed in CONFIGURATION mode, operation can be enabled by entering OPERATION ACTIVE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION ACTIVE and waiting for the RSENTnMST.OMS to transition to OPERATION ACTIVE.

Once in OPERATION ACTIVE mode the RSENT module begins to receive messages or SPC communication can be started depending on the configuration.

**Figure 27.5, Communication Enable Flow** shows the communication enabled flow assuming that the RSENT module is in RESET mode:

Figure 27.5 Communication Enable Flow

To leave OPERATION ACTIVE mode, communication should be disabled first by entering OPERATION IDLE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION IDLE and waiting for the RSENTnMST.OMS bits to transition to OPERATION IDLE.

However, when the SPC mode is enabled (RSENTnCC.SPCE set to 1) and the SPC trigger transmission has not been requested after the previous SPC communication has been completed (e.g. successful reception for the previous SPC trigger transmission), the RSENT module can directly enter the CONFIGURATION mode.

The transition between OPERATION ACTIVE and OPERATION IDLE depends on the setting of the RSENTnCC.SPCE bit.

**(1) RSENTnCC.SPCE = 0**

In case a reception is currently ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the receive buffer was updated or error was flagged (see **Section 27.4.3.2(3), Fast Channel Message Reception**).

In case no reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place immediately.

**(2) RSENTnCC.SPCE = 1**

In case a reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

In case a no response error is flagged, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place at the same time as the error flagging.

The mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the sequence of making a SPC trigger and receiving the response has been completed. This means when a response was already received, the transition takes place immediately. When the response is still pending, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

CONFIGURATION mode can be entered by writing CONFIGURATION to the RSENTnMDC.OMC bits and waiting for the RSENTnMST.OMS to transition to CONFIGURATION.

Once CONFIGURATION mode is entered, the remaining status and message information stored in the RSENT module is lost since status and message information is cleared in CONFIGURATION mode.

**Figure 27.6, Communication Disable Flow** shows the communication disable flow assuming that the RSENT module is in OPERATION ACTIVE mode.

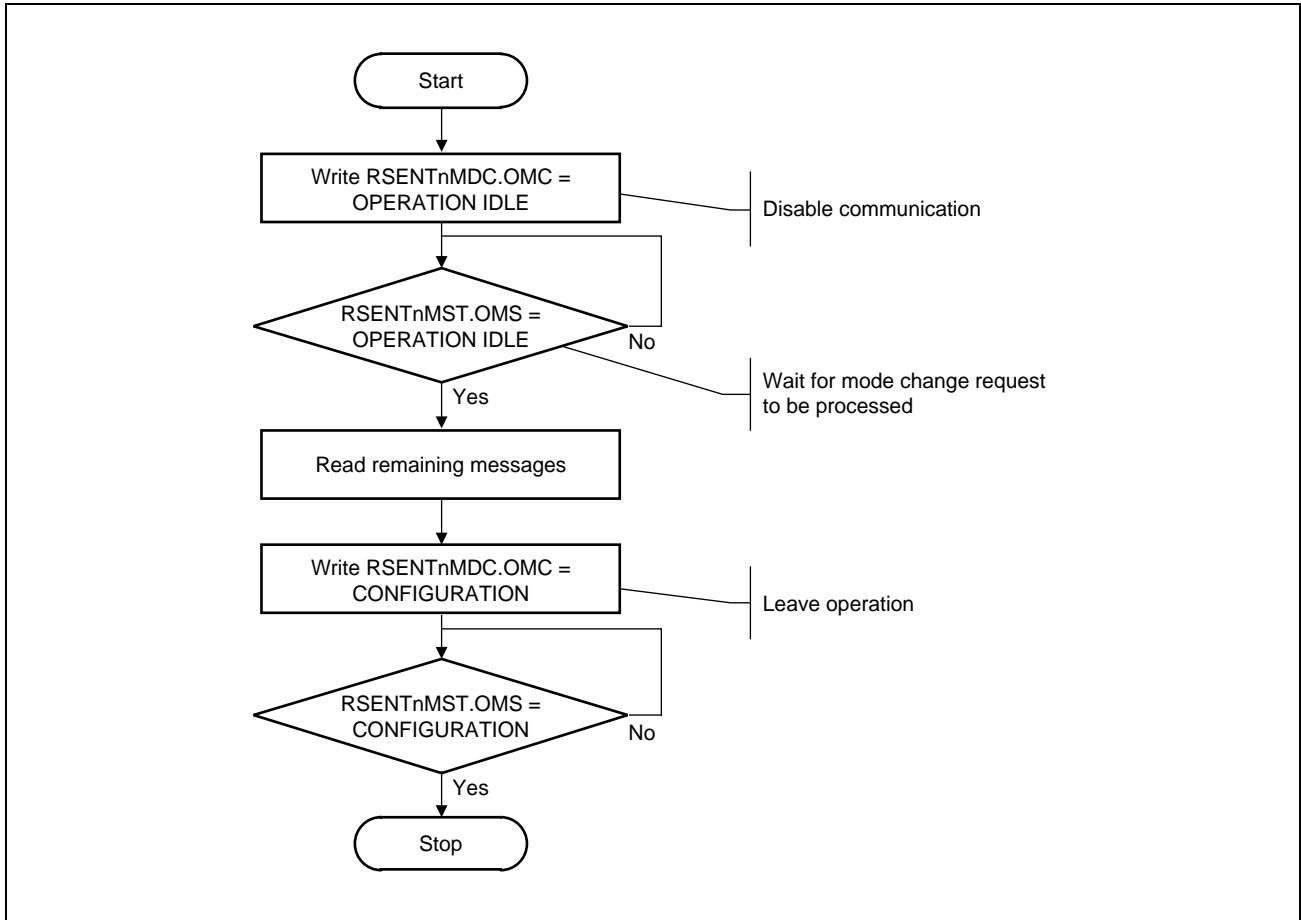

Figure 27.6 Communication Disable Flow

### 27.4.3.2 Message Reception

SENT message reception is composed of the calibration pulse reception followed by the data nibble pulse reception.

Figure 27.7 SENT Received Message Structure

#### (1) Calibration Pulse Reception

Within the calibration pulse reception phase the internally generated clock tick is adjusted to the transmit clock speed.

In addition, the calibration pulse is used to end the previous message and perform message diagnostics. The RSENT module supports automatic calibration pulse length diagnostics in variable message length modes (RSENTnCC.PPTC = 0). In case the calibration pulse ratio check fails, the calibration pulse length variation error flag (RSENTnCS.CVS) is set to 1.

#### (2) Data Nibble Reception

The receive function of the RSENT module is a straightforward capture and compare function. The RSENT module receives sensor information encoded by the temporal distance of two consecutive falling edges on the data line. The temporal distance (the Number of Clock Ticks) is captured and compared against a set of values to determine the actual nibble value. The data encoding is illustrated in **Table 27.34, Data Nibble Encoding** below.

Table 27.34 Data Nibble Encoding

Nibble Period (Number of Clock Ticks)	Nibble Value (Binary)
12	0000 <sub>B</sub>
13	0001 <sub>B</sub>
14	0010 <sub>B</sub>
15	0011 <sub>B</sub>
16	0100 <sub>B</sub>
17	0101 <sub>B</sub>
18	0110 <sub>B</sub>
19	0111 <sub>B</sub>
20	1000 <sub>B</sub>
21	1001 <sub>B</sub>
22	1010 <sub>B</sub>
23	1011 <sub>B</sub>
24	1100 <sub>B</sub>
25	1101 <sub>B</sub>
26	1110 <sub>B</sub>
27	1111 <sub>B</sub>

The received data nibbles are composed into an SENT message which is then stored in the fast channel message reception buffer.

Any other received nibble period during the reception of data nibbles will cause a fast channel nibble encoding error.

### (3) Fast Channel Message Reception

Messages received on the fast message channel are stored in a receive buffer.

A fast channel message reception buffer is composed of the calibration pulse length register (RSENTnCPL), the message length register (RSENTnML), the fast channel receive timestamp register (RSENTnFRTS), and the fast channel receive data register (RSENTnFRXD).

All registers are placed on successive addresses that allows transferring the register content into memory using DMA.

The RSENT module is equipped with a double receive buffer structure that allows the storage of two complete SENT messages including the related timestamp and message length information. Message decoding and assembling are done in a separate register stage.

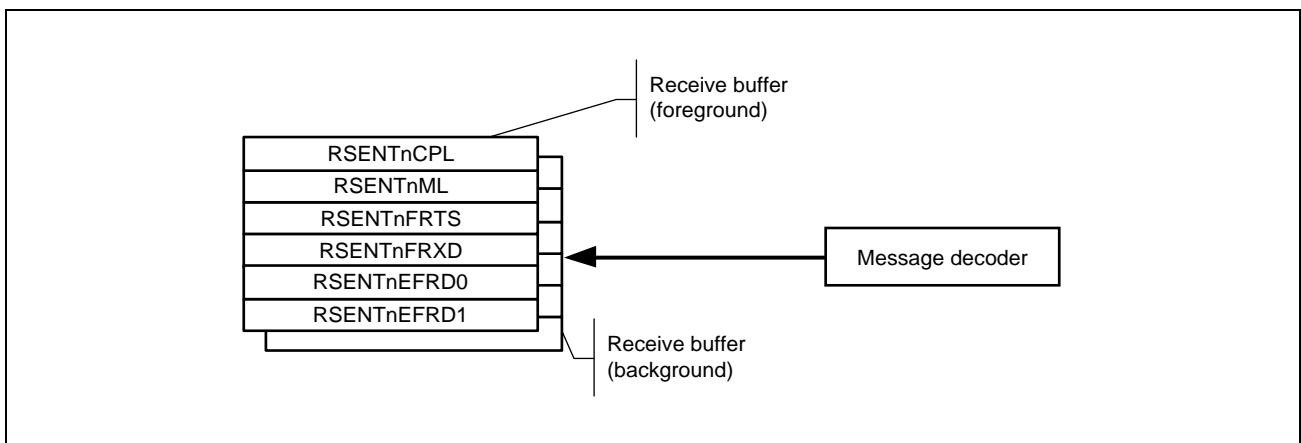

Figure 27.8 Fast Channel Message Reception Buffer

The first received message is placed into the message buffer that can be accessed by the CPU. This buffer (except the RSENTnFRXD.SNDM and RSENTnEFRD0.SNDM bit) is not updated any more until the RSENTnFRXD or RSENTnEFRD1 register was read.

When a new message is placed into a receive buffer, the RSENTnFRXD.FND and RSENTnEFRD0.FND bit is set. At the same time, the RSENTnCS.FRS bit is set and, if enabled, a receive interrupt request is generated.

When the foreground receive buffer is holding an unprocessed message (the RSENTnFRXD.FND and RSENTnEFRD0.FND bit is 1), any further incoming message is placed in the background buffer. The background buffer is updated with any further incoming messages. In case an unprocessed background message buffer message is overwritten, the RSENTnCS.FMS bit is set to 1.

When the CPU reads the RSENTnFRXD or RSENTnEFRD1 register and there is valid data in the background buffer, the data previously located in the background buffer becomes available in the receive buffer and is accessible by the CPU. If enabled, a new interrupt request for fast channel data is generated and RSENTnCS.FRS is set.

When the RSENTnFRXD.FND and RSENTnEFRD0.FND/RSENTnCS.FRS bit is not set, the data in the receive buffer is not defined and the CPU should not access the receive buffer.

Figure 27.9 Fast Channel Message Reception Buffer Update Timing

The update timing of the receive buffer depends on the applied configuration as depicted in **Figure 27.10, Buffer Update in Variable Message Length Mode and Preferred Check Method** to **Figure 27.13, Buffer Update in SPC Mode**.

The RSENTnFRTS register is updated with the current timestamp counter register value when the calibration pulse is detected.

The data alignment in the RSENTnFRXD register depends on the nibble data count (RSENTnCC.NDN).

Table 27.35 Data Nibble Alignment in RSENTnFRXD Register

RSENTnFRXD RSENTnCC.NDN	23:20	19:16	15:12	11:8	7:4	3:0
000 <sub>B</sub>	Undefined	Undefined	Undefined	Undefined	Undefined	Nibble 1
001 <sub>B</sub>	Undefined	Undefined	Undefined	Undefined	Nibble 1	Nibble 2
010 <sub>B</sub>	Undefined	Undefined	Undefined	Nibble 1	Nibble 2	Nibble 3

**(a) SAE Operation with Variable Message Length and Preferred Check Method  
(RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 0, RSENTnCC.FCM = 0)**

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the preferred option in the J2716 2016 specification. In this mode, message diagnostics is done after the calibration pulse was received following a message.

If this check is passed, the message reception buffer is updated.

If this check is not passed, the message reception buffer is not updated and RSENTnCS.CVS is set to 1.

Figure 27.10 Buffer Update in Variable Message Length Mode and Preferred Check Method

**(b) SAE Operation with Variable Message Length and Optional Check Method  
(RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 0, RSENTnCC.FCM = 1)**

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the optional frame check method as described in the J2716 2016 specification. In this mode, the calibration pulse of the current frame is compared to the calibration pulse of the last valid preceding frame.

If this check is passed, the message reception buffer is updated.

If this check is not passed, the message reception buffer is not updated and RSENTnCS.CVS is set to 1.

Figure 27.11 Buffer Update in Variable Message Length Mode and Optional Check Method

**(c) SAE Operation with Fixed Message Length (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 1)**

In this mode, the RSENT module does not perform the check for calibration pulse and message length ratio according to the preferred option in the J2716 2016 specification. In this mode, the RSENT module provides the calibration pulse length in the RSENTnCPL register and the message length information in the RSENTnML register. The numbers provided are based on samples.

The message buffer is updated at the beginning of the following calibration pulse irrespective of the values in the RSENTnCPL and RSENTnML registers. The CPU needs to calculate the ratio and either accept or discard the message.

Figure 27.12 Buffer Update in Fixed Message Length Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.

**(d) SPC Operation (RSENTnCC.SPCE = 1)**

In this operation mode, sensor data transmission is done following a SPC master trigger pulse. Within SAE SENT communication, the calibration pulse or pause pulse is terminating the previous message. In SPC communication, the sensor is only sending data following a SPC trigger request. An end pulse sent by the sensor is terminating the message. The message buffer is updated at the beginning of the end pulse.

Figure 27.13 Buffer Update in SPC Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.

The RSENT module provides the calibration pulse length in the RSENTnCPL register and the message length information in the RSENTnML register. The numbers provided are based on samples. The CPU needs to calculate the ratio of calibration pulses and/or message length and either accept or discard the message.

In case of variable message length mode, the RSENT module cannot perform this check because the receive timing of the next calibration pulse depends on the next SPC trigger timing.

#### (4) Fast Channel Reception Flow

In **Figure 27.14, Fast Channel Reception Flow**, the recommended reception flow for the fast channel message reception buffer is shown.

When using a polling or event driven method, the CPU should only read the setting of the RSENTnCS.FRS bit to check the availability of new fast channel data.

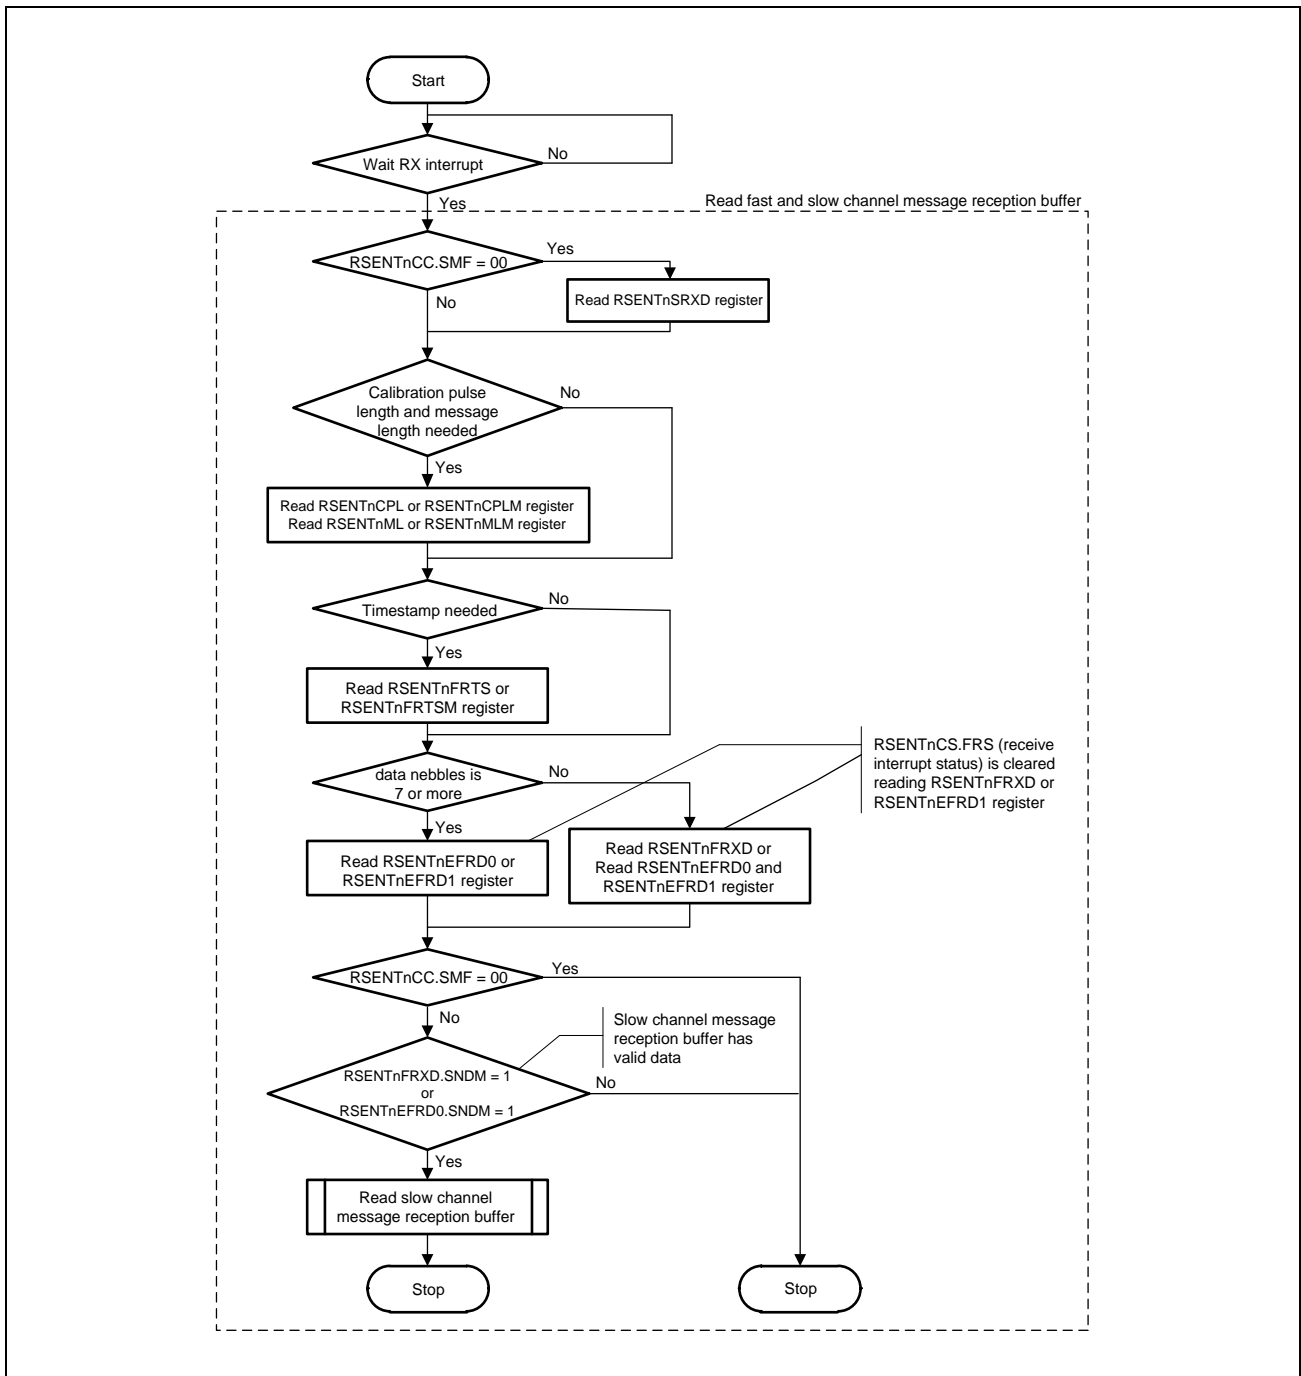

Figure 27.14 Fast Channel Reception Flow

In any case, the CPU should keep the order in reading the receive buffer registers as shown in the flow. The RSENTnFRXD or RSENTnEFRD0 register should be the last register to be accessed.

The handling of the slow channel message reception buffer is described in **Section 27.4.3.2(6), Slow Channel Reception Flow**.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU. In case the variation check fails, the CPU must discard the received message.

### (5) Slow Channel Message Reception

The RSENT module supports extraction of the slow message out of the fast channel messages by using the bits 3 and 2 out of the status and communication nibble. In order to enable the slow channel extraction, the CPU should set the RSENTnCC.SMF bits to the expected serial message format.

When no serial message extraction is selected (RSENTnCC.SMF = 00<sub>B</sub>), the RSENTnSRXD register becomes part of the fast channel message reception buffer structure (including background buffer) and RSENTnSRTS register should be ignored. The status and communications nibbles is placed in the RSENTnSRXD.IDD bits. Furthermore no slow channel new data and slow channel message lost flags are generated.

In order to receive the slow channel serial message, all fast channel serial messages contributing to a slow channel serial message must be received successfully and the received slow channel serial message must comply with the selected serial message format.

A message lost on the fast channel does not impact the reception on the slow channel.

A slow channel message reception buffer is composed of the slow channel receive timestamp register (RSENTnSRTS) and the slow channel receive data register (RSENTnSRXD).

In opposite to the fast channel message reception buffer, the slow channel message reception buffer does not support a double receive buffer structure; only a single receive buffer structure is available.

Message decoding and assembling is done in a separate register stage.

Figure 27.15 Slow Channel Message Reception Buffer

The slow channel message reception buffer is updated at the same time as the fast channel message reception buffer that holds the last status and communication nibble required for the slow channel message. The RSENTnSRXD.SND bit is set to 1 at the same time.

Further updates to the buffer are not carried out until after the RSENTnSRXD.SND bit has been read.

When the receive buffer is holding an unprocessed message (RSENTnSRXD.SND is 1), any further incoming message is lost (the slow channel message reception buffer is not updated) and RSENTnCS.SMS is set to 1.

When the CPU reads the RSENTnSRXD register, RSENTnSRXD.SND is automatically cleared.

The RSENTnSRTS register is updated with the current timestamp counter register value of the last frame contributing to the slow channel message.

Figure 27.16 Slow Channel Message Reception Buffer Update Timing

The data alignment in the RSENTnSRXD register depends on the slow channel message format (RSENTnCC.SMF) and the received configuration bit.

Table 27.37 Data Alignment in RSENTnSRXD Register

RSENTn CC.SMF	RSENTnSRXD. SMGC	RSENTnSRXD. IDD[19:16]	RSENTnSRXD. IDD[15:12]	RSENTnSRXD. IDD[11:8]	RSENTnSRXD. IDD[7:4]	RSENTnSRXD. IDD[3:0]
00 <sub>B</sub>	Undefined	Undefined	Undefined	Undefined	Undefined	Status and communication nibble
01 <sub>B</sub>	Undefined	Undefined	Undefined	Message ID[3:0]	DATA[7:4]	DATA[3:0]
10 <sub>B</sub>	0	Message ID[7:4]	Message ID[3:0]	DATA[11:8]	DATA[7:4]	DATA[3:0]
10 <sub>B</sub>	1	Message ID[3:0]	DATA[15:12]	DATA[11:8]	DATA[7:4]	DATA[3:0]

### (6) Slow Channel Reception Flow

In **Figure 27.17, Slow Channel Reception Flow**, the recommended reception flow for the slow channel message reception buffer is shown. When the slow channel receive data is required, this process should be executed as part of the fast channel reception flow.

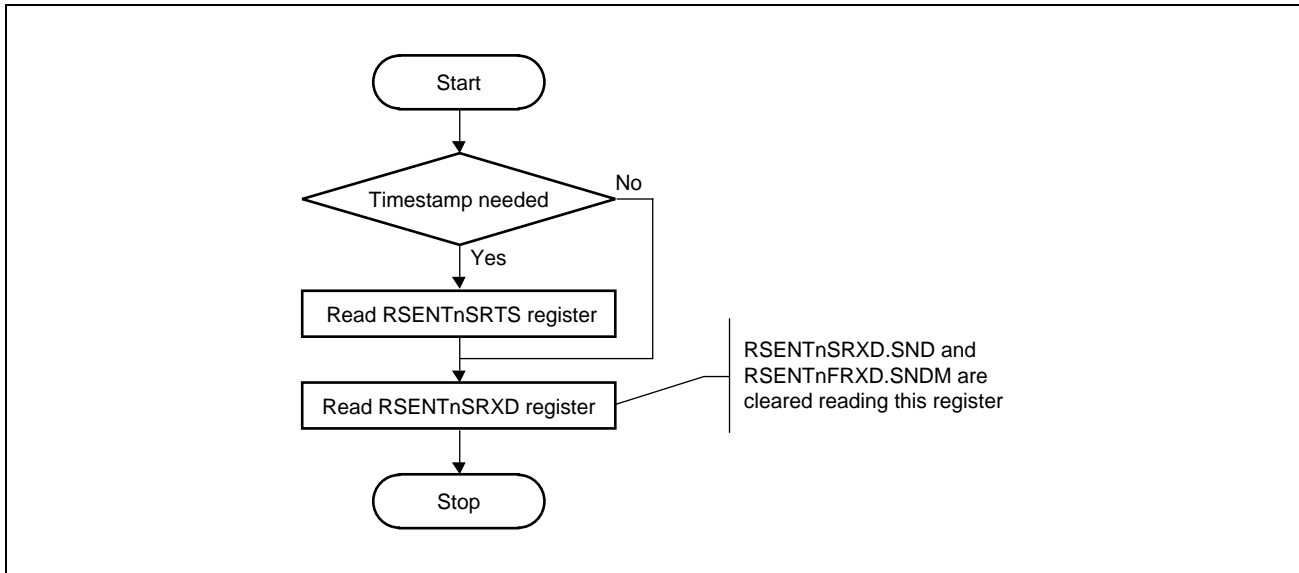

Figure 27.17 Slow Channel Reception Flow

In any case, the CPU should keep the order in reading the slow channel message reception buffer registers as shown in the flow. The RSENTnSRXD.SND bit should be accessed as last.

**(7) DMA Flow**

In case of DMA usage, the start address for the DMA usage and the number of transfers define which part of the receive buffer will be transferred. The RSENTnFRXD or RSENTnEFRD1 register should be the last register to be accessed using a 32 bit access method.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU. In case the variation check fails, the CPU must discard the received message.

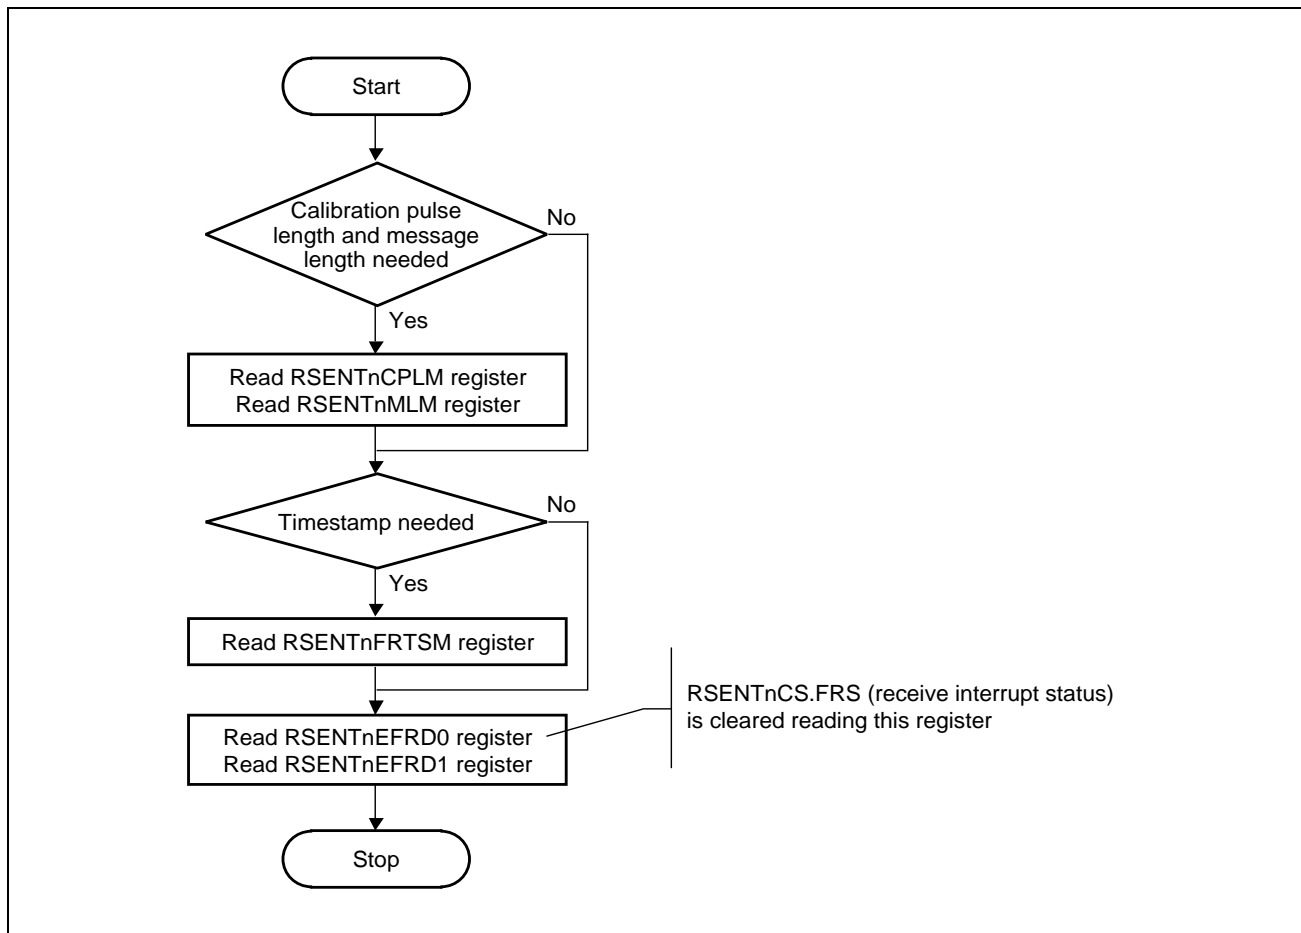

Figure 27.18 DMA Reception Flow

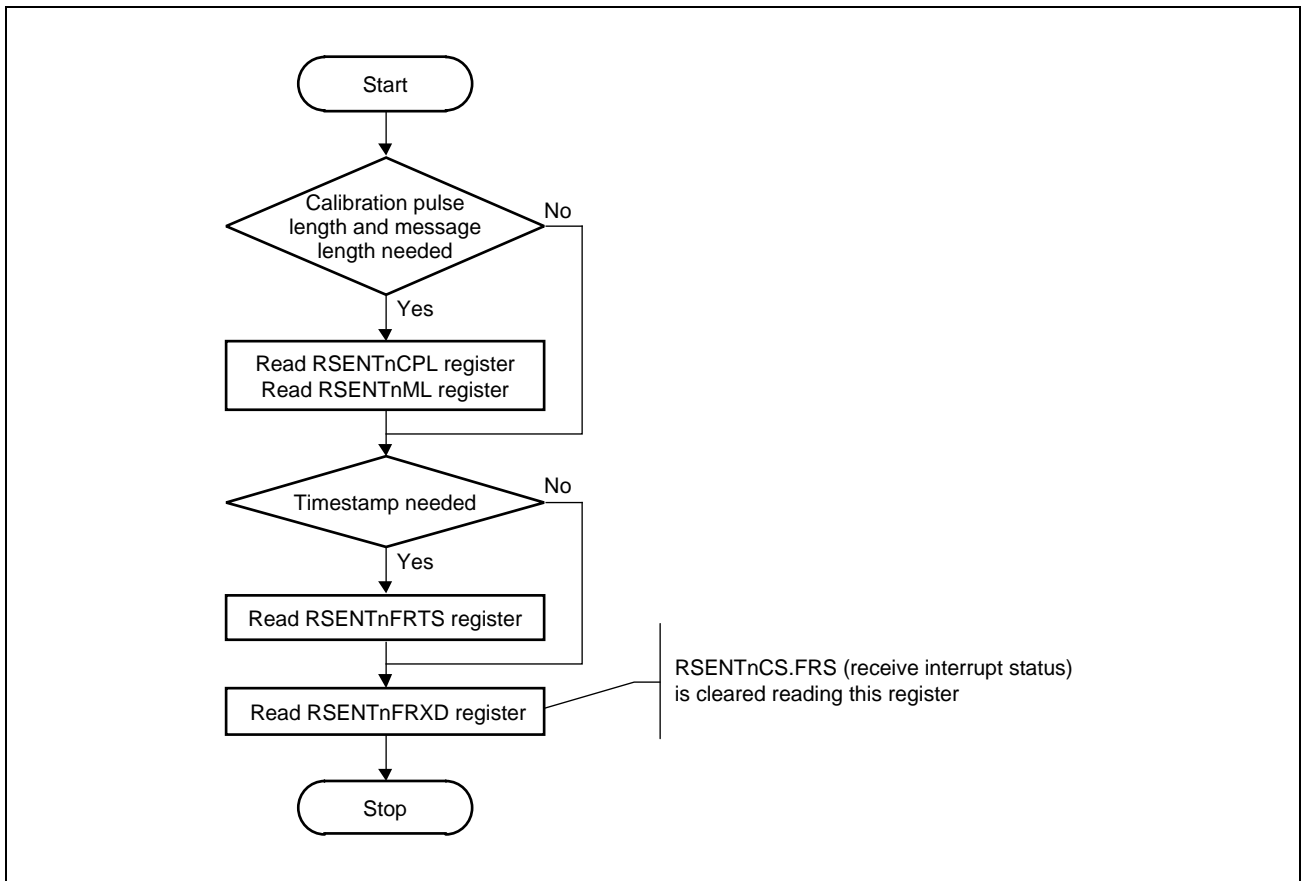

Figure 27.19 DMA Reception Flow (Data nibbles are 6 or less)

In the software processing, when the transferred data set, the CPU should check the status of the transferred RSENTnFRXD.SNDM bit. If this bit is set to 1, then the user needs to read the slow channel message reception buffer if needed.

**(8) Error Flagging**

The message lost error flag (RSENTnCS.SMS or RSENTnCS.FMS) is set when a new message's diagnostics pass before the previous message is read.

The SPC communication error (shown in RSENTnCS.NRS) is flagged when the CPU writes to RSENTnSPCT.TLL before/during response reception.

The timing at which the fast channel reception error flags (RSENTnCS.CVS, RSENTnCS.CLS, RSENTnCS.FNS, RSENTnCS.FES, and RSENTnCS.FCS) and the slow channel reception error flags (RSENTnCS.SCS, and RSENTnCS.SES) are updated varies with the setting of bits in the communications configuration register (RSENTnCC.SPCE, RSENTnCC.FCM, RSENTnCC.PPC, and RSENTnCC.PPTC).

**Table 27.38, Timing to Set Error Flag (RSENTnCC.SPCE = 0)** and **Table 27.39, Timing to Set Error Flag (RSENTnCC.SPCE = 1)** list the timings with which the error flags corresponding to each setting are updated.

In case a nibble encoding error or calibration pulse length error is detected, message reception is terminated immediately. No further error flagging for this message is done. Message decoding starts again after a calibration pulse without calibration length error (RSENTnCS.CLS) is detected.

Table 27.38 Timing to Set Error Flag (RSENTnCC.SPCE = 0)

RSENTnCC.SPCE	0							
RSENTnCC.FCM	0				1			
RSENTnCC.PPC	0		1		0		1	
RSENTnCC.PPTC	0	1	0	1	0	1	0	1
RSENTnCS.FCS	EC	X	EC	IM	IM	X	IM	IM
RSENTnCS.FES	EC	X	EC	IM	IM	X	IM	IM
RSENTnCS.FNS	EC	X	EC	—	—	X	—	—
RSENTnCS.SCS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.SES	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.CLS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.CVS	EC	X	EC	—	EC	X	EC	—

**Note:** EC: End of calibration pulse (on the falling edge of a valid calibration pulse)  
 IM: Immediately upon detection (immediately when the error is detected)  
 —: Error flag not detected  
 X: Setting prohibited

**NOTE**

When RSENTnCC.PPC and RSENTnCC.PPTC are 1, the mode is pause pulse with fixed message length.

When this mode, this diagnostic can be used as the receiver does not need to wait for the next calibration pulse to diagnose the current received frame, so RSENTnCS.FNS and RSENTnCS.CVS are not set.

Table 27.39 Timing to Set Error Flag (RSENTnCC.SPCE = 1)

RSENTnCC.SPCE	1							
RSENTnCC.FCM	0				1			
RSENTnCC.PPC	0		1		0		1	
RSENTnCC.PPTC	0	1	0	1	0	1	0	1
RSENTnCS.FCS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.FES	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.FNS	—	X	—	—	—	X	—	—
RSENTnCS.SCS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.SES	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.CLS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.CVS	—	X	—	—	—	X	—	—

**Note:** IM: Immediately upon detection (immediately when the error is detected)  
 —: Error flag not detected  
 X: Setting prohibited

#### NOTE

In case the sensor stops communication, no buffer update or status update for last message takes place. The SW should take care of this by timeout checks.

SPC mode is a communication of only one frame that is start the SPC trigger to the starting point. The Error flags are immediately set when they are detected. So RSENTnCS.FNE and RSENTnCS.CVS are not set.

When a transition to OPERATION IDLE is configured in RSENTnMDC.OMC and an error for the calibration or the fast channel reception is detected in the message in which the mode transition was requested, the error is not flagged and the message is aborted.

In case of a fast channel encoding error or a calibration pulse length error the OPERATION IDLE mode is entered immediately.

In case of a fast channel nibble count error, fast channel CRC error, or fast channel calibration pulse variation error the OPERATION IDLE state is entered at the end of the next status and communications nibble.

RERSENTnCS.FNS is only set after a valid calibration pulse was detected and all following nibbles have a valid length ( $\geq 12$  ticks and  $\leq 27$  ticks) or no nibble was received between two valid calibration pulses.

RSENTnCS.FES is only set if the nibble with an encoding error occurred in the communication and status nibble, CRC nibble or in one of the expected data nibbles.

If SPC is enabled (RSENTnCC.SPCE = 1), RSENTnCS.CLS is set if a calibration pulse was expected but the pulse length does not meet the calibration pulse range. If SPC is disabled (RSENTnCC.SPCE = 0), RSENTnCS.CLS is set only after a valid calibration pulse has been received and a calibration pulse was expected but the pulse length does not meet the calibration pulse range.

During re-synchronization additional error flags might be set which is not affecting the reception of the following frame.

### 27.4.4 SPC Function

The RSENT module supports an extension of the J2716 specification known as SPC, whereby the RSENT module can pull down the RX line to initiate SENT message transmission.

The user can configure the polarity of the sent\_spc port.

The text below describes the behavior of the sent\_spc port with the default settings of RSENTnCC.SOPC. When the value of RSENTnCC.SOPC after a reset is changed, the sent\_spc port operates with inverted polarity.

The user can enable or disable the SPC extension by setting the RSENTnCC.SPCE bit. When the RSENTnCC.SPCE bit is set to 0, SPC is disabled. The sent\_spc port is driven low by the RSENT module, allowing normal SENT reception to take place. When the RSENTnCC.SPCE bit is set to 1, SPC is enabled and the sent\_spc port can be driven high by the RSENT module to request a frame transmission by the sensor.

The transmission function of the RSENT module is a straightforward PWM function. The purpose of this function is to communicate in direction to the sensor by the output sent\_spc. With the sent\_spc output, the RSENT module can pull down the signal line by an external transistor.

The signal line will be held low for a configured length of tick time specified in the RSENTnSPCT.TLL bits.

The Tick time is configured with the RSENTnBRP.TTI bits and the RSENTnBRP.TTF bits which are equal to the transmission tick time. For details, see **Section 27.4.2.2(2), RX and SPC Tick Settings**.

In a single sensor system, this function can be used to trigger data transmission from the sensor. Further data can be sent to the sensor by varying the trigger pulse length. In a multi sensor system, this function can be used to address a dedicated sensor and request a data transmission.

Once RSENT SPC initialization is complete, transmission can be triggered by writing the trigger pulse width to the RSENTnSPCT.TLL register. When a transmission is triggered, the trigger pulse with the configured length is sent. Then a frame reception is expected. After frame reception was done, a new trigger pulse can be sent.

Writing to RSENTnSPCT.TLL requests a SPC trigger transmission. After writing to RSENTnSPCT.TLL, the CPU should read RSENTnCS.NRS to check whether the previous request was completed or not.

In case RSENTnCS.NRS is set, no SPC trigger is sent and any potentially ongoing reception at this time is aborted. The CPU should clear RSENTnCS.NRS by writing 1 to RSENTnCS.NRC. The CPU can write again to RSENTnSPCT.TLL to request a SPC trigger transmission.

In case RSENTnCS.NRS is not set, the CPU should set a reception timeout counter in software. If a reception occurs before the timeout counter elapses, the user should process the received slow and fast channel data as shown in the fast channel reception flow (**Figure 27.14, Fast Channel Reception Flow**) and slow channel reception flow (**Figure 27.17, Slow Channel Reception Flow**).

When the timeout counter elapses without any successful reception, the addressed sensor seems not to send any valid response. The CPU should analyze the RSENTnCS register to analyze the reason for no successful reception. A new request can be made considering that when RSENTnCS.NRS gets set no SPC trigger is sent.

Purpose of the timeout function is to define a timeout window for response reception in software.

**Figure 27.20, Transmission Flow** shows a transmission flow with a timeout function implemented in software. The timeout function is optional and can be omitted if not needed.

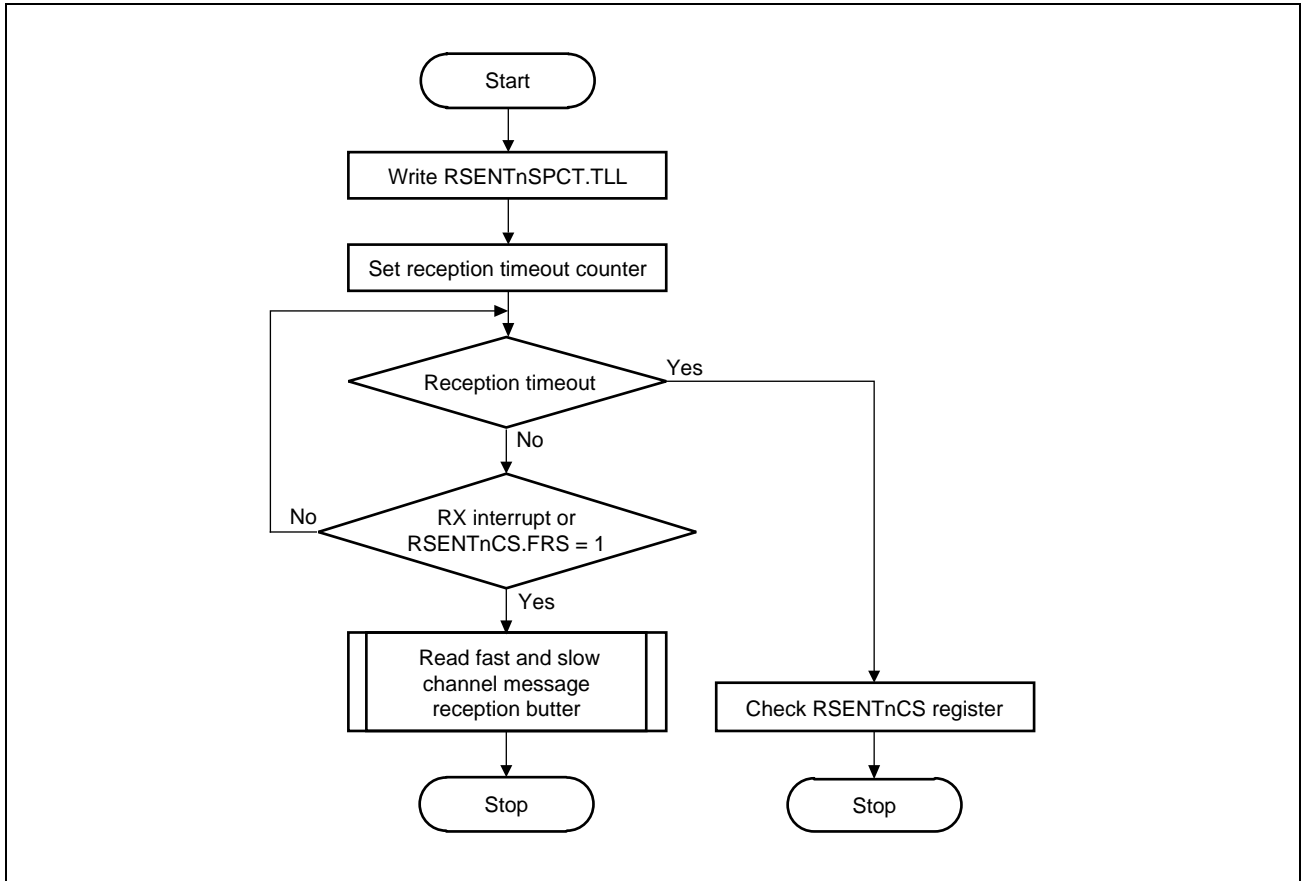

Figure 27.20 Transmission Flow

### 27.4.5 Interrupts and Checks

The RSENT module provides two interrupt lines.

The successful fast channel receive interrupt notifies the CPU that the fast channel message reception buffer was updated and is holding a set of valid received data. Also, the reception status bit is set (RSENTnCS.FRS).

The status interrupt notifies the CPU that at least one of the error flags or message lost flags in the RSENTnCS register is set.

Whether a status flag in the RSENTnCS register is contributing to the generation of an interrupt event or not can be set individually.

The execution of the CRC checks can be disabled for the slow channel and fast channel individually. In case a check is disabled, the CRC of the received message is not checked and the related error flag is never set.

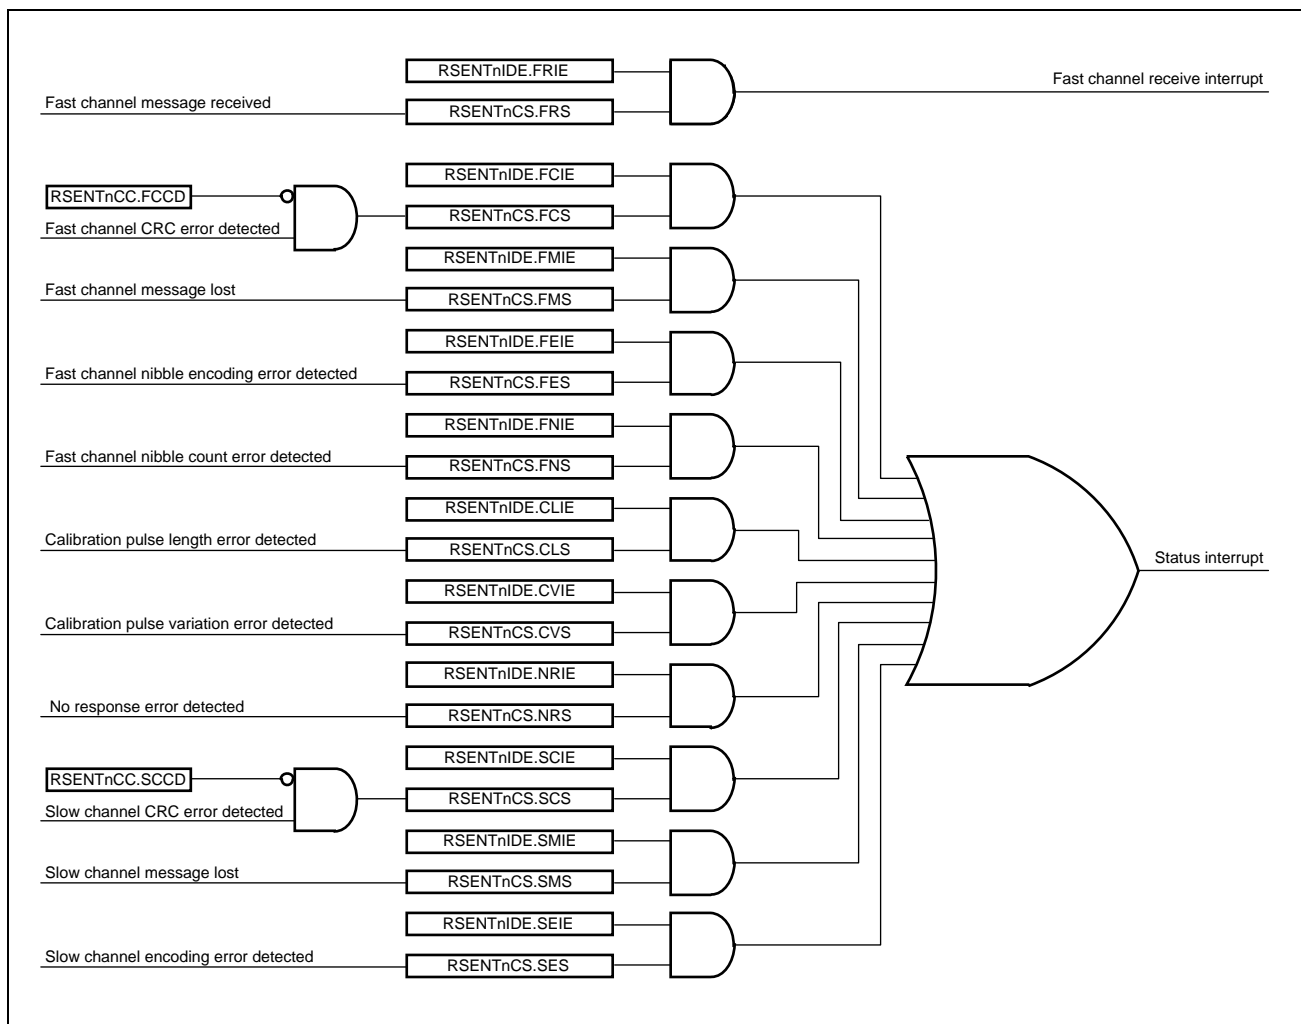

Figure 27.21 Interrupt Structure

**Table 27.40, Status Flag Influence to Receive Buffer Behavior** gives an overview about the relationship between set status flags and the buffer update.

Table 27.40 Status Flag Influence to Receive Buffer Behavior

RSENTnCS	Fast Channel Message Reception Buffer	Slow Channel Message Reception Buffer
FRS	Updated	Updated if all status and communications nibbles of slow channel messages are received and RSENTnCS.SES = 0 and RSENTnCS.SCS = 0
FCS	Not updated	Receive process aborted. Search for new start condition
FMS	Message lost	Not impacted
FES	Not updated	Receive process aborted. Search for new start condition
FNS	Not updated	Receive process aborted. Search for new start condition
CLS	Not updated	Receive process aborted. Search for new start condition
CVS	Not updated	Receive process aborted. Search for new start condition
NRS	Not updated	Receive process aborted. Search for new start condition
SCS	Not impacted	Not updated
SMS	Not impacted	Message lost
SES	Not impacted	Receive process aborted. Search for new start condition

## Section 28 Reserved

## Section 29 Window Watchdog Timer (WDTA)

This section contains a generic description of the Window Watchdog Timer (WDTA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of WDTA.

### 29.1 Features of RH850/F1KH, RH850/F1KM WDTA

#### 29.1.1 Number of Units

This microcontroller has the following number of WDTA units.

Each WDTA unit has single channel interface.

Table 29.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	3	3	3
Name	WDTAn (n = 0 to 2)	WDTAn (n = 0 to 2)	WDTAn (n = 0 to 2)

Table 29.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	2	2	2	2	2
Name	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)

Table 29.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	2	2	2
Name	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)

Table 29.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	2	2	2	2
Name	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)

Table 29.5 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual window watchdog timer units are identified by the index "n": for example, WDTAnWDTE (n = 0 to 2) is the WDTAn enable register.

Table 29.6 Index (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual window watchdog timer units are identified by the index "n": for example, WDTAnWDTE (n = 0, 1) is the WDTAn enable register.

### 29.1.2 Register Base Addresses

WDTAn base addresses are listed in the following table.

WDTAn register addresses are given as offsets from the base addresses.

Table 29.7 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<WDTA0_base>	FFED 0000 <sub>H</sub>
<WDTA1_base>	FFED 1000 <sub>H</sub>
<WDTA2_base>	FFED 2000 <sub>H</sub>

Table 29.8 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<WDTA0_base>	FFED 0000 <sub>H</sub>
<WDTA1_base>	FFED 1000 <sub>H</sub>

### 29.1.3 Clock Supply

The WDTAn clock supply is shown in the following table.

Table 29.9 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name	Description
WDTA0	WDTATCKI	CKSCLK_AWDTA	Timer count clock
	Register access clock	CPUCLK_L	Bus clock
WDTA1	WDTATCKI	LS IntOSC $f_{RL}$	Timer count clock
	Register access clock	CPUCLK_L	Bus clock
WDTA2	WDTATCKI	LS IntOSC $f_{RL}$	Timer count clock
	Register access clock	CPUCLK_L	Bus clock

Table 29.10 Clock Supply (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
WDTA0	WDTATCKI	CKSCLK_AWDTA	Timer count clock
	Register access clock	CPUCLK_L	Bus clock
WDTA1	WDTATCKI	LS IntOSC $f_{RL}$	Timer count clock
	Register access clock	CPUCLK_L	Bus clock

### 29.1.4 Interrupt Requests

WDTAn interrupt requests are listed in the following table.

Table 29.11 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
WDTA0			
INTWDTAn	WDTA0 75% interrupt	40	—
WDTA1			
INTWDTAn	WDTA1 75% interrupt	41	—
WDTA2			
INTWDTAn	WDTA2 75% interrupt	42	—

Table 29.12 Interrupt Requests (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
WDTA0			
INTWDTAn	WDTA0 75% interrupt	40	—
WDTA1			
INTWDTAn	WDTA1 75% interrupt	41	—

Table 29.13 Interrupt Request (FE Level Non-Maskable Interrupt) (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Name	DMA Trigger Number
WDTA0			
WDTAnTNMI	WDTA0 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA0NMI	—
WDTA1			
WDTAnTNMI	WDTA1 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA1NMI	—
WDTA2			
WDTAnTNMI	WDTA2 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA2NMI	—

Table 29.14 Interrupt Request (FE Level Non-Maskable Interrupt) (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Name	DMA Trigger Number
WDTA0			
WDTAnTNMI	WDTA0 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA0NMI	—
WDTA1			
WDTAnTNMI	WDTA1 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA1NMI	—

### 29.1.5 Reset Sources

WDTAn reset sources are listed in the following table. WDTAn is initialized by these reset sources.

Table 29.15 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
WDTA0	Reset sources (AWORES)
WDTA1	All reset sources (ISORES)
WDTA2	All reset sources (ISORES)

**Note:** WDTA1 and WDTA2 are stopped in STOP mode.

Table 29.16 Reset Sources (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
WDTA0	Reset sources (AWORES)
WDTA1	All reset sources (ISORES)

**Note:** WDTA1 is stopped in STOP mode.

### 29.1.6 Internal Input/Output Signals

The internal input/output signals of WDTA are listed in the following table.

Table 29.17 Internal Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Connection
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA0RES)
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA1RES)
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA2RES)

Table 29.18 Internal Input/Output Signals (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Connection
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA0RES)
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA1RES)

### 29.1.7 State in RUN Mode and Stand-by Modes

The state of the WDTA in respective RUN mode and stand-by modes are listed in the following table.

Table 29.19 States in Respective RUN Mode and Stand-by Modes (RH850/F1KH-D8)

Run Mode/Stand-by Mode	State of WDTA0	State of WDTA1	State of WDTA2
RUN mode (HALT state)	Operation enabled	Operation enabled	Operation enabled
STOP mode	Operation enabled	Operation stopped	Operation stopped
DeepSTOP mode	Operation enabled	Power off	Power off
Cyclic RUN mode	Operation enabled	Operation prohibited	Operation prohibited
Cyclic STOP mode	Operation enabled	Operation stopped	Operation stopped

Table 29.20 States in Respective RUN Mode and Stand-by Modes (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Run Mode/Stand-by Mode	State of WDTA0	State of WDTA1
RUN mode (HALT state)	Operation enabled	Operation enabled
STOP mode	Operation enabled	Operation stopped
DeepSTOP mode	Operation enabled	Power off
Cyclic RUN mode	Operation enabled	Operation prohibited
Cyclic STOP mode	Operation enabled	Operation stopped

## 29.2 Overview

### 29.2.1 Functional Overview

WDTA has the following functions:

- Selection of the operation mode after reset, by using the option bytes

Enabling/disabling of WDTA, starting/stopping of the counter after reset, setting of the counter overflow time, and enabling/disabling of the VAC function can be selected. WDTA startup options to be set by the option bytes are described in **Table 29.21, WDTA Start-Up Options (RH850/F1KH-D8)** and **Table 29.22, WDTA Start-Up Options (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)**.

- WDTA trigger function

Writing an activation code to the WDTA trigger register starts WDTA and restarts the counter. Activation codes include fixed activation codes and variable activation codes (VAC function). In a variable activation code, a different value from the previous time (variable value) is written to the WDTA trigger register, which causes the counter to be restarted.

- 75% interrupt request signal

An interrupt request signal can be generated when the WDTA counter reaches 75% of the overflow interval time (this function can be enabled or disabled by the setting of WDTAnMD.WDTAnWIE).

- Window function

The period during which writing to the WDTA trigger register is valid (window-open period) can be set. Writing to the WDTA trigger register during a period other than the window-open period causes an error.

- WDTA error detection function

When an error is detected, a non-maskable interrupt request or an internal reset is generated.

For details about the error sources, see **Section 29.5.3, WDTA Error Detection**.

Table 29.21 WDTA Start-Up Options (RH850/F1KH-D8)

Start-Up Option	Function	Description	Option Byte
OPWDEN	WDTA setting	Enables/disables the WDTA. 0: WDTA is disabled 1: WDTA is enabled	<ul style="list-style-type: none"> <li>• WDTA0: OPBT0.WDT0_0</li> <li>• WDTA1: OPBT0.WDT1_0</li> <li>• WDTA2: OPBT0.WDT2_0</li> </ul>
OPWDOVF[2:0]	Overflow interval time reset value setting	Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0].	WDTA0/WDTA1/WDTA2: OPBT0.WDT_[2:0]
OPWDRUN	Start mode setting	Specifies the start mode. 0: Software trigger start mode 1: Default start mode For details, see <b>Section 29.5.1, WDTA after Reset Release</b> .	<ul style="list-style-type: none"> <li>• WDTA0: OPBT0.WDT0_1</li> <li>• WDTA1: OPBT0.WDT1_1</li> <li>• WDTA2: OPBT0.WDT2_1</li> </ul>
OPWDVAC	Variable activation code selection	Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing. 0: WDTAnWDTE (fixed) 1: WDTAnEVAC (variable) When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed (ACH). When WDTAnEVAC is selected, the activation code to be written to the register is variable. For details, see <b>Section 29.5.2, WDTA Trigger</b> and <b>Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used</b> .	<ul style="list-style-type: none"> <li>• WDTA0: OPBT0.WDT0_3</li> <li>• WDTA1: OPBT0.WDT1_3</li> <li>• WDTA2: OPBT0.WDT2_3</li> </ul>

Table 29.22 WDTA Start-Up Options (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Start-Up Option	Function	Description	Option Byte
OPWDEN	WDTA setting	Enables/disables the WDTA. 0: WDTA is disabled 1: WDTA is enabled	<ul style="list-style-type: none"> <li>WDTA0: OPBT0.WDT0_0</li> <li>WDTA1: OPBT0.WDT1_0</li> </ul>
OPWDOVF[2:0]	Overflow interval time reset value setting	Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0].	WDTA0/WDTA1: OPBT0.WDT_[2:0]
OPWDRUN	Start mode setting	Specifies the start mode. 0: Software trigger start mode 1: Default start mode For details, see <b>Section 29.5.1, WDTA after Reset Release</b> .	<ul style="list-style-type: none"> <li>WDTA0: OPBT0.WDT0_1</li> <li>WDTA1: OPBT0.WDT1_1</li> </ul>
OPWDVAC	Variable activation code selection	Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing. 0: WDTAnWDTE (fixed) 1: WDTAnEVAC (variable) When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed (AC <sub>H</sub> ). When WDTAnEVAC is selected, the activation code to be written to the register is variable. For details, see <b>Section 29.5.2, WDTA Trigger</b> and <b>Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used</b> .	<ul style="list-style-type: none"> <li>WDTA0: OPBT0.WDT0_3</li> <li>WDTA1: OPBT0.WDT1_3</li> </ul>

## NOTE

For the option byte settings, see **Section 44.9, Option Bytes**.

### 29.2.2 Block Diagram

Figure 29.1, Block Diagram of the Window Watchdog Timer A shows the main components of the WDTA.

Figure 29.1 Block Diagram of the Window Watchdog Timer A

## 29.3 Registers

### 29.3.1 List of Registers

WDTA registers are listed in the following table.

For details about <WDTAn\_base>, see **Section 29.1.2, Register Base Addresses**.

Table 29.23 List of Registers

Module Name	Register Name	Symbol	Address
WDTAn	WDTA enable register	WDTAnWDTE	<WDTAn_base> + 0000 <sub>H</sub>
	WDTA enable VAC register	WDTAnEVAC	<WDTAn_base> + 0004 <sub>H</sub>
	WDTA reference value register	WDTAnREF	<WDTAn_base> + 0008 <sub>H</sub>
	WDTA mode register	WDTAnMD	<WDTAn_base> + 000C <sub>H</sub>

### 29.3.2 WDTAnWDTE — WDTA Enable Register

This register is the WDTA trigger register when the VAC function is not used (start-up option OPWDVAC = 0).

Writing AC<sub>H</sub> to this register generates a WDTA trigger and starts or restarts the WDTA counter.

See **Section 29.5.2, WDTA Trigger**, for details.

The behavior of this register depends on the setting of the start-up option (OPWDVAC), see **Table 29.26, WDTAnWDTE Behavior**.

WDTA0 is initialized by AWORES.

WDTA1 and WDTA2 are initialized by a reset of any type.

**Access:** This register can be read or written in 8-bit units.

**Address:** <WDTAn\_base> + 0000<sub>H</sub>

**Value after reset:** The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See **Table 29.25, Values of WDTAnRUN7 after Reset**.

Bit	7	6	5	4	3	2	1	0
	WDTAnRUN[7:0]							
Value after reset	0/1	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.24 WDTAnWDTE Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnRUN[7:0]	Writing the fixed activation code (AC <sub>H</sub> ) generates the WDTA trigger and starts/restarts the WDTAn counter. Writing a value other than AC <sub>H</sub> generates an error. The WDTAn cannot be stopped once it is started. See <b>Table 29.26, WDTAnWDTE Behavior</b> , when reading from or writing to these bits.

The WDTAnRUN7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is disabled (OPWDVAC = 0). **Table 29.25, Values of WDTAnRUN7 after Reset** lists the values of the WDTAnRUN7 bit after reset according to the start-up options.

Table 29.25 Values of WDTAnRUN7 after Reset

Start-Up Options			Start Mode	Value of WDTAnRUN7 after Reset
OPWDEN	OPWDVAC	OPWDRUN		
1	0	1	Default start	1
		0	Software trigger start	0

The behavior of WDTAnWDTE during read/write accesses depends on the OPWDVAC setting, as shown in **Table 29.26, WDTAnWDTE Behavior**.

Table 29.26 WDTAnWDTE Behavior

OPWDVAC	Description	WDTAnWDTE	
		Read	Write
0	The VAC function is disabled. WDTAnWDTE is enabled.	2C <sub>H</sub> is returned (in software trigger start mode, before the activation of WDTAn). AC <sub>H</sub> is returned (after the activation of WDTAn).	WDTA trigger Write AC <sub>H</sub> *1.
1	The VAC function is enabled. WDTAnWDTE is disabled.	2C <sub>H</sub> is returned.	Writing is ignored.

Note 1. Any other write value will cause an error.

### 29.3.3 WDTAnEVAC — WDTA Enable VAC Register

This register is the WDTA trigger register when the VAC function is used (start-up option OPWDVAC = 1).

Writing a correct activation code to this register generates a WDTA trigger and starts or restarts the WDTA counter. For details, see **Section 29.5.2, WDTA Trigger**. For details about the activation codes when the VAC function is used, see **Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

The behavior of this register depends on the setting of the start-up option (OPWDVAC). See **Table 29.29, WDTAnEVAC Behavior**.

WDTA0 is initialized by AWORES.

WDTA1 and WDTA2 are initialized by a reset of any type.

**Access:** This register can be read or written in 8-bit units.

**Address:** <WDTAn\_base> + 0004<sub>H</sub>

**Value after reset:** The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See **Table 29.28, Values of WDTAnEVAC7 after Reset**.

Bit	7	6	5	4	3	2	1	0
	WDTAnEVAC[7:0]							
Value after reset	0/1	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.27 WDTAnEVAC Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnEVAC [7:0]	Writing a variable activation code generates the WDTA trigger and starts/restarts the WDTAn counter. Writing an incorrect activation code generates an error. The WDTAn cannot be stopped once it is started. See <b>Table 29.29, WDTAnEVAC Behavior</b> , when reading from or writing to these bits.

The WDTAnEVAC7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is enabled (OPWDVAC = 1). **Table 29.28, Values of WDTAnEVAC7 after Reset** lists the values of the WDTAnEVAC7 bit after reset according to the start-up options.

Table 29.28 Values of WDTAnEVAC7 after Reset

Start-Up Options			Start Mode	Value of WDTAnEVAC7 after Reset
OPWDEN	OPWDVAC	OPWDRUN		
1	1	1	Default start	1
		0	Software trigger start	0

The behavior of WDTAnEVAC during read/write accesses depends on the OPWDVAC setting, as shown in **Table 29.29, WDTAnEVAC Behavior**.

Table 29.29 WDTAnEVAC Behavior

OPWDVAC	Description	WDTAnEVAC	
		Read	Write
0	The VAC function is disabled. WDTAnEVAC is disabled.	2C <sub>H</sub> is returned.	Writing is ignored.
1	The VAC function is enabled. WDTAnEVAC is enabled.	2C <sub>H</sub> is returned (in software trigger start mode, before the activation of WDTAn). The variable activation code written last is read (after the activation of WDTAn).	Write the variable activation code* <sup>1</sup> For details, see <b>Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used</b> .

Note 1. Any other write value will cause an error.

### 29.3.4 WDTAnREF — WDTA Reference Value Register

This register contains the reference value for calculating the activation code of the VAC function. It is automatically updated after every trigger operation. See **Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used.**

If the VAC function is disabled ( $OPWDVAC = 0$ ), reading this register returns  $00_{\text{H}}$ .

WDTA0 is initialized by AWORES.

WDTA1 and WDTA2 are initialized by a reset of any type.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:**  $\langle \text{WDTAn\_base} \rangle + 0008_{\text{H}}$

**Value after reset:**  $00_{\text{H}}$

Bit	7	6	5	4	3	2	1	0
	WDTAnREF[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 29.30 WDTAnREF Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnREF[7:0]	Reference value for activation code calculation for the VAC function.

### 29.3.5 WDTAnMD — WDTA Mode Register

This register specifies the overflow interval time, 75% interrupt enable/disable, the error mode, and the window-open period.

The value of this register can be updated only once after reset release and before the first trigger is generated. The updated value will be effective after a maximum of 3 x Timer count clock cycles once the WDTA trigger register is written.

Updating this register after the first WDTA trigger is generated generates an error, but an error does not occur if the same value has been written to it.

WDTA0 is initialized by AWORES.

WDTA1 and WDTA2 are initialized by a reset of any type.

**Access:** This register can be read or written in 8-bit units.

**Address:** <WDTAn\_base> + 000C<sub>H</sub>

**Value after reset:** The initial value depends on the start-up options (OPWDOVF[2:0]). See **Table 29.21, WDTA Start-Up Options (RH850/F1KH-D8)** and **Table 29.22, WDTA Start-Up Options (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)**.

Bit	7	6	5	4	3	2	1	0
	—	WDTAnOVF[2:0]			WDTAnWIE	WDTAnERM	WDTAnWS[1:0]	
Value after reset	0	*1	*1	*1	0	1	1	1
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The WDTAnOVF[2:0] value after reset can be set by the start-up options OPWDOVF[2:0].

Table 29.31 WDTAnMD Register Contents

Bit Position	Bit Name	Function																																				
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.																																				
6 to 4	WDTAnOVF[2:0]	Selects the overflow interval time. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>WDTAnOVF2</th> <th>WDTAnOVF1</th> <th>WDTAnOVF0</th> <th>Overflow Interval Time</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>2<sup>9</sup> / WDTATCKI</td> </tr> <tr> <td>0</td> <td>0</td> <td>1</td> <td>2<sup>10</sup> / WDTATCKI</td> </tr> <tr> <td>0</td> <td>1</td> <td>0</td> <td>2<sup>11</sup> / WDTATCKI</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> <td>2<sup>12</sup> / WDTATCKI</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>2<sup>13</sup> / WDTATCKI</td> </tr> <tr> <td>1</td> <td>0</td> <td>1</td> <td>2<sup>14</sup> / WDTATCKI</td> </tr> <tr> <td>1</td> <td>1</td> <td>0</td> <td>2<sup>15</sup> / WDTATCKI</td> </tr> <tr> <td>1</td> <td>1</td> <td>1</td> <td>2<sup>16</sup> / WDTATCKI</td> </tr> </tbody> </table>	WDTAnOVF2	WDTAnOVF1	WDTAnOVF0	Overflow Interval Time	0	0	0	2 <sup>9</sup> / WDTATCKI	0	0	1	2 <sup>10</sup> / WDTATCKI	0	1	0	2 <sup>11</sup> / WDTATCKI	0	1	1	2 <sup>12</sup> / WDTATCKI	1	0	0	2 <sup>13</sup> / WDTATCKI	1	0	1	2 <sup>14</sup> / WDTATCKI	1	1	0	2 <sup>15</sup> / WDTATCKI	1	1	1	2 <sup>16</sup> / WDTATCKI

1	0	75%															
1	1	100%															

## 29.4 Interrupt Sources

WDTA checks the status of the WDTA counter value, detects illegal accesses to the WDTA-related registers, and generates an interrupt request. The following are WDTA interrupt requests:

- (1) INTWDTAn (WDTA timer count 75% interrupt request)  
An interrupt request signal is generated at 75% of the counter overflow time of the WDTA timer.  
An interrupt request signal can be enabled or disabled by using the WDTA mode register (WDTAnMD).
- (2) WDTAnTNMI (WDTA error detection interrupt)  
Detection of a WDTA error to generation of an NMI interrupt request. The WDTA mode register (WDTAnMD) can be used to switch between an NMI interrupt and a reset. For details about WDTA errors, see **Section 29.5.3, WDTA Error Detection**.

## 29.5 Functions

### 29.5.1 WDTA after Reset Release

#### 29.5.1.1 Start Modes

There are two start modes (software start mode and default start mode) when WDTAn starts after reset release. The start mode can be selected by the start-up option.

The start mode selection is listed in **Table 29.32, Start Modes**.

Table 29.32 Start Modes

Start-Up Option	Start Mode	Description
OPWDRUN 0	Software trigger	<ul style="list-style-type: none"> <li>The WDTA counter stops (0000<sub>H</sub>) after reset release.</li> <li>Writing an activation code to the WDTA trigger register starts WDTA.</li> </ul>
1	Default	The WDTA counter starts after reset release.

#### 29.5.1.2 WDTA Settings after Reset Release

(1) **Table 29.33, WDTA Settings after Reset Release** shows the WDTA settings after reset release.

Table 29.33 WDTA Settings after Reset Release

Function	Setting	Remark
WDTA enable/disable	Specified by start-up options	
Start mode		
VAC function		
WDTA overflow interval time	Specified by start-up options	Modification is possible only once by the setting of the WDTA mode register (WDTAnMD).
75% interrupt mode	75% interrupt disabled	
Behavior on error detection	Reset generation	
Window-open period	100%	

The setting of the WDTA mode register (WDTAnMD) is enabled behind a maximum of 3 x Timer count clock cycles when the first WDTA trigger is generated (writing an activation code to WDTAnWDTE and WDTAnEVAC). Perform the WDTAnMD register setting before a WDTA trigger is generated.

Setting of WDTA by using WDTAnMD is possible only once. If the value set to WDTAnMD is changed after a WDTA trigger is generated, an error occurs. However, an error does not occur if the same value is set.

### 29.5.1.3 Default Start Mode Timing

The default start mode timing and the changes to the WDTA settings are illustrated in **Figure 29.2, Timing Diagram of WDTA Start in Default Start Mode**.

Figure 29.2 Timing Diagram of WDTA Start in Default Start Mode

The timing diagram shown in **Figure 29.2, Timing Diagram of WDTA Start in Default Start Mode** shows the following behaviors:

- (1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

Example: Overflow interval time after reset release =  $2^{16}/WDTATCKI$  ( $OPWDOVF[2:0] = 111_B$ )

- (2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.

- (3) Write to the WDTA trigger register before the WDTA counter overflows.

The WDTAnMD setting is applied by the generation of a WDTA trigger behind a maximum of 3 x Timer count clock.

Example: Overflow interval time after a WDTA trigger is generated =  $2^{13}/WDTATCKI$

#### 29.5.1.4 Software Trigger Start Mode Timing

The software trigger start mode timing and the changes to the WDTA settings are illustrated in **Figure 29.3, Timing Diagram of WDTA Start in Software Trigger Start Mode**.

Figure 29.3 Timing Diagram of WDTA Start in Software Trigger Start Mode

The timing diagram shown in **Figure 29.3, Timing Diagram of WDTA Start in Software Trigger Start Mode** shows the following behaviors:

- (1) The WDTA counter value remains 0000<sub>H</sub> until the first trigger is generated after reset release. The overflow interval time is set by start-up options, but this setting has no effect because the counter is not operating.
- (2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.
- (3) The WDTA counter starts by the generation of a WDTA trigger. After the generation of a WDTA trigger behind a maximum of 3 x Timer count clock, the overflow interval time specified in WDTAnMD and other settings are applied.

## 29.5.2 WDTA Trigger

Writing a special value called an activation code to the WDTA enable register (WDTAnWDTE) and the WDTA enable VAC register (WDTAnEVAC) leads to generation of a WDTA trigger.

The WDTA trigger has the following functions:

- Starting the WDTA counter in software trigger start mode
- Restarting the WDTA counter
- Setting the WDTA mode specified by the WDTAnMD register (only for the first WDTA trigger after reset release)

The WDTA trigger register, which generates a WDTA trigger, is specified by the start-up option OPWDVAC.

**Table 29.34, WDTA Trigger Registers and Activation Codes** lists the WDTA trigger registers and activation codes.

Table 29.34 WDTA Trigger Registers and Activation Codes

Type of Activation Code	Trigger Register	Activation Code
Fixed (OPWDVAC = 0)	WDTAnWDTE	AC <sub>H</sub>
Variable (OPWDVAC = 1)	WDTAnEVAC	For details, see <b>Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used.</b>

### CAUTION

- When successively writing the processing to clear WDTA, the clear processing below is not acknowledged for the following period:  
 $“12 \times \text{CPU clock}^{*1} \text{ cycles} + 6 \times \text{WDT clock}^{*2} \text{ cycles}”$
- After writing the processing to clear WDTA and then changing to standby mode during the above-mentioned period, the clear processing below is not acknowledged for the following period after return from stand-by mode:  
 $“6 \times \text{CPU clock}^{*1} \text{ cycles} + 3 \times \text{WDT clock}^{*2} \text{ cycles}”$

Note 1. CPU clock: Clock selected by CKSC\_CPUCLKS\_CTL and CKSC\_CPUCLKD\_CTL

Note 2. WDT clock: Clock selected by CKSC\_AWDTAD\_CTL is used for WDTA0.

LS IntOSC is used for WDTA1 and WDTA2.

### 29.5.2.1 Calculating an Activation Code when the VAC Function is Used

Use the following expression to calculate the variable activation code (ExpectWDTE) to be set in the WDTA trigger register (WDTAnEVAC) when the VAC function is used, by using the WDTA reference value register (WDTAnREF):

$$\text{ExpectWDTE} = \text{AC}_H - \text{WDTAnREF (previous)}$$

Note that the value in the WDTAnREF register is updated every time a start-code is written to the trigger register WDTAnEVAC. Use the following expression to calculate the updated value of the WDTAnREF register:

$$\text{WDTAnREF (following)} = (\text{rotate the value of ExpectWDTE to the left by 1 bit})$$

**Table 29.35, Expected Variable Activation Code Development** lists the variable activation codes according to the number of WDTA triggers.

Table 29.35 Expected Variable Activation Code Development

No*1	WDTAnREF (Previous)		ExpectWDTE (AC <sub>H</sub> - WDTAnREF)		WDTAnREF (Following)	
0	0000 0000	00 <sub>H</sub>	1010 1100	AC <sub>H</sub>	0101 1001	59 <sub>H</sub>
1	0101 1001	59 <sub>H</sub>	0101 0011	53 <sub>H</sub>	1010 0110	A6 <sub>H</sub>
2	1010 0110	A6 <sub>H</sub>	0000 0110	06 <sub>H</sub>	0000 1100	0C <sub>H</sub>
...	...	...	...	...	...	...

Note 1. Number of triggers after reset

#### NOTE

Writing an incorrect activation code generates an error.

### 29.5.3 WDTA Error Detection

WDTA detects an error, including generation of the WDTA count overflow or illegal operations.

The following events are detected as errors:

- WDTA counter overflow
- Incorrect activation code is written to the WDTA trigger register
- Writing to the trigger register at a time outside the window-open period
- When the setting value in the WDTA mode register (WDTAnMD) is changed after the first WDTA trigger is generated
- When the value of the WDTA mode register (WDTAnMD) is changed twice before the first WDTA trigger is generated\*1

**Note 1.** In this case, WDTAnRES is generated regardless setting of WDTA error mode bit (WDTAnMD.WDTAnERM).

### 29.5.3.1 WDTA Error Mode

When a WDTA error is detected, either an NMI interrupt or a reset is generated according to the setting of the WDTA error mode bit (WDTAnMD.WDTAnERM). The error mode bit after reset release is set to the reset mode.

- WDTAnMD.WDTAnERM = 0: NMI mode
- WDTAnMD.WDTAnERM = 1: Reset mode

**Figure 29.4, Timing Diagram of WDTA NMI Request or Reset Generation** shows the reset or NMI request generation when the counter overflows and default start mode is selected.

Figure 29.4 Timing Diagram of WDTA NMI Request or Reset Generation

The timing diagram shown in **Figure 29.4, Timing Diagram of WDTA NMI Request or Reset Generation** shows the following behaviors:

- (1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.
- (2) WDTAnMD is set before a WDTA trigger is generated. In this case,  $2^{16}/\text{WDTATCKI}$  is set for the overflow interval time.
- (3) A WDTA trigger is generated, and the WDTAnMD setting is applied.
- (4) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.
- (5) When the system is reset, the counter is cleared and stops until reset release.

### 29.5.4 75% Interrupt Request Signals

When the WDTA counter reaches 75% of the time set for the overflow interval, the interrupt request INTWDTAn is generated.

This function can be enabled or disabled by the WDTAnMD.WDTAnWIE register.

**Figure 29.5, Timing Diagram of WDTA 75% Interrupt Request Signals** shows the 75% interrupt request generated under following conditions:

- Default start mode is selected.
- 75% interrupt request is enabled after the first WDTA trigger is generated
- WDTA overflow interval time is  $2^{16}/\text{WDTATCKI}$

Figure 29.5 Timing Diagram of WDTA 75% Interrupt Request Signals

- (1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.
- (2) WDTAnMD is set before a WDTA trigger is generated. In this case,  $2^{16}/\text{WDTATCKI}$  is set for the overflow interval time.
- (3) A WDTA trigger is generated, and the WDTAnMD setting is applied.
- (4) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.
- (5) The WDTA trigger restarts counting.
- (6) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.
- (7) Error detection

- (7) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

### 29.5.5 Window Function

The period when a WDTA trigger is valid (window-open period) can be set. If the window-open period is set to the value less than 100%, the generation of a WDTA trigger not in the window-open period causes an error. The window-open period after reset release is 100%. The period is set to the value by the WDTAnMD.WDTAnWS[1:0] setting after the first WDTA trigger is generated.

**Figure 29.6, Timing Diagram of WDTA Window Function** shows the behavior of the window function under the following conditions.

- Default start mode is selected.
- 25% window-open period is enabled after the first WDTA trigger is generated (WDTAnWS[1:0] = 00<sub>B</sub>)
- WDTA overflow interval time is  $2^{16}/\text{WDTATCKI}$

Figure 29.6 Timing Diagram of WDTA Window Function

- (1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.
- (2) WDTAnMD is set before a WDTA trigger is generated. In this case,  $2^{16}/\text{WDTATCKI}$  is set for the overflow interval time.
- (3) A WDTA trigger is generated, and the WDTAnMD setting is applied.
- (4) During the window-open period, the WDTA trigger restarts counting.
- (5) During the window-closed period, an error is detected by the WDTA trigger. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.
- (6) When the system is reset, the counter is cleared and stops until reset release.

## Section 30 OS Timer (OSTM)

This section contains a generic description of the OS Timer (OSTM).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of OSTM.

### 30.1 Features of RH850/F1KH, RH850/F1KM OSTM

#### 30.1.1 Number of Units

This microcontroller has the following number of units of the OSTM.

Each OSTM unit has single channel interface.

Table 30.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	10	10	10
Name	OSTMn (n = 0 to 9)	OSTMn (n = 0 to 9)	OSTMn (n = 0 to 9)

Table 30.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	5	5	5	5	5
Name	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)

Table 30.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	5	5	5
Name	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)

Table 30.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	OSTMn (n = 0)	OSTMn (n = 0)	OSTMn (n = 0)	OSTMn (n = 0)

Table 30.5 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual OSTM units are identified by the index "n"; for example, OSTMnCNT is the OSTM counter register.

### 30.1.2 Register Base Addresses

OSTM base addresses are listed in the following table.

OSTM register addresses are given as offsets from the base addresses.

Table 30.6 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<OSTM0_base>	FFD7 0000 <sub>H</sub>
<OSTM1_base>	FFD7 0100 <sub>H</sub>
<OSTM2_base>	FFD7 0200 <sub>H</sub>
<OSTM3_base>	FFD7 0300 <sub>H</sub>
<OSTM4_base>	FFD7 0400 <sub>H</sub>
<OSTM5_base>	FFD7 1000 <sub>H</sub>
<OSTM6_base>	FFD7 1100 <sub>H</sub>
<OSTM7_base>	FFD7 1200 <sub>H</sub>
<OSTM8_base>	FFD7 1300 <sub>H</sub>
<OSTM9_base>	FFD7 1400 <sub>H</sub>

Table 30.7 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S2)

Base Address Name	Base Address
<OSTM0_base>	FFD7 0000 <sub>H</sub>
<OSTM1_base>	FFD7 0100 <sub>H</sub>
<OSTM2_base>	FFD7 0200 <sub>H</sub>
<OSTM3_base>	FFD7 0300 <sub>H</sub>
<OSTM4_base>	FFD7 0400 <sub>H</sub>

Table 30.8 Register Base Address (RH850/F1KM-S1)

Base Address Name	Base Address
<OSTM0_base>	FFD7 0000 <sub>H</sub>

### 30.1.3 Clock Supply

The OSTM clock supply is shown in the following table.

Table 30.9 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
OSTMn	PCLK	CPUCLK_L	Timer count clock
	Register access clock	CPUCLK_L	Bus clock

### 30.1.4 Interrupt Requests

OSTM interrupt requests are listed in the following table.

Table 30.10 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
OSTM0			
OSTMTINT	OSTM0 interrupt	84 (INTOSTM0)	—
OSTM5			
OSTMTINT	OSTM5 interrupt	314 (INTOSTM5)	—

Table 30.11 Interrupt Request (RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
OSTM0			
OSTMTINT	OSTM0 interrupt	84 (INTOSTM0)	—

Table 30.12 Interrupt Requests (FE Level Maskable Interrupt Request) (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Name	DMA Trigger Number
OSTM0			
OSTMTINT	OSTM0 interrupt	INTOSTM0_FE	—

### 30.1.5 Reset Sources

OSTM reset sources are listed in the following table. OSTM is initialized by these reset sources.

Table 30.15 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
OSTMn	All reset sources (ISORES)

## 30.2 Overview

OSTM is a 32-bit timer/counter.

It can be used in interval timer mode or in free-run compare mode. The settings for operating mode specify the direction of counting (up or down) to control the generation of interrupt requests.

### 30.2.1 Functional Overview

OSTM has the following features.

- Two operating modes
  - Interval timer mode
  - Free-run compare mode
- OSTMTINT interrupt

### 30.2.2 Block Diagram

The following block diagram shows the main components of OSTM.

Figure 30.1 Block Diagram of OSTM

### 30.2.3 Count Clock

The count clock used by OSTM is PCLK.

### 30.2.4 Interrupt Sources (OSTMTINT)

An OSTMTINT interrupt request is generated on counter underflow (interval timer mode) or when the counter matches the compare value (free-run compare mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This is illustrated in the following figure.

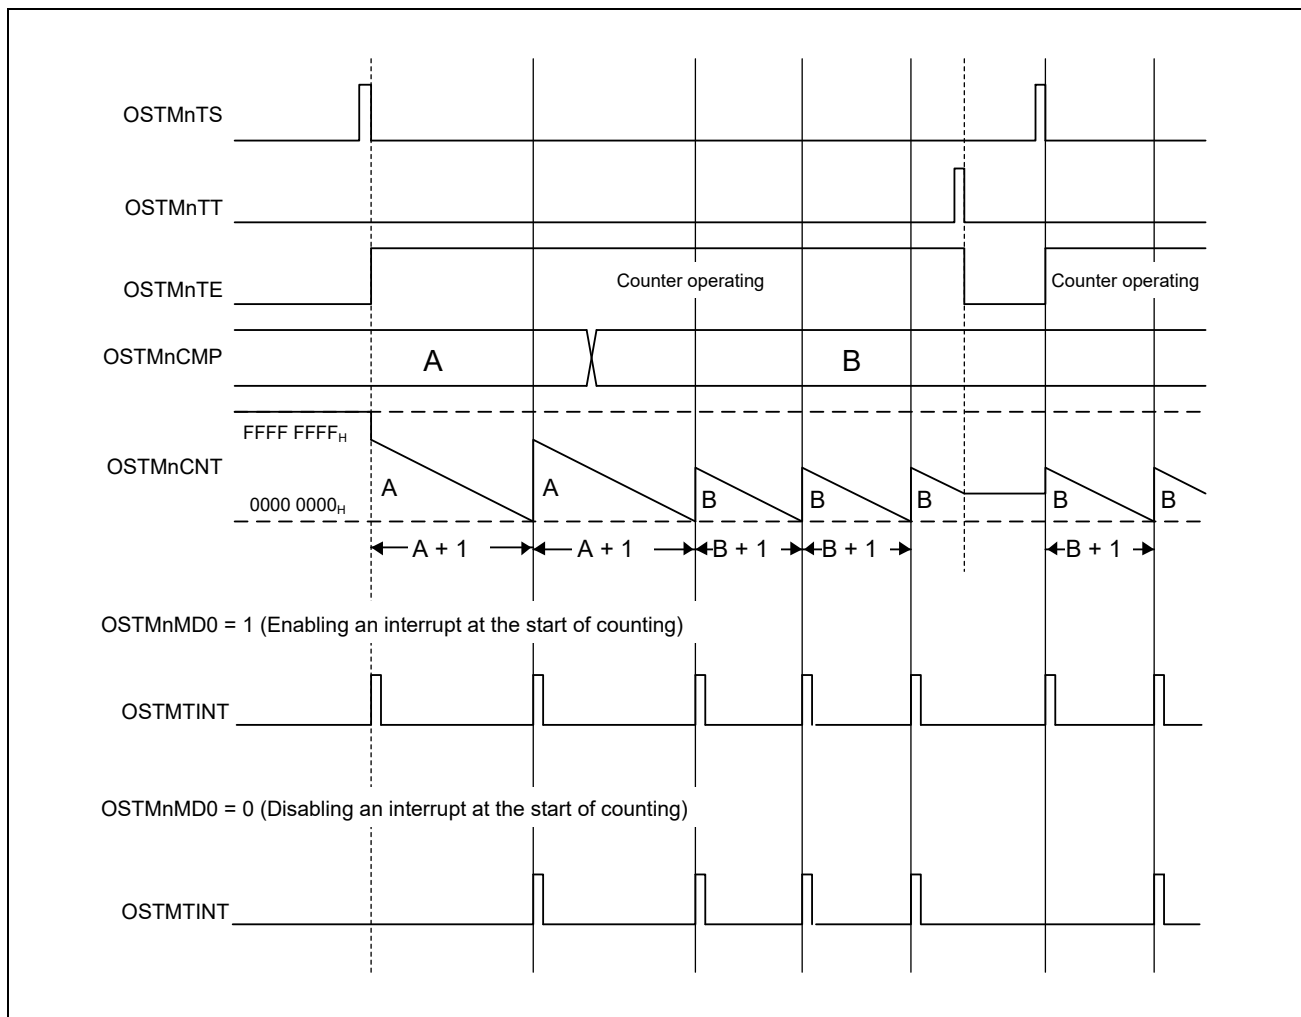

Figure 30.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

## 30.3 Registers

### 30.3.1 List of Registers

OSTM registers are listed in the following table.

For details about <OSTMn\_base>, see **Section 30.1.2, Register Base Addresses**.

Table 30.16 List of Registers

Module Name	Register Name	Symbol	Address
OSTMn	OSTMn compare register	OSTMnCMP	<OSTMn_base> + 00 <sub>H</sub>
	OSTMn counter register	OSTMnCNT	<OSTMn_base> + 04 <sub>H</sub>
	OSTMn count enable status register	OSTMnTE	<OSTMn_base> + 10 <sub>H</sub>
	OSTMn count start trigger register	OSTMnTS	<OSTMn_base> + 14 <sub>H</sub>
	OSTMn count stop trigger register	OSTMnTT	<OSTMn_base> + 18 <sub>H</sub>
	OSTMn control register	OSTMnCTL	<OSTMn_base> + 20 <sub>H</sub>
	OSTMn emulation register	OSTMnEMU	<OSTMn_base> + 24 <sub>H</sub>

### 30.3.2 OSTMnCMP — OSTMn Compare Register

This register stores the start value of the down-counter or the value with which the counter is compared, depending on the operation mode.

**Access:** This register can be read or written in 32-bit units.

**Address:** <OSTMn\_base> + 00<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCMP[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.17 OSTMnCMP Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCMP[31:0]	<ul style="list-style-type: none"> <li>• In interval timer mode: start value of the down-counter</li> <li>• In free-run compare mode: compare value</li> </ul>

### 30.3.3 OSTMnCNT — OSTMn Counter Register

This register indicates the counter value of the timer.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <OSTMn\_base> + 04<sub>H</sub>

**Value after reset:** FFFF FFFF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCNT[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.18 OSTMnCNT Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCNT[31:0]	Timer counter value

**Table 30.19, Correspondence among Operating Mode, Counting Direction, and Start Value** lists the correspondence among the OSTM operating mode, counting direction, and start value. The start value indicates the value to be read after the operating mode is changed.

Table 30.19 Correspondence among Operating Mode, Counting Direction, and Start Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Start Value
Interval timer mode	0*1	Down	FFFF FFFF <sub>H</sub>
Free-run compare mode	1	Up	0000 0000 <sub>H</sub>

Note 1. Value after reset.

### 30.3.4 OSTMnTE — OSTMn Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <OSTMn\_base> + 10<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.20 OSTMnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	OSTMnTE	Indicates whether the counter is enabled or disabled: 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1. Setting OSTMnTT.OSTMnTT to 1 resets this bit to 0.

#### NOTE

If the counter is disabled, the counter value retains its value.

If the counter is restarted, it

- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
- restarts counting up from the counter value 0000 0000<sub>H</sub> if it is in free-run compare mode.

### 30.3.5 OSTMnTS — OSTMn Count Start Trigger Register

This register starts the counter.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <OSTMn\_base> + 14<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 30.21 OSTMnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OSTMnTS	Starts the counter: <ul style="list-style-type: none"> <li>0: This setting is invalid.</li> <li>1: Starts the counter and sets OSTMnTE.OSTMnTE = 1.</li> <li>• In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1.</li> <li>• In free-run compare mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1.</li> </ul>

### 30.3.6 OSTMnTT — OSTMn Count Stop Trigger Register

This register stops the counter.

**Access:** This register is a write-only register that can be written in 8-bit units.

**Address:** <OSTMn\_base> + 18<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 30.22 OSTMnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OSTMnTT	Stops the counter: 0: This setting is invalid. 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

### 30.3.7 OSTMnCTL — OSTMn Control Register

This register specifies the operating mode for the counter and controls the generation of OSTMTINT interrupt requests when counting starts.

Although this register is readable and writable, this register can only be written when OSTMnTS.OSTMnTE = 0.

**Access:** This register can be read or written in 8-bit units.

**Address:** <OSTMn\_base> + 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OSTMnMD1	OSTMnMD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 30.23 OSTMnCTL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OSTMnMD1	Specifies the operating mode for the counter: 0: Interval timer mode 1: Free-run compare mode
0	OSTMnMD0	Controls the generation of OSTMTINT interrupt requests at the start of counting: 0: Interrupts when counting starts are disabled. 1: Interrupts when counting starts are enabled.

### 30.3.8 OSTMnEMU — OSTMn Emulation Register

This register controls operation in combination with SVSTOP.

**Access:** This register can be read or written in 8-bit units.

Only proceed with writing while the counter is stopped (OSTMnTE.OSTMnTE = 0 and EPC.SVSTOP = 0).

**Address:** <OSTMn\_base> + 24<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	OSTMnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 30.24 OSTMnEMU Register Contents

Bit Position	Bit Name	Function
7	OSTMnSVSDIS	When EPC.SVSTOP = 0 Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on) regardless of the value of this bit (0/1). When EPC.SVSTOP = 1 0: The count clock is stopped when the debugger acquires control of the microcontroller (at breakpoints and so on). 1: Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

## 30.4 Operation

### 30.4.1 Starting and Stopping OSTM

OSTM is started and stopped as follows:

#### Starting the Timer

OSTM is started by the following setting.

- Setting the OSTMnTS.OSTMnTS bit to 1

The OSTMnTE.OSTMnTE status bit is set to 1.

The counter starts to count up or down in accordance with the settings for operating mode. For details, see **Section 30.4.2, Interval Timer Mode** and **Section 30.4.3, Free-Run Compare Mode**.

#### Stopping the Timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops OSTM.

This also clears the OSTMnTE.OSTMnTE status bit.

### 30.4.2 Interval Timer Mode

In interval timer mode, OSTM can be used as a reference timer generating interrupt requests at fixed intervals.

#### 30.4.2.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMTINT interrupt request is generated when the counter underflows (reaches 0000 0000<sub>H</sub>).

To select interval timer mode, set OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next 0000 0000<sub>H</sub> is reached. Then the counter continues with the new value.

#### OSTMTINT Period

The periods of OSTMTINT is:

- OSTMTINT generation period = count clock period × (OSTMnCMP + 1)

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

Figure 30.3 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:

- (1) The counter starts counting when  $OSTMnTS.OSTMnTS = 1$ . The  $OSTMnTE.OSTMnTE$  bit is set to indicate enabling of the counter.  
The counter starts counting down from the value of  $OSTMnCMP$ .  
If  $OSTMnCTL.OSTMnMD0$  is 1,  $OSTMTINT$  interrupt requests are generated at the start of counting. The  $OSTMnCNT$  register indicates the counter value.
- (2) When the counter reaches  $0000\ 0000_H$ , an  $OSTMTINT$  interrupt request is generated. The counter loads the new start value from  $OSTMnCMP$  and continues counting down.
- (3) When the counter is stopped ( $OSTMnTT.OSTMnTT = 1$ ), the  $OSTMnTE.OSTMnTE$  bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
- (4) When counting is restarted ( $OSTMnTS.OSTMnTS = 1$ ), the counter loads the new start value from  $OSTMnCMP$  and starts counting down.

### Forced Restart

The counter is forcibly restarted by setting  $OSTMnTS.OSTMnTS = 1$  during counting.

The counter loads the start value from the  $OSTMnCMP$  register and continues to count down.

The following figure shows the timing in interval timer mode, with counter-start interrupts enabled ( $OSTMnCTL.OSTMnMD0 = 1$ ).

Figure 30.4 Timing Diagram of Forced Restart in Interval Timer Mode

The timing diagram above shows the following operations:

- (1) The counter is started and stopped as described under **Figure 30.3, Timing Diagram of OSTM in Interval Timer Mode**.
- (2) Setting  $OSTMnTS.OSTMnTS = 1$  restarts the counter while counting is in progress (i.e. while  $OSTMnTE.OSTMnTE = 1$ ).  
The counter immediately restarts counting down, starting with the current value of  $OSTMnCMP$ .  
When  $OSTMnCTL.OSTMnMD0 = 1$ , an  $OSTMTINT$  interrupt request is generated when counting starts.

### 30.4.2.2 Operation when OSTMnCMP = 0000 0000<sub>H</sub>

When OSTMnCMP = 0000 0000<sub>H</sub>, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1.

The following figure shows operations of OSTM when OSTMnCMP = 0000 0000<sub>H</sub>, and counter-start interrupts are enabled.

Figure 30.5 Timing Diagram when OSTMnCMP = 0000 0000<sub>H</sub> in Interval Timer Mode

The timing diagram above shows the following operations:

- (1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value 0000 0000<sub>H</sub> is retained in OSTMnCMP.
- (2) The OSTMTINT interrupt request is continuously asserted.
- (3) After the counter stops, the OSTMTINT interrupt request signal is deasserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

### 30.4.2.3 Setting Procedure for Interval Timer Mode

The setting procedure in interval timer mode after reset release is described below:

#### Setting Procedure

- (1) Set the start value of the counter in the OSTMnCMP register.
- (2) Select interval timer mode by setting the OSTMnCTL.OSTMnMD1 bit to 0.
- (3) Enable or disable interrupts when counting starts (OSTMnCTL.OSTMnMD0).

### 30.4.3 Free-Run Compare Mode

#### 30.4.3.1 Basic Operation in Free-Run Compare Mode

In free-run compare mode, the counter counts up from 0000 0000<sub>H</sub> to FFFF FFFF<sub>H</sub>. When the value of the OSTMnCMP register matches the current counter value, an OSTMTINT interrupt request is output.

In free-run compare mode, set OSTMnCTL.OSTMnMD1 = 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

Figure 30.6 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:

- (1) The counter starts counting when OSTMnTS.OSTMnTS = 1.  
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from 0000 0000<sub>H</sub> to FFFF FFFF<sub>H</sub>. The OSTMnCNT register indicates the counter value.  
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated at the start of counting.
- (2) When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.
- (3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.  
The counter retains its current value until it is restarted.
- (4) Counting by the counter restarts from 0000 0000<sub>H</sub> when OSTMnTS.OSTMnTS = 1.

### OSTMTINT Period

The OSTMTINT generation period is different depending on the starting time. If OSTMnCMP is rewritten during operation, the period is changed according to the size of the new and old compare values.

Table 30.25 OSTMTINT Generation Timing

Old Value for Comparison	New Value for Comparison	Counter Value at Time of Rewriting	Period of OSTMTINT Generation	Label in Timing Diagram
Counter starts			$(A + 1) \times \text{count clock period}$	(a)
A	A	No rewriting	$(FFFF\ FFFF_H + 1) \times \text{count clock period}$	(b)
B	$C > B$	$B < \text{counter value} < C$	$(C - B) \times \text{count clock period}$	(c)
C	$D < C$	Counter value $> D, C$	$(FFFF\ FFFF_H - C + D + 1) \times \text{count clock period}$	(d)

### Forced Restart

Forced restarting of the counter does not proceed if the OSTMnTS.OSTMnTS bit is set during counting. The counter ignores the attempted setting and continues counting.

### 30.4.3.2 Operation when OSTMnCMP = 0000 0000<sub>H</sub>

The following figure shows the operation of OSTM when OSTMnCMP = 0000 0000<sub>H</sub>, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

Figure 30.7 Timing Diagram when OSTMnCMP = 0000 0000<sub>H</sub> in Free-Run Compare Mode

The timing diagram above shows the following operations.

- (1) Once the counter starts, it counts up from 0000 0000<sub>H</sub> to FFFF FFFF<sub>H</sub>.
- (2) An OSTMTINT interrupt request is generated when counting starts.
- (3) If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated. If OSTMnCMP = 0000 0000<sub>H</sub> as shown above, OSTMTINT is generated over two clock cycles.
- (4) An OSTMTINT interrupt request is generated for each clock cycle (FFFF FFFF<sub>H</sub> + 1).

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

### 30.4.3.3 Setting Procedure for Free-Run Compare Mode

The setting procedure in free-run compare mode after reset release is described below:

#### Setting Procedure

- (1) Set the compare value in the OSTMnCMP register.
- (2) Select free-run compare mode by setting the OSTMnCTL.OSTMnMD1 bit to 1.
- (3) Enable or disable interrupts when counting starts by the OSTMnCTL.OSTMnMD0 bit.

## Section 31 Timer Array Unit B (TAUB)

This section contains a generic description of the timer array unit B (TAUB).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of TAUB.

### 31.1 Features of RH850/F1KH, RH850/F1KM TAUB

#### 31.1.1 Number of Units and Channels

This microcontroller has the following number of TAUB units and channels.

Table 31.1 Number of Units (RH850/F1KH-D8)

	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	2	2	2
Name	TAUBn (n = 0, 1)	TAUBn (n = 0, 1)	TAUBn (n = 0, 1)

Table 31.2 Number of Units (RH850/F1KM-S4)

	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	2	2	2
Name	TAUBn (n = 0)	TAUBn (n = 0)	TAUBn (n = 0, 1)	TAUBn (n = 0, 1)	TAUBn (n = 0, 1)

Table 31.3 Number of Units (RH850/F1KM-S2)

	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	1	1	2
Name	TAUBn (n = 0)	TAUBn (n = 0)	TAUBn (n = 0, 1)

Table 31.4 Number of Units (RH850/F1KM-S1)

	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	1	1
Name	—	—	TAUBn (n = 0)	TAUBn (n = 0)

Table 31.5 TAUBn Unit Configurations and Channels (RH850/F1KH-D8)

Unit Name	Number of Channels per Unit	RH850/F1KH-D8 176 Pins (32 ch)	RH850/F1KH-D8 233 Pins (32 ch)	RH850/F1KH-D8 324 Pins (32 ch)
TAUB0	16	✓	✓	✓
TAUB1	16	✓	✓	✓

Table 31.6 TAUBn Unit Configurations and Channels (RH850/F1KM-S4)

Unit Name	Number of Channels per Unit	RH850/F1KM-S4 100 Pins (16 ch)	RH850/F1KM-S4 144 Pins (16 ch)	RH850/F1KM-S4 176 Pins (32 ch)	RH850/F1KM-S4 233 Pins (32 ch)	RH850/F1KM-S4 272 Pins (32 ch)
TAUB0	16	✓	✓	✓	✓	✓
TAUB1	16	—	—	✓	✓	✓

Table 31.7 TAUBn Unit Configurations and Channels (RH850/F1KM-S2)

Unit Name TAUBn	Number of Channels per Unit	RH850/F1KM-S2 100 Pins (16 ch)	RH850/F1KM-S2 144 Pins (16 ch)	RH850/F1KM-S2 176 Pins (32 ch)
TAUB0	16	✓	✓	✓
TAUB1	16	—	—	✓

Table 31.8 TAUBn Unit Configurations and Channels (RH850/F1KM-S1)

Unit Name TAUBn	Number of Channels per Unit	RH850/F1KM-S1 48 Pins (—)	RH850/F1KM-S1 64 Pins (—)	RH850/F1KM-S1 80 Pins (16 ch)	RH850/F1KM-S1 100 Pins (16 ch)
TAUB0	16	—	—	✓	✓

Table 31.9 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual TAUB units are identified by the index “n”; for example, TAUBnTOM is the TAUBn channel output mode register.
m	The TAUB has 16 channels. Throughout this section, the individual channels are identified by the index “m”, thus a certain channel is denoted as CHm (m = 0 to 15). The even numbered channels (m = 0, 2, 4, 6, 8, 10, 12, 14) are denoted as CHm_even. The odd numbered channels (m = 1, 3, 5, 7, 9, 11, 13, 15) are denoted as CHm_odd.

### 31.1.2 Register Base Addresses

TAUBn base addresses are listed in the following table.

TAUBn register addresses are given as offsets from the base addresses.

Table 31.10 Register Base Addresses (RH850/F1KH-D8)

Name	Base Address
<TAUB0_base>	FFE3 0000 <sub>H</sub>
<TAUB1_base>	FFE3 1000 <sub>H</sub>

Table 31.11 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S2)

Name	Base Address
<TAUB0_base>	FFE3 0000 <sub>H</sub>
<TAUB1_base>	FFE3 1000 <sub>H</sub>

Table 31.12 Register Base Address (RH850/F1KM-S1)

Name	Base Address
<TAUB0_base>	FFE3 0000 <sub>H</sub>

### 31.1.3 Clock Supply

The TAUBn clock supply is shown in the following table.

Table 31.13 TAUBn Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAUBn	PCLK	CKSCLK_IPER12	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_IPER12	Bus clock

### 31.1.4 Interrupt Requests

TAUBn interrupt requests are listed in the following table.

Table 31.14 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
TAUB0			
INTTAUB0I0	Channel 0 interrupt	142	33 to 38
INTTAUB0I1	Channel 1 interrupt	143	33 to 38
INTTAUB0I2	Channel 2 interrupt	144	33 to 38
INTTAUB0I3	Channel 3 interrupt	145	33 to 38
INTTAUB0I4	Channel 4 interrupt	146	33 to 38
INTTAUB0I5	Channel 5 interrupt	147	33 to 38
INTTAUB0I6	Channel 6 interrupt	148	33 to 38
INTTAUB0I7	Channel 7 interrupt	149	33 to 38
INTTAUB0I8	Channel 8 interrupt	150	33 to 38
INTTAUB0I9	Channel 9 interrupt	151	33 to 38
INTTAUB0I10	Channel 10 interrupt	152	33 to 38
INTTAUB0I11	Channel 11 interrupt	153	33 to 38
INTTAUB0I12	Channel 12 interrupt	154	33 to 38
INTTAUB0I13	Channel 13 interrupt	155	33 to 38
INTTAUB0I14	Channel 14 interrupt	156	33 to 38
INTTAUB0I15	Channel 15 interrupt	157	33 to 38
TAUB1			
INTTAUB1I0	Channel 0 interrupt	256	52 to 57
INTTAUB1I1	Channel 1 interrupt	257	52 to 57
INTTAUB1I2	Channel 2 interrupt	258	52 to 57
INTTAUB1I3	Channel 3 interrupt	259	52 to 57
INTTAUB1I4	Channel 4 interrupt	260	52 to 57
INTTAUB1I5	Channel 5 interrupt	261	52 to 57
INTTAUB1I6	Channel 6 interrupt	262	52 to 57
INTTAUB1I7	Channel 7 interrupt	263	52 to 57
INTTAUB1I8	Channel 8 interrupt	264	52 to 57
INTTAUB1I9	Channel 9 interrupt	265	52 to 57
INTTAUB1I10	Channel 10 interrupt	266	52 to 57
INTTAUB1I11	Channel 11 interrupt	267	52 to 57
INTTAUB1I12	Channel 12 interrupt	268	52 to 57
INTTAUB1I13	Channel 13 interrupt	269	52 to 57
INTTAUB1I14	Channel 14 interrupt	270	52 to 57
INTTAUB1I15	Channel 15 interrupt	271	52 to 57

Table 31.15 Interrupt Requests (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
TAUB0			
INTTAUB0I0	Channel 0 interrupt	142	33 to 38
INTTAUB0I1	Channel 1 interrupt	143	33 to 38
INTTAUB0I2	Channel 2 interrupt	144	33 to 38
INTTAUB0I3	Channel 3 interrupt	145	33 to 38
INTTAUB0I4	Channel 4 interrupt	146	33 to 38
INTTAUB0I5	Channel 5 interrupt	147	33 to 38
INTTAUB0I6	Channel 6 interrupt	148	33 to 38
INTTAUB0I7	Channel 7 interrupt	149	33 to 38
INTTAUB0I8	Channel 8 interrupt	150	33 to 38
INTTAUB0I9	Channel 9 interrupt	151	33 to 38

INTTAUB0I10	Channel 10 interrupt	152	33 to 38
INTTAUB0I11	Channel 11 interrupt	153	33 to 38
INTTAUB0I12	Channel 12 interrupt	154	33 to 38
INTTAUB0I13	Channel 13 interrupt	155	33 to 38
INTTAUB0I14	Channel 14 interrupt	156	33 to 38
INTTAUB0I15	Channel 15 interrupt	157	33 to 38

### 31.1.5 Reset Sources

TAUBn reset sources are listed in the following table. TAUBn is initialized by these reset sources.

Table 31.17 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
TAUBn	All reset sources (ISOIRES)

### 31.1.6 External input/output Signals

External input/output signals of TAUBn are listed below.

Table 31.18 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
TAUB0		
TAUBTTIN0	Channel 0 input* <sup>1</sup>	TAUB0I0
TAUBTTIN1	Channel 1 input* <sup>1</sup>	TAUB0I1
TAUBTTIN2	Channel 2 input* <sup>1</sup>	TAUB0I2
TAUBTTIN3	Channel 3 input* <sup>1</sup>	TAUB0I3
TAUBTTIN4	Channel 4 input* <sup>1</sup>	TAUB0I4
TAUBTTIN5	Channel 5 input* <sup>1</sup>	TAUB0I5
TAUBTTIN6	Channel 6 input* <sup>1</sup>	TAUB0I6
TAUBTTIN7	Channel 7 input* <sup>1</sup>	TAUB0I7
TAUBTTIN8	Channel 8 input* <sup>1</sup>	TAUB0I8
TAUBTTIN9	Channel 9 input* <sup>1</sup>	TAUB0I9
TAUBTTIN10	Channel 10 input* <sup>1</sup>	TAUB0I10
TAUBTTIN11	Channel 11 input* <sup>1</sup>	TAUB0I11
TAUBTTIN12	Channel 12 input* <sup>1</sup>	TAUB0I12
TAUBTTIN13	Channel 13 input* <sup>1</sup>	TAUB0I13
TAUBTTIN14	Channel 14 input* <sup>1</sup>	TAUB0I14
TAUBTTIN15	Channel 15 input* <sup>1</sup>	TAUB0I15
TAUBTTOUT0	Channel 0 output	TAUB0O0
TAUBTTOUT1	Channel 1 output	TAUB0O1
TAUBTTOUT2	Channel 2 output	TAUB0O2
TAUBTTOUT3	Channel 3 output	TAUB0O3
TAUBTTOUT4	Channel 4 output	TAUB0O4
TAUBTTOUT5	Channel 5 output	TAUB0O5
TAUBTTOUT6	Channel 6 output	TAUB0O6
TAUBTTOUT7	Channel 7 output	TAUB0O7
TAUBTTOUT8	Channel 8 output	TAUB0O8
TAUBTTOUT9	Channel 9 output	TAUB0O9
TAUBTTOUT10	Channel 10 output	TAUB0O10
TAUBTTOUT11	Channel 11 output	TAUB0O11
TAUBTTOUT12	Channel 12 output	TAUB0O12
TAUBTTOUT13	Channel 13 output	TAUB0O13
TAUBTTOUT14	Channel 14 output	TAUB0O14
TAUBTTOUT15	Channel 15 output	TAUB0O15

Table 31.18 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
TAUB1		
TAUBTTIN0	Channel 0 input*1	TAUB110
TAUBTTIN1	Channel 1 input*1	TAUB111
TAUBTTIN2	Channel 2 input*1	TAUB112
TAUBTTIN3	Channel 3 input*1	TAUB113
TAUBTTIN4	Channel 4 input*1	TAUB114
TAUBTTIN5	Channel 5 input*1	TAUB115
TAUBTTIN6	Channel 6 input*1	TAUB116
TAUBTTIN7	Channel 7 input*1	TAUB117
TAUBTTIN8	Channel 8 input*1	TAUB118
TAUBTTIN9	Channel 9 input*1	TAUB119
TAUBTTIN10	Channel 10 input*1	TAUB1110
TAUBTTIN11	Channel 11 input*1	TAUB1111
TAUBTTIN12	Channel 12 input*1	TAUB1112
TAUBTTIN13	Channel 13 input*1	TAUB1113
TAUBTTIN14	Channel 14 input*1	TAUB1114
TAUBTTIN15	Channel 15 input*1	TAUB1115
TAUBTTOUT0	Channel 0 output	TAUB1O0
TAUBTTOUT1	Channel 1 output	TAUB1O1
TAUBTTOUT2	Channel 2 output	TAUB1O2
TAUBTTOUT3	Channel 3 output	TAUB1O3
TAUBTTOUT4	Channel 4 output	TAUB1O4
TAUBTTOUT5	Channel 5 output	TAUB1O5
TAUBTTOUT6	Channel 6 output	TAUB1O6
TAUBTTOUT7	Channel 7 output	TAUB1O7
TAUBTTOUT8	Channel 8 output	TAUB1O8
TAUBTTOUT9	Channel 9 output	TAUB1O9
TAUBTTOUT10	Channel 10 output	TAUB1O10
TAUBTTOUT11	Channel 11 output	TAUB1O11
TAUBTTOUT12	Channel 12 output	TAUB1O12
TAUBTTOUT13	Channel 13 output	TAUB1O13
TAUBTTOUT14	Channel 14 output	TAUB1O14
TAUBTTOUT15	Channel 15 output	TAUB1O15

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector.**

Table 31.19 External Input/Output Signals (RH850/F1KM-S4, RH850/F1KM-S2)

Unit Signal Name	Description	Alternative Port Pin Signal
TAUB0		
TAUBTTIN0	Channel 0 input*1	TAUB0I0

### 31.1.7 TAUBn Input Selection

The output from port TAUBnIm ( $n = 0, 1, m = 0$  to 15) can be input to TAUBTTINm ( $m = 0$  to 15) as shown in the following figure.

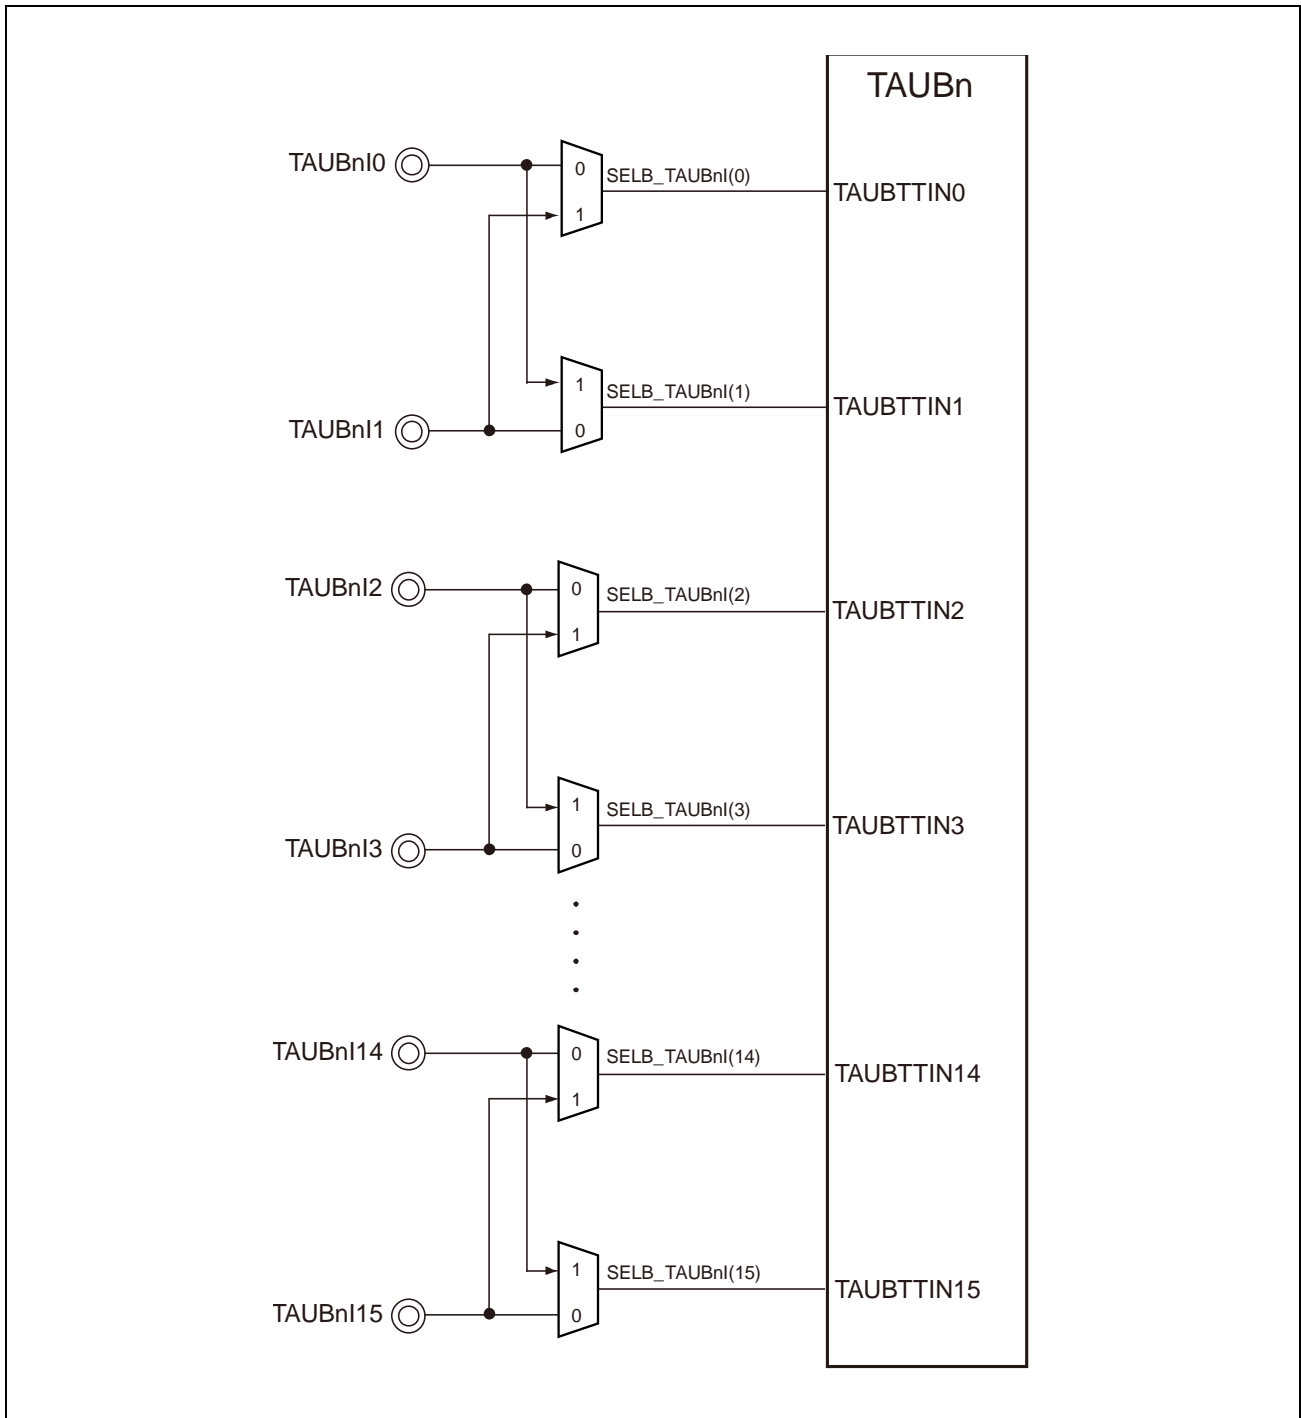

Figure 31.1 TAUBn Input/Output and Interrupt Request Signals

The following table shows the input signals to several TAUBn inputs.

Table 31.21 TAUBn Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Input Signal	Function	Settings
TAUBTTIN[m]	Port TAUBn[m]	SELB_TAUBn[m] = 0
	Port TAUBn[m + 1]	SELB_TAUBn[m] = 1
TAUBTTIN[m + 1]	Port TAUBn[m + 1]	SELB_TAUBn[m + 1] = 0
	Port TAUBn[m]	SELB_TAUBn[m + 1] = 1

**Note:** m = 0, 2, 4, 6, 8, 10, 12, 14

### 31.1.7.1 List of Registers

Input signal selection register is listed in the following table.

Table 31.22 List of Registers (RH850/F1KH-D8)

Module Name	Register Name	Symbol	Address
TAUBn input selection registers			
SL_TAUBn	TAUBTTINm input signal selection register	SELB_TAUB0I	FFE3 2000 <sub>H</sub>
	TAUBTTINm input signal selection register	SELB_TAUB1I	FFE3 3000 <sub>H</sub>

	1	x	Selection of port TAUB1I[m]																			

**NOTE:** m = 0, 2, 4, 6, 8, 10, 12, 14

#### CAUTION

Do not change the input signal of the each channel during the timer counting.

## 31.2 Overview

### 31.2.1 Functional Overview

The TAUB has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUB is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUBnCNTm and a 16-bit data register TAUBnCDRm to hold the count start value and compare value.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels. The synchronous operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

### 31.2.2 Terms

In this section, the following terms are used:

#### Independent channel operation function/synchronous channel operation function

TAUB has 16 channels, and provides an independent channel operation function whereby individual channels operate independently and a synchronous channel operation function whereby multiple channels operate in combination.

- The independent channel operation function can be used by any channel independently of all other channels.
- The synchronous channel operation function is implemented using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

#### Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

#### Upper/lower channel

Depending on the channel number  $m$ , a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:

For channel 5, channel 3 is an upper channel and channel 9 is a lower channel. Channel 0 is the highest channel and channel 15 is the lowest channel.

The following describes the functional blocks:

#### Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of  $2^0$  to  $2^{15}$ .

#### Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTIN $m$  input signal valid edge

#### Controller

The controller controls the main operations of the counter:

- Operating mode (selected with the TAUBnCMOR $m$ .TAUBnMD[4:0] bits)
- Counter start enable (TAUBnTS.TAUBnTSM) and counter stop (TAUBnTT.TAUBnTTM)  
When counter start is enabled, status flag TAUBnTE.TAUBnTEM is set.
- Count direction (up/down) (can be controlled by the master channel)

### Trigger selector

The counter starts automatically when it is enabled ( $TAUBnTE.TAUBnTEm = 1$ ), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit.

### Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used in synchronous operation functions. The data registers ( $TAUBnCDRm$ ) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

## 31.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 31.27 Functional List of TAUB Operations

Operation Function	Setting Example

### 31.2.4 TAUB I/O and Interrupt Request Signals

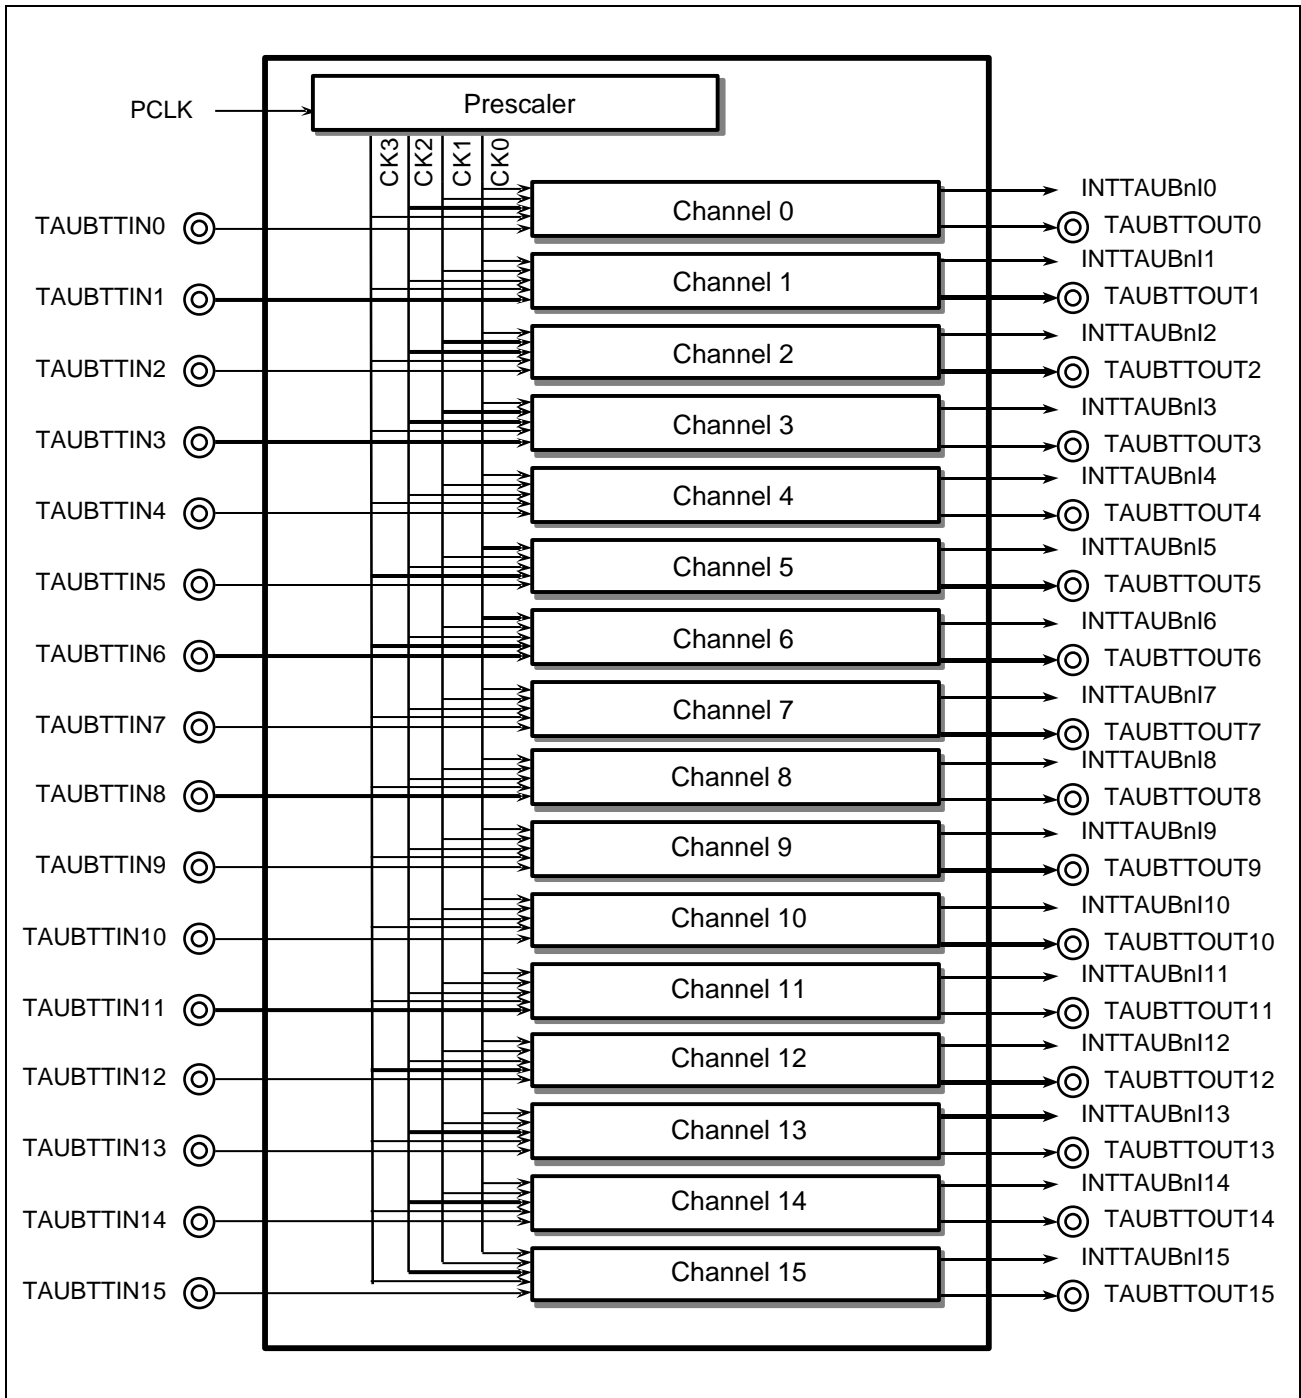

Figure 31.2 TAUB Input/Output and Interrupt Request Signals

### 31.2.5 Block Diagram

The following figure shows the main components of the TAUB.

Figure 31.3 Block Diagram of the TAUB

The prefix “TAUBn” has been omitted from the register names for the sake of clarity in the above figure.

### 31.2.6 Description of Blocks

The following describes the functional blocks:

#### Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of  $2^0$  to  $2^{15}$ .

#### Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTINm input signal valid edge

#### Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUBnCMORm.TAUBnMD[4:0])
- Counter start enable (TAUBnTS.TAUBnTSm) and counter stop (TAUBnTT.TAUBnTTm)  
When counter start is enabled, status flag TAUBnTE.TAUBnTEm is set.
- Count direction (up/down) (can be controlled by the master channel)

#### Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUBnTE.TAUBnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- Input of TAUBTTINm valid edge
- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit

#### Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used if multiple channels like synchronous operation functions are used. The data registers (TAUBnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

#### TAUBnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

## 31.3 Registers

### 31.3.1 List of Registers

TAUB registers are listed in the following table.

For details about <TAUBn\_base>, see **Section 31.1.2, Register Base Addresses**.

Table 31.28 List of Registers

Module Name	Register Name	Symbol	Address
TAUBn prescaler registers			
TAUBn	TAUBn prescaler clock select register	TAUBnTPS	<TAUBn_base> + 240 <sub>H</sub>
TAUBn control registers			
TAUBn	TAUBn channel data register	TAUBnCDRm	<TAUBn_base> + 0 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUBn channel counter register	TAUBnCNTm	<TAUBn_base> + 80 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUBn channel mode OS register	TAUBnCMORm	<TAUBn_base> + 200 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUBn channel mode user register	TAUBnCMURm	<TAUBn_base> + C0 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUBn channel status register	TAUBnCSRm	<TAUBn_base> + 140 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUBn channel status clear trigger register	TAUBnCSCm	<TAUBn_base> + 180 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUBn channel start trigger register	TAUBnTS	<TAUBn_base> + 1C4 <sub>H</sub>
	TAUBn channel enable status register	TAUBnTE	<TAUBn_base> + 1C0 <sub>H</sub>
	TAUBn channel stop trigger register	TAUBnTT	<TAUBn_base> + 1C8 <sub>H</sub>
TAUBn output registers			
TAUBn	TAUBn channel output enable register	TAUBnTOE	<TAUBn_base> + 5C <sub>H</sub>
	TAUBn channel output register	TAUBnTO	<TAUBn_base> + 58 <sub>H</sub>
	TAUBn channel output mode register	TAUBnTOM	<TAUBn_base> + 248 <sub>H</sub>
	TAUBn channel output configuration register	TAUBnTOC	<TAUBn_base> + 24C <sub>H</sub>
	TAUBn channel output active level register	TAUBnTOL	<TAUBn_base> + 040 <sub>H</sub>
	TAUBn channel dead time output enable register	TAUBnTDE	<TAUBn_base> + 250 <sub>H</sub>
	TAUBn channel dead time output level register	TAUBnTDL	<TAUBn_base> + 54 <sub>H</sub>
TAUBn reload data registers			
TAUBn	TAUBn channel reload data enable register	TAUBnRDE	<TAUBn_base> + 260 <sub>H</sub>
	TAUBn channel reload data mode register	TAUBnRDM	<TAUBn_base> + 264 <sub>H</sub>
	TAUBn channel reload data control channel select register	TAUBnRDS	<TAUBn_base> + 268 <sub>H</sub>
	TAUBn channel reload data control register	TAUBnRDC	<TAUBn_base> + 26C <sub>H</sub>
	TAUBn channel reload data trigger register	TAUBnRDT	<TAUBn_base> + 44 <sub>H</sub>
	TAUBn channel reload status register	TAUBnRSF	<TAUBn_base> + 48 <sub>H</sub>
TAUBn emulation register			
TAUBn	TAUBn emulation register	TAUBnEMU	<TAUBn_base> + 290 <sub>H</sub>

### 31.3.2 Details of TAUBn Prescaler Registers

#### 31.3.2.1 TAUBnTPS — TAUBn Prescaler Clock Select Register

This register specifies the clocks CK0, CK1, CK2, and CK3 for all channels of the PCLK prescaler.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUBn\_base> + 240<sub>H</sub>

**Value after reset:** FFFF<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnPRS3[3:0]				TAUBnPRS2[3:0]				TAUBnPRS1[3:0]				TAUBnPRS0[3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.29 TAUBnTPS Register Contents

Bit Position	Bit Name	Function
15 to 12	TAUBnPRS3[3:0]	Specifies the CK3 clock.
	TAUBnPRS3[3:0]	CK3 clock
	0000 <sub>B</sub>	PCLK/2 <sup>0</sup>
	0001 <sub>B</sub>	PCLK/2 <sup>1</sup>
	0010 <sub>B</sub>	PCLK/2 <sup>2</sup>
	0011 <sub>B</sub>	PCLK/2 <sup>3</sup>
	0100 <sub>B</sub>	PCLK/2 <sup>4</sup>
	0101 <sub>B</sub>	PCLK/2 <sup>5</sup>
	0110 <sub>B</sub>	PCLK/2 <sup>6</sup>
	0111 <sub>B</sub>	PCLK/2 <sup>7</sup>
	1000 <sub>B</sub>	PCLK/2 <sup>8</sup>
	1001 <sub>B</sub>	PCLK/2 <sup>9</sup>
	1010 <sub>B</sub>	PCLK/2 <sup>10</sup>
	1011 <sub>B</sub>	PCLK/2 <sup>11</sup>
	1100 <sub>B</sub>	PCLK/2 <sup>12</sup>

	1110 <sub>B</sub>	PCLK/2 <sup>14</sup>
	1111 <sub>B</sub>	PCLK/2 <sup>15</sup>

These bits can only be rewritten when all counters using CK0 are stopped (TAUBnTE.TAUBnTE<sub>m</sub> = 0).

## NOTE

The TAUBn clock input PCLK is specified in the first part of this section, **Section 31.1.3, Clock Supply**.

### 31.3.3 Details of TAUBn Control Registers

#### 31.3.3.1 TAUBnCDRm — TAUBn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operation mode specified in TAUBnCMORm.TAUBnMD[4:1].

**Access:** This register can be read or written in 16-bit units.

- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

**Address:** <TAUBn\_base> + m × 4<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.30 TAUBnCDRm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnCDR[15:0]	Data register for the capture/compare value.

### 31.3.3.2 TAUBnCNTm — TAUBn Channel Counter Register

This register is the channel m counter register.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUBn\_base> + 80<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** FFFF<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.31 TAUBnCNTm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnCNT[15:0]	16-bit counter value.

The read value depends on the counter, the operation mode change, and the values of the TAUBnTS.TAUBnTSm and TAUBnTT.TAUBnTTm bits.

The initial counter read value depends on the operation mode and how the counter was stopped:

- by a reset
- by a counter stop trigger (TAUBnTT.TAUBnTTm = 1)

The following table lists the initial counter read values after the counter has stopped (TAUBnTE.TAUBnTEm = 0) and re-enabled (TAUBnTS.TAUBnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUBnTS.TAUBnTSm = 1) for modes where the counter waits for a start trigger.

Table 31.32 TAUBnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUBnCNTm		
		Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	FFFF <sub>H</sub>	Stop value	—
Judge mode	Count down	FFFF <sub>H</sub>	Stop value	—
Capture mode	Count up	0000 <sub>H</sub>	Stop value	—
Event count mode	Count down	FFFF <sub>H</sub>	Stop value	—
One-count mode	Count down	FFFF <sub>H</sub>	Stop value	FFFF <sub>H</sub>
Capture and one-count mode	Count up	0000 <sub>H</sub>	Stop value	Capture value + 1 (TAUBnCDRm)
Judge and one-count mode	Count down	FFFF <sub>H</sub>	Stop value	TAUBnCNTm value – 1
Count-up/-down mode	Count up/down	FFFF <sub>H</sub>	Stop value	—
Pulse one-count mode	Count down	FFFF <sub>H</sub>	Stop value	0000 <sub>H</sub>
Count capture mode	Count up	0000 <sub>H</sub>	Stop value	—
Gate count mode	Count down	FFFF <sub>H</sub>	Stop value	Stop value
Capture and gate count mode	Count up	0000 <sub>H</sub>	Stop value	Stop value

Note 1. The value set for TAUBnCNTm when operation mode is changed after reset release

### 31.3.3.3 TAUBnCMORm — TAUBn Channel Mode OS Register

This register controls channel m operation.

**Access:** This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

**Address:** <TAUBn\_base> + 200<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

### 31.3.3.5 TAUBnCSRm — TAUBn Channel Status Register

This register indicates the count direction and the overflow status of the counter for channel m.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUBn\_base> + 140<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnCSF	TAUBnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 31.35 TAUBnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	TAUBnCSF	Indicates the count direction: 0: Counts up 1: Counts down The read value of this bit is only valid in the following mode: <ul style="list-style-type: none"> <li>Up/Down Count mode</li> </ul>
0	TAUBnOVF	Indicates the counter overflow status: 0: No overflow occurred 1: Overflow occurred This bit is used only in the following modes: <ul style="list-style-type: none"> <li>Capture mode</li> <li>Capture and one-count mode</li> </ul> The function of this bit depends on the setting of control bits TAUBnCMORm.TAUBnCOS[1:0].

### 31.3.3.6 TAUBnCSCm — TAUBn Channel Status Clear Trigger Register

This register is a trigger register for clearing the overflow flag TAUBnCSRm.TAUBnOVF of channel m.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as 00<sub>H</sub>.

**Address:** <TAUBn\_base> + 180<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUBnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 31.36 TAUBnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUBnCLOV	0: No function 1: Clears the overflow flag TAUBnCSRm.TAUBnOVF

### 31.3.3.7 TAUBnTS — TAUBn Channel Start Trigger Register

This register enables the counter for each channel.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as 0000<sub>H</sub>.

**Address:** <TAUBn\_base> + 1C4<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTS15	TAUBnTS14	TAUBnTS13	TAUBnTS12	TAUBnTS11	TAUBnTS10	TAUBnTS09	TAUBnTS08	TAUBnTS07	TAUBnTS06	TAUBnTS05	TAUBnTS04	TAUBnTS03	TAUBnTS02	TAUBnTS01	TAUBnTS00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 31.37 TAUBnTS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTsm	Enables the counter for channel m: 0: No function 1: Enables the counter and sets TAUBnTE.TAUBnTE <sub>m</sub> = 1. TAUBnTE.TAUBnTE <sub>m</sub> = 1 only enables the counter. Whether the counter starts depends on the selected operation mode.

### 31.3.3.8 TAUBnTE — TAUBn Channel Enable Status Register

This register indicates whether counter is enabled or disabled.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUBn\_base> + 1C0<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTE15	TAUBnTE14	TAUBnTE13	TAUBnTE12	TAUBnTE11	TAUBnTE10	TAUBnTE09	TAUBnTE08	TAUBnTE07	TAUBnTE06	TAUBnTE05	TAUBnTE04	TAUBnTE03	TAUBnTE02	TAUBnTE01	TAUBnTE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.38 TAUBnTE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTE <sub>m</sub>	Indicates whether counter for channel m is enabled or disabled: 0: Counter disabled 1: Counter enabled Setting TAUBnTS.TAUBnTsm to 1 sets this bit to 1. Setting TAUBnTT.TAUBnTT <sub>m</sub> to 1 resets this bit to 0.

### 31.3.3.9 TAUBnTT — TAUBn Channel Stop Trigger Register

This register stops the counter for each channel.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as 0000<sub>H</sub>.

**Address:** <TAUBn\_base> + 1C8<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TT15	TAUBn TT14	TAUBn TT13	TAUBn TT12	TAUBn TT11	TAUBn TT10	TAUBn TT09	TAUBn TT08	TAUBn TT07	TAUBn TT06	TAUBn TT05	TAUBn TT04	TAUBn TT03	TAUBn TT02	TAUBn TT01	TAUBn TT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 31.39 TAUBnTT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTTm	Stops the counter of channel m: 0: No function 1: Stops the counter and resets TAUBnTE.TAUBnTEm. TAUBnCNTm, TAUBnTO.TAUBnTOM, and TAUBTTOUTm all retain the values they had before the counter was stopped.

### 31.3.4 Details of TAUBn Simultaneous Rewrite Registers

#### 31.3.4.1 TAUBnRDE — TAUBn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUBnCDRm/TAUBnTOLm.

**Access:** This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

**Address:** <TAUBn\_base> + 260<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnRDE15	TAUBnRDE14	TAUBnRDE13	TAUBnRDE12	TAUBnRDE11	TAUBnRDE10	TAUBnRDE09	TAUBnRDE08	TAUBnRDE07	TAUBnRDE06	TAUBnRDE05	TAUBnRDE04	TAUBnRDE03	TAUBnRDE02	TAUBnRDE01	TAUBnRDE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.40 TAUBnRDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDEm	Enables/disables simultaneous rewrite of the data register of channel m: 0: Disables simultaneous rewrite 1: Enabled simultaneous rewrite

#### 31.3.4.2 TAUBnRDS — TAUBn Channel Reload Data Control Channel Select Register

This register selects the control channel for simultaneous rewrite.

**Access:** This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

**Address:** <TAUBn\_base> + 268<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnRDS15	TAUBnRDS14	TAUBnRDS13	TAUBnRDS12	TAUBnRDS11	TAUBnRDS10	TAUBnRDS09	TAUBnRDS08	TAUBnRDS07	TAUBnRDS06	TAUBnRDS05	TAUBnRDS04	TAUBnRDS03	TAUBnRDS02	TAUBnRDS01	TAUBnRDS00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.41 TAUBnRDS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDSm	Specifies which channel is controlled for the simultaneous rewrite trigger: 0: Master channel 1: Another upper channel

### 31.3.4.3 TAUBnRDM — TAUBn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

**Access:** This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

**Address:** <TAUBn\_base> + 264H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnRDM15	TAUBnRDM14	TAUBnRDM13	TAUBnRDM12	TAUBnRDM11	TAUBnRDM10	TAUBnRDM09	TAUBnRDM08	TAUBnRDM07	TAUBnRDM06	TAUBnRDM05	TAUBnRDM04	TAUBnRDM03	TAUBnRDM02	TAUBnRDM01	TAUBnRDM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.42 TAUBnRDM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDMm	Selects when the signal that triggers simultaneous rewrite is generated: 0: When the master channel counter starts counting 1: At the top of a triangle wave cycle These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 0.

### 31.3.4.4 TAUBnRDC — TAUBn Channel Reload Data Control Register

This register specifies the channel that generates the INTTAUBnIm signal that triggers simultaneous rewrite.

**Access:** This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0

**Address:** <TAUBn\_base> + 26CH

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnRDC15	TAUBnRDC14	TAUBnRDC13	TAUBnRDC12	TAUBnRDC11	TAUBnRDC10	TAUBnRDC09	TAUBnRDC08	TAUBnRDC07	TAUBnRDC06	TAUBnRDC05	TAUBnRDC04	TAUBnRDC03	TAUBnRDC02	TAUBnRDC01	TAUBnRDC00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.43 TAUBnRDC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDCm	Specifies whether the channel generates a simultaneous rewrite trigger signal or not. 0: Does not operate as a simultaneous rewrite trigger channel. 1: Operates as a simultaneous rewrite trigger channel. These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 1.

### 31.3.4.5 TAUBnRDT — TAUBn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as 0000<sub>H</sub>.

**Address:** <TAUBn\_base> + 044<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnRDT15	TAUBnRDT14	TAUBnRDT13	TAUBnRDT12	TAUBnRDT11	TAUBnRDT10	TAUBnRDT09	TAUBnRDT08	TAUBnRDT07	TAUBnRDT06	TAUBnRDT05	TAUBnRDT04	TAUBnRDT03	TAUBnRDT02	TAUBnRDT01	TAUBnRDT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 31.44 TAUBnRDT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDTm	Triggers the simultaneous rewrite enabling state: 0: No function. Writing 0 is ignored (the operation is not affected). 1: The simultaneous rewrite enabling flag (TAUBnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger. These bits only apply when: • TAUBnRDE.TAUBnRDEm = 1

### 31.3.4.6 TAUBnRSF — TAUBn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUBn\_base> + 048<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnRSF15	TAUBnRSF14	TAUBnRSF13	TAUBnRSF12	TAUBnRSF11	TAUBnRSF10	TAUBnRSF09	TAUBnRSF08	TAUBnRSF07	TAUBnRSF06	TAUBnRSF05	TAUBnRSF04	TAUBnRSF03	TAUBnRSF02	TAUBnRSF01	TAUBnRSF00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.45 TAUBnRSF Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRSFm	Indicates the simultaneous rewrite status: 0: Indicates simultaneous rewrite is completed due to the generation of the simultaneous rewrite trigger. 1: Indicates the simultaneous rewrite trigger waiting state when simultaneous rewrite is enabled (TAUBnRDTm = 1).

### 31.3.5 Details of TAUBn Output Registers

#### 31.3.5.1 TAUBnTOE — TAUBn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUBn\_base> + 5C<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TOE15	TAUBn TOE14	TAUBn TOE13	TAUBn TOE12	TAUBn TOE11	TAUBn TOE10	TAUBn TOE09	TAUBn TOE08	TAUBn TOE07	TAUBn TOE06	TAUBn TOE05	TAUBn TOE04	TAUBn TOE03	TAUBn TOE02	TAUBn TOE01	TAUBn TOE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.46 TAUBnTOE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOEm	Enables/disables independent channel output mode: 0: Disables independent channel output mode (controlled by software) 1: Enables independent channel output mode

#### 31.3.5.2 TAUBnTO — TAUBn Channel Output Register

This register specifies and reads the level of TAUBTTOUTm.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUBn\_base> + 58<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TO15	TAUBn TO14	TAUBn TO13	TAUBn TO12	TAUBn TO11	TAUBn TO10	TAUBn TO09	TAUBn TO08	TAUBn TO07	TAUBn TO06	TAUBn TO05	TAUBn TO04	TAUBn TO03	TAUBn TO02	TAUBn TO01	TAUBn TO00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.47 TAUBnTO Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOM	Specifies/reads the level of TAUBTTOUTm: 0: Low 1: High  Only TAUBnTOM bits for which Independent Channel Output function is disabled (TAUBnTOEm = 0) can be written.

### 31.3.5.3 TAUBnTOM — TAUBn Channel Output Mode Register

This register specifies the output mode of each channel.

**Access:** This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

**Address:** <TAUBn\_base> + 248<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTOM15	TAUBnTOM14	TAUBnTOM13	TAUBnTOM12	TAUBnTOM11	TAUBnTOM10	TAUBnTOM09	TAUBnTOM08	TAUBnTOM07	TAUBnTOM06	TAUBnTOM05	TAUBnTOM04	TAUBnTOM03	TAUBnTOM02	TAUBnTOM01	TAUBnTOM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.48 TAUBnTOM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOMm	Specifies the channel output mode: 0: Independent channel output mode 1: Synchronous channel output mode

### 31.3.5.4 TAUBnTOC — TAUBn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUBnTOMm.

**Access:** This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

**Address:** <TAUBn\_base> + 24CH

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TOC15	TAUBn TOC14	TAUBn TOC13	TAUBn TOC12	TAUBn TOC11	TAUBn TOC10	TAUBn TOC09	TAUBn TOC08	TAUBn TOC07	TAUBn TOC06	TAUBn TOC05	TAUBn TOC04	TAUBn TOC03	TAUBn TOC02	TAUBn TOC01	TAUBn TOC00

Table 31.49 TAUBnTOC Register Contents

Bit Position	Bit Name	Function													
15 to 0	TAUBnTOCm	Specifies the output mode: 0: Operation mode 1 1: Operation mode 2  The output mode also depends on TAUBnTOM.TAUBnTOMm, as can be seen in the following table.													
		<table border="1"> <thead> <tr> <th>TOMm</th> <th>TOCm</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td rowspan="2">0</td> <td>0</td> <td>Toggle mode: Toggles when INTTAUBnIm occurs.</td> </tr> <tr> <td>1</td> <td>Set/reset mode: Set when INTTAUBnIm occurs upon count start and reset when INTTAUBnIm occurs due to detection of a match between TAUBnCNTm and TAUBnCDRm.</td> </tr> <tr> <td rowspan="2">1</td> <td>0</td> <td>Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel.</td> </tr> <tr> <td>1</td> <td>Synchronous channel operation mode 2: Set when INTTAUBnIm occurs while the slave channel is counting down and reset when INTTAUBnIm occurs while the slave channel is counting up.</td> </tr> </tbody> </table>	TOMm	TOCm	Description	0	0	Toggle mode: Toggles when INTTAUBnIm occurs.	1	Set/reset mode: Set when INTTAUBnIm occurs upon count start and reset when INTTAUBnIm occurs due to detection of a match between TAUBnCNTm and TAUBnCDRm.	1	0	Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel.	1	Synchronous channel operation mode 2: Set when INTTAUBnIm occurs while the slave channel is counting down and reset when INTTAUBnIm occurs while the slave channel is counting up.
TOMm	TOCm	Description													
0	0	Toggle mode: Toggles when INTTAUBnIm occurs.													
	1	Set/reset mode: Set when INTTAUBnIm occurs upon count start and reset when INTTAUBnIm occurs due to detection of a match between TAUBnCNTm and TAUBnCDRm.													
1	0	Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel.													
	1	Synchronous channel operation mode 2: Set when INTTAUBnIm occurs while the slave channel is counting down and reset when INTTAUBnIm occurs while the slave channel is counting up.													

### 31.3.5.5 TAUBnTOL — TAUBn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUBnTO.TAUBnTOm).

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUBn\_base> + 040H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTOL15	TAUBnTOL14	TAUBnTOL13	TAUBnTOL12	TAUBnTOL11	TAUBnTOL10	TAUBnTOL09	TAUBnTOL08	TAUBnTOL07	TAUBnTOL06	TAUBnTOL05	TAUBnTOL04	TAUBnTOL03	TAUBnTOL02	TAUBnTOL01	TAUBnTOL00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 31.50 TAUBnTOL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOLm	Specifies the output logic of the channel m output bit (TAUBnTO.TAUBnTOm): 0: Positive logic (active high) 1: Negative logic (active low)  The setting of these bits applies to all channel output modes other than independent channel output mode controlled by software and independent channel output mode 1.

## 31.3.6 Details of TAUBn Dead Time Output Registers

### 31.3.6.1 TAUBnTDE — TAUBn Channel Dead Time Output Enable Register

This register enables/disables dead time operation for each channel.

**Access:** This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

**Address:** <TAUBn\_base> + 250H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 31.3.7 TAUBn Emulation Register

#### 31.3.7.1 TAUBnEMU — TAUBn Emulation Register

This register controls SVSTOP operations.

**Access:** This register can be read or written in 8-bit units.

Write to this register only when the counter is stopped (TAUBnTE.TAUBnTEm = 0) and when EPC.SVSTOP = 0.

**Address:** <TAUBn\_base> + 290<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	TAUBnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0

Table 31.53 TAUBnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUBnSVSDIS	<p>(When EPC.SVSTOP = 0)</p> <p>Regardless of the value of this bit (1/0), the count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint).</p> <p>(When EPC.SVSTOP = 1)</p> <p>0: The count clock stops when the debugger obtains the control of the microcontroller (e.g., at a breakpoint).</p> <p>1: The count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint).</p>
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

## 31.4 General Operating Procedure

The following describes the general operation procedure for the TAUBn:

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUBTTOUTm is also initialized and outputs a low level.

1. Set the TAUBnTPS register to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUBn function:
  - Set the operation mode
  - Set the channel output mode
  - Set any other control bits
3. Enable the counter by setting the TAUBnTS.TAUBnTSM bit to 1.  
The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUBnTT.TAUBnTTm bit to 1. The counter can be forcibly restarted by setting the TAUBnTS.TAUBnTSM bit to 1.
5. Stop the function by setting the TAUBnTT.TAUBnTTm bit to 1.

### NOTE

- A detailed description of the required control bits and the operation of the individual functions is given below.
  - **Section 31.12, Independent Channel Operation Functions**
  - **Section 31.14, Synchronous Channel Operation Functions**
- The function can be changed while the counter is stopped (TAUBnTE.TAUBnTEm=0).

## 31.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in **Section 31.5.1, Rules of Synchronous Channel Operation Function**.

Two special features for synchronous channel operation are detailed in the following:

- **Section 31.5.2, Simultaneous Start and Stop of Synchronous Channel Counters**
- **Section 31.6, Simultaneous Rewrite**

### 31.5.1 Rules of Synchronous Channel Operation Function

#### Number of master and slave channels

- Only even channels (CH0, CH2, CH4, ...) can be set as master channels.  
Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.  
Example: If CH2 is a master channel, CH3 and the lower channels (CH3, CH4, CH5, ...) can be set as slave channels.
- If multiple master channels are used, a range of slave channels that includes another master channel cannot be set for a given master channel.  
Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

#### Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the same value to the TAUBnCMORM.TAUBnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave channel usage and operation clocks are illustrated in **Figure 31.4, Grouping of the Channels and Assignment of Operation Clocks**.

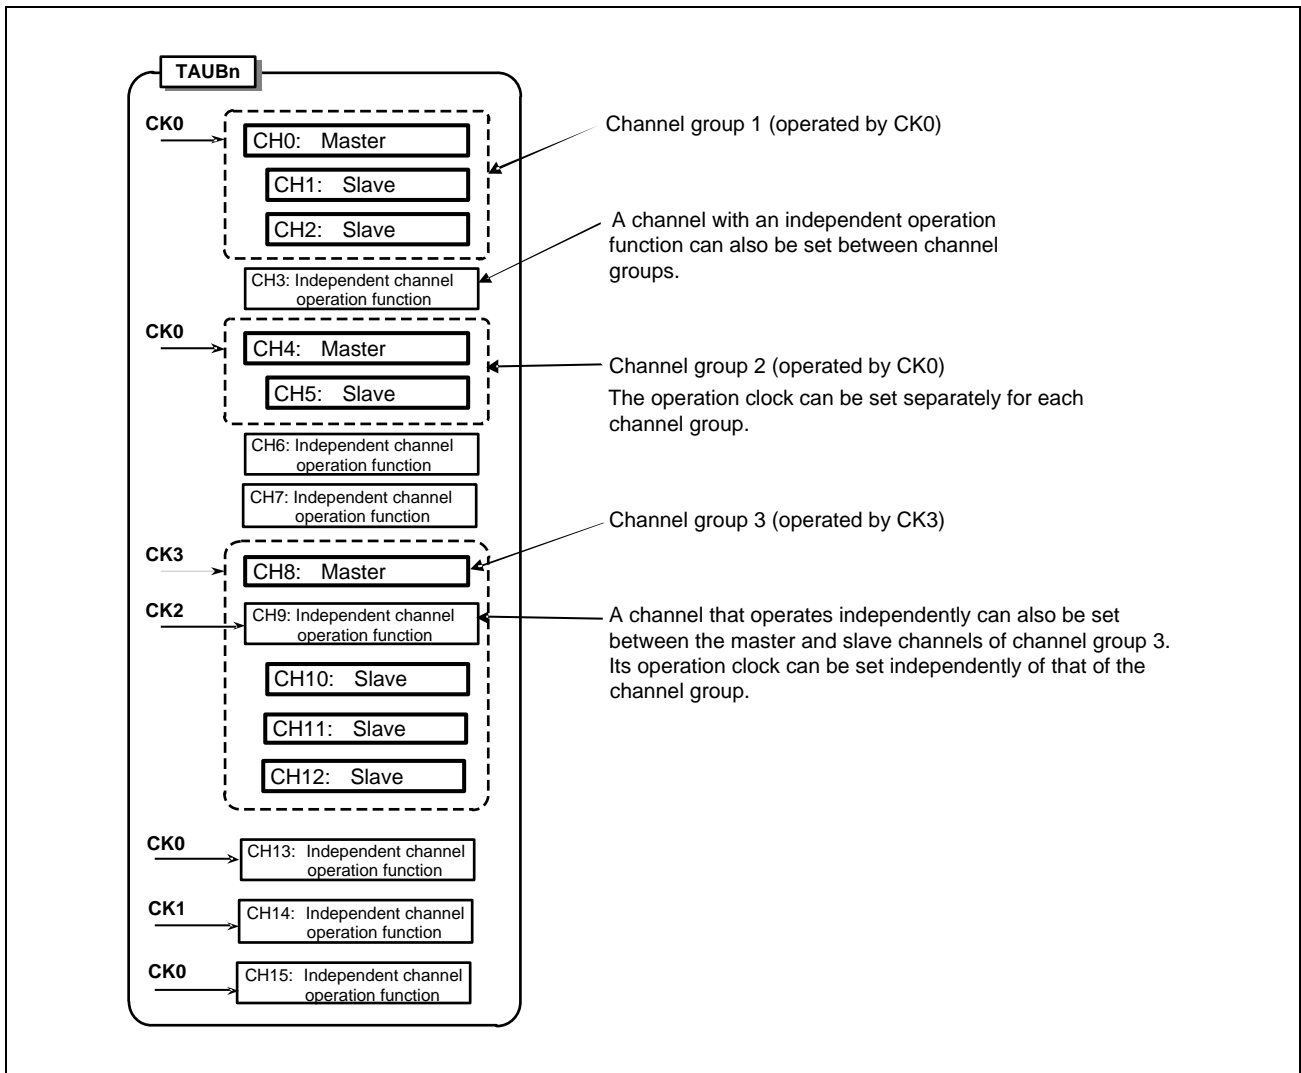

Figure 31.4 Grouping of the Channels and Assignment of Operation Clocks

## 31.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit.

### 31.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUBnTS.TAUBnTSM bits of the channels must be set at the same time.
- To simultaneously stop synchronized channels, the TAUBnTT.TAUBnTTM bits of the channels must be set at the same time.

Setting the TAUBnTS.TAUBnTSM bits to 1 sets the corresponding TAUBnTE.TAUBnTEM bits to 1, enabling counting. The exact time that it starts depends on the operation mode.

## 31.6 Simultaneous Rewrite

### 31.6.1 Introduction

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUBnCDRm and TAUBnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUBnIm being issued on the upper channel specified by TAUBnRDC.TAUBnRDCm

There are three methods for simultaneous rewrite. These are listed in the following table, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 31.54 Simultaneous Rewrite Methods and when They are Triggered

Method	Trigger	TAUBnRDE. TAUBnRDEm	TAUBnRDS. TAUBnRDSm	TAUBnRDM. TAUBnRDMm
—	No simultaneous rewrite	0	0	0
A	The master channel (re)starts counting	1	0	0
B	Counting is started in the master channel. The master channel starts counting down at the peak of triangular wave of the corresponding slave channel.	1	0	1
C1	INTTAUBnIm is generated on an upper channel specified by TAUBnRDC.TAUBnRDCm	1	1	0/1

The following table lists which of these three methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 31.13, Independent Channel Simultaneous Rewrite Functions** and **Section 31.14, Synchronous Channel Operation Functions**.

Table 31.55 Channel Functions and the Methods They Use for Simultaneous Rewrite

### 31.6.2 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite.

The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

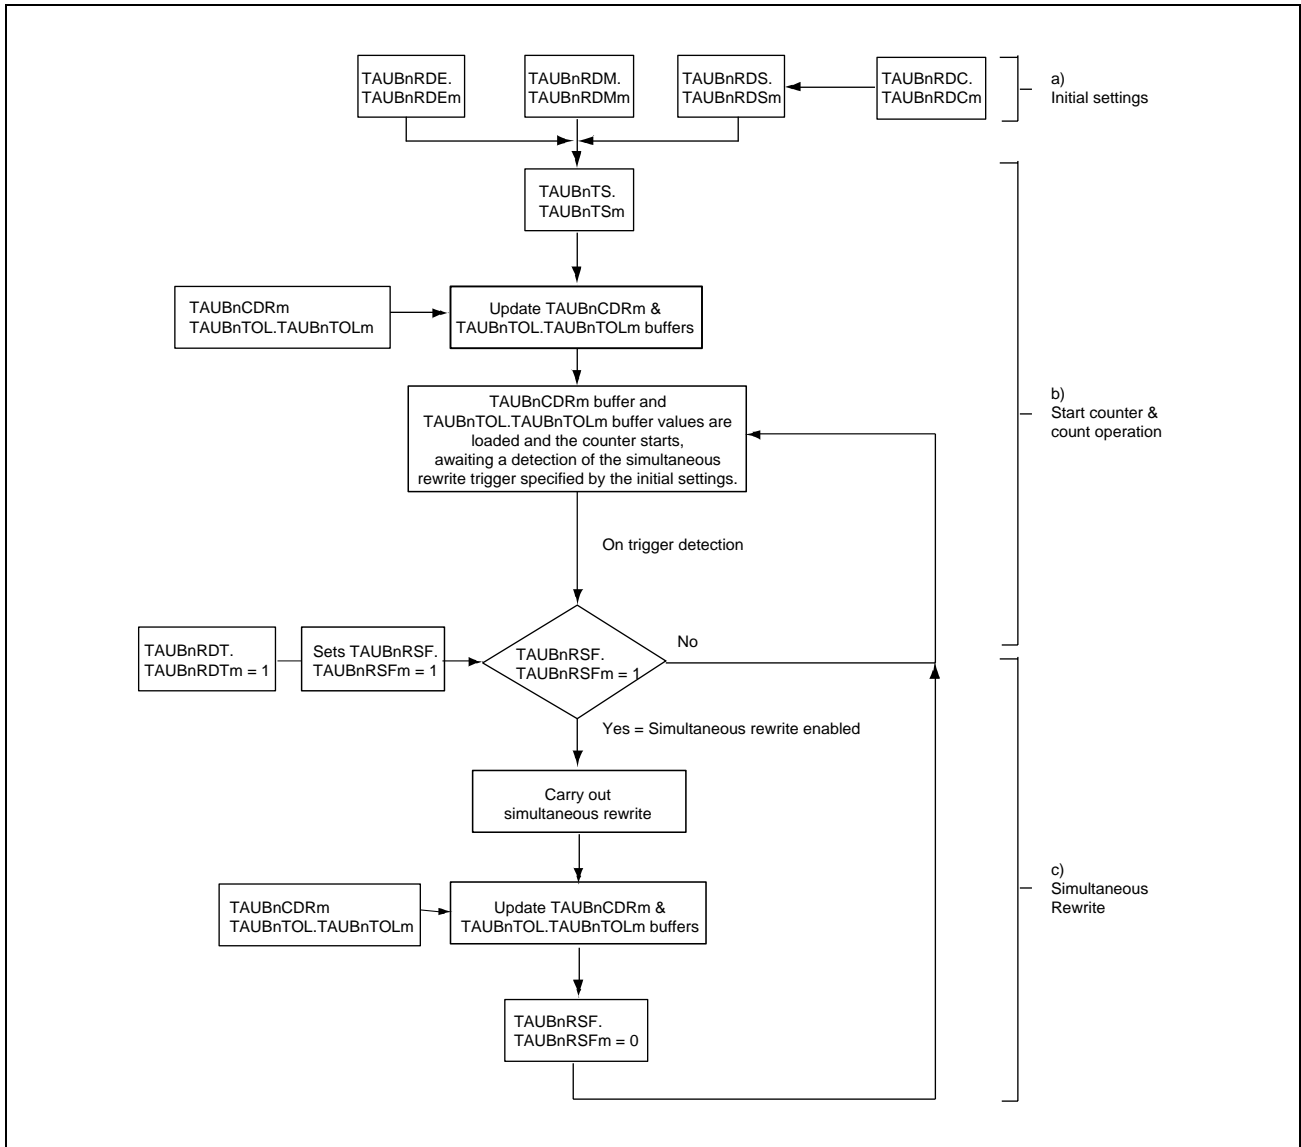

Figure 31.5 General Procedure for Simultaneous Rewrite

### 31.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set  $TAUBnRDE.TAUBnRDEm = 1$ .
- To select the type of simultaneous rewrite, set  $TAUBnRDM.TAUBnRDMm$  and  $TAUBnRDS.TAUBnRDSm$  according to the values in **Table 31.54, Simultaneous Rewrite Methods and when They are Triggered**.
- Specify a simultaneous rewrite trigger channel by using  $TAUBnRDC.TAUBnRDCm$ . (Prerequisite:  $TAUBnRDS.TAUBnRDSm$  has been set to the upper channel.)

### 31.6.2.2 Start Counter and Count Operation

- To start all the  $TAUBnCNTm$  counters in the channel group, set the corresponding  $TAUBnTS.TAUBnTSm$  bits to 1.  $TAUBnTOL.TAUBnTOLm$  and the values in the data registers ( $TAUBnCDRm$ ) are written to the corresponding  $TAUBnTOL.TAUBnTOLm$  buffer ( $TAUBnTOL.TAUBnTOLm$  buf) and data buffer registers ( $TAUBnCDRm$  buf) and the counters start.
- Setting the reload data trigger bit ( $TAUBnRDT.TAUBnRDTm$ ) to 1 sets the reload flag ( $TAUBnRSF.TAUBnRSFm$ ) to 1, enabling simultaneous rewrite.  $TAUBnRSF.TAUBnRSFm$  remains at 1 until simultaneous rewrite has taken place.
- When the specified trigger for simultaneous rewrite is detected, the  $TAUBnRSF.TAUBnRSFm$  bit is checked to see if simultaneous rewrite is enabled ( $TAUBnRSF.TAUBnRSFm = 1$ ). If it is, simultaneous rewrite is carried out. Otherwise, simultaneous rewrite is not carried out, and the system awaits the next simultaneous rewrite trigger detection.

### 31.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled ( $TAUBnRSF.TAUBnRSFm = 1$ ) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then written to the corresponding counters and the values are applied the next time the counter starts or restarts.
- When simultaneous rewrite is finished, the  $TAUBnRSF.TAUBnRSFm$  bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

### 31.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUBnRDE.TAUBnRDEm, TAUBnRDS.TAUBnRDSm, TAUBnRDM.TAUBnRDMm, and TAUBnRDC.TAUBnRDCm cannot be changed while the counter is in operation (TAUBnTE.TAUBnTEm = 1).
- TAUBnTOL.TAUBnTOLm can only be rewritten during operation in PWM output function or triangle PWM output function. For all other output functions, TAUBnTOL.TAUBnTOLm must be written before the counter starts. If it is rewritten in another function mode, TAUBTTOUTm outputs an invalid wave.
- When a simultaneous rewrite trigger is issued on an upper channel (TAUBnRDS.TAUBnRDSm = 1), the TAUBnRDC.TAUBnRDCm bit controls all the lower channels. This means that if the TAUBnRDC.TAUBnRDCm bits of CH2 and CH7 are set to 1 and the TAUBnRDC.TAUBnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger generation channel (TAUBnRDE.TAUBnRDEm and TAUBnRDS.TAUBnRDSm = 1) but no upper channel is set (TAUBnRDC.TAUBnRDC[15:0] = 0), simultaneous rewrite cannot take place.

### 31.6.4 Types of Simultaneous Rewrite

In the following section, the three simultaneous rewrite methods are explained using timing diagrams.

#### 31.6.4.1 Simultaneous Rewrite when the Master Channel (Re)Starts Counting (Method A)

Figure 31.6 Simultaneous Rewrite when the Master Channel (Re)Starts Counting

#### Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

#### Description:

- (1) When  $TAUBnTS.TAUBnTsm = 1$  is set, the value of  $TAUBnCDRm$  is copied to the  $TAUBnCDRm$  buffer and the value of  $TAUBnTOL.TAUBnTOLm$  is copied to the  $TAUBnTOL.TAUBnTOLm$  buffer.
- (2) The  $TAUBnCDRm$  and  $TAUBnTOL.TAUBnTOLm$  registers can be written at any time.
- (3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled ( $TAUBnRSF.TAUBnRSFm = 0$ )

- (4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.
- (5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.
- (6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

### 31.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel (Method B)

Figure 31.7 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel

**Setting:**

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

**Description:**

- (1) When  $TAUBnTS.TAUBnTsm = 1$  is set, the value of  $TAUBnCDRm$  is copied to the  $TAUBnCDRm$  buffer.
- (2) The  $TAUBnCDRm$  and  $TAUBnTOL$  registers can be written at any time.
- (3) Simultaneous rewrite does not occur because it is disabled ( $TAUBnRSF.TAUBnRSFm = 0$ ).
- (4) The reload data trigger bit ( $TAUBnRDT.TAUBnRDTm$ ) is set to 1 which sets the status flag ( $TAUBnRSF.TAUBnRSFm = 1$ ), enabling simultaneous rewrite.
- (5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.
- (6) Simultaneous rewrite takes place at the start timing of the top of the triangular cycle. The  $TAUBnCDRm$  value is loaded into the  $TAUBnCDRm$  buffer, and the  $TAUBnTOL.TAUBnTOLm$  value is loaded into the  $TAUBnTOL.TAUBnTOLm$  buffer.
- (7) The counters count down and await the next simultaneous rewrite trigger. The values of  $TAUBnCDRm$  and  $TAUBnTOL.TAUBnTOLm$  can be changed again.

**31.6.4.3 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm (Method C1)**

Figure 31.8 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm

**Setting:**

CH1 is an upper channel used counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUBnRDC register specifies a channel which generates simultaneous rewrite triggers.

**Description:**

- (1) When TAUBnTS.TAUBnTSM is set to 1, the TAUBnCDRm value is copied to the TAUBnCDRm buffer.
- (2) The TAUBnCDRm register is always ready to write.
- (3) By setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1, the status flag is set (TAUBnRSF.TAUBnRSFm = 1) to enable simultaneous rewrite.
- (4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.
- (5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches 0000<sub>H</sub>. The TAUBnCDRm values are loaded into the corresponding TAUBnCDRm buffers.
- (6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUBnCDRm register can be rechanged.

## 31.7 Channel Output Modes

The output of the TAUBTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUBnTOE.TAUBnTOEm = 0)  
When controlled by software, the value written in the output register bit (TAUBnTO.TAUBnTOm) is sent to the output pin (TAUBTTOUTm).
- By TAUB signals (TAUBnTOE.TAUBnTOEm = 1)  
When controlled by TAUB signals, the output level of TAUBTTOUTm is set or reset or toggled by internal signals. The value of TAUBnTO.TAUBnTOm is updated accordingly to reflect the value of TAUBTTOUTm.
  - Independently (TAUBnTOM.TAUBnTOMm = 0)  
In case of independent operation, the output of the TAUBTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUBnTOM.TAUBnTOMm = 0).
  - Synchronously (TAUBnTOM.TAUBnTOMm = 1)  
In case of synchronous operation, the output of the TAUBTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUBnTOM.TAUBnTOMm = 1).

The TAUBnTO.TAUBnTOm bit can always be read to determine the current value of TAUBTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

### Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 31.56, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 31.7.2, Channel Output Modes Controlled Independently by TAUBn Signals**
- **Section 31.7.3, Channel Output Modes Controlled Synchronously by TAUBn Signals**

### Batch operation of TAUBnTOm bit

Whether a set value is reflected to the TAUBnTOm bit or not is controlled by the TAUBnTOE.TAUBnTOEm bit.

The TAUBnTOm setting is written only to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 0 when a write to the TAUBnTO register is attempted. No TAUBnTOm setting is reflected to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 1.

### NOTE

The TAUBnTO.TAUBnTOm bit is placed so that its bit number corresponds to a channel number.

## Output logic

Positive logic or negative logic of the output is specified by control bit TAUBnTOL.TAUBnTOLm.

The value of TAUBnTOL.TAUBnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. If TAUBnTOL.TAUBnTOLm is changed after the counter starts, the output of TAUBTTOUTm is undefined.

See **Section 31.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 31.56, Channel Output Modes**.

Table 31.56 Channel Output Modes

Channel Output Mode	TAUBnTOE. TAUBnTOEm	TAUBnTOM. TAUBnTOMm	TAUBnTOC. TAUBnTOCm	TAUBnTDE. TAUBnTDEm
By software				
Independent channel output mode controlled by software	0		x	
By TAUB signals, independently				
Independent channel output mode 1	1	0	0	0
Independent channel output mode 2			1	
By TAUB signals, synchronously				
Synchronous channel output mode 1	1	1	0	0
Synchronous channel output mode 2			1	0
Synchronous channel output mode 2 with dead time output				1

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

### NOTE

The following bits cannot be changed during count operation (TAUBnTE.TAUBnTEm = 1):

- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

### 31.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUBTTOUT<sub>m</sub> channel output mode. The prerequisite is that timer output operation is disabled (TAUBnTOE.TAUBnTOEm = 0).

- (1) Set TAUBnTO.TAUBnTOm to specify the initial level of the TAUBTTOUT<sub>m</sub> output.
- (2) Set channel output mode according to **Table 31.56, Channel Output Modes**, and the output logic using the TAUBnTOL.TAUBnTOLm bit.
- (3) Start the counter (TAUBnTS.TAUBnTSm = 1).

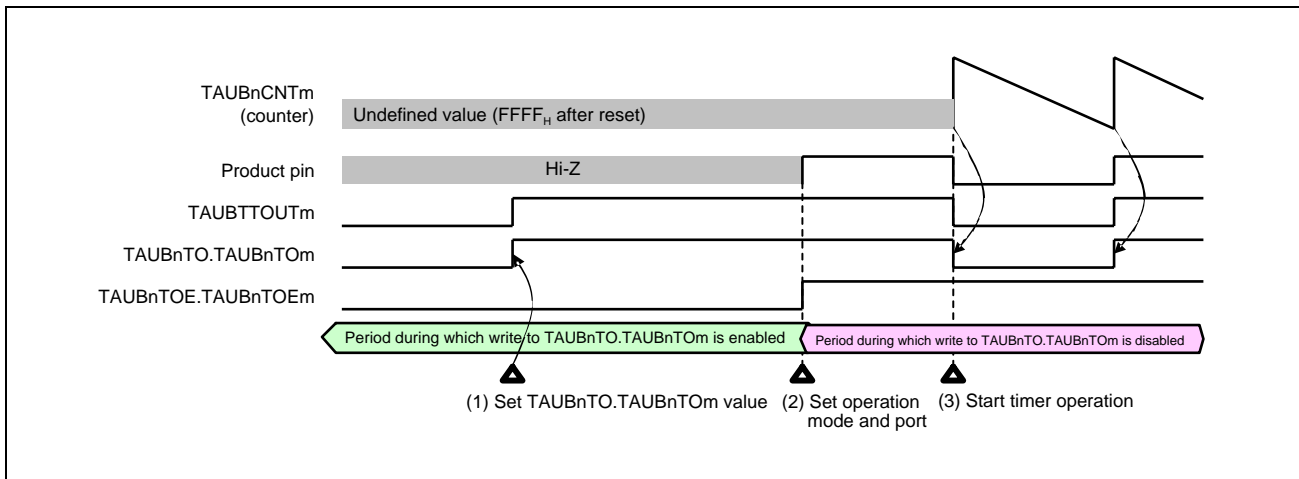

Figure 31.9 General Procedure for Specifying a TAUBTTOUT<sub>m</sub> Channel Output Mode

## 31.7.2 Channel Output Modes Controlled Independently by TAUBn Signals

This section lists the channel output modes that are controlled independently by TAUBn signals. The control bits used to specify a mode are listed in **Table 31.56, Channel Output Modes**.

### 31.7.2.1 Independent Channel Output Mode 1

#### Set/reset conditions

In this output mode, TAUBTTOUT<sub>m</sub> toggles when INTTAUBnIm is detected. The value of TAUBnTOL.TAUBnTOL<sub>m</sub> is ignored.

#### Prerequisites

There are no prerequisites other than those shown in **Table 31.56, Channel Output Modes**.

### 31.7.2.2 Independent Channel Output Mode 2

#### Set/reset conditions

In this output mode, TAUBTTOUT<sub>m</sub> is set when INTTAUBnIm occurs at the time of count start, and reset when INTTAUBnIm occurs due to a match between TAUBnCNT<sub>m</sub> and TAUBnCDR<sub>m</sub>.

#### Prerequisites

There are no prerequisites other than those shown in **Table 31.56, Channel Output Modes**.

## 31.7.3 Channel Output Modes Controlled Synchronously by TAUBn Signals

This section lists the channel output modes that are controlled synchronously by TAUBn signals. The control bits used to specify a mode are listed in **Table 31.56, Channel Output Modes**.

### 31.7.3.1 Synchronous Channel Output Mode 1

#### Set/reset conditions

In this output mode, INTTAUBnIm of master channel serves as a set signal and INTTAUBnIm of the slave channel as a reset signal. If INTTAUBnIm of the master channel and INTTAUBnIm of the slave channel are generated at the same time, INTTAUBnIm of the slave channel (reset signal) has priority over INTTAUBnIm (set signal) of the master channel, i.e., the master channel is ignored.

#### Prerequisites

There are no prerequisites other than those shown in **Table 31.56, Channel Output Modes**.

### 31.7.3.2 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is triangular wave PWM output at TAUBTTOUT<sub>m</sub>. For details, see **Section 31.14.5, Triangle PWM Output Function**.

#### Set/reset conditions

TAUBnCNT<sub>m</sub> of the slave channel counts down and up alternatively. When it passes 0001<sub>H</sub> it generates an interrupt, causing TAUBTTOUT<sub>m</sub> to toggle.

### Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUBTTOUTm should be set to 0 before the function starts.

#### 31.7.3.3 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUBTTOUTm. The set/reset conditions are shown in **Figure 31.10, Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output**.

#### Set/reset conditions

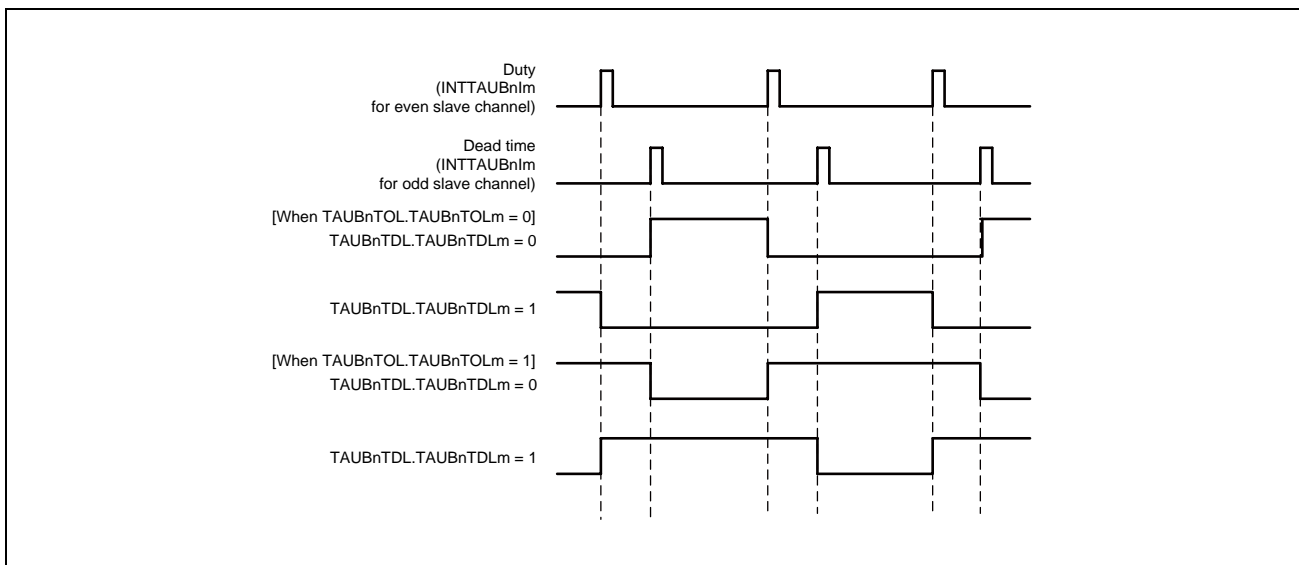

Figure 31.10 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUBnTDL.TAUBnTDLm = 0 for rising edges and TAUBnTDL.TAUBnTDLm = 1 for falling edges.

### Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel  
The master channel should be set to interval timer mode.
- One even slave channel  
The even slave channel should be set to count-up/-down mode.
- One odd slave channel (even channel + 1)  
The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUBnTOE.TAUBnTOEm
- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

## 31.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUBnTS.TAUBnTSM is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

### CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

### 31.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-Up/-Down Mode, and Count Capture Mode

The counter starts operating at the next count clock after TAUBnTS.TAUBnTSM is set to 1. The value of data register is also loaded when the counter starts.

Figure 31.11 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Up/Down Count Mode, and Count Capture Mode

### NOTE

Make sure to set TAUBnCMORm.TAUBnMD0 to 0 when using the count-up/-down mode.

### 31.8.2 Event Count Mode

The value of data register is loaded as soon as TAUBnTS.TAUBnTSM is set to 1. The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

Figure 31.12 Start Timing in Event Count Mode

### 31.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUBTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

Figure 31.13 Count Start Timing in Other Operating Modes

### 31.9 TAUBTTOUTm Output and INTTAUBnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUBnIm is generated using the TAUBnCMORm.TAUBnMD0 bit. The generation of INTTAUBnIm when the TAUBnCMORm.TAUBnMD0 bit starts counting and the effect to TAUBTTOUTm depend on the selected function. For details, refer to the description of TAUBnCMORm.TAUBnMD0 of each function.

Figure 31.14 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0 = 0)

Figure 31.15 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0 = 1)

## 31.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches  $FFFF_H$  and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches  $0000_H$  at the same time as the first channel overflows ( $TAUBnCNTm = FFFF_H$ ).
- Set  $TAUBnCDRm$  of the second channel to  $FFFF_H$ .
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same  $TAUBTTINm$  input.
- The trigger detection settings ( $TAUBnCMORm.TAUBnSTS[2:0]$  and  $TAUBnCMURm.TAUBnTIS[1:0]$ ) must be identical for both channels.

### Result:

The down-counter of the second channel reaches  $0000_H$  at exactly the same time as the up-counter of the first channel overflows ( $TAUBnCNTm = FFFF_H$ ). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

### 31.10.1 Example of Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the TAUBTTINm input interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input pulse interval measurement function exceeds FFFF<sub>H</sub>.

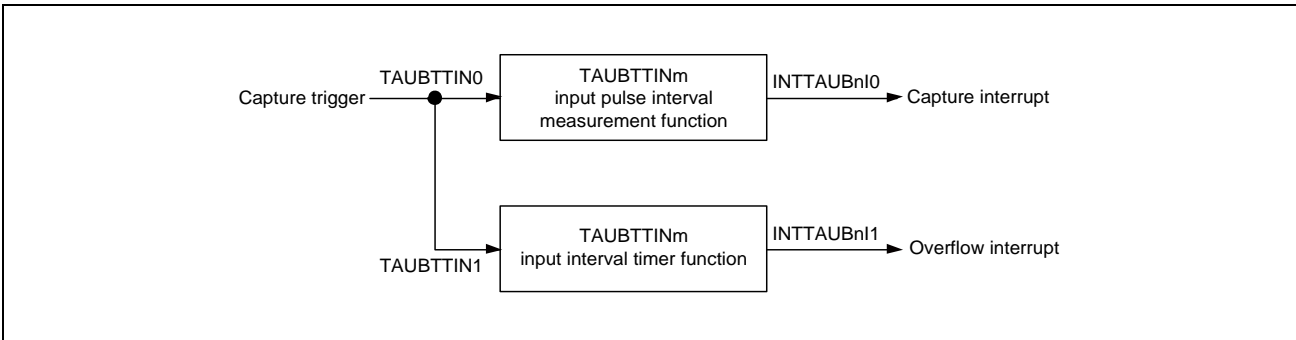

Figure 31.16 Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

#### Timing diagram

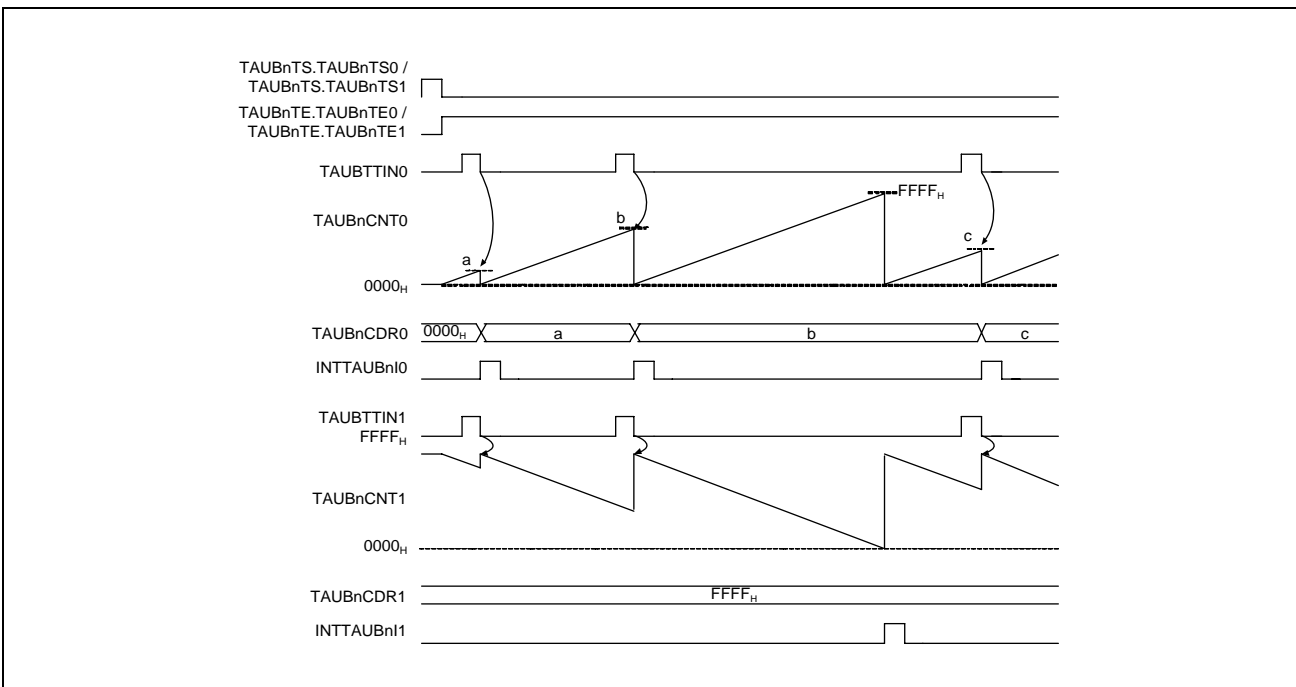

Figure 31.17 Interrupt Generation by Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

### 31.10.2 Example of Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm width measurement) can detect the overflow when TAUBnCNTm of the TAUBTTINm input signal width measurement function exceeds FFFF<sub>H</sub>.

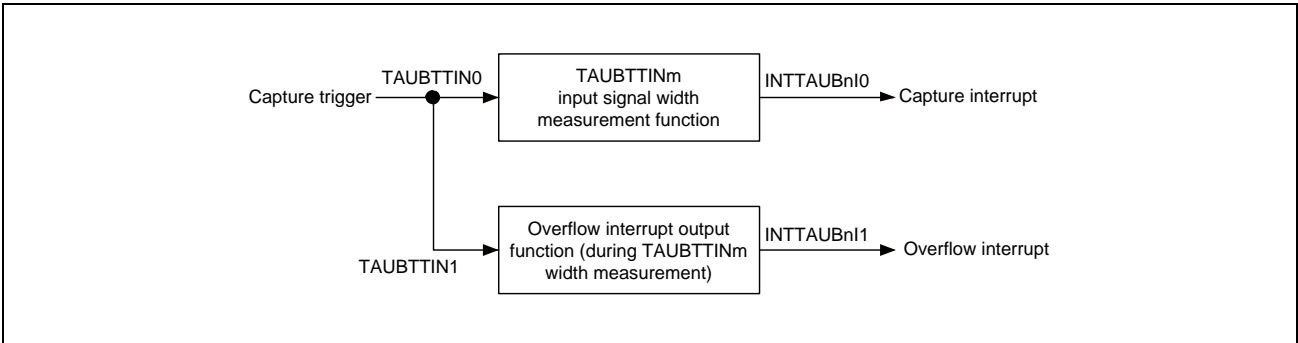

Figure 31.18 Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

#### Timing diagram

Figure 31.19 Interrupt Generation by Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

### 31.10.3 Example of Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUBnIm of the interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input position detection function exceeds FFFF<sub>H</sub>.

Figure 31.20 Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

#### Timing diagram

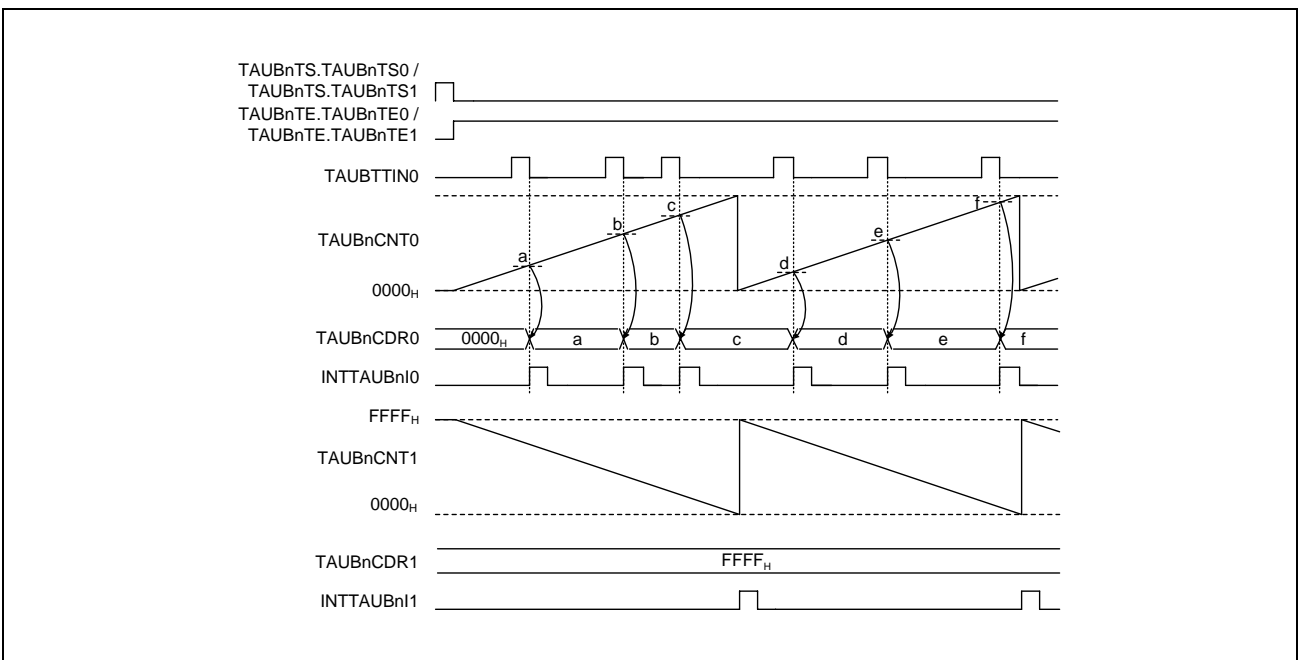

Figure 31.21 Interrupt Generation by Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

### 31.10.4 Example of Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm input period count detection) can detect the overflow when TAUBnCNTm of the TAUBTTINm input period count detection function exceeds FFFF<sub>H</sub>.

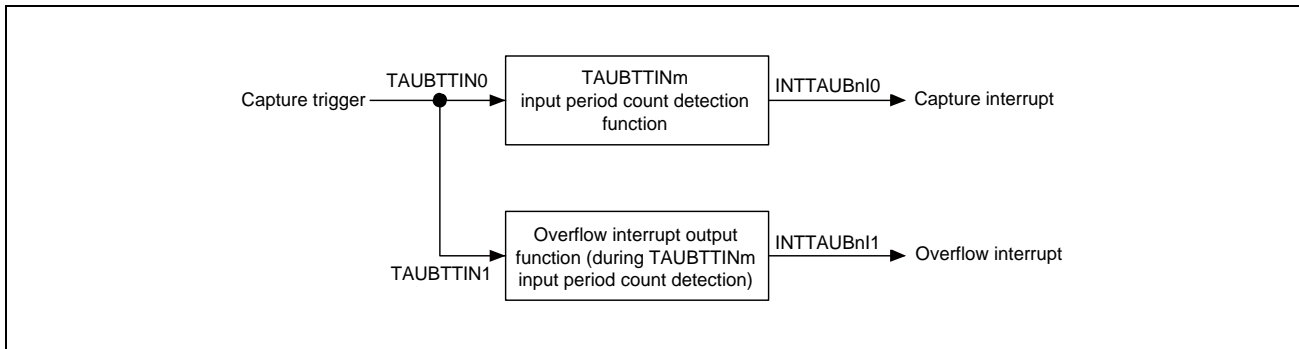

Figure 31.22 Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (TAUBTTINm Input Period Count Detection)

#### Timing diagram

Figure 31.23 Interrupt Generation by Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

### 31.11 TAUBTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

Figure 31.24 Basic Edge Detection Timing

**Figure 31.24, Basic Edge Detection Timing** is an image of the operation timing. Actually, the delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn will be generated.

## 31.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUB. For a general overview of independent channel operation functions, see **Section 31.2, Overview**.

### 31.12.1 Interval Timer Function

#### 31.12.1.1 Overview

##### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals. When an interrupt is generated, the TAUBTTOUTm signal toggles, resulting in a square wave.

##### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

When the counter reaches 0000<sub>H</sub>, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

##### Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle. This results in an inverted TAUBTTOUTm signal output when TAUBnCMORm.TAUBnMD0 is set to 1.

#### 31.12.1.2 Equations

INTTAUBnIm cycle = count clock cycle × (TAUBnCDRm + 1)

TAUBTTOUTm square wave cycle = count clock cycle × (TAUBnCDRm + 1) × 2

31.12.1.3 Block Diagram and General Timing Diagram

Figure 31.25 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

Figure 31.26 General Timing Diagram for Interval Timer Function

### 31.12.1.4 Register Settings

#### (1) TAUBnCMORM

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 31.57 Contents of the TAUBnCMORM Register for Interval Timer Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0 <sub>B</sub> .
11	TAUBnMAS	Write 0 <sub>B</sub> .
10 to 8	TAUBnSTS[2:0]	Write 000 <sub>B</sub> .
7, 6	TAUBnCOS[1:0]	Write 00 <sub>B</sub> .
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000 <sub>B</sub> .
0	TAUBnMD0	0: INTTAUBnIm is not generated and TAUBTTOUTm does not toggle at operation start. 1: INTTAUBnIm is generated and TAUBTTOUTm toggles at operation start or restart.

#### (2) TAUBnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 31.58 Contents of the TAUBnCMURm Register for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

**(3) Channel output mode**

Table 31.59 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1 <sub>B</sub> .
TAUBnTOM.TAUBnTOMm	Write 0 <sub>B</sub> .
TAUBnTOC.TAUBnTOCm	Write 0 <sub>B</sub> .
TAUBnTOL.TAUBnTOLm	Write 0 <sub>B</sub> .
TAUBnTDE.TAUBnTDEm	Write 0 <sub>B</sub> .
TAUBnTDL.TAUBnTDLm	Write 0 <sub>B</sub> .

**NOTE**

The channel output mode can also be set to channel output mode controlled by software by setting TAUBnTOE.TAUBnTOEm = 0. TAUBTTOUTm can then be controlled independently of the interrupts.

**(4) Simultaneous rewrite**

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Interval Timer Function. Therefore, these registers must be set to 0.

Table 31.60 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

### 31.12.1.5 Operating Procedure for Interval Timer Function

Table 31.61 Operating Procedure for Interval Timer Function

	Operation	Status of TAUBn
Restart operation	Initial channel setting	Channel operation is stopped.
	Start operation	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated and TAUBTTOUTm toggles.
	During operation	<ul style="list-style-type: none"> <li>TAUBnCNTm counts down. When the counter reaches 0000<sub>H</sub>:</li> <li>TAUBnCNTm reloads the TAUBnCDRm value and continues count operation</li> </ul> INTTAUBnIm is generated and TAUBTTOUTm toggles.
	Stop operation	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

### 31.12.1.6 Specific Timing Diagrams

#### (1) TAUBnCDRm = 0000H, count clock = PCLK/2

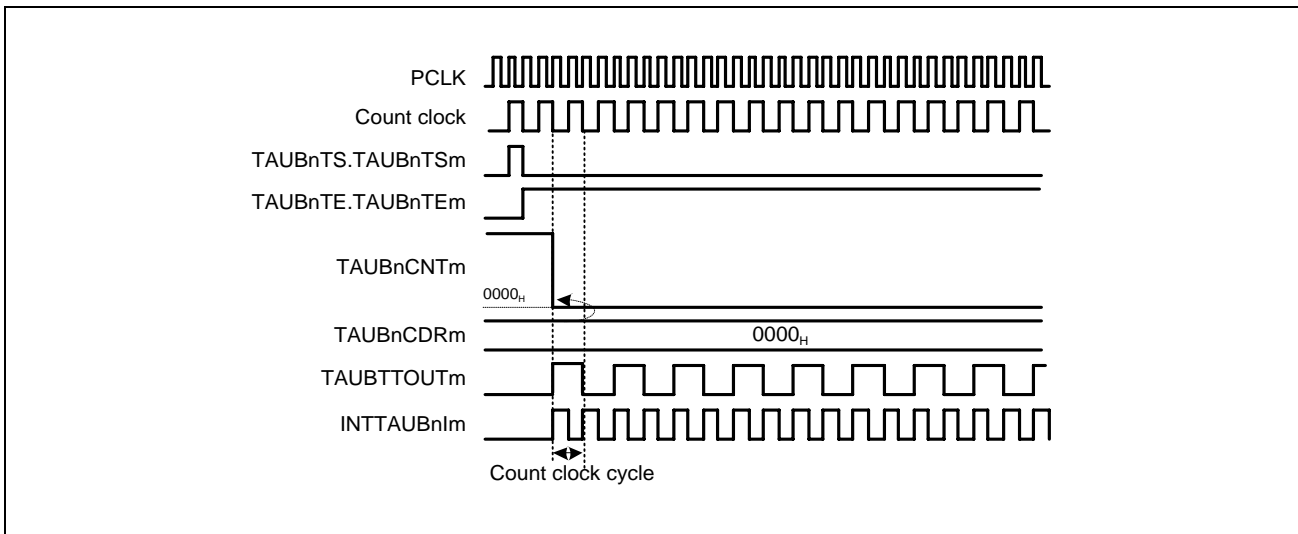

Figure 31.27 TAUBnCDRm = 0000H, Count Clock = PCLK/2

- TAUBnCDRm = 0000H, and the count clock = PCLK/2, the TAUBnCDRm value is written to TAUBnCNTm every count clock, meaning that TAUBnCNTm is always 0000H.
- INTTAUBnIm is generated every count clock, resulting in TAUBTTOUTm toggling every count clock.

**(2) TAUBnCDRm = 0000<sub>H</sub>, count clock = PCLK**Figure 31.28 TAUBnCDRm = 0000<sub>H</sub>, Count Clock = PCLK

- TAUBnCDRm = 0000<sub>H</sub>, and the count clock = PCLK, the TAUBnCDRm value is written to TAUBnCNTm every PCLK clock, meaning that TAUBnCNTm is always 0000<sub>H</sub>.
- INTTAUBnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.  
TAUBTTOUTm is toggled every PCLK clock.

**(3) Operation stop and restart (TAUBnCMORm TAUBnMD0 = 1)**

Figure 31.29 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 1

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1.

**(4) Operation stop and restart (TAUBnCMORm.TAUBnMD0 = 0)**

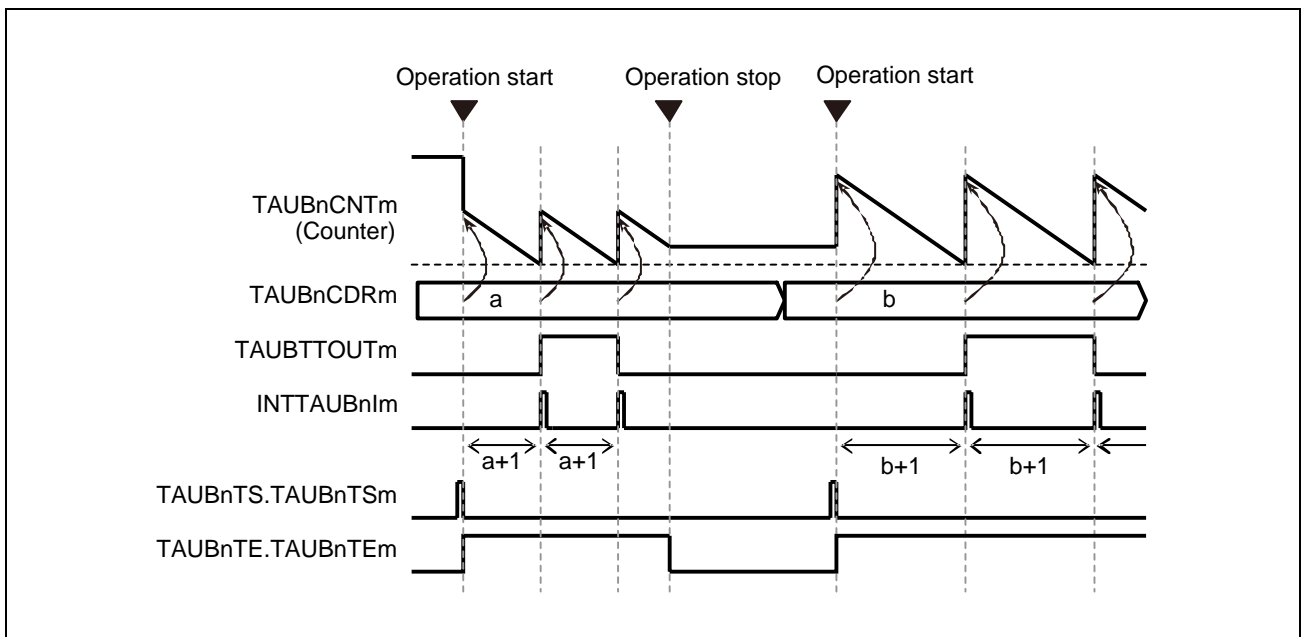

Figure 31.30 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 0

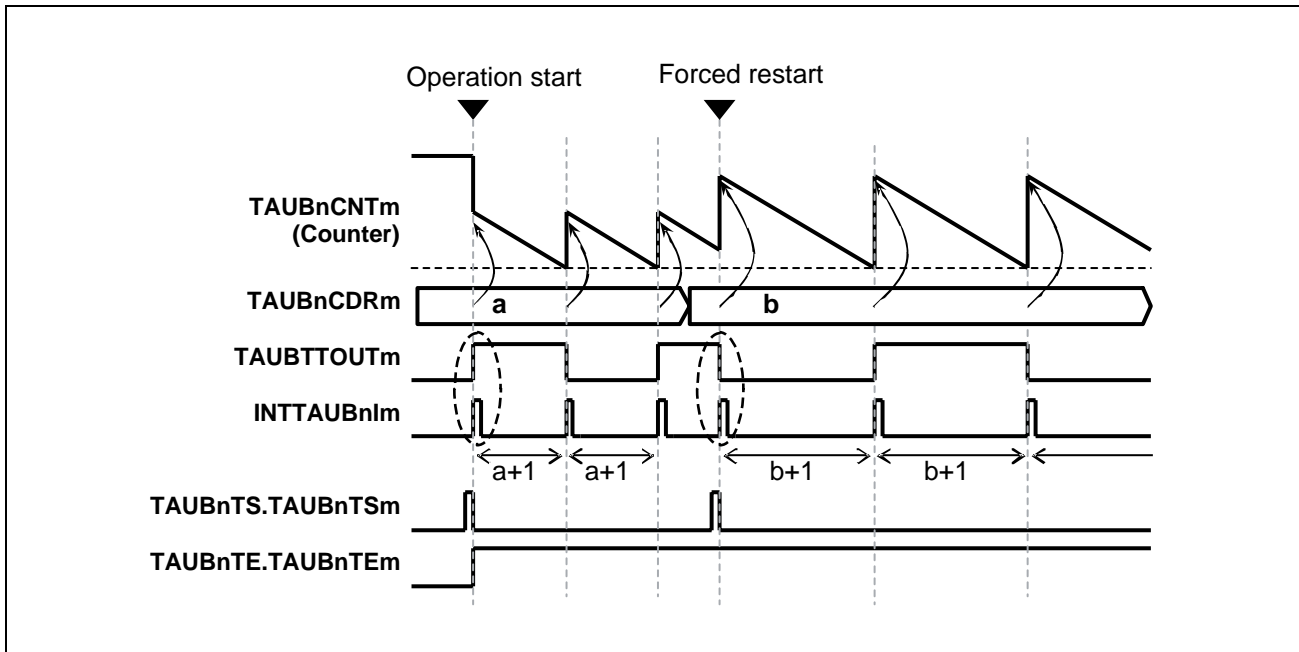

**(5) Forced restart (TAUBnCMORm.TAUBnMD0 = 1)**

Figure 31.31 Forced Restart Operation, TAUBnCMORm.TAUBnMD0 = 1

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt at start or restart is generated and the output TAUBTTOUTm toggles.

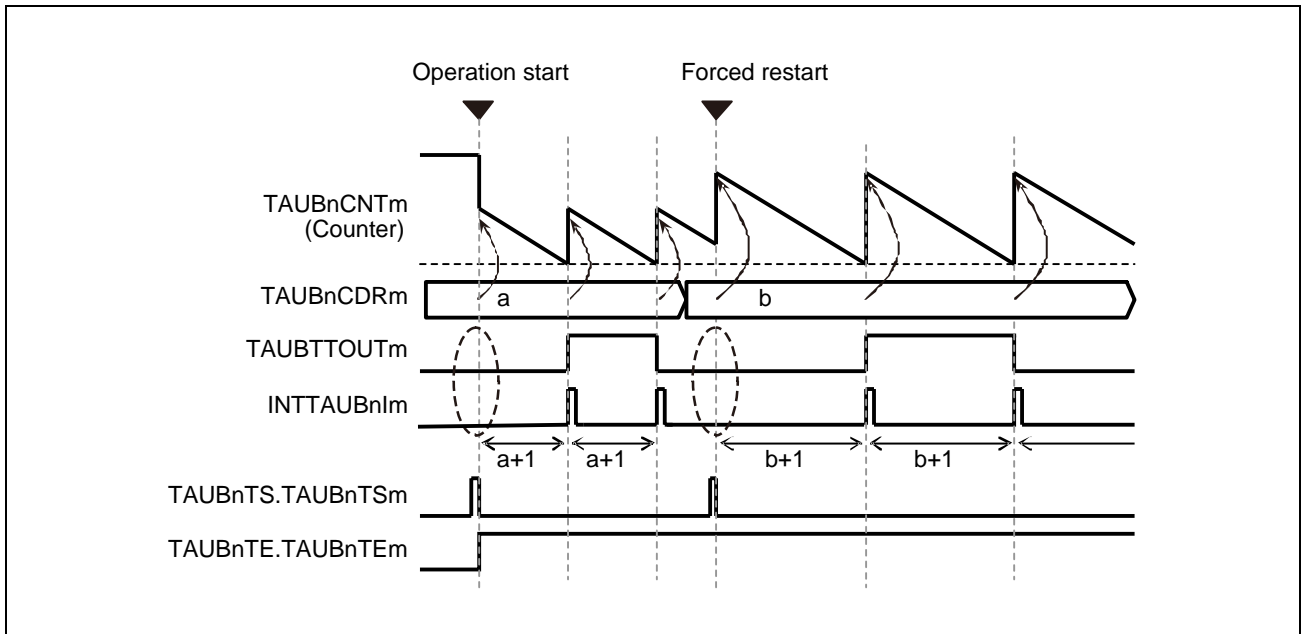

**(6) Forced restart (TAUBnCMORm.TAUBnMD0 = 0)**

Figure 31.32 Forced Restart Operation (TAUBnCMORm.TAUBnMD0 = 0)

- The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle.

## 31.12.2 TAUBTTINm Input Interval Timer Function

### 31.12.2.1 Overview

#### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals or when a valid TAUBTTINm input edge is detected.

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

INTTAUBnIm is generated when the counter reaches 0000<sub>H</sub> or by an effective TAUBTTINm input edge. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The type of edge used as the trigger is specified using the TAUBnCMURm.TAUBnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

31.12.2.2 Block Diagram and General Timing Diagram

Figure 31.33 Block Diagram for TAUBTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1).
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01<sub>B</sub>)

#### (3) Channel output mode

This function does not use channel output mode.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Interval Timer Function. Therefore, these registers must be set to 0.

Table 31.64 Simultaneous Rewrite Settings for TAUBTTINm Input Interval Timer Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

#### 31.12.2.4 Operating Procedure for TAUBTTINm Input Interval Timer Function

Table 31.65 Operating Procedure for TAUBTTINm Input Interval Timer Function

	Operation	Status of TAUBn
Restart operation	Initial channel setting Set the TAUBnCMORm and TAUBnCMURm registers as described in <b>Table 31.62, Contents of the TAUBnCMORm Register for TAUBTTINm Input Interval Timer Function</b> and <b>Table 31.63, Contents of the TAUBnCMURm Register for TAUBTTINm Input Interval Timer Function</b>  Set the value of the TAUBnCDRm register.	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated.
	During operation The values of the TAUBnCMURm.TAUBnTIS[1:0] and the TAUBnCDRm register can be changed at any time. The TAUBnCNTm register can be read at all times.  Detection of TAUBTTINm edge	TAUBnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>TAUBnCNTm reloads the TAUBnCDRm value and continues count operation</li> <li>INTTAUBnIm is generated</li> </ul> When a TAUBTTINm input valid edge is detected during count operation, TAUBnCNTm reloads the TAUBnCDRm value and continues count operation. Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1 TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stop and retain their current values.

### 31.12.2.5 Specific Timing Diagrams

The timing diagrams in **Section 31.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by an effective TAUBTTINm input edge.

Figure 31.35 Counter Triggered by Rising TAUBTTINm Input Edge (TAUBnCMURm.TAUBnTIS[1:0] = 01<sub>B</sub>),  
TAUBnCMORM.TAUBnMD0 = 1

- If an effective TAUBTTINm input edge is detected, an interrupt INTTAUBnIm is generated. In this example, the effective edge is a rising edge (TAUBnCMURm.TAUBnTIS[1:0] = 01<sub>B</sub>).

### 31.12.3 Clock Divide Function

#### 31.12.3.1 Overview

##### Summary

This function is used as a frequency divider. The frequency of the input signal TAUBTTINm is divided by a factor related to TAUBnCDRm, and an interrupt INTTAUBnIm is generated.

##### Prerequisites

- TAUBTTINm must have a fixed frequency
- The operation mode must be set to interval timer mode, see **Table 31.66, Contents of the TAUBnCMORm Register for Clock Divide Function**

##### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value, using TAUBTTINm as the count clock.

When the counter value reaches 0000<sub>H</sub>, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm stops but retain their values. The function can be restarted by setting TAUBnTS.TAUBnTsm = 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTsm = 1 during operation.

##### Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated.

##### NOTE

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by TAUBnCMORm.TAUBnCKs[1:0] bits.

### 31.12.3.2 Block Diagram and General Timing Diagram

Figure 31.36 Block Diagram for Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01<sub>B</sub>)

Figure 31.37 General Timing Diagram for Clock Divide Function

TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

#### 31.12.3.4 Operating Procedure for Clock Divide Function

Table 31.69 Operating Procedure for Clock Divide Function

	Operation	Status of TAUBn
Restart operation	Initial channel setting Set the TAUBnCMORM and TAUBnCMURm registers as described in <b>Table 31.66, Contents of the TAUBnCMORM Register for Clock Divide Function</b> and <b>Table 31.67, Contents of the TAUBnCMURm Register for Clock Divide Function</b>  Set the value of the TAUBnCDRm register.	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORM.TAUBnMD0 is set to 1, INTTAUBnIm is generated.
	During operation The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at all times.	When a TAUBTTInm input edge is detected, TAUBnCNTm counts down. When the counter reaches 0000H: <ul style="list-style-type: none"> <li>• TAUBnCNTm loads the TAUBnCDRm value and continues count operation</li> <li>• INTTAUBnIm is generated</li> </ul>
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

### 31.12.3.5 Specific Timing Diagrams

#### (1) TAUBnCDRm = 0000H

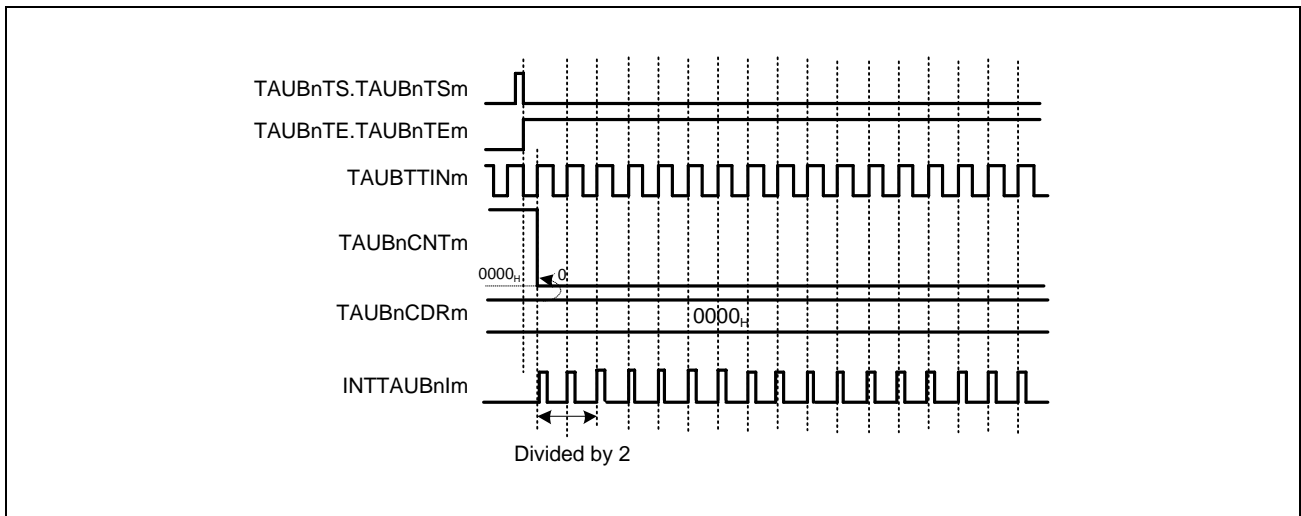

Figure 31.38 TAUBnCDRm = 0000H, TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01B

- If TAUBnCDRm is 0000H, TAUBnCNTm is also always 0000H.
- INTTAUBnIm is generated every count clock.

#### Figure 31.38, TAUBnCDRm = 0000H, TAUBnCMORm.TAUBnMD0 = 1,

TAUBnCMURm.TAUBnTIS[1:0] = 01B is an image of the operation timing. Actually, there is a delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn.

#### (2) Operation restart

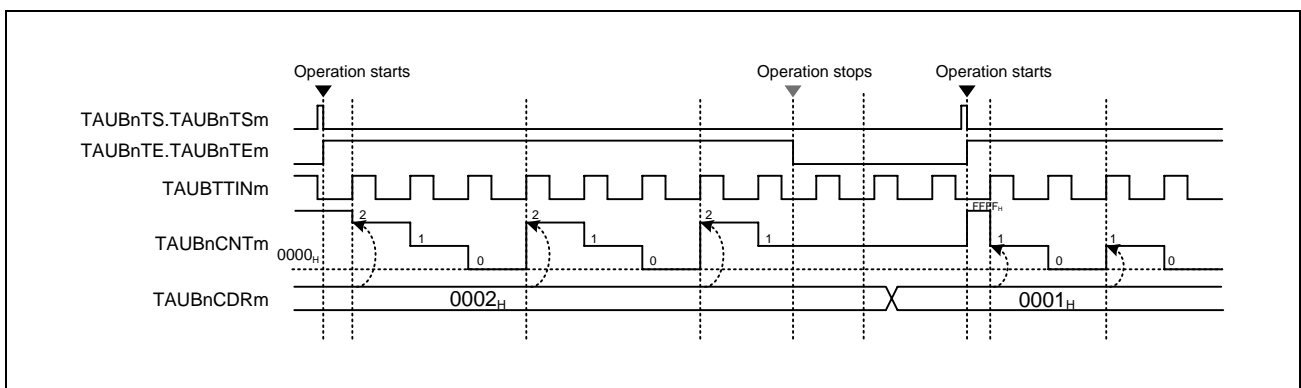

Figure 31.39 Operation Restart (TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01B)

**(3) Forced restart**

Figure 31.40 Forced Restart (TAUBnCMORM.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01B)

To forcibly restart the counter.

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSM = 1 during operation.
- The value of TAUBnCDRm is written to TAUBnCNTm and the count operation restarts.

## 31.12.4 External Event Count Function

### 31.12.4.1 Overview

#### Summary

This function is used as an event timer. It generates an interrupt (INTTAUBnIm) when a specific number of valid edges of TAUBTTINm input are detected.

#### Prerequisites

- The operation mode must be set to event count mode, see **Table 31.70, Contents of the TAUBnCMORm Register for External Event Count Function**
- TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When the counter starts, the current value of TAUBnCDRm is written to TAUBnCNTm.

When an effective TAUBTTINm input edge is detected, the value of TAUBnCNTm reduces by 1. TAUBnCNTm retains this value until a valid TAUBTTINm input edge is detected or the counter is restarted.

When effective edges are detected (TAUBnCDRm + 1) times, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues to operate.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

#### Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 01<sub>B</sub>, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 10<sub>B</sub>, rising and falling edges trigger the counter.

### 31.12.4.2 Equations

Number of valid edges,  
detected before INTTAUBnIm is generated = TAUBnCDRm + 1

#### (3) Channel output mode

The channel output mode is not used by this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the External Event Count Function.

Therefore, these registers must be set to 0.

Table 31.72 Simultaneous Rewrite Settings for External Event Count Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

#### 31.12.4.5 Operating Procedure for External Event Count Function

Table 31.73 Operating Procedure for External Event Count Function

	Operation	Status of TAUBn
Restart operation	Initial channel setting Set the TAUBnCMORm and TAUBnCMURm registers as described in <b>Table 31.70, Contents of the TAUBnCMORm Register for External Event Count Function</b> and <b>Table 31.71, Contents of the TAUBnCMURm Register for External Event Count Function</b> Set the value of the TAUBnCDRm register	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value and waits for detection of the TAUBTTINm input edge.
	During operation Detection of TAUBTTINm edges. The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at any time.	TAUBnCNTm performs count-down operation each time a TAUBTTINm input edge is detected. When effective edges are detected (TAUBnCDRm + 1) times: <ul style="list-style-type: none"> <li>• TAUBnCNTm loads the TAUBnCDRm value and continues count operation</li> <li>• INTTAUBnIm is generated.</li> </ul> Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

### 31.12.4.6 Specific Timing Diagrams

#### (1) TAUBnCDRm = 0000H

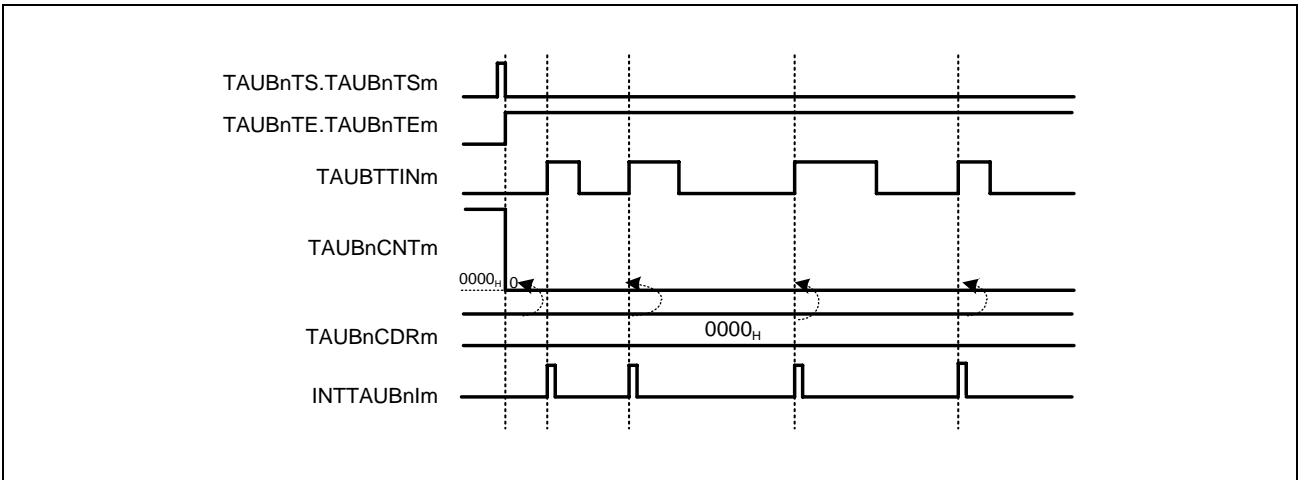

Figure 31.43 TAUBnCDRm = 0000H, TAUBnCMURm.TAUBnTIS[1:0] = 01B

- If 0000H = TAUBnCDRm, 0000H is loaded to TAUBnCNTm every time a valid TAUBTTINm input edge is detected.

This means, INTTAUBnIm is generated every time a valid TAUBTTINm input edge is detected.

#### (2) Operation stop and restart

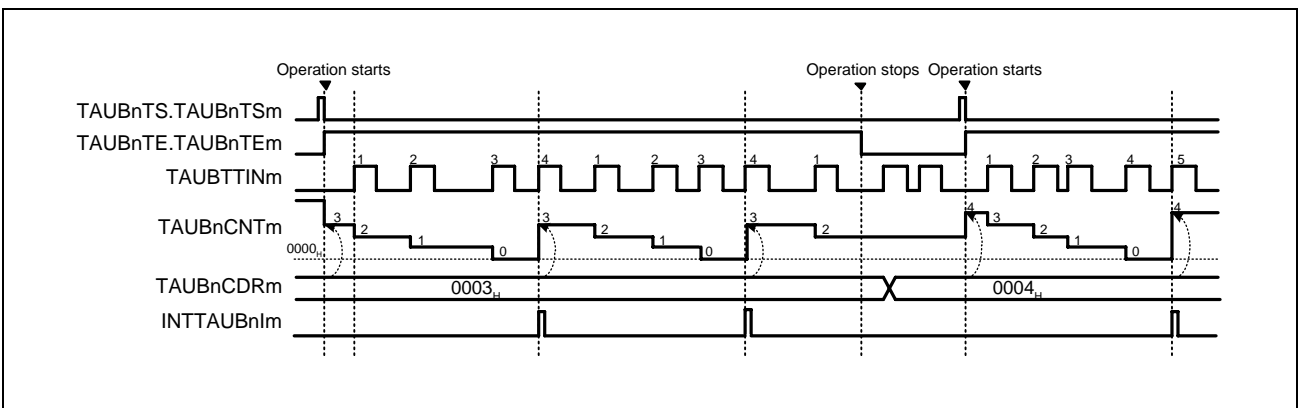

Figure 31.44 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = 01B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained. TAUBTTINm continues and TAUBnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUBnTS.TAUBnTSM to 1. TAUBnCNTm loads the TAUBnCDRm value and restarts count operation.

**(3) Forced restart**

Figure 31.45 Forced Restart (TAUBnCMURm.TAUBnTIS[1:0] = 01<sub>B</sub>)

A forced restart applies the new TAUBnCDRm value to TAUBnCNTm immediately.

- The counter can be restarted (without stopping it first), by setting TAUBnTS.TAUBnTSM to 1 during operation.
- The value of TAUBnCDRm is loaded to TAUBnCNTm and the counter awaits the next valid TAUBTTINm input edge.

## 31.12.5 One-Pulse Output Function

### 31.12.5.1 Overview

#### Summary

This function generates an interrupt (INTTAUBnIm) when a valid TAUBTTINm input edge is detected and subsequently, in a specific interval. TAUBTTINm input signal pulses that occur within the defined interval are ignored.

#### Prerequisites

- The operation mode must be set to pulse one-count mode. (See **Table 31.74, Contents of the TAUBnCMORm Register for One-Pulse Output Function**).
- Trigger detection must be disabled during counting (TAUBnCMORm.TAUBnMD0 = 0).

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input edge is detected. The value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from the TAUBnCDRm value, and an interrupt is generated.

When the counter reaches 0001<sub>H</sub> an interrupt is generated. The counter stops at 0000<sub>H</sub> and awaits the next effective TAUBTTINm input edge.

When the counter is counting down, further TAUBTTINm input signals are ignored, i.e. the counter does not reset.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

#### Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 01<sub>B</sub>, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 10<sub>B</sub>, rising and falling edges trigger the counter.

### 31.12.5.2 Equations

Interval between TAUBTTINm and INTTAUBnIm = count clock cycle × TAUBnCDRm

#### (3) Channel output mode

This function does not use channel output mode.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the One-Pulse Output Function.

Therefore, these registers must be set to 0.

Table 31.76 Simultaneous Rewrite Settings for One-Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

#### 31.12.5.5 Operating Procedure for One-Pulse Output Function

Table 31.77 Operating Procedure for One-Pulse Output Function

	Operation	Status of TAUBn
Restart operation	Initial channel setting Set the TAUBnCMORm and TAUBnCMURm registers as described in <b>Table 31.74, Contents of the TAUBnCMORm Register for One-Pulse Output Function</b> and <b>Table 31.75, Contents of the TAUBnCMURm Register for One-Pulse Output Function</b>  Set the value of the TAUBnCDRm register	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSM to 1. TAUBnTS.TAUBnTSM is a trigger bit, so it is automatically cleared to 0.  Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEM is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.  When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value.
	During operation The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at all times.	INTTAUBnIm is generated when TAUBnCNTm starts.  TAUBnCNTm counts down. When the counter reaches 0001 <sub>H</sub> , INTTAUBnIm is generated.  TAUBnCNTm stops counting and waits for a trigger.  If a trigger occurs while TAUBnCNTm is counting, the trigger is ignored.  Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTM to 1. TAUBnTT.TAUBnTTM is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEM is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

## 31.12.6 TAUBTTINm Input Pulse Interval Measurement Function

### 31.12.6.1 Overview

#### Summary

This function captures the count value and uses this value and the overflow bit TAUBnCSRm.TAUBnOVF to measure the interval of the TAUBTTINm input signal.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTsm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter TAUBnCNTm starts counting up from 0000<sub>H</sub>. When a valid TAUBTTINm edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter resets to 0000<sub>H</sub> and subsequently continues operation.

If the counter reaches FFFF<sub>H</sub> before a valid TAUBTTINm edge is detected, it overflows to 0000<sub>H</sub>. The counter is reset to 0000<sub>H</sub> and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

Table 31.78 Effects of an Overflow

TAUBnCMORm. TAUBnCOS[1:0]	When Overflow Occurs		When a Valid TAUBTTINm Input is then Detected	
	TAUBnCDRm	TAUBnCSRm. TAUBnOVF	TAUBnCDRm, TAUBnCNTm	TAUBnCSRm. TAUBnOVF
00	Unchanged	0	TAUBnCNTm loaded to TAUBnCDRm	1
01		1		
10	Set to FFFF <sub>H</sub>	0	TAUBnCNTm set to 0, TAUBnCDRm unchanged	Unchanged
11		1		

If TAUBnCMORm.TAUBnCOS[0] is 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the interval of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

The function can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm stops but retains its value. While the function is stopped, TAUBTTINm input valid edge detection and TAUBnCNTm capture are not performed.

The counter is reset to 0000<sub>H</sub> and subsequently continues operation.

#### Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the interrupt at start or restart is not generated.

#### NOTE

When TAUBnCMORm.TAUBnCOS[1:0] = 10<sub>B</sub> or 11<sub>B</sub>, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 31.12.6.2 Equations

TAUBTTINm input pulse interval = count clock cycle ×  
 [(TAUBnCSRm.TAUBnOVF × (FFFF<sub>H</sub> + 1)) + TAUBnCDRm capture value + 1]

### 31.12.6.3 Block Diagram and General Timing Diagram

Figure 31.48 Block Diagram for TAUBTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>)
- When a valid TAUBTTINm input is detected after an overflow TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = 00<sub>B</sub>)

#### (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Pulse Interval Measurement Function. Therefore, these registers must be set to 0.

Table 31.81 Simultaneous Rewrite Settings for TAUBTTINm Input Pulse Interval Measurement Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

### 31.12.6.5 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

Table 31.82 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

	Operation	Status of TAUBn
Restart operation	Initial channel setting Set the TAUBnCMORm and TAUBnCMURm registers as described in <b>Table 31.79, Contents of the TAUBnCMORm Register for TAUBTTINm Input Pulse Interval Measurement Function</b> and <b>Table 31.80, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Measurement Function</b>  The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm is cleared to 0000 <sub>H</sub> . INTTAUBnIm is generated when TAUBnCMORm.TAUBnMD0 is set to 1.
	During operation Detection of TAUBTTINm edges.  The values of TAUBnCMURm.TAUBnTIS[1:0] bits can be changed at any time. The TAUBnCDRm and TAUBnCSRm registers can be read at any time. The TAUBnCSCm.TAUBnCLOV bit can be set to 1. (The TAUBnCSRm.TAUBnOVF bit can be cleared to 0.)	TAUBnCNTm starts to count up from 0000 <sub>H</sub> . When a TAUBTTINm valid edge is detected: <ul style="list-style-type: none"> <li>• TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and returns to 0000<sub>H</sub></li> <li>• INTTAUBnIm is then generated.</li> </ul> Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values.

### 31.12.6.6 Specific Timing Diagrams: Overflow Behavior

#### (1) TAUBnCMORm.TAUBnCOS[1:0] = 00<sub>B</sub>

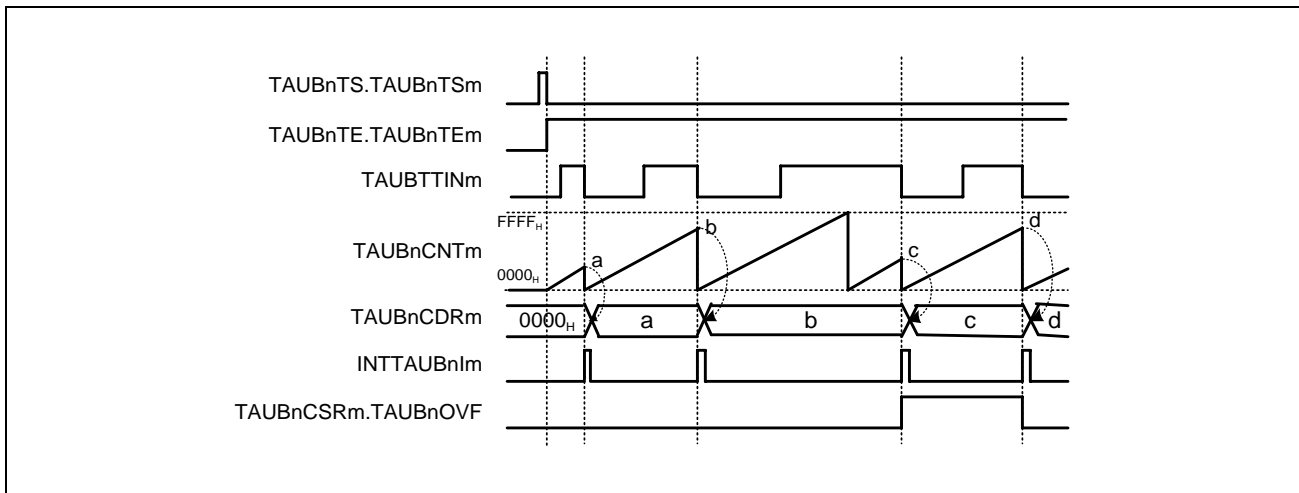

Figure 31.50 TAUBnCMORm.TAUBnCOS[1:0] = 00<sub>B</sub>, TAUBnCMORm.TAUBnMD0 = 0,  
TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is loaded to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

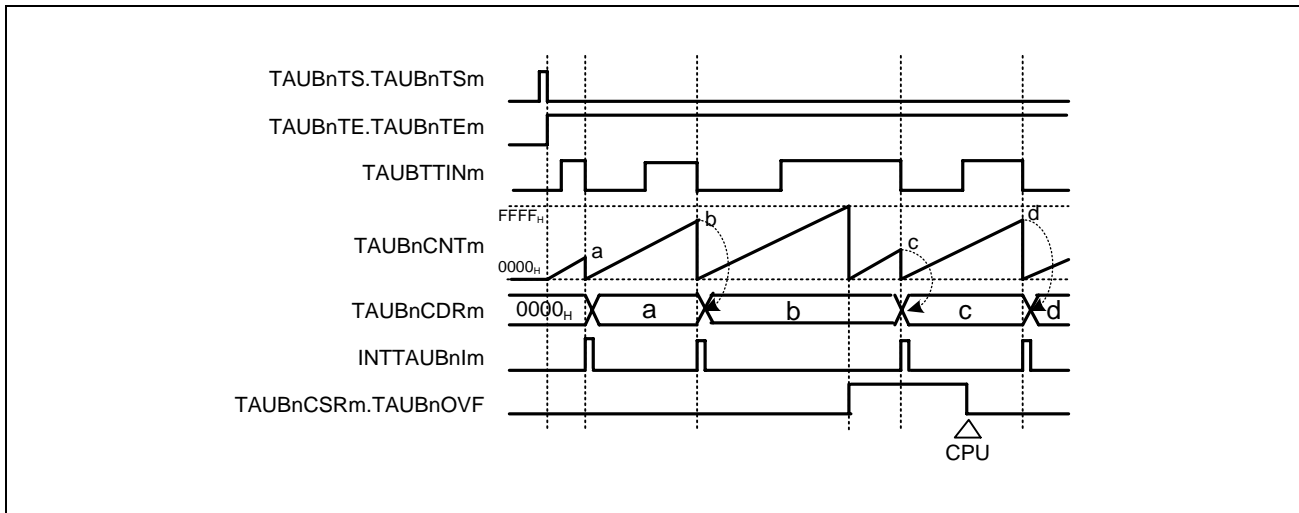

**(2) TAUBnCMORm.TAUBnCOS[1:0] = 01<sub>B</sub>**

Figure 31.51 TAUBnCMORm.TAUBnCOS[1:0] = 01<sub>B</sub>, TAUBnCMORm.TAUBnMD0 = 0,  
TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command. (TAUBnCSCm.TAUBnCLOV bit = 1)

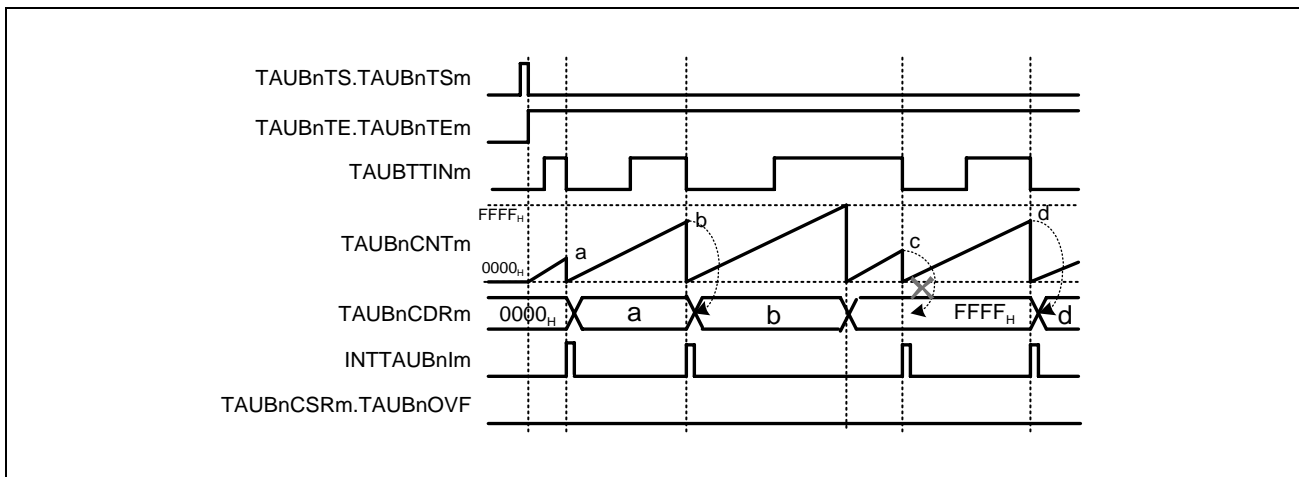

**(3) TAUBnCMORm.TAUBnCOS[1:0] = 10<sub>B</sub>**

Figure 31.52 TAUBnCMORm.TAUBnCOS[1:0] = 10<sub>B</sub>, TAUBnCMORm.TAUBnMD0 = 0,  
TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, TAUBnCDRm is set to FFFF<sub>H</sub> and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

**(4) TAUBnCMORm.TAUBnCOS[1:0] = 11<sub>B</sub>**

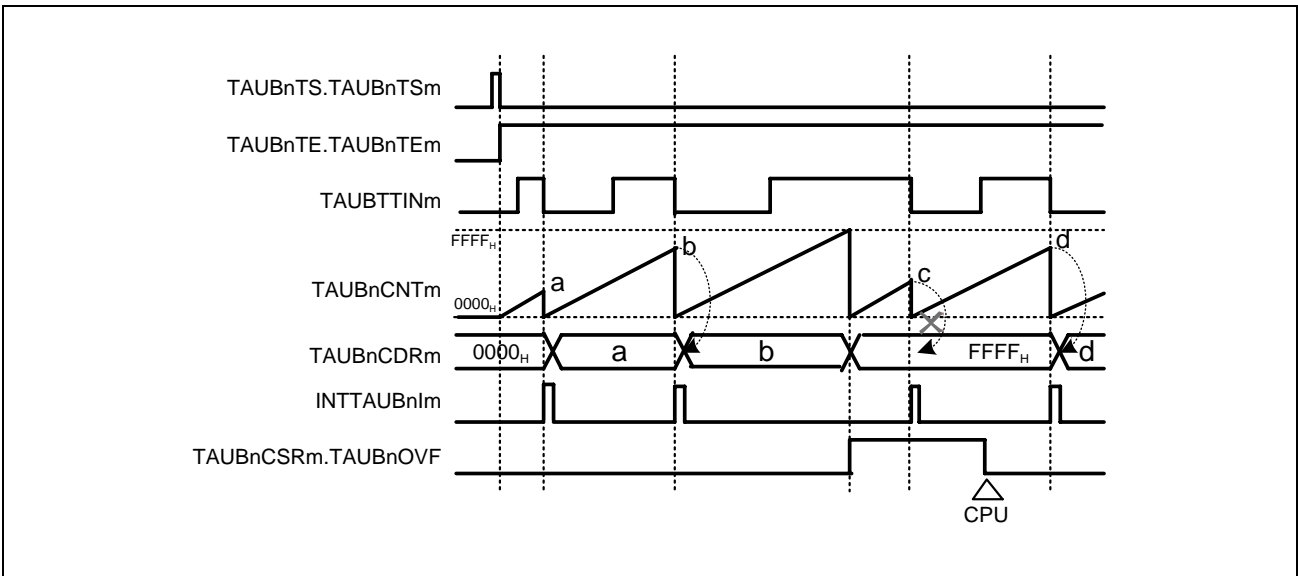

Figure 31.53 TAUBnCMORm.TAUBnCOS[1:0] = 11<sub>B</sub>, TAUBnCMORm.TAUBnMD0 = 0,  
TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, TAUBnCDRm is set to FFFF<sub>H</sub>, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

**(5) When rising and falling edge detection are selected (TAUBnCMORm.TAUBnMD0 = 1)**

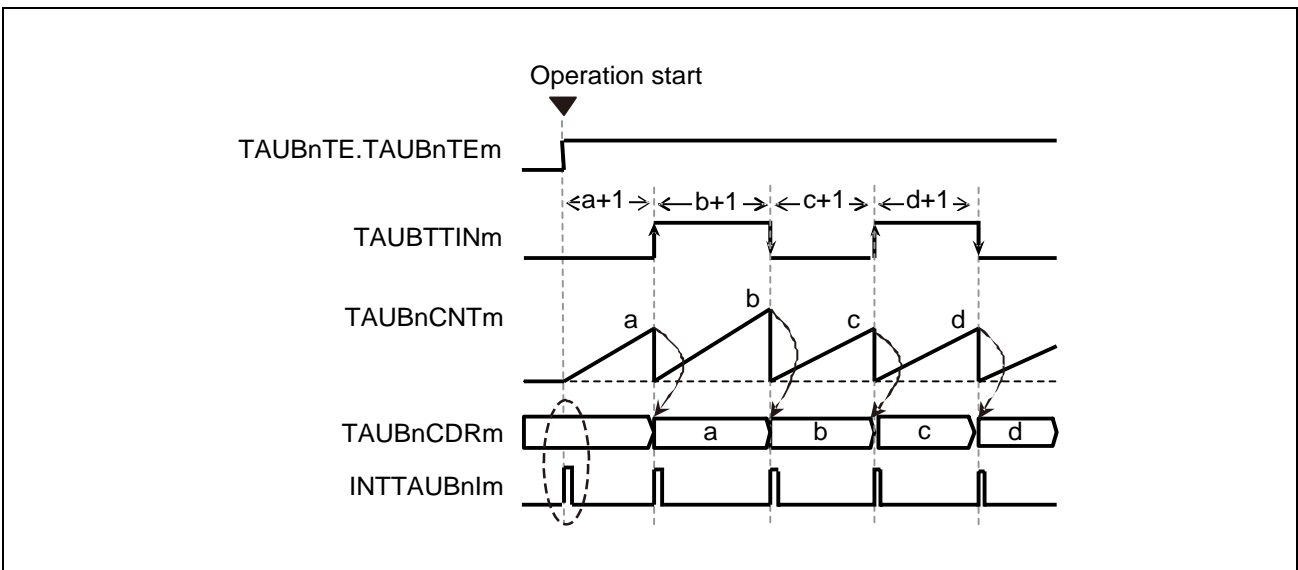

Figure 31.54 TAUBnCMORm.TAUBnMD0 = 1

Setting TAUBnCMURm.TAUBnTIS[1:0] to 10<sub>B</sub> (detection of both edges selected) measures the TAUBTTINm rising and falling edge intervals.

**(6) Operation stop and operation restart (TAUBnCMORm.TAUBnMD0 = 0)**

Figure 31.55 Operation Stop and Operation Restart (TAUBnCMORm.TAUBnMD0 = 0)

Setting TAUBnTT.TAUBnTTm to 1 clears TAUBnTE.TAUBnTEm to 0, which stops the count operation. At this time, TAUBnCNTm retains the status and stops.

When TAUBnTE.TAUBnTEm retains 0 (operation stopped), TAUBTTINm input is ignored (edge detection is ignored and capture operation is not performed).

Setting TAUBnTS.TAUBnTSm to 1 clears the counter to 0000<sub>H</sub> and restarts count-up operation.

## 31.12.7 TAUBTTINm Input Signal Width Measurement Function

### 31.12.7.1 Overview

#### Summary

This function measures the width of a TAUBTTINm signal by starting counting on one edge of the TAUBTTINm signal and capturing the counter value on the opposite edge.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm start edge is detected, the counter TAUBnCNTm starts counting up from 0000<sub>H</sub>. When a valid TAUBTTINm stop edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter retains its value (TAUBnCDRm + 1) and awaits the next valid TAUBTTINm input start edge.

If the counter reaches FFFF<sub>H</sub> before a valid TAUBTTINm stop edge is detected, it overflows. The counter is reset to 0000<sub>H</sub> and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

Table 31.83 Effects of an Overflow

TAUBnCMORm. TAUBnCOS[1:0]	When Overflow Occurs		When a Valid TAUBTTINm Input Stop Edge is Detected	
	TAUBnCDRm	TAUBnCSRm. TAUBnOVF	TAUBnCDRm, TAUBnCNTm	TAUBnCSRm. TAUBnOVF
00	Unchanged	0	TAUBnCNTm written to TAUBnCDRm	1
01		1		
10	Set to FFFF <sub>H</sub>	0	TAUBnCNTm stops counting TAUBnCDRm unchanged	Unchanged
11		1		

If TAUBnCMORm.TAUBnCOS[0] = 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the width of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

This function cannot be forcibly restarted.

#### NOTE

When TAUBnCMORm.TAUBnCOS[1] = 1, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 31.12.7.2 Equations

TAUBTTINm input signal width = count clock cycle ×

$$[(TAUBnCSRm.OVF \times (FFFF_H + 1)) + TAUBnCDRm \text{ capture value} + 1]$$

### 31.12.7.3 Block Diagram and General Timing Diagram

Figure 31.56 Block Diagram for TAUBTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>)
- When a valid TAUBTTINm input is detected after an overflow, TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = 00<sub>B</sub>)

Figure 31.57 General Timing Diagram for TAUBTTINm Input Signal Width Measurement Function

### 31.12.7.4 Register Settings

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	10: Rising and falling edge detection (low width measurement) 11: Rising and falling edge detection (high width measurement)

#### (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Signal Width Measurement Function. Therefore, these registers must be set to 0.

Table 31.86 Simultaneous Rewrite Settings for TAUBTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

### 31.12.7.5 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

Table 31.87 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

	Operation	Status of TAUBn
Restart operation ↑	Initial channel setting Set the TAUBnCMORm and TAUBnCMURm registers as described in <b>Table 31.84, Contents of the TAUBnCMORm Register for TAUBTTINm Input Signal Width Measurement Function</b> and <b>Table 31.85, Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Measurement Function</b> . The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When a TAUBTTINm start edge is detected, TAUBnCNTm start edge to count up.
	During operation The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time. TAUBnCSCm.TAUBnCLOV bit can be set to 1.	TAUBnCNTm starts to count up from 0000 <sub>H</sub> . When a TAUBTTINm valid edge is detected: <ul style="list-style-type: none"> <li>• TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and retains its value</li> <li>• INTTAUBnIm is then generated.</li> <li>• The count stops at the value transferred to TAUBnCDRm + 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.</li> </ul> Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TEm is cleared to 0 and the counter stops. TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values.

### 31.12.7.6 Specific Timing Diagrams: Overflow Behavior

#### (1) TAUBnCMORm.TAUBnCOS[1:0] = 00<sub>B</sub>

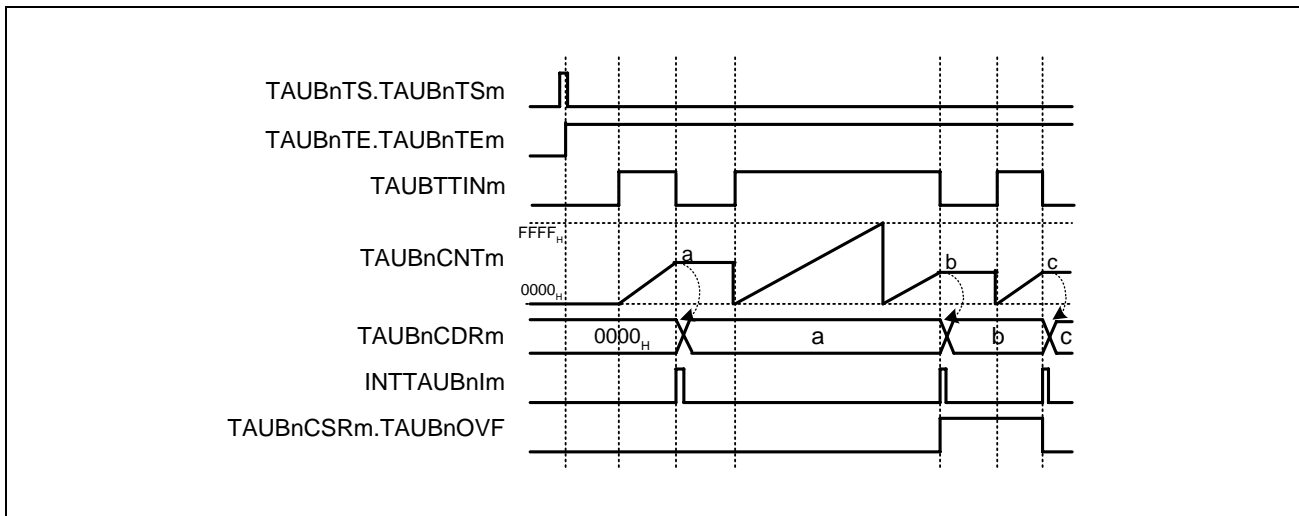

Figure 31.58 TAUBnCMORm.TAUBnCOS[1:0] = 00<sub>B</sub>, TAUBnCMORm.TAUBnMD0 = 0,  
TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

**(2) TAUBnCMORm.TAUBnCOS[1:0] = 01<sub>B</sub>**

Figure 31.59 TAUBnCMORm.TAUBnCOS[1:0] = 01<sub>B</sub>, TAUBnCMORm.TAUBnMDO = 0,  
TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command (The TAUBnCSCm.TAUBnCLOV bit = 1).

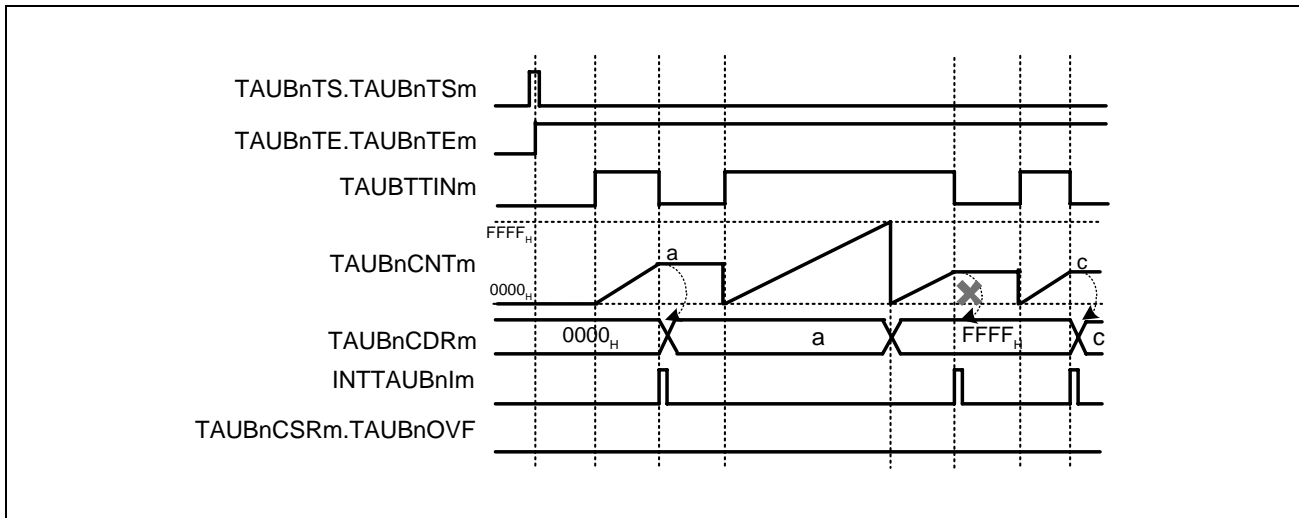

**(3) TAUBnCMORm.TAUBnCOS[1:0] = 10<sub>B</sub>**

Figure 31.60 TAUBnCMORm.TAUBnCOS[1:0] = 10<sub>B</sub>, TAUBnCMORm.TAUBnMD0 = 0,  
TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, TAUBnCDRm is set to FFFF<sub>H</sub> and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

**(4) TAUBnCMORm.TAUBnCOS[1:0] = 11<sub>B</sub>**

Figure 31.61 TAUBnCMORm.TAUBnCOS[1:0] = 11<sub>B</sub>, TAUBnCMORm.TAUBnMD0 = 0,  
TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, TAUBnCDRm is set to FFFF<sub>H</sub>, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

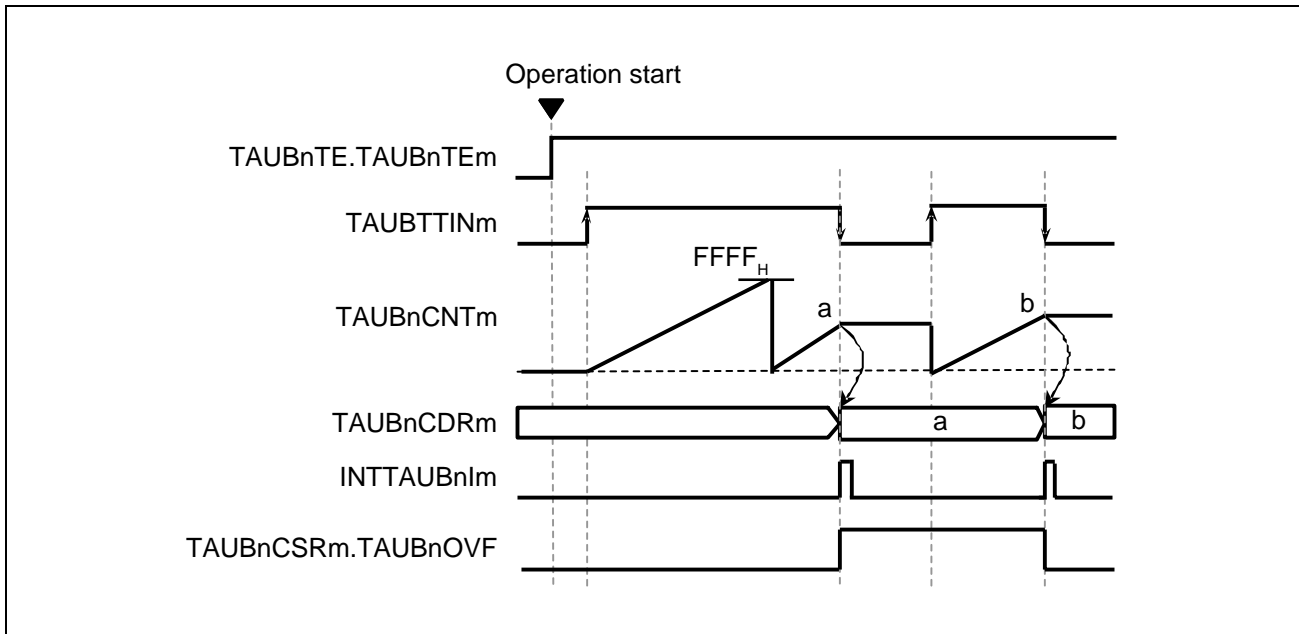

**(5) When an overflow occurs (high width measurement)**

Figure 31.62 When an Overflow Occurs

When a capture trigger is input after the counter value has overflowed, the counter value is transferred to TAUBnCDRm and at the same time TAUBnCSRm.TAUBnOVF is set to 1.

TAUBnCSRm.TAUBnOVF is kept at 1 until the next capture trigger occurs.

If the next capture trigger is not accompanied by an overflow, TAUBnCSRm.TAUBnOVF is cleared to 0.

TAUBTTINm input signal width (example when TAUBnCSRm.TAUBnOVF is 1 and TAUBnCDRm is a)

$$= \text{count clock cycle} \times ((10000_{\text{H}} \times \text{TAUBnCSRm.TAUBnOVF}) + (\text{TAUBnCDRm capture value} + 1))$$

$$= \text{count clock cycle} \times ((10000_{\text{H}} \times 1) + (a+1))$$

$$= \text{count clock cycle} \times (10000_{\text{H}} + a+1)$$

## 31.12.8 TAUBTTINm Input Position Detection Function

### 31.12.8.1 Overview

#### Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUBTTINm signal.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSM) to 1. This in turn sets TAUBnTE.TAUBnTEM = 1, enabling count operation. The counter starts to count from 0000<sub>H</sub>. When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The count operation continues.

When the counter reaches FFFF<sub>H</sub>, the counter restarts from 0000<sub>H</sub>.

#### NOTE

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits.

#### Conditions

If the TAUBnCMORm.MD0 bit is set to 0, the first interrupt after a start or restart is not generated.

### 31.12.8.2 Equations

Function duration at a TAUBTTINm input pulse =  
 count clock cycle × (TAUBnCDRm capture value + 1)

### 31.12.8.3 Block Diagram and General Timing Diagram

Figure 31.63 Block Diagram for TAUBTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>)

Figure 31.64 General Timing Diagram for TAUBTTINm Input Position Detection Function

#### (3) Channel output mode

The channel output mode is not used by this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Position Detection Function. Therefore, these registers must be set to 0.

Table 31.90 Simultaneous Rewrite Settings for TAUBTTINm Input Position Detection Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

#### 31.12.8.5 Operating Procedure for TAUBTTINm Input Position Detection Function

Table 31.91 Operating Procedure for TAUBTTINm Input Position Detection Function

	Operation	Status of TAUBn
Restart operation	Initial channel setting Set the TAUBnCMORm and TAUBnCMURm registers as described in <b>Table 31.88, Contents of the TAUBnCMORm Register for TAUBTTINm Input Position Detection Function</b> and <b>Table 31.89, Contents of the TAUBnCMURm Register for TAUBTTINm Input Position Detection Function</b> The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSM to 1. TAUBnTS.TAUBnTSM is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEM is set to 1 and the counter starts. INTTAUBnIm is generated when TAUBnCMORm.TAUBnMD0 is set to 1.
	During operation The values of TAUBnCMURm.TAUBnTIS[1:0] bits can be changed at any time. The TAUBnCDRm and TAUBnCSRm registers can be read at any time.	TAUBnCNTm starts to count up from 0000 <sub>H</sub> . When a TAUBTTINm valid edge is detected: <ul style="list-style-type: none"> <li>• TAUBnCNTm transfers (captures) its value to TAUBnCDRm</li> <li>• INTTAUBnIm is output.</li> <li>• The counter value is not cleared to 0000<sub>H</sub> and TAUBnCNTm continues count operation.</li> </ul> Afterwards, this procedure is repeated. If TAUBnCNTm reaches FFFF <sub>H</sub> , the counter restarts from 0000 <sub>H</sub> .
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEM is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

### 31.12.8.6 Specific Timing Diagrams

#### (1) Operation stop and restart

Figure 31.65 Operation Stop and Restart (TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>)

- The counter can be stopped by setting TAUBnTT.TAUBnTTM to 1, which in turn sets TAUBnTE.TEM to 0.
- TAUBnCNTM stops and the current value is retained.
- If the counter is stopped, valid TAUBnTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSM to 1. TAUBnCNTM restarts to count from 0000<sub>H</sub>.

## 31.12.9 TAUBTTINm Input Period Count Detection Function

### 31.12.9.1 Overview

#### Summary

This function measures the cumulative width of a TAUBTTINm input signal.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter awaits a valid TAUBTTINm input edge.

When a valid TAUBTTINm input start edge is detected, the counter starts to count from 0000<sub>H</sub>.

When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The counter stops and retains its value (TAUBnCDRm + 1) until the next valid TAUBTTINm input start edge is detected.

When a next valid TAUBTTINm input start edge is detected, the counter restarts from the value retained while stopping.

If the counter reaches FFFF<sub>H</sub>, the counter restarts from 0000<sub>H</sub>.

#### NOTES

1. The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits.
2. As this function is to measure the TAUBTTINm input signal width, setting TAUBnTS.TAUBnTSm to 1 is disabled while TAUBnTE.TAUBnTEm = 1.

#### Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10<sub>B</sub>, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

### 31.12.9.2 Equations

Cumulative TAUBTTINm input width =

count clock cycle × (TAUBnCDRm capture value + 1)

31.12.9.3 Block Diagram and General Timing Diagram

Figure 31.66 Block Diagram for TAUBTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>)

Figure 31.67 General Timing Diagram for TAUBTTINm Input Period Count Detection Function

### 31.12.9.4 Register Settings

#### (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

**(4) Simultaneous rewrite**

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Period Count Detection Function. Therefore, these registers must be set to 0.

Table 31.94 Simultaneous Rewrite Settings for TAUBTTINm Input Period Count Detection Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

**31.12.9.5 Operating Procedure for TAUBTTINm Input Period Count Detection Function**

Table 31.95 Operating Procedure for TAUBTTINm Input Period Count Detection Function

	Operation	Status of TAUBn
Restart operation ↑	Initial channel setting Set the TAUBnCMORM and TAUBnCMURm registers as described in <b>Table 31.92, Contents of the TAUBnCMORM Register for TAUBTTINm Input Period Count Detection Function</b> and <b>Table 31.93, Contents of the TAUBnCMURm Register for the TAUBTTINm Input Period Count Detection Function</b> The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.
	During operation Detection of TAUBTTINm edges. The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time.	When a TAUBTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUBnCNTm starts to count up from the stop value. When TAUBnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUBnCDRm and INTTAUBnIm is generated. Counting stops at the "value transferred to TAUBnCDRm + 1" value and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When TAUBnCNTm reaches FFFF <sub>H</sub> , the counter restarts from 0000 <sub>H</sub> . Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

### 31.12.9.6 Specific Timing Diagrams

#### 31.12.9.7 Operation stop and restart

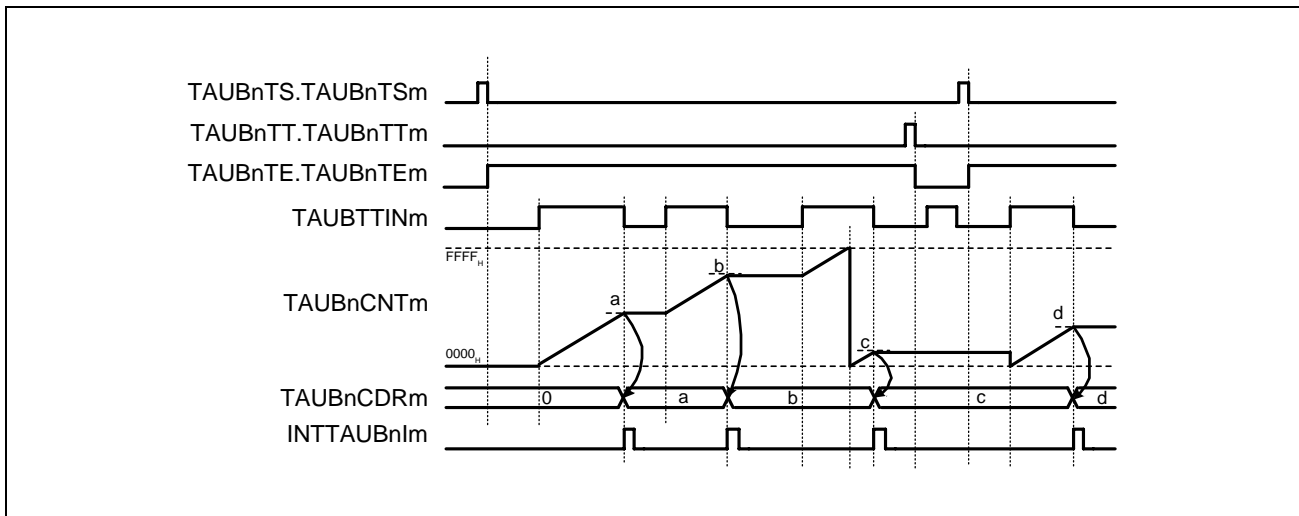

Figure 31.68 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from 0000<sub>H</sub>.

## 31.12.10 TAUBTTINm Input Pulse Interval Judgment Function

### 31.12.10.1 Overview

#### Summary

This function outputs the result of a comparison between the count value (TAUBnCNTm) and the value in the channel data register (TAUBnCDRm) when a TAUBTTINm input pulse occurs. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSM) to 1.

This in turn sets TAUBnTE.TAUBnTEM = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid edge is detected or TAUBnTS.TAUBnTSM is set to 1, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. TAUBnCNTm reloads the value of TAUBnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches 0000<sub>H</sub> before a TAUBTTINm valid edge is detected, TAUBnCNTm overflows and is set to FFFF<sub>H</sub>. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

#### Conditions

The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:

- If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when  $TAUBnCNTm \leq TAUBnCDRm$ .
- If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when  $TAUBnCNTm > TAUBnCDRm$ .

**31.12.10.4 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function**

Table 31.99 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function

	Operation	Status of TAUBn
Restart operation ↑	Initial channel setting Set the TAUBnCMORM and TAUBnCMURm registers as described in <b>Table 31.96, Contents of the TAUBnCMORM Register for TAUBTTINm Input Pulse Interval Judgment Function</b> and <b>Table 31.97, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Judgment Function</b> Set the value of the TAUBnCDRm register	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTsm to 1. TAUBnTS.TAUBnTsm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value.
	During operation The following register can be changed at any time: TAUBnCDRm register	When TAUBnCMORM.TAUBnMD0 = 0 If TAUBnCNTm ≤ TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated.  When TAUBnCMORM.TAUBnMD0 = 1 If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated. If a TAUBTTINm input edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm.  Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

## 31.12.11 TAUBTTINm Input Signal Width Judgment Function

### 31.12.11.1 Overview

#### Summary

This function compares the count value (TAUBnCNTm) for the high or low level width of a TAUBTTINm input signal and the TAUBnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUBnIm.

#### Prerequisites

TAUBTTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm input start edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid stop edge is detected, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. The counter TAUBnCNTm retains its value until the next TAUBTTINm valid start edge is detected, regardless of the result of the comparison.

If the counter reaches 0000<sub>H</sub> before a valid TAUBTTINm stop edge is detected, TAUBnCNTm overflows and is set to FFFF<sub>H</sub>. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

#### Conditions

- The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:
  - If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when  $TAUBnCNTm \leq TAUBnCDRm$ .
  - If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when  $TAUBnCNTm > TAUBnCDRm$ .
- The TAUBnCMURm.TAUBnTIS[1:0] bits specify the type of width measurement:
  - For high width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>) the start edge is a rising TAUBTTINm edge and the stop edge is a falling TAUBTTINm edge.
  - For low width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = 10<sub>B</sub>) the start edge is a falling TAUBTTINm edge and the stop edge is a rising TAUBTTINm edge.
- Setting TAUBnTS.TAUBnTSm to 1 is prohibited during operation.

31.12.11.2 Block Diagram and General Timing Diagram

Figure 31.71 Block Diagram for TAUBTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated when  $TAUBnCNTm \leq TAUBnCDRm$  ( $TAUBnCMORm.TAUBnMD0 = 0$ )
- TAUBTTINm valid start edge = rising edge, TAUBTTINm valid stop edge = falling edge ( $TAUBnCMURm.TAUBnTIS[1:0] = 11_B$ )

	Start operation Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.
	During operation The following register can be changed at any time: • TAUBnCDRm register	If a TAUBTTINm start edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm.  When TAUBnCMORm.TAUBnMD0 = 0 If TAUBnCNTm ≤ TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated.  When TAUBnCMORm.TAUBnMD0 = 1 If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated.  Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

## 31.12.12 Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

### 31.12.12.1 Overview

#### Summary

This function measures the width of an individual TAUBTTINm input signal. An interrupt is generated if the TAUBTTINm input width is longer than  $FFFF_H + 1$ .

#### Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to  $FFFF_H$ .

#### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected.  $FFFF_H$  is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUBTTINm input start edge is detected, TAUBnCNTm loads  $FFFF_H$  and starts to count down.

If the counter reaches  $0000_H$  before a stop edge is detected, an interrupt is generated.

#### Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] =  $10_B$ , the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] =  $11_B$ , the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

#### NOTE

The counter cannot be restarted during operation.

31.12.12.2 Block Diagram and General Timing Diagram

Figure 31.73 Block Diagram for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>)

**31.12.12.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)**

Table 31.107 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

	Operation	Status of TAUBn
Restart operation	Initial channel setting Set the TAUBnCMORm and TAUBnCMURm registers as described in <b>Table 31.104, Contents of the TAUBnCMORm Register for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)</b> and <b>Table 31.105, Contents of the TAUBnCMURm Register for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)</b>  Set the value of the TAUBnCDRm register to FFFF <sub>H</sub> .	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.  Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the start edge.  When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value (FFFF <sub>H</sub> ).
	During operation The TAUBnCNTm register can be read at any time.	TAUBnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : INTTAUBnIm is generated When a TAUBTTINm input stop edge is detected during count operation: TAUBnCNTm stops and retains its current value. When a TAUBTTINm input start edge is detected while the counter is stopped: The TAUBnCDRm value (FFFF <sub>H</sub> ) is loaded to TAUBnCNTm again and the counter starts to count down. Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

### 31.12.13 Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

#### 31.12.13.1 Overview

##### Summary

This function measures the cumulative width of a TAUBTTINm input signal. An interrupt is generated and an overflow interrupt can be output if the cumulative TAUBTTINm input width is longer than FFFF<sub>H</sub>.

##### Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to FFFF<sub>H</sub>

##### Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. FFFF<sub>H</sub> is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUBTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000<sub>H</sub> an interrupt is generated. FFFF<sub>H</sub> is written to TAUBnCNTm and the counter continues to count down until a TAUBTTINm input stop edge is detected.

##### Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10<sub>B</sub>, the TAUBTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>, the TAUBTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

##### NOTE

The counter cannot be restarted during operation.

31.12.13.2 Block Diagram and General Timing Diagram

Figure 31.75 Block Diagram for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11<sub>B</sub>)

Figure 31.76 General Timing Diagram for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

### 31.12.13.3 Register Settings

1, 0	TAUBnTIS[1:0]	10: Rising and falling edge detection (Low width measurement) 11: Rising and falling edge detection (High width measurement)

#### (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

#### (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection). Therefore, these registers must be set to 0.

Table 31.110 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

#### 31.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

Table 31.111 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

	Operation	Status of TAUBn
Restart operation	Initial channel setting Set the TAUBnCMORm and TAUBnCMURm registers as described in <b>Table 31.108, Contents of the TAUBnCMORm Register for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)</b> and <b>Table 31.109, Contents of the TAUBnCMURm Register for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)</b>  Set the value of the TAUBnCDRm register to FFFF <sub>H</sub> .	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSm to 1 TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.  Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1. TAUBnCNTm waits for detection of the start edge.  When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value (FFFF <sub>H</sub> ).
	During operation The TAUBnCNTm register can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : INTTAUBnIm is generated TAUBnCNTm reloads the TAUBnCDRm value (FFFF <sub>H</sub> ) and continues count operation When a TAUBTTINm input stop edge is detected during count operation: TAUBnCNTm stops and retains its current value. When a TAUBTTINm input start edge is detected while the counter is stopped: TAUBnCNTm starts to count down from the stop value. Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

## 31.13 Independent Channel Simultaneous Rewrite Functions

The following describes functions that carry out simultaneous rewrite:

### 31.13.1 Simultaneous Rewrite Trigger Generation Function Type 1

#### 31.13.1.1 Overview

##### Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals. The upper channel is for generating the simultaneous rewrite trigger (TAUBnRDC.TAUBnRDCm = 1), and the lower channels are for conducting simultaneous rewrite when triggered from the upper channel (TAUBnRDC.TAUBnRDCm = 0).

##### Prerequisites

- Two (or more) channels that are lower than the channel used as the upper channel, each with simultaneous rewrite enabled (TAUBnRDE.TAUBnRDEm = 1)
- The operation mode of the upper channel must be set to interval timer mode, see **Table 31.112, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1**.
- For the operation modes that can be set to the lower channels, see **Table 31.55, Channel Functions and the Methods They Use for Simultaneous Rewrite**.
- In this function, TAUBTTOUTm is not used for all the channels.

##### Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) of the upper and lower channel(s) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of the data register buffer of the upper channel (TAUBnCDRm buf) is written to the counter (TAUBnCNTm) and the counter starts to count down from this value.

The counter(s) of the lower channel(s) start to count as specified by their selected operating modes.

When a counter reaches 0000<sub>H</sub>, an interrupt is generated from the channel.

The corresponding TAUBnCNTm then reloads the current TAUBnCDRm buffer value and subsequently continues operation.

If the channel where the interrupt occurs is specified as the trigger channel for simultaneous rewrite (TAUBnRDC.TAUBnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUBnRSF.TAUBnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

##### Condition

- The channel which is monitored for INTTAUBnIm is specified by setting TAUBnRDC.TAUBnRDCm = 1 for the corresponding channel. The TAUBnRDC.TAUBnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.

### 31.13.1.2 Equations

Simultaneous rewrite trigger generation cycle = count clock cycle  $\times$  (TAUBnCDRm + 1)

To control simultaneous rewrite, the following condition must be satisfied:

#### [For PWM]

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1)  $\times$  number of interrupts] - 1

#### [For triangle PWM]

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1)  $\times$  2  $\times$  number of interrupts] - 1

That is, the ratio of TAUBnCDRm + 1 and value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

Note that the cycle for the triangle PWM is twice the cycle for the PWM

31.13.1.3 Block Diagram and General Timing Diagram

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

#### (3) Channel output mode for the upper channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function. However, it can be used in independent channel output mode controlled by software.

**(4) Simultaneous rewrite for the upper channel**Table 31.114 Simultaneous Rewrite Settings for the Upper Channel in Simultaneous Rewrite Trigger Generation  
Function Type 1

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	1: Selects an upper channel as the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting
TAUBnRDC.TAUBnRDCm	1: Channel is monitored for an INTTAUBnIm signal that is used as the simultaneous rewrite trigger

**31.13.1.5 Register Settings for the Lower Channel(s)****(1) TAUBnCMORm for the lower channel(s)**

For the TAUBnCMORm register of the lower channels, follow the TAUBnCMORm register settings for the operation mode that can be set. (See **Table 31.55, Channel Functions and the Methods They Use for Simultaneous Rewrite**)

**(2) TAUBnCMURm for the lower channel(s)**

For the TAUBnCMURm register of the lower channels, follow the TAUBnCMURm register settings for the operation mode that can be set. (See **Table 31.55, Channel Functions and the Methods They Use for Simultaneous Rewrite**)

**(3) Channel output mode for the lower channel(s)**

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 31.55, Channel Functions and the Methods They Use for Simultaneous Rewrite**.

**(4) Simultaneous rewrite for the lower channel(s)**Table 31.115 Simultaneous Rewrite Settings for the Lower Channel in Simultaneous Rewrite Trigger Generation  
Function Type 1

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	1: Selects an upper channel as the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

### 31.13.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 31.116 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

	Operation	Status of TAUBn
Restart operation	Initial channel setting Set the TAUBnCMORm and TAUBnCMURm registers for the upper channel as described in <b>Table 31.112, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1</b> and <b>Table 31.113, Contents of the TAUBnCMURm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1</b>  Set the TAUBnCMORm and TAUBnCMURm registers for the lower channel as described in <b>Section 31.13.1.5, Register Settings for the Lower Channel(s)</b>  Set the value of the TAUBnCDRm register	Channel operation is stopped.
	Start operation Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated.
	During operation TAUBnRDT.TAUBnRDTm, TAUBnCDRm.TAUBnCDR can be changed. TAUBnRSF.TAUBnRSFm can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : TAUBnCNTm reloads the TAUBnCDRm value and continues count operation INTTAUBnIm is generated Simultaneous rewrite is controlled when INTTAUBnIm is generated from the channel where TAUBnRDC.TAUBnRDCm is set to 1. Afterwards, this procedure is repeated.
	Stop operation Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

## 31.14 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the Timer Array Unit B. For a general overview of synchronous channel operation, see Overview.

### 31.14.1 PWM Output Function

#### 31.14.1.1 Overview

##### Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the pulse width (duration) of the TAUBTTOUT<sub>m</sub> to be set. The pulse cycle is set in the master channel. The pulse width is set in the slave channel.

##### Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 31.117, Contents of the TAUBnCMOR<sub>m</sub> Register for the Master Channel of the PWM Output Function.**
- The operation mode of the slave channel(s) must be set to one-count mode, see **Table 31.120, Contents of the TAUBnCMOR<sub>m</sub> Register for the Slave Channel of the PWM Output Function.**
- TAUBTTOUT<sub>m</sub> is not used for the master channel of this function.
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 1.

##### Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTS<sub>m</sub>) to 1. This in turn sets TAUBnTE.TAUBnTE<sub>m</sub> = 1, enabling count operation. The current value of TAUBnCDR<sub>m</sub> is written to TAUBnCNT<sub>m</sub> and the counters start to count down from these values. INTTAUBnIm is generated on the master channel and TAUBTTOUT<sub>m</sub> (slave) toggles, which realizes a PWM output.

- Master channel:

When the counter of the master channel reaches 0000<sub>H</sub>, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter loads the TAUBnCDR<sub>m</sub> value and counts down.

- Slave channel:

INTTAUBnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUBnCDR<sub>m</sub> (slave) is written to TAUBnCNT<sub>m</sub> (slave) and the counter starts to count down from this value. The TAUBTTOUT<sub>m</sub> signal is set to the active level.

When the counter reaches 0000<sub>H</sub>, i.e. duty time has elapsed, INTTAUBnIm is generated and the TAUBTTOUT<sub>m</sub> signal is reset to the inactive level. The counter returns to FFFF<sub>H</sub> and awaits the next INTTAUBnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUBnTT.TAUBnTT<sub>m</sub> to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTE<sub>m</sub> to 0. TAUBnCNT<sub>m</sub> and TAUBTTOUT<sub>m</sub> of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTS<sub>m</sub> to 1.

##### Conditions

Set Simultaneous rewrite with this function. Please see **Section 31.6, Simultaneous Rewrite.**

### 31.14.1.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUBnCDRm (slave) / (TAUBnCDRm (master) + 1)) × 100

- Duty cycle = 0%  
TAUBnCDRm (slave) = 0000<sub>H</sub>
- Duty cycle = 100%  
TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

### 31.14.1.3 Block Diagram and General Timing Diagram

Figure 31.79 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

Figure 31.80 General Timing Diagram for PWM Output Function

#### NOTE

- The interval between the start of the count and an interrupt being generated is the value of corresponding TAUBnCDRm + 1.
- TAUBTTOUTm of the slave channel will rise with a delay of one count clock after the rising of INTTAUBnIm of the master channel.

### 31.14.1.4 Register Settings for the Master Channel

#### (1) TAUBnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 31.117 Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0 <sub>B</sub> .
11	TAUBnMAS	Write 1 <sub>B</sub> .
10 to 8	TAUBnSTS[2:0]	Write 000 <sub>B</sub> .
7, 6	TAUBnCOS[1:0]	Write 00 <sub>B</sub> .
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000 <sub>B</sub> .
0	TAUBnMD0	Write 1 <sub>B</sub> .

#### (2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 31.118 Contents of the TAUBnCMURm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

#### (3) Channel output mode for the master channel

The channel output mode is not used by this function.

#### (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.119 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

#### NOTE

When used in TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel operating in **Section 31.13.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Configure the operation following the conditions below.

- The channel set to Simultaneous Rewrite Trigger Output Function Type 1: TAUBnRDCm = 1, TAUBnRDSm = 1  
The setting value of TAUBnCDRm to this channel is as follows.  
= ((setting value of TAUBnCDRm of the master channel subject to simultaneous rewrite + 1) × number of interrupts) – 1
- Master channel: TAUBnRDCm = 0, TAUBnRDSm = 1
- Slave channel: TAUBnRDCm = 0, TAUBnRDSm = 1

Although the value of duty exceeds 100% when the setting value of TAUBnCDRm (slave) > the setting value of TAUBnCDRm (master) + 1, the output will be aggregated to 100%.

### 31.14.1.5 Register Settings for the Slave Channel(s)

#### (1) TAUBnCMORm for the slave channel(s)

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

### 31.14.1.6 Operating Procedure for PWM Output Function

Table 31.124 Operating Procedure for PWM Output Function

	Operation	Status of TAUBn
Restart operation ↑	Initial channel setting  Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in <b>Section 31.14.1.4, Register Settings for the Master Channel</b> .  Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in <b>Section 31.14.1.5, Register Settings for the Slave Channel(s)</b> .  Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
	Start operation  Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start.  INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) is set.
	During operation  TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time.  TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel loads TAUBnCDRm and counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUBnIm (master) is generated</li> <li>• TAUBnCNTm (master) loads the TAUBnCDRm value and continues count operation</li> <li>• TAUBnCNTm (slave) loads the TAUBnCDRm value and counts down</li> <li>• TAUBTTOUTm (slave) is set to the active level</li> </ul> When TAUBnCNTm (slave) reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• The counter of TAUBnCNTm (slave) stops.</li> <li>• INTTAUBnIm (slave) is generated</li> <li>• TAUBTTOUTm (slave) is set to the inactive level</li> </ul>
	Stop operation  Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.  TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

## 31.14.1.7 Specific Timing Diagrams

## (1) Duty cycle = 0%

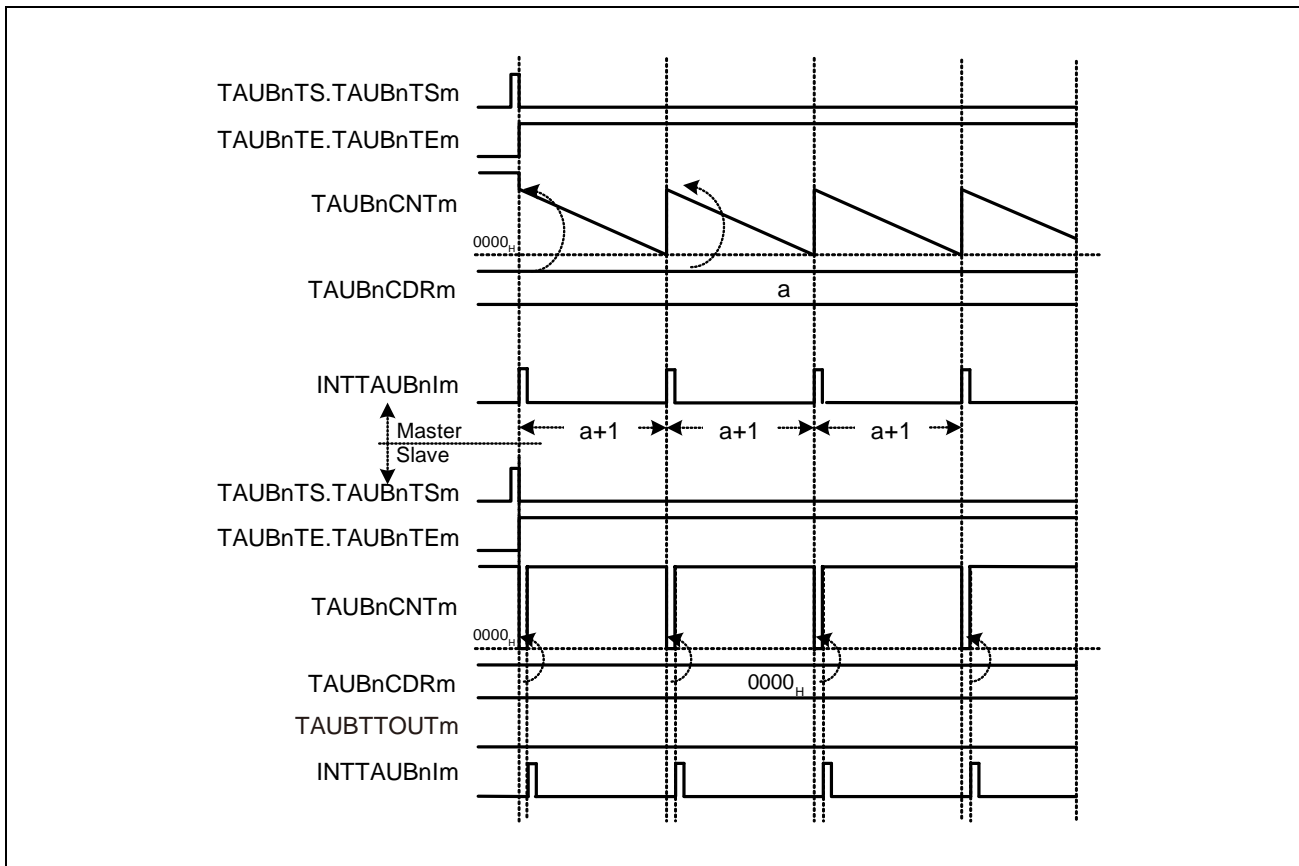

Figure 31.81 TAUBnCDRm (slave) = 0000<sub>H</sub>,  
Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

- Every time the master channel generates an interrupt (INTTAUBnIm), 0000<sub>H</sub> is written to TAUBnCNTm (slave). As a result, a slave channel interrupt (INTTAUBnIm) is generated at the same time and TAUBTTOUTm remains inactive.
- TAUBnCNTm (slave) generates an interrupt every time the value of TAUBnCDRm is loaded.

(2) Duty cycle = 100%

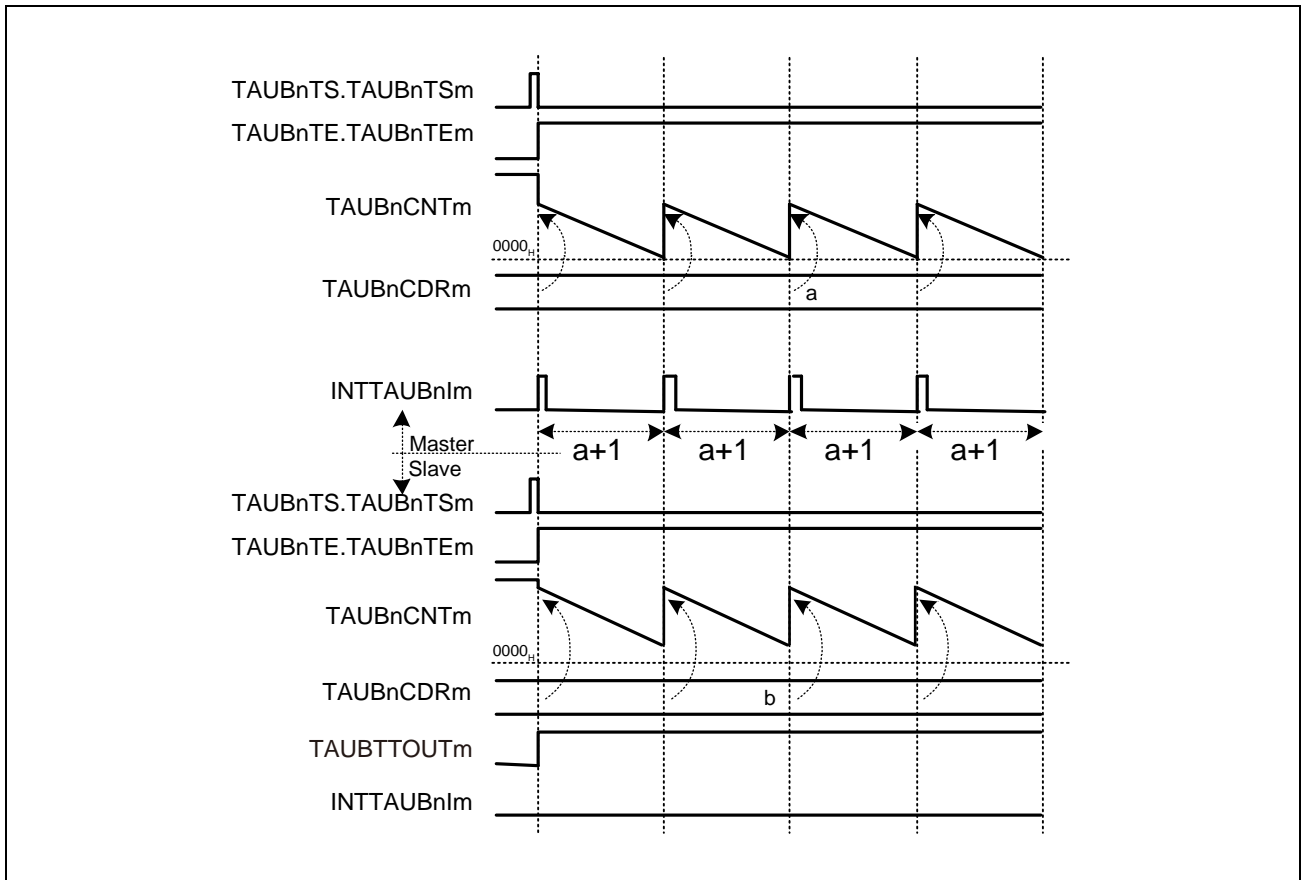

Figure 31.82 TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1,  
Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

If the value TAUBnCDRm (slave) is higher than the value TAUBnCDRm (master), the counter of the slave channel cannot reach 0000<sub>H</sub> and cannot generate interrupts. The TAUBTTOUTm remains at active state.

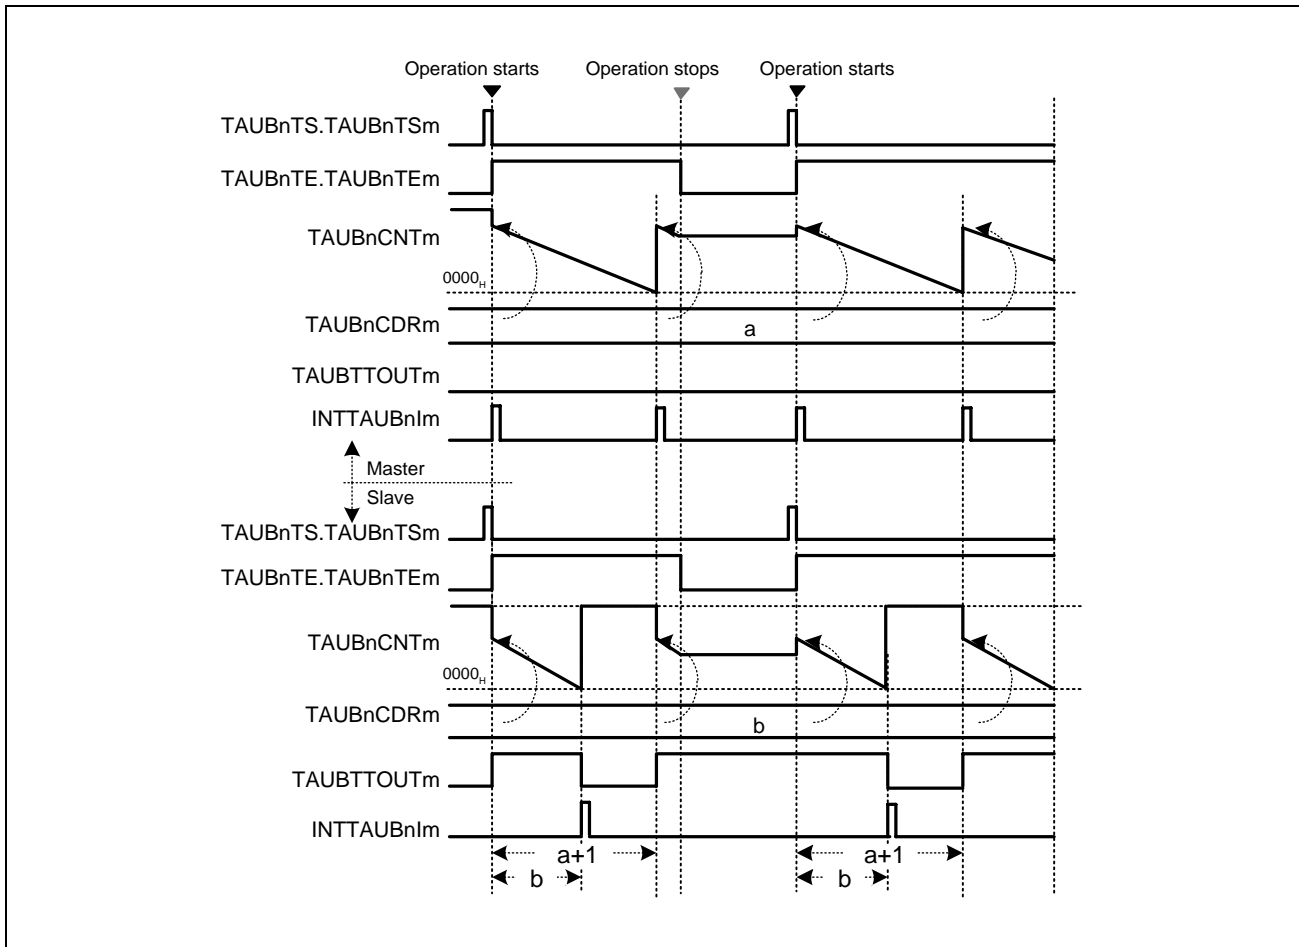

**(3) Operation stop and restart**

Figure 31.83 Operation Stop and Restart, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm of the master and slave channel(s) to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUBnTS.TAUBnTEm of master and slave channel(s) to 1. TAUBnCNTm of master and slave channel reload the current values of TAUBnCDRm and start to count down from these values.

**(4) Operation stop and restart (Slave output, Initialization)**

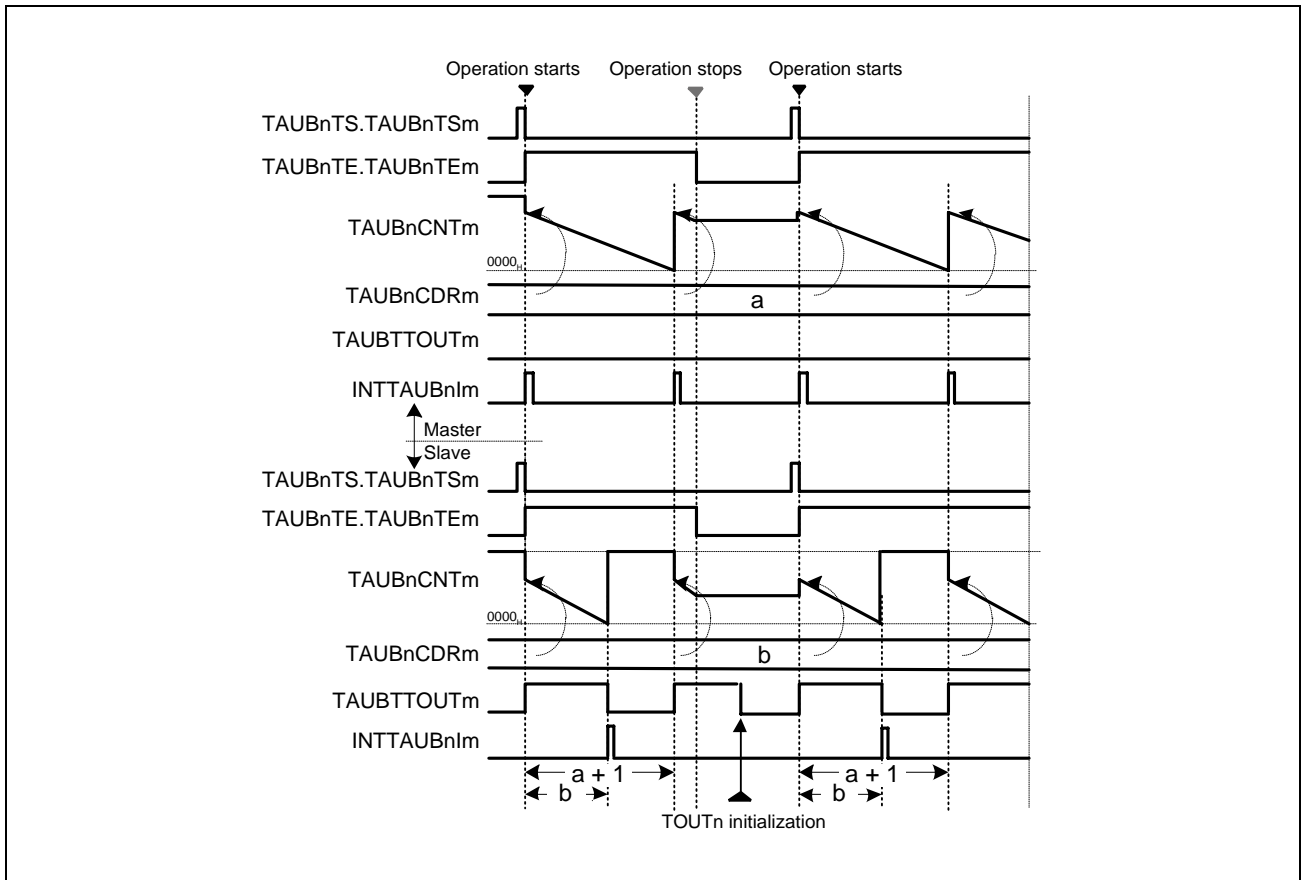

Figure 31.84 Operation Stop and Restart (Slave Output, Initialization)

When TAUBnTOE.TAUBnTOEm of the slave channel is set to 0 while TAUBnTE.TAUBnTEM = 0 and the inactive level of TAUBTTOUTm is written in the TAUBnTO.TAUBnTOM, the output level of TAUBTTOUTm (slave channel) becomes active when INTTAUBnIm is issued when the count operation is started after restart.

## 31.14.2 One-Shot Pulse Output Function

### 31.14.2.1 Overview

#### Summary

This function outputs a signal pulse with a defined pulse width and a specific delay time compared to an external input signal pulse by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

#### Prerequisites

- Two channels
- The operation mode of the master channel must be set to one-count mode, see **Table 31.125, Contents of the TAUBnCMORm Register for the Master Channel of the One-Shot Pulse Output Function**
- The operation mode of the slave channel must be set to pulse one-count mode, see **Table 31.128, Contents of the TAUBnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function**
- TAUBTTOUTm is not used for the master channel of this function
- The channel output mode of the slave channel must be set to independent channel output mode 2.
- TAUBTTINm (master) has to be detected while TAUBnCNTm (master) and TAUBnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUBTTINm (slave).

#### Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) for master and slave channels to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

- Master channel:  
When the next valid TAUBTTINm input edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm. The counter starts to count down from this value. If TAUBnCMORm.TAUBnMD0 = 0, a trigger (TAUBTTINm) which is detected within the delay time is ignored.  
When the counter of the master channel reaches 0000<sub>H</sub>, INTTAUBnIm is generated. The counter returns to FFFF<sub>H</sub> and awaits the next valid TAUBTTINm input edge.
- Slave channel:  
INTTAUBnIm generated on the master channel triggers the counter of the slave channel. The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value. An interrupt is generated and the TAUBTTOUTm signal is set.  
When the counter reaches 0001<sub>H</sub>, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter remains at 0000<sub>H</sub> and awaits the next INTTAUBnIm of the master channel.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

The counter of the master channel can be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

## NOTES

1. If a forced restart of the counter is executed during operation, the width of the output signal does not correspond to the value of TAUBnCDRm (slave).
2. The TAUBTTINm input signal is sampled at the frequency of the operating clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of  $\pm 1$  operation clock cycle.

## Conditions

- If TAUBnCMORm.TAUBnMD0 of the master channel is set to 0, during counting detected TAUBTTINm input edges are ignored.
- Simultaneous rewrite can be used with this function. Please see **Section 31.6, Simultaneous Rewrite**.

## 31.14.2.2 Equations

Delay from trigger input to pulse output

$$= (\text{TAUBnCDRm (master)} + 1) \times \text{count clock cycle}$$

Pulse width = (TAUBnCDRm (slave))  $\times$  count clock cycle

## 31.14.2.3 Block Diagram and General Timing Diagram

Figure 31.85 Block Diagram for One-Shot Pulse Output Function

The following settings apply to the general basic diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>)

Figure 31.86 General Timing Diagram for One-Shot Pulse Output Function

### 31.14.2.4 Register Settings for the Master Channel

#### (1) TAUBnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

#### (3) Channel output mode for the master channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

#### (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.127 Simultaneous Rewrite Settings for the Master Channel of the One-Shot Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

### 31.14.2.5 Register Settings for the Slave Channel

#### (1) TAUBnCMORm for the slave channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 31.128 Contents of the TAUBnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channels must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0 <sub>B</sub> .
11	TAUBnMAS	Write 0 <sub>B</sub> .
10 to 8	TAUBnSTS[2:0]	Write 100 <sub>B</sub> .
7, 6	TAUBnCOS[1:0]	Write 00 <sub>B</sub> .
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 1010 <sub>B</sub> .
0	TAUBnMD0	0: Disables start trigger detection during counting 1: Enables start trigger detection during counting The value of the MD0 bit of the master and slave channels must be identical.

#### (2) TAUBnCMURm for the slave channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 31.129 Contents of the TAUBnCMURm Register for the Slave Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

**(3) Channel output mode for the slave channel**

Table 31.130 Control Bit Settings for Independent Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	1: Enables independent channel output mode
TAUBnTOM.TAUBnTOMm	0: Independent channel output
TAUBnTOC.TAUBnTOCm	1: Operating mode 2
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	0: Disables dead time operation
TAUBnTDL.TAUBnTDLm	0: When dead time operation is disabled (TAUBnTDE.TAUBnTDEm = 0), set these bits to 0

**(4) Simultaneous rewrite for the slave channel**

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.131 Simultaneous Rewrite Settings for the Slave Channel of the One-Shot Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

### 31.14.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 31.132 Operating Procedure for One-Shot Pulse Output Function

	Operation	Status of TAUBn
Restart operation →	Initial channel setting	Channel operation is stopped.
	Start operation	TAUBnTE.TAUBnTE <sub>m</sub> (master and slave channels) is set to 1 and the master channel awaits a TAUBTTIN <sub>m</sub> input.
	During operation	<p>When a valid TAUBTTIN<sub>m</sub> input edge is detected, TAUBnCNT<sub>m</sub> of the master channel loads the TAUBnCDR<sub>m</sub> value and counts down. When the counter reaches 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUBnIm (master) is generated</li> <li>• TAUBnCNT<sub>m</sub> (master) is reset to FFFF<sub>H</sub> and waits for the next valid TAUBTTIN<sub>m</sub> input edge.</li> <li>• TAUBnCNT<sub>m</sub> (slave) reloads the TAUBnCDR<sub>m</sub> value and starts to count down</li> <li>• INTTAUBnIm (slave) is generated</li> <li>• TAUBTTOUT<sub>m</sub> (slave) is set to the active level.</li> </ul> <p>When TAUBnCNT<sub>m</sub> (slave) reaches 0001<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• The counter of TAUBnCNT<sub>m</sub> (slave) stops.</li> <li>• INTTAUBnIm (slave) is generated</li> <li>• TAUBTTOUT<sub>m</sub> (slave) is set to an inactive level.</li> </ul>
	Stop operation	TAUBnTE.TAUBnTE <sub>m</sub> is cleared to 0 and the counter stops. TAUBnCNT <sub>m</sub> and TAUBTTOUT <sub>m</sub> stop and retain their current values.

### 31.14.2.7 Specific Timing Diagrams

#### (1) TAUBnCDRm (master) = 0000H

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>)

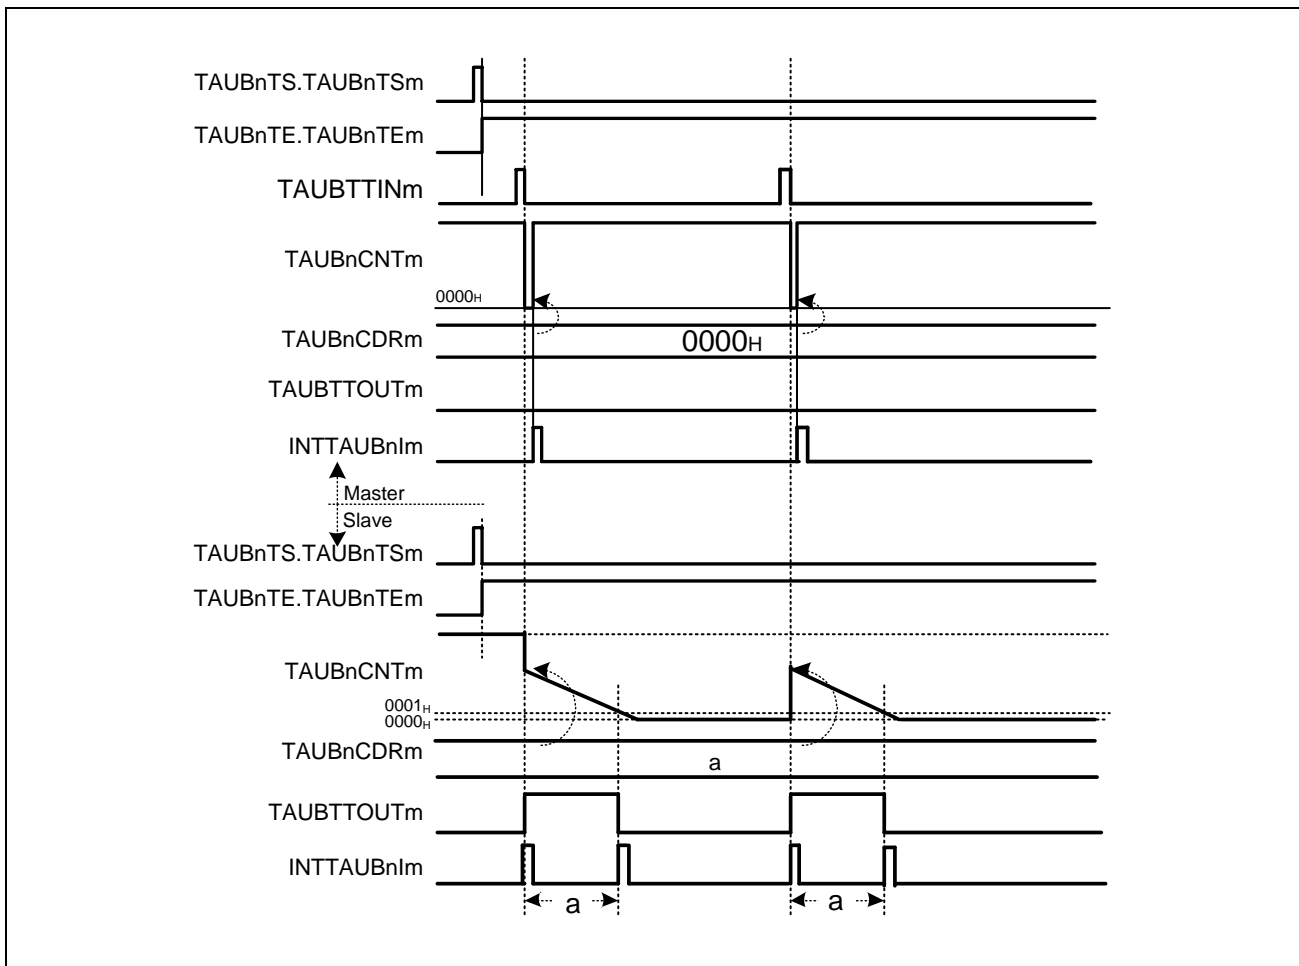

Figure 31.87 TAUBnCDRm (Master) = 0000H

- When a valid TAUBTTINm input edge is detected, the value 0000<sub>H</sub> is written to TAUBnCNTm (master). The counter is set to 0000<sub>H</sub> for one count and returns to FFFF<sub>H</sub>. Thus, the slave channel starts to count down one count clock later to TAUBTTINm (master).

**(2) TAUBnCDRm (slave) = 0000H**

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>)

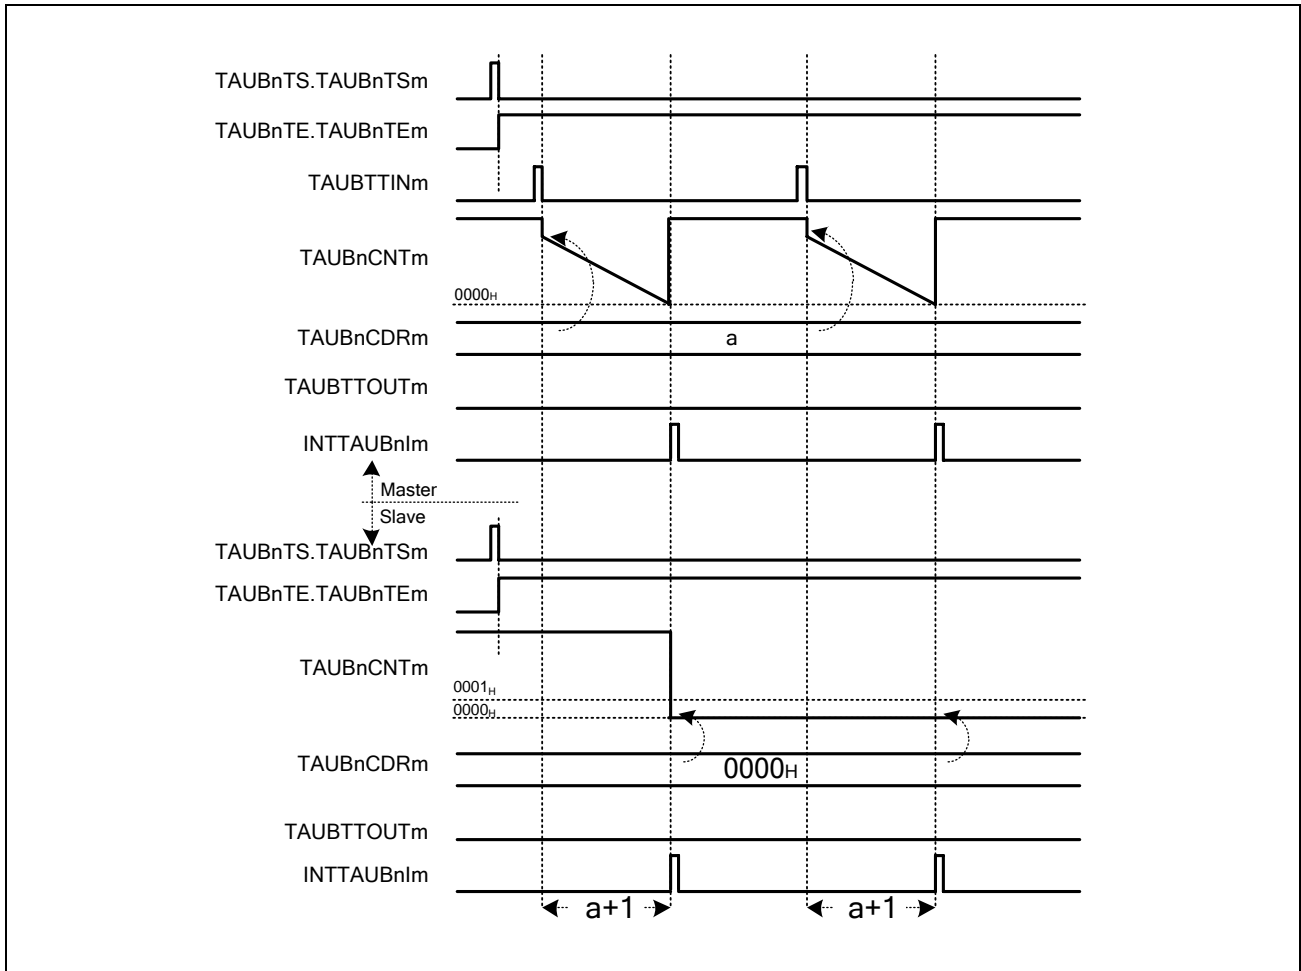

Figure 31.88 TAUBnCDRm (Slave) = 0000H

- TAUBTTOUTm remains at inactive state, because the pulse width is zero.

**(3) TAUBnCMORm.TAUBnMD0 = 0**

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>)

Figure 31.89 TAUBnCMORm.TAUBnMD0 = 0

- Even when an effective edge is input to TAUBTTINm while the counter of the master channel counts down, the counter continues counting down.

**(4) TAUBnCMORm.TAUBnMD0 = 1**

The following settings apply to this diagram.

- Start trigger detection enabled during counting (TAUBnCMORm.TAUBnMD0 = 1)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>)

Figure 31.90 TAUBnCMORm.TAUBnMD0 = 1

- If a valid TAUBTTINm input edge is detected while the counter of the master channel counts down, TAUBnCNTm reloads the value of TAUBnCDRm. The counter restarts to count down.

This means the delay for INTTAUBnIm generation interval is extended by the value of TAUBnCNTm at the time when a valid TAUBTTINm input edge is detected.

(5) Operation stop and restart

Figure 31.91 Stopping and Restarting the Operation

Setting TTm of the master and slave channels to 1 clears TAUBnTE.TAUBnTEm to 0, thereby stopping the count operation. If this happens, TAUBnCNTm and TAUBTTOUTm stop operation with the values retained.

Setting TAUBnTS.TAUBnTsm of the master and slave channels to 1 concurrently sets TAUBnTE.TAUBnTEm to 1.

When the start trigger is detected while the TAUBnTE.TAUBnTEm is set to 1, the TAUBnCDRm value is transferred to TAUBnCNTm and the operation restarts.

**(6) Restarting the master channel while the slave channel is counting**

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00<sub>B</sub>)

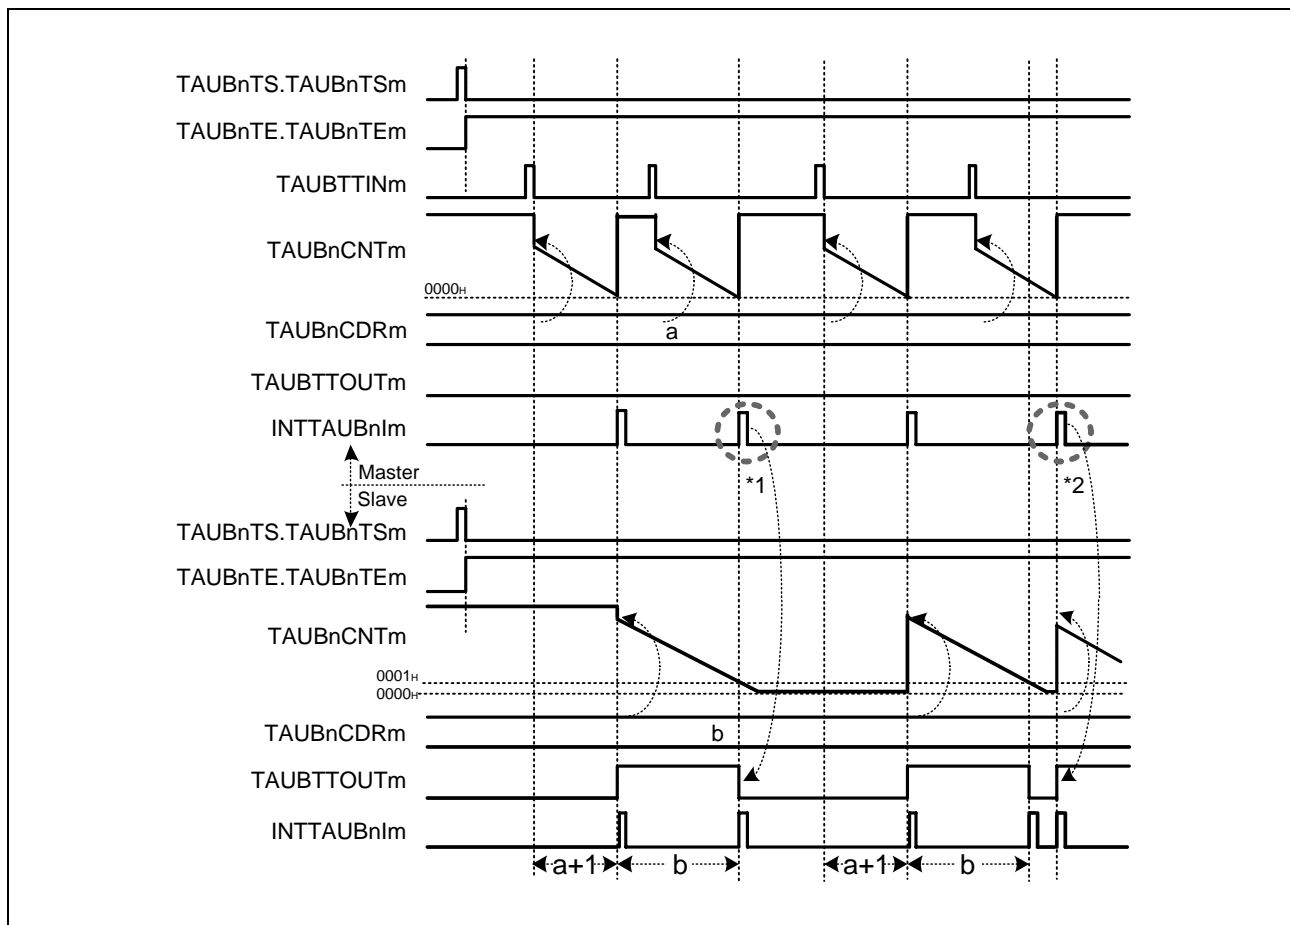

Figure 31.92 Input Interval of TAUBTTINm ≤ Delay Time + Pulse Width + 1

- If the master channel generates an interrupt before the counter of the slave channel has reached 0001<sub>H</sub> or exactly when 0001<sub>H</sub> is reached\*<sup>1</sup>, the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUBnCDRm (slave) is reloaded. An interrupt is generated and TAUBTTOUTm toggles. If TAUBnCNTm (master) has started to count down while the TAUBnCNTm (slave) is still counting\*<sup>2</sup>, TAUBTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

### 31.14.3 Delay Pulse Output Function

#### 31.14.3.1 Overview

##### Summary

This function outputs two signals. The reference signal has a defined pulse width and pulse cycle specified using the master channel and slave channel 1.

Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by amount specified in slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1.  
The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified in slave channel 2.

##### Prerequisites

- Four channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 31.133, Contents of the TAUBnCMORm Register for the Master Channel of the Delay Pulse Output Function**.
- The operation mode of slave channels 1 and 2 must be set to one-count mode, see **Table 31.136, Contents of the TAUBnCMORm Register for the Slave Channel 1 of the Delay Pulse Output Function** and **Table 31.140, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Delay Pulse Output Function**.
- The operation mode of slave channel 3 must be set to pulse one-count mode, see **Table 31.143, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Delay Pulse Output Function**
- TAUBTTOUTm is not used for the master channel and slave channel 2
- The channel output mode of slave channel 1 must be set to synchronous channel output mode 1.
- The channel output mode of slave channel 3 must be set to independent channel output mode 1.

##### Description

The counters of the channel group are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm to 1, enabling count operation.

- Master channel:

The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value. INTTAUBnIm is generated on the master channel.

When the counter of the master channel reaches 0000<sub>H</sub>, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter reloads the TAUBnCDRm value and counts down.

- Slave channels 1 and 2:

When the slave channels 1 and 2 detect an interrupt from the master channel, they start to count down from the current value of TAUBnCDRm. The TAUBTTOUTm signal (slave 1) is set.

- Slave channel 1:

When the counter of slave channel 1 reaches 0000<sub>H</sub> (duty time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter returns to FFFF<sub>H</sub> and awaits the next INTTAUBnIm of the master channel.

- Slave channel 2:

When the counter of slave channel 2 reaches 0000<sub>H</sub>, delay time has elapsed and INTTAUBnIm is generated. The counter returns to FFFF<sub>H</sub> and awaits the next INTTAUBnIm of the master channel.

INTTAUBnIm (slave channel 2) triggers the counter of slave channel 3

- Slave channel 3:

When slave channel 3 detects an interrupt from slave channel 2, it starts to count down from the current value of TAUBnCDRm. INTTAUBnIm is generated and the TAUBTTOUTm signal (slave 3) is set.

When the counter of slave channel 3 reaches 0001<sub>H</sub>, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset.

The output from slave channel 3 is the delayed PWM pulse.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

### Conditions

Simultaneous rewrite can be used with this function. Please see **Section 31.6, Simultaneous Rewrite**.

#### 31.14.3.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty width 1 = (TAUBnCDRm (slave 1)) × count clock cycle

Delay = (TAUBnCDRm (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUBnCDRm (slave 3)) × count clock cycle

Where the setting of the delay is within the following range:

$0000_{\text{H}} \leq \text{TAUBnCDRm (slave 2)} < \text{TAUBnCDRm (master)}$

#### NOTES

1. The output waveform of TAUBTTOUTm (slave 3) is the output waveform of TAUBTTOUTm (slave 1) delayed for the delay generated by slave 2. It cannot be delayed for more than the pulse cycle.
2. When INTTAUBnIm of slave 2 occurs while slave 3 is counting, slave 3 restarts the operation. Therefore, the output waveform of TAUBTTOUTm (slave 3) retains the active level. (In this case, TAUBTTOUTm (slave 3) cannot output the waveform of the delayed basic pulse of TAUBTTOUTm (slave 1).)

31.14.3.3 Block Diagram and General Timing Diagram

Figure 31.93 Block Diagram for Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

Figure 31.94 General Timing Diagram for Delay Pulse Output Function

### 31.14.3.4 Register Settings for the Master Channel

#### (1) TAUBnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	During operation	<p>TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time.</p> <p>TAUBnRDT.TAUBnRDTm can be changed during operation.</p>	<p>TAUBnCNTm of the master channel and slave channels 1 and 2 load TAUBnCDRm and count down.</p> <p>When the counter of the master channel reaches 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUBnIm (master) is generated</li> <li>• TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation</li> <li>• TAUBnCNTm (slave 1 and slave 2) reload the TAUBnCDRm value and start counting down</li> <li>• TAUBTTOUm (slave 1) is set</li> </ul> <p>When TAUBnCNTm (slave 1) reaches 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUBnIm (slave 1) is generated</li> <li>• TAUBTTOUm (slave 1) is reset</li> </ul> <p>When TAUBnCNTm (slave 2) reaches 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUBnIm (slave 2) is generated</li> <li>• INTTAUBnIm (slave 3) is generated</li> <li>• TAUBTTOUm (slave 3) is set</li> <li>• TAUBnCNTm (slave 3) reloads the TAUBnCDRm value and starts counting down</li> </ul> <p>When TAUBnCNTm (slave 3) reaches 0001<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUBnIm (slave 3) is generated</li> <li>• TAUBTTOUm (slave 3) is reset</li> </ul>
	Stop operation	<p>Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.</p>	<p>TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUm stop and retain their current values.</p>

### 31.14.3.9 Specific Timing Diagrams

#### (1) Duty cycle (slave 3) = 100%

The following values apply to the figure below.

- TAUBnCDRm (master) = 000A<sub>H</sub>
- TAUBnCDRm (slave 1) = 000B<sub>H</sub>
- TAUBnCDRm (slave 2) = 0000<sub>H</sub>
- TAUBnCDRm (slave 3) = 000B<sub>H</sub>

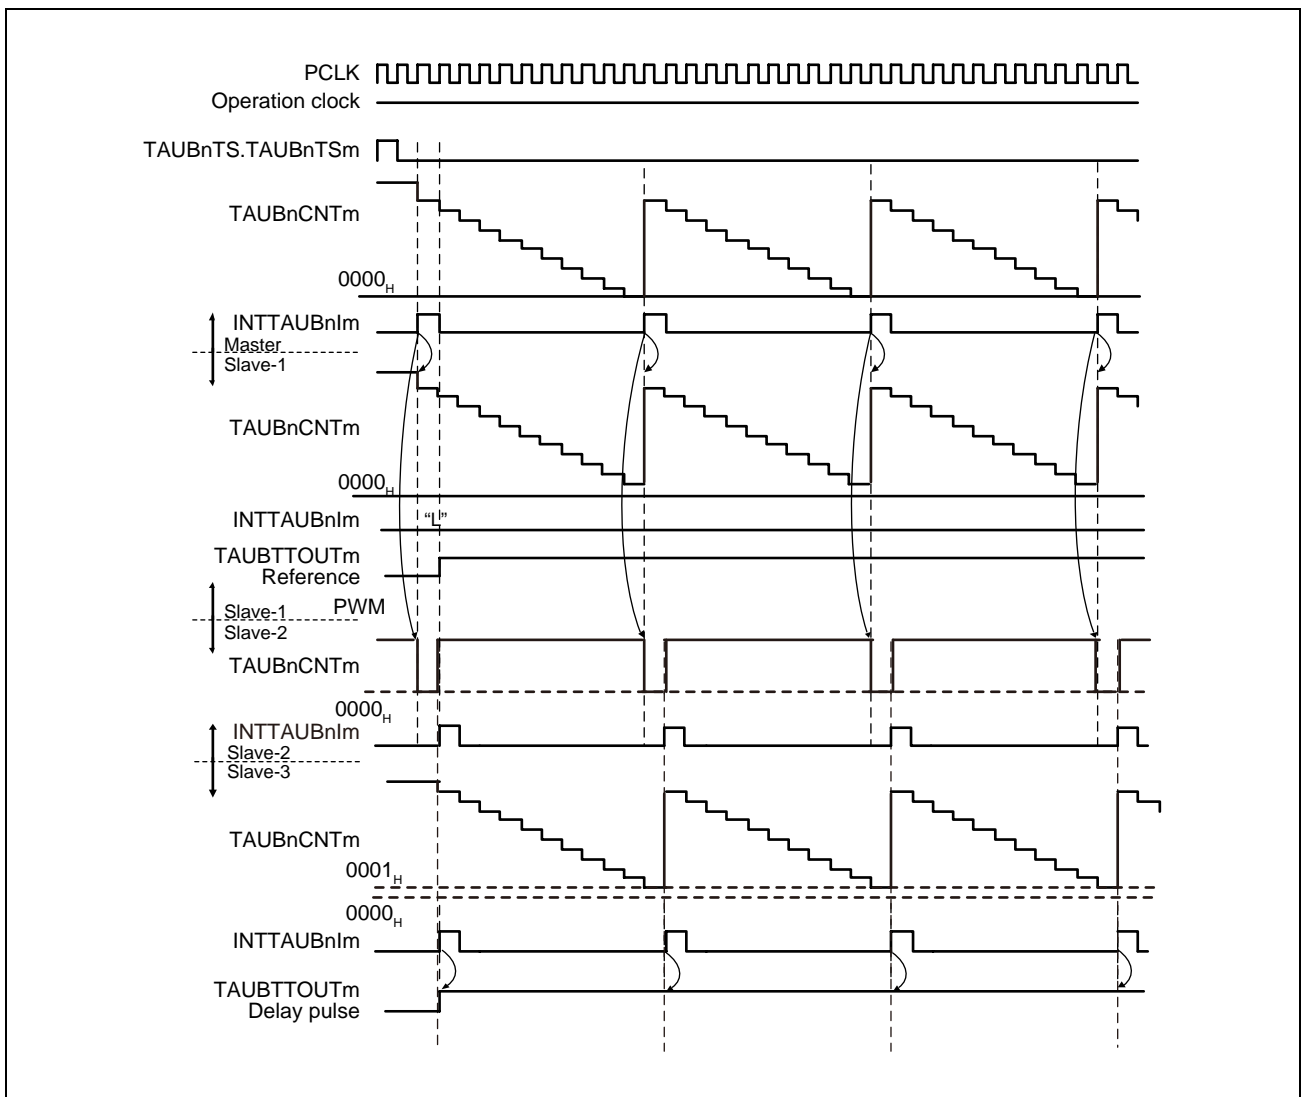

Figure 31.95 Duty Cycle (Slave 3) = 100%

- If the value of TAUBnCDRm (slave 1 and 3) is higher than the value of TAUBnCDRm (master), the counter of slave channel 1 cannot reach 0000<sub>H</sub> and cannot generate interrupt request signals. TAUBTTOUTm of channels 1 and 3 remain in the active state.

**(2) TAUBTTOUTm (slave 1) = TAUBTTOUTm (slave 3)**

The following values apply to the figure below.

- TAUBnCDRm (master) = 000A<sub>H</sub>
- TAUBnCDRm (slave 1) = 0005<sub>H</sub>
- TAUBnCDRm (slave 2) = 0000<sub>H</sub>
- TAUBnCDRm (slave 3) = 0005<sub>H</sub>

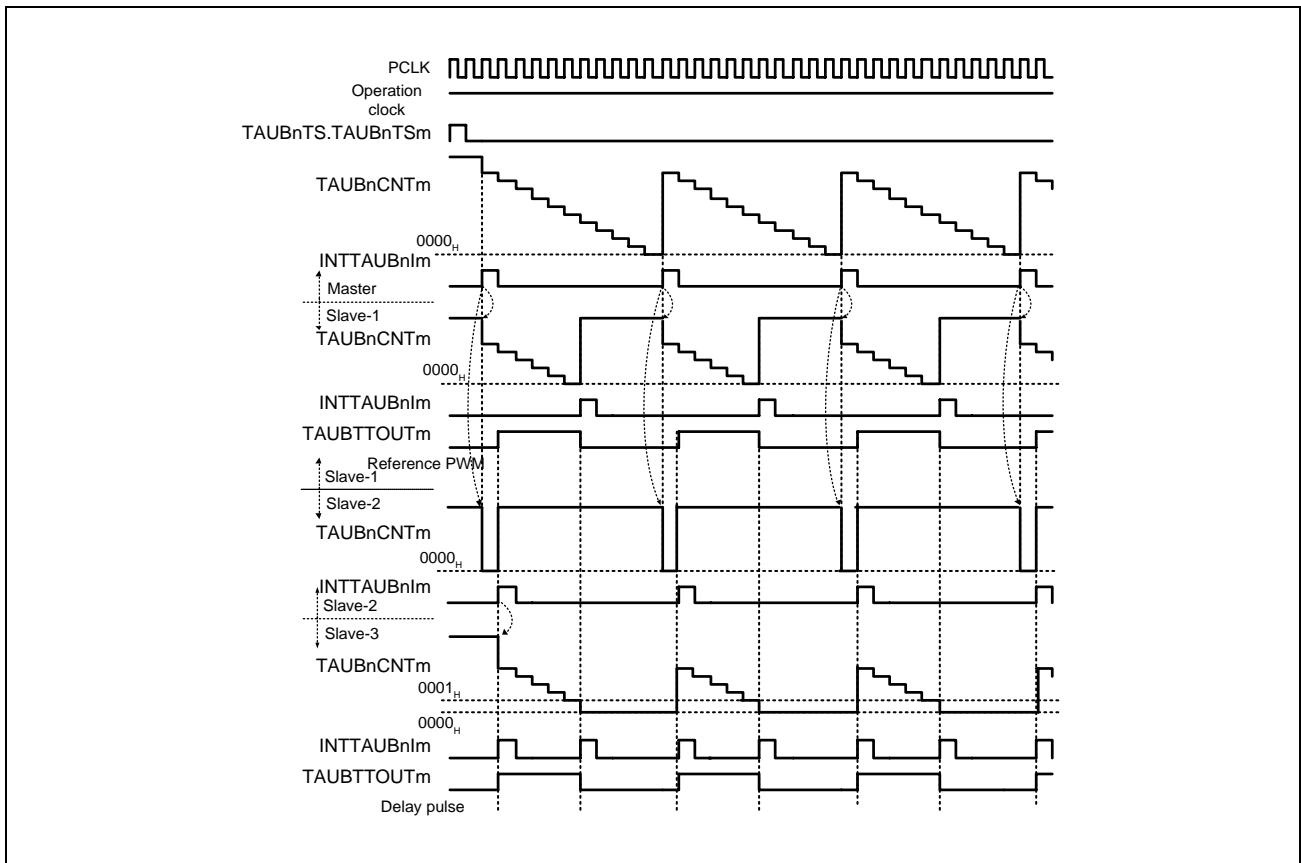

Figure 31.96 TAUBTTOUTm (Slave 1) = TAUBTTOUTm (Slave 3)

- If TAUBnCDRm (slave 2) = 0000<sub>H</sub>, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

### 31.14.4 AD Conversion Trigger Output Function Type 1

#### 31.14.4.1 Overview

##### Summary

This function is identical to **Section 31.14.1, PWM Output Function** except that TAUBTTOUTm is not output. This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

#### 31.14.4.2 Block Diagram and General Timing Diagram

Figure 31.97 Block Diagram for AD Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

Figure 31.98 General Timing Diagram for AD Conversion Trigger Output Function Type 1

## 31.14.5 Triangle PWM Output Function

### 31.14.5.1 Overview

#### Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUT<sub>m</sub> to be set using the master and slave channel(s) respectively.

The master channel generates a carrier cycle from two pulse cycles. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slaves counter.

#### Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 31.148, Contents of the TAUBnCMOR<sub>m</sub> Register for the Master Channel of the Triangle PWM Output Function.**
- The operation mode of the slave channel(s) must be set to up down count mode, see **Table 31.152, Contents of the TAUBnCMOR<sub>m</sub> Register for the Slave Channel of the Triangle PWM Output Function.**
- The channel output mode of the master channel must be set to independent channel output mode 1.
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUT<sub>m</sub> at high level for the down status of the carrier cycle.
  - If the TAUBnCMOR<sub>m</sub>.TAUBnMD0 (master) bit is set to 0, TAUBnTO.TAUBnTO<sub>m</sub> must be set to 1 while TAUBnTOE.TAUBnTOE<sub>m</sub> is 0. (recommended)
  - If the TAUBnCMOR<sub>m</sub>.TAUBnMD0 (master) bit is set to 1, TAUBnTO.TAUBnTO<sub>m</sub> must be set to 0 while TAUBnTOE.TAUBnTOE<sub>m</sub> is 0.

#### Functional description

The counters are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTS<sub>m</sub>) to 1 for every channel. This in turn sets TAUBnTE.TAUBnTE<sub>m</sub>, enabling count operation. The current values of TAUBnCDR<sub>m</sub> (master and slave) are written to TAUBnCNT<sub>m</sub> (master and slave) and the counters start to count down from these values. If the master channel TAUBnCMOR<sub>m</sub>.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUT<sub>m</sub> signal of the master toggles.

- Master channel:
  - When the counter of the master channel reaches 0000<sub>H</sub> (pulse cycle time has elapsed) INTTAUBnIm is generated and the TAUBTTOUT<sub>m</sub> signal toggles. TAUBnCNT<sub>m</sub> then reloads the TAUBnCDR<sub>m</sub> value and counts down.
- Slave channel:
  - INTTAUBnIm generated on the master channel triggers the counter of the slave channel:
    - If the slave counter currently counts down, it changes count direction.
    - If the slave counter currently counts up, the value of TAUBnCDR<sub>m</sub> is reloaded and the counter counts down.

When the counter of the slave channel reaches 0001<sub>H</sub> while counting up or down, INTTAUBnIm is generated and the TAUBTTOUT<sub>m</sub> (slave) signal is set or reset.

The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.

TAUBTTOUT<sub>m</sub> can be switched between positive and negative phase setting TAUBnTOL.TAUBnTOL<sub>m</sub> during operation.

The counters can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBnTOUTm of master and slave channel(s) stop but retain their values.

### Conditions

Simultaneous rewrite can be used with this function. Please see **Section 31.6, Simultaneous Rewrite**.

#### 31.14.5.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq \text{TAUBnCDRm (master)} < \text{FFFF}_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle =

$[(\text{TAUBnCDRm (master)} + 1 - \text{TAUBnCDRm (slave)}) / (\text{TAUBnCDRm (master)} + 1)] \times 100$

- Duty cycle = 100%

TAUBnCDRm (slave) = 0000<sub>H</sub>

- Duty cycle = 0%

TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

31.14.5.3 Block Diagram and General Timing Diagram

Figure 31.99 Block Diagram for Triangle PWM Output Function

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

Figure 31.100 General Timing Diagram for Triangle PWM Output Function

### 31.14.5.4 Register Settings for the Master Channel

#### (1) TAUBnCMORm for the master channel

7, 6	TAUBnCOS[1:0]	Write 00 <sub>B</sub> .
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000 <sub>B</sub> .
0	TAUBnMD0	0: INTTAUBnIm not generated and TAUBTTOUTm does not toggle at operation start 1: Generates INTTAUBnIm and toggles TAUBTTOUTm at operation start

#### (2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 31.149 Contents of the TAUBnCMURm Register for the Master Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

**(3) Channel output mode for the master channel**

Table 31.150 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1 <sub>B</sub> .
TAUBnTOM.TAUBnTOMm	Write 0 <sub>B</sub> .
TAUBnTOC.TAUBnTOCm	Write 0 <sub>B</sub> .
TAUBnTOL.TAUBnTOLm	Write 0 <sub>B</sub> .
TAUBnTDE.TAUBnTDEm	Write 0 <sub>B</sub> .
TAUBnTDL.TAUBnTDLm	Write 0 <sub>B</sub> .

**(4) Simultaneous rewrite for the master channel**

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.151 Simultaneous Rewrite Settings for the Master Channel of the Triangle PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

**NOTE**

If TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel that generates the simultaneous rewrite trigger signal.

### 31.14.5.5 Register Settings for the Slave Channel(s)

#### (1) TAUBnCMORm for the slave channel(s)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBnCCS0	TAUBnMAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 31.152 Contents of the TAUBnCMORm Register for the Slave Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0 <sub>B</sub> .
11	TAUBnMAS	Write 0 <sub>B</sub> .
10 to 8	TAUBnSTS[2:0]	Write 111 <sub>B</sub> .
7, 6	TAUBnCOS[1:0]	Write 00 <sub>B</sub> .
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 1001 <sub>B</sub> .
0	TAUBnMD0	Write 0 <sub>B</sub> .

#### (2) TAUBnCMURm for the slave channel(s)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 31.153 Contents of the TAUBnCMURm Register for the Slave Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

**(3) Channel output mode for the slave channel(s)**

Table 31.154 Control Bit Settings for Synchronous Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1 <sub>B</sub> .
TAUBnTOM.TAUBnTOMm	Write 1 <sub>B</sub> .
TAUBnTOC.TAUBnTOCm	Write 1 <sub>B</sub> .
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0 <sub>B</sub> .
TAUBnTDL.TAUBnTDLm	Write 0 <sub>B</sub> .

**(4) Simultaneous rewrite for the slave channel(s)**

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.155 Simultaneous Rewrite Settings for the Slave Channel of the Triangle PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

### 31.14.5.6 Operating Procedure for Triangle PWM Output Function

Table 31.156 Operating Procedure for Triangle PWM Output Function

	Operation	Status of TAUBn
Restart operation ↑	Initial channel setting  Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in <b>Section 31.14.5.4, Register Settings for the Master Channel</b>  Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in <b>Section 31.14.5.5, Register Settings for the Slave Channel(s)</b>  Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
	Start operation  Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start.  INTTAUBnIm (master) is generated on the master channel when TAUBnCMORm.TAUBnMD0 set to 1.
	During operation  TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time.  TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master and slave channels loads TAUBnCDRm and counts down. When the counter of the master channel reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUBnIm (master) is generated</li> <li>• TAUBTTOUTm (master) toggles</li> <li>• TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation.</li> <li>• TAUBnCNTm (slave) reloads the TAUBnCDRm value or counts in the reverse direction.</li> </ul> When TAUBnCNTm of the slave = 0001 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUBnIm (slave) is generated</li> <li>• TAUBTTOUTm (slave) is set (in count-down status) or reset (in count-up status)</li> </ul>
	Stop operation  Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops.  TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

### 31.14.5.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnCDRm = a = 5<sub>H</sub>
- Slave channel:
  - TAUBnCDRm = 6<sub>H</sub>

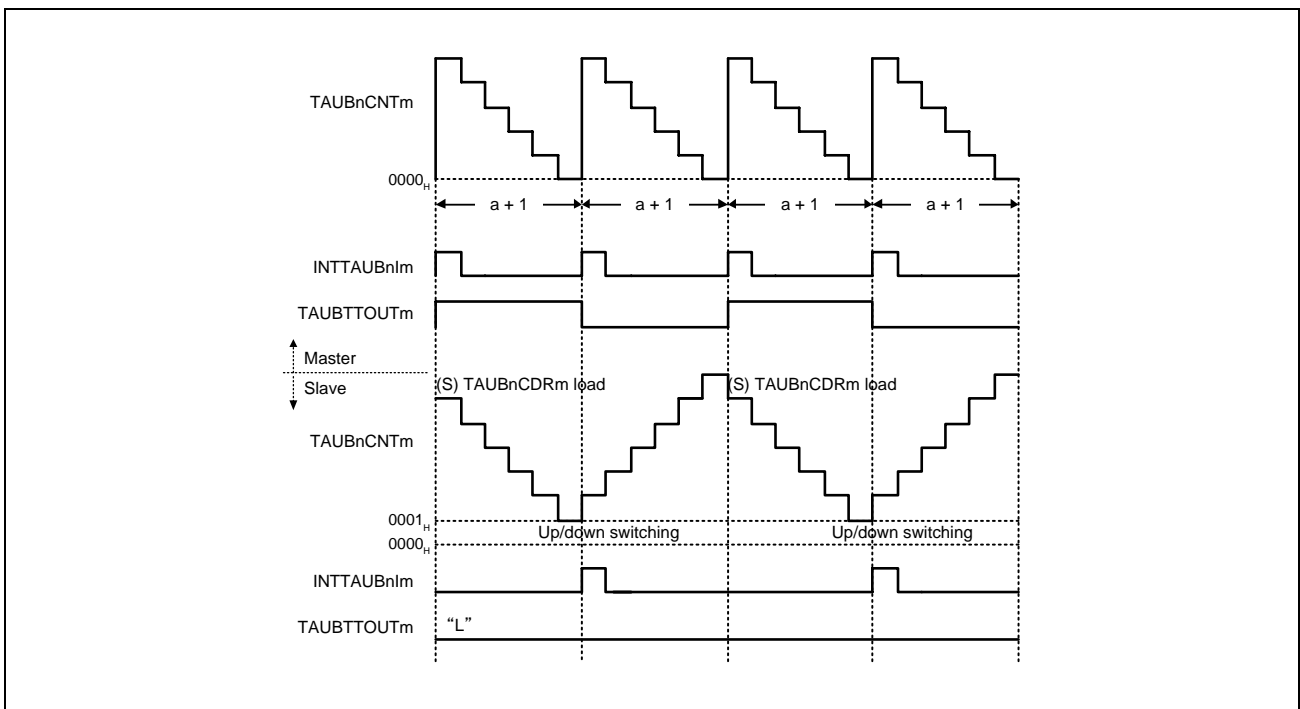

Figure 31.101 TAUBnCDRm (Slave) ≥ TAUBnCDRm (Master) + 1

- If TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1, INTTAUBnIm of slave channel is not generated during counting down. The set signal is never detected, so TAUBTTOUTm remains at low state.

**(2) Duty cycle = 100%**

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start ( $TAUBnCMORm.TAUBnMD0 = 1$ )
  - $TAUBnCDRm = a = 5_H$
- Slave channel:
  - $TAUBnCDRm = 0_B$

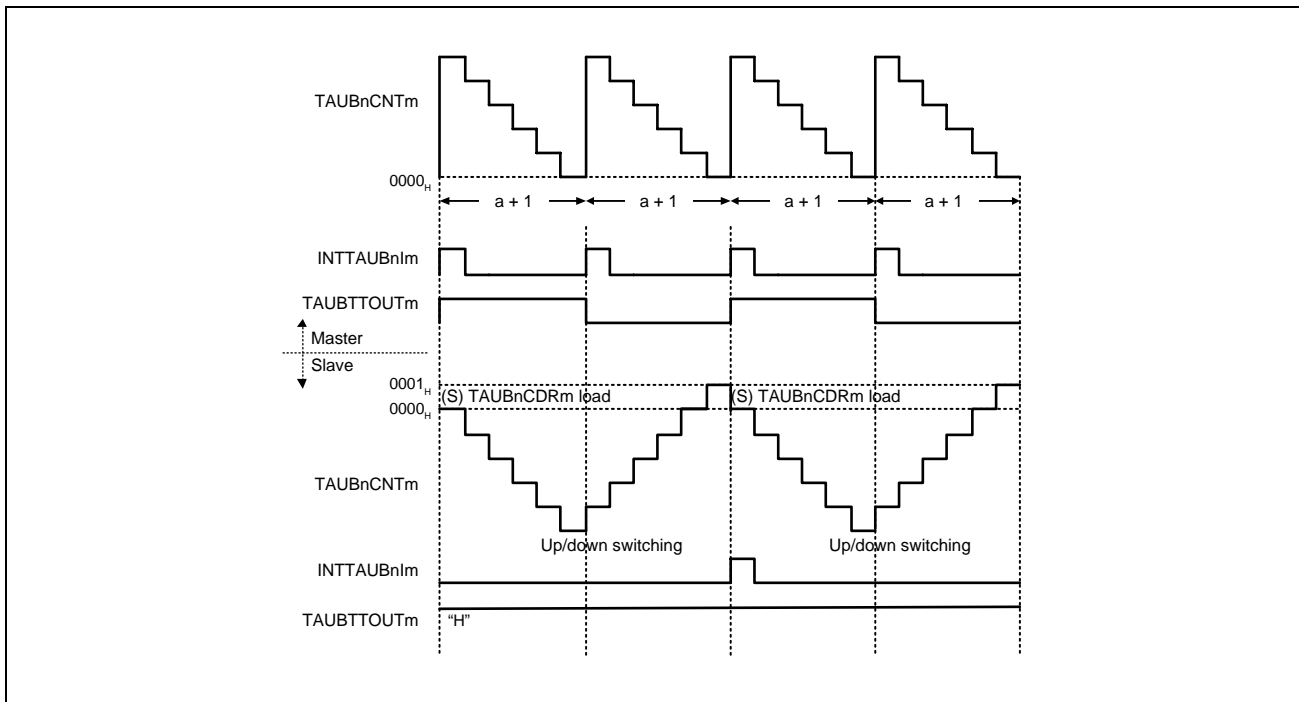

Figure 31.102 TAUBnCDRm (Slave) = 0000H

- If  $TAUBnCDRm$  (slave) = 0000H, INTTAUBnIm of slave channel is not generated during counting up. The reset signal is never detected, so TAUBTTOUTm remains at high state.

## 31.14.6 Triangle PWM Output Function with Dead Time

### 31.14.6.1 Overview

#### Summary

This function generates multiple triangle PWM outputs with a defined dead time by using a master and two or more slave channels. The resulting PWM signals with the dead time are output via TAUBTTOUT<sub>m</sub> of the slave channels 2 and 3. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUT<sub>m</sub> to be set using the master and slave channel(s) respectively.

The master generates a carrier cycle. The first pulse controls the down status and the second pulse controls the up status of the slaves counter.

An interrupt on slave 2 causes TAUBTTOUT<sub>m</sub> of the slave channels to be set or reset.

Depending on the settings of TAUBnTDL.TAUBnTDL<sub>m</sub>, delay time is added to positive or negative logic side of the signal (i.e. whether TAUBTTOUT<sub>m</sub> is set or reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

#### Prerequisites

- Three channels. Select an even channel CH (a) and an odd channel CH (a + 1) for slave channel 2 and 3 respectively.
- The operation mode of the master channel must be set to interval timer mode, see **Table 31.158, Contents of the TAUBnCMOR<sub>m</sub> Register for the Master Channel of the Triangle PWM Output Function with Dead Time**
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even-numbered channel (a), and slave channel 3 is an odd-numbered channel (a + 1). Slave channel 1 can be used as a separate timer (independent function).
- The operation mode of slave channel 2 must be set to up down mode, see **Table 31.162, Contents of the TAUBnCMOR<sub>m</sub> Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time**  
Furthermore, slave channel 2 must be an even channel
- The operation mode of slave channel 3 must be set to one-count mode, see **Table 31.166, Contents of the TAUBnCMOR<sub>m</sub> Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time**  
Furthermore, slave channel 3 must be an odd channel
- The channel output mode of the master channel must be set to independent channel output mode 1
- The channel output mode of the slave channels 2 and 3 must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUT<sub>m</sub> at high level for the down status of the carrier cycle.
  - If the TAUBnCMOR<sub>m</sub>.MD0 (master) bit is set to 0, TAUBnTO.TAUBnTO<sub>m</sub> must be set to 1 while TAUBnTOE.TAUBnTOE<sub>m</sub> is 0. (recommended)
  - If the TAUBnCMOR<sub>m</sub>.MD0 (master) bit is set to 1, TAUBnTO.TAUBnTO<sub>m</sub> must be set to 0 while TAUBnTOE.TAUBnTOE<sub>m</sub> is 0.

#### NOTE

Slave channel 1 is not used for Triangle PWM Output Function with Dead Time. Slave channel 1 can be used as a separate timer (independent function).

### Functional description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSM) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current values of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:

When the counter of the master channel reaches 0000<sub>H</sub>, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. The counter reloads the TAUBnCDRm value and counts down.

- Slave channel 2:

INTTAUBnIm generated on the master channel triggers the counter of the slave channel 2:

- If the slave counter currently counts down, it changes count direction.
- If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.

When the counter value of slave channel 2 reaches 0001<sub>H</sub>, INTTAUBnIm is generated.

- Slave channel 3:

INTTAUBnIm of slave channel 2 triggers the counter of slave channel 3. The current value of TAUBnCDRm (slave 3) is written to TAUBnCNTm (slave 3) and the counter starts to count down from this TAUBnCDRm value.

When the counter reaches 0000<sub>H</sub>, INTTAUBnIm is generated. The counter returns to FFFF<sub>H</sub> and awaits the next INTTAUBnIm of slave channel 2.

The TAUBnTDL.TAUBnTDLm settings of the corresponding channel specify whether it is set/reset immediately, or after dead time has elapsed, as shown in **Table 31.157, Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2**.

The TAUBnTOL.TOLm settings specify whether set corresponds to a high signal (TAUBnTOL.TAUBnTOLm = 0) or a low signal (TAUBnTOL.TAUBnTOLm = 1).

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

TAUBnCDRm value of slave channel 2 can be set to 0000<sub>H</sub> to output 100% TAUBTTOUTm.

#### NOTE

If a forced restart is executed during operation, TAUBTTOUTm is not output as a triangle PWM signal.

### Conditions

Simultaneous rewrite can be used with this function. Please see **Section 31.6, Simultaneous Rewrite**.

TAUBnTOL.TAUBnTOLm and TAUBnTDL.TAUBnTDLm bits should be set before the counter starts, and slave channels 2 and 3 should have opposite TAUBnTOL.TAUBnTOLm settings or opposite TAUBnTDL.TAUBnTDLm settings.

Table 31.157 Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2

TAUBnTDL.TAUBnTDLm	Count Direction of Slave Channel 2 when Interrupt is Generated	TAUBTTOUTm Set/Reset Timing
0	Down	Set after dead time has elapsed
	Up	Reset immediately
1	Down	Set immediately
	Up	Reset after dead time has elapsed

#### 31.14.6.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq \text{TAUBnCDRm (master)} < \text{FFFF}_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (positive phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 – (TAUBnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (negative phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 + (TAUBnCDRm (slave 3) + 1)] × count clock cycle

31.14.6.3 Block Diagram and General Timing Diagram

Figure 31.103 Block Diagram for Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Slave channel 2:
  - INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
  - TAUBnTDL.TAUBnTDLm = 0
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Enables start trigger detection during counting (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnTDL.TAUBnTDLm = 1
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)

Figure 31.104 General Timing Diagram for Triangle PWM Output Function with Dead Time

### 31.14.6.4 Register Settings for the Master Channel

#### (1) TAUBnCMORM for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBnCCS0	TAUBnMAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBnMD0

Table 31.158 Contents of the TAUBnCMORM Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0 <sub>B</sub> .
11	TAUBnMAS	Write 1 <sub>B</sub> .
10 to 8	TAUBnSTS[2:0]	Write 000 <sub>B</sub> .
7, 6	TAUBnCOS[1:0]	Write 00 <sub>B</sub> .
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000 <sub>B</sub> .
0	TAUBnMD0	0: INTTAUBnIm not generated and TAUBTTOUTm does not toggle at operation start 1: Generates INTTAUBnIm and toggles TAUBTTOUTm at operation start

#### (2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 31.159 Contents of the TAUBnCMURm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

**(3) Channel output mode for the master channel**

Table 31.160 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1 <sub>B</sub> .
TAUBnTOM.TAUBnTOMm	Write 0 <sub>B</sub> .
TAUBnTOC.TAUBnTOCm	Write 0 <sub>B</sub> .
TAUBnTOL.TAUBnTOLm	Write 0 <sub>B</sub> .
TAUBnTDE.TAUBnTDEm	Write 0 <sub>B</sub> .
TAUBnTDL.TAUBnTDLm	Write 0 <sub>B</sub> .

**(4) Simultaneous rewrite for the master channel**

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.161 Simultaneous Rewrite Settings for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

**NOTE**

If TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel that generates the simultaneous rewrite trigger signal.

### 31.14.6.5 Register Settings for Slave Channel 2

#### (1) TAUBnCMORm for slave channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBnCCS0	TAUBnMAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBnMD0

1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

**(3) Channel output mode for slave channel 3**

Table 31.168 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1 <sub>B</sub> .
TAUBnTOM.TAUBnTOMm	Write 1 <sub>B</sub> .
TAUBnTOC.TAUBnTOCm	Write 1 <sub>B</sub> .
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 1 <sub>B</sub> .
TAUBnTDL.TAUBnTDLm	0: Dead time is added to the positive phase 1: Dead time is added to the negative phase

**CAUTION**

Set TAUBnTDL.TAUBnTDLm exclusively to the even channel.

**(4) Simultaneous rewrite for slave channel 3**

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.169 Simultaneous Rewrite Settings for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

### 31.14.6.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 31.170 Operating Procedure for Triangle PWM Output with Dead Time

	Operation	Status of TAUBn
Restart operation ↑	Initial channel setting  Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in <b>Section 31.14.6.4 Register Settings for the Master Channel</b>  Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in <b>Section 31.14.6.5, Register Settings for Slave Channel 2</b>  Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in <b>Section 31.14.6.6, Register Settings for Slave Channel 3</b>  Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
	Start operation  Set TAUBnTS.TAUBnTsm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTsm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEM (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm (master) is generated when TAUBnCMORm.TAUBnMD0 is set to 1 on the master channel.
	During operation  TAUBnCDRm can be changed at any time.  TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time.  TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel and slave channel 2 load TAUBnCDRm and count down. When the counter of the master channel reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUBnIm (master) is generated</li> <li>• TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation</li> <li>• TAUBnCNTm (slave 2) reloads the TAUBnCDRm value or counts in the reverse direction</li> </ul> When TAUBnCNTm (slave 2) reaches 0001 <sub>H</sub> : INTTAUBnIm (slave 2) is generated TAUBnCNTm of slave channel 3 loads the TAUBnCDRm value and counts down When TAUBnCNTm of slave channel 3 = 0000 <sub>H</sub> : INTTAUBnIm is generated
	Stop operation  Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEM is cleared to 0 and the counter stops. TAUBnCNTm and TAUBnTTOUTm stop and retain their current values.

### 31.14.6.8 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

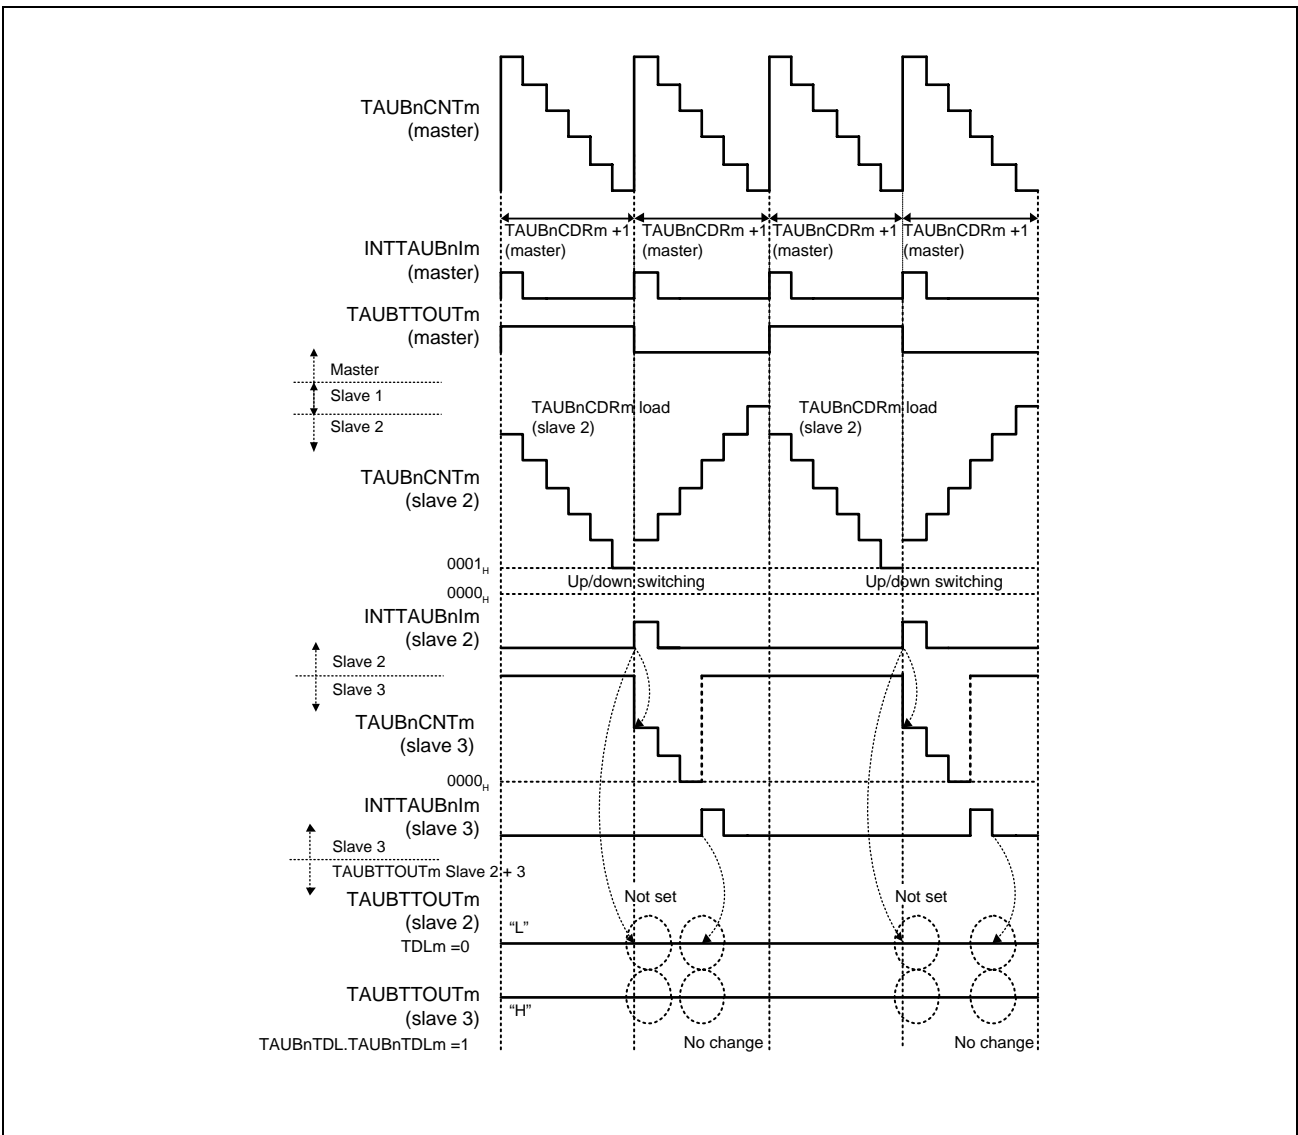

Figure 31.105 TAUBnCDRm (Slave 2) ≥ TAUBnCDRm (Master) + 1

- If  $TAUBnCDRm (slave\ 2) \geq TAUBnCDRm (master)$ , the counter of slave channel cannot reach 0000H during counting down. Therefore TAUBTTOUTm cannot toggle, i.e. it remains at its initial state. The interrupt from slave channel 2 occurs during count up, therefore it is a reset signal.

**(2) Duty cycle = 100%**

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

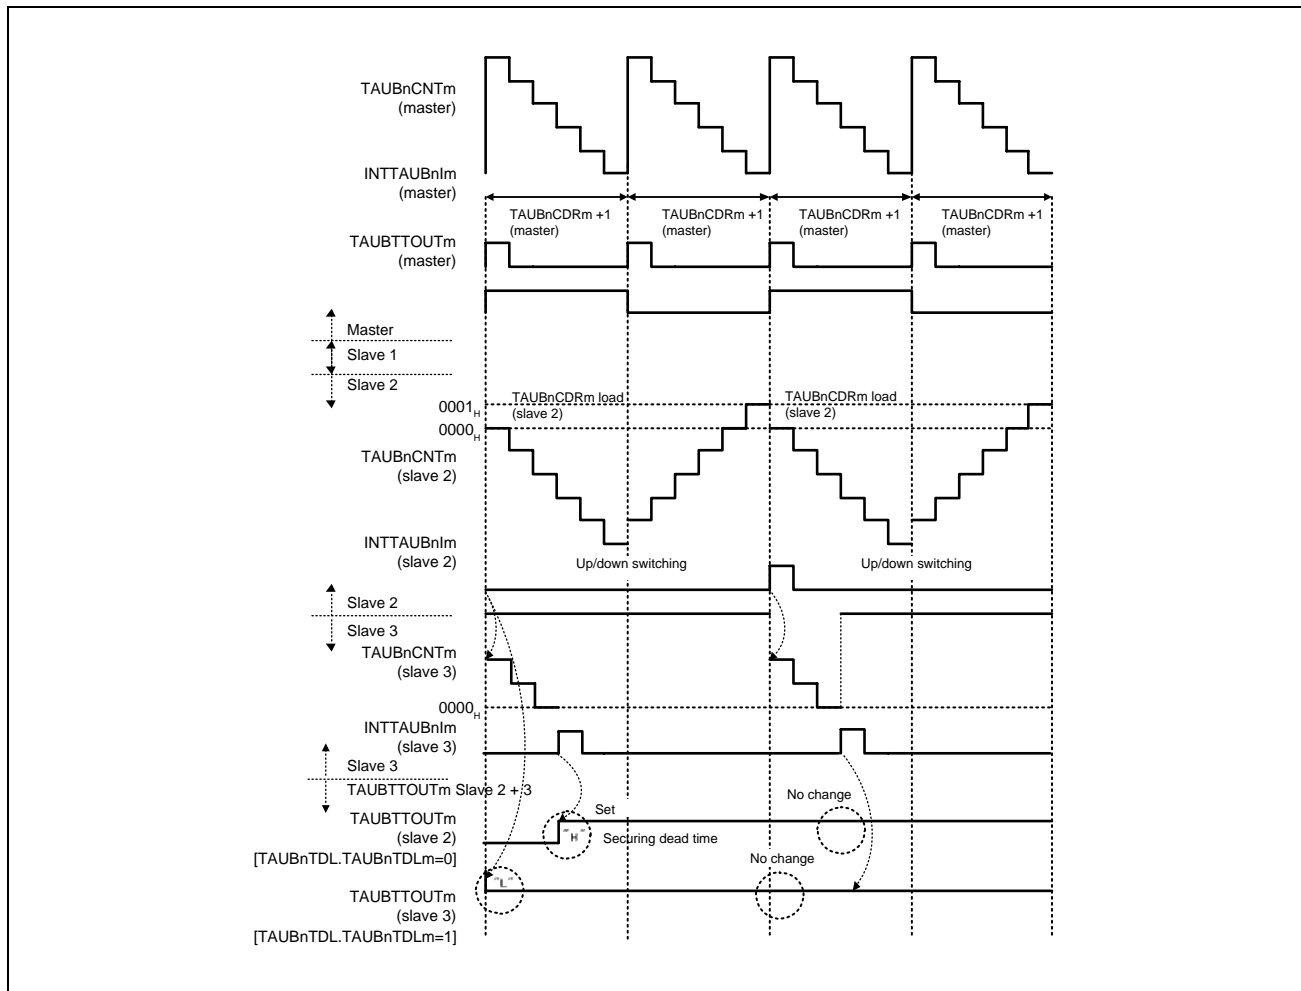

Figure 31.106 TAUBnCDRm (Slave 2) = 0000H

- If TAUBnCDRm (slave 2) = 0000H the counter of slave channel cannot reach 0001H while counting up and therefore cannot generate an INTTAUBnIm while counting up.
  - The set conditions for a channel in which TAUBnTDL.TAUBnTDLm = 0 are met after dead time has elapsed. TAUBTTOUTm toggles but remains in the new state because the reset conditions are never satisfied for such a channel.
  - Slave channel 3 in the above diagram is set when the counter starts. However, the reset conditions for a channel in which TAUBnTDL.TAUBnTDLm = 1 are never satisfied so TAUBTTOUTm remains in its initial state for such a slave channel.

**(3) TAUBTTOUTm (slave 2) = 0% and TAUBTTOUTm (slave 3) ≥ 0%**

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

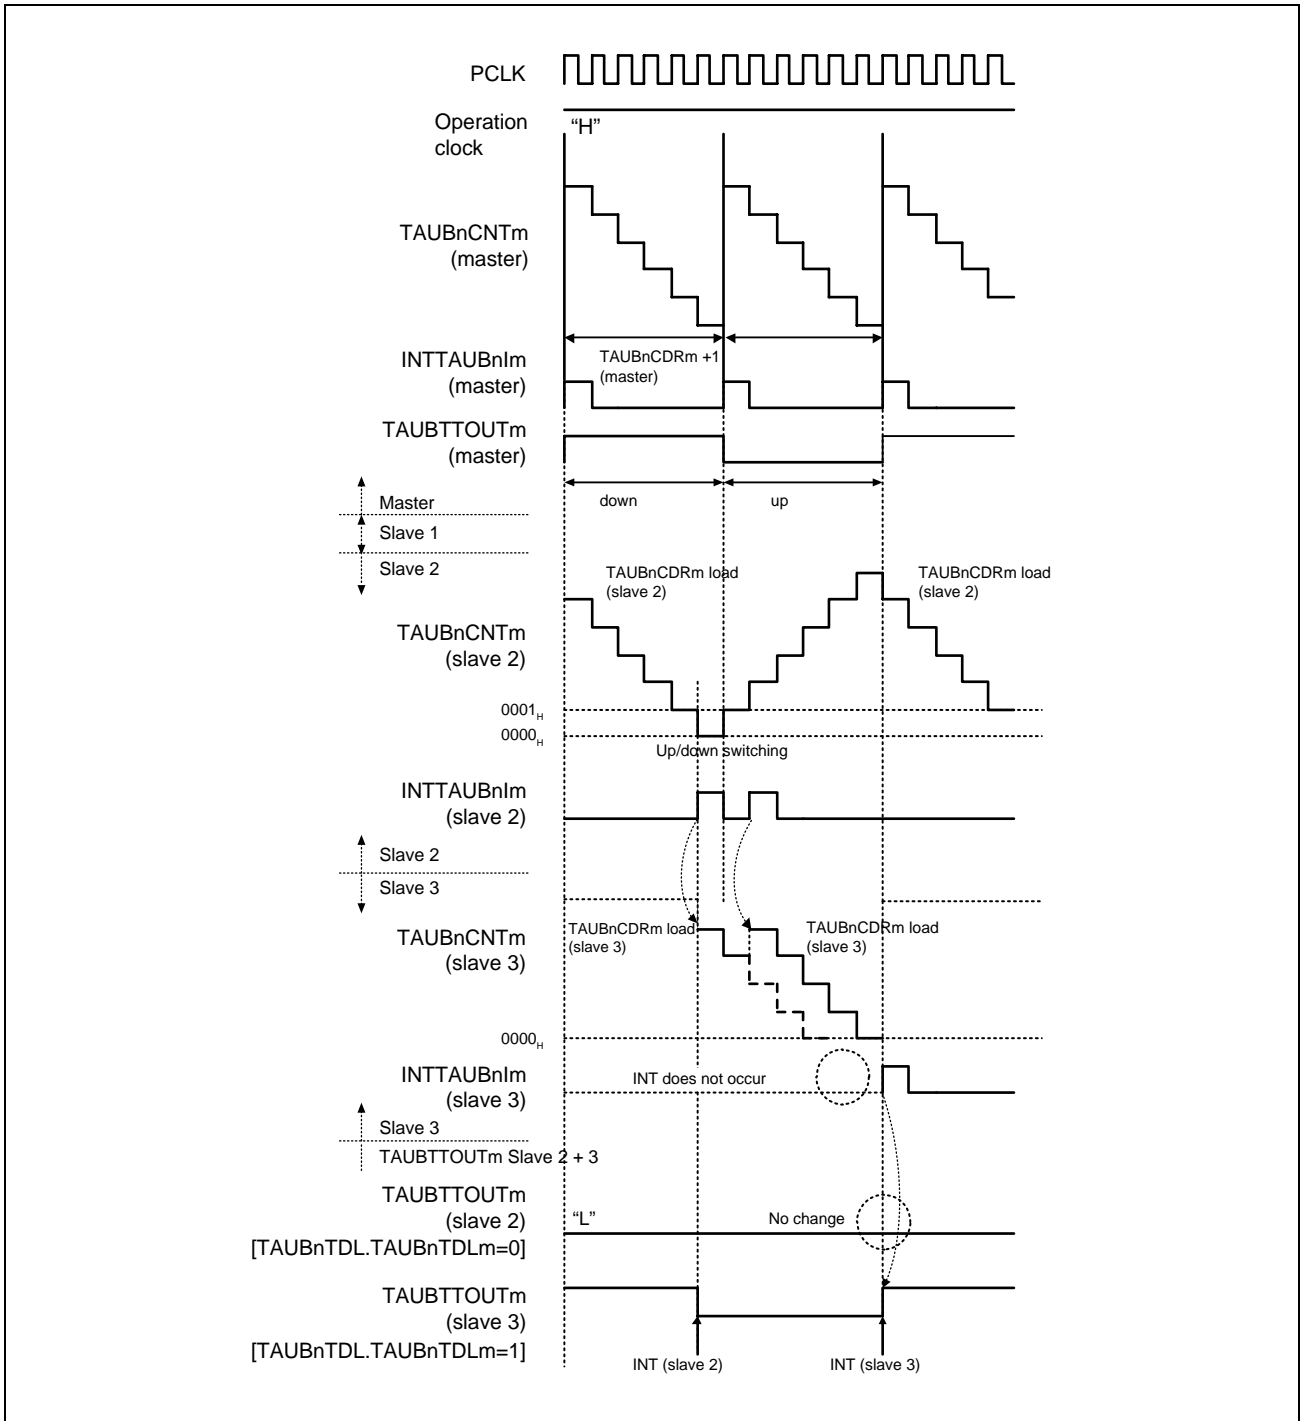

Figure 31.107 TAUBnCDRm (Master) = 0005H, TAUBnCDRm (Slave 2) = 0005H TAUBnCDRm (Slave 3) = 0004H

- When the counter of slave channel 2 reaches 0000<sub>H</sub> after detecting that the counter reached 0001<sub>H</sub>, INTTAUBnIm (slave 2) is generated. The counter of slave channel 3 starts to count down.
- If another INTTAUBnIm (slave 2) is generated while the counter of slave channel 3 is still counting down, the value of TAUBnCDRm (slave 3) is reloaded and the counter restarts counting down from this value.
- In the diagram above, the first interrupt on channel 2 occurs while the counter is counting down, and the second while it is counting up.
- After the first interrupt, a slave for which TAUBnTDL.TAUBnTDLm = 0 waits for dead time to elapse before setting. However, if another interrupt occurs on slave 2, before the dead time has elapsed, the counter is counting up, so the signal acts as a reset signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 0 always remains inactive.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 is set and reset as normal when the corresponding INTTAUBnIm is generated.

**(4) TAUBTTOUTm (slave 2) > 0% and TAUBTTOUTm (slave 3) = 100%**

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

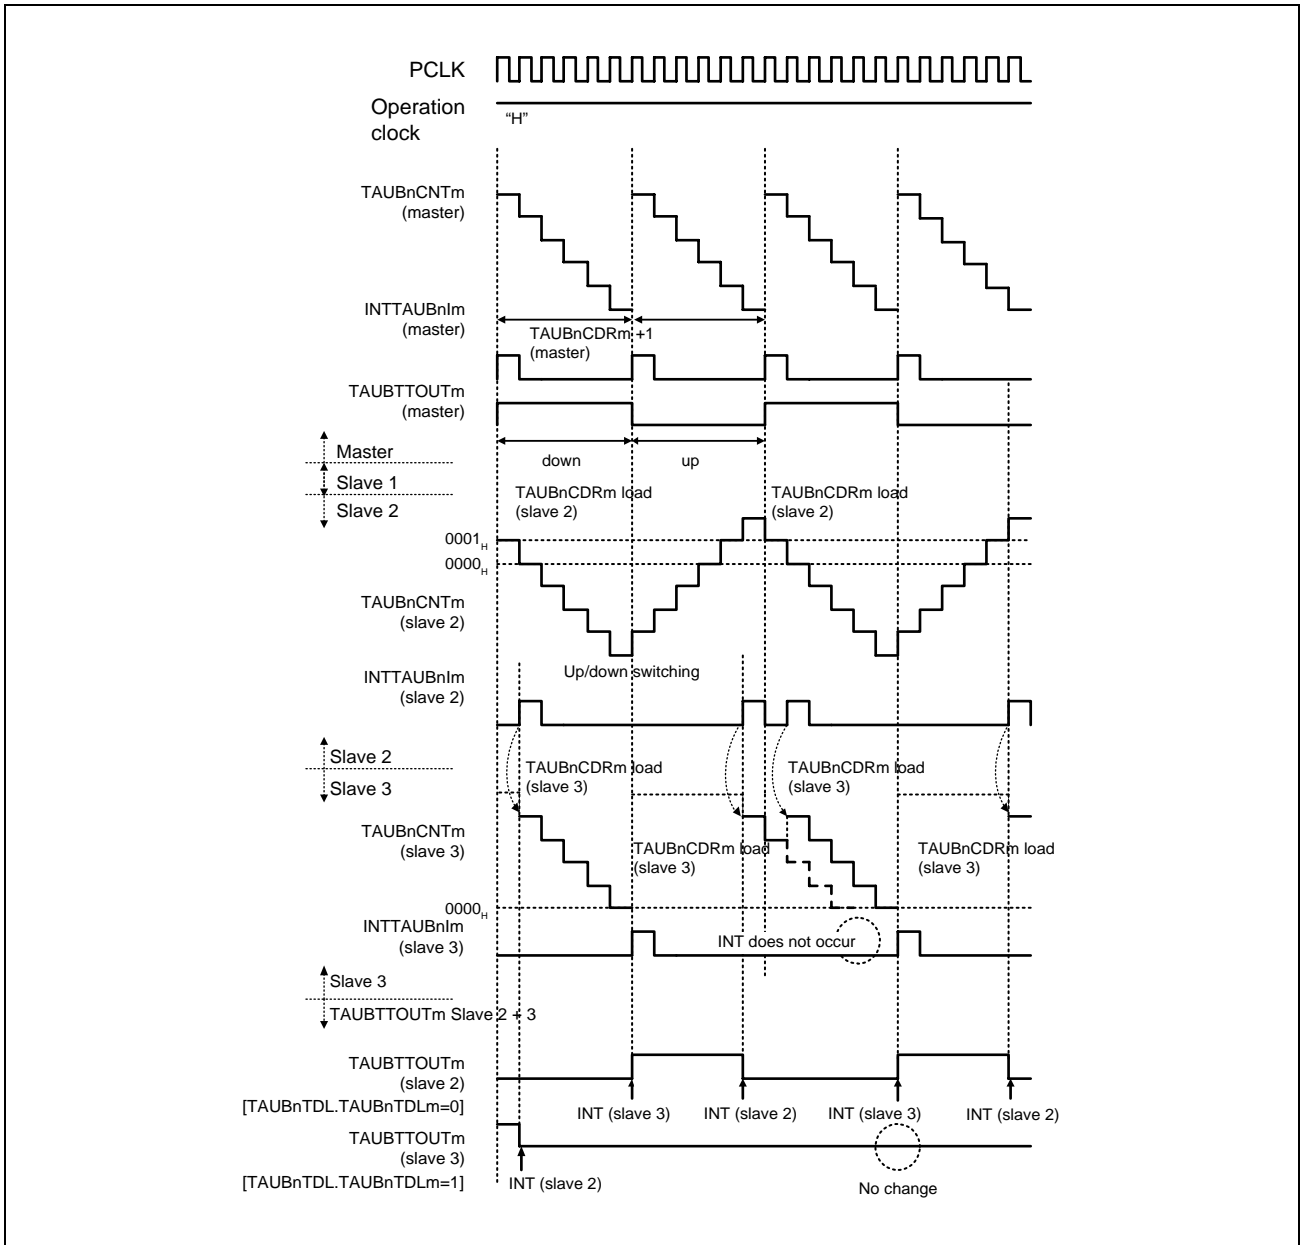

Figure 31.108 TAUBnCDRm (Master) = 0005<sub>H</sub>, TAUBnCDRm (Slave 2) = 0001<sub>H</sub> TAUBnCDRm (Slave 3) = 0004<sub>H</sub>  
 PWM Signal Width (Negative Phase) ≥ Carrier Cycle

- After the second interrupt on slave channel 2, a slave for which  $TAUBnTDL.TAUBnTDLm = 1$  is reset after the dead time has elapsed. However if another interrupt occurs on slave 2 before the dead time has elapsed, slave channel 3 is restarted, and then if an interrupt on slave channel 3 is generated, the counter is counting up, so the signal acts as a setting signal, meaning that a channel for which  $TAUBnTDL.TAUBnTDLm = 1$  always remains active.
- $TAUBTTOUTm$  of a slave channel for which  $TAUBnTDL.TAUBnTDLm = 0$  is set and reset as normal when the corresponding  $INTTAUBnIm$  is generated.

#### **(5) Inhibited $INTTAUBnIm$ to set $TAUBTTOUTm$ positive phase period**

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic ( $TAUBnTOL.TAUBnTOLm = 0$ )
- Slave channel 3:
  - Negative logic ( $TAUBnTOL.TAUBnTOLm = 1$ )

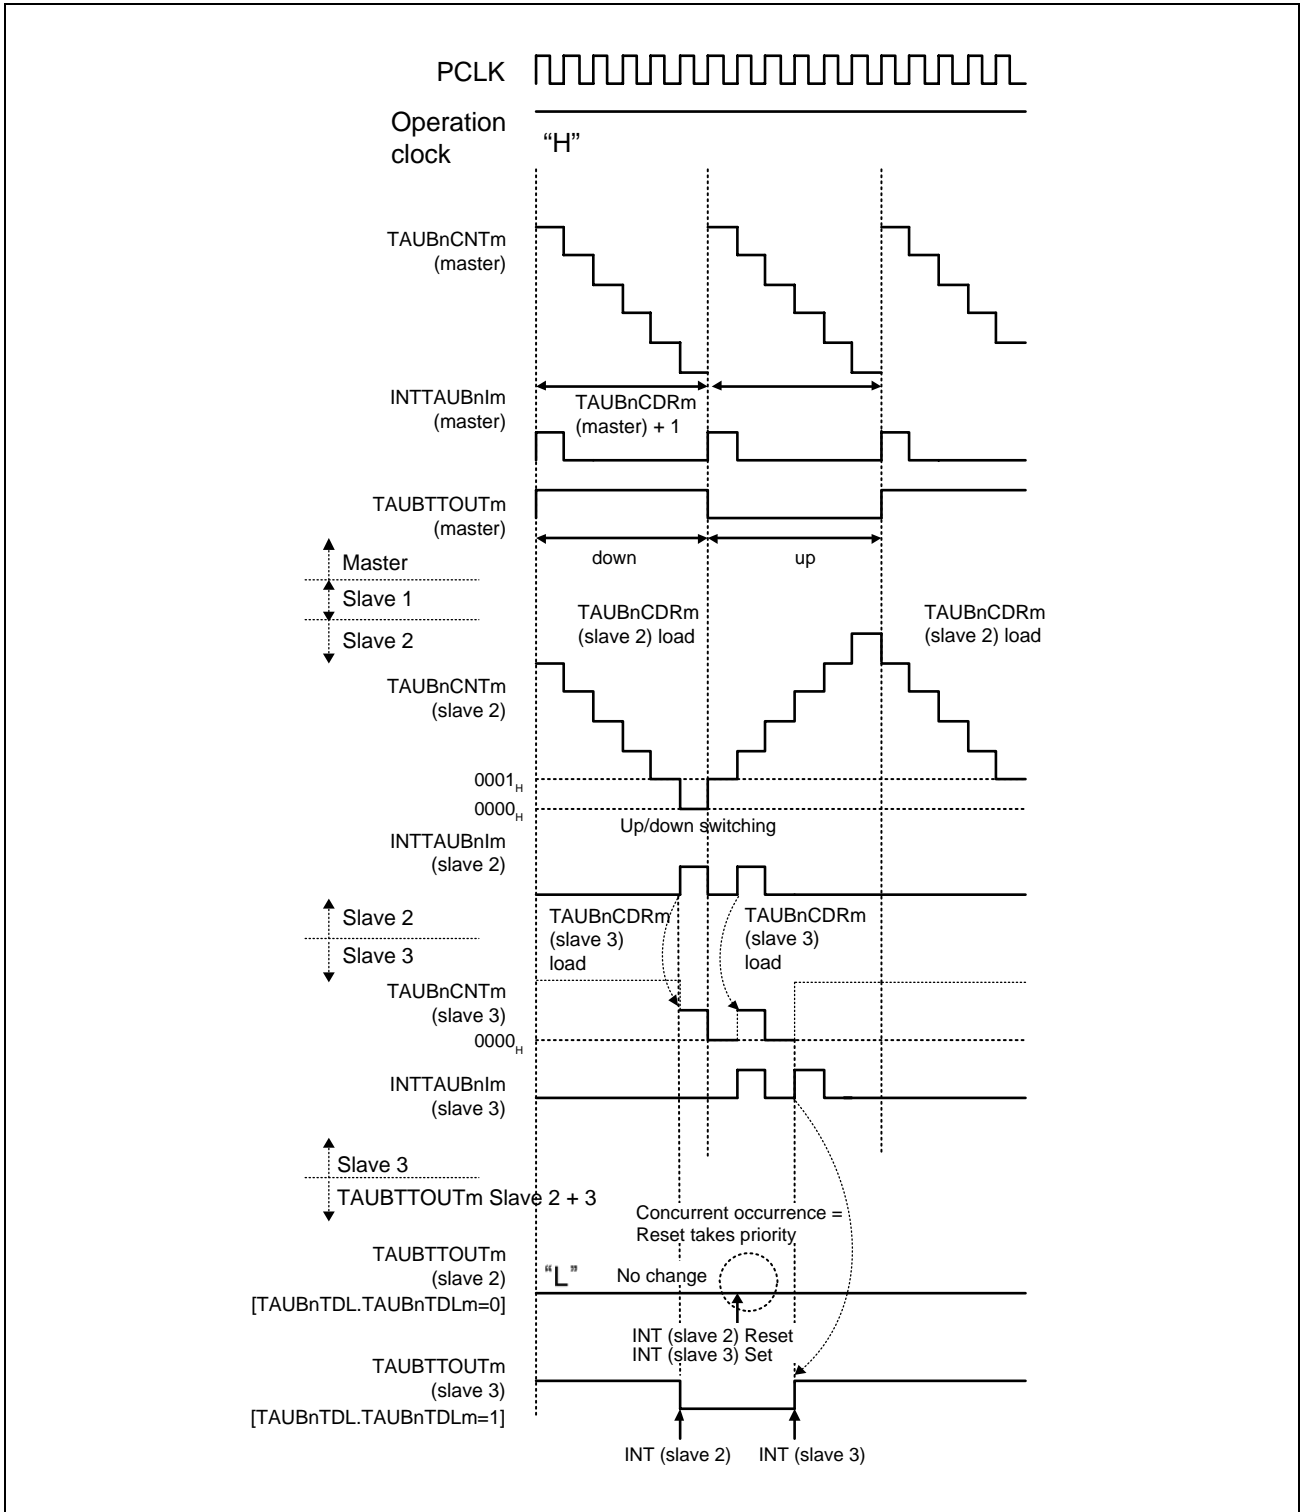

Figure 31.109 TAUBnCDRm (Master) = 0005H, TAUBnCDRm (Slave 2) = 0005H, TAUBnCDRm (Slave 3) = 0001H  
 PWM Signal Width (Positive Phase) = 0

- The counter of slave channel 3 reaches  $0000_H$  and generates an  $INTTAUBnIm$  to set the  $TAUBTTOUTm$  of slave channel for which  $TAUBnTDL.TAUBnTDLm = 0$  (slave channel 2 in this example).
- If slave channel 2 generates an  $INTTAUBnIm$  and resets  $TAUBTTOUTm$  simultaneously, this reset signal is given priority if  $TAUBnTOL.TAUBnTOLm = 0$  (if  $TAUBnTOL.TAUBnTOLm = 1$ , the set signal is given priority).
- Therefore,  $TAUBTTOUTm$  of a slave channel for which  $TAUBnTDL.TAUBnTDLm = 0$  remains in the value after reset.

**(6) Inhibited INTTAUBnIm to set TAUBTTOUTm negative phase period**

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

Figure 31.110 TAUBnCDRm (Master) = 0005H, TAUBnCDRm (Slave 2) = 0001H, TAUBnCDRm (Slave 3) = 0001H  
 PWM Signal Width (Negative Phase) = Carrier Cycle

- The counter of slave channel 3 reaches 0000<sub>H</sub> and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 1 (slave 3 in this example).
- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, the set signal is given priority if TAUBnTOL.TAUBnTOLm = 1 (if TAUBnTOL.TAUBnTOLm = 0, the reset signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 remains in the value after reset.

### (7) Slave 2 TAUBnCDRm = 0000<sub>H</sub> (Duty cycle = 100%)

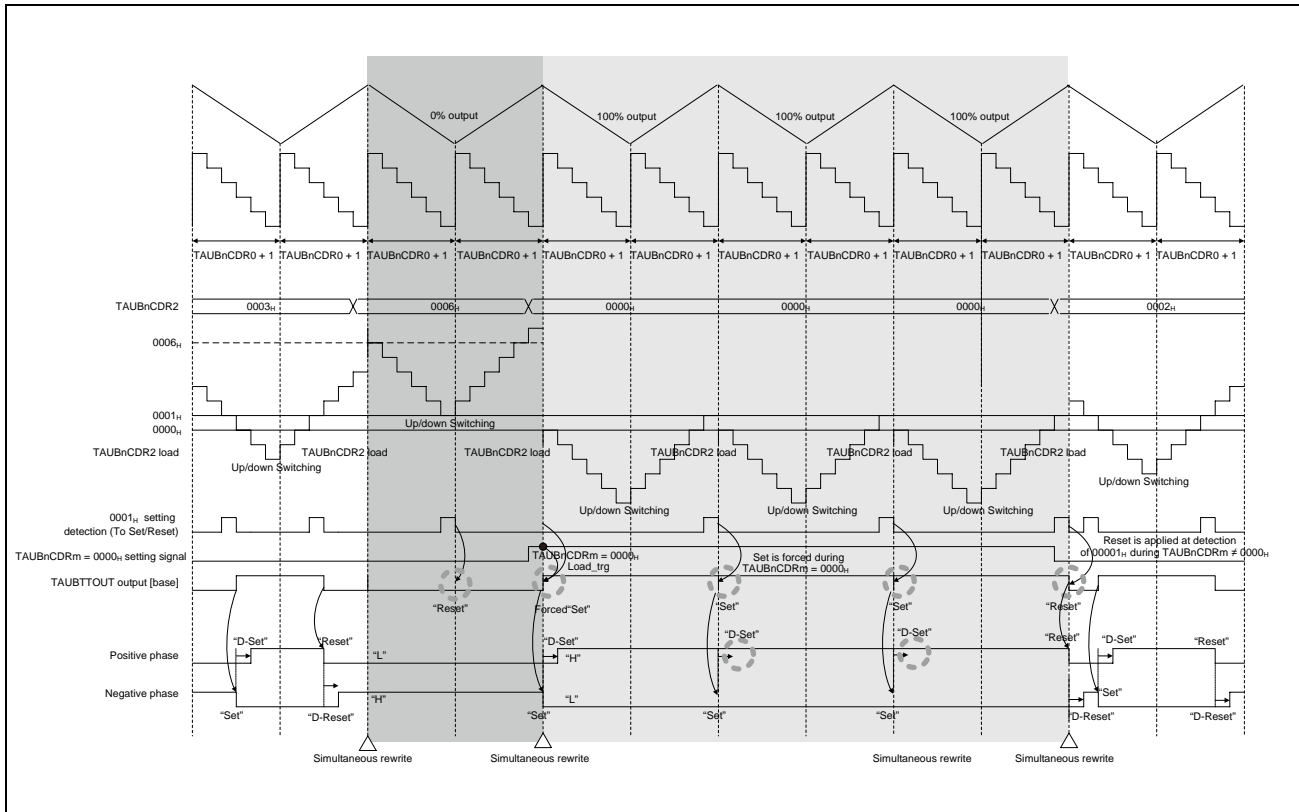

Figure 31.111 Slave 2 TAUBnCDRm = 0000<sub>H</sub> (Duty cycle = 100%)

When rewriting (slave channel 2) TAUBnCDRm  $\neq$  0000<sub>H</sub> to (slave channel 2) TAUBnCDRm = 0000<sub>H</sub> (100% output), set the negative phase side at the start of the carrier cycle, and set the positive phase side after dead time is secured.

When rewriting (slave channel 2) TAUBnCDRm = 0000<sub>H</sub> (100% output) to (slave channel 2) TAUBnCDRm  $\neq$  0000<sub>H</sub>, reset the positive phase side at the end of the carrier cycle, and reset the negative phase side after dead time is secured.

### 31.14.7 A/D Conversion Trigger Output Function Type 2

#### 31.14.7.1 Overview

##### Summary

This function is identical to **Section 31.14.5, Triangle PWM Output Function**, except that TAUBTTOUT<sub>m</sub> is not output.

This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

#### 31.14.7.2 Block Diagram and General Timing Diagram

Figure 31.112 Block Diagram for A/D Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start ( $TAUBnCMORm.TAUBnMD0 = 1$ )

Figure 31.113 General Timing Diagram for A/D Conversion Trigger Output Function Type 2

## Section 32 Timer Array Unit D (TAUD)

This section contains a generic description of the timer array unit D (TAUD).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of TAUD.

### 32.1 Features of RH850/F1KH, RH850/F1KM TAUD

#### 32.1.1 Number of Units and Channels

This microcontroller has the following number of TAUD units and channels.

Table 32.1 Number of Units (RH850/F1KH-D8)

	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	TAUDn (n = 0)	TAUDn (n = 0)	TAUDn (n = 0)

Table 32.2 Number of Units (RH850/F1KM-S4)

	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	TAUDn (n = 0)	TAUDn (n = 0)	TAUDn (n = 0)	TAUDn (n = 0)	TAUDn (n = 0)

Table 32.3 Number of Units (RH850/F1KM-S2)

	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	1	1	1
Name	TAUDn (n = 0)	TAUDn (n = 0)	TAUDn (n = 0)

Table 32.4 Number of Units (RH850/F1KM-S1)

	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	TAUDn (n = 0)	TAUDn (n = 0)	TAUDn (n = 0)	TAUDn (n = 0)

Table 32.5 TAUDn Unit Configurations and Channels (RH850/F1KH-D8)

Unit Name	Number of Channels per Unit	RH850/F1KH-D8 176 Pins (16 ch)	RH850/F1KH-D8 233 Pins (16 ch)	RH850/F1KH-D8 324 Pins (16 ch)
TAUD0	16	✓	✓	✓

Table 32.6 TAUDn Unit Configurations and Channels (RH850/F1KM-S4)

Unit Name	Number of Channels per Unit	RH850/F1KM-S4 100 Pins (16 ch)	RH850/F1KM-S4 144 Pins (16 ch)	RH850/F1KM-S4 176 Pins (16 ch)	RH850/F1KM-S4 233 Pins (16 ch)	RH850/F1KM-S4 272 Pins (16 ch)
TAUD0	16	✓	✓	✓	✓	✓

Table 32.7 TAUDn Unit Configurations and Channels (RH850/F1KM-S2)

Unit Name TAUDn	Number of Channels per Unit	RH850/F1KM-S2 100 Pins (16 ch)	RH850/F1KM-S2 144 Pins (16 ch)	RH850/F1KM-S2 176 Pins (16 ch)
TAUD0	16	✓	✓	✓

Table 32.8 TAUDn Unit Configurations and Channels (RH850/F1KM-S1)

Unit Name TAUDn	Number of Channels per Unit	RH850/F1KM-S1 48 Pins (16 ch)	RH850/F1KM-S1 64 Pins (16 ch)	RH850/F1KM-S1 80 Pins (16 ch)	RH850/F1KM-S1 100 Pins (16 ch)
TAUD0	16	✓	✓	✓	✓

Table 32.9 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual TAUD units are identified by the index “n”; for example, TAUDnTOM is the TAUDn channel output mode register.
m	The TAUD has 16 channels. Throughout this section, the individual channels are identified by the index “m”, thus a certain channel is denoted as CHm (m = 0 to 15). The even numbered channels (m = 0, 2, 4, 6, 8, 10, 12, 14) are denoted as CHm_even. The odd numbered channels (m = 1, 3, 5, 7, 9, 11, 13, 15) are denoted as CHm_odd.

### 32.1.2 Register Base Address

TAUDn base address is listed in the following table.

TAUDn register addresses are given as an offset from the base address.

Table 32.10 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<TAUD0_base>	FFE2 0000 <sub>H</sub>

### 32.1.3 Clock Supply

The TAUDn clock supply is shown in the following table.

Table 32.11 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAUDn	PCLK	CKSCLK_IPER11	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPER11	Bus clock

### 32.1.4 Interrupt Requests

TAUDn interrupt requests are listed in the following table.

Table 32.12 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
TAUDO			
INTTAUD0I0	Channel 0 interrupt	8, 132	0 to 3, 17, 18
INTTAUD0I1	Channel 1 interrupt	48	0 to 3, 17, 18
INTTAUD0I2	Channel 2 interrupt	9, 158	0 to 3, 17, 18
INTTAUD0I3	Channel 3 interrupt	49	0 to 3, 17, 18
INTTAUD0I4	Channel 4 interrupt	10, 133	0 to 3, 17, 18
INTTAUD0I5	Channel 5 interrupt	50	0 to 3, 17, 18
INTTAUD0I6	Channel 6 interrupt	11, 134	0 to 3, 17, 18
INTTAUD0I7	Channel 7 interrupt	51	0 to 3, 17, 18
INTTAUD0I8	Channel 8 interrupt	12, 135	0 to 3, 17, 18
INTTAUD0I9	Channel 9 interrupt	52	0 to 3, 17, 18
INTTAUD0I10	Channel 10 interrupt	13, 159	0 to 3, 17, 18
INTTAUD0I11	Channel 11 interrupt	53	0 to 3, 17, 18
INTTAUD0I12	Channel 12 interrupt	14, 160	0 to 3, 17, 18
INTTAUD0I13	Channel 13 interrupt	54	0 to 3, 17, 18
INTTAUD0I14	Channel 14 interrupt	15, 161	0 to 3, 17, 18
INTTAUD0I15	Channel 15 interrupt	55	0 to 3, 17, 18

### 32.1.5 Reset Sources

TAUDn reset sources are listed in the following table. TAUDn is initialized by these reset sources.

Table 32.13 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
TAUDn	All reset sources (ISORES)

### 32.1.6 External Input/Output Signals

External input/output signals of TAUDn are listed below.

Table 32.14 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
TAUD0		
TAUDTTIN0	Channel 0 input*1	TAUD0I0
TAUDTTIN1	Channel 1 input*1	TAUD0I1
TAUDTTIN2	Channel 2 input*1	TAUD0I2
TAUDTTIN3	Channel 3 input*1	TAUD0I3
TAUDTTIN4	Channel 4 input*1	TAUD0I4
TAUDTTIN5	Channel 5 input*1	TAUD0I5
TAUDTTIN6	Channel 6 input*1	TAUD0I6
TAUDTTIN7	Channel 7 input*1	TAUD0I7
TAUDTTIN8	Channel 8 input*1	TAUD0I8
TAUDTTIN9	Channel 9 input*1	TAUD0I9
TAUDTTIN10	Channel 10 input*1	TAUD0I10
TAUDTTIN11	Channel 11 input*1	TAUD0I11
TAUDTTIN12	Channel 12 input*1	TAUD0I12
TAUDTTIN13	Channel 13 input*1	TAUD0I13
TAUDTTIN14	Channel 14 input*1	TAUD0I14
TAUDTTIN15	Channel 15 input*1	TAUD0I15
TAUDTTOUT0	Channel 0 output	TAUD0O0
TAUDTTOUT1	Channel 1 output	TAUD0O1
TAUDTTOUT2	Channel 2 output	TAUD0O2
TAUDTTOUT3	Channel 3 output	TAUD0O3
TAUDTTOUT4	Channel 4 output	TAUD0O4
TAUDTTOUT5	Channel 5 output	TAUD0O5
TAUDTTOUT6	Channel 6 output	TAUD0O6
TAUDTTOUT7	Channel 7 output	TAUD0O7
TAUDTTOUT8	Channel 8 output	TAUD0O8
TAUDTTOUT9	Channel 9 output	TAUD0O9
TAUDTTOUT10	Channel 10 output	TAUD0O10
TAUDTTOUT11	Channel 11 output	TAUD0O11
TAUDTTOUT12	Channel 12 output	TAUD0O12
TAUDTTOUT13	Channel 13 output	TAUD0O13
TAUDTTOUT14	Channel 14 output	TAUD0O14
TAUDTTOUT15	Channel 15 output	TAUD0O15

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector** and **Section 2C.12, Noise Filter & Edge/Level Detector**.

### 32.1.7 Internal Input/Output Signals

The internal input/output signals of TAUDn are listed below.

Table 32.15 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
TAUDnTSSTm	Simultaneous channel start trigger input	PIC
TAUDnTUDCm (m = 0, 2, 8)	TAUD master up/down signal output	PIC

### 32.1.8 TAUD0 Input Selection

The output from port TAUD0Im (m = 0 to 15) can be input to TAUDTTINm (m = 0 to 15) as shown in the following figure.

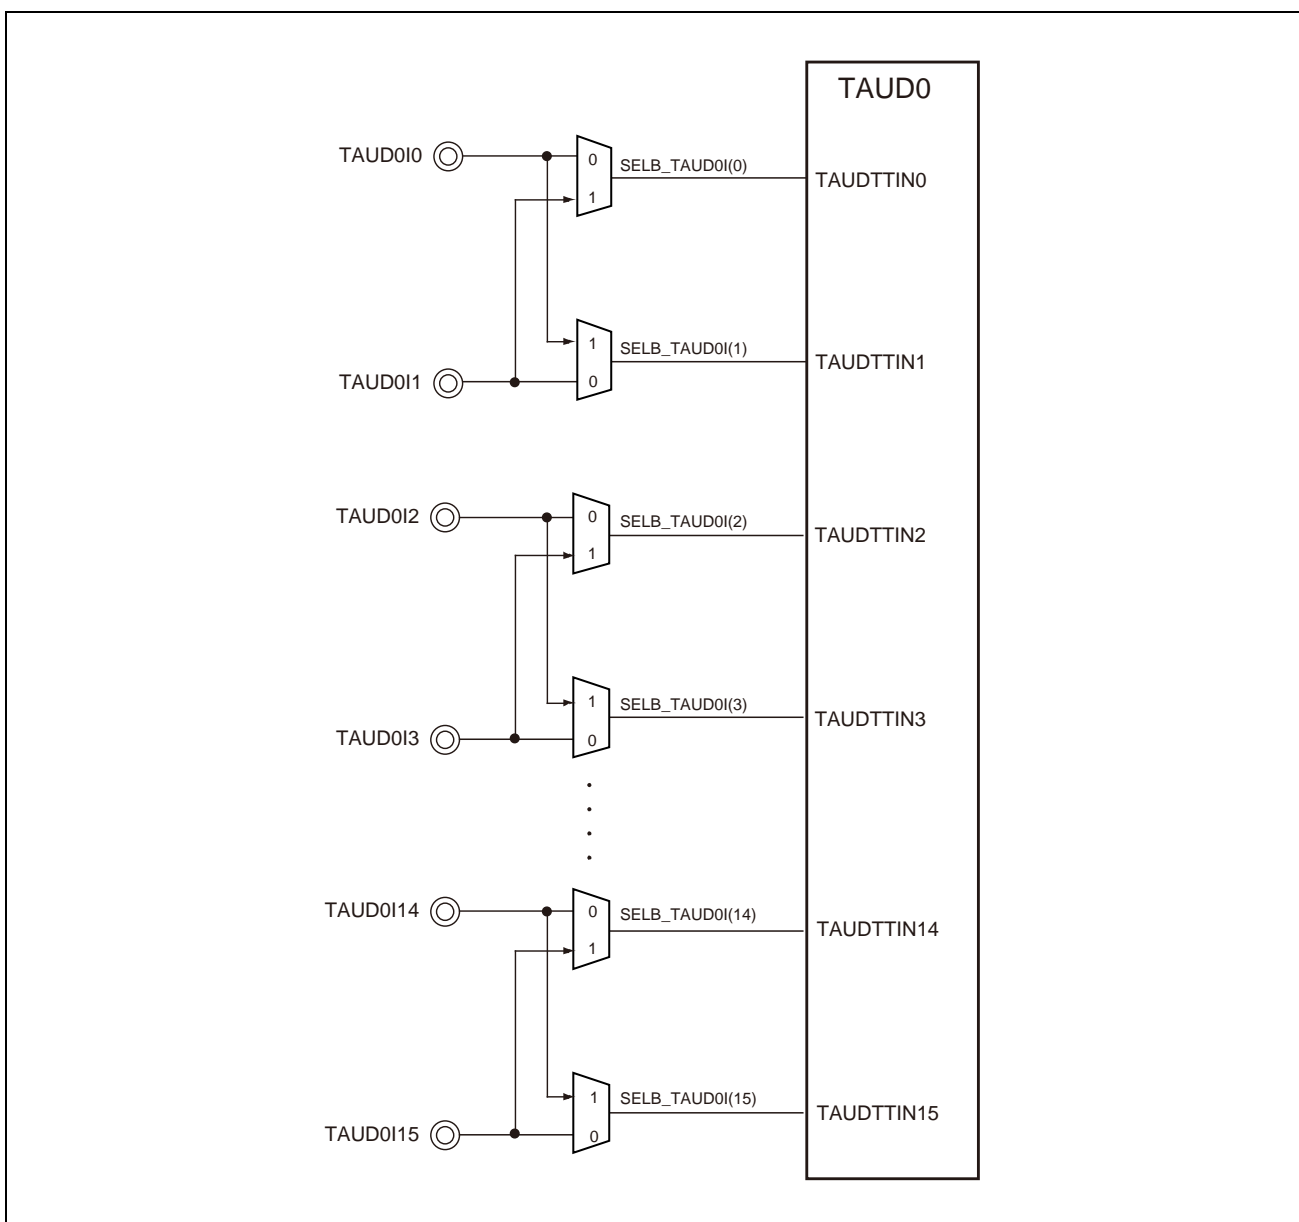

Figure 32.1 Selection of Signals Input to TAUD0

The following table shows the method of selecting input signals to several TAUD0 inputs.

Table 32.16 TAUD0 Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Input Signal	Function	Settings
TAUDTTIN [m]	Port TAUD0[m]	SELB_TAUD0I [m] = 0
	Port TAUD0[m + 1]	SELB_TAUD0I [m] = 1
TAUDTTIN [m + 1]	Port TAUD0[m + 1]	SELB_TAUD0I [m + 1] = 0
	Port TAUD0[m]	SELB_TAUD0I [m + 1] = 1

### 32.1.8.1 List of Registers

Input signal selection register is listed in the following table.

Table 32.17 List of Register

Module Name	Register Name	Symbol	Address
TAUDn input selection register			
SL_TAUDn	TAUDTTINm input signal selection register	SELB_TAUD0I	FFE2 4000 <sub>H</sub>

### 32.1.8.2 SELB\_TAUD0I — TAUDTTINm Input Signal Selection Register

This register selects the TAUDTTINm input signals.

**Access:** This register can be read or written in 16-bit units.

**Address:** FFE2 4000<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SELB_TAUD0I15	SELB_TAUD0I14	SELB_TAUD0I13	SELB_TAUD0I12	SELB_TAUD0I11	SELB_TAUD0I10	SELB_TAUD0I09	SELB_TAUD0I08	SELB_TAUD0I07	SELB_TAUD0I06	SELB_TAUD0I05	SELB_TAUD0I04	SELB_TAUD0I03	SELB_TAUD0I02	SELB_TAUD0I01	SELB_TAUD0I00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.18 SELB\_TAUD0I Register Contents

Bit Position	Bit Name	Function																		
15 to 0	SELB_TAUD0Im	Selection of TAUDTTINm input signal																		
		<table border="1"> <thead> <tr> <th>TAUD Input</th> <th>Bit [m+1]</th> <th>Bit [m]</th> <th>Input signal</th> </tr> </thead> <tbody> <tr> <td rowspan="2">TAUDTTIN[m]</td> <td>x</td> <td>0</td> <td>Selection of port TAUD0[m]</td> </tr> <tr> <td>x</td> <td>1</td> <td>Selection of port TAUD0[m + 1]</td> </tr> <tr> <td rowspan="2">TAUDTTIN[m+1]</td> <td>0</td> <td>x</td> <td>Selection of port TAUD0[m + 1]</td> </tr> <tr> <td>1</td> <td>x</td> <td>Selection of port TAUD0[m]</td> </tr> </tbody> </table>	TAUD Input	Bit [m+1]	Bit [m]	Input signal	TAUDTTIN[m]	x	0	Selection of port TAUD0[m]	x	1	Selection of port TAUD0[m + 1]	TAUDTTIN[m+1]	0	x	Selection of port TAUD0[m + 1]	1	x	Selection of port TAUD0[m]

	1	x	Selection of port TAUD0[m]																	
		(m = 0, 2, 4, 6, 8, 10, 12, 14)																		

#### CAUTION

Do not change the input signal of each channel during the timer counting.

## 32.2 Overview

### 32.2.1 Functional Overview

The TAUD has the following functions:

- 16 channels
- 16-bit counter and 16-bit data register per channel
- Independent channel operation
- Synchronous channel operation (master and slave operation)
- Generation of different types of output signal
- Real-time output
- Counter can be triggered by external signal
- Interrupt generation

The Timer Array Unit D is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUDnCNTm and a 16-bit data register TAUDnCDRm to hold the start or compare value of the counter.

It also contains several control and status registers.

#### Independent and synchronous operation

Every channel can operate in different operation modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, its operation mode and functions are not affected by those of other channels. When a channel is operated synchronously it is either a master or a slave. A master channel can have multiple slaves, and the state of one channel affects that of the other channels. For example, this means that one channel can control when another starts to count, is reset, etc.

### 32.2.2 Terms

In this section, the following terms are used.

#### Independent / synchronous channel operation

Independent or synchronous channel operation describes the dependency of channels on each other:

- If a channel operates independently of all other channels, this is called independent channel operation.
- If a channel operates depending on other channels, this is called synchronous channel operation.

#### Channel group

In synchronous channel operation, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

#### Operation mode

An operation mode can be selected for every channel  $m$ . The operation mode defines the basic operation and features of a channel.

In synchronous channel operation, every channel in the channel group can operate in a different operation mode.

Examples are “Capture Mode”, “Event Count Mode”, and “Interval Timer Mode”.

#### Channel output mode

The channel output mode defines the operation of  $TAUDTTOUTm$

- of a single channel (independent output operation) or
- of all channels in a channel group (synchronous output operation).

Examples are “Independent Channel Output Mode 1” and “Synchronous Channel Output Mode 2 with Dead Time Output”.

#### Channel operation function

The channel operation function defines the complete function and all features

- of a single channel (independent channel operation) or
- of all channels in a channel group (synchronous channel operation).

#### Upper / lower channel

Depending on the channel number  $m$ , a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:

For channel 5, channel 3 is an upper channel and channel 9 is a lower channel.

### 32.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 32.19 Functional List of TAUD Operations

Operation Function	Example

### 32.2.4 TAUD I/O and Interrupt Request Signals

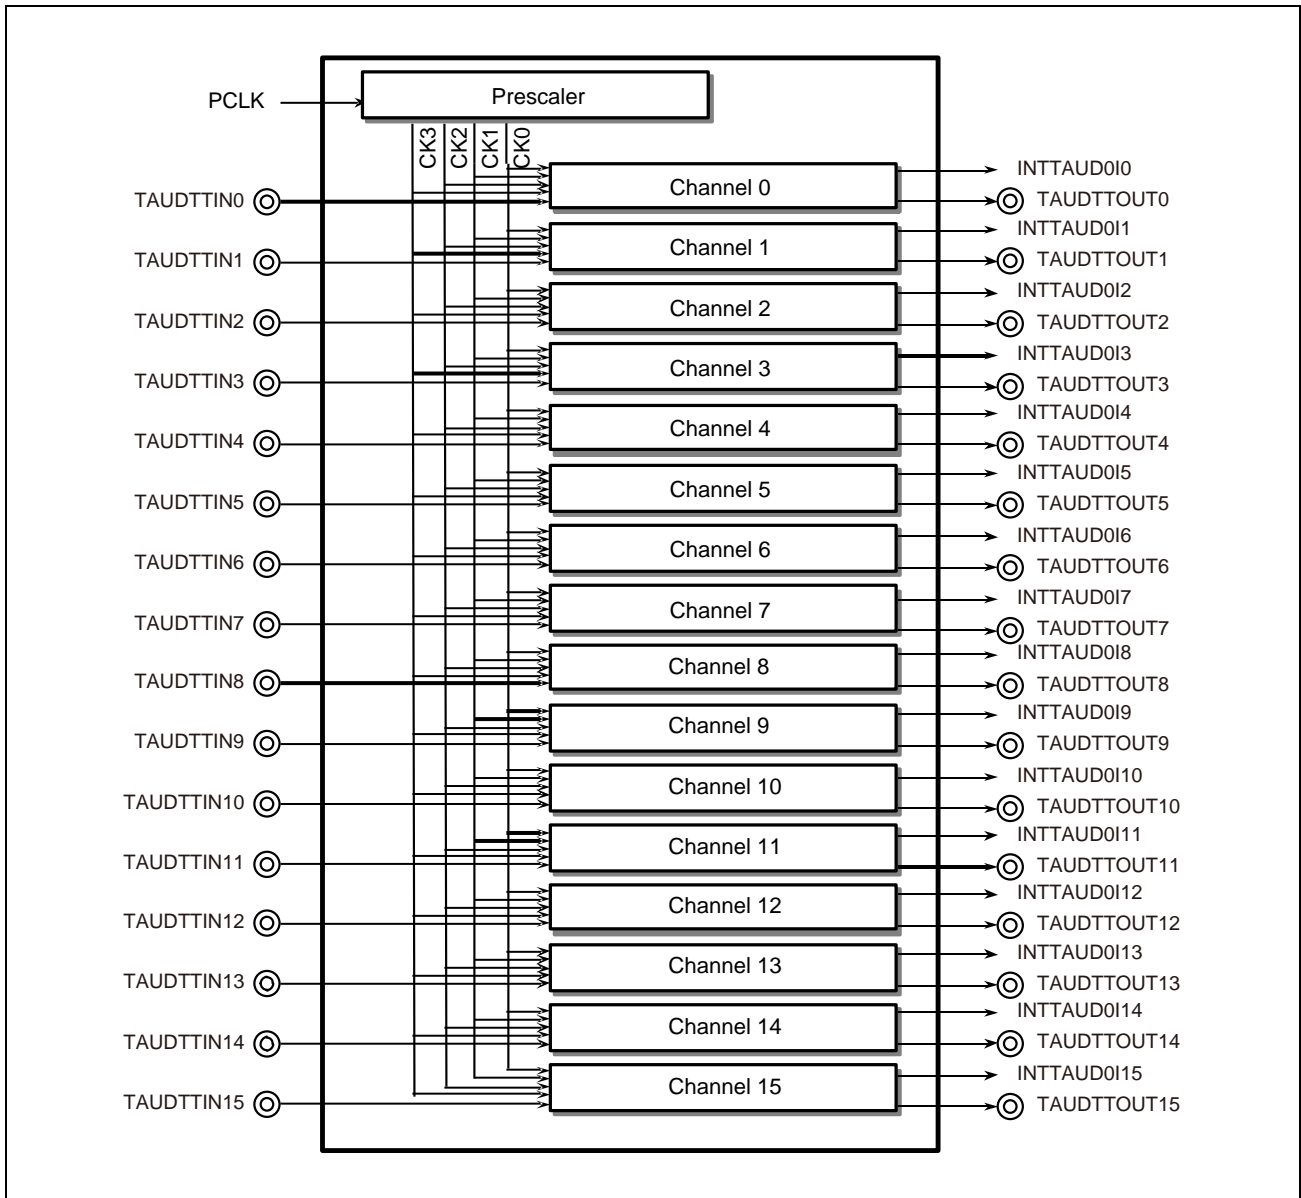

Figure 32.2 TAUD I/O and Interrupt Request Signals

### 32.2.5 Block Diagram

Figure 32.3, Block Diagram of the TAUD shows the main components of the TAUD.

Figure 32.3 Block Diagram of the TAUD

The module name “TAUDn” has been omitted from the register names for the sake of clarity in the above figure.

### 32.2.6 Description of Blocks

The following describes the functional blocks:

#### Prescaler block

The prescaler block provides up to four clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived from PCLK by a configurable prescaler division factor of  $2^0$  to  $2^{15}$ . The fourth count clock CK3 can be adjusted more precisely by using BRG to set an additional division factor that is not a power of 2.

#### Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- INTTAUDnIm from master channel
- TAUDTTINm input signal valid edge

#### Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUDnCMORm.TAUDnMD[4:0])
- Counter start enable (TAUDnTS.TAUDnTSm) and counter stop (TAUDnTT.TAUDnTTm)  
When counter start is enabled, status flag TAUDnTE.TAUDnTEm is set.
- Count direction (up/down) (can be controlled by master channel)

#### Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUDnTE.TAUDnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

- Synchronous channel start trigger input TAUDnTSSTm
- TAUDTTINm input signal valid edge
- INTTAUDnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUDTTOUTm generation unit.

#### Simultaneous rewrite controller

Simultaneous rewrite control is a function that can be used in synchronous operating modes. The data registers (TAUDnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

#### TAUDnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

## 32.3 Registers

### 32.3.1 List of Registers

TAUD registers are listed in the following table.

For details about <TAUDn\_base>, see **Section 32.1.2, Register Base Address**.

Table 32.20 List of Registers

Module Name	Register Name	Symbol	Address
TAUDn prescaler registers			
TAUDn	TAUDn prescaler clock select register	TAUDnTPS	<TAUDn_base> + 240 <sub>H</sub>
	TAUDn prescaler baud rate setting register	TAUDnBRS	<TAUDn_base> + 244 <sub>H</sub>
TAUDn control registers			
TAUDn	TAUDn channel data register	TAUDnCDRm	<TAUDn_base> + m × 4 <sub>H</sub>
	TAUDn channel counter register	TAUDnCNTm	<TAUDn_base> + 80 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUDn channel mode OS register	TAUDnCMORm	<TAUDn_base> + 200 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUDn channel mode user register	TAUDnCMURm	<TAUDn_base> + C0 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUDn channel status register	TAUDnCSRm	<TAUDn_base> + 140 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUDn channel status clear trigger register	TAUDnCSCm	<TAUDn_base> + 180 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUDn channel start trigger register	TAUDnTS	<TAUDn_base> + 1C4 <sub>H</sub>
	TAUDn channel enable status register	TAUDnTE	<TAUDn_base> + 1C0 <sub>H</sub>
	TAUDn channel stop trigger register	TAUDnTT	<TAUDn_base> + 1C8 <sub>H</sub>
TAUDn output registers			
TAUDn	TAUDn channel output enable register	TAUDnTOE	<TAUDn_base> + 5C <sub>H</sub>
	TAUDn channel output register	TAUDnTO	<TAUDn_base> + 58 <sub>H</sub>
	TAUDn channel output mode register	TAUDnTOM	<TAUDn_base> + 248 <sub>H</sub>
	TAUDn channel output configuration register	TAUDnTOC	<TAUDn_base> + 24C <sub>H</sub>
	TAUDn channel output active level register	TAUDnTOL	<TAUDn_base> + 040 <sub>H</sub>
	TAUDn channel dead time output enable register	TAUDnTDE	<TAUDn_base> + 250 <sub>H</sub>
	TAUDn channel dead time output mode register	TAUDnTDM	<TAUDn_base> + 254 <sub>H</sub>
	TAUDn channel dead time output level register	TAUDnTDL	<TAUDn_base> + 54 <sub>H</sub>
	TAUDn channel real-time output register	TAUDnTRO	<TAUDn_base> + 4C <sub>H</sub>
	TAUDn channel real-time output enable register	TAUDnTRE	<TAUDn_base> + 258 <sub>H</sub>
	TAUDn channel real-time output control register	TAUDnTRC	<TAUDn_base> + 25C <sub>H</sub>
	TAUDn channel modulation output enable register	TAUDnTME	<TAUDn_base> + 50 <sub>H</sub>
TAUDn reload data registers			
TAUDn	TAUDn channel reload data enable register	TAUDnRDE	<TAUDn_base> + 260 <sub>H</sub>
	TAUDn channel reload data mode register	TAUDnRDM	<TAUDn_base> + 264 <sub>H</sub>
	TAUDn channel reload data control channel select register	TAUDnRDS	<TAUDn_base> + 268 <sub>H</sub>
	TAUDn channel reload data control register	TAUDnRDC	<TAUDn_base> + 26C <sub>H</sub>
	TAUDn channel reload data trigger register	TAUDnRDT	<TAUDn_base> + 44 <sub>H</sub>
	TAUDn channel reload status register	TAUDnRSF	<TAUDn_base> + 48 <sub>H</sub>
TAUDn emulation register			
TAUDn	TAUDn emulation register	TAUDnEMU	<TAUDn_base> + 290 <sub>H</sub>

### 32.3.2 Details of TAUDn Prescaler Registers

#### 32.3.2.1 TAUDnTPS — TAUDn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3\_PRE for all channels of the PCLK prescaler. CK3 is generated by dividing CK3\_PRE by the factor specified in TAUDnBRS.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn\_base> + 240<sub>H</sub>

**Value after reset:** FFFF<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnPRS3 [3:0]				TAUDnPRS2 [3:0]				TAUDnPRS1 [3:0]				TAUDnPRS0 [3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.21 TAUDnTPS Register Contents

Bit Position	Bit Name	Function
15 to 12	TAUDnPRS3 [3:0]	Specifies CK3_PRE clock. CK3_PRE clock is an input clock to BRG unit which supplies the CK3 operation clock to all channels.
	TAUDnPRS3[3:0]	CK3_PRE Clock
	0000 <sub>B</sub>	PCLK/2 <sup>0</sup>
	0001 <sub>B</sub>	PCLK/2 <sup>1</sup>
	0010 <sub>B</sub>	PCLK/2 <sup>2</sup>
	0011 <sub>B</sub>	PCLK/2 <sup>3</sup>
	0100 <sub>B</sub>	PCLK/2 <sup>4</sup>
	0101 <sub>B</sub>	PCLK/2 <sup>5</sup>
	0110 <sub>B</sub>	PCLK/2 <sup>6</sup>
	0111 <sub>B</sub>	PCLK/2 <sup>7</sup>
	1000 <sub>B</sub>	PCLK/2 <sup>8</sup>
	1001 <sub>B</sub>	PCLK/2 <sup>9</sup>
	1010 <sub>B</sub>	PCLK/2 <sup>10</sup>
	1011 <sub>B</sub>	PCLK/2 <sup>11</sup>
	1100 <sub>B</sub>	PCLK/2 <sup>12</sup>
	1101 <sub>B</sub>	PCLK/2 <sup>13</sup>
	1110 <sub>B</sub>	PCLK/2 <sup>14</sup>
	1111 <sub>B</sub>	PCLK/2 <sup>15</sup>
The above bits are rewritable only when all the counters using CK3 are stopped (TAUDnTE.TAUDnTEm = 0).		

Table 32.21 TAUDnTPS Register Contents

Bit Position	Bit Name	Function	
11 to 8	TAUDnPRS2 [3:0]	Specifies the CK2 clock.	
		TAUDnPRS2[3:0]	CK2 Clock
		0000 <sub>B</sub>	PCLK/2 <sup>0</sup>
		0001 <sub>B</sub>	PCLK/2 <sup>1</sup>
		0010 <sub>B</sub>	PCLK/2 <sup>2</sup>
		0011 <sub>B</sub>	PCLK/2 <sup>3</sup>
		0100 <sub>B</sub>	PCLK/2 <sup>4</sup>
		0101 <sub>B</sub>	PCLK/2 <sup>5</sup>
		0110 <sub>B</sub>	PCLK/2 <sup>6</sup>
		0111 <sub>B</sub>	PCLK/2 <sup>7</sup>
		1000 <sub>B</sub>	PCLK/2 <sup>8</sup>
		1001 <sub>B</sub>	PCLK/2 <sup>9</sup>
		1010 <sub>B</sub>	PCLK/2 <sup>10</sup>

		1100 <sub>B</sub>	PCLK/2 <sup>12</sup>
		1101 <sub>B</sub>	PCLK/2 <sup>13</sup>
		1110 <sub>B</sub>	PCLK/2 <sup>14</sup>
		1111 <sub>B</sub>	PCLK/2 <sup>15</sup>
		The above bits are rewritable only when all the counters using CK2 are stopped (TAUDnTE.TAUDnTEm = 0).	
7 to 4	TAUDnPRS1 [3:0]	Specifies the CK1 clock.	
		TAUDnPRS1[3:0]	CK1 Clock
		0000 <sub>B</sub>	PCLK/2 <sup>0</sup>
		0001 <sub>B</sub>	PCLK/2 <sup>1</sup>
		0010 <sub>B</sub>	PCLK/2 <sup>2</sup>
		0011 <sub>B</sub>	PCLK/2 <sup>3</sup>
		0100 <sub>B</sub>	PCLK/2 <sup>4</sup>
		0101 <sub>B</sub>	PCLK/2 <sup>5</sup>
		0110 <sub>B</sub>	PCLK/2 <sup>6</sup>
		0111 <sub>B</sub>	PCLK/2 <sup>7</sup>
		1000 <sub>B</sub>	PCLK/2 <sup>8</sup>
		1001 <sub>B</sub>	PCLK/2 <sup>9</sup>
		1010 <sub>B</sub>	PCLK/2 <sup>10</sup>
		1011 <sub>B</sub>	PCLK/2 <sup>11</sup>
		1100 <sub>B</sub>	PCLK/2 <sup>12</sup>
		1101 <sub>B</sub>	PCLK/2 <sup>13</sup>
		1110 <sub>B</sub>	PCLK/2 <sup>14</sup>
		1111 <sub>B</sub>	PCLK/2 <sup>15</sup>
		The above bits are rewritable only when all the counters using CK1 are stopped (TAUDnTE.TAUDnTEm = 0).	

Table 32.21 TAUDnTPS Register Contents

Bit Position	Bit Name	Function
3 to 0	TAUDnPRS0 [3:0]	Specifies the CK0 clock.
	TAUDnPRS0[3:0]	CK0 Clock
	0000 <sub>B</sub>	PCLK/2 <sup>0</sup>
	0001 <sub>B</sub>	PCLK/2 <sup>1</sup>
	0010 <sub>B</sub>	PCLK/2 <sup>2</sup>
	0011 <sub>B</sub>	PCLK/2 <sup>3</sup>
	0100 <sub>B</sub>	PCLK/2 <sup>4</sup>
	0101 <sub>B</sub>	PCLK/2 <sup>5</sup>
	0110 <sub>B</sub>	PCLK/2 <sup>6</sup>
	0111 <sub>B</sub>	PCLK/2 <sup>7</sup>
	1000 <sub>B</sub>	PCLK/2 <sup>8</sup>
	1001 <sub>B</sub>	PCLK/2 <sup>9</sup>
	1010 <sub>B</sub>	PCLK/2 <sup>10</sup>
	1011 <sub>B</sub>	PCLK/2 <sup>11</sup>
	1100 <sub>B</sub>	PCLK/2 <sup>12</sup>
	1101 <sub>B</sub>	PCLK/2 <sup>13</sup>
	1110 <sub>B</sub>	PCLK/2 <sup>14</sup>
	1111 <sub>B</sub>	PCLK/2 <sup>15</sup>
The above bits are rewritable only when all the counters using CK0 are stopped (TAUDnTE.TAUDnTEm = 0).		

**NOTE**

The TAUDn clock input PCLK is specified in the first part of this section, **Section 32.1.3, Clock Supply**.

### 32.3.2.2 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3\_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3\_PRE is specified in TAUDnTPS.TAUDnPRS3[3:0].

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUDn\_base> + 244<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	TAUDnBRS[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.22 TAUDnBRS Register Contents

Bit Position	Bit Name	Function
7 to 0	TAUDnBRS[7:0]	Specifies a CK3_PRE clock division factor for generating CK3.
	TAUDnBRS[7:0]	CK3 Clock
	0000 0000 <sub>B</sub>	CK3_PRE / 1
	0000 0001 <sub>B</sub>	CK3_PRE / 2
	0000 0010 <sub>B</sub>	CK3_PRE / 3
	0000 0011 <sub>B</sub>	CK3_PRE / 4
	...	...
	1111 1110 <sub>B</sub>	CK3_PRE / 255
	1111 1111 <sub>B</sub>	CK3_PRE / 256

### 32.3.3 Details of TAUDn Control Registers

#### 32.3.3.1 TAUDnCDRm — TAUDn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUDnCMORm.TAUDnMD[4:1].

**Access:** This register can be read or written in 16-bit units.

- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

**Address:** <TAUDn\_base> + m × 4<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCDR[15:0]

	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.23 TAUDnCDRm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnCDR [15:0]	Data register for capture/compare values

### 32.3.3.2 TAUDnCNTm — TAUDn Channel Counter Register

This is a channel m counter register.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUDn\_base> + 80<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** FFFF<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.24 TAUDnCNTm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnCNT [15:0]	16-bit counter value

A read value depends on a counter value, a changed operating mode, TAUDnTS.TAUDnTSM or TAUDnTT.TAUDnTTm bit value.

The initial read value of the counter depends on an operating mode and how the counter is stopped.

- Stop by a reset
- Stop by a counter stop trigger (TAUDnTT.TAUDnTTm = 1)

**Table 32.25, TAUDnCNTm Read Values after Re-Enabling Counter** lists the initial counter read values after the counter is stopped (TAUDnTE.TAUDnTEm = 0) and re-enabled (TAUDnTS.TAUDnTSM = 1).

The table also contains the counter read value one count after the counter is enabled (TAUDnTS.TAUDnTSM = 1) with the counter waiting for a start trigger.

Table 32.25 TAUDnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUDnCNTm Value		
		Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	FFFF <sub>H</sub>	Stop value	—
Judge mode	Count down	FFFF <sub>H</sub>	Stop value	—
Capture mode	Count up	0000 <sub>H</sub>	Stop value	—
Event count mode	Count down	FFFF <sub>H</sub>	Stop value	—
One-count mode	Count down	FFFF <sub>H</sub>	Stop value	FFFF <sub>H</sub>
Capture and one-count mode	Count up	0000 <sub>H</sub>	Stop value	Capture value + 1 (TAUDnCDRm)
Judge and one-count mode	Count down	FFFF <sub>H</sub>	Stop value	TAUDnCNTm value – 1
Count-up/-down mode	Count down/up	FFFF <sub>H</sub>	Stop value	—
Pulse one-count mode	Count down	FFFF <sub>H</sub>	Stop value	0000 <sub>H</sub>
Count capture mode	Count up	0000 <sub>H</sub>	Stop value	—
Gate count mode	Count down	FFFF <sub>H</sub>	Stop value	Stop value
Capture and gate count mode	Count up	0000 <sub>H</sub>	Stop value	Stop value

Note 1. The value set for TAUDnCNTm when the operating mode is changed after a reset is deasserted.

### 32.3.3.3 TAUDnCMORm — TAUDn Channel Mode OS Register

This register controls channel m operation.

**Access:** This register can be read or written in 16-bit units. Writable only when the counter is stopped (TAUDnTE.TAUDnTE<sub>m</sub> = 0).

**Address:** <TAUDn\_base> + 200<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 32.3.3.4 TAUDnCMURm — TAUDn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUDTTINm input.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUDn\_base> + C0<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.27 TAUDnCMURm Register Contents

Bit Position	Bit Name	Function	
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.	
1, 0	TAUDnTIS[1:0]	Specifies a valid edge of TAUDTTINm input signal.	
	TAUDnTIS1	TAUDnTIS0	Functional Description
	0	0	Falling edge
	0	1	Rising edge
	1	0	Detection of rising and falling edges (selects low width measurement) Start trigger: Falling edge Stop trigger (capture): Rising edge
	1	1	Detection of rising and falling edges (selects high width measurement) Start trigger: Rising edge Stop trigger (capture): Falling edge
			<ul style="list-style-type: none"> <li>Edge detection of TAUDTTINm input signal is based on the operation clock selected by TAUDnCMORm.TAUDnCKS[1:0].</li> </ul>

### 32.3.3.5 TAUDnCSRm — TAUDn Channel Status Register

This register indicates the count direction and overflow status of channel m counter.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUDn\_base> + 140<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnCSF	TAUDnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.28 TAUDnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	TAUDnCSF	Indicates a count direction. 0: Count-up 1: Count-down The read value of this bit is valid only in the following mode: <ul style="list-style-type: none"> <li>Count-up/-down mode</li> </ul>
0	TAUDnOVF	Indicates counter overflow status. 0: No overflow occurs. 1: Overflow occurs. This bit is used only in the following modes: <ul style="list-style-type: none"> <li>Capture mode</li> <li>Capture and one-count mode</li> </ul> <p>The function of this bit depends on the setting of control bit TAUDnCMORm.TAUDnCOS[1:0].</p>

### 32.3.3.6 TAUDnCSCm — TAUDn Channel Status Clear Trigger Register

This is a trigger register for clearing the overflow flag TAUDnCSRm.TAUDnOVF of channel m.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as 00<sub>H</sub>.

**Address:** <TAUDn\_base> + 180<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUDnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 32.29 TAUDnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUDnCLOV	0: No function 1: Clears overflow flag TAUDnCSRm.TAUDnOVF.

### 32.3.3.7 TAUDnTS — TAUDn Channel Start Trigger Register

This register enables the counter operation of each channel.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as 0000<sub>H</sub>.

**Address:** <TAUDn\_base> + 1C4<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 32.30 TAUDnTS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTSM	Enables the counter operation of channel m. 0: No function 1: Enables the counter operation and sets TAUDnTE.TAUDnTEm to 1. The counter operation is only enabled when TAUDnTE.TAUDnTEm is set to 1. Whether counting is started or not depends on a selected operating mode.

### 32.3.3.8 TAUDnTE — TAUDn Channel Enable Status Register

This register enables/disables a counter operation.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUDn\_base> + 1C0H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.31 TAUDnTE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTE <sub>m</sub>	Enables/disables the counter operation of channel m. 0: Disables counter operation. 1: Enables counter operation.  This bit is set to 1 when trigger input of TAUDnTSST <sub>m</sub> (synchronous channel start trigger signal) is detected or when TAUDnTS.TAUDnTS <sub>m</sub> is set to 1. This bit is set to 0 when TAUDnTT.TAUDnTT <sub>m</sub> is set to 1.

### 32.3.3.9 TAUDnTT — TAUDn Channel Stop Trigger Register

This register stops the counter operation of each channel.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as 0000H.

**Address:** <TAUDn\_base> + 1C8H

**Value after reset:** 0000H

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 32.32 TAUDnTT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTT <sub>m</sub>	Stops the counter operation of channel m. 0: No function 1: Stops the counter operation and resets TAUDnTE.TAUDnTE <sub>m</sub> . TAUDnCNT <sub>m</sub> , TAUDnTO.TAUDnTO <sub>m</sub> , and TAUDTTOUT <sub>m</sub> retain the values provided before the counter is stopped.

### 32.3.4 Details of TAUDn Simultaneous Rewrite Registers

#### 32.3.4.1 TAUDnRDE — TAUDn Channel Reload Data Enable Register

This register enables/disables simultaneous rewrite of TAUDnCDRm/TAUDnTOLm data register.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn\_base> + 260<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.34 TAUDnRDS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDSm	Selects a channel that controls a simultaneous rewrite trigger. 0: Master channel 1: Another upper channel

### 32.3.4.3 TAUDnRDM — TAUDn Channel Reload Data Mode Register

This register selects the timing for generating a simultaneous rewrite control signal.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn\_base> + 264H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnRDM15	TAUDnRDM14	TAUDnRDM13	TAUDnRDM12	TAUDnRDM11	TAUDnRDM10	TAUDnRDM09	TAUDnRDM08	TAUDnRDM07	TAUDnRDM06	TAUDnRDM05	TAUDnRDM04	TAUDnRDM03	TAUDnRDM02	TAUDnRDM01	TAUDnRDM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.35 TAUDnRDM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDMm	Selects the timing for generating a simultaneous rewrite trigger signal. 0: When the master channel counter starts to count 1: At the peak of cycle of triangular wave These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 0.

### 32.3.4.4 TAUDnRDC — TAUDn Channel Reload Data Control Register

This register specifies a channel which generates an INTTAUDnIm signal to trigger simultaneous rewrite.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn\_base> + 26CH

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnRDC15	TAUDnRDC14	TAUDnRDC13	TAUDnRDC12	TAUDnRDC11	TAUDnRDC10	TAUDnRDC09	TAUDnRDC08	TAUDnRDC07	TAUDnRDC06	TAUDnRDC05	TAUDnRDC04	TAUDnRDC03	TAUDnRDC02	TAUDnRDC01	TAUDnRDC00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.36 TAUDnRDC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDCm	Specifies whether the channel generates a simultaneous rewrite trigger signal or not. 0: Does not operate as a simultaneous rewrite trigger channel. 1: Operates as a simultaneous rewrite trigger channel. These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 1.

### 32.3.4.5 TAUDnRDT — TAUDn Channel Reload Data Trigger Register

This register triggers a simultaneous rewrite enabling state.

**Access:** This register is a write-only register that can be written in 16-bit units. It is always read as 0000<sub>H</sub>.

**Address:** <TAUDn\_base> + 044<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnRDT15	TAUDnRDT14	TAUDnRDT13	TAUDnRDT12	TAUDnRDT11	TAUDnRDT10	TAUDnRDT09	TAUDnRDT08	TAUDnRDT07	TAUDnRDT06	TAUDnRDT05	TAUDnRDT04	TAUDnRDT03	TAUDnRDT02	TAUDnRDT01	TAUDnRDT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 32.37 TAUDnRDT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDTm	Triggers a simultaneous rewrite enabling state. 0: No function 1: The simultaneous rewrite enabling flag (TAUDnRSFm) is set to 1. The system waits for a simultaneous rewrite trigger. These bits only apply when: <ul style="list-style-type: none"> <li>TAUDnRDE.TAUDnRDEm = 1</li> </ul>

### 32.3.4.6 TAUDnRSF — TAUDn Channel Reload Status Register

This flag register indicates simultaneous rewrite status.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAUDn\_base> + 048<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnRSF15	TAUDnRSF14	TAUDnRSF13	TAUDnRSF12	TAUDnRSF11	TAUDnRSF10	TAUDnRSF09	TAUDnRSF08	TAUDnRSF07	TAUDnRSF06	TAUDnRSF05	TAUDnRSF04	TAUDnRSF03	TAUDnRSF02	TAUDnRSF01	TAUDnRSF00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.38 TAUDnRSF Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRSFm	Indicates simultaneous rewrite status. 0: Indicates that simultaneous rewrite has been completed due to the generation of simultaneous rewrite trigger. 1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous rewrite enabling state (TAUDnRDTm = 1).

### 32.3.5 Details of TAUDn Output Registers

#### 32.3.5.1 TAUDnTOE — TAUDn Channel Output Enable Register

This register enables/disables the independent channel output mode controlled by software.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn\_base> + 5C<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TOE15	TAUDn TOE14	TAUDn TOE13	TAUDn TOE12	TAUDn TOE11	TAUDn TOE10	TAUDn TOE09	TAUDn TOE08	TAUDn TOE07	TAUDn TOE06	TAUDn TOE05	TAUDn TOE04	TAUDn TOE03	TAUDn TOE02	TAUDn TOE01	TAUDn TOE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.39 TAUDnTOE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOEm	Enables/disables the independent channel output function. 0: Disables the independent timer output function (controlled by software). 1: Enables the independent timer output function.

#### 32.3.5.2 TAUDnTO — TAUDn Channel Output Register

This register specifies and reads a TAUDTTOUTm level.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn\_base> + 58<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TO15	TAUDn TO14	TAUDn TO13	TAUDn TO12	TAUDn TO11	TAUDn TO10	TAUDn TO09	TAUDn TO08	TAUDn TO07	TAUDn TO06	TAUDn TO05	TAUDn TO04	TAUDn TO03	TAUDn TO02	TAUDn TO01	TAUDn TO00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.40 TAUDnTO Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOM	Specifies and reads a TAUDTTOUTm level. 0: Low level 1: High level Only TAUDnTOM bits for which Independent Channel Output function is disabled (TAUDnTOEm = 0) can be written.

### 32.3.5.3 TAUDnTOM — TAUDn Channel Output Mode Register

This register specifies the output mode of each channel.

**Access:** This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

**Address:** <TAUDn\_base> + 248H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTOM15	TAUDnTOM14	TAUDnTOM13	TAUDnTOM12	TAUDnTOM11	TAUDnTOM10	TAUDnTOM09	TAUDnTOM08	TAUDnTOM07	TAUDnTOM06	TAUDnTOM05	TAUDnTOM04	TAUDnTOM03	TAUDnTOM02	TAUDnTOM01	TAUDnTOM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.41 TAUDnTOM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOMm	Specifies an output mode. 0: Independent channel operation 1: Synchronous channel operation

### 32.3.5.4 TAUDnTOC — TAUDn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUDnTOMm.

**Access:** This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

**Address:** <TAUDn\_base> + 24CH

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTOC15	TAUDnTOC14	TAUDnTOC13	TAUDnTOC12	TAUDnTOC11	TAUDnTOC10	TAUDnTOC09	TAUDnTOC08	TAUDnTOC07	TAUDnTOC06	TAUDnTOC05	TAUDnTOC04	TAUDnTOC03	TAUDnTOC02	TAUDnTOC01	TAUDnTOC00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.42 TAUDnTOC Register Contents

Bit Position	Bit Name	Function	
15 to 0	TAUDnTOCm	Specifies an output mode. 0: Operating mode 1 1: Operating mode 2 As listed below, the output mode depends on the setting of TAUDnTOM.TAUDnTOMm.	
	TAUDnTOMm	TAUDnTOCm	Functional Description
	0	0	Toggle mode: Toggle operation is conducted when INTTAUDnIm occurs.
	0	1	Set/reset mode: Set when INTTAUDnIm occurs at the beginning of count operation, and reset when INTTAUDnIm is caused by detection of a match between TAUDnCNTm and TAUDnCDRm.
	1	0	Synchronous channel operating mode 1: Set when INT occurs on master channels, and reset when INT occurs on slave channels.
	1	1	Synchronous channel operating mode 2: Set when INTTAUDnIm occurs in count-down status, and reset when INTTAUDnIm occurs in count-up status.

### 32.3.5.5 TAUDnTOL — TAUDn Channel Output Active Level Register

This register specifies the output logic of channel output bit (TAUDnTO.TAUDnTOm).

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn\_base> + 040H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTOL15	TAUDnTOL14	TAUDnTOL13	TAUDnTOL12	TAUDnTOL11	TAUDnTOL10	TAUDnTOL09	TAUDnTOL08	TAUDnTOL07	TAUDnTOL06	TAUDnTOL05	TAUDnTOL04	TAUDnTOL03	TAUDnTOL02	TAUDnTOL01	TAUDnTOL00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.43 TAUDnTOL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOLm	<p>Specifies the output logic of channel m output bit (TAUDnTO.TAUDnTOm).</p> <p>0: Positive logic (active high)</p> <p>1: Negative logic (active low)</p> <p>The setting of these bits applies to all channel output modes other than independent channel output mode controlled by software and independent channel output mode 1 and independent channel output mode 1 with real-time output.</p>

### 32.3.6 Details of TAUDn Dead Time Output Registers

#### 32.3.6.1 TAUDnTDE — TAUDn Channel Dead Time Output Enable Register

This register enables/disables the dead time operation of every channel.

**Access:** This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

**Address:** <TAUDn\_base> + 250H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTDE15	TAUDnTDE14	TAUDnTDE13	TAUDnTDE12	TAUDnTDE11	TAUDnTDE10	TAUDnTDE09	TAUDnTDE08	TAUDnTDE07	TAUDnTDE06	TAUDnTDE05	TAUDnTDE04	TAUDnTDE03	TAUDnTDE02	TAUDnTDE01	TAUDnTDE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.44 TAUDnTDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTDEm	Enables/disables the dead time control operation of channel m. 0: Disables dead time operation 1: Enables dead time operation. The same setting should be made for both even and odd slave channels in pairs. These bit settings are applied when: <ul style="list-style-type: none"> <li>TAUDnTOE.TAUDnTOEm, TAUDnTOM.TAUDnTOMm, TAUDnTOC.TAUDnTOCm = 1</li> </ul>

#### 32.3.6.2 TAUDnTDM — TAUDn Channel Dead Time Output Mode Register

This register specifies the timing to add dead time during dead time output.

**Access:** This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

**Address:** <TAUDn\_base> + 254H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTDM15	TAUDnTDM14	TAUDnTDM13	TAUDnTDM12	TAUDnTDM11	TAUDnTDM10	TAUDnTDM09	TAUDnTDM08	TAUDnTDM07	TAUDnTDM06	TAUDnTDM05	TAUDnTDM04	TAUDnTDM03	TAUDnTDM02	TAUDnTDM01	TAUDnTDM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.45 TAUDnTDM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTDMm	Specifies the timing to add dead time during dead time output. 0: When detecting the duty cycle of an upper even channel (duty dead time output). 1: When detecting the TIN input edge of a lower odd channel (one-phase dead time output). The same setting should be made for both even and odd slave channels in pairs. These bit settings are applied when: <ul style="list-style-type: none"> <li>TAUDnTOE.TAUDnTOEm, TAUDnTOM.TAUDnTOMm, TAUDnTOC.TAUDnTOCm, TAUDnTDE.TAUDnTDEm = 1</li> </ul>

### 32.3.6.3 TAUDnTDL — TAUDn Channel Dead Time Output Level Register

This register selects a phase in which dead time is added.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn\_base> + 54<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TDL15	TAUDn TDL14	TAUDn TDL13	TAUDn TDL12	TAUDn TDL11	TAUDn TDL10	TAUDn TDL09	TAUDn TDL08	TAUDn TDL07	TAUDn TDL06	TAUDn TDL05	TAUDn TDL04	TAUDn TDL03	TAUDn TDL02	TAUDn TDL01	TAUDn TDL00

Table 32.46 TAUDnTDL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTDLm	Selects a phase in which dead time is added. 0: Normal phase 1: Reverse phase These bit settings are applied when: <ul style="list-style-type: none"> <li>• TAUDnTOE.TAUDnTOEm, TAUDnTOM.TAUDnTOMm, TAUDnTOC.TAUDnTOCm, TAUDnTDE.TAUDnTDEm = 1</li> </ul>

### 32.3.7 Details of TAUDn Real-time/Modulation Output Registers

#### 32.3.7.1 TAUDnTRE — TAUDn Channel Real-time Output Enable Register

This register enables/disables real-time output.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn\_base> + 258H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTRE15	TAUDnTRE14	TAUDnTRE13	TAUDnTRE12	TAUDnTRE11	TAUDnTRE10	TAUDnTRE09	TAUDnTRE08	TAUDnTRE07	TAUDnTRE06	TAUDnTRE05	TAUDnTRE04	TAUDnTRE03	TAUDnTRE02	TAUDnTRE01	TAUDnTRE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.47 TAUDnTRE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTREm	Enables or disables real-time output of channel m. 0: Disables real-time output 1: Enables real-time output. These bit settings are applied only when TAUDnTOE.TAUDnTOEm = 1. When TAUDnTRE.TAUDnTREm = 0, TAUDTTOUTm is not affected by real-time output. When TAUDnTRE.TAUDnTREm = 1, TAUDTTOUTm outputs the value of real-time output bit TAUDnTRO.TAUDnTROM in response to a timer operation.

#### 32.3.7.2 TAUDnTRC — TAUDn Channel Real-time Output Control Register

This register controls the real-time output trigger of each channel.

**Access:** This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

**Address:** <TAUDn\_base> + 25CH

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTRC15	TAUDnTRC14	TAUDnTRC13	TAUDnTRC12	TAUDnTRC11	TAUDnTRC10	TAUDnTRC09	TAUDnTRC08	TAUDnTRC07	TAUDnTRC06	TAUDnTRC05	TAUDnTRC04	TAUDnTRC03	TAUDnTRC02	TAUDnTRC01	TAUDnTRC00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.48 TAUDnTRC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTRCm	Specifies a channel on which the real-time output trigger for channel m is generated. 0: Next upper channel with this bit set to 1 1: Channel m These bit settings are applied only when TAUDnTRE.TAUDnTREm = 1.

### 32.3.7.3 TAUDnTRO — TAUDn Channel Real-time Output Register

This register sets a value which is output to TAUDTTOUTm.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn\_base> + 04Ch

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.49 TAUDnTRO Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTROm	Sets a value which is output to TAUDTTOUTm. 0: Low 1: High TAUDnTROm value is not output to TAUDTTOUTm when TAUDnTRE.TAUDnTREM = 0, even if a real-time output trigger occurs.

### 32.3.7.4 TAUDnTME — TAUDn Channel Modulation Output Enable Register

This register enables/disables modulation output for timer output and real-time output.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUDn\_base> + 050H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.50 TAUDnTME Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTME m	Enables/disables modulation output for timer output and real-time output of channel m. 0: Disables modulation 1: Enables modulation These bit settings are applied only when TAUDnTOE.TAUDnTOEm and TAUDnTRE.TAUDnTREM = 1.

### 32.3.8 TAUDn Emulation Register

#### 32.3.8.1 TAUDnEMU — TAUDn Emulation Register

This register controls SVSTOP operations.

**Access:** This register can be read or written in 8-bit units.

Perform write operations when the counter is stopped (TAUDnTE.TAUDnTEm = 0) and (EPC.SVSTOP = 0).

**Address:** <TAUDn\_base> + 290<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	TAUDnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 32.51 TAUDnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUDnSVSDIS	<p>When EPC.SVSTOP bit = 0: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0).</p> <p>When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint). 1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint).</p>
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

## 32.4 Operating Procedure

The following lists the general operation procedure for the TAUDn.

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUDTTOUTm is also initialized and outputs a low level.

- (1) Set the TAUDnTPS and TAUDnBRS registers to specify the clock frequency of CK0 to CK3.
- (2) Configure the desired TAUDn function:
  - Set the operation mode
  - Set the channel output mode
  - Set any other control bits
- (3) Enable the counter by setting the TAUDnTS.TAUDnTSM bit to 1.  
The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
- (4) If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUDnTT.TAUDnTTm bit to 1. The counter can be forcibly restarted by setting the TAUDnTS.TAUDnTSM bit to 1.
- (5) Stop the function by setting the TAUDnTT.TAUDnTTm bit to 1.

### NOTES

1. A detailed description of the required control bits and the operation of the individual functions are given in **Section 32.12, Independent Channel Operation Functions** and **Section 32.15, Synchronous Channel Operation Functions**.
2. The function can be changed while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

## 32.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels). Several rules apply to the settings of channels. These rules are detailed in **Section 32.5.1, Rules of Synchronous Channel Operation**.

Two special features for synchronous channel operation are detailed in the following:

- **Section 32.5.2, Simultaneous Start and Stop of Synchronous Channel Counters**
- **Section 32.6, Simultaneous Rewrite**

### 32.5.1 Rules of Synchronous Channel Operation

#### Number of master and slave channels

- Only even channels (CH0, CH2, CH4, ...) can be set as master channels. Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.  
Example: If CH2 is a master channel, CH3 and the lower channels (CH3, CH4, CH5, ...) can be set as slave channels.
- If multiple master channels are used, slave channels cannot cross the master channels.  
Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

#### Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the TAUDnCMORm.TAUDnCKS[1:0] bits of the slave and master channel.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 32.4, Grouping of Channels and Assignment of Operatiion Clocks**.

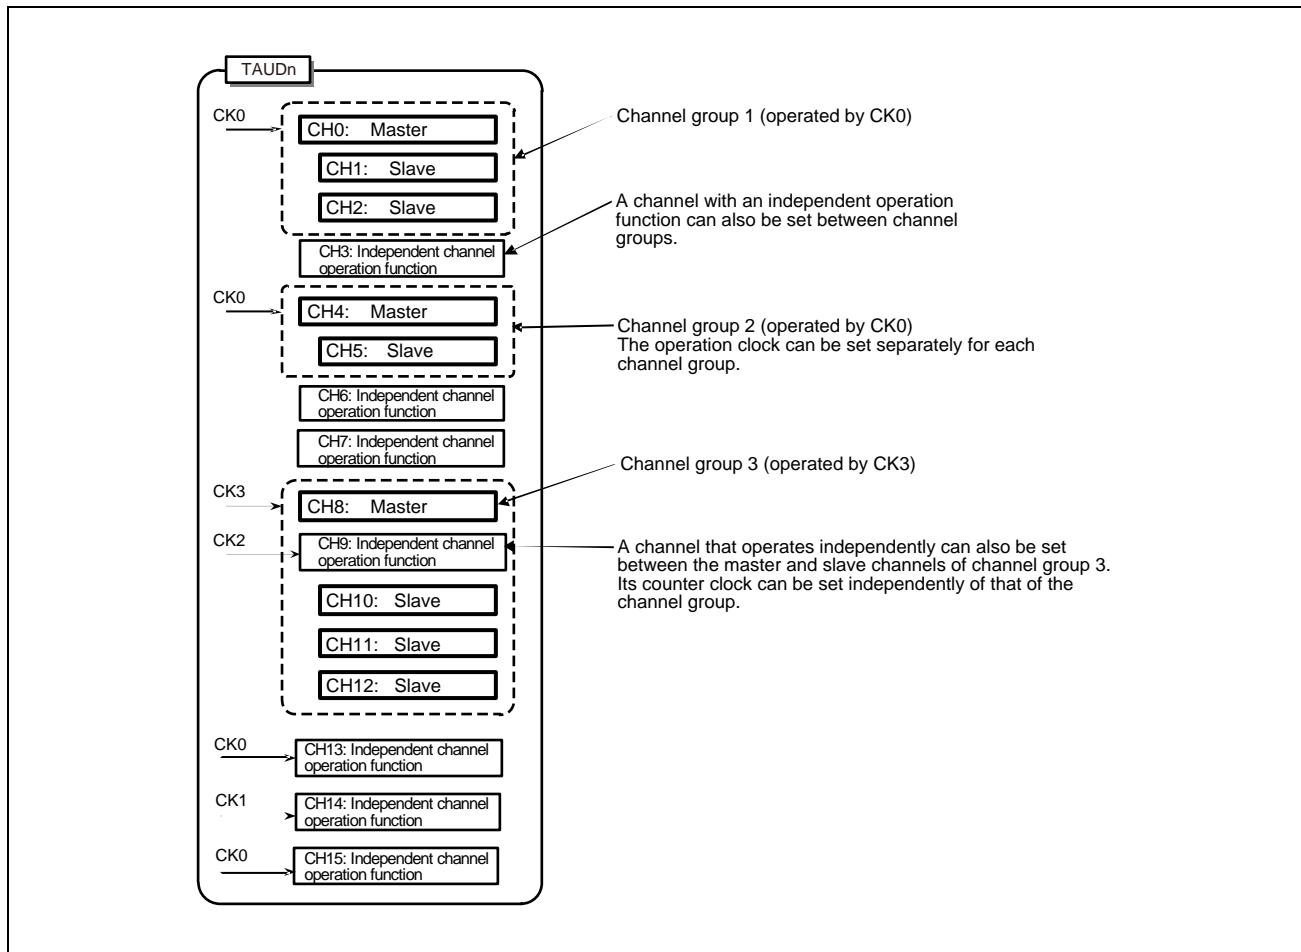

Figure 32.4 Grouping of Channels and Assignment of Operation Clocks

### Control trigger signal for master/slave channels

- Master channels can output control trigger signals to slave channels.
- Slave channels can use control trigger signals from master channels but cannot output control trigger signals for their own to lower channels.
- Master channels cannot use control trigger signals from upper master channels.

## 32.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit and between the units.

### 32.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUDnTS.TAUDnTSM bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUDnTT.TAUDnTTM bits of the channels should be set at the same time.

Setting to the TAUDnTS.TAUDnTSM bits to 1 also sets the corresponding TAUDnTE.TAUDnTEM bits to 1, enabling counting. The count start timing depends on operating mode.

### 32.5.2.2 Simultaneous Start between the Units

Counters in different units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

For details about how to perform simultaneous start between the units, see **Section 36.8, Simultaneous Start Trigger Function**.

## 32.6 Simultaneous Rewrite

### 32.6.1 Overview of Operations

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUDnCDRm and TAUDnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUDnIm being issued on the upper channel specified by TAUDnRDC.TAUDnRDCm

There are four methods for simultaneous rewrite. These are listed in **Table 32.52, Simultaneous Rewrite Methods and when They are Triggered**, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 32.52 Simultaneous Rewrite Methods and when They are Triggered

Method	Simultaneous Rewrite Triggered when	TAUDnRDE. TAUDnRDEm	TAUDnRDS. TAUDnRDSm	TAUDnRDM. TAUDnRDMm
—	No simultaneous rewrite	0	0	0
A	The master channel (re)starts counting	1	0	0
B	Counting is started in the master channel. The master channel starts counting down at the peak of triangular cycle of the corresponding slave channel.	1	0	1
C1	INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm	1	1	0/1
C2	INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm that in turn is triggered by an external signal	1	1	0/1

**Table 32.53, Channel Functions and the Methods They Use for Simultaneous Rewrite** lists which of these four methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 32.14, Independent Channel Simultaneous Rewrite Functions**, **Section 32.15, Synchronous Channel Operation Functions**, and **Section 32.16, Synchronous Non-Complementary and Complementary Modulation Output Functions**.

Table 32.53 Channel Functions and the Methods They Use for Simultaneous Rewrite

Function	A	B	C1	C2	TAUDnTOL. TAUDnTOLm
Simultaneous Rewrite Trigger Output Function Type 1			✓		
PWM Output Function	✓		✓		✓

Non-Complementary Modulation Output Function Type 2		✓	✓		
Complementary Modulation Output Function		✓	✓		

**Note:** ✓: Available, (Blank): Unavailable

### 32.6.2 How to Control Simultaneous Rewrite

**Figure 32.5, General Procedure for Simultaneous Rewrite** shows the general procedure for simultaneous rewrite. The three main blocks (initial settings, start and counter count operation, and simultaneous rewrite) are explained afterwards.

Figure 32.5 General Procedure for Simultaneous Rewrite

### 32.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set  $TAUDnRDE.TAUDnRDEm = 1$
- To select the type of simultaneous rewrite, set  $TAUDnRDM.TAUDnRDMm$  and  $TAUDnRDS.TAUDnRDSm$  according to the values listed in **Table 32.52, Simultaneous Rewrite Methods and when They are Triggered**.
- Specify a simultaneous rewrite trigger channel by using  $TAUDnRDC.TAUDnRDCm$ . (Prerequisite:  $TAUDnRDS.TAUDnRDSm$  has been set to the upper channel.)

### 32.6.2.2 Start Counter and Count Operation

- To start all the  $TAUDnCNTm$  counters of the channel group, set the corresponding  $TAUDnTS.TAUDnTSM$  bits to 1. The values of  $TAUDnTOL.TAUDnTOLm$  and the data registers ( $TAUDnCDRm$ ) are loaded into the corresponding  $TAUDnTOL.TAUDnTOLm$  buffer ( $TAUDnTOL.TAUDnTOLm$  buf) and data buffer registers ( $TAUDnCDRm$  buf) and the counters start.
- Setting the reload data trigger bit ( $TAUDnRDT.TAUDnRDTm$ ) to 1 sets the reload flag ( $TAUDnRSF.TAUDnRSFm$ ) to 1, enabling simultaneous rewrite.  $TAUDnRSF.TAUDnRSFm$  remains set to 1 until simultaneous rewrite is completed.
- When the specified trigger for simultaneous rewrite is detected, the  $TAUDnRSF.TAUDnRSFm$  bit is checked to see if simultaneous rewrite is enabled ( $TAUDnRSF.TAUDnRSFm = 1$ ). If it is, simultaneous rewrite is carried out. Otherwise the simultaneous rewrite is not carried out and waits for the next trigger detection.

### 32.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled ( $TAUDnRSF.TAUDnRSFm = 1$ ) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and are applied the next time the counter starts or restarts.
- When simultaneous rewrite is complete, the  $TAUDnRSF.TAUDnRSFm$  bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

### 32.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUDnRDE.TAUDnRDEm, TAUDnRDS.TAUDnRDSm, TAUDnRDM.TAUDnRDMm, and TAUDnRDC.TAUDnRDCm cannot be changed while the counter is in operation (TAUDnTE.TAUDnTEm = 1).
- TAUDnTOL.TAUDnTOLm can only be rewritten during operation with PWM output function or triangle PWM output function. For all other output functions, TAUDnTOL.TAUDnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUDTTOUTm outputs an invalid wave.
- When an upper channel is used as a channel issuing the simultaneous rewrite trigger (TAUDnRDS.TAUDnRDSm = 1), the TAUDnRDC.TAUDnRDCm bit controls all the lower channels. This means that if the TAUDnRDC.TAUDnRDCm bits of CH2 and CH7 are set to 1 and the TAUDnRDC.TAUDnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger (TAUDnRDE.TAUDnRDEm and TAUDnRDS.TAUDnRDSm = 1) but no upper channel is set (TAUDnRDC.TAUDnRDC[15:0] = 0), simultaneous rewrite cannot take place.

### 32.6.4 Types of Simultaneous Rewrite

In the following section, the four simultaneous rewrite methods are explained using timing diagrams.

#### 32.6.4.1 Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A)

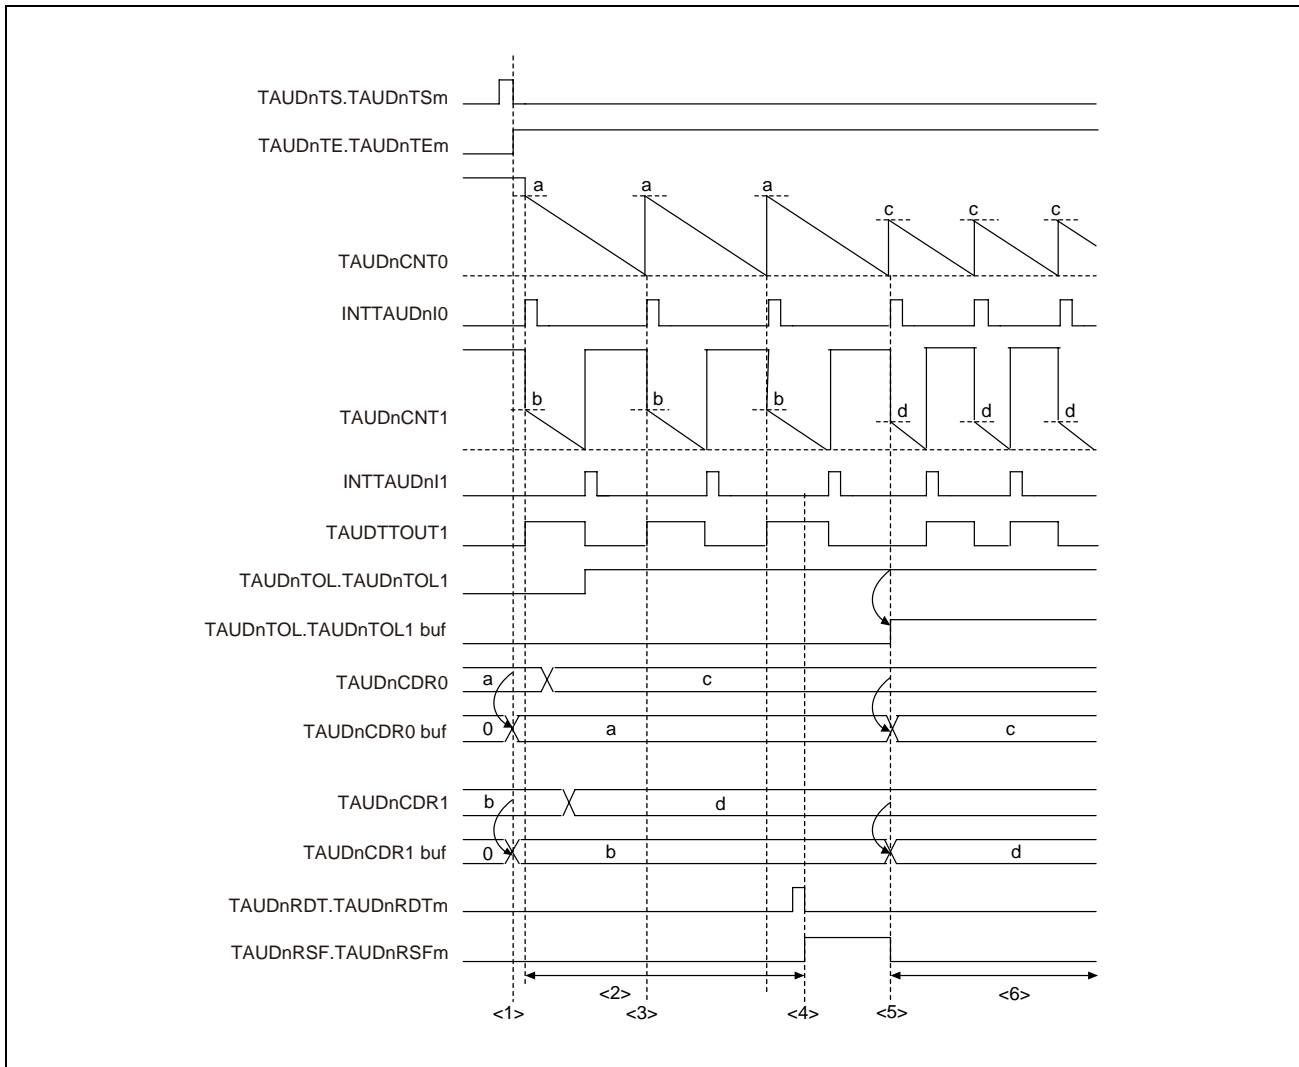

Figure 32.6 Simultaneous Rewrite when the Master Channel (Re)starts Counting

#### Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

#### Description:

- (1) When TAUDnTS.TAUDnTSM is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer and TAUDnTOL.TAUDnTOLm value is copied to the TAUDnTOL.TAUDnTOLm buffer.
- (2) The TAUDnCDRm and TAUDnTOL.TAUDnTOLm registers can be written at any time.
- (3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0)

- (4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.
- (5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer and the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.
- (6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

### 32.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel (Method B)

Figure 32.7 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel

#### Setting:

CH0 is the master channel which performs counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

#### Description:

- (1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer.
- (2) The TAUDnCDRm and TAUDnTOL registers can be written at any time.
- (3) Simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0).
- (4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.
- (5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.

- (6) Simultaneous rewrite takes place at the top of the triangular cycle. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer, the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.
- (7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

**32.6.4.3 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1)**

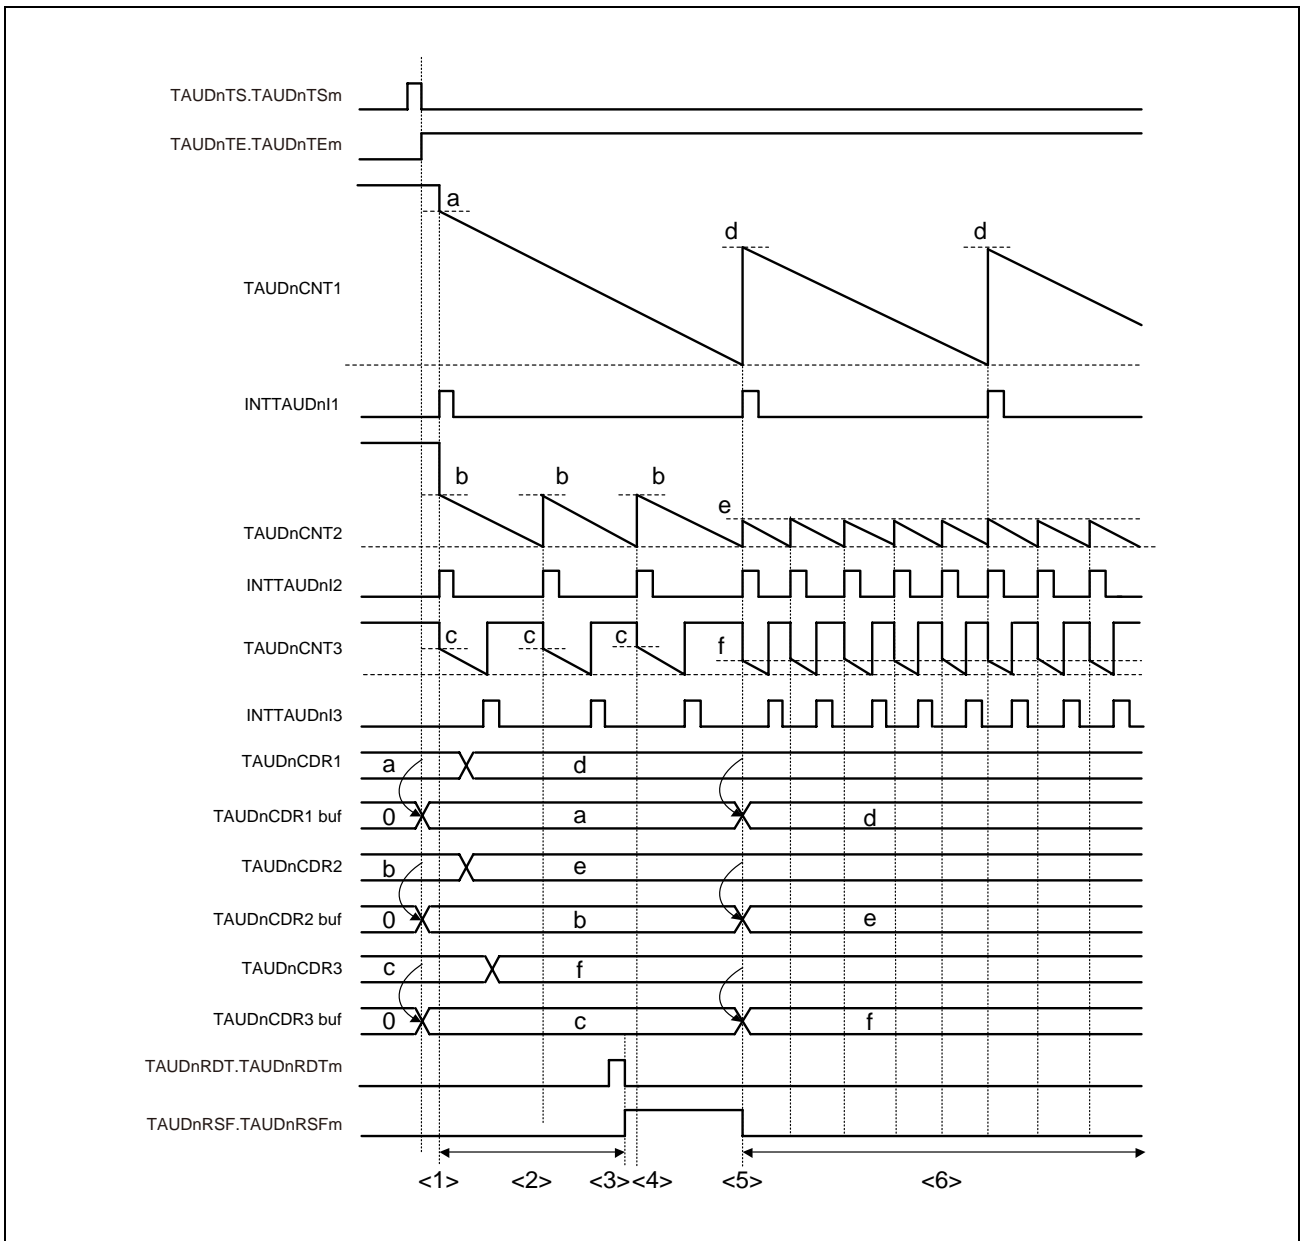

Figure 32.8 Simultaneous Rewrite When INTTAUDnIm Is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm

**Setting:**

CH1 is an upper channel which performs counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUDnRDC register specifies a channel which generates simultaneous rewrite triggers.

**Description:**

- (1) When TAUDnTS.TAUDnTSM is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer.
- (2) The TAUDnCDRm register is always ready to write.
- (3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.
- (4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.
- (5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches 0000<sub>H</sub>. The TAUDnCDRm values are loaded into the corresponding TAUDnCDRm buffers.
- (6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be rechanged.

**32.6.4.4 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2)**

Figure 32.9 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal

**Setting:**

CH1 is an upper channel which performs counting up, CH2 is a master channel, and CH3 is the slave channel. The synchronous channel operation method C2 is applied. The TAUDnRDC register specifies which upper channel is monitored for an INTTAUDnIm trigger.

**Description:**

- (1) When TAUDnTS.TAUDnTSM is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer. However, as TAUDnCDR1 operates in capture mode, TAUDnCDR1 value is not copied to the TAUDnCDR1 buffer.

- (2) The TAUDnCDRm register is always ready to write.
- (3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.
- (4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.
- (5) Simultaneous rewrite is triggered by INT1 which is caused by external signal TIN1. The TAUDnCDRm values are written to the corresponding TAUDnCDRm buffers.
- (6) The counters count down and await the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be changed again.
- (7) An external signal occurs at TIN2 but simultaneous rewrite does not take place because it is disabled (TAUDnRSF.TAUDnRSFm = 0).

## 32.7 Channel Output Modes

The output of the TAUDTTOUT<sub>m</sub> pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUDnTOE.TAUDnTOEm = 0)  
When controlled by software, the value written in the output register bit (TAUDnTO.TAUDnTOm) is sent to the output pin (TAUDTTOUT<sub>m</sub>).
- By TAUD signals (TAUDnTOE.TAUDnTOEm = 1)  
When controlled by TAUD signals, the output level of TAUDTTOUT<sub>m</sub> is set or reset or toggled by internal signals. The value of TAUDnTO.TAUDnTOm is updated accordingly to reflect the value of TAUDTTOUT<sub>m</sub>.
  - Independently (TAUDnTOM.TAUDnTOMm = 0)  
In case of independent operation, the output of the TAUDTTOUT<sub>m</sub> pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUDnTOM.TAUDnTOMm = 0).
  - Synchronously (TAUDnTOM.TAUDnTOMm = 1)  
In case of synchronous operation, the output of the TAUDTTOUT<sub>m</sub> pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUDnTOM.TAUDnTOMm = 1).

The TAUDnTO.TAUDnTOm bit can always be read to determine the current value of TAUDTTOUT<sub>m</sub>, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

### Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 32.54, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 32.7.2, Channel Output Modes Controlled Independently by TAUDn Signals**
- **Section 32.7.3, Channel Output Modes Controlled Synchronously by TAUDn Signals**

### Batch operation of TAUDnTOm bit

Whether a set value is reflected to the TAUDnTOm bit or not is controlled by the TAUDnTOE.TAUDnTOEm bit.

The TAUDnTOm setting is written only to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 0 when a write to the TAUDnTO register is attempted. No TAUDnTOm setting is reflected to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 1.

### NOTE

---

TAUDnTO.TAUDnTOm bit is placed so that its bit number corresponds to a channel number.

---

## Output logic

Positive logic or negative logic of the output is specified by control bit TAUDnTOL.TAUDnTOLm.

The value of TAUDnTOL.TAUDnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. Otherwise, changes to TAUDnTOL.TAUDnTOLm result in an undefined TAUDTTOUTm signal output.

See **Section 32.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 32.54, Channel Output Modes**.

Table 32.54 Channel Output Modes

Channel Output Mode	TAUDn TOE. TAUDn TOEm	TAUDn TOM. TAUDn TOMm	TAUDn TOC. TAUDn TOCm	TAUDn TDE. TAUDn TDEm	TAUDn TRE. TAUDn TREm	TAUDn TME. TAUDn TMEm	TAUDn TDM. TAUDn TDMm
By software							
Independent channel output mode controlled by software	0	X					
By TAUD signals, independently							
Independent channel output mode 1	1	0	0	0	0	0	0
with real-time output					1		
Independent channel output mode 2			1		0		
By TAUD signals, synchronously							
Synchronous channel output mode 1	1	1	0	0	0	0	0
with non-complementary modulation output					1	X	
Synchronous channel output mode 2			1	0	0	0	0
with dead time output				1			
with one-phase PWM output							1
with complementary modulation output					1	1	0
with non-complementary modulation output			1	0			

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

## NOTES

- The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1):
  - TAUDnTOM.TAUDnTOMm
  - TAUDnTOC.TAUDnTOCm
  - TAUDnTDE.TAUDnTDEm
  - TAUDnTRE.TAUDnTREm
  - TAUDnTDM.TAUDnTDMm
- The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1) except in channel output modes with modulation output:
  - TAUDnTME.TAUDnTMEm
  - TAUDnTDL.TAUDnTDLm

### 32.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUDTTOUT<sub>m</sub> channel output mode. The prerequisite is that timer output operation is disabled (TAUDnTOE.TAUDnTOEm = 0).

- (1) Set TAUDnTO.TAUDnTOm to specify the initial level of the TAUDTTOUT<sub>m</sub> output.
- (2) Set channel output mode according to **Table 32.54, Channel Output Modes**, and the output logic using the TAUDnTOL.TAUDnTOLm bit.
- (3) Start the counter (TAUDnTS.TAUDnTSM = 1).

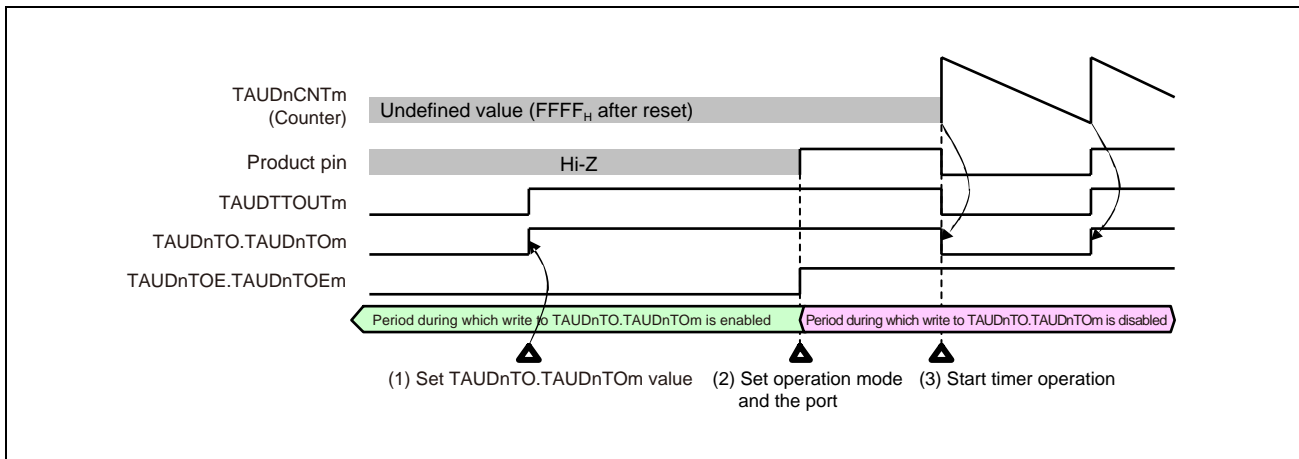

Figure 32.10 General Procedure for Specifying a TAUDTTOUT<sub>m</sub> Channel Output Mode

## 32.7.2 Channel Output Modes Controlled Independently by TAUDn Signals

This section lists the channel output modes that are controlled independently by TAUDn signals. The control bits used to specify a mode are listed in **Table 32.54, Channel Output Modes**.

### 32.7.2.1 Independent Channel Output Mode 1

#### Set/reset conditions

In this output mode, TAUDTTOUTm toggles when INTTAUDnIm is detected. The value of TAUDnTOL.TAUDnTOLm is ignored.

#### Prerequisites

There are no prerequisites other than those shown in **Table 32.54, Channel Output Modes**.

### 32.7.2.2 Independent Channel Output Mode 1 with Real-Time Output

In this output mode, the value of TAUDnTRO.TAUDnTROM bit of the trigger channel is output to TAUDTTOUTm. The trigger channel is specified by setting the corresponding TAUDnTRC.TAUDnTRCm bit to 1. It controls all lower channels for which TAUDnTRC.TAUDnTRCm = 0.

#### Set/reset conditions

The value of TAUDnTRO.TAUDnTROM bit is sent to TAUDTTOUTm only when an INTTAUDnIm interrupt occurs on the trigger channel. The interrupt is generated either:

- at certain specified intervals or
- on detection of a valid TAUDTTINm input edge/counter start

The type of trigger is set using the TAUDnCMORM.TAUDnMD[4:1] bits.

#### Prerequisites

Both the master and slave channels can be set as a trigger generation channel. A channel for which TAUDnTRC.TAUDnTRCm is set to 1 serves as a trigger generation channel regardless of the value of TAUDnTRE.TAUDnTREM.

If there is no channel for which TAUDnTRC.TAUDnTRCm is set to 1 or if TAUDnTRC.TAUDnTRC0 = 0, real-time output cannot take place.

This can be seen in **Figure 32.11, Real-Time Output.**

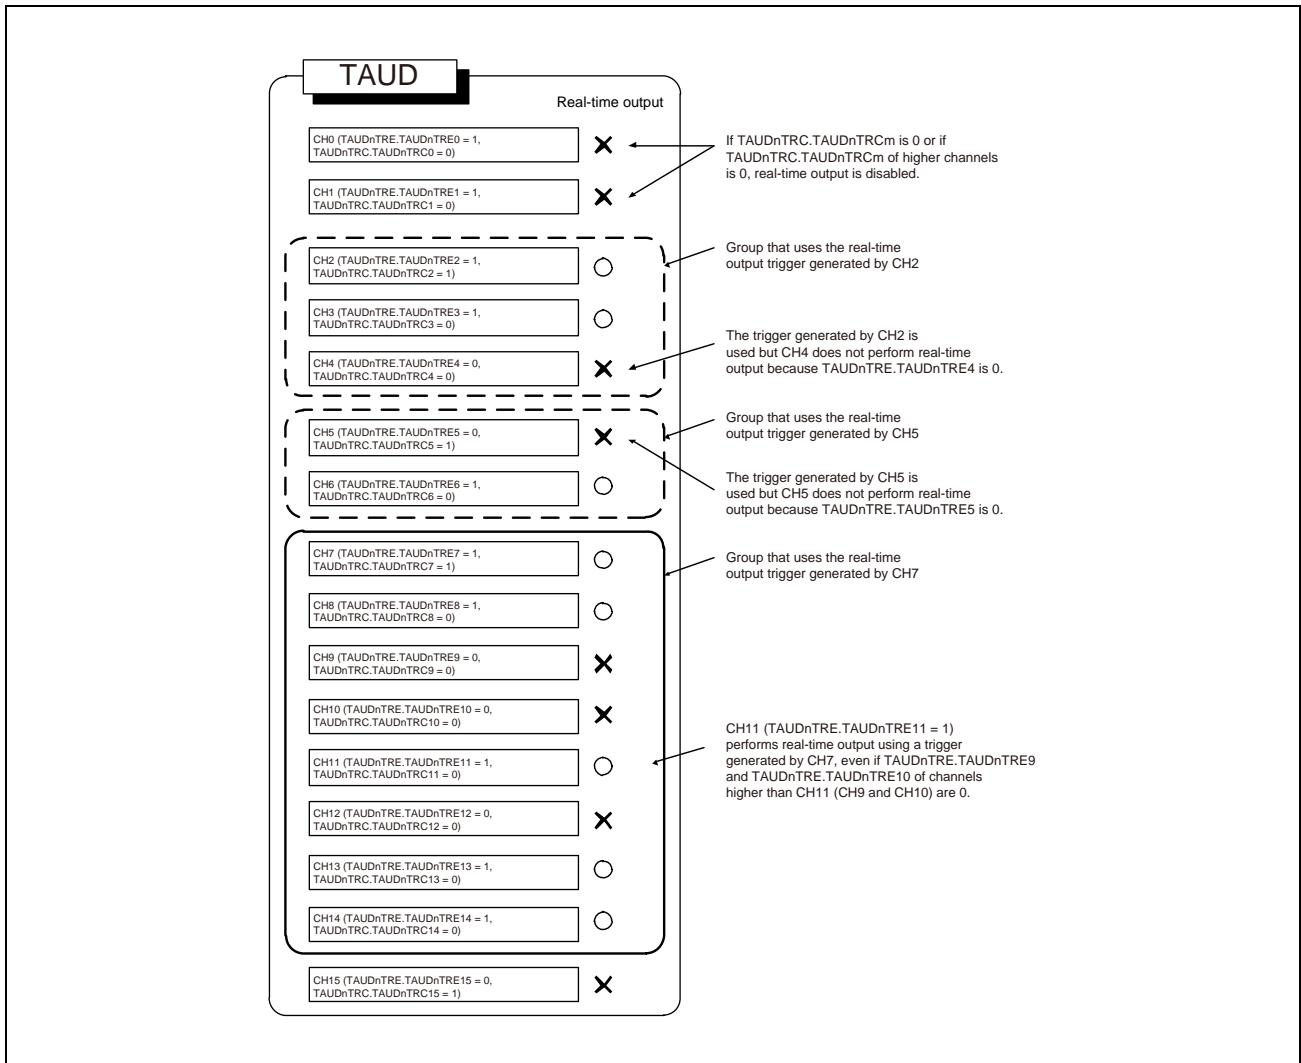

Figure 32.11 Real-Time Output

### 32.7.2.3 Independent Channel Output Mode 2

#### Set/reset conditions

In this output mode, TAUDTTOUT<sub>m</sub> is set when INTTAUDnIm occurs at the time of count start, and reset when INTTAUDnIm occurs due to a match between TAUDnCNT<sub>m</sub> and TAUDnCDR<sub>m</sub>.

#### Prerequisites

There are no prerequisites other than those shown in **Table 32.54, Channel Output Modes.**

### 32.7.3 Channel Output Modes Controlled Synchronously by TAUDn Signals

This section lists the channel output modes that are controlled synchronously by TAUDn signals. The control bits used to specify a mode are listed in **Table 32.54, Channel Output Modes**.

#### 32.7.3.1 Synchronous Channel Output Mode 1

##### Set/reset conditions

In this output mode, INTTAUDnIm of master channel serves as a set signal and INTTAUDnIm of the slave channel as a reset signal. If INTTAUDnIm of master channel and INTTAUDnIm of the slave channel are generated at the same time, INTTAUDnIm of the slave channel (reset signal) has priority over INTTAUDnIm (set signal) of master channel, i.e., the master channel is ignored.

##### Prerequisites

There are no prerequisites other than those shown in **Table 32.54, Channel Output Modes**.

#### 32.7.3.2 Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

##### Set/reset conditions

In this output mode, TAUDTTOUTm outputs the result of an AND operation between the PWM output and the real-time output bit (TAUDnTRO.TAUDnTROm) of a channel.

The phase period to which the dead time is added is specified using the TAUDnTDL.TAUDnTDLm bit; for positive phase set TAUDnTDL.TAUDnTDLm = 0 and for negative phase set TAUDnTDL.TAUDnTDLm = 1.

##### Prerequisites

A set of at least three channels is required to generate the PWM output. The master channel and slave channel 1 generate a period, and slave channel 2 generates the duty cycle. In typical applications, five more slave channels are also used that operate in the same manner as slave channel 2.

Only the PWM output and the real-time output bit of the same channel can be combined.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed, its new value is applied upon detection of INTTAUDnIm on the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on the master channel.

#### 32.7.3.3 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is a triangle PWM output at TAUDTTOUTm. For details, see **Section 32.15.7, Triangle PWM Output Function**.

##### Set/reset conditions

TAUDnCNTm of the slave channel counts down and up alternatively. When it passes 0001<sub>H</sub> it generates an interrupt, causing TAUDTTOUTm to toggle.

### Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUDTTOUTm should be set to 0 before the function starts.

#### 32.7.3.4 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 32.12, Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output**.

#### Set/reset conditions

Figure 32.12 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

### Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel  
The master channel should be set to interval timer mode.
- One even slave channel  
The even slave channel should be set to count-up/-down mode.
- One odd slave channel (even channel + 1)  
The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm

- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

### 32.7.3.5 Synchronous Channel Output Mode 2 with One-Phase PWM Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 32.13, Set/Reset Conditions for Synchronous Channel Output Mode 2 with One-Phase PWM Output.**

#### Set/reset conditions

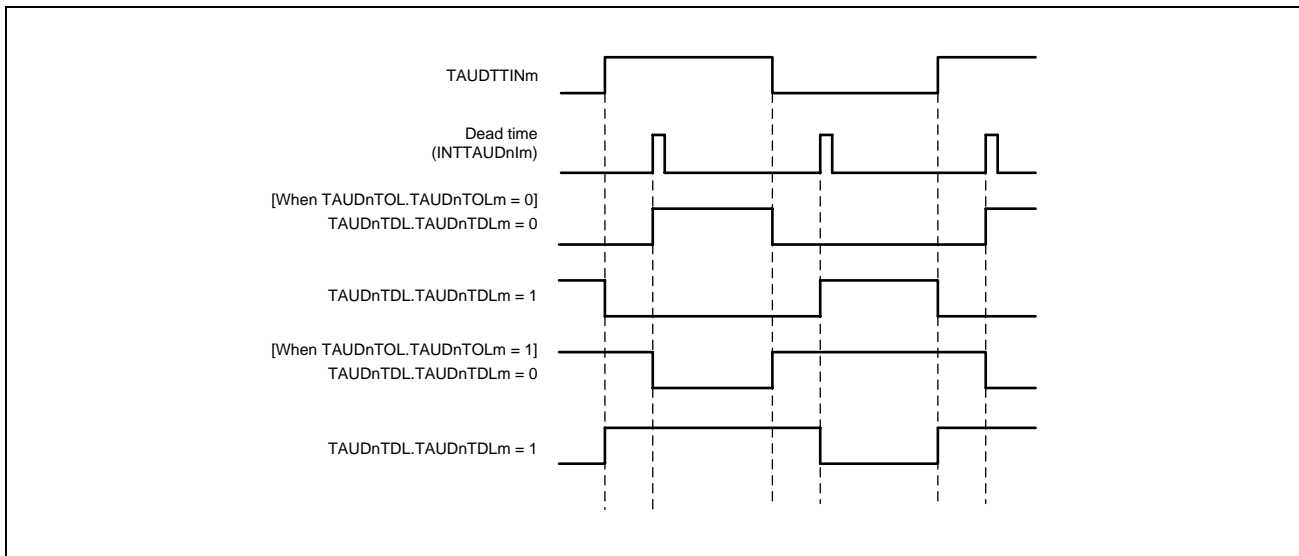

Figure 32.13 Set/Reset Conditions for Synchronous Channel Output Mode 2 with One-Phase PWM Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

#### Prerequisites

One-phase PWM output control requires a set of two channels:

- One even slave channel
- One odd slave channel (even channel + 1)  
The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEEm
- TAUDnTRE.TAUDnTREEm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm
- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

### 32.7.3.6 Synchronous Channel Output Mode 2 with Complementary Modulation Output

#### Set/reset conditions

In this output mode, TAUDTTOUT<sub>m</sub> outputs a PWM signal, a high signal, or a low signal depending on the value of real-time output bit (TAUDnTRO.TAUDnTRO<sub>m</sub>), the modulation output bit (TAUDnTME.TAUDnTME<sub>m</sub>), and the output level bit (TAUDnTOL.TAUDnTOL<sub>m</sub>) of a pair of slave channels.

For details, see **Section 32.16.3, Complementary Modulation Output Function**.

#### Prerequisites

A set of at least four channels is required for this mode. The master channel and slave channel 1 generate a period, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time. Slave channels 2 and 3 are a pair. In typical applications, four more channels are also used, which operates in the same manner as slave channels 2 and 3 respectively.

TAUDnTRO.TAUDnTRO<sub>m</sub>, TAUDnTME.TAUDnTME<sub>m</sub>, and TAUDnTDL.TAUDnTDL<sub>m</sub> can only be changed during count operation.

- If TAUDnTME.TAUDnTME<sub>m</sub> is changed during operation, its new value is applied upon detection of INTTAUDnIm at the specified channel.
- If TAUDnTME.TAUDnTME<sub>m</sub> and TAUDnTDL.TAUDnTDL<sub>m</sub> are changed, their new values are applied upon detection of INTTAUDnIm on an even slave channel.

### 32.7.3.7 Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

The difference from synchronous channel output mode 1 with non-complementary modulation output is the PWM wave shape.

Mode 1 has a square wave while mode 2 has a triangular wave.

## 32.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUDnTS.TAUDnTSM is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

### CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

### 32.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUDnTS.TAUDnTSM is set to 1. The value of data register is also loaded when the counter starts.

Figure 32.14 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode

### NOTE

Make sure to set TAUDnCMORm.TAUDnMD0 to 0 when using the count-up/-down mode.

### 32.8.2 Event Count Mode

The value of data register is loaded as soon as TAUDnTS.TAUDnTSM is set to 1. The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

Figure 32.15 Start Timing in Event Count Mode

### 32.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUDTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

Figure 32.16 Count Start Timing in Other Operating Modes

### 32.9 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUDnIm is generated using the TAUDnCMORm.TAUDnMD0 bit. The generation of INTTAUDnIm when the TAUDnCMORm.TAUDnMD0 bit starts counting and the effect to TAUDTTOUTm depend on the selected function. For details, refer to the description of TAUDnCMORm.TAUDnMD0 of each function.

Figure 32.17 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 = 0)

Figure 32.18 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 = 1)

## 32.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches  $FFFF_H$  and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches  $0000_H$  at the same time as the first channel overflows ( $TAUDnCNTm = FFFF_H$ ).
- Set  $TAUDnCDRm$  of the second channel to  $FFFF_H$ .
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same  $TAUDTTINm$  input.
- The trigger detection settings ( $TAUDnCMORm.TAUDnSTS[2:0]$  and  $TAUDnCMURm.TAUDnTIS[1:0]$ ) must be identical for both channels.

### Result:

The down-counter of the second channel reaches  $0000_H$  at exactly the same time as the up-counter of the first channel overflows ( $TAUDnCNTm = FFFF_H$ ). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

### 32.10.1 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the TAUDTTINm input interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input pulse interval measurement function exceeds FFFF<sub>H</sub>.

Figure 32.19 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

#### Timing diagram

Figure 32.20 Interrupt Generation via Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

### 32.10.2 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at measuring the TAUDTTINm width) can detect the overflow when TAUDnCNTm of the TAUDTTINm input signal width measurement function exceeds FFFF<sub>H</sub>.

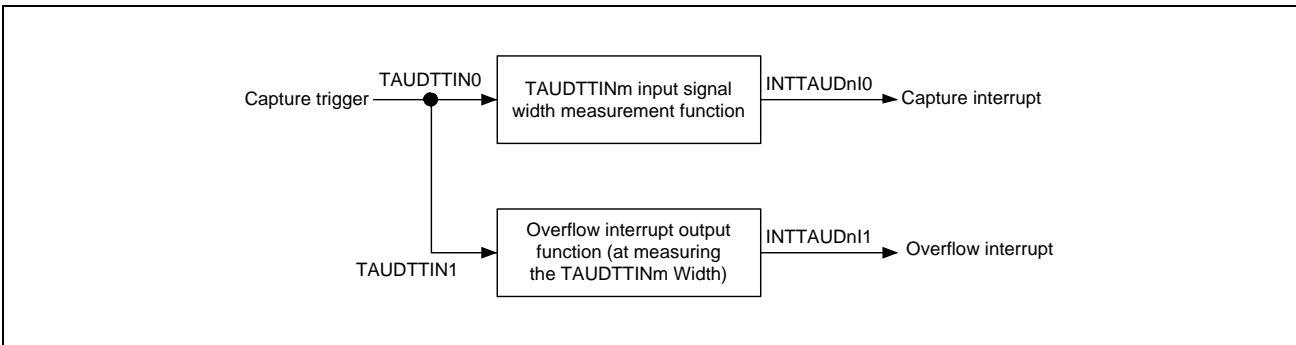

Figure 32.21 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

#### Timing diagram

Figure 32.22 Interrupt Generation via Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

### 32.10.3 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUDnIm of the interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input position detection function exceeds FFFF<sub>H</sub>.

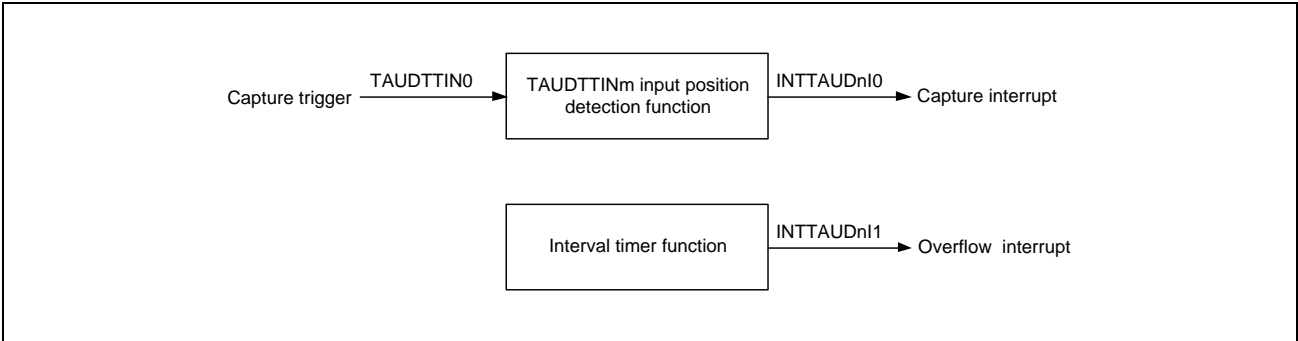

Figure 32.23 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

#### Timing diagram

Figure 32.24 Interrupt Generation via Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

### 32.10.4 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at detecting the TAUDTTINm input period count) can detect the overflow when TAUDnCNTm of the TAUDTTINm input period count detection function exceeds FFFF<sub>H</sub>.

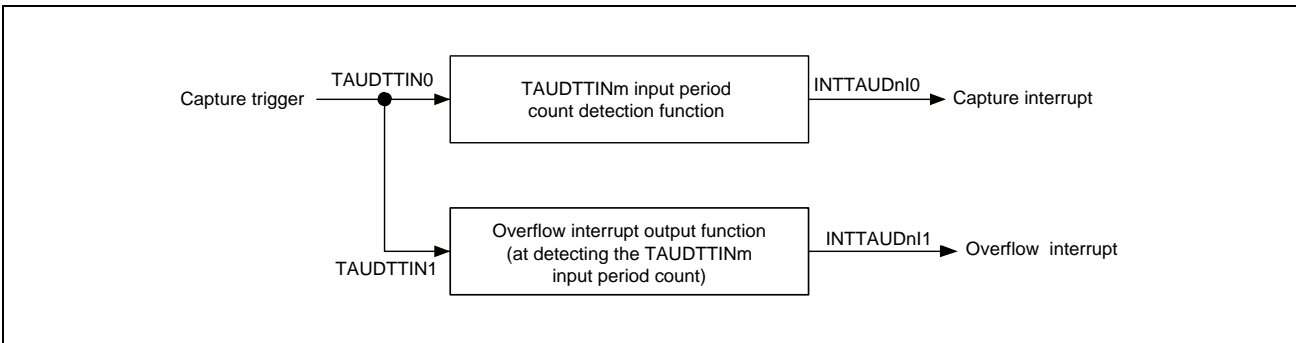

Figure 32.25 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

#### Timing diagram

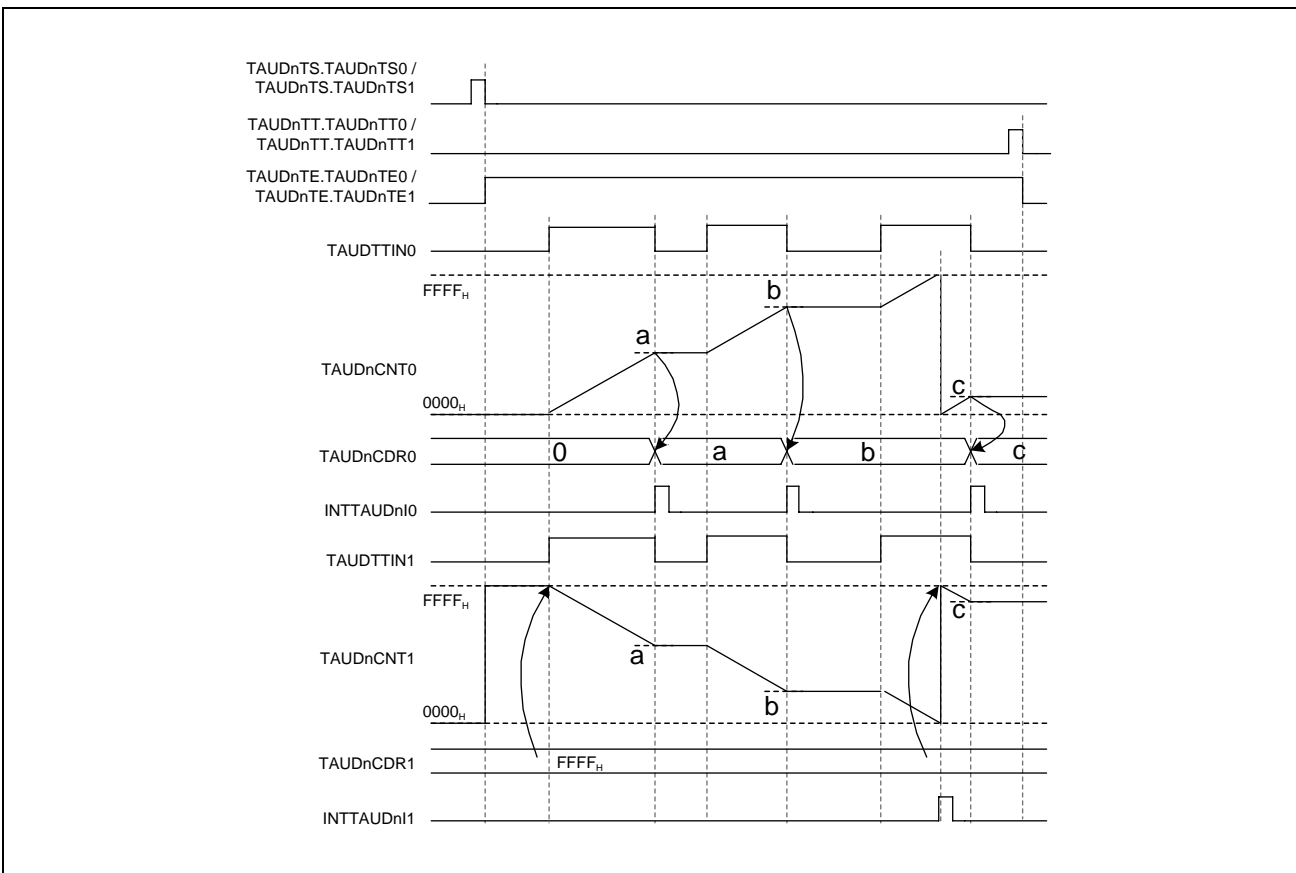

Figure 32.26 Interrupt Generation via Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

### 32.11 TAUDTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

**Figure 32.27, Basic Edge Detection Timing** shows when edge detection takes place.

Figure 32.27 Basic Edge Detection Timing

**Figure 32.27, Basic Edge Detection Timing** shows an operation timing image. Actually, a noise filter or synchronization circuit which is located between the TAUDnIm pin and TAUDn causes a delay time.

## 32.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the Timer Array Unit D. For a general overview of independent channel operation, see **Section 32.2, Overview**.

This section describes functions that generate interrupts at regular intervals or with a specified delay.

### 32.12.1 Interval Timer Function

#### 32.12.1.1 Overview

##### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

##### Prerequisites

- The operation mode must be set to Interval Timer Mode, see **Table 32.55, Contents of the TAUDnCMORm Register for Interval Timer Function**.
- The channel output mode must be set to Independent Channel Output Mode 1, see **Section 32.7, Channel Output Modes**.

##### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is written to TAUDnCNTm and the counter starts to count down from this value.

When the counter reaches 0000<sub>H</sub>, INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and subsequently continues operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.

##### Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in a negative TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

#### 32.12.1.2 Equations

INTTAUDnIm cycle = count clock cycle × (TAUDnCDRm + 1)

TAUDTTOUTm square wave cycle = count clock cycle × (TAUDnCDRm + 1) × 2

32.12.1.3 Block Diagram and General Timing Diagram

Figure 32.28 Block Diagram of Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1).

Figure 32.29 General Timing Diagram of Interval Timer Function

### 32.12.1.4 Register Settings

#### (1) TAUDnCMORM

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.55 Contents of the TAUDnCMORM Register for Interval Timer Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS [1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Independent operation, set to 0.
10 to 8	TAUDnSTS[2:0]	000: Triggers the counter by software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated to toggle TAUDTTOUTm at the beginning of an operation. 1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation.

#### (2) TAUDnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.56 Contents of the TAUDnCMURm Register for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode

Table 32.57 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

#### NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Section 32.7, Channel Output Modes**.

### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the interval timer function. Therefore, these registers should be set to 0.

Table 32.58 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.12.1.5 Operating Procedure for Interval Timer Function

Table 32.59 Operating Procedure for Interval Timer Function

	Operation	TAUDn Status
 Restart Operation	<b>Initial Channel Setting</b> Set TAUDnCMORm and TAUDnCMURm registers as described in <b>Table 32.55, Contents of the TAUDnCMORm Register for Interval Timer Function</b> , and <b>Table 32.56, Contents of the TAUDnCMURm Register for Interval Timer Function</b> .  Set the value of TAUDnCDRm register.  Set channel output mode by setting the control bits as described in <b>Table 32.57, Control Bit Settings in Independent Channel Output Mode 1</b> .	Channel operation is stopped.
	<b>Start Operation</b> Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles.
	<b>During Operation</b> The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues.</li> <li>• INTTAUDnIm is generated and TAUDTTOUTm toggles.</li> </ul>
	<b>Stop Operation</b> Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.12.1.6 Specific Timing Diagrams

(1) TAUDnCDRm = 0000H, count clock = PCLK/2

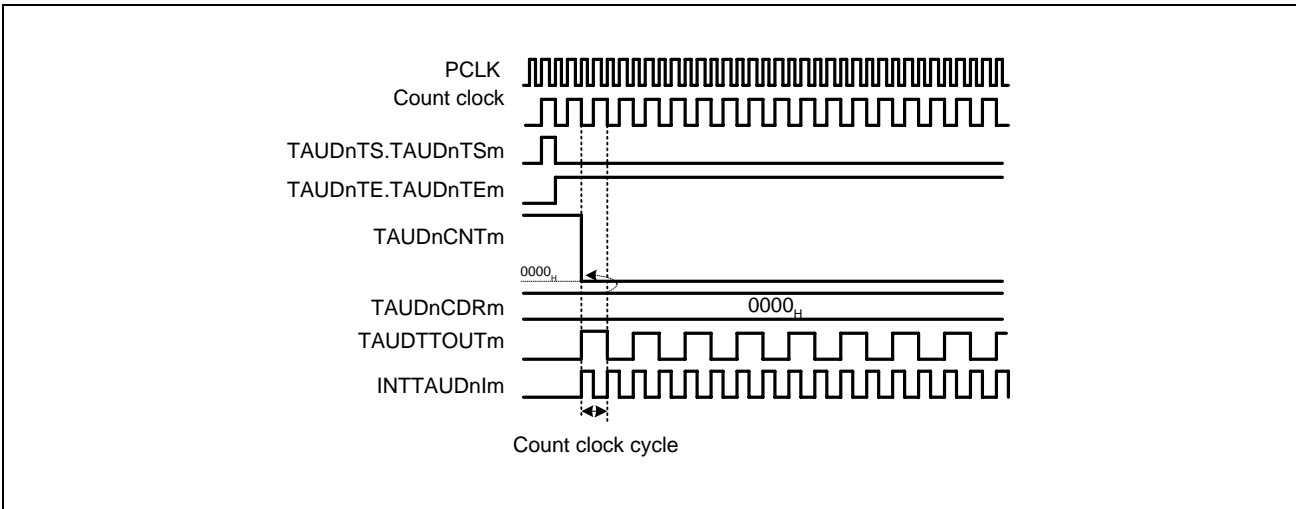

Figure 32.30 TAUDnCDRm = 0000H, Count Clock = PCLK/2

- If TAUDnCDRm = 0000H and the count clock = PCLK/2, the TAUDnCDRm value is loaded into TAUDnCNTm every count clock, meaning that TAUDnCNTm is always 0000H.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

(2) TAUDnCDRm = 0000H, count clock = PCLK

Figure 32.31 TAUDnCDRm = 0000H, Count Clock = PCLK

- If TAUDnCDRm = 0000H and the count clock = PCLK, the TAUDnCDRm value is loaded into TAUDnCNTm every PCLK clock, meaning that TAUDnCNTm is always 0000H.
- INTTAUDnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.  
TAUDTTOUTm is toggled every PCLK clock.

**(3) Operation Stop and Restart**

Figure 32.32 Operation Stop and Restart (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

**(4) Forced Restart (TAUDnCMORm.TAUDnMD0 = 1)**

Figure 32.33 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSM to 1 during operation.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUDnCDRm value is reflected to TAUDnCNTm and counting starts. Execute a forced restart to reflect the changed TAUDnCDRm value immediately.
- When a forced restart is made, an interrupt (INTTAUDnIm) is generated and TAUDTTOUTm is inverted.

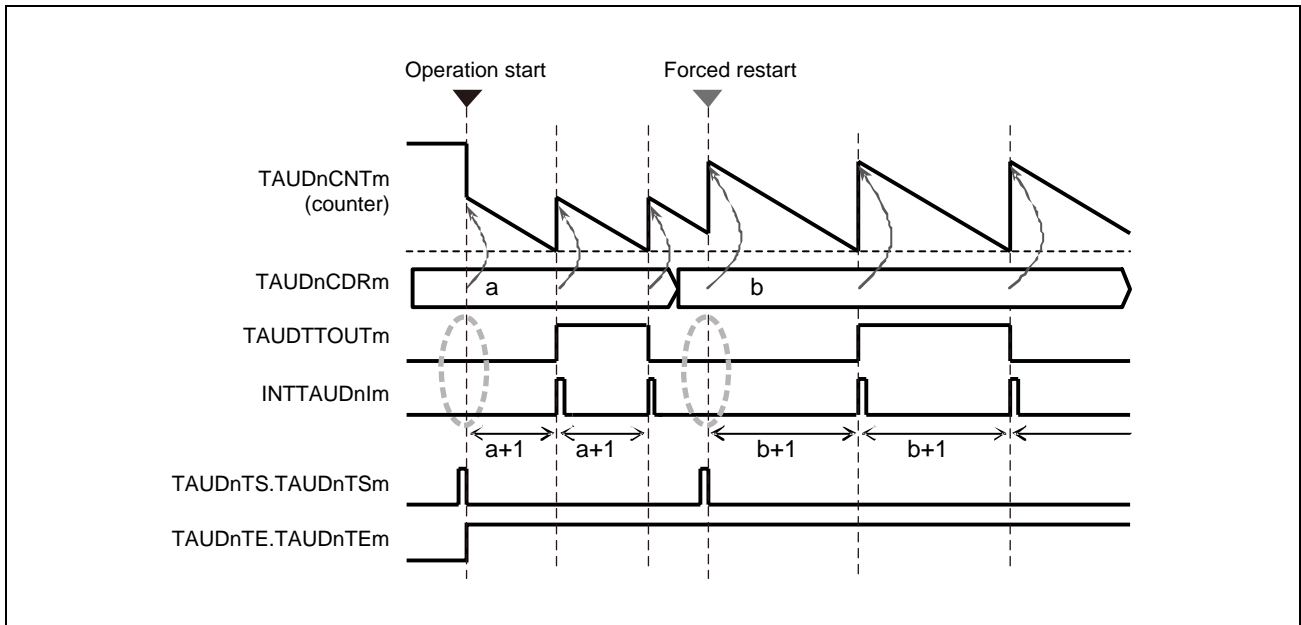

**(5) Forced Restart (TAUDnCMORm.TAUDnMD0 = 0)**

Figure 32.34 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 0)

- When a forced restart is made, an interrupt (INTTAUDnIm) is not generated and TAUDTTOUTm is not inverted.

## 32.12.2 TAUDTTINm Input Interval Timer Function

### 32.12.2.1 Overview

#### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals or when a valid TAUDTTINm input edge is detected. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

#### Prerequisites

- The operating mode should be set to interval timer mode (see **Table 32.60, Contents of the TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function**).
- The channel output mode should be set to independent channel output mode 1. See **Section 32.7, Channel Output Modes**.

#### Functional description

This function operates in an identical manner to the interval timer function (see **Section 32.12.1, Interval Timer Function**) except that this function is restarted by a valid TAUDTTINm input edge. The type of edge used as a trigger is specified using the TAUDnCMURm.TAUDnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

### 32.12.2.2 Equations

$\text{INTTAUDnIm cycle} = \text{count clock cycle} \times (\text{TAUDnCDRm} + 1)$

$\text{TAUDTTOUTm square wave cycle} = \text{count clock cycle} \times (\text{TAUDnCDRm} + 1) \times 2$

32.12.2.3 Block Diagram and General Timing Diagram

Figure 32.35 Block Diagram of TAUDTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1).
- Rising edge detection (TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>)

Figure 32.36 General Timing Diagram of TAUDTTINm Input Interval Timer Function

### (3) Channel Output Mode

Table 32.62 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

#### NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Section 32.7, Channel Output Modes**.

### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm Input Interval Timer Function. Therefore, these registers should be set to 0.

Table 32.63 Simultaneous Rewrite Settings for TAUDTTINm Input Interval Timer Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.12.2.5 Operating Procedure for TAUDTTINm Input Interval Timer Function

Table 32.64 Operating Procedure for TAUDTTINm Input Interval Timer Function

	Operation	TAUDn Status
Restart Operation ↑	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles.
	During Operation	TAUDnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues.</li> <li>INTTAUDnIm is generated and TAUDTTOUTm toggles.</li> </ul> When a TAUDTTINm input valid edge is detected during count operation, the TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. Afterwards, this procedure is repeated.
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

### 32.12.2.6 Specific Timing Diagrams

The timing diagrams in **Section 32.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by a valid TAUDTTINm input edge.

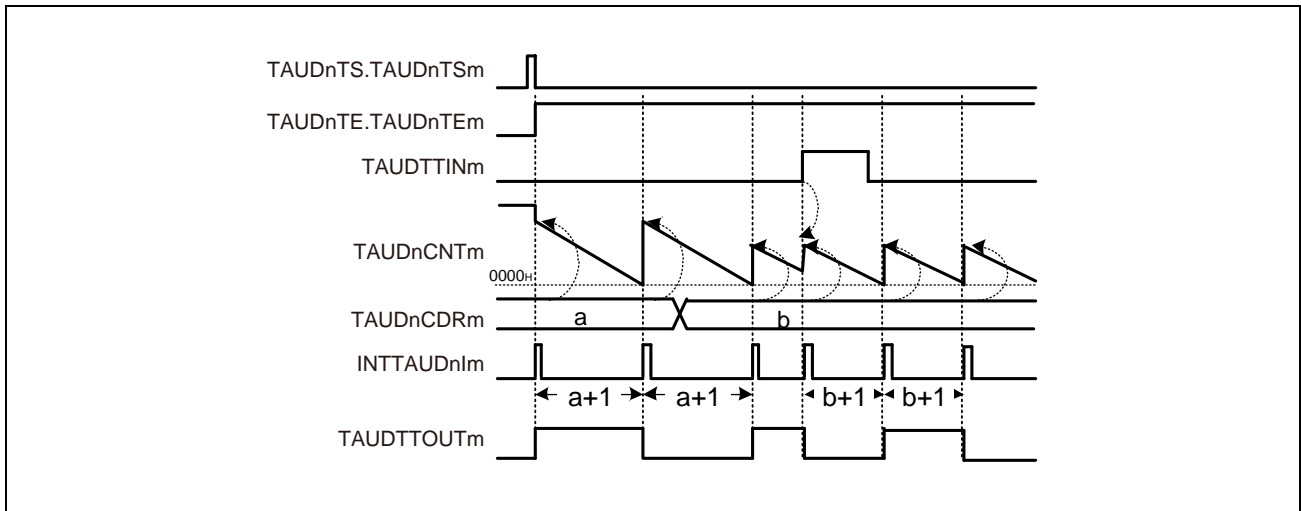

Figure 32.37 Counter Triggered by Rising TAUDTTINm Input Edge (TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>), TAUDnCMORM.TAUDnMDO = 1

- If a valid TAUDTTINm input edge is detected, an interrupt is generated which causes TAUDTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>)

### 32.12.3 Clock Divide Function

#### 32.12.3.1 Overview

##### Summary

This function is used as a frequency divider. The frequency of the input signal TAUDTTIN<sub>m</sub> is divided by a factor related to TAUDnCDR<sub>m</sub>, and the resulting signal is output to TAUDTTOUT<sub>m</sub>.

##### Prerequisites

- TAUDTTIN<sub>m</sub> should have a fixed frequency.
- The operating mode should be set to interval timer mode (see **Table 32.65, Contents of the TAUDnCMOR<sub>m</sub> Register for Clock Divide Function**).
- The channel output mode should be set to independent channel output mode 1. See **Section 32.7, Channel Output Modes**.

##### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSM) to 1. This in turn sets TAUDnTE.TAUDnTEM = 1, enabling count operation. The current value of TAUDnCDR<sub>m</sub> is loaded into TAUDnCNT<sub>m</sub> and the counter starts to count down from this value, using TAUDTTIN<sub>m</sub> as a count clock.

When the counter value reaches 0000<sub>H</sub>, INTTAUDnIm occurs and TAUDTTOUT<sub>m</sub> signal is toggled. Then, TAUDnCDR<sub>m</sub> value is loaded into TAUDnCNT<sub>m</sub> to continue operation subsequently.

The value of TAUDnCDR<sub>m</sub> can be rewritten at any time. The changed value of TAUDnCDR<sub>m</sub> is applied when the counter starts to count down next time.

The counter can be stopped by setting TAUDnTT.TAUDnTTM = 1. This sets TAUDnTE.TAUDnTEM = 0. TAUDnCNT<sub>m</sub> and TAUDTTOUT<sub>m</sub> stop but retain their values. The function can be restarted by setting TAUDnTS.TAUDnTSM = 1. The counter can also be forcibly restarted without making a stop by setting TAUDnTS.TAUDnTSM = 1 during operation (forced restart).

##### Conditions

If the TAUDnCMOR<sub>m</sub>.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUT<sub>m</sub> does not toggle. This results in a negative TAUDTTOUT<sub>m</sub> signal compared to when TAUDnCMOR<sub>m</sub>.TAUDnMD0 is set to 1. For details, see **Section 32.9, TAUDTTOUT<sub>m</sub> Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

##### NOTE

TAUDTTIN<sub>m</sub> input signals are sampled at the frequency of the operation clock set by TAUDnCMOR<sub>m</sub>.TAUDnCKS[1:0] bits. Therefore, the TAUDTTOUT<sub>m</sub> output clock cycle has an error of ± 1 operation clock cycle.

### 32.12.3.2 Equations

- When rising edge detection is selected:  
 $TAUDTTOUTm \text{ frequency} = TAUDTTINm \text{ frequency} / [(TAUDnCDRm + 1) \times 2]$
- When falling edge detection is selected:  
 $TAUDTTOUTm \text{ frequency} = TAUDTTINm \text{ frequency} / [(TAUDnCDRm + 1) \times 2]$
- When falling and rising edge detection is selected:  
 $TAUDTTOUTm \text{ frequency} = TAUDTTINm \text{ frequency} / (TAUDnCDRm + 1)$

### 32.12.3.3 Block Diagram and General Timing Diagram

Figure 32.38 Block Diagram of Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>)

Figure 32.39 General Timing Diagram of Clock Divide Function

### 32.12.3.4 Register Settings

Table 32.65 Contents of the TAUDnCMORM Register for Clock Divide Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3
13, 12	TAUDnCCS[1:0]	01: Valid TAUDTTINm input edge is used as a count clock.
11	TAUDnMAS	0: Independent operation. Set to 0.
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated to toggle TAUDTTOUTm at the beginning of an operation. 1: INTTAUDnIm is generated and TAUDTTOUTm is toggled at the beginning of operation.

#### (2) TAUDnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.66 Contents of the TAUDnCMURm Register for Clock Divide Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges 11: Setting prohibited

**(3) Channel Output Mode**

Table 32.67 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

**(4) Simultaneous Rewrite**

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the clock divide function. Therefore, these registers should be set to 0.

Table 32.68 Simultaneous Rewrite Settings for Clock Divide Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.12.3.5 Operating Procedure for Clock Divide Function

Table 32.69 Operating Procedure for Clock Divide Function

	Operation	TAUDn Status
Restart Operation ↑	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEM is set to 1 and the counter starts. TAUDnCNTm loads TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 is set to 1, INTTAUDnIm is generated and TAUDTTOUTm is toggled.
	During Operation	TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues.</li> <li>• INTTAUDnIm is generated.</li> <li>• TAUDTTOUTm is toggled.</li> </ul> Afterwards, this procedure is repeated.
	Stop Operation	TAUDnTE.TAUDnTEM is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm and TAUDTTOUTm retain their current values.

### 32.12.3.6 Specific Timing Diagrams

#### (1) TAUDnCDRm = 0000H

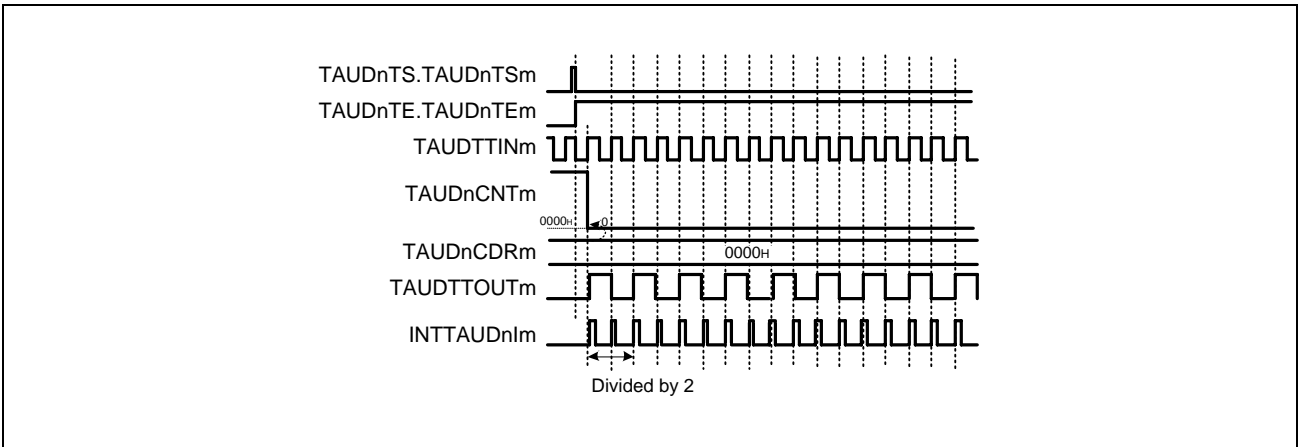

Figure 32.40 TAUDnCDRm = 0000H, TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01B

- If TAUDnCDRm is 0000H, TAUDnCNTm is always 0000H.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

**Figure 32.40, TAUDnCDRm = 0000H, TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01B** shows an operation timing example. Actually, there is a delay from TINm detection until TOUTm output because of the delay time of a noise filter or synchronization circuit placed between the TAUDnIm pin and TAUDn.

#### (2) Operation Restart

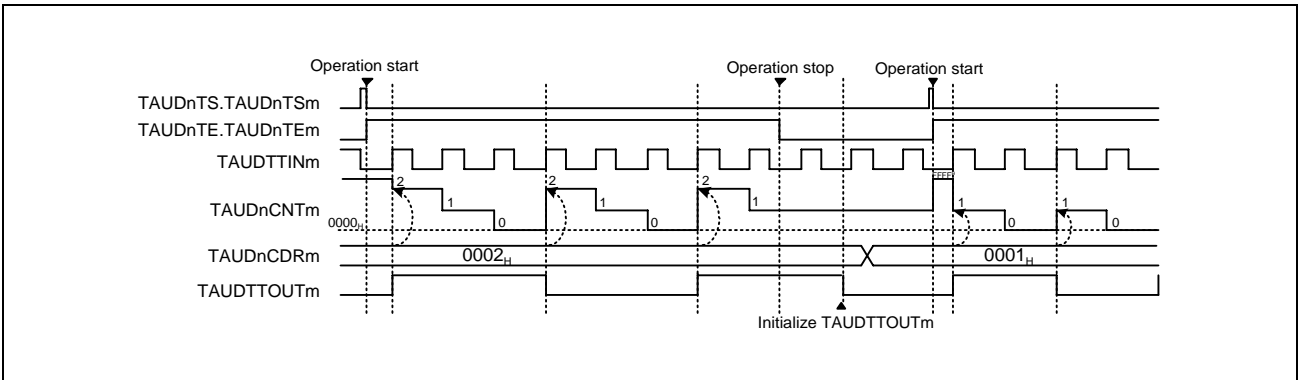

Figure 32.41 Operation Restart  
(TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01B)

To reset the value of TAUDTTOUTm:

- Set TAUDnTOE.TAUDnTOEm = 0 when the counter is stopped (TAUDnTE.TAUDnTEm = 0).
- Then, write either 0 or 1 to TAUDnTO.TAUDnTOM to set the new start value of TAUDTTOUTm.

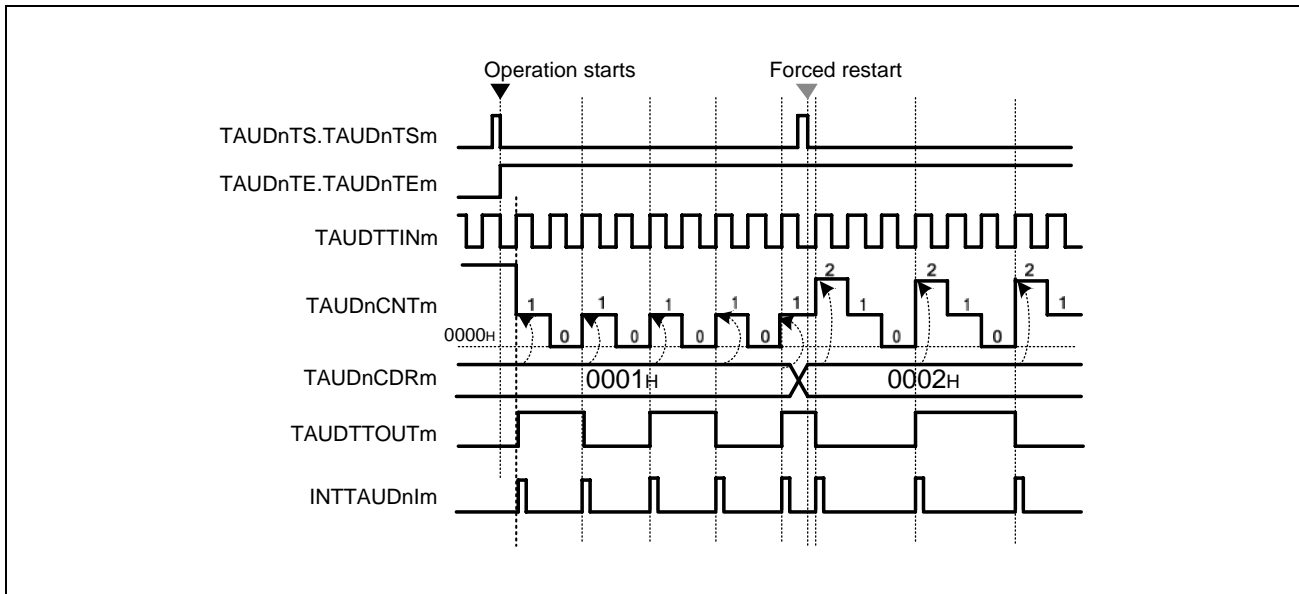

**(3) Forced Restart**

Figure 32.42 Forced Restart Operation

(TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>)

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSM = 1 during operation.
- The value of TAUDnCDRm is written to TAUDnCNTm and the count operation restarts.
- TAUDTTOUTm restarts at the same level as before the forced restart.

## 32.12.4 External Event Count Function

### 32.12.4.1 Overview

#### Summary

This function is used as an event timer, which generates an interrupt (INTTAUDnIm) when a specific number of valid TAUDTTINm input edges are detected.

#### Prerequisites

- The operating mode should be set to the event count mode (see **Table 32.70, Contents of the TAUDnCMORm Register for External Event Count Function**).
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When the counter starts, the current value of TAUDnCDRm is loaded into TAUDnCNTm.

When a valid TAUDTTINm input edge is detected, the value of TAUDnCNTm decrements by 1. TAUDnCNTm retains this value until a valid TAUDTTINm input edge is detected or the counter is restarted.

When the valid edge is detected for the (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUDnTS.TAUDnTSm to 1 during operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

An edge type used as a trigger is specified by TAUDnCMURm.TAUDnTIS[1:0] bits.

- When TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>, falling edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>, rising edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = 10<sub>B</sub>, both edges are counted.

### 32.12.4.2 Equations

Number of valid edges detected before INTTAUDnIm generation = TAUDnCDRm + 1

32.12.4.3 Block Diagram and General Timing Diagram

#### (3) Channel Output Mode

The channel output mode is not used by this function.

#### (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the external event count function. Therefore, these registers should be set to 0.

Table 32.72 Simultaneous Rewrite Settings for External Event Count Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

#### 32.12.4.5 Operating Procedure for External Event Count Function

Table 32.73 Operating Procedure for External Event Count Function

	Operation	TAUDn Status
Restart Operation	Initial Channel Setting Set TAUDnCMORm and TAUDnCMURm registers as described in <b>Table 32.70, Contents of the TAUDnCMORm Register for External Event Count Function</b> , and <b>Table 32.71, Contents of the TAUDnCMURm Register for External Event Count Function</b> .  Set the value of TAUDnCDRm register.	Channel operation is stopped.
	Start Operation Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm loads TAUDnCDRm value and waits for TAUDTTINm input edge detection.
	During Operation Detection of TAUDTTINm edge  The value of TAUDnCDRm is changeable at any time.  The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When effective edges are detected (TAUDnCDRm + 1) times: <ul style="list-style-type: none"> <li>• TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues.</li> <li>• INTTAUDnIm is generated.</li> </ul> Afterwards, this procedure is repeated.
	Stop Operation Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

### 32.12.4.6 Specific Timing Diagrams

#### (1) TAUDnCDRm = 0000H

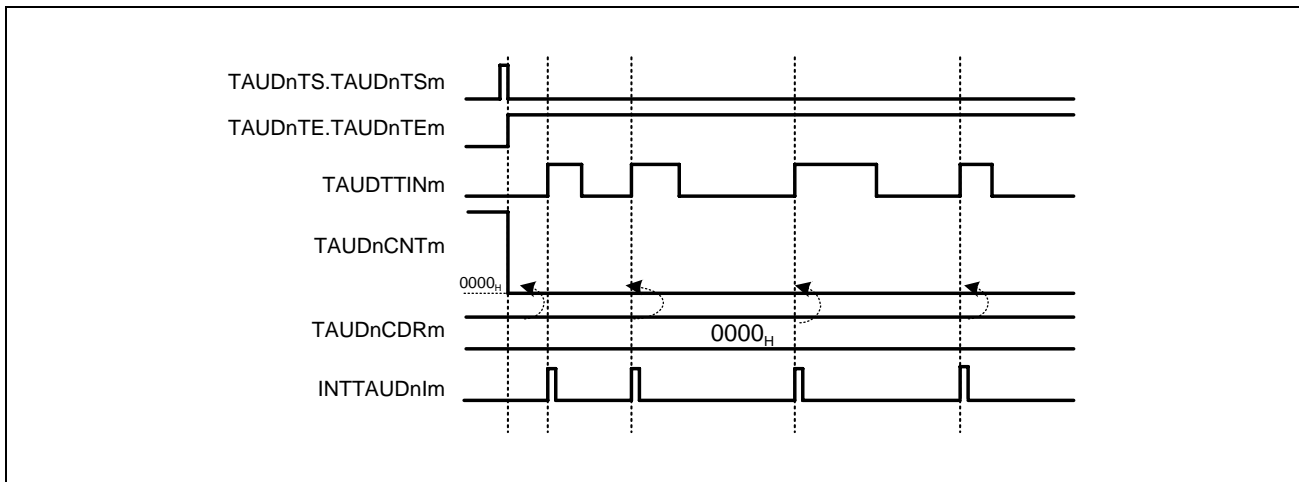

Figure 32.45 TAUDnCDRm = 0000H, TAUDnCMURm.TAUDnTIS[1:0] = 01B

- If  $0000_H = \text{TAUDnCDRm}$ ,  $0000_H$  is loaded into TAUDnCNTm each time a valid TAUDTTINm input edge is detected.  
In other words, INTTAUDnIm is generated each time a valid TAUDTTINm input edge is detected.

#### (2) Operation Stop and Restart

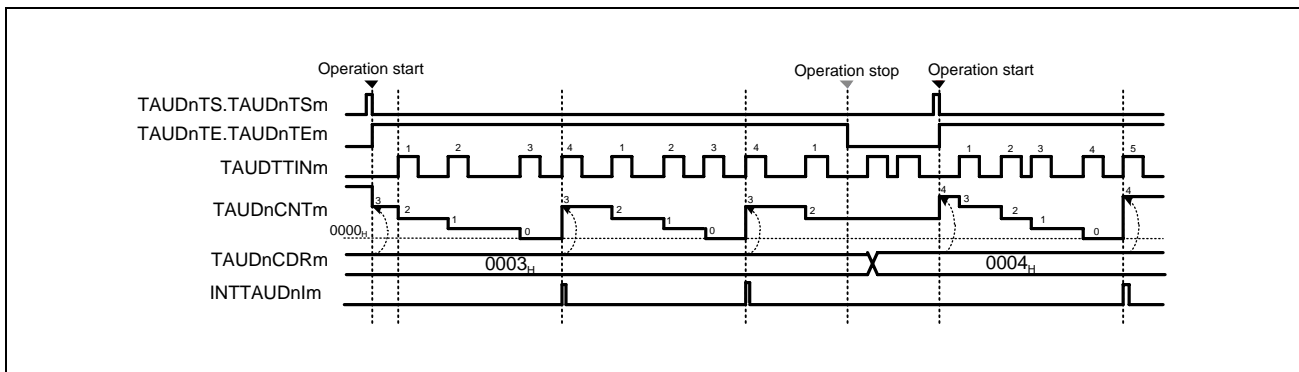

Figure 32.46 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = 01B)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEM to 0.
- TAUDnCNTm stops and retains its current value. TAUDTTINm continues and TAUDnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUDnTS.TAUDnTSM to 1. TAUDnCNTm loads the TAUDnCDRm value and restarts count operation.

**(3) Forced Restart**

Figure 32.47 Forced Restart Operation (TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>)

Once a forced restart is made, the changed TAUDnCDRm value is applied to TAUDnCNTm immediately.

- The counter can be restarted without making a stop by setting TAUDnTS.TAUDnTSM to 1 during operation.
- The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter awaits the next valid TAUDTTINm input edge.

## 32.12.5 Delay Count Function

### 32.12.5.1 Overview

#### Summary

This function generates interrupts (INTTAUDnIm), which have a defined delay to the TAUDTTINm input signal. TAUDTTINm input signal pulses that occur within the delay period are ignored.

#### Prerequisites

- The operating mode should be set to one-count mode (see **Table 32.74, Contents of the TAUDnCMORm Register for Delay Count Function**).
- TAUDTTOUTm is not used with this function.
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches 0000<sub>H</sub>, an interrupt is generated. The counter returns to FFFF<sub>H</sub> and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 10<sub>B</sub>, rising and falling edges trigger the counter.

### 32.12.5.2 Equations

Delay between TAUDTTINm and INTTAUDnIm = count clock cycle × (TAUDnCDRm + 1)

32.12.5.3 Block Diagram and General Timing Diagram

Figure 32.48 Block Diagram of Delay Count Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

Figure 32.49 General Timing Diagram of Delay Count Function

### 32.12.5.4 Register Settings

#### (1) TAUDnCMORM

#### (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function. However, this mode can be used in independent channel output mode controlled by software.

#### (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the delay count function. Therefore, these registers should be set to 0.

Table 32.76 Simultaneous Rewrite Settings for Delay Count Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

#### 32.12.5.5 Operating Procedure for Delay Count Function

Table 32.77 Operating Procedure for Delay Count Function

	Operation	TAUDn Status
Restart Operation ↑	Initial Channel Setting Set TAUDnCMORm and TAUDnCMURm registers as described in <b>Table 32.74, Contents of the TAUDnCMORm Register for Delay Count Function</b> , and <b>Table 32.75, Contents of the TAUDnCMURm Register for Delay Count Function</b> .  Set the value of TAUDnCDRm register.	Channel operation is stopped.
	Start Operation Set TAUDnTS.TAUDnTSM to 1. TAUDnTS.TAUDnTSM is a trigger bit, which is automatically cleared to 0.  Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEM is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge.  When a start edge is detected, the TAUDnCDRm value is loaded in TAUDnCNTm.
	During Operation The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000 <sub>H</sub> , INTTAUDnIm is generated. TAUDnCNTm stops counting, returns FFFF <sub>H</sub> , and waits for a trigger.  If a trigger occurs while TAUDnCNTm is counting, the trigger is ignored. Afterwards, this procedure is repeated.
	Stop Operation Set TAUDnTT.TAUDnTTM to 1. TAUDnTT.TAUDnTTM is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEM is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its value.

## 32.12.6 One-Pulse Output Function

### 32.12.6.1 Overview

#### Summary

This function generates an interrupt (INTTAUDnIm) when a valid TAUDTTINm input edge is detected and at a defined interval afterward. TAUDTTINm input signal pulses that occur within the defined interval are ignored. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

#### Prerequisites

- The operation mode should be set to pulse one-count mode (see **Table 32.78, Contents of the TAUDnCMORm Register for One-Pulse Output Function**).
- The channel output mode should be set to independent channel output mode 2. See **Section 32.7, Channel Output Modes**.
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. An interrupt is generated and TAUDTTOUTm is set to active level.

When the counter reaches 0001<sub>H</sub>, an interrupt is generated and TAUDTTOUTm is set to the inactive level. The counter stops at 0000<sub>H</sub> and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 10<sub>B</sub>, rising and falling edges trigger the counter.

### 32.12.6.2 Equations

Interval between TAUDTTINm and INTTAUDnIm = TAUDTTOUTm (timer output) width = count clock cycle × TAUDnCDRm

32.12.6.3 Block Diagram and General Timing Diagram

Figure 32.50 Block Diagram of One-Pulse Output Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

#### NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Table 32.54, Channel Output Modes**.

### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the One-Pulse Output Function. Therefore, these registers should be set to 0.

Table 32.81 Simultaneous Rewrite Settings for One-Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.12.6.5 Operating Procedure for One-Pulse Output Function

Table 32.82 Operating Procedure for One-Pulse Output Function

	Operation	TAUDn Status
Restart Operation ↑ ↓	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge.  When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value.
	During Operation	INTTAUDnIm is generated when TAUDnCNTm starts and TAUDTTOUTm is set to its active level. TAUDnCNTm counts down. When the counter reaches 0001 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm is generated.</li> <li>• TAUDTTOUTm is set to its inactive level.</li> </ul> TAUDnCNTm stops counting and waits for a trigger.  If a trigger occurs while TAUDnCNTm is counting, the trigger is ignored.
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

## 32.12.7 TAUDTTINm Input Pulse Interval Measurement Function

### 32.12.7.1 Overview

#### Summary

This function captures the count value and uses this value and the overflow bit TAUDnCSRm.TAUDnOVF to measure the interval of the TAUDTTINm input signals.

#### Prerequisites

- The operating mode should be set to capture mode (see **Table 32.84, Contents of the TAUDnCMORM Register for TAUDTTINm Input Pulse Interval Measurement Function**).
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter TAUDnCNTm starts to count up from 0000<sub>H</sub>. When a valid TAUDTTINm edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter resets to 0000<sub>H</sub> and subsequently continues operation.

If the counter reaches FFFF<sub>H</sub> before a valid TAUDTTINm edge is detected, it overflows to 0000<sub>H</sub>. The counter is reset to 0000<sub>H</sub> and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORM.TAUDnCOS[1:0].

Table 32.83 Effects of Overflow

TAUDnCMORM. TAUDnCOS[1:0]	When Overflow Occurs		When a Valid TAUDTTINm Input is Detected	
	TAUDnCDRm	TAUDnCSRm. TAUDnOVF	TAUDnCDRm, TAUDnCNTm	TAUDnCSRm. TAUDnOVF
00	Unchanged	0	TAUDnCNTm loaded into TAUDnCDRm	1
01		1		
10	Set to FFFF <sub>H</sub>	0	TAUDnCNTm set to 0, TAUDnCDRm unchanged	Unchanged
11		1		

When TAUDnCMORM.TAUDnCOS[0] = 1, the overflow bit (TAUDnCSRm.TAUDnOVF) can be cleared only by setting TAUDnCSCm.TAUDnCLOV = 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the interval of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, the overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

The function can be stopped by setting TAUDnTT.TAUDnTTm = 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm stops but retains its value. While the function is stopped, valid TAUDTTINm input edge detection and TAUDnCNTm capture are not performed.

The counter is reset to 0000<sub>H</sub> and subsequently continues operation.

**Conditions**

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.**

**NOTE**

---

When TAUDnCMORm.TAUDnCOS[1:0] = 10<sub>B</sub> or 11<sub>B</sub>, the value of TAUDnCNTm is not loaded into TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

---

**32.12.7.2 Equations**

TAUDTTINm input pulse interval = count clock cycle × [(TAUDnCSRm.TAUDnOVF × (FFFF<sub>H</sub> + 1)) + TAUDnCDRm capture value + 1]

### 32.12.7.3 Block Diagram and General Timing Diagram

Figure 32.52 Block Diagram of TAUDTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 0).
- Falling edge detection (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1 (TAUDnCMORm.TAUDnCOS[1:0] = 00<sub>B</sub>).

Figure 32.53 General Timing Diagram of TAUDTTINm Input Pulse Interval Measurement Function

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges 11: Setting prohibited

### (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval measurement function. Therefore, these registers should be set to 0.

Table 32.86 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Measurement Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.12.7.5 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

Table 32.87 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

	Operation	TAUDn Status
Restart Operation	Initial Channel Setting Set TAUDnCMORm and TAUDnCMURm registers as described in <b>Table 32.84, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function</b> , and <b>Table 32.85, Contents of the TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Measurement Function</b> .  The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
	Start Operation Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000 <sub>H</sub> . INTTAUDnIm is generated when TAUDnCMORm.TAUDnMD0 is set to 1.
	During Operation Detection of TAUDTTINm edge  The values of TAUDnCMURm.TAUDnTIS[1:0] bits can be changed at any time. The TAUDnCDRm and TAUDnCSRm registers can be read at any time. TAUDnCSCm.TAUDnCLOV can be written to 1. (TAUDnCSRm.TAUDnOVF bit is cleared to 0.)	TAUDnCNTm starts to count up from 0000 <sub>H</sub> . When a TAUDTTINm valid edge is detected: <ul style="list-style-type: none"> <li>• TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and returns to 0000<sub>H</sub>.</li> <li>• INTTAUDnIm is then generated.</li> </ul> Afterwards, this procedure is repeated.
	Stop Operation Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values.

### 32.12.7.6 Specific Timing Diagrams: Overflow Operation

#### (1) TAUDnCMORm.TAUDnCOS[1:0] = 00<sub>B</sub>

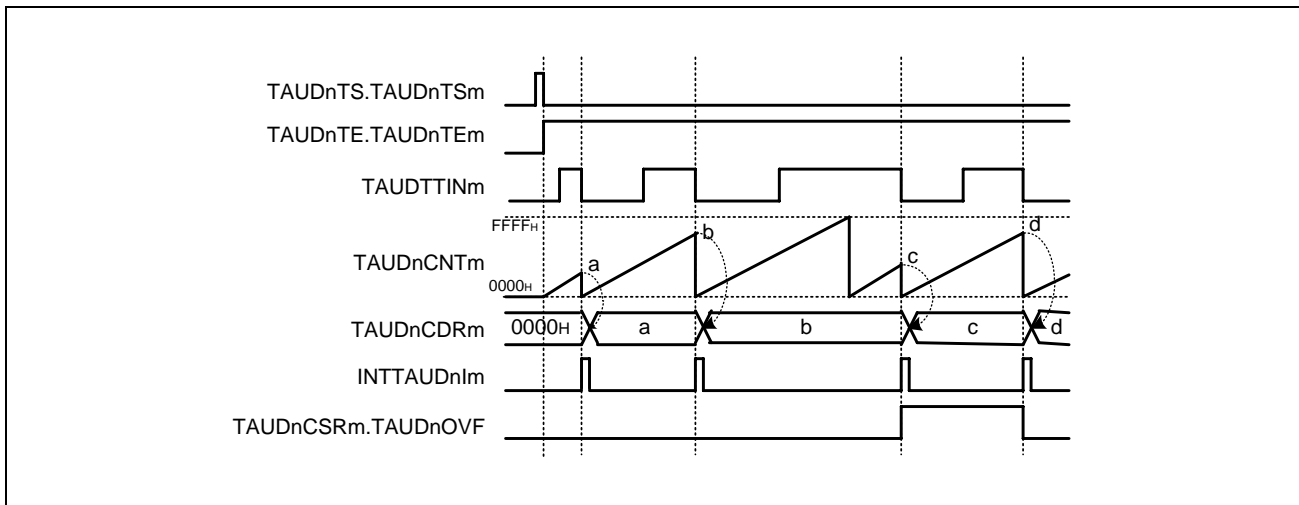

Figure 32.54 TAUDnCMORm.TAUDnCOS[1:0] = 00<sub>B</sub>, TAUDnCMORm.TAUDnMD0 = 0,  
TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

**(2) TAUDnCMORm.TAUDnCOS[1:0] = 01<sub>B</sub>**

Figure 32.55 TAUDnCMORm.TAUDnCOS[1:0] = 01<sub>B</sub>, TAUDnCMORm.TAUDnMD0 = 0,  
TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

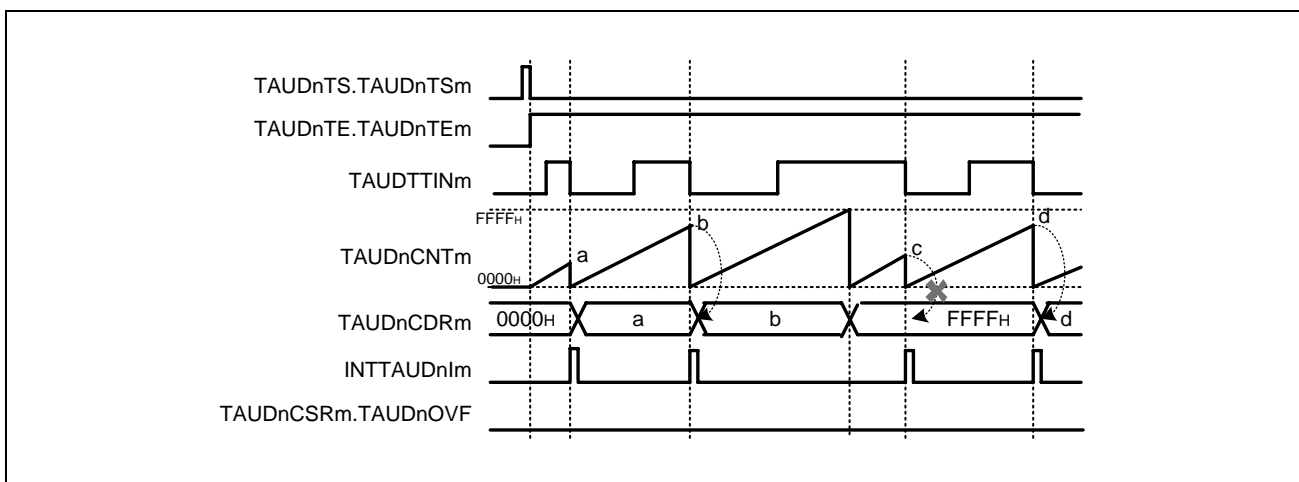

**(3) TAUDnCMORm.TAUDnCOS[1:0] = 10<sub>B</sub>**

Figure 32.56 TAUDnCMORm.TAUDnCOS[1:0] = 10<sub>B</sub>, TAUDnCMORm.TAUDnMD0 = 0,  
TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, TAUDnCDRm is set to FFFF<sub>H</sub> and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.

**(4) TAUDnCMORm.TAUDnCOS[1:0] = 11<sub>B</sub>**

Figure 32.57 TAUDnCMORm.TAUDnCOS[1:0] = 11<sub>B</sub>, TAUDnCMORm.TAUDnMD0 = 0,  
TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, TAUDnCDRm is set to FFFF<sub>H</sub> and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

## 32.12.8 TAUDTTINm Input Signal Width Measurement Function

### 32.12.8.1 Overview

#### Summary

This function measures the width of a TAUDTTINm signal, by starting the count at one edge of TAUDTTINm and capturing the count value at the other edge.

#### Prerequisites

- The operating mode should be set to capture and one-count mode (see **Table 32.89, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function**).
- TAUDTTOUTm is not used with this function.
- TAUDnCMORm.TAUDnMD0 should be set to 0.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When a valid TAUDTTINm start edge is detected, the counter TAUDnCNTm starts to count up from 0000<sub>H</sub>. When a valid TAUDTTINm stop edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter retains its value (TAUDnCDRm + 1) and awaits the next valid TAUDTTINm input start edge.

If the counter reaches FFFF<sub>H</sub> before a valid TAUDTTINm stop edge is detected, it overflows. The counter is reset to 0000<sub>H</sub> and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

Table 32.88 Effects of Overflow

TAUDnCMORm. TAUDnCOS[1:0]	When Overflow Occurs		When a Valid TAUDTTINm Input Stop Edge is Detected	
	TAUDnCDRm	TAUDnCSRm. TAUDnOVF	TAUDnCDRm, TAUDnCNTm	TAUDnCSRm. TAUDnOVF
00	Unchanged	0	TAUDnCNTm loaded into TAUDnCDRm	1
01		1		
10	Set to FFFF <sub>H</sub>	0	TAUDnCNTm stops counting	Unchanged
11		1	TAUDnCDRm unchanged	

When TAUDnCMORm.TAUDnCOS[0] = 1, overflow bit TAUDnCSRm.TAUDnOVF can be cleared only by setting TAUDnCSCm.TAUDnCLOV to 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the width of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

This function cannot be forcibly restarted.

#### NOTE

When TAUDnCMORm.TAUDnCOS[1] = 1, the value of TAUDnCNTm is not loaded to TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 32.12.8.2 Equations

TAUDTTINm input signal width = count clock cycle × [(TAUDnCSRm.TAUDnOVF × (FFFF<sub>H</sub> + 1)) + TAUDnCDRm capture value + 1]

### 32.12.8.3 Block Diagram and General Timing Diagram

Figure 32.58 Block Diagram of TAUDTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>)
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1. (TAUDnCMORm.TAUDnCOS[1:0] = 00<sub>B</sub>)

Figure 32.59 General Timing Diagram of TAUDTTINm Input Signal Width Measurement Function

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

### (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input signal width measurement function. Therefore, these registers should be set to 0.

Table 32.91 Simultaneous Rewrite Settings for TAUDTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.12.8.5 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

Table 32.92 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

	Operation	TAUDn Status
Restart Operation	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a TAUDTTINm start edge is detected, TAUDnCNTm starts to count up.
	During Operation	TAUDnCNTm starts to count up from 0000 <sub>H</sub> . When TAUDTTINm valid edge is detected: <ul style="list-style-type: none"> <li>TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and retains its value. INTTAUDnIm is then generated.</li> </ul> Counting stops at the “value that transferred to TAUDnCDRm + 1” and TAUDnCNTm waits for detection of the TAUDTTINm start edge. Afterwards, this procedure is repeated.
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values.

### 32.12.8.6 Specific Timing Diagrams: Overflow Operation

#### (1) TAUDnCMORm.TAUDnCOS[1:0] = 00<sub>B</sub>

Figure 32.60 TAUDnCMORm.TAUDnCOS[1:0] = 00<sub>B</sub>, TAUDnCMORm.TAUDnMD0 = 0,  
TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

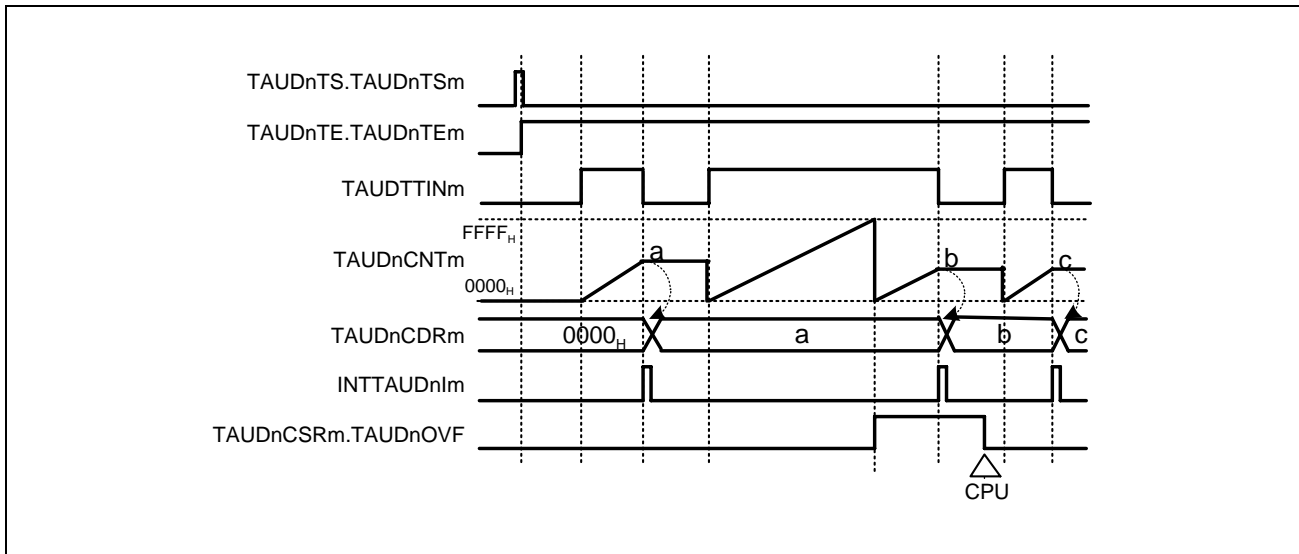

**(2) TAUDnCMORm.TAUDnCOS[1:0] = 01<sub>B</sub>**

Figure 32.61 TAUDnCMORm.TAUDnCOS[1:0] = 01<sub>B</sub>, TAUDnCMORm.TAUDnMD0 = 0,  
TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

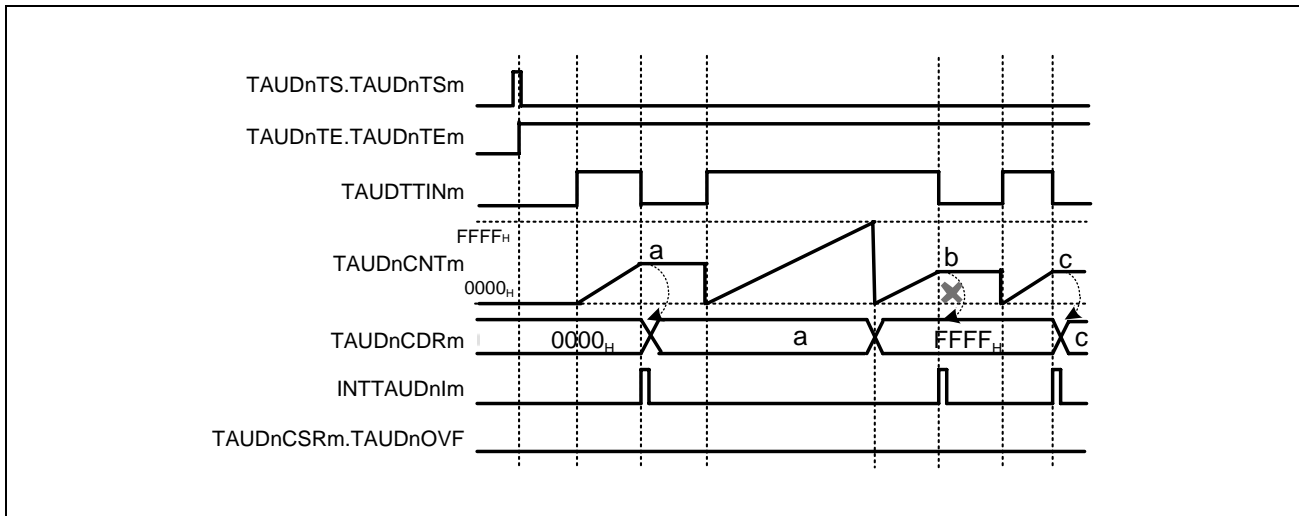

**(3) TAUDnCMORm.TAUDnCOS[1:0] = 10<sub>B</sub>**

Figure 32.62 TAUDnCMORm.TAUDnCOS[1:0] = 10<sub>B</sub>, TAUDnCMORm.TAUDnMD0 = 0,  
TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, TAUDnCDRm is set to FFFF<sub>H</sub> and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.

**(4) TAUDnCMORm.TAUDnCOS[1:0] = 11<sub>B</sub>**

Figure 32.63 TAUDnCMORm.TAUDnCOS[1:0] = 11<sub>B</sub>, TAUDnCMORm.TAUDnMD0 = 0,  
TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, TAUDnCDRm is set to FFFF<sub>H</sub> and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

## 32.12.9 TAUDTTINm Input Position Detection Function

### 32.12.9.1 Overview

#### Summary

This function measures the input signal duration by capturing the count value at the valid edge of TAUDTTINm.

#### Prerequisites

- The operating mode should be set to count capture mode (see **Table 32.93, Contents of the TAUDnCMORm Register for TAUDTTINm Input Position Detection Function**).
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter starts counting from 0000<sub>H</sub>. When a valid TAUDTTINm input edge is detected, the current value of TAUDnCNTm is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The count operation continues.

When the counter reaches FFFF<sub>H</sub>, the counter restarts from 0000<sub>H</sub>.

#### NOTE

The TAUDTTINm input signal is sampled at the frequency of the operation clock, specified by TAUDnCMORm.TAUDnCKS[1:0] bits.

#### Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt does not occur at the beginning of operation or after restart. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

### 32.12.9.2 Equations

Functional duration at a TAUDTTINm input pulse =  
 count clock cycle × (TAUDnCDRm capture value + 1)

32.12.9.3 Block Diagram and General Timing Diagram

Figure 32.64 Block Diagram of TAUDTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

Figure 32.65 General Timing Diagram of TAUDTTINm Input Position Detection Function

### 32.12.9.4 Register Settings

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges 11: Setting prohibited

#### (3) Channel Output Mode

The channel output mode is not used by this function.

#### (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input position detection function. Therefore, these registers should be set to 0.

Table 32.95 Simultaneous Rewrite Settings for TAUDTTINm Input Position Detection Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

#### 32.12.9.5 Operating Procedure for TAUDTTINm Input Position Detection Function

Table 32.96 Operating Procedure for TAUDTTINm Input Position Detection Function

	Operation	TAUDn Status
Restart	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm occurs.
	During Operation	TAUDnCNTm starts to count up from 0000 <sub>H</sub> . When a valid TAUDTTINm edge is detected: <ul style="list-style-type: none"> <li>• TAUDnCNTm transfers (captures) its own value to TAUDnCDRm.</li> <li>• Outputs INTTAUDnIm.</li> <li>• The counter is not cleared to 0000<sub>H</sub> and TAUDnCNTm continues counting.</li> </ul> Afterwards, this procedure is repeated. When TAUDnCNTm reaches FFFF <sub>H</sub> , the counter restarts from 0000 <sub>H</sub> .
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

### 32.12.9.6 Specific Timing Diagrams

#### (1) Operation Stop and Restart

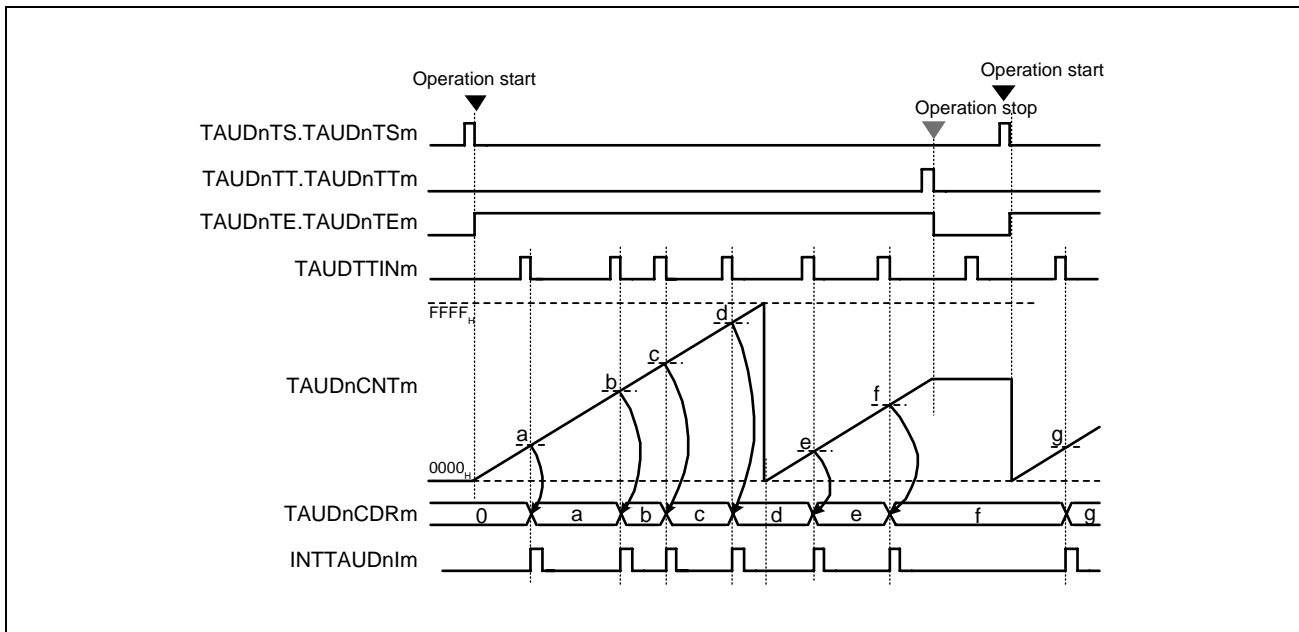

Figure 32.66 Operation Stop and Restart  
(TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00B)

- The counter can stop operating by setting TAUDnTT.TAUDnTTM to 1. This sets TAUDnTE.TAUDnTEM to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter stops operating, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSM to 1. TAUDnCNTm restarts to count from 0000H.

## 32.12.10 TAUDTTINm Input Period Count Detection Function

### 32.12.10.1 Overview

#### Summary

This function measures the cumulative width of a TAUDTTINm input signal.

#### Prerequisites

- The operating mode should be set to capture and gate count mode (see **Table 32.97, Contents of the TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function**).
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSM) to 1. This in turn sets TAUDnTE.TAUDnTEM = 1, enabling count operation. The counter awaits a valid TAUDTTINm input edge.

When a valid TAUDTTINm input start edge is detected, the counter starts to count from 0000<sub>H</sub>.

When a valid TAUDTTINm input stop edge is detected, the current TAUDnCNTm value is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The counter stops and retains its value (TAUDnCDRm + 1) until the next valid TAUDTTINm input start edge is detected.

When the next valid TAUDTTINm input start edge is detected, the counter restarts to count from the value retained when stopped.

If the counter reaches FFFF<sub>H</sub>, the counter restarts from 0000<sub>H</sub>.

#### NOTES

1. TAUDTTINm input signal is sampled at the frequency of an operation clock set by the TAUDnCMORm.TAUDnCKS[1:0] bits.
2. As this function is to measure the TAUDTTINm input signal width, setting TAUDnTS.TAUDnTSM to 1 is disabled while TAUDnTE.TAUDnTEM = 1.

#### Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 10<sub>B</sub>, the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>, the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

### 32.12.10.2 Equations

Cumulative TAUDTTINm input width =  
count clock cycle × (TAUDnCDRm capture value + 1)

32.12.10.3 Block Diagram and General Timing Diagram

Figure 32.67 Block Diagram of TAUDTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>)

Figure 32.68 General Timing Diagram of TAUDTTINm Input Period Count Detection Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Independent operation. Set to 0.
10 to 8	TAUDnSTS[2:0]	010: Valid edge of the TAUDTTINm input signal is used as an external start trigger and the reverse edge as a stop trigger.
7, 6	TAUDnCOS[1:0]	01: Set to this value.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1101: Capture and gate count mode
0	TAUDnMD0	0: Disables the start trigger during operation.

#### (2) TAUDnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.98 Contents of the TAUDnCMURm Register for TAUDTTINm Input Period Count Detection Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

#### (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

**(4) Simultaneous Rewrite**

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input period count detection function. Therefore, these registers should be set to 0.

Table 32.99 Simultaneous Rewrite Settings for TAUDTTINm Input Period Count Detection Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

**32.12.10.5 Operating Procedure for TAUDTTINm Input Period Count Detection Function**

Table 32.100 Operating Procedure for TAUDTTINm Input Period Count Detection Function

	Operation	TAUDn Status
Restart Operation	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge.
	During Operation	When a TAUDTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUDnCNTm starts counting up from the stop value. When TAUDnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUDnCDRm and INTTAUDnIm is generated. Counting stops at the "value transferred to TAUDnCDRm + 1" and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When TAUDnCNTm reaches FFFF <sub>H</sub> , the counter restarts from 0000 <sub>H</sub> . Afterwards, this procedure is repeated.
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

### 32.12.10.6 Specific Timing Diagrams

#### (1) Operation stop and restart

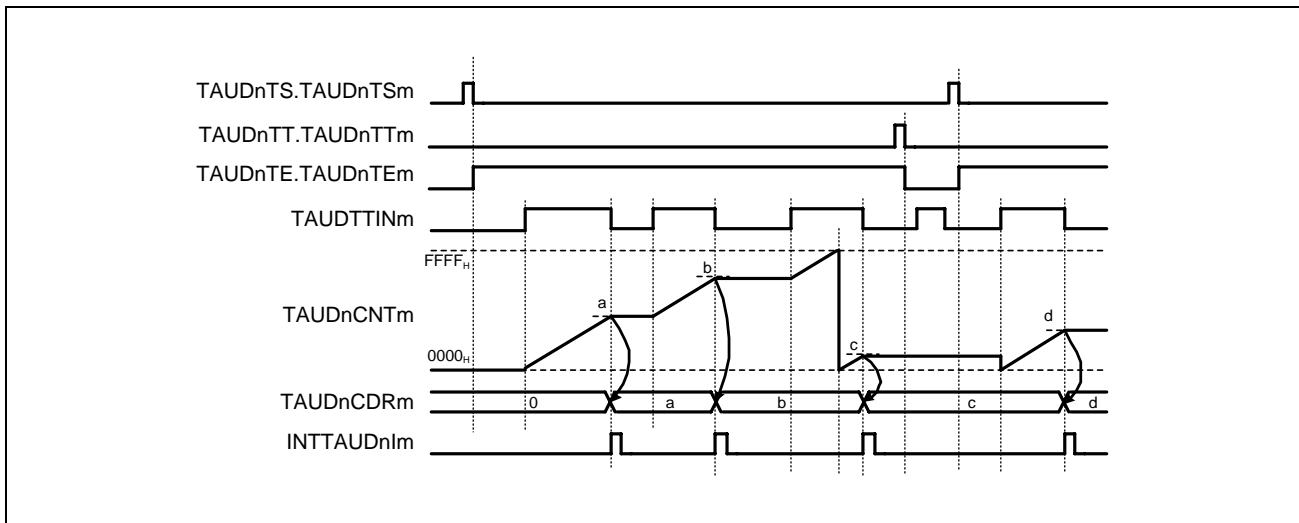

Figure 32.69 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = 11B)

- The counter can be stopped by setting TAUDnTT.TAUDnTTM to 1. This sets TAUDnTE.TAUDnTEM to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter is stopped, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSM to 1. TAUDnCNTm restarts to count from 0000H.

## 32.12.11 TAUDTTINm Input Pulse Interval Judgment Function

### 32.12.11.1 Overview

#### Summary

This function outputs the result of a comparison between the count value (TAUDnCNTm) and the value in the channel data register (TAUDnCDRm) when a TAUDTTINm input pulse occurs. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true.

#### Prerequisites

- The operating mode should be set to judge mode (see **Table 32.101, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function**).
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid edge is detected or TAUDnTS.TAUDnTSm is set to 1, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. TAUDnCNTm reloads the value of TAUDnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches 0000<sub>H</sub> before a TAUDTTINm valid edge is detected, TAUDnCNTm overflows and is set to FFFF<sub>H</sub>. It then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:

- If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when  $TAUDnCNTm \leq TAUDnCDRm$ .
- If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when  $TAUDnCNTm > TAUDnCDRm$ .

### (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

### (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval judgment function. Therefore, these registers should be set to 0.

Table 32.103 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Judgment Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.12.11.4 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

Table 32.104 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

	Operation	TAUDn Status
Restart Operation ↓	Initial Channel Setting Set TAUDnCMORm and TAUDnCMURm registers as described in <b>Table 32.101, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function</b> , and <b>Table 32.102, Contents of the TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Judgment Function</b> . Set the value of TAUDnCDRm register.	Channel operation is stopped.
	Start Operation Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCDRm value is loaded into TAUDnCNTm.
	During Operation The following register can be changed at any time: • TAUDnCDRm register	When TAUDnCMORm.TAUDnMD0 = 0 If TAUDnCNTm ≤ TAUDnCDRm when a TAUDTTINm input edge is detected, INTTAUDnIm is generated. When TAUDnCMORm.TAUDnMD0 = 1 If TAUDnCNTm > TAUDnCDRm when a TAUDTTINm input edge is detected, INTTAUDnIm is generated. If a TAUDTTINm input edge is detected, then TAUDnCNTm starts to count down from the value of TAUDnCDRm. Afterwards, this procedure is repeated.
	Stop Operation Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

## 32.12.12 TAUDTTINm Input Signal Width Judgment Function

### 32.12.12.1 Overview

#### Summary

This function compares the count value (TAUDnCNTm) for the high or low level width of a TAUDTTINm input signal and the TAUDnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUDnIm.

#### Prerequisites

- The operating mode should be set to judge and one-count mode (See **Table 32.105, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Judgment Function**).
- TAUDTTOUTm is not used with this function.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When a valid TAUDTTINm input start edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid stop edge is detected, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. The counter TAUDnCNTm retains its value until the next valid TAUDTTINm start edge is detected, regardless of the result of the comparison.

If the counter reaches 0000<sub>H</sub> before a valid TAUDTTINm stop edge is detected, TAUDnCNTm overflows and is set to FFFF<sub>H</sub>. The counter then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

#### Conditions

- The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:
  - If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when  $TAUDnCNTm \leq TAUDnCDRm$ .
  - If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when  $TAUDnCNTm > TAUDnCDRm$ .
- The TAUDnCMURm.TAUDnTIS[1:0] bits specify a type of width measurement:
  - For high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>), TAUDTTINm rising edge is used as a start edge and TAUDTTINm falling edge as a stop edge.
  - For low width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 10<sub>B</sub>), TAUDTTINm falling edge is used as a start edge and TAUDTTINm rising edge as a stop edge.
- Setting TAUDnTS.TAUDnTSm to 1 is prohibited during operation.

### 32.12.12.2 Block Diagram and General Timing Diagram

Figure 32.72 Block Diagram of TAUDTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated when  $TAUDnCNTm \leq TAUDnCDRm$  ( $TAUDnCMORm.TAUDnMD0 = 0$ ).
- TAUDTTINm valid start edge = rising edge, TAUDTTINm valid stop edge = falling edge ( $TAUDnCMURm.TAUDnTIS[1:0] = 11_B$ )

	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

### 32.12.13 Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

#### 32.12.13.1 Overview

##### Summary

This function measures the width of an individual TAUDTTINm input signal. An interrupt is generated if the TAUDTTINm input width is longer than  $FFFF_H + 1$ .

##### Prerequisites

- The operation mode must be set to One-Count Mode (see **Table 32.109, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**).
- TAUDTTOUTm is not used for this function.
- The value of TAUDnCDRm must be set to  $FFFF_H$ .

##### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSM) to 1. This in turn sets TAUDnTE.TAUDnTEM = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected.  $FFFF_H$  is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUDTTINm input start edge is detected, TAUDnCNTm loads  $FFFF_H$  and starts to count down.

If the counter reaches  $0000_H$  before a stop edge is detected, an interrupt is generated.

##### Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] =  $10_B$ , the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] =  $11_B$ , the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

##### NOTE

The counter cannot be restarted during operation.

32.12.13.2 Block Diagram and General Timing Diagram

Figure 32.74 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>)

Table 32.112 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

	Operation	TAUDn Status
Restart Operation ↓	Initial Channel Setting Set TAUDnCMORm and TAUDnCMURm registers as described in <b>Table 32.109, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)</b> , and <b>Table 32.110, Contents of the TAUDnCMURm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)</b> .  Set the value of TAUDnCDRm register to FFFF <sub>H</sub> .	Channel operation is stopped.
	Start Operation Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.  Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the start edge.  When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value (FFFF <sub>H</sub> ).
	During Operation The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : INTTAUDnIm is generated. When TAUDTTINm input stop edge is detected during count operation: <ul style="list-style-type: none"> <li>TAUDnCNTm stops and retains its current value.</li> </ul> When TAUDTTINm input start edge is detected while the counter is stopped: <ul style="list-style-type: none"> <li>TAUDnCNTm loads the TAUDnCDRm value (FFFF<sub>H</sub>) again, and continues to count down.</li> </ul> Afterwards, this procedure is repeated.
	Stop Operation Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

## 32.12.14 Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

### 32.12.14.1 Overview

#### Summary

This function measures the cumulative width of a TAUDTTINm input signal. If the cumulative TAUDTTINm input width is longer than FFFF<sub>H</sub>, an interrupt is generated and an overflow interrupt can be output.

#### Prerequisites

- The operation mode must be set to Gate Count Mode (see **Table 32.113, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**).
- TAUDTTOUTm is not used with this function.
- The value of TAUDnCDRm must be set to FFFF<sub>H</sub>.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. FFFF<sub>H</sub> is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUDTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000<sub>H</sub> an interrupt is generated. FFFF<sub>H</sub> is loaded to TAUDnCNTm and the counter continues to count down until a TAUDTTINm input stop edge is detected.

#### Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 10<sub>B</sub>, the TAUDTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>, the TAUDTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

#### NOTE

The counter cannot be restarted during operation.

32.12.14.2 Block Diagram and General Timing Diagram

Figure 32.76 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11B)

Figure 32.77 General Timing Diagram for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

#### 32.12.14.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

Table 32.116 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

	Operation	TAUDn Status
Restart Operation ↓	Initial Channel Setting Set TAUDnCMORm and TAUDnCMURm registers as described in <b>Table 32.113, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)</b> , and <b>Table 32.114, Contents of the TAUDnCMURm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)</b> .  Set the value of TAUDnCDRm register to FFFF <sub>H</sub> .	Channel operation is stopped.
	Start Operation Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.  Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the start edge.  When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value (FFFF <sub>H</sub> ).
	During Operation The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm is generated.</li> <li>• TAUDnCNTm loads the TAUDnCDRm value (FFFF<sub>H</sub>) and continues to count down.</li> </ul> When TAUDTTINm input stop edge is detected during count operation: <ul style="list-style-type: none"> <li>• TAUDnCNTm stops and retains the current value.</li> </ul> When TAUDTTINm input start edge is detected while the counter is stopped: <ul style="list-style-type: none"> <li>• TAUDnCNTm counts down from the stop value.</li> </ul> Afterwards, this procedure is repeated.
	Stop Operation Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

## 32.12.15 One-Phase PWM Output Function

### 32.12.15.1 Overview

#### Summary

This function adds dead time to a TAUDTTINm input signal. The resulting PWM signal is output via TAUDTTOUTm of the channel and TAUDTTOUTm of upper channels.

#### Prerequisites

- Each of two (or more) channels is enabled for dead time control (TAUDnTDE.TAUDnTDEm = 1).
- The operating mode for the lower channel should be set to one-count mode (see **Table 32.118, Contents of the TAUDnCMORm Register for the Lower Channel of the One-Phase PWM Output Function**).
- Any operating mode can be set to upper channels.
- Channel output mode for upper and lower channels should be set to synchronous channel output mode 2 with one-phase PWM output. See **Section 32.7, Channel Output Modes**.

#### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSM) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches 0000<sub>H</sub>, an interrupt occurs. The counter is reset to FFFF<sub>H</sub> and waits for the next valid TAUDTTINm input start edge.

Table 32.117 TAUDTTOUTm to which Dead Time is Added and State of TAUDTTINm

TAUDnCMURm. TAUDnTIS[1:0]	TAUDnTOL. TAUDnTOLm	TAUDTTOUTm to which Dead Time is Added	TAUDnTDL. TAUDnTDLm	TAUDTTINm State when Added
10	0	TAUDTTOUTm low	0	High
			1	Low
	1	TAUDTTOUTm high	0	High
			1	Low
11	0	TAUDTTOUTm low	0	Low
			1	High
	1	TAUDTTOUTm high	0	Low
			1	High

### Conditions

- TAUDnCMURm.TAUDnTIS[1:0] bits specify the type of width measurement:
  - TAUDnCMURm.TAUDnTIS[1:0] = 10<sub>B</sub>: Uses both edges as valid edges for detection (Low width measurement).
  - TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>: Uses both edges as valid edges for detection (High width measurement).
- The TAUDnTDL.TAUDnTDLm bit specifies the operation of TAUDTTOUTm for each channel when an interrupt or valid TAUDTTINm edge is detected on the lower channel:
  - If TAUDnTDL.TAUDnTDLm = 0, an interrupt is used as a TAUDTTOUTm set trigger and a valid TAUDTTINm edge as a TAUDTTOUTm reset trigger.
  - If TAUDnTDL.TAUDnTDLm = 1, a valid TAUDTTINm edge is used as a TAUDTTOUTm set trigger and an interrupt as a TAUDTTOUTm reset trigger.
- This function cannot make a forced restart.

### 32.12.15.2 Block Diagram and General Timing Diagram

Figure 32.78 Block Diagram of One-Phase PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11<sub>B</sub>)

This setting considers a duty as an active high.

Figure 32.79 General Timing Diagram of One-Phase PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

### (3) Channel Output Mode for Lower Channels

Table 32.120 Control Bit Settings in Synchronous Channel Output Mode 2 with One-Phase PWM Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	1: Adds dead time upon detection of a TAUDTTINm input edge on a lower odd channel.
TAUDnTDL.TAUDnTDLm	0: Adds dead time of the positive-phase width 1: Adds dead time of the negative-phase width
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

#### CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from upper channels.

### (4) Simultaneous Rewrite for Lower Channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the one-phase PWM output function. Therefore, these registers should be set to 0.

Table 32.121 Simultaneous Rewrite Settings for One-Phase PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.12.15.4 Register Settings for Upper Channels

#### (1) TAUDnCMORm for Upper Channels

TAUDnCMORm register for upper channels can be set arbitrarily.

#### (2) TAUDnCMURm for Upper Channels

TAUDnCMURm register for upper channels can be set arbitrarily.

#### (3) Channel Output Mode for Upper Channels

Table 32.122 Control Bit Settings for Upper Channels in Synchronous Channel Output Mode 2 with One-Phase PWM Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	1: Adds dead time upon detection of a TAUDTTINm input edge on a lower odd channel.
TAUDnTDL.TAUDnTDLm	0: Adds dead time of the positive-phase width 1: Adds dead time of the negative-phase width
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

#### CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from lower channels.

#### (4) Simultaneous Rewrite for Upper Channels

Simultaneous rewrite register for upper channels can be set arbitrarily.

### 32.12.15.5 Operating Procedure for One-phase PWM Output Function

Table 32.123 Operating Procedure for One-phase PWM Output Function

	Operation	TAUDn Status
Restart Operation	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm is set to 1 (slave channel 2) and TAUDnCNTm waits for detection of TAUDTTINm start edge.  TAUDnCNTm loads TAUDnCDRm value.
	During Operation	TAUDnCNTm of slave channel 2 counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm is generated.</li> <li>• TAUDnCNTm stops counting.</li> </ul> TAUDTTOUTm is changed by a TAUDTTINm edge detection signal and slave channel 2 INTTAUDnIm signal to output one-phase PWM waveform with dead time. Afterwards, this operation is repeated.
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm and TAUDTTOUTm retain their current values.

## 32.13 Independent Channel Real-Time Functions

This section describes functions that output the value of the TAUDnTRO.TAUDnTROM bit in real time.

### 32.13.1 Real-Time Output Function Type 1

#### 32.13.1.1 Overview

##### Summary

This function outputs a value of the TAUDnTRO.TAUDnTROM bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated at certain specified intervals.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

##### Prerequisites

- Channels should use the TAUDTTOUTm control of other channels.
- The operating mode for the upper channel should be set to interval timer mode (see **Table 32.124, Contents of the TAUDnCMORM Register for the Upper Channel of Real-Time Output Function Type 1**).
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. See **Section 32.7, Channel Output Modes**.
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREM = 1).

##### Functional description

The counter of the upper channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSM) to 1. This in turn sets TAUDnTE.TAUDnTEM to 1, enabling count operation. The current value of the data register of the upper channel (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.

When the counter of the upper channel reaches 0000H, INTTAUDnIm is generated and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROM) of every channel (only channels with TAUDnTRE.TAUDnTREM = 1). TAUDnCNTm then reloads the TAUDnCDRm value to continue operation subsequently.

The TAUDTTOUTm signal changes only when an interrupt is generated, and when its value is different from the current value of TAUDnTRO.TAUDnTROM at the moment that the interrupt is generated.

##### Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREM = 0) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel's TAUDnTRO.TAUDnTROM bit is output when INTTAUDnIm is generated in that channel.

- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREM = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not output. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.**

### 32.13.1.2 Equations

INTTAUDnIm generation cycle = count clock cycle × (TAUDnCDRm value + 1)

#### (2) TAUDnCMURm for Lower Channels

The TAUDnCMURm register for lower channels can be set arbitrarily.

#### (3) Channel Output Mode for Lower Channels

Table 32.128 Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTDL.TAUDnTDLm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTRE.TAUDnTREm	1: Enables real-time output
TAUDnTRO.TAUDnTROm	0: Real-time output is low 1: Real-time output is high
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m
TAUDnTME.TAUDnTMEm	0: Disables modulation

#### (4) Simultaneous Rewrite for Lower Channels

Simultaneous rewrite registers for lower channels can be set arbitrarily.

### 32.13.1.6 Operating Procedure for Real-Time Output Function Type 1

Table 32.129 Operating Procedure for Real-Time Output Function Type 1

	Operation	TAUDn Status	
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in <b>Table 32.124, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 1</b> , and <b>Table 32.125, Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 1</b> .	Channel operation is stopped.	
	Set TAUDnCMORm and TAUDnCMURm registers for lower channels as described in <b>Section 32.13.1.5, Register Settings for Lower Channels</b> .		
	Set the value of TAUDnCDRm register (only channels with TAUDnTRC.TAUDnTRCm = 1)		
	Set channel output mode by setting the control bits as described in <b>Table 32.126, Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output</b> .		
Restart Operation	Set channel output mode by setting the control bits as described in <b>Table 32.128, Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output</b> .		
	Start Operation	Set TAUDnTS.TAUDnTSm = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	[Channel with TAUDnTRC.TAUDnTRCm set to 1] TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm is generated.
	During Operation	TAUDnCDRm and TAUDnTRO.TAUDnTROM can be changed at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues.</li> <li>INTTAUDnIm is generated.</li> <li>TAUDTTOUTm outputs the current value of the real-time output bit TAUDnTRO.TAUDnTROM.</li> </ul> Afterwards, this procedure is repeated.
	Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. Both TAUDnCNTm and TAUDTTOUTm retain their current values.

32.13.1.7 Specific Timing Diagrams

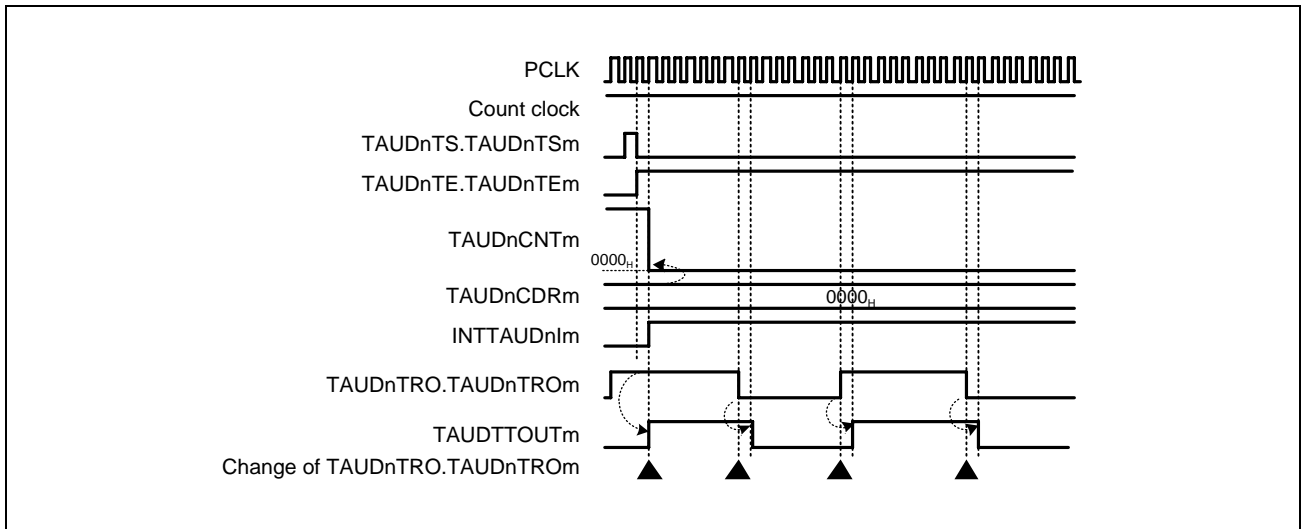

Figure 32.82 TAUDnCDRm = 0000H, TAUDnCMORM.TAUDnMD0 = 1

- The value of TAUDTTOUTm changes according to the setting of TAUDnTRO.TAUDnTROM with a delay of one PCLK cycle.

## 32.13.2 Real-Time Output Function Type 2

### 32.13.2.1 Overview

#### Summary

This function outputs the value of TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated when a valid TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

#### Prerequisites

- Channels should use the TAUDTTOUTm control of the other channels.
- The operating mode for the upper channel should be set to capture mode (see **Table 32.130, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 2**).
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. See **Section 32.7, Channel Output Modes**.
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

#### Functional description

The counter for upper channels is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The counter starts to count up.

When a valid TAUDTTINm input edge is generated on one of upper channels, an interrupt occurs and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1).

The TAUDTTOUTm signal changes only when an interrupt is generated, and when TAUDTTOUTm value is different from the current value of TAUDnTRO.TAUDnTROm during the occurrence of the interrupt.

#### Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm = 0) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.
- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not output. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

32.13.2.2 Block Diagram and General Timing Diagram

Figure 32.83 Block Diagram of Real-Time Output Function Type 2

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)

#### (1) TAUDnCMORm for Lower Channels

The TAUDnCMORm register for lower channels can be set arbitrarily.

#### (2) TAUDnCMURm for Lower Channels

The TAUDnCMURm register for lower channels can be set arbitrarily.

#### (3) Channel Output Mode for Lower Channels

Table 32.134 Control Bit Settings for Lower Channels in Independent Channel Output Mode 1 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low 1: Real-time output is high
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m
TAUDnTME.TAUDnTMEm	0: Disables modulation

#### (4) Simultaneous Rewrite for Lower Channels

Simultaneous rewrite registers for lower channels can be set arbitrarily.

### 32.13.2.5 Operating Procedure for Real-Time Output Function Type 2

Table 32.135 Operating Procedure for Real-Time Output Function Type 2

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in <b>Table 32.130, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 2</b> , and <b>Table 32.131, Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 2</b> .	Channel operation is stopped.
	Set TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in <b>Section 32.13.2.4, Register Settings for Lower Channels</b> .	
	The TAUDnCDRm register functions as a capture register (only channels with TAUDnTRC.TAU nTRCm = 1).	
	Set channel output mode by setting the control bits as described in <b>Table 32.132, Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output</b> .	
	Set channel output mode by setting the control bits as described in <b>Table 32.134, Control Bit Settings for Lower Channels in Independent Channel Output Mode 1 with Real-Time Output</b> .	
Start Operation	Set TAUDnTS.TAUDnTSM = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1. TAUDnTS.TAUDnTSM is a trigger bit, which is automatically cleared to 0.	[Channel with TAUDnTRC.TAUDnTRCm set to 1] TAUDnTE.TAUDnTEM is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000 <sub>H</sub> . If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm is generated.
	TAUDnTRO.TAUDnTROM can be changed at any time.	TAUDnCNTm starts to count up from 0000 <sub>H</sub> . When a valid TAUDTTINm input edge is detected: <ul style="list-style-type: none"> <li>• TAUDnCNTm captures the TAUDnCDRm value, and the counter is cleared to 0000<sub>H</sub>.</li> <li>• INTTAUDnIm is generated.</li> <li>• When the TAUDTTINm input valid edge is detected immediately after the generation of an overflow, the TAUDnCSRm.TAUDnOVF bit is set to 1. When detected before the generation of an overflow, the TAUDnCSRm.TAUDnOVF bit is cleared to 0.</li> </ul> TAUDTTOUTm outputs the current value of real-time output bit TAUDnTRO.TAUDnTROM. Afterwards, this procedure is repeated.
During Operation		
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEM is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm, TAUDnCSRm.TAUDnOVF, and TAUDTTOUTm retain their current values.

Restart Operation

### 32.13.2.6 Specific Timing Diagrams

#### (1) Operation Start and Stop

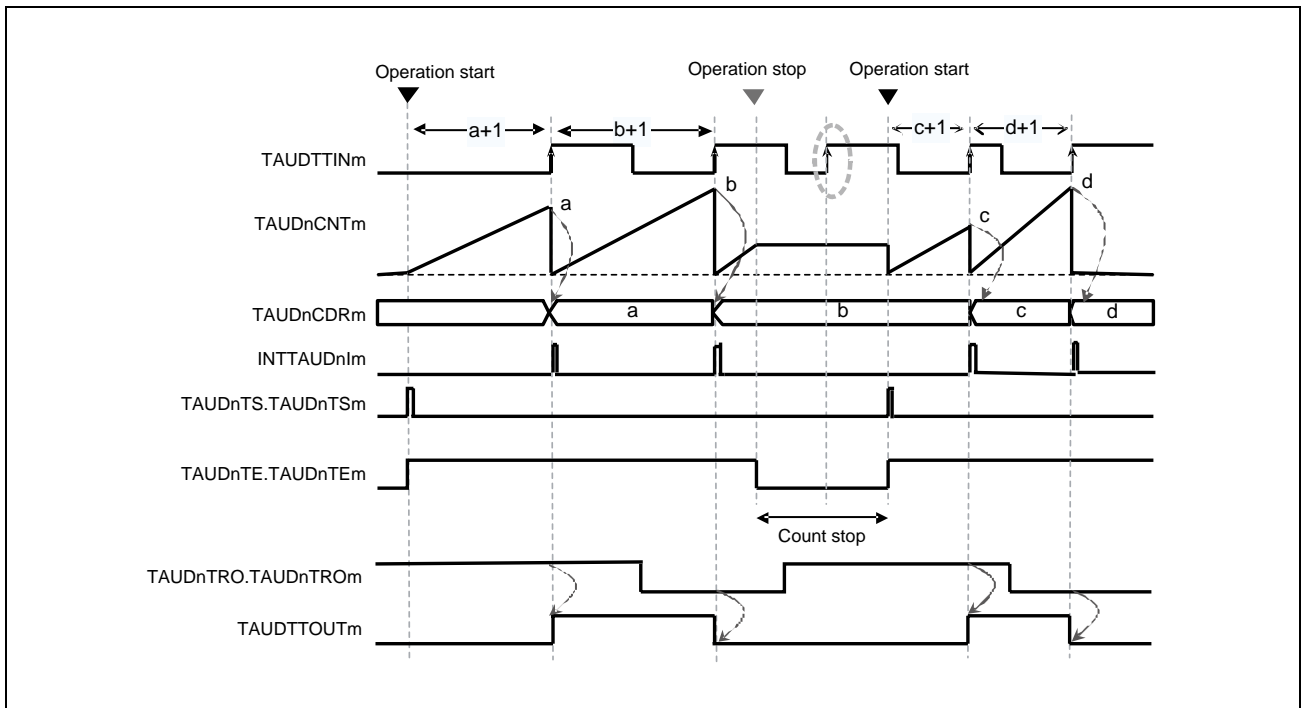

Figure 32.85 Operation Start and Stop (TAUDnCMORm.TAUDnMD0 = 0)

- When TAUDnTS.TAUDnTSm is set to 1, the counter starts counting up.
- When a valid input edge is detected, the current value of the counter is written to the data register (TAUDnCDRm) and an interrupt is generated.
- TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) and the counter resets and starts to count up again.
- The TAUDTTOUTm signal only changes when an interrupt is generated, and then only when its value is different from the current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.
- If the counter is stopped (TAUDnTE.TAUDnTEm = 0), valid input edges are ignored and no interrupt is generated.

## 32.14 Independent Channel Simultaneous Rewrite Functions

This section describes functions that carry out simultaneous rewrite.

### 32.14.1 Simultaneous Rewrite Trigger Generation Function Type 1

#### 32.14.1.1 Overview

##### Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals.

The upper channel is a channel which generates a simultaneous rewrite trigger ( $TAUDnRDC.TAUDnRDCm = 1$ ), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger ( $TAUDnRDC.TAUDnRDCm = 0$ ).

##### Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite ( $TAUDnRDE.TAUDnRDEm = 1$ ).
- The operating mode for the upper channel should be set to interval timer mode (see **Table 32.136, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**).
- For the operating mode that can be set for lower channels, see **Table 32.53, Channel Functions and the Methods They Use for Simultaneous Rewrite**.
- $TAUDTTOUTm$  is not used for any channel in this function.

##### Functional description

The counter operation is enabled by setting the channel trigger bits ( $TAUDnTS.TAUDnTSm$ ) for upper and lower channels to 1. This sets  $TAUDnTE.TAUDnTEm = 1$ , enabling count operation. The current value of the data register buffer for upper channels ( $TAUDnCDRm$  buf) is loaded into the counter ( $TAUDnCNTm$ ) and the counter starts to count down from this value. The counter for lower channels start to count according to the selected operating mode.

Once the counter reaches  $0000H$ , an interrupt occurs on the channel. The current value of the corresponding  $TAUDnCDRm$  buffer is loaded into  $TAUDnCNTm$  to continue operation subsequently.

If the channel where an interrupt occurs is specified as a trigger channel for simultaneous rewrite ( $TAUDnRDC.TAUDnRDCm = 1$ ) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible ( $TAUDnRSF.TAUDnRSFm = 1$ ).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

##### Conditions

- The channel which is monitored for  $INTTAUDnIm$  occurrence is specified by setting  $TAUDnRDC.TAUDnRDCm = 1$  for the corresponding channel. The  $TAUDnRDC.TAUDnRDCm$  bit should be set to 0 for all other channels in which simultaneous rewrite should take place.

- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.**

### 32.14.1.2 Equations

Simultaneous rewrite trigger generation cycle = count clock cycle  $\times$  (TAUDnCDRm + 1)

To control simultaneous rewrite, the following condition should be satisfied:

[PWM]

$$\text{TAUDnCDRm} = [(\text{value of TAUDnCDRm of master channel subject to simultaneous rewrite} + 1) \times \text{number of interrupts}] - 1$$

[Triangle PWM]

$$\text{TAUDnCDRm} = [(\text{value of TAUDnCDRm of master channel subject to simultaneous rewrite} + 1) \times 2 \times \text{number of interrupts}] - 1$$

That is, the ratio of TAUDnCDRm + 1 and value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

For triangle PWM, remember that the cycle doubles.

32.14.1.3 Block Diagram and General Timing Diagram

Figure 32.86 Block Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

Figure 32.87 General Timing Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

### 32.14.1.4 Register Settings for Upper Channels

#### (1) TAUDnCMORm for Upper Channels

Table 32.137 Contents of the TAUDnCMURm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

#### (3) Channel Output Mode for Upper Channels

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function. However, this mode can be used in independent channel output mode controlled by software.

#### (4) Simultaneous Rewrite for Upper Channels

Table 32.138 Simultaneous Rewrite Settings for Upper Channels in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts counting.
TAUDnRDC.TAUDnRDCm	1: Monitors INTTAUDnIm signal which triggers a simultaneous rewrite on the channel.

### 32.14.1.5 Register Settings for Lower Channels

#### (1) TAUDnCMORm for Lower Channels

TAUDnCMORm register for lower channels must follow the TAUDnCMORm register settings in the operating mode which can be set. (See **Table 32.53, Channel Functions and the Methods They Use for Simultaneous Rewrite.**)

#### (2) TAUDnCMURm for Lower Channels

TAUDnCMURm register for lower channels must follow the TAUDnCMURm register settings in the operating mode which can be set. (See **Table 32.53, Channel Functions and the Methods They Use for Simultaneous Rewrite.**)

#### (3) Channel Output Mode for Lower Channels

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 32.52, Simultaneous Rewrite Methods and when They are Triggered.**

#### (4) Simultaneous Rewrite for Lower Channels

Table 32.139 Simultaneous Rewrite Settings for Lower Channels in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts counting.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.14.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 32.140 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

	Operation	TAUDn Status
Restart Operation ↑	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCDRm value is loaded into TAUDnCNTm. If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated.
	During Operation	TAUDnCNTm counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues.</li> <li>INTTAUDnIm is generated.</li> </ul> If INTTAUDnIm is generated on the channel where TAUDnRDC.TAUDnRDCm is set to 1, simultaneous rewrite is controlled. Afterwards, this procedure is repeated.
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

## 32.14.2 Simultaneous Rewrite Trigger Generation Function Type 2

### 32.14.2.1 Overview

#### Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. In this function, the interrupt is generated when a valid TAUDTTIN<sub>m</sub> input edge is detected or the function starts.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDC<sub>m</sub> = 1), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDC<sub>m</sub> = 0).

#### Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.TAUDnRDE<sub>m</sub> = 1).
- The operation mode of the upper channel must be set to Capture Mode (see **Table 32.141, Contents of the TAUDnCMOR<sub>m</sub> Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 2**).
- For the operation mode that can be set for a lower channel, see **Table 32.53, Channel Functions and the Methods They Use for Simultaneous Rewrite**.

#### Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTS<sub>m</sub>) for upper and lower channels to 1. This sets TAUDnTE.TAUDnTE<sub>m</sub> = 1, enabling count operation. The counter for the upper channel starts to count up, and then the counter for lower channels start to count according to the selected operating mode.

When a TAUDTTIN<sub>m</sub> input edge occurs on the upper channel, an interrupt is generated. The trigger is detected by the lower channel(s), which then also generate an interrupt.

When TAUDnRDC.TAUDnRDC<sub>m</sub> = 1 on the upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.TAUDnRSF<sub>m</sub> = 1).

The values of the data registers are copied to the corresponding data register buffers.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

#### Conditions

- The channel which is monitored for INTTAUDnIm is specified by setting TAUDnRDC.TAUDnRDC<sub>m</sub> = 1 for the corresponding channel. The TAUDnRDC.TAUDnRDC<sub>m</sub> bit must be 0 for all other channels in which simultaneous rewrite should take place.
- If the TAUDnCMOR<sub>m</sub>.TAUDnMD0 bit is set to 1, an interrupt is generated when the function starts. For details see **Section 32.9, TAUDTTOUT<sub>m</sub> Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

32.14.2.2 Block Diagram and General Timing Diagram

Figure 32.88 Block Diagram for Simultaneous Rewrite Trigger Generation Function Type 2

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)
- Upper channel (CH1) generates simultaneous rewrite trigger.

Figure 32.89 General Timing Diagram for Simultaneous Rewrite Trigger Generation Function Type 2

### 32.14.2.3 Register Settings for Upper Channels

#### (1) TAUDnCMORm for Upper Channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.14.2.5 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 2

Table 32.147 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 2

	Operation	TAUDn Status
Restart Operation ↑	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000 <sub>H</sub> . INTTAUDnIm is generated when TAUDnCMORm.TAUDnMD0 is set to 1.
	During Operation	TAUDnCNTm counts up from 0000 <sub>H</sub> . When a TAUDTTINm valid edge is detected: <ul style="list-style-type: none"> <li>• TAUDnCNTm transfers (captures) its value to TAUDnCDRm and returns to 0000<sub>H</sub>.</li> <li>• INTTAUDnIm is generated.</li> </ul> Simultaneous rewrite is controlled when INTTAUDnIm is generated from the channel where TAUDnRDC.TAUDnRDCm is set to 1. Afterwards, this procedure is repeated.
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and it retains its current value.

## 32.15 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the timer array unit D. For a general overview of synchronous channel operation, see **Section 32.2, Overview**.

This section describes functions that generate PWM signals at regular intervals.

### 32.15.1 PWM Output Function

#### 32.15.1.1 Overview

##### Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty cycle of the TAUDTTOUT<sub>m</sub> to be set. The pulse cycle is set in the master channel. The duty cycle is set in the slave channel.

##### Prerequisites

- Two channels
- The operating mode for the master channel should be set to interval timer mode (see **Table 32.148, Contents of the TAUDnCMOR<sub>m</sub> Register for the Master Channel of the PWM Output Function**).
- The operating mode for the slave channels should be set to one-count mode (see **Table 32.151, Contents of the TAUDnCMOR<sub>m</sub> Register for the Slave Channel of the PWM Output Function**).
- TAUDTTOUT<sub>m</sub> is not used with the master channel of this function.
- The channel output mode for the slave channels should be set to Synchronous Channel Output Mode 1 (see **Section 32.7, Channel Output Modes**).

##### Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSM) to 1. This sets TAUDnTE.TAUDnTEM = 1, enabling count operation. The current value of TAUDnCDR<sub>m</sub> is loaded into TAUDnCNT<sub>m</sub>, and the counter starts counting down from the TAUDnCDR<sub>m</sub> value. If an INTTAUDnIm is generated on the master channel and TAUDTTOUT<sub>m</sub> (slave) is set/reset, PWM output is made.

- Master channel:  
When the master channel counter reaches 0000<sub>H</sub> and the pulse cycle time has passed, INTTAUDnIm is generated. The counter loads TAUDnCDR<sub>m</sub> value into TAUDnCNT<sub>m</sub> and counts down.
- Slave channel:  
When INTTAUDnIm is generated on the master channel, the counter operation of the slave channel is triggered. The current value of TAUDnCDR<sub>m</sub> (slave) is loaded into TAUDnCNT<sub>m</sub> (slave) and the counter starts counting down from the TAUDnCDR<sub>m</sub> value. TAUDTTOUT<sub>m</sub> signal is set to the active level.  
When the counter reaches to 0000<sub>H</sub> (duty time has elapsed), INTTAUDnIm is generated and a TAUDTTOUT<sub>m</sub> signal is set to an inactive level. The counter is reset to FFFF<sub>H</sub> and waits for the next INTTAUDnIm (start of the next pulse cycle) of the master channel.

The counter can stop operating by setting the TAUDnTT.TAUDnTT<sub>m</sub> of master and slave channels to 1. This sets TAUDnTE.TAUDnTEM to 0. TAUDnCNT<sub>m</sub> and TAUDTTOUT<sub>m</sub> of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSM to 1.

##### Conditions

Set Simultaneous rewrite with this function. See **Section 32.6, Simultaneous Rewrite**.

### 32.15.1.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUDnCDRm (slave)/(TAUDnCDRm (master) + 1)) × 100

- Duty cycle = 0%  
TAUDnCDRm (slave) = 0000<sub>H</sub>
- Duty cycle = 100%  
TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

### 32.15.1.3 Block Diagram and General Timing Diagram

Figure 32.90 Block Diagram of PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.91 General Timing Diagram of PWM Output Function

#### NOTES

1. The interval between the start of the count and an interrupt being generated is the value of corresponding TAUDnCDRm + 1.
2. TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.15.1.4 Register Settings for the Master Channel

5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	1: INTTAUDnIm generated at the beginning of operation.

#### (2) TAUDnCMURM for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.149 Contents of the TAUDnCMURM Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for the Master Channel

The channel output mode is not used with this function.

### (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.150 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

#### NOTE

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires a channel higher than the master channel that operates with **Section 32.14.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Conduct operation settings under the following conditions:

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1  
TAUDnCDRm settings for this channel are as follows:  
= ((TAUDnCDR setting for the master channel targeted for simultaneous rewrite + 1) × interrupt count) – 1
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm = 0, TAUDnRDSm = 1

If TAUDnCDRm (slave) setting > TAUDnCDRm (master) setting + 1, the duty value (which exceeds 100%) is aggregated to be 100% output.

### 32.15.1.5 Register Settings for Slave Channels

#### (1) TAUDnCMORm for Slave Channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]			TAUDnMD0	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.151 Contents of the TAUDnCMORm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid.

#### (2) TAUDnCMURm for Slave Channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.152 Contents of the TAUDnCMURm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for Slave Channels

Table 32.153 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

### (4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.154 Simultaneous Rewrite Settings for Slave Channels of PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.15.1.6 Operating Procedure for PWM Output Function

Table 32.155 Operating Procedure for PWM Output Function

	Operation	TAUDn Status
Restart Operation ↑	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set.
	During operation	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm (master) is generated.</li> <li>• TAUDnCDRm value is loaded into TAUDnCNTm (master) to continue count operation.</li> <li>• TAUDnCDRm value is loaded into TAUDnCNTm (slave) to perform counting down.</li> <li>• TAUDTTOUTm (slave) is set to the active level.</li> </ul> If TAUDnCNTm (slave) reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm (slave) is generated.</li> <li>• TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops.</li> </ul>
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

## 32.15.1.7 Specific Timing Diagrams

## (1) Duty cycle = 0%

Figure 32.92 TAUDnCDRm (Slave) = 0000<sub>H</sub>,  
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- Every time the master channel generates an interrupt (INTTAUDnIm), 0000<sub>H</sub> is loaded into TAUDnCNTm (slave). As a result, a slave channel interrupt (INTTAUDnIm) is generated at the same time and TAUDTTOUTm remains inactive.
- TAUDnCDRm value is loaded into TAUDnCNTm (slave) to generate an interrupt.

(2) Duty cycle = 100%

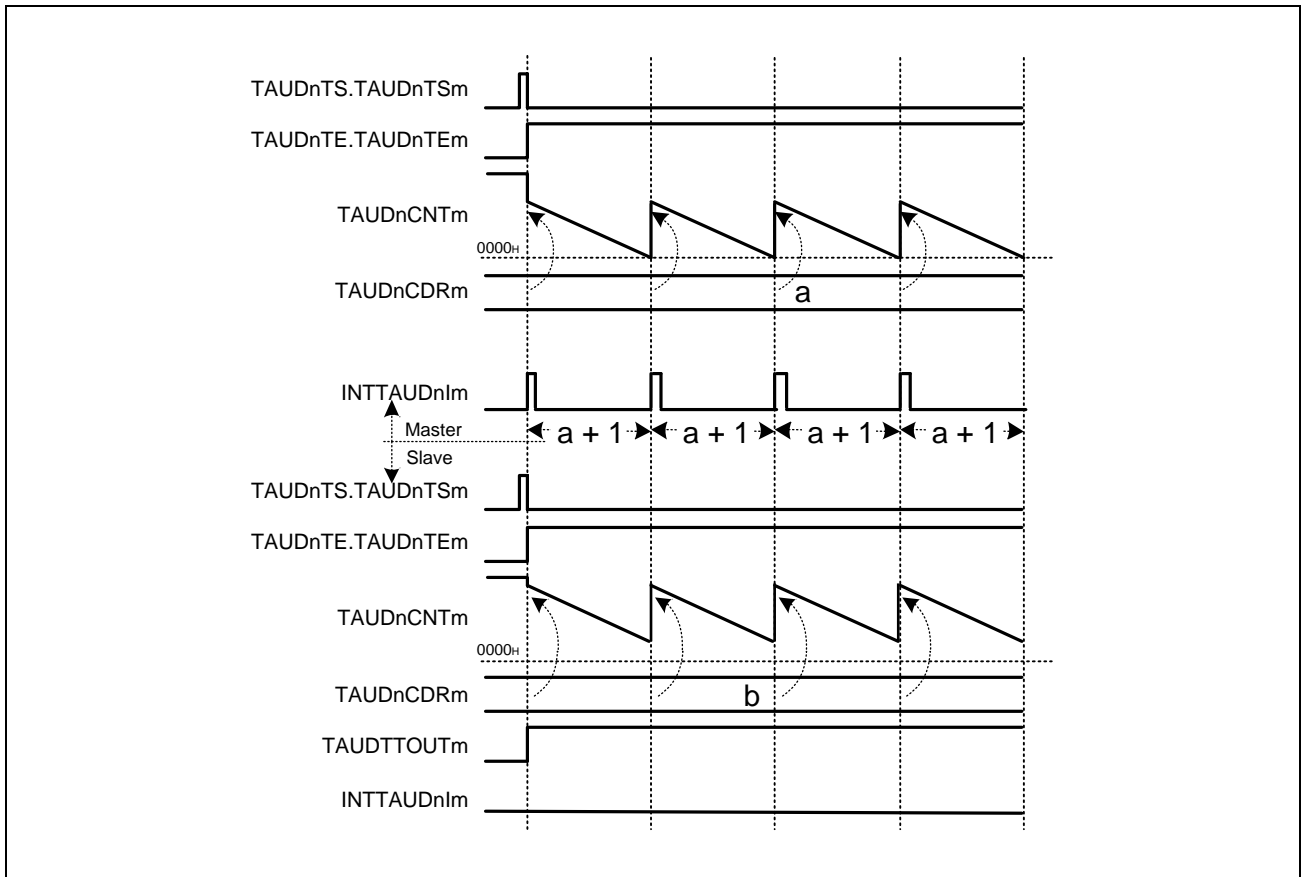

Figure 32.93 TAUDnCDRm (Slave)  $\geq$  TAUDnCDRm (Master) + 1  
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- If TAUDnCDRm (slave) value is greater than TAUDnCDRm (master) value, the slave channel counter does not reach  $0000_H$  and consequently, no interrupt occurs. TAUDTTOUTm remains active.

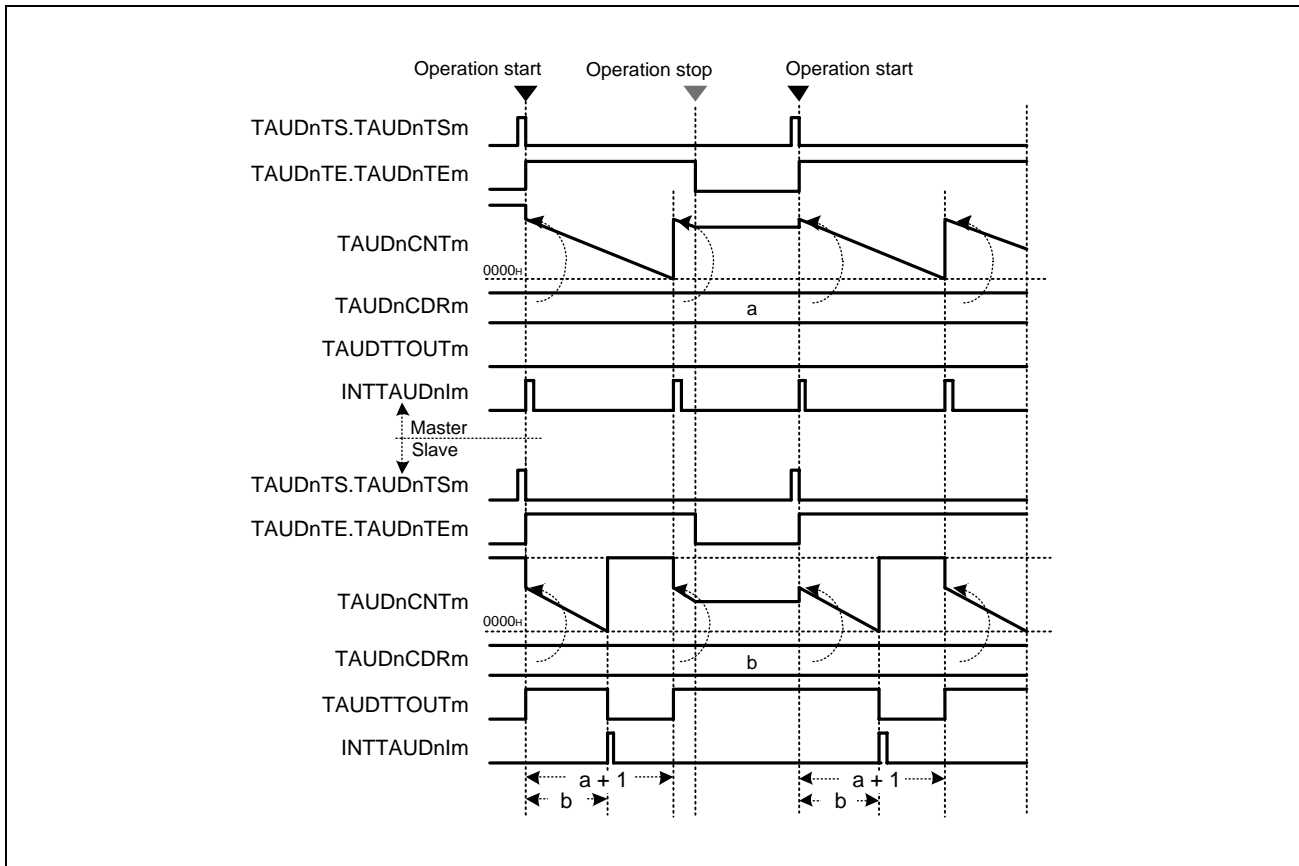

**(3) Operation Stop and Restart**

Figure 32.94 Operation Stop and Restart  
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm of master and slave channels to 1. TAUDnCDRm values of the master and slave channels are loaded to TAUDnCNTm and start to count down from these values.

## 32.15.2 One-Shot Pulse Output Function

### 32.15.2.1 Overview

#### Summary

This function outputs a signal pulse with a specific pulse width and delay time (both defined relative to an external input signal pulse) by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

#### Prerequisites

- Two channels
- The operating mode for the master channel should be set to one-count mode (see **Table 32.156, Contents of the TAUDnCMORm Register for the Master Channel of the One-Shot Pulse Output Function**).
- The operating mode for slave channels should be set to pulse one-count mode (see **Table 32.159, Contents of the TAUDnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function**).
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channel should be set to independent channel output mode 2 (see **Section 32.7, Channel Output Modes**).
- TAUDTTINm (master) has to be detected while TAUDnCNTm (master) and TAUDnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUDTTINm (slave).

#### Functional description

The counters are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSM) to 1 for the master and slave channels. This sets TAUDnTE.TAUDnTEM to 1, enabling count operation.

- Master channel:  
When the next valid TAUDTTINm input edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm. The counter starts to count down from this value. If TAUDnCMORm.TAUDnMD0 = 0, a trigger (TAUDTTINm) which is detected within the delay time is ignored.  
When the counter of master channel reaches 0000<sub>H</sub>, INTTAUDnIm is generated. The counter is reset to FFFF<sub>H</sub> and waits for the next valid TAUDTTINm input edge.
- Slave channel:  
INTTAUDnIm generated on master channel triggers the counter operation of slave channel. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave). The counter starts counting down from this value. An interrupt occurs and the TAUDTTOUTm signal is set.  
When the counter reaches 0001<sub>H</sub>, INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter stops at 0000<sub>H</sub> and waits for the next INTTAUDnIm of master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEM to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSM to 1.

Setting TAUDnTS.TAUDnTSM to 1 while counting allows the counter to restart counting of master channel without making a stop (forced restart).

### Conditions

- If TAUDnCMORn.TAUDnMD0 of master channel is set to 0, TAUDTTINm input edges detected during counting are ignored.
- Simultaneous rewrite can be used with this function. See **Section 32.6, Simultaneous Rewrite**.

### 32.15.2.2 Equations

Delay from trigger input to pulse output

$$= (\text{TAUDnCDRm (master)} + 1) \times \text{count clock cycle}$$

Pulse width = (TAUDnCDRm (slave)) × count clock cycle

### 32.15.2.3 Block Diagram and General Timing Diagram

Figure 32.95 Block Diagram of One-Shot Pulse Output Function

The following settings apply to the general timing diagram.

- Start trigger detection is disabled during counting (TAUDnCMORm.TAUDnMD0 = 0).
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

Figure 32.96 General Timing Diagram of One-Shot Pulse Output Function

### 32.15.2.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.156 Contents of the TAUDnCMORm Register for the Master Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	001: Valid TAUDTTINm input edge signal is used as the start trigger
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	0: Disables detection of start trigger during count operation. 1: Enables detection of start trigger during count operation. The value of the MD0 bits of the master and slave channels must be identical.

#### (2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R/W	R	R	R	R	R	R/W	R/W

Table 32.157 Contents of the TAUDnCMURm Register for the Master Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges 11: Setting prohibited

**(3) Channel Output Mode for the Master Channel**

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

**(4) Simultaneous Rewrite for the Master Channel**

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.158 Simultaneous Rewrite Settings for the Master Channel of One-Shot Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.15.2.5 Register Settings for Slave Channels

#### (1) TAUDnCMORm for Slave Channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.159 Contents of the TAUDnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1010: Pulse one-count mode
0	TAUDnMD0	0: Disables detection of start trigger during count operation. 1: Enables start trigger detection while counting. The MD0 bits of the master and slave channels must be identical.

#### (2) TAUDnCMURm for Slave Channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R/W	R	R	R	R	R	R/W	R/W

Table 32.160 Contents of the TAUDnCMURm Register for the Slave Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for the Slave Channel

Table 32.161 Control Bit Settings in Independent Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTDL.TAUDnTDLm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

### (4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.162 Simultaneous Rewrite Settings for Slave Channels of One-Shot Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDsm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.15.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 32.163 Operating Procedure for One-Shot Pulse Output Function

	Operation	TAUDn Status
 Restart Operation	<b>Initial Channel Setting</b> Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.15.2.4, Register Settings for the Master Channel</b> . Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and channel output mode as described in <b>Section 32.15.2.5, Register Settings for Slave Channels</b> . Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
	<b>Start Operation</b> Set TAUDnTS.TAUDnTSM of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSM is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEM (master and slave channels) is set to 1 and the master channel awaits a TAUDTTINm input.
	<b>During Operation</b> TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	When valid TAUDTTINm input edge is detected, TAUDnCDRm value of master channel is loaded into TAUDnCNTm to perform counting down. When the counter reaches 0000H: <ul style="list-style-type: none"> <li>• INTTAUDnIm (master) is generated.</li> <li>• TAUDnCNTm (master) is reset to FFFFH and waits for the next valid TAUDTTINm input edge.</li> <li>• TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to perform counting down.</li> <li>• INTTAUDnIm (slave) is generated.</li> <li>• TAUDTTOUTm (slave) is set to the active level.</li> </ul> When TAUDnCNTm (slave) reaches 0001H: <ul style="list-style-type: none"> <li>• INTTAUDnIm (slave) is generated.</li> <li>• TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops.</li> </ul>
	<b>Stop Operation</b> Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEM is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

### 32.15.2.7 Specific Timing Diagrams

#### (1) TAUDnCDRm (master) = 0000H

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

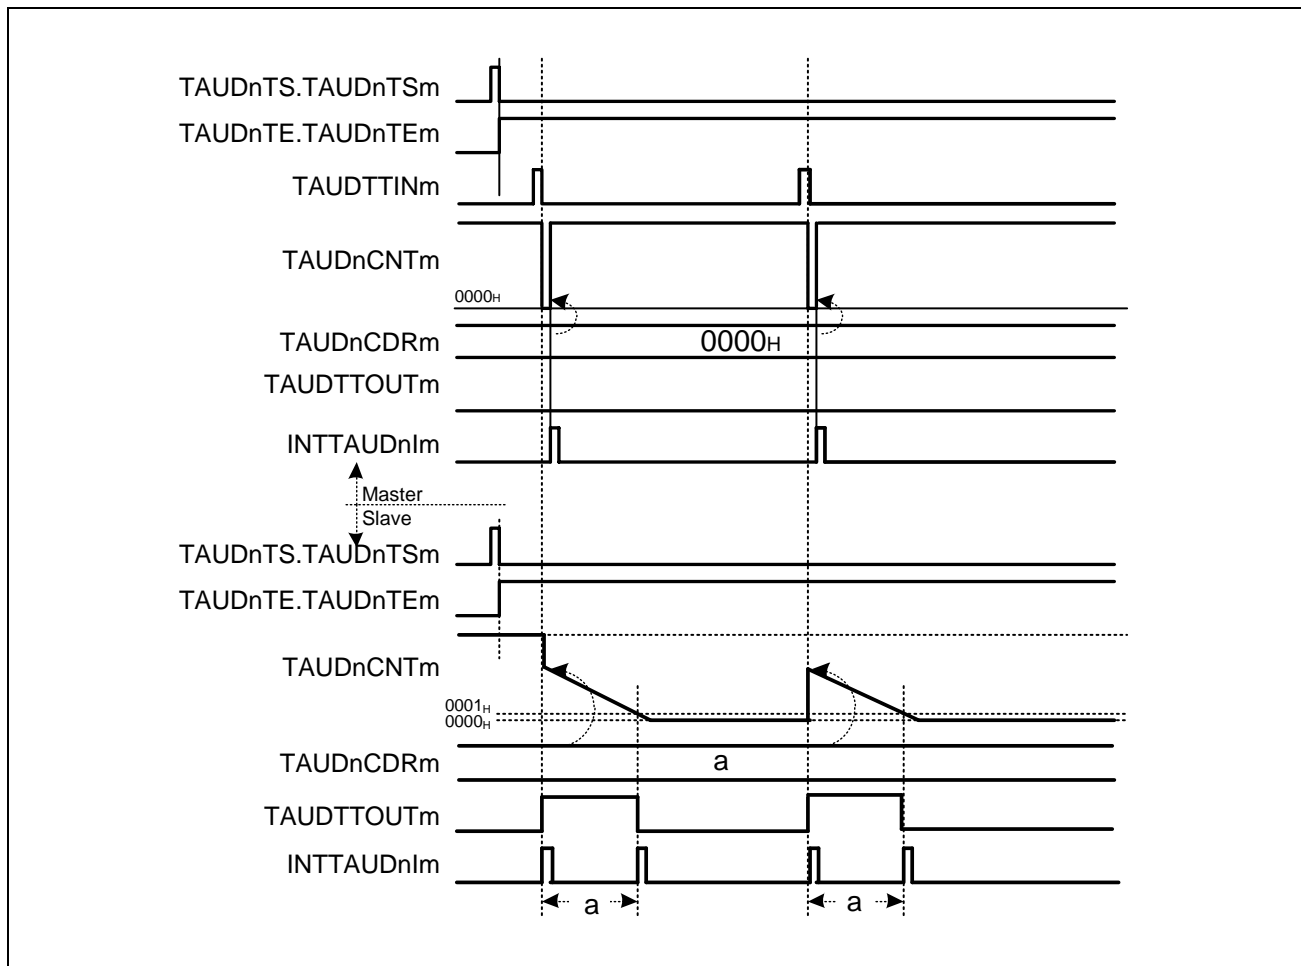

Figure 32.97 TAUDnCDRm (Master) = 0000H

- When a valid TAUDTTINm input edge is detected, the value 0000<sub>H</sub> is written to TAUDnCNTm (master). The counter is set to 0000<sub>H</sub> for one count and returns to FFFF<sub>H</sub>. Thus the slave channel starts to count down one count clock later than TAUDTTINm (master).

**(2) TAUDnCDRm (slave) = 0000H**

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

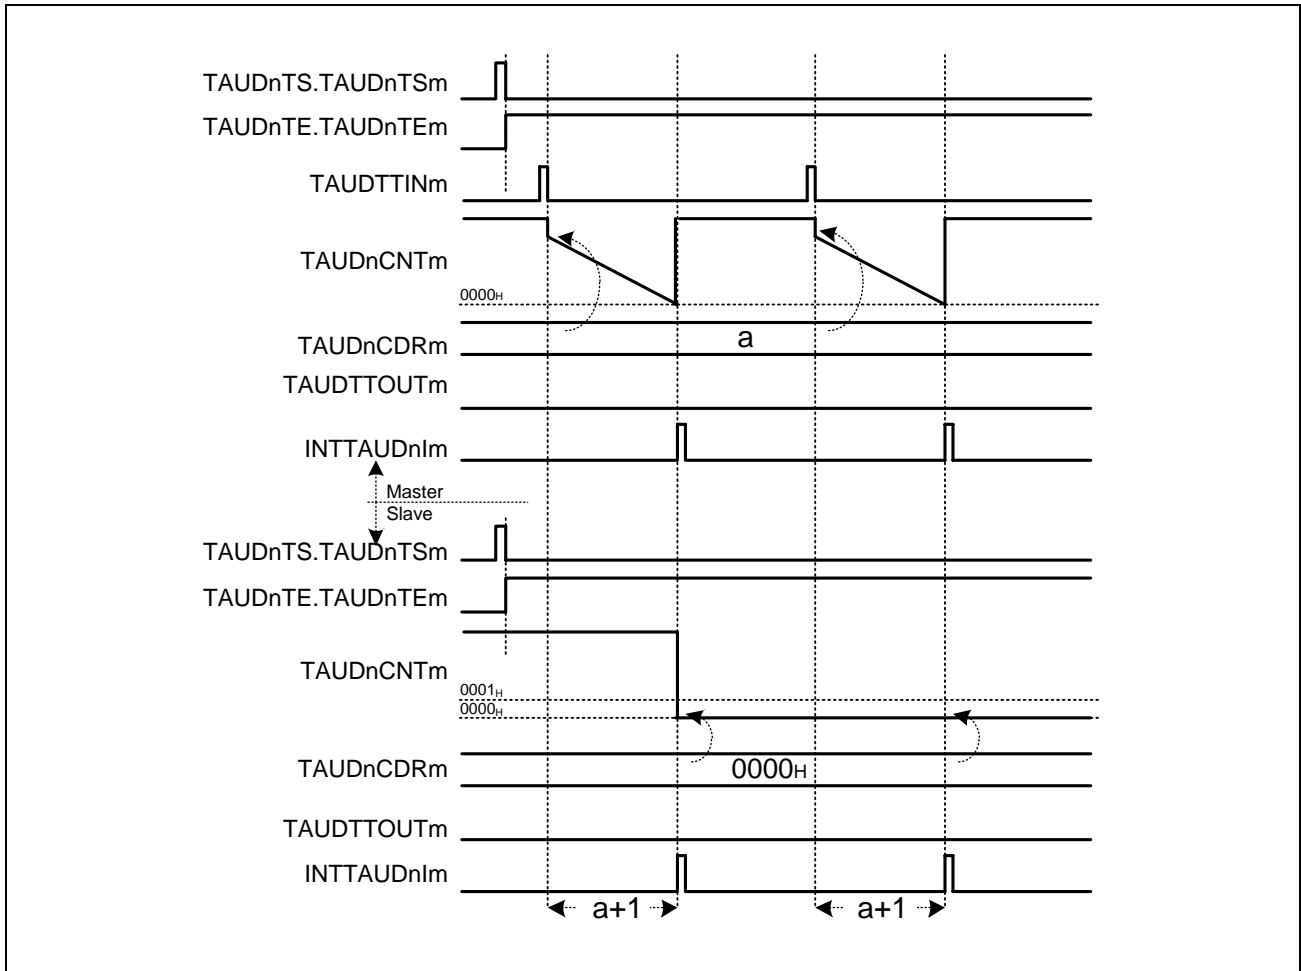

Figure 32.98 TAUDnCDRm (Slave) = 0000H

- TAUDTTOUTm remains inactive, because the pulse width is zero.

**(3) TAUDnCMORm.TAUDnMD0 = 1**

The following settings apply to this diagram.

- Enables start trigger detection while counting. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

Figure 32.99 TAUDnCMORm.TAUDnMD0 = 1

- If a valid TAUDTTINm input edge is detected while the counter of the master channel counts down, TAUDnCNTm reloads the value of TAUDnCDRm. The counter restarts to count down. This means the delay is extended by the value of TAUDnCNTm at the time when a valid TAUDTTINm input edge is detected.

**(4) Restarting the Master Channel while the Slave Channel is Counting**

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

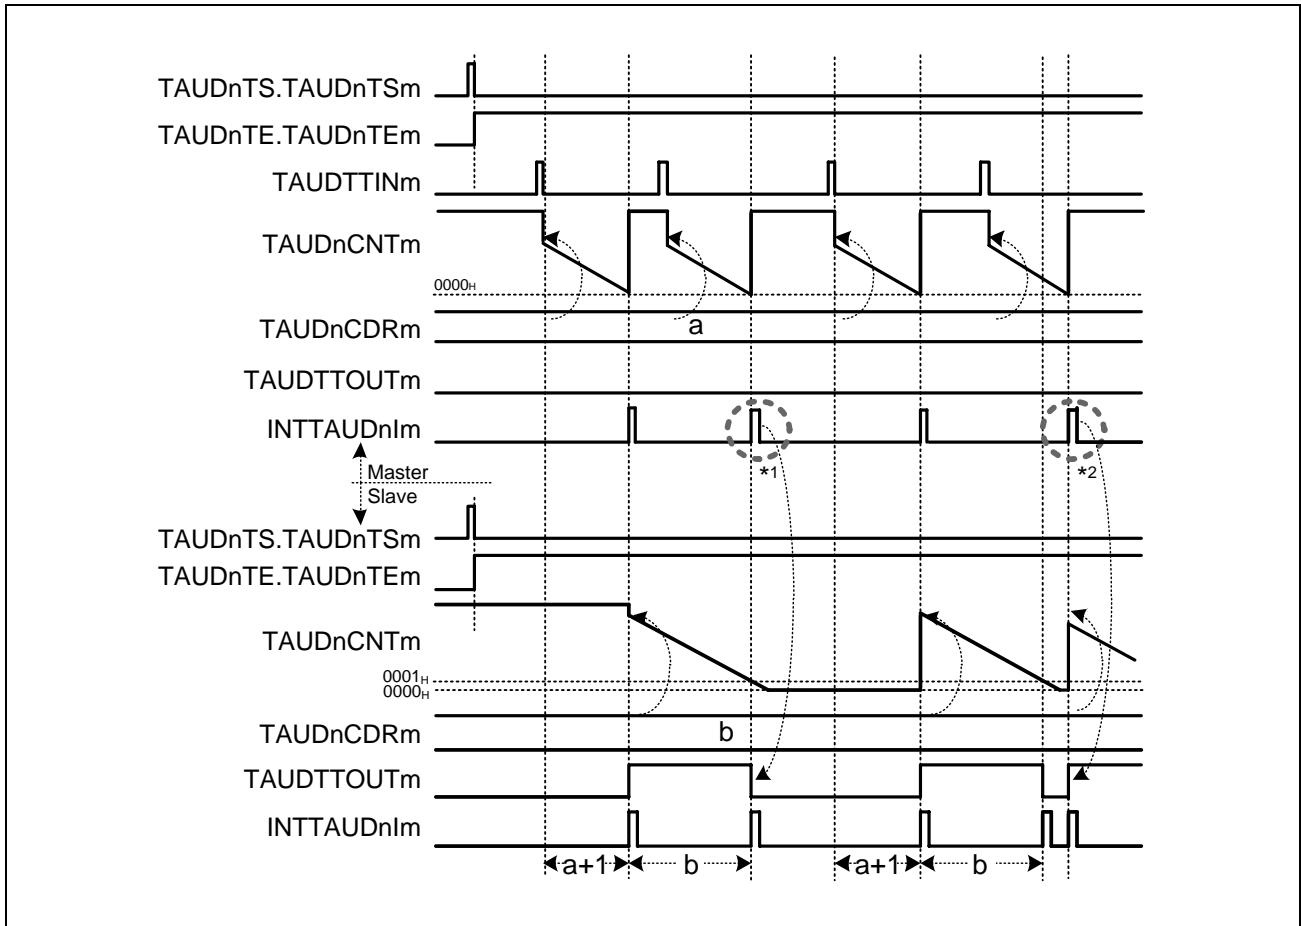

Figure 32.100 TAUDTTINm input interval  $\leq$  Delay Time + Pulse Width + 1

- If the master channel generates an interrupt before the counter of the slave channel has reached 0001<sub>H</sub> or exactly when 0001<sub>H</sub> is reached\*<sup>1</sup>, the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUDnCDRm (slave) is reloaded. An interrupt is generated and TAUDTTOUTm toggles. If TAUDnCNTm (master) has started to count down while the TAUDnCNTm (slave) is still counting\*<sup>2</sup>, TAUDTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

### 32.15.3 Trigger Start PWM Output Function

#### 32.15.3.1 Overview

##### Summary

This function generates a PWM output using a master and a slave channel. It enables the pulse cycle (frequency) and the duty of the TAUDTTOUT<sub>m</sub> to be set. The pulse cycle is specified using the master channel. The duty is specified using the slave channel. The Trigger Start PWM Output Function is identical to PWM Output Function except that the master channel of this function can be reset by a valid TAUDTTIN<sub>m</sub> input edge.

##### Prerequisites

- Two channels
- The operation mode of the master channel must be set to Interval Timer Mode (see **Table 32.164, Contents of the TAUDnCMOR<sub>m</sub> Register for the Master Channel of the Trigger Start PWM Output Function**).
- The operation mode of the slave channel must be set to One-Count Mode (see **Table 32.167, Contents of the TAUDnCMOR<sub>m</sub> Register for the Slave Channel of the Trigger Start PWM Output Function**).
- TAUDTTOUT<sub>m</sub> is not used with the master channel of this function.
- The channel output mode of the slave channel must be set to Synchronous Channel Output Mode 1 (see **Section 32.6, Simultaneous Rewrite**).

##### Functional description

The counters (master and slave) are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSM) to 1. This in turn sets TAUDnTE.TAUDnTEM to 1, enabling count operation. The current value of TAUDnCDR<sub>m</sub> is loaded to TAUDnCNT<sub>m</sub>, and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel, and a PWM output is realized by setting and resetting TAUDTTOUT<sub>m</sub> (slave).

- Master channel:
 

The current value of TAUDnCDR<sub>m</sub> is loaded to the counter (TAUDnCNT<sub>m</sub>), INTTAUDnIm is generated and the counter starts to count down from this value.

When the counter reaches 0000<sub>H</sub> and the pulse cycle time has elapsed, INTTAUDnIm is generated and the counters (master and slave) load the current TAUDnCDR<sub>m</sub> values.

If a valid TAUDTTIN<sub>m</sub> input edge is detected, the counter of the master channel loads the current TAUDnCDR<sub>m</sub> value, restarts counting down and generates an interrupt.
- Slave channel:
 

When the slave detects an interrupt from the master channel, it starts to count down from the current value of TAUDnCDR<sub>m</sub>. The TAUDTTOUT<sub>m</sub> signal is set to the active level.

When the counter reaches 0000<sub>H</sub> (duty time has elapsed), INTTAUDnIm is generated and the TAUDTTOUT<sub>m</sub> signal is reset. The counter returns to FFFF<sub>H</sub> and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTM to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEM to 0. TAUDnCNT<sub>m</sub> and TAUDTTOUT<sub>m</sub> of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSM to 1.

##### Conditions

Simultaneous rewrite can be used with this function. See **Section 32.6, Simultaneous Rewrite**.

### 32.15.3.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave) / (TAUDnCDRm (master) + 1)] × 100

- Duty cycle = 0%  
TAUDnCDRm (slave) = 0000<sub>H</sub>
- Duty cycle = 100%  
TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

### 32.15.3.3 Block Diagram and General Timing Diagram

Figure 32.101 Block Diagram for Trigger Start PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01<sub>B</sub>)
- Positive logic (TAUDnTOL.TAUDnTOLm (slave) = 0)

Figure 32.102 General Timing Diagram for Trigger Start PWM Output Function

NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.15.3.4 Register Settings for the Master Channel

Table 32.168 Contents of the TAUDnCMURm Register for the Slave Channel of the Trigger Start PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for the Slave Channel

Table 32.169 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROM	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

### (4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.170 Simultaneous Rewrite Settings for the Slave Channel of the Trigger Start PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.15.3.6 Operating Procedure for Trigger Start PWM Output Function

Table 32.171 Operating Procedure for Trigger Start PWM Output Function

	Operation	TAUDn Status
Restart Operation ↑	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel.
	During Operation	<p>TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUDnIm (master) is generated.</li> <li>• TAUDnCDRm value is loaded into TAUDnCNTm (master) to continue count operation.</li> <li>• TAUDnCNTm (slave) loads the TAUDnCDRm value and starts to count down</li> <li>• TAUDTTOUTm (slave) is set</li> </ul> <p>When TAUDnCNTm of the slave = 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUDnIm (slave) is generated.</li> <li>• TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops.</li> </ul> <p>If a TAUDTTINm input is detected on the master channel while TAUDnCNTm of the master channel is counting down:</p> <ul style="list-style-type: none"> <li>• TAUDnCNTm (master and slave) loads the TAUDnCDRm value and counts down</li> <li>• INTTAUDnIm (master) is generated.</li> <li>• TAUDTTOUTm (slave) is set to the active level.</li> </ul>
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

## 32.15.3.7 Specific Timing Diagrams

## (1) Duty cycle = 0%

Figure 32.103 TAUDnCDRm (Slave) = 0000<sub>H</sub>,  
 Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)  
 Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

- Every time the master channel generates an interrupt (INTTAUDnIm), 0000<sub>H</sub> is written to TAUDnCNTm (slave). Therefore, TAUDnCNTm (slave) cannot start to count and TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

(2) Duty cycle = 100%

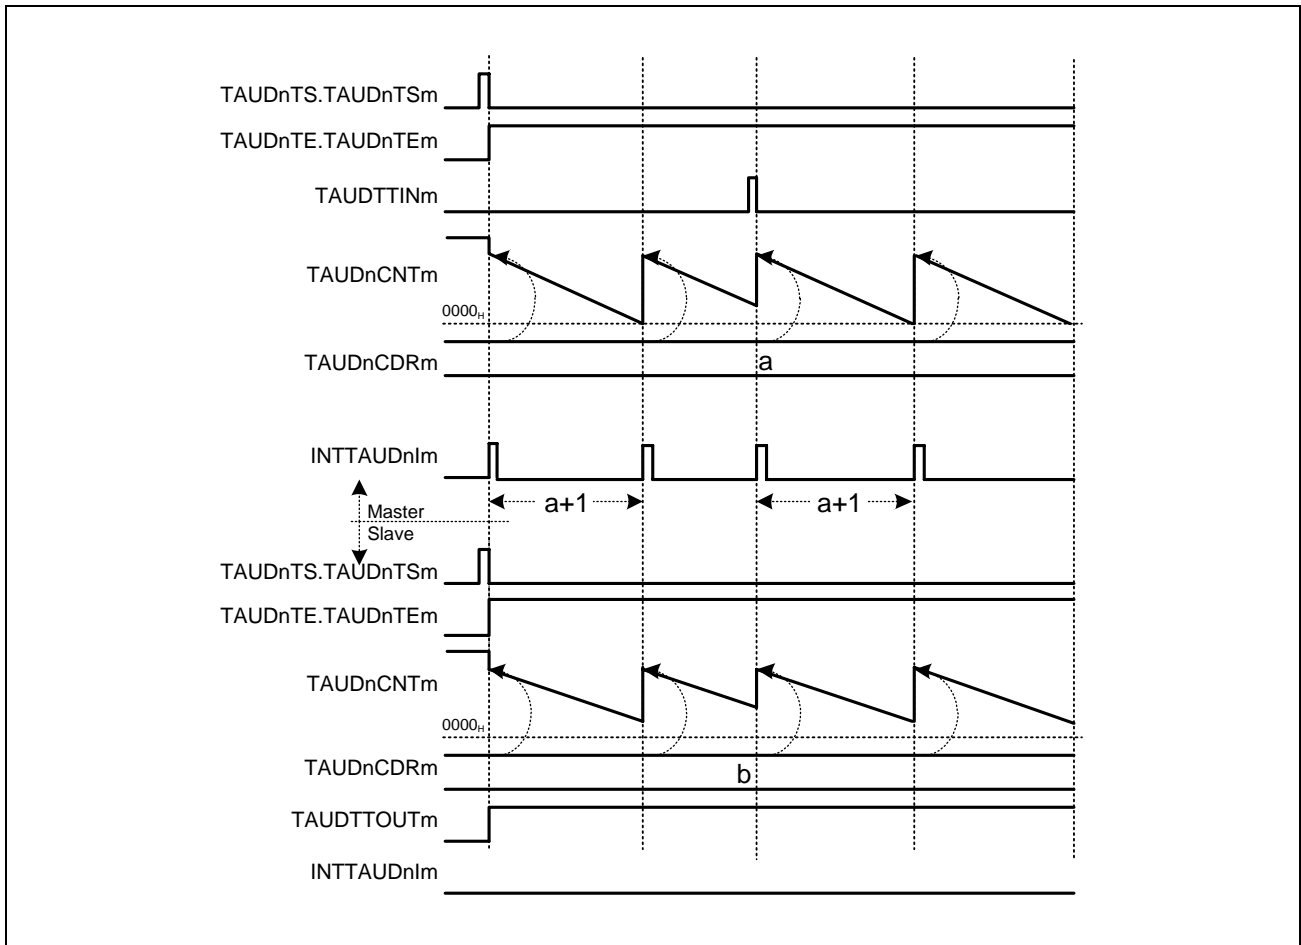

Figure 32.104 TAUDnCDRm (Slave)  $\geq$  TAUDnCDRm (Master) + 1,  
 Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)  
 Falling Edge Detection (TAUDnCMURm.TIS[1:0] = 00B)

- If the value TAUDnCDRm (slave) is higher than the value TAUDnCDRm (master), the counter of the slave channel cannot reach 0000<sub>H</sub> and cannot generate interrupts.  
 The TAUDTTOUTm remains at active state.  
 The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

**(3) TAUDTTINm Detection and Active Slave Counter**

Figure 32.105 Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)  
 Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = 00B)

- If TAUDnCNTm (slave) reloads the value TAUDnCDRm (slave) while it is still counting down, TAUDTTOUTm remains unchanged and extends the duty.  
 The duty does not correspond to the value of the slave's data register.

## 32.15.4 Delay Pulse Output Function

### 32.15.4.1 Overview

#### Summary

This function outputs two signals. The pulse width and pulse cycle of the reference signal are defined using the master channel and slave channel 1. Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by the amount specified on slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1. The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified on slave channel 2.

#### Prerequisites

- Four channels
- The operating mode for the master channel should be set to interval timer mode (see **Table 32.172, Contents of the TAUDnCMORm Register for the Master Channel of the Delay Pulse Output Function**).
- The operating mode for slave channels 1 and 2 should be set to one-count mode (see **Table 32.175, Contents of the TAUDnCMORm Register for Slave Channel 1 of the Delay Pulse Output Function** and **Table 32.179, Contents of the TAUDnCMORm Register for Slave Channel 2 of the Delay Pulse Output Function**).
- The operating mode for slave channel 3 should be set to pulse one-count mode (see **Table 32.182, Contents of the TAUDnCMORm Register for Slave Channel 3 of the Delay Pulse Output Function**).
- TAUDTTOUTm is not used with the master channel and slave channel 2.
- The channel output mode for slave channel 1 should be set to synchronous channel output mode 1 (see **Section 32.7, Channel Output Modes**).
- The channel output mode for slave channel 3 should be set to independent channel output mode 2 (see **Section 32.7, Channel Output Modes**).

#### Functional description

The counters of the channel group are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSM) to 1. This sets TAUDnTE.TAUDnTEM to 1, enabling count operation.

- Master channel:  
The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel.  
When the counter value of master channel reaches 0000<sub>H</sub> and pulse cycle time has elapsed, INTTAUDnIm is generated. The TAUDnCDRm value is reloaded into the counter to perform counting down.
- Slave channels 1 and 2:  
Slave channels 1 and 2 start to count down from the current TAUDnCDRm value when detecting an interrupt from the master channel. TAUDTTOUTm signal (slave 1) is set.
- Slave channel 1:  
When the counter of slave channel 1 reaches 0000<sub>H</sub> (duty time has elapsed), INTTAUDnIm is generated and

TAUDTTOUT<sub>m</sub> signal is reset. The counter is reset to FFFF<sub>H</sub> and waits for the next INTTAUD<sub>nIm</sub> of master channel.

– Slave channel 2:

When the counter of slave channel 2 reaches 0000<sub>H</sub> and delay time has elapsed, INTTAUD<sub>nIm</sub> is generated. The counter is reset to FFFF<sub>H</sub> and waits for the next INTTAUD<sub>nIm</sub> of master channel.

Generating INTTAUD<sub>nIm</sub> (slave channel 2) triggers the counter of slave channel 3.

• Slave channel 3:

When slave channel 3 detects an interrupt from slave channel 2, its counter starts counting down from the current value of TAUD<sub>nCDRm</sub>. INTTAUD<sub>nIm</sub> is generated and the TAUDTTOUT<sub>m</sub> signal (slave channel 3) is set.

When the counter of slave channel 3 reaches 0001<sub>H</sub>, INTTAUD<sub>nIm</sub> is generated and the TAUDTTOUT<sub>m</sub> signal is reset.

The delayed PWM pulse is output from slave channel 3.

The counter can be stopped by setting TAUD<sub>nTT</sub>.TAUD<sub>nTTm</sub> of master and slave channels to 1. This sets TAUD<sub>nTE</sub>.TAUD<sub>nTEm</sub> to 0. TAUD<sub>nCNTm</sub> and TAUDTTOUT<sub>m</sub> of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUD<sub>nTS</sub>.TAUD<sub>nTSm</sub> to 1.

### Conditions

Simultaneous rewrite can be used with this function. See **Section 32.6, Simultaneous Rewrite**.

#### 32.15.4.2 Equations

Pulse cycle = (TAUD<sub>nCDRm</sub> (master) + 1) × count clock cycle

Duty width 1 = (TAUD<sub>nCDRm</sub> (slave 1)) × count clock cycle

Delay width = (TAUD<sub>nCDRm</sub> (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUD<sub>nCDRm</sub> (slave 3)) × count clock cycle

However, the delay width shall be set within the following range:

$0000_H \leq \text{TAUD}_{nCDRm}(\text{slave } 2) < \text{TAUD}_{nCDRm}(\text{master})$

#### NOTES

1. The waveform of TAUDTTOUT<sub>m</sub> (slave 3) becomes the waveform made by delaying the waveform of TAUDTTOUT<sub>m</sub> (slave 1) by the quantity generated by slave 2. It is impossible to make a delay longer than the pulse cycle.
2. If INTTAUD<sub>0Im</sub> of slave 2 is generated while slave 3 is counting, slave 3 restarts operation. Therefore, the waveform of TAUDTTOUT<sub>m</sub> (slave 3) is retained on the active level. In this case, TAUDTTOUT<sub>m</sub> (slave 3) cannot output the waveform generated by delaying the basic pulse of TAUDTTOUT<sub>m</sub> (slave 1).

32.15.4.3 Block Diagram and General Timing Diagram

Figure 32.106 Block Diagram of Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUDnTOL.TAUDnTOLm = 0)
- Slave channel 3: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.107 General Timing Diagram of Delay Pulse Output Function

NOTE

TAUDTTOUTm of slave channel 1 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.15.4.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the Master Channel

	Stop Operation	<p>Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.</p>	<p>TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.</p>

### 32.15.4.9 Specific Timing Diagrams

#### (1) Duty cycle (slave 3) = 100%

The following values apply to **Figure 32.108, Duty Cycle (Slave 3) = 100%**:

- TAUDnCDRm (master) = 000A<sub>H</sub>
- TAUDnCDRm (slave 1) = 000B<sub>H</sub>
- TAUDnCDRm (slave 2) = 0000<sub>H</sub>
- TAUDnCDRm (slave 3) = 000B<sub>H</sub>

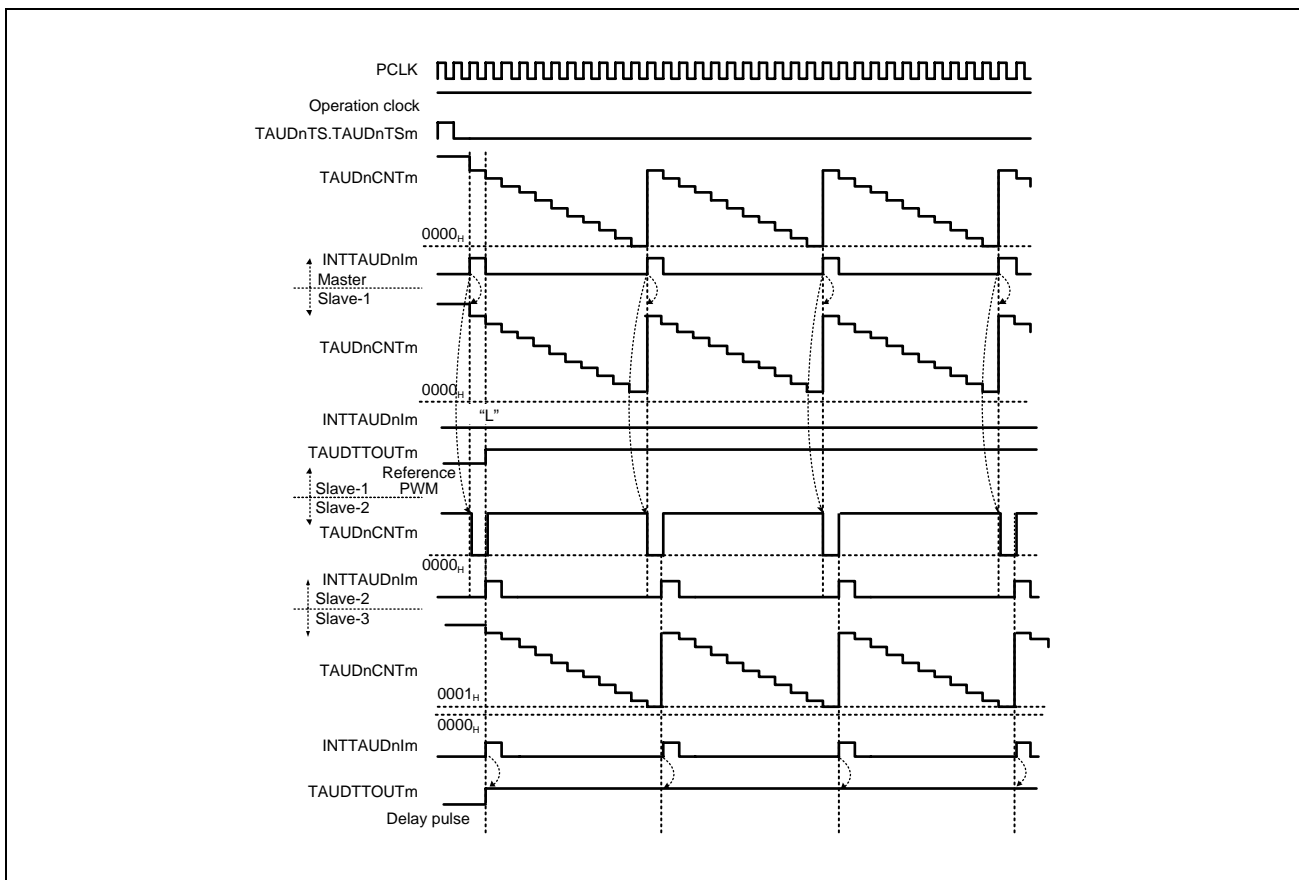

Figure 32.108 Duty Cycle (Slave 3) = 100%

- If the value of TAUDnCDRm (slaves 1 and 3) is higher than the value of TAUDnCDRm (master), the counter of the slave channel 1 cannot reach 0000<sub>H</sub> and cannot generate interrupts. TAUDTTOUTm of channels 1 and 3 remain in the active state.

**(2) TAUDTTOUTm (slave 1) = TAUDTTOUTm (slave 3)**

The following values apply to **Figure 32.109, TAUDTTOUTm (Slave 1) = TAUDTTOUTm (Slave 3).**

- TAUDnCDRm (master) = 000AH
- TAUDnCDRm (slave 1) = 0005H
- TAUDnCDRm (slave 2) = 0000H
- TAUDnCDRm (slave 3) = 0005H

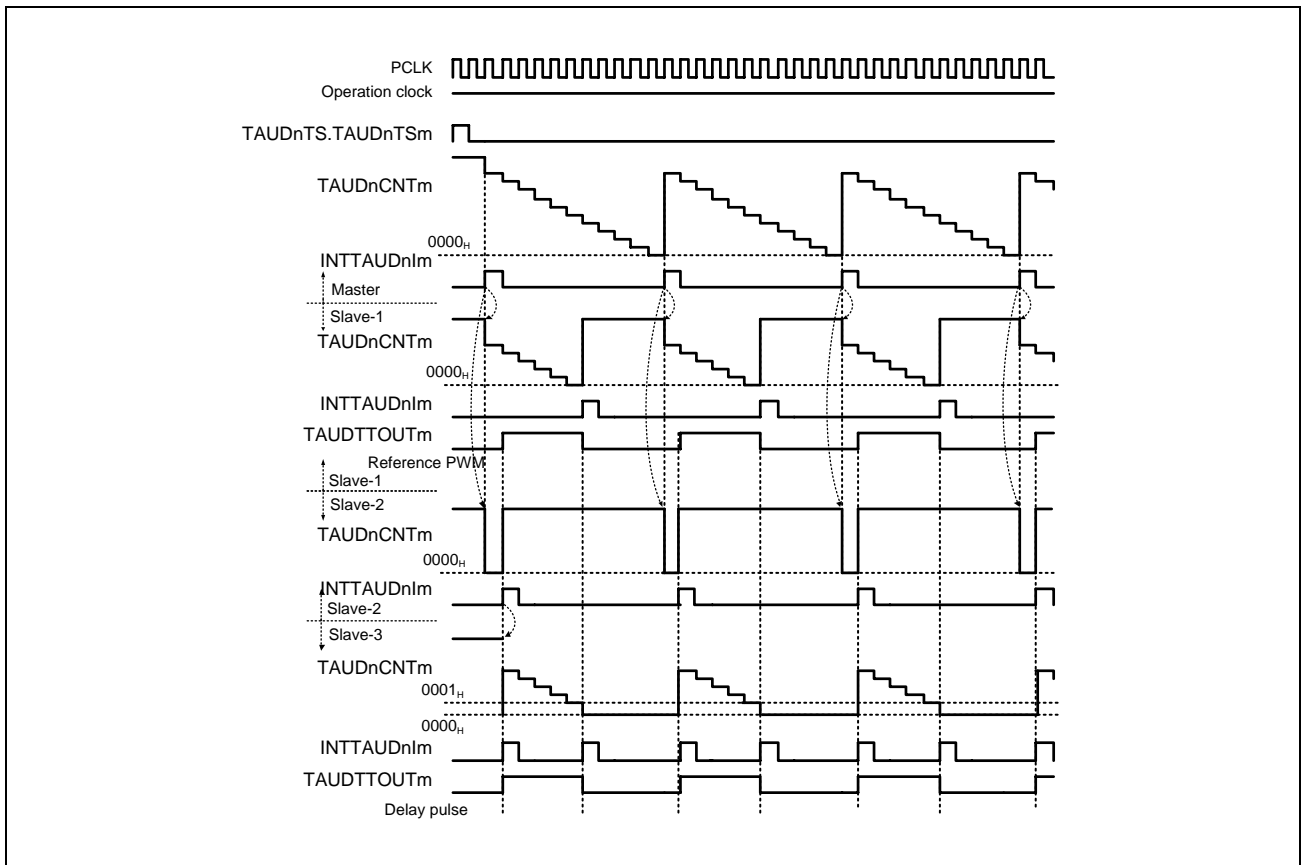

Figure 32.109 TAUDTTOUTm (Slave 1) = TAUDTTOUTm (Slave 3)

- If TAUDnCDRm (slave 2) = 0000H, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

## 32.15.5 Offset Trigger Output Function

### 32.15.5.1 Overview

#### Summary

This function generates a PWM output using a master channel and a slave channel, enabling the pulse width (duration) of the TAUDTTOUT<sub>m</sub> to be set. The pulse cycle is set by detecting a valid input edge of master channel. The pulse width is specified on the slave channel.

#### Prerequisites

- Two channels
- The operating mode for the master channel should be set to capture mode (see **Table 32.187, Contents of the TAUDnCMOR<sub>m</sub> Register for the Master Channel of the Offset Trigger Output Function**).
- The operating mode for slave channels should be set to one-count mode (see **Table 32.190, Contents of the TAUDnCMOR<sub>m</sub> Register for the Slave Channel of the Offset Trigger Output Function**).
- The output mode for slave channels should be set to synchronous channel output mode 1 (see **Section 32.7, Channel Output Modes**).
- TAUDTTOUT<sub>m</sub> is not used with the master channel of this function.

#### Functional description

The counter can be enabled by setting the channel trigger bit (TAUDnTS.TAUDnTS<sub>m</sub>) to 1. This makes TAUDnTE.TAUDnTE<sub>m</sub> = 1, enabling count operation. The master channel counter (TAUDnCNT<sub>m</sub>) starts to count up from 0000<sub>H</sub>.

- Master channel:  
When a valid TAUDTTIN<sub>m</sub> input edge is detected, the current value of the counter (TAUDnCNT<sub>m</sub>) is loaded into the data register of master channel (TAUDnCDR<sub>m</sub>). INTTAUDnIm is generated and the counter restarts to count up from 0000<sub>H</sub>.
- Slave channel:  
If INTTAUDnIm is generated on the master channel, the TAUDTTOUT<sub>m</sub> (slave) signal is set and the counter of the slave channel is triggered. The current value of TAUDnCDR<sub>m</sub> (slave) is loaded into TAUDnCNT<sub>m</sub> (slave) and the counter starts to count down from this value.  
When the counter reaches 0000<sub>H</sub> (duty time has elapsed), INTTAUDnIm is generated and TAUDTTOUT<sub>m</sub> signal is reset. The counter returns to FFFF<sub>H</sub> and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTT<sub>m</sub> of master and slave channels to 1. This sets TAUDnTE.TAUDnTE<sub>m</sub> to 0. TAUDnCNT<sub>m</sub> and TAUDTTOUT<sub>m</sub> of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTS<sub>m</sub> to 1.

### 32.15.5.2 Equations

Pulse width = (TAUDnCDRm (slave)) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave)/(TAUDnCDRm (master) + 1)] × 100

- Duty cycle = 0%  
TAUDnCDRm (slave) = 0000<sub>H</sub>
- Duty cycle = 100%  
TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

### 32.15.5.3 Block Diagram and General Timing Diagram

Figure 32.110 Block Diagram of Offset Trigger Output Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

Figure 32.111 General Timing Diagram of Offset Trigger Output Function

**NOTE**

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.15.5.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.187 Contents of the TAUDnCMORm Register for the Master Channel of the Offset Trigger Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	001: Valid TAUDTTINm input edge signal is used as the start trigger
7, 6	TAUDnCOS[1:0]	11: Capture register is updated upon detection of a valid TAUDTTINm input edge or when a counter overflow occurs: – Detection of valid TAUDTTINm input edge: The counter value is written into TAUDnCDRm. – Occurrence of overflow: FFFF <sub>H</sub> is written into TAUDnCDRm. A valid TAUDTTINm input edge to be detected next is ignored. TAUDnCSRm.TAUDnOVF is set when a counter overflow occurs, and cleared by setting TAUDnCSCm.TAUDnCLOV = 1.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0010: Capture mode
0	TAUDnMD0	1: INTTAUDnIm generated at the beginning of operation.

#### (2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R/W	R	R	R	R	R	R/W	R/W

Table 32.188 Contents of the TAUDnCMURm Register for the Master Channel of the Offset Trigger Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges 11: Setting prohibited

**(3) Channel Output Mode for the Master Channel**

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

**(4) Simultaneous Rewrite for the Master Channel**

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0.

Table 32.189 Simultaneous Rewrite Settings for the Master Channel of Offset Trigger Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.15.5.5 Register Settings for Slave Channels

#### (1) TAUDnCMORm for Slave Channels

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

#### (2) TAUDnCMURm for Slave Channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.191 Contents of the TAUDnCMURm Register for the Slave Channel of the Offset Trigger Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for Slave Channels

Table 32.192 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROM	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

### (4) Simultaneous Rewrite for Slave Channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0.

Table 32.193 Simultaneous Rewrite Settings for Slave Channels of Offset Trigger Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

### 32.15.5.6 Operating Procedure for Offset Trigger Output Function

Table 32.194 Operating Procedure for Offset Trigger Output Function

	Operation	TAUDn Status	
Restart Operation ↑	Initial Channel Setting	<p>Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.15.5.4, Register Settings for the Master Channel</b>.</p> <p>Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and channel output mode as described in <b>Section 32.15.5.5, Register Settings for Slave Channels</b>.</p> <p>The TAUDnCDRm register of master channel functions as a capture register. Set the value of TAUDnCDRm register of slave channel.</p>	Channel operation is stopped.
	Start Operation	<p>Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.</p>	<p>TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start:</p> <ul style="list-style-type: none"> <li>• TAUDnCNTm (master) counts up.</li> <li>• TAUDnCDRm value is loaded into TAUDnCNTm (slave) to perform counting down.</li> </ul> <p>INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set.</p>
	During Operation	<p>TAUDnCDRm can be changed at any time.</p> <p>TAUDnCSCm.TAUDnCLOV can be set to 1. TAUDnCDRm of slave channel can be changed after the generation of INTTAUDnIm (master). TAUDnCNTm and TAUDnCSRm can be read at any time.</p>	<p>When TAUDnCNTm of the slave = 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUDnIm (slave) is generated.</li> <li>• TAUDTTOUTm (slave) is reset, and the counter of slave channel stops.</li> </ul> <p>When TAUDTTINm input edge is detected on the master channel:</p> <ul style="list-style-type: none"> <li>• INTTAUDnIm (master) is generated.</li> <li>• TAUDnCNTm (master) is reset to 0000<sub>H</sub> and then continues count operation subsequently.</li> <li>• TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to perform counting down.</li> <li>• TAUDTTOUTm (slave) is set.</li> </ul>
	Stop Operation	<p>Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.</p>	<p>TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.</p>

### 32.15.5.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

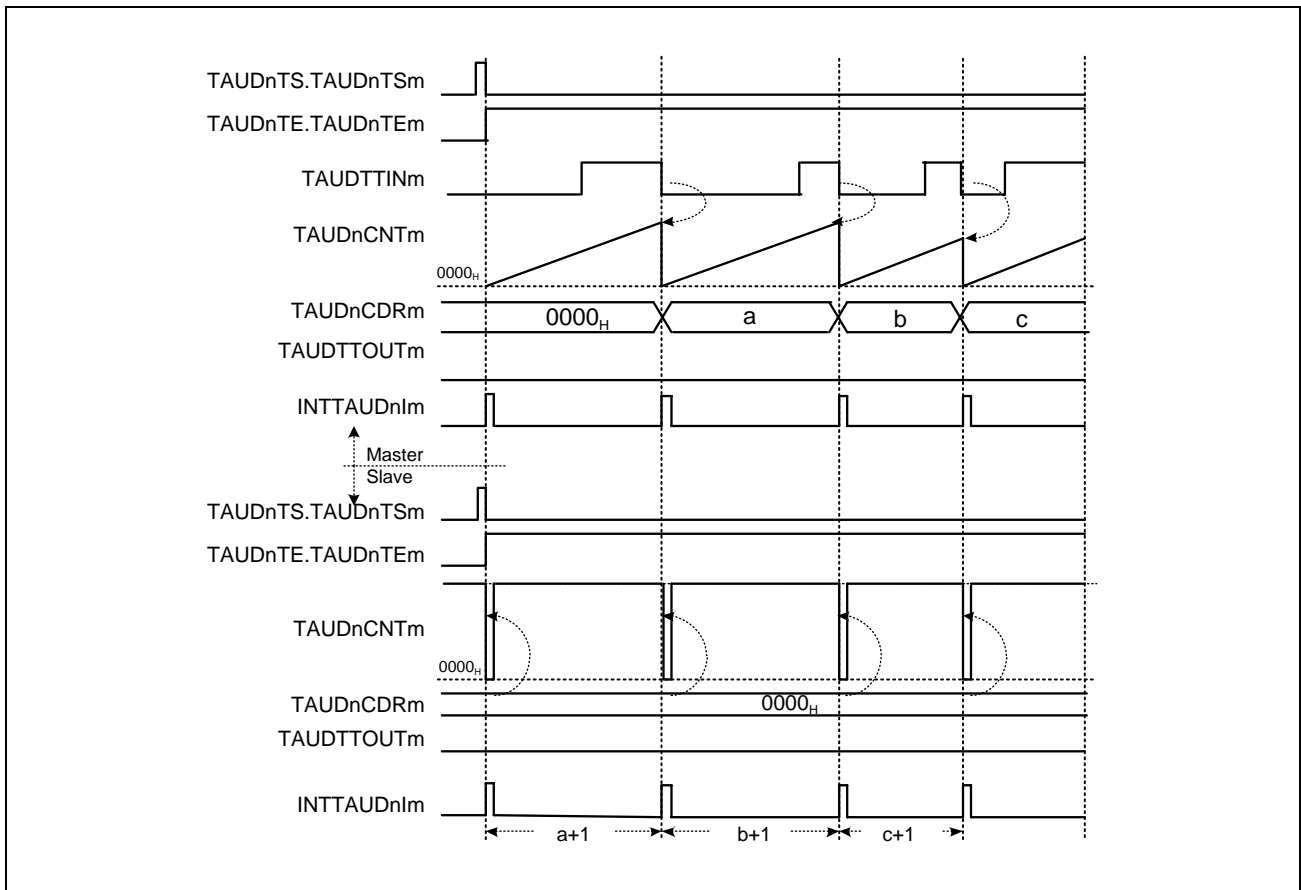

Figure 32.112 TAUDnCDRm (Slave) = 0000<sub>H</sub>

- When TAUDnCDRm (slave) = 0000<sub>H</sub>, 0000<sub>H</sub> is written to TAUDnCNTm every time the master channel generates an interrupt (INTTAUDnIm), and TAUDnCNTm cannot start to count. The TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The slave and the master channels generate interrupts in the same cycle.

**(2) Duty cycle = 100%**

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00<sub>B</sub>)

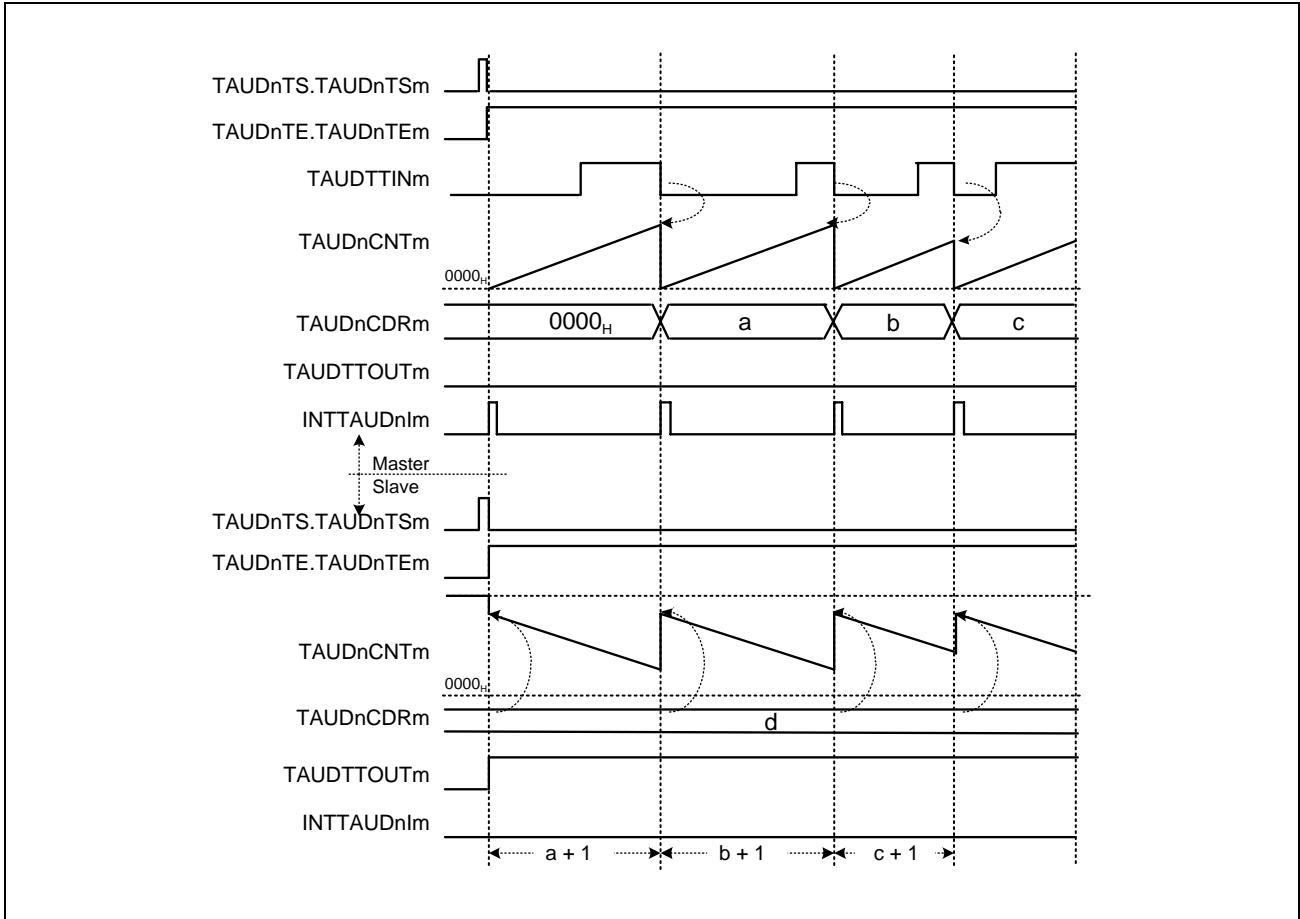

Figure 32.113 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1

- If the value TAUDnCDRm (slave) is higher than the interval of valid input edges, the counter of the slave channel cannot reach 0000<sub>H</sub> and cannot generate interrupts. The TAUDTTOUTm remains at active state.

### 32.15.6 A/D Conversion Trigger Output Function Type 1

#### 32.15.6.1 Overview

##### Summary

This function is identical to **Section 32.15.1, PWM Output Function**, except that TAUDTTOUTm is not output.

This function is enabled by setting the channel output mode for the slave to independent channel output mode controlled by software.

#### 32.15.6.2 Block Diagram and General Timing Diagram

Figure 32.114 Block Diagram of A/D Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

Figure 32.115 General Timing Diagram of A/D Conversion Trigger Output Function Type 1

## 32.15.7 Triangle PWM Output Function

### 32.15.7.1 Overview

#### Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUDTTOUT<sub>m</sub> to be set using the master and slave channels respectively.

The master channel generates a carrier cycle. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slave counter.

#### Prerequisites

- Two channels
- The operating mode for the master channels should be set to interval timer mode (see **Table 32.195, Contents of the TAUDnCMOR<sub>m</sub> Register for the Master Channel of the Triangle PWM Output Function**).
- The operating mode for slave channels should be set to count-up/-down mode (see **Table 32.199, Contents of the TAUDnCMOR<sub>m</sub> Register for the Slave Channel of the Triangle PWM Output Function**).
- The channel output mode for the master channel should be set to independent channel output mode 1 (see **Section 32.7, Channel Output Modes**).
- The channel output mode for slave channels should be set to synchronous channel output mode 2 (see **Section 32.7, Channel Output Modes**).
- The following settings allow the TAUDTTOUT<sub>m</sub> signal to be at high level during the down status of a carrier cycle.
  - If TAUDnCMOR<sub>m</sub>.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTO<sub>m</sub> should be set to 1 while TAUDnTOE.TAUDnTOE<sub>m</sub> is set to 0 (recommended setting).
  - If TAUDnCMOR<sub>m</sub>.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTO<sub>m</sub> should be set to 0 while TAUDnTOE.TAUDnTOE<sub>m</sub> is set to 0.

#### Functional description

The counters are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTS<sub>m</sub>) to 1 for every channel. This in turn sets TAUDnTE.TAUDnTE<sub>m</sub>, enabling count operation. The current values of TAUDnCDR<sub>m</sub> (master and slave) are loaded into TAUDnCNT<sub>m</sub> (master and slave) and the counters start counting down from these values. When the TAUDnCMOR<sub>m</sub>.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and TAUDTTOUT<sub>m</sub> signal of master toggles.

- Master channel:
  - When the counter of master channel reaches 0000<sub>H</sub> (pulse cycle time has elapsed), INTTAUDnIm is generated and the TAUDTTOUT<sub>m</sub> signal toggles. TAUDnCNT<sub>m</sub> then reloads the TAUDnCDR<sub>m</sub> value and counts down.
- Slave channel:
  - If INTTAUDnIm is generated on the master channel, the counter of the slave channel is triggered.
    - If the slave counter is counting down, the count direction changes.
    - If the slave counter is counting up, the TAUDnCDR<sub>m</sub> value is reloaded and the counter starts to count down.

When the counter of the slave channel reaches 0001<sub>H</sub> while counting up or down, INTTAUDnIm is generated and the TAUDTTOUT<sub>m</sub> (slave) signal is set/reset.

The counter continues count-up/-down and waits for the next INTTAUDnIm of the master channel.

Setting TAUDnTOL.TAUDnTOLm allows TAUDTTOUTm signal switching between normal phase and reverse phase during operation.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

### Conditions

This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.

#### 32.15.7.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq \text{TAUDnCDRm (master)} < \text{FFFF}_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle 100 [%] =

$[(\text{TAUDnCDRm (master)} + 1 - \text{TAUDnCDRm (slave)}) / (\text{TAUDnCDRm (master)} + 1)] \times 100$

- Duty cycle = [%]

TAUDnCDRm (slave) = 0000<sub>H</sub>

- Duty cycle = 0%

TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

32.15.7.3 Block Diagram and General Timing Diagram

Figure 32.116 Block Diagram of Triangle PWM Output Function

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUDnIm is generated at the beginning of operation.  
(TAUDnCMORm.TAUDnMD0 = 1)

Figure 32.117 General Timing Diagram of Triangle PWM Output Function

### 32.15.7.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.195 Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated to toggle TAUDTTOUTm at the beginning of an operation. 1: INTTAUDnIm is generated and TAUDTTOUTm is toggled at the beginning of operation.

#### (2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.196 Contents of the TAUDnCMURm Register for the Master Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for the Master Channel

Table 32.197 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

### (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.198 Simultaneous Rewrite Settings for the Master Channel of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

#### NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 32.15.7.5 Register Settings for Slave Channels

#### (1) TAUDnCMORm for Slave Channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.199 Contents of the TAUDnCMORm Register for the Slave Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	111: Up/down output trigger signal of master channel
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1001: Count-up/-down mode
0	TAUDnMD0	0: INTTAUDnIm not generated at the beginning of operation.

#### (2) TAUDnCMURm for Slave Channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.200 Contents of the TAUDnCMURm Register for the Slave Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for Slave Channels

Table 32.201 Control Bit Settings in Synchronous Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

### (4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.202 Simultaneous Rewrite Settings for Slave Channels of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when the master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.15.7.6 Operating Procedure for Triangle PWM Output Function

Table 32.203 Operating Procedure for Triangle PWM Output Function

	Operation	TAUDn Status
Restart Operation ↑	Initial Channel Setting	Channel operation is stopped.
	Start Operation	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1.
	During Operation	TAUDnCDRm value of master and slave channels is loaded into TAUDnCNTm to count down. When the counter of master channel reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm (master) is generated.</li> <li>• TAUDTTOUTm (master) is toggled.</li> <li>• TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation.</li> <li>• TAUDnCDRm value is reloaded into TAUDnCNTm (slave) or counting is started in opposite direction.</li> </ul> When TAUDnCNTm of slave channel reaches 0001 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm (slave) is generated.</li> <li>• TAUDTTOUTm (slave) is set in the count-down status or reset in count-up status.</li> </ul>
	Stop Operation	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

### 32.15.7.7 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = 5<sub>H</sub>
- Slave channel:
  - TAUDnCDRm = 6<sub>H</sub>

Figure 32.118 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1

- If TAUDnCDRm (slave) value ≥ TAUDnCDRm (master) value + 1, INTTAUDnIm of the slave channel is not generated while counting down. TAUDTTOUTm remains low because there is no set signal to be detected.

**(2) Duty cycle = 100%**

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation.  
(TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = 5<sub>H</sub>
- Slave channel:
  - TAUDnCDRm = 0<sub>H</sub>

Figure 32.119 TAUDnCDRm (Slave) = 0000<sub>H</sub>

- If TAUDnCDRm (slave) = 0000<sub>H</sub>, INTTAUDnIm of the slave channel is not generated while counting up. TAUDTTOUTm remains high because there is no reset signal to be detected.

## 32.15.8 Triangle PWM Output Function with Dead Time

### 32.15.8.1 Overview

#### Summary

This function generates multiple triangle PWM outputs with a predefined dead time added by using a master and two or more slave channels. The resulting PWM signals with dead time are output via TAUDTTOUT<sub>m</sub> of the slave channels 2 and 3, enabling the pulse cycle (frequency) and the duty cycle of TAUDTTOUT<sub>m</sub> to be set using the master and slave channels.

Carrier cycles are generated on the master channel. The first pulse controls the down status of the slave counter and the second one controls the up status.

An interrupt on slave 2 causes TAUDTTOUT<sub>m</sub> of slave channels to be set/reset. Depending on the settings of TAUDnTDL.TAUDnTDL<sub>m</sub>, delay time is added to positive or negative logic side of the signal (i.e., whether TAUDTTOUT<sub>m</sub> is set/reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

#### Prerequisites

- Three channels. For slave channels 2 and 3, select even channel CH (a) and odd channel CH (a + 1).
- The operating mode for the master channel should be set to interval timer mode (see **Table 32.205, Contents of the TAUDnCMOR<sub>m</sub> Register for the Master Channel of the Triangle PWM Output Function with Dead Time**).
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even channel (a), and slave channel 3 is an odd channel (a + 1). Slave channel 1 can be used as a separate timer (independent function).
- The operating mode for slave channel 2 should be set to count-up/-down mode (see **Table 32.209, Contents of the TAUDnCMOR<sub>m</sub> Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time**). Slave channel 2 should be an even channel.
- The operating mode for slave channel 3 should be set to one-count mode (see **Table 32.213, Contents of the TAUDnCMOR<sub>m</sub> Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time**). Slave channel 3 should be an odd channel.
- The channel output mode for the master channel should be set to independent channel output mode 1 (see **Section 32.7, Channel Output Modes**).
- The output mode for slave channels 2 and 3 should be set to synchronous channel output mode 2 with dead time output (see **Section 32.7, Channel Output Modes**).
- The following settings make a TAUDTTOUT<sub>m</sub> signal at high level during the down status of the carrier cycle:
  - If TAUDnCMOR<sub>m</sub>.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTO<sub>m</sub> should be set to 1 while TAUDnTOE.TAUDnTOE<sub>m</sub> is set to 0 (recommended setting).
  - If TAUDnCMOR<sub>m</sub>.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTO<sub>m</sub> should be set to 0 while TAUDnTOE.TAUDnTOE<sub>m</sub> is set to 0.

#### NOTE

The triangle PWM output function with dead time does not use slave channel 1. Slave channel 1 can be used as a separate timer (independent function).

### Functional description

The counter starts by setting the channel trigger bit (TAUDnTS.TAUDnTSM) to 1. This makes TAUDnTE.TAUDnTEM = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and the master's TAUDTTOUTm signal is toggled.

- Master channel:

When the counter of the master channel reaches 0000<sub>H</sub>, an INTTAUDnIm is generated and the TAUDTTOUTm signal is toggled. The TAUDnCDRm value is reloaded to continue counting down.

- Slave channel 2:

If INTTAUDnIm is generated on the master channel, the counter of slave channel 2 is triggered.

- If the slave counter is counting down, the counting direction changes.
- If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts counting down.

The counter continues to count down/up and waits for the next INTTAUDnIm of the master channel.

When the counter value of slave channel 2 reaches 0001<sub>H</sub>, INTTAUDnIm is generated

- Slave channel 3:

If INTTAUDnIm is generated on slave channel 2, the counter of slave channel 3 is triggered. The current value of TAUDnCDRm (slave 3) is loaded into TAUDnCNTm (slave 3) and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches 0000<sub>H</sub>, INTTAUDnIm occurs. The counter returns to FFFF<sub>H</sub> and waits for the next INTTAUDnIm of slave channel 2.

As described in **Table 32.204, Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2**, the set/reset timing (right after occurrence of an interrupt or after dead time has elapsed) depends on the TAUDnTDL.TAUDnTDLm setting of the corresponding channel.

The setting of TAUDnTOL.TAUDnTOLm also determines whether a high level signal (TAUDnTOL.TAUDnTOLm = 0) or a low level signal (TAUDnTOL.TAUDnTOLm = 1) is output from the corresponding channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEM to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

TAUDTTOUTm can be 100% output by setting the TAUDnCDRm value of slave channel 2 to 0000<sub>H</sub>.

### Conditions

This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.

TAUDnTOL.TAUDnTOLm and TAUDnTDL.TAUDnTDLm should be set before start of count operation. Slave channels 2 and 3 should have the opposite settings of TAUDnTDL.TAUDnTDLm.

Table 32.204 Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2

TAUDnTDL. TAUDnTDLm	Count Direction of Slave Channel 2 upon Occurrence of Interrupt	TAUDTTOUTm Set/Reset Timing
0	Down	Set after elapse of dead time
	Up	Reset right after interrupt occurs
1	Down	Set right after interrupt occurs
	Up	Reset after elapse of dead time

### 32.15.8.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq \text{TAUDnCDRm (master)} < \text{FFFF}_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (normal phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 – (TAUDnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (reverse phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 + (TAUDnCDRm (slave 3) + 1)] × count clock cycle

## 32.15.8.3 Block Diagram and General Timing Diagram

Figure 32.120 Block Diagram of Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUdNMD0 = 1)
- Slave channel 2:
  - INTTAUDnIm not generated at the beginning of operation. (TAUDnCMORm.TAUdNMD0 = 0)
  - TAUdNTDL.TAUdNTDLm = 0
  - Positive logic (TAUDnTOL.TAUdNTOLm = 0)

- Slave channel 3:
  - Enables start trigger detection during counting ( $TAUDnCMORm.TAUDnMD0 = 1$ )
  - $TAUDnTDL.TAUDnTDLm = 1$
  - Positive logic ( $TAUDnTOL.TAUDnTOLm = 0$ )

Figure 32.121 General Timing Diagram of Triangle PWM Output Function with Dead Time

### 32.15.8.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for the Master Channel

Table 32.207 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

### (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.208 Simultaneous Rewrite Setting for the Master Channel of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

#### NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 32.15.8.5 Register Settings for Slave Channel 2

#### (1) TAUDnCMORm for Slave Channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.209 Contents of the TAUDnCMORm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	111: Up/down output trigger signal of master channel
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1001: Count-up/-down mode
0	TAUDnMD0	0: INTTAUDnIm not generated at the beginning of operation.

#### (2) TAUDnCMURm for Slave Channel 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.210 Contents of the TAUDnCMURm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for Slave Channel 2

Table 32.211 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

#### CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

### (4) Simultaneous Rewrite for Slave Channel 2

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.212 Simultaneous Rewrite Settings for Slave Channel 2 of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.15.8.6 Register Settings for Slave Channel 3

Table 32.213 Contents of the TAUDnCMORm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	110: Dead time output signal of the TAUDTTOUTm generation unit
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

#### (2) TAUDnCMURm for Slave Channel 3

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.214 Contents of the TAUDnCMURm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

**(3) Channel Output Mode for Slave Channel 3**

Table 32.215 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

**CAUTION**

Set TAUDnTDL.TAUDnTDLm exclusively from even channels.

**(4) Simultaneous Rewrite for Slave Channel 3**

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.216 Simultaneous Rewrite Settings for Slave Channel 3 of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.15.8.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 32.217 Operating Procedure for Triangle PWM Output Function with Dead Time

	Operation	TAUDn Status
Restart Operation 	<b>Initial Channel Setting</b>  Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.15.8.4, Register Settings for the Master Channel</b> .  Slave channel 2: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.15.8.5, Register Settings for Slave Channel 2</b> .  Slave channel 3: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.15.8.6, Register Settings for Slave Channel 3</b> .  Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
	<b>Start Operation</b>  Set TAUDnTS.TAUDnTSM of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSM is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEM (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1.
	<b>During Operation</b>  TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.  TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channel 2 is loaded into TAUDnCNTm to perform counting down. When the counter of master channel reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm (master) is generated.</li> <li>• TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation.</li> <li>• TAUDnCDRm value is reloaded into TAUDnCNTm (slave 2) or counting is started in opposite direction.</li> </ul> When TAUDnCNTm of slave channel 2 reaches 0001 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm (slave 2) is generated.</li> <li>• TAUDnCDRm value of slave channel 3 is loaded into TAUDnCNTm perform counting down.</li> </ul> When TAUDnCNTm of slave channel 3 reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm is generated.</li> </ul>
	<b>Stop Operation</b>  Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEM is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

### 32.15.8.8 Specific Timing Diagrams

#### (1) Duty cycle = 0%

The following settings apply to the general timing diagram in **Figure 32.122, TAUDnCDRm (Slave 2) ≥ TAUDnCDRm (Master) + 1.**

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

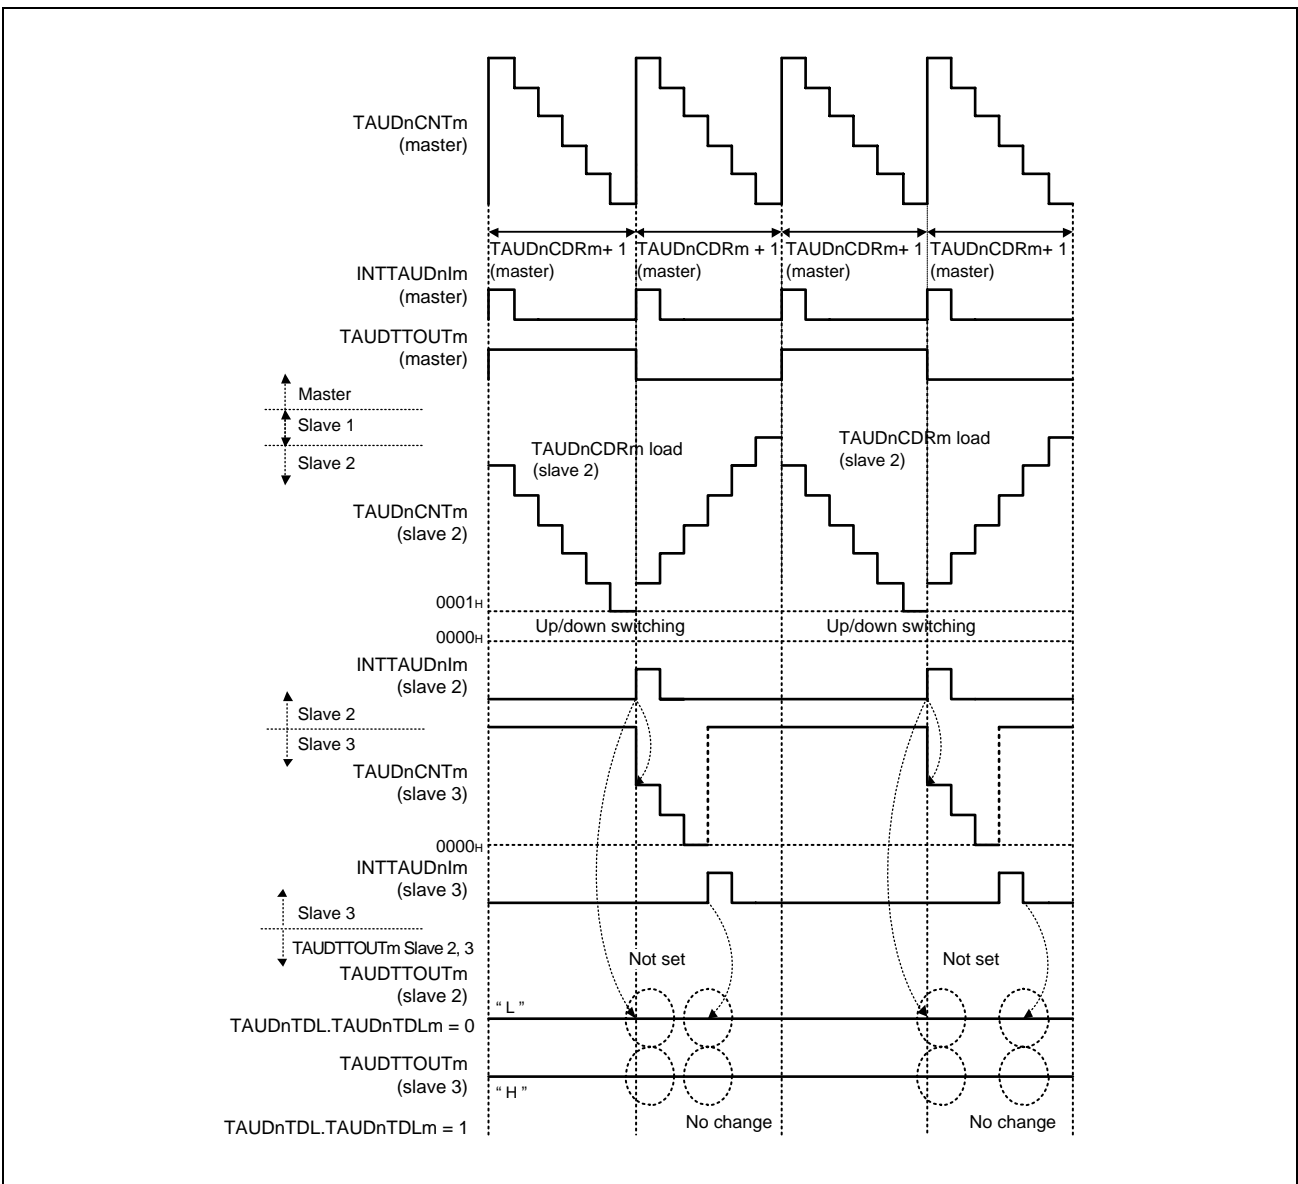

Figure 32.122 TAUDnCDRm (Slave 2) ≥ TAUDnCDRm (Master) + 1

- If TAUDnCDRm (slave 2) is greater than TAUDnCDRm (master), the counter of slave channel does not reach 0000<sub>H</sub> while counting down. Therefore, TAUDTTOUTm signal is not set/reset and remains in the initial state. This signal becomes a reset signal because an interrupt occurs on slave channel 2 during count-up operation.

**(2) Duty cycle = 100%**

The following settings apply to the general timing diagram in **Figure 32.123, TAUDnCDRm (Slave) = 0000H.**

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

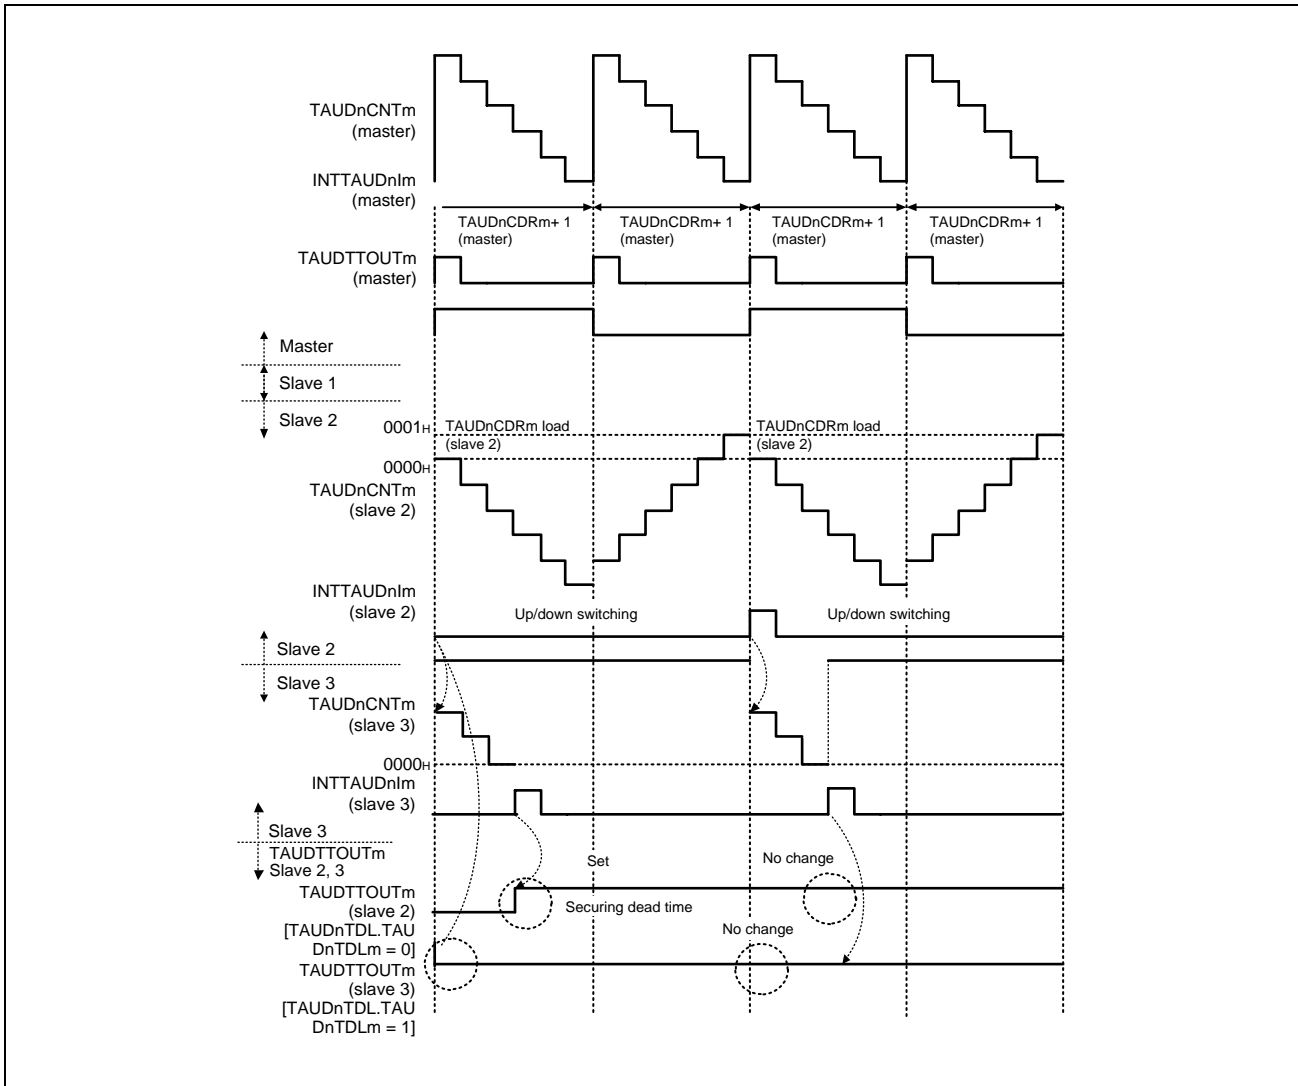

Figure 32.123 TAUDnCDRm (Slave) = 0000H

- If TAUDnCDRm (slave 2) = 0000H, the slave channel counter does not reach 0001H while counting up. Therefore, no INTTAUDnIm is generated during count-up operation.
  - The set conditions for a channel with TAUDnTDL.TAUDnTDLm = 0 are met after elapse of dead time. TAUDTTOUTm is left in a newly set state even if a set/reset is made because no reset conditions are satisfied on such a channel.
  - Slave channel 3 in the above diagram is set when the counter starts. However, TAUDTTOUTm is left in an initial state on the slave channel with TAUDnTDL.TAUDnTDLm = 1 because no reset conditions are satisfied on that channel.

### 32.15.9 A/D Conversion Trigger Output Function Type 2

#### 32.15.9.1 Overview

##### Summary

This function is identical to **Section 32.15.7, Triangle PWM Output Function**, except that TAUDTTOUTm is not output.

This function is enabled by setting channel output mode for the slave to independent channel output mode controlled by software.

#### 32.15.9.2 Block Diagram and General Timing Diagram

Figure 32.124 Block Diagram of A/D Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUDnIm is generated at the beginning of operation.  
(TAUDnCMORm.TAUDnMD0 = 1)

Figure 32.125 General Timing Diagram of A/D Conversion Trigger Output Function Type 2

## 32.15.10 Interrupt Request Signals Culling Function

### 32.15.10.1 Overview

#### Summary

This function divides the number of interrupts of the master channel by a specified value using a slave channel.

The interrupt request signals culling function is a sub function of the following functions:

- PWM Output Function (See **Section 32.15.1, PWM Output Function**)
- Triangle PWM Output Function (See **Section 32.15.7, Triangle PWM Output Function**)
- Triangle PWM Output Function with Dead Time  
(See **Section 32.15.8, Triangle PWM Output Function with Dead Time**)

#### Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode (see **Table 32.218, Contents of the TAUDnCMORm Register for the Master Channel of the Interrupt Request Signals Culling Function**).
- The operation mode of the slave channel must be set to Event Count Mode (see **Table 32.221, Contents of the TAUDnCMORm Register for the Slave Channel of the Interrupt Request Signals Culling Function**).
- This function does not use TAUDTTOUTm.

#### Functional description

The counters (master and slave) are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for both channels. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current value of the data register of the master channel and slave channel (TAUDnCDRm) are written to the counter (TAUDnCNTm).

- Master channel:  
When the counter of the master channel reaches 0000<sub>H</sub>, INTTAUDnIm is generated and TAUDnCDRm value is reloaded to TAUDnCNTm.
- Slave channel:  
Every time the master channel generates an INTTAUDnIm, the counter of the slave channel decrements by one. When the counter reaches 0000<sub>H</sub>, it awaits the next interrupt from the master channel. This causes TAUDnCNTm (slave) to reload the value of TAUDnCDRm, and an INTTAUDnIm is generated.

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm of master and slave channels stops but retains its value.

#### Conditions

This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.

### 32.15.10.2 Equations

Interrupt division operator =  $TAUDnCDRm$  (slave channel)

- One  $INTTAUDnIm$  is generated for the  $INTTAUDnIm$  count of the master channel defined by  $TAUDnCDRm$  (slave channel) + 1.

### 32.15.10.3 Block Diagram and General Timing Diagram

Figure 32.126 Block Diagram of Interrupt Request Signals Culling Function

The following settings apply to the general timing diagram.

Master channel:

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

Figure 32.127 General Timing Diagram of Interrupt Request Signals Culling Function

### 32.15.10.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.218 Contents of the TAUDnCMORm Register for the Master Channel of the Interrupt Request Signals Culling Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm not generated at the beginning of operation. 1: INTTAUDnIm generated at the beginning of operation.

#### (2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.219 Contents of the TAUDnCMURm Register for the Master Channel of the Interrupt Request Signals Culling Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

**(3) Channel Output Mode for the Master Channel**

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

**(4) Simultaneous Rewrite for the Master Channel**

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.220 Simultaneous Rewrite Settings for the Master Channel of Interrupt Request Signals Culling Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDsm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

### 32.15.10.5 Register Settings for the Slave Channel

#### (1) TAUDnCMORm for the Slave Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.221 Contents of the TAUDnCMORm Register for the Slave Channel of the Interrupt Request Signals Culling Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm not generated at the beginning of operation.

#### (2) TAUDnCMURm for the Slave Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.222 Contents of the TAUDnCMURm Register for the Slave Channel of the Interrupt Request Signals Culling Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

#### (3) Channel Output Mode for the Slave Channel

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

#### (4) Simultaneous Rewrite for the Slave Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.223 Simultaneous Rewrite Settings for the Slave Channel of Interrupt Request Signals Culling Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

#### 32.15.10.6 Operating Procedure for Interrupt Request Signals Culling Function

Table 32.224 Operating Procedure for Interrupt Request Signals Culling Function

	Operation	TAUDn Status
Restart Operation ↑	Initial Channel Setting  Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.15.10.4, Register Settings for the Master Channel</b> .  Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.15.10.5, Register Settings for the Slave Channel</b> .  Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
	Start Operation  Set TAUDnTS.TAUDnTSM of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSM is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEM (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel.
	During Operation  TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.  TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm (master) is generated.</li> <li>• TAUDnCNTm (master) loads TAUDnCDRm value and continues count operation.</li> <li>• TAUDnCNTm of slave channels counts down each time INTTAUDnIm of master channel is detected.</li> </ul> When TAUDnCNTm of the slave = 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUDnIm (slave) is generated.</li> <li>• The TAUDnCDRm value is loaded in TAUDnCNTm (slave) and count operation continues.</li> </ul>
	Stop Operation  Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEM is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

## 32.15.10.7 Specific Timing Diagrams

## (1) Interrupt count (master) = interrupt count (slave)

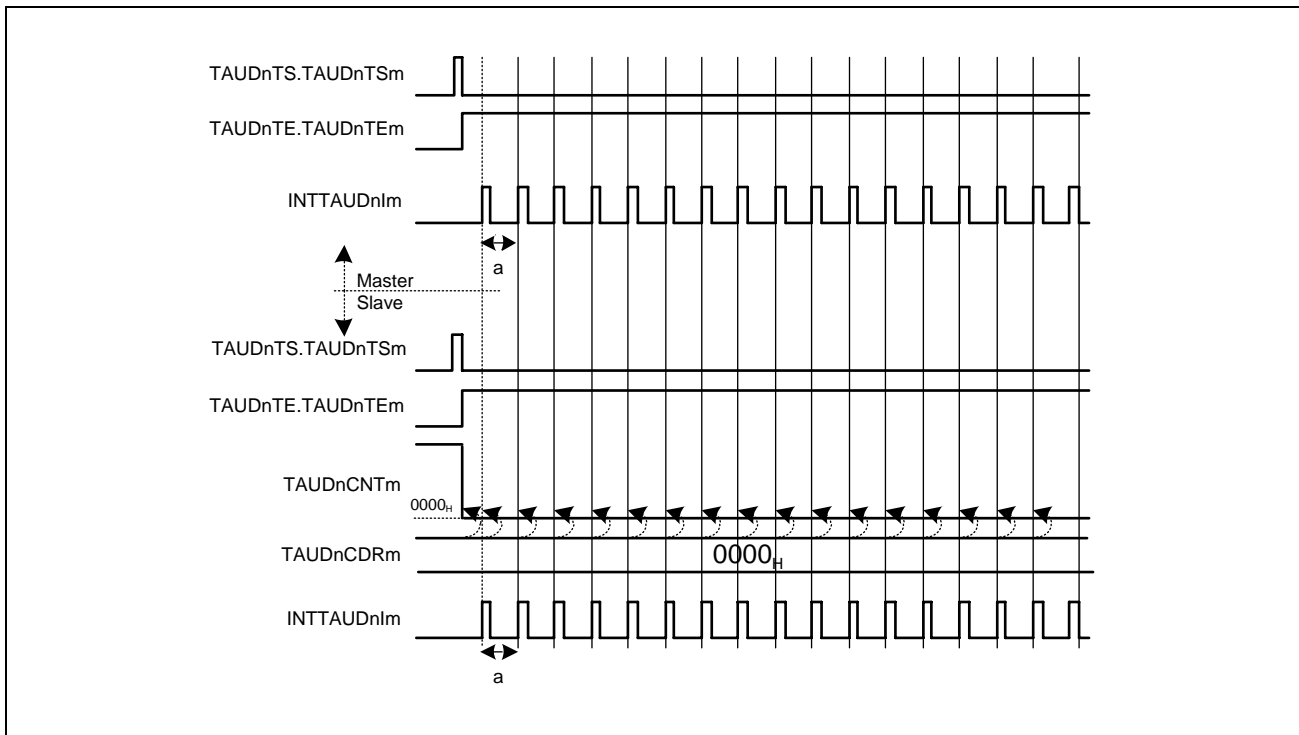

Figure 32.128 TAUDnCDRm (Slave) = 0000H

- If  $TAUDnCDRm = 0000_H$ , the  $TAUDnCDRm$  value of the slave channel is loaded into  $TAUDnCNTm$  each time  $INTTAUDnIm$  of master channel is detected. In other words,  $TAUDnCNTm$  is always  $0000_H$ .
- Therefore, an interrupt occurs on the master channel and simultaneously an interrupt occurs on slave channels.

## 32.16 Synchronous Non-Complementary and Complementary Modulation Output Functions

This section describes functions that generate 6-phase PWM output or triangle PWM output using a master channel and seven slave channels.

### 32.16.1 Non-Complementary Modulation Output Function Type 1

#### 32.16.1.1 Overview

##### Summary

This function outputs a PWM signal, a high-level signal, or a low-level signal from TAUDTTOUT<sub>m</sub> depending on the values of the real-time output bits (TAUDnTRO.TAUDnTROM) and the modulation output enable bits (TAUDnTME.TAUDnTME<sub>m</sub>) of a pair of slave channels. Three pairs of channels are typically used.

##### Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (see **Table 32.226, Contents of the TAUDnCMOR<sub>m</sub> Register for the Master Channel of Non-Complementary Modulation Output Function Type 1**).
- The operating mode for slave channels 1 to 7 should be set to one-count mode (see **Table 32.229, Contents of the TAUDnCMOR<sub>m</sub> Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1**, and **Table 32.232, Contents of the TAUDnCMOR<sub>m</sub> Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1**).
- TAUDTTOUT<sub>m</sub> is not used with the master channel of this function.
- TAUDTTOUT<sub>m</sub> of slave channel 1 is not used with this function, but TAUDnTRC.TAUDnTRC<sub>m</sub> should be set to 1 (see **Section 32.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 1 with non-complementary modulation output (see **Section 32.7, Channel Output Modes**).
- TAUDnCDR<sub>m</sub> of slave channel 1 should be set to 0000<sub>H</sub>.

##### Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTS<sub>m</sub>) to 1. This sets TAUDnTE.TAUDnTE<sub>m</sub> = 1, enabling count operation. The value of data register (TAUDnCDR<sub>m</sub>) is loaded into the counter (TAUDnCNT<sub>m</sub>) and the counter starts to count down. When the counter reaches 0000<sub>H</sub>, INTTAUDnIm is generated.

- Slave channel 1:  
Slave channel 1 is set as a channel that triggers real-time output (TAUDnTRC.TAUDnTRC<sub>m</sub> = 1). If an interrupt occurs on slave channel 1 (TAUDnCDR<sub>m</sub> is fixed to 0000<sub>H</sub>), the value of real-time output bit (TAUDnTRO.TAUDnTROM) of the channel that monitors the interrupt on slave channel 1 is reflected to the TAUDTTOUT<sub>m</sub> output. After that, the counter returns to FFFF<sub>H</sub> and waits for the next interrupt of master channel.
- Slave channel 2:  
Slave channel 2 generates a PWM output. The master channel specifies a PWM output cycle and slave channel 2 specifies a duty cycle. After generating an interrupt, the counter returns to FFFF<sub>H</sub> and awaits the next interrupt from the master channel.

Slave channels 3 to 7 operate like slave channel 2.

As described in **Table 32.225, TAUDTTOUT<sub>m</sub> Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOL<sub>m</sub> = 0)**, a signal output from TAUDTTOUT<sub>m</sub> depends on the value of the real-time output bit (TAUDnTRO.TAUDnTRO<sub>m</sub>) and modulation output bit (TAUDnTME.TAUDnTME<sub>m</sub>) of slave channel.

This function cannot use a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTT<sub>m</sub> of master and slave channels to 1. This sets TAUDnTE.TAUDnTE<sub>m</sub> to 0. TAUDnCNT<sub>m</sub> and TAUDTTOUT<sub>m</sub> of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTS<sub>m</sub> to 1.

### Conditions

- If TAUDnTME.TAUDnTME<sub>m</sub> = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOL<sub>m</sub> = 0):
  - If the channel's TAUDnTRO.TAUDnTRO<sub>m</sub> is set to 1, TAUDTTOUT<sub>m</sub> outputs a high-level signal.
  - If the channel's TAUDnTRO.TAUDnTRO<sub>m</sub> is set to 0, TAUDTTOUT<sub>m</sub> outputs a low-level signal.
- If TAUDnTME.TAUDnTME<sub>m</sub> = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOL<sub>m</sub> = 0):
  - If the channel's TAUDnTRO.TAUDnTRO<sub>m</sub> is set to 1, TAUDTTOUT<sub>m</sub> outputs PWM (positive logic) corresponding to the channel.
  - If the channel's TAUDnTRO.TAUDnTRO<sub>m</sub> is set to 0, TAUDTTOUT<sub>m</sub> outputs a low-level signal.
- If TAUDnTOL.TAUDnTOL<sub>m</sub> is set to 1, high-level and low-level signals output from TAUDTTOUT<sub>m</sub> are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOL<sub>m</sub> is permitted (cannot be changed during operation).

Table 32.225 TAUDTTOUT<sub>m</sub> Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOL<sub>m</sub> = 0)

TAUDnTME.TAUDnTME <sub>m</sub>	TAUDnTRO.TAUDnTRO <sub>m</sub>	TAUDTTOUT <sub>m</sub> Output
0	0	Low level
	1	High level
1	0	Low level
	1	PWM (positive logic)

- This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.
- TAUDnCDR<sub>m</sub> value of slave channel 1 should be set to 0000<sub>H</sub> so that a real-time output is triggered at the same time with PWM generation on slave channels 2 to 7.
- If TAUDnTOL.TAUDnTOL<sub>m</sub> is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTO<sub>m</sub> is set to 0 (low) before TAUDnTE.TAUDnTE<sub>m</sub> is set to 0.
- If TAUDnTOL.TAUDnTOL<sub>m</sub> is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTO<sub>m</sub> is set to 1 (high) before TAUDnTE.TAUDnTE<sub>m</sub> is set to 0.

### 32.16.1.2 Equations

Slave channels 2 to 7:

Pulse period = [TAUDnCDR<sub>m</sub> (master) + 1] × count clock cycle

Duty time = [TAUDnCDR<sub>m</sub> (slave)] × count clock cycle

32.16.1.3 Block Diagram and General Timing Diagram

Figure 32.129 Block Diagram of Non-Complementary Modulation Output Function Type 1

The following settings apply to the general timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.130 General Timing Diagram of Non-Complementary Modulation Output Function Type 1

NOTE

TAUDTTOUTm of slave channel 2 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.16.1.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.226 Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	1: INTTAUDnIm is generated at the beginning of operation or at a restart time.

#### (2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.227 Contents of the TAUDnCMURm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for the Master Channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

### (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.228 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

#### NOTE

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires an upper channel higher than the master channel that operates with **Section 32.14.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Conduct operation settings under the following conditions.

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1  
In addition, TAUDnCDRm settings for this channel are as follows.  
= ((TAUDnCDR setting for the master channel targeted for simultaneous rewrite + 1) × Interrupt count) – 1
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm = 0, TAUDnRDSm = 1

### 32.16.1.5 Register Settings for Slave Channel 1

#### (1) TAUDnCMORm for Slave Channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.229 Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid.

#### (2) TAUDnCMURm for Slave Channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.230 Contents of the TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

**(3) Channel Output Mode**

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

**CAUTION**

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

**(4) Simultaneous Rewrite for Slave Channel 1**

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.231 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

### 32.16.1.6 Register Settings for Slave Channels 2 to 7

#### (1) TAUDnCMORm for Slave Channels 2 to 7

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid.

#### (2) TAUDnCMURm for Slave Channels 2 to 7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.233 Contents of the TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

**(3) Channel Output Mode for Slave Channels 2 to 7**

Table 32.234 Control Bit Settings in Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

**(4) Simultaneous Rewrite of Slave Channels 2 to 7**

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.235 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

### 32.16.1.7 Operating Procedure for Non-Complementary Modulation Output Function Type 1

Table 32.236 Operating Procedure for Non-Complementary Modulation Output Function Type 1

	Stop Operation	<p>Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.</p>	<p>TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.</p>

### 32.16.1.8 Specific Timing Diagrams

The following settings apply to the specific timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.131 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 1

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The “Setting” symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROM can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and master channel cycle. According to the modified setting, modulation waveforms are output from TAUDTTOUTm.

A TAUDnTRO.TAUDnTROM bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

## 32.16.2 Non-Complementary Modulation Output Function Type 2

### 32.16.2.1 Overview

#### Summary

This function outputs a triangular PWM output signal, a high-level signal, or low-level signal from TAUDTTOUT<sub>m</sub> depending on the real-time output bit value (TAUDnTRO.TAUDnTRO<sub>m</sub>) and the modulation output enable bit value (TAUDnTME.TAUDnTME<sub>m</sub>) of a pair of slave channels. Three pairs of channels are typically used.

#### Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (see **Table 32.238, Contents of the TAUDnCMOR<sub>m</sub> Register for the Master Channel of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channel 1 should be set to event count mode (see **Table 32.242, Contents of the TAUDnCMOR<sub>m</sub> Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channels 2 to 7 should be set to count-up/-down mode (see **Table 32.245, Contents of the TAUDnCMOR<sub>m</sub> Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2**).
- The output mode for the master channel should be set to independent channel output mode 1 (see **Section 32.7, Channel Output Modes**).
- This function does not use TAUDTTOUT<sub>m</sub> of slave channel 1 but TAUDnTRC.TAUDnTRC<sub>m</sub> should be set to 1 (see **Section 32.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with non-complementary modulation output (see **Section 32.7, Channel Output Modes**).

### Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSM) to 1. This sets TAUDnTE.TAUDnTEM = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm).

- Master channel:

The counter of master channel starts to count down. When the counter reaches 0000<sub>H</sub>, INTTAUDnIm is generated.

- Slave channel 1:

When slave channel 1 detects an interrupt from the master channel, the TAUDnCNTm value is decremented. When an interrupt from the master channel is detected (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, the TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

Since slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1), if an interrupt occurs on slave channel 1, the real-time output bit (TAUDnTRO.TAUDnTROM) of the channel which monitors an interrupt on the corresponding channel is reflected to the TAUDTTOUTm output.

- Slave channel 2:

Once detecting an interrupt from the master channel, TAUDnCNTm counts in the reverse direction. When an interrupt is detected during count-up operation, TAUDnCDRm value is reloaded and then the counter starts to count down.

If TAUDnCNTm = 0001<sub>H</sub>, an interrupt occurs and a PWM output signal is set/reset.

The combined use of the master channel and slave channel 2 generates a PWM output signal. The master channel generates a PWM output cycle and slave channel 2 generate a duty cycle.

Slave channels 3 to 7 operate like slave channel 2.

A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROM) and a modulation output bit value (TAUDnTME.TAUDnTME<sub>m</sub>) of the slave channel, as described in **Table 32.237, TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOL<sub>m</sub> = 0)**.

This function cannot make a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEM to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSM to 1.

**Conditions**

- If TAUDnTME.TAUDnTMEm = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM (positive logic) corresponding to the channel.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

Table 32.237 TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)

TAUDnTME.TAUDnTMEm	TAUDnTRO.TAUDnTROm	TAUDTTOUTm Output
0	0	Low level
	1	High level
1	0	Low level
	1	PWM (positive logic)

- This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTOM is set to 0 (low) before TAUDnTE.TAUDnTEM is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOM is set to 1 (high) before TAUDnTE.TAUDnTEM is set to 0.

**32.16.2.2 Equations**

Slave channels 2 to 7:

Carrier cycle (down/up) = [TAUDnCDRm (master) + 1] × 2 × count clock cycle

Duty time = [TAUDnCDRm (master) + 1 - TAUDnCDRm (slave)] × 2 × count clock cycle

32.16.2.3 Block Diagram and General Timing Diagram

Figure 32.132 Block Diagram of Non-Complementary Modulation Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORM.TAUDnMD0 = 0)
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.133 General Timing Diagram of Non-Complementary Modulation Output Function Type 2

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.238 Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time. 1: INTTAUDnIm is generated at the beginning of operation or at a restart time.

#### (2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.239 Contents of the TAUDnCMURm Register for the Master channel of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for the Master Channel

Table 32.240 Control Bit Settings for the Master Channel in Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (toggle mode with TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

### (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.241 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

#### NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 32.16.2.5 Register Settings for Slave Channel 1

#### (1) TAUDnCMORM for Slave Channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.242 Contents of the TAUDnCMORM Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software. 011: Triggers simultaneous rewrite.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

#### (2) TAUDnCMURM for Slave Channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.243 Contents of the TAUDnCMURM Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

**(3) Channel Output Mode**

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

**CAUTION**

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

**(4) Simultaneous Rewrite for Slave Channel 1**

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.244 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

### 32.16.2.6 Register settings for slave channels 2 to 7

#### (1) TAUDnCMORm for Slave Channels 2 to 7

15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	111: The up/down output trigger signal of the master channel
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1001: Count-up/-down mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

#### (2) TAUDnCMURm for Slave Channels 2 to 7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.246 Contents of the TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

**(3) Output Mode for Slave Channels 2 to 7**

Table 32.247 Control Bit Settings in Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: The upper channel generates the real-time output trigger for channel m
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

**(4) Simultaneous Rewrite for Slave Channels 2 to 7**

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.248 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

### 32.16.2.7 Operating Procedure for Non-Complementary Modulation Output Function Type 2

Table 32.249 Operating Procedure for Non-Complementary Modulation Output Function Type 2

	Operation	TAUDn Status
Initial Channel Setting	<p>Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.16.2.4, Register Settings for the Master Channel.</b></p> <p>Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.16.2.5, Register Settings for Slave Channel 1.</b></p> <p>Slave channels 2 to 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.16.2.6, Register settings for slave channels 2 to 7.</b></p> <p>Set the value of TAUDnCDRm register of every channel. Set pulse cycle in TAUDnCDRm of master channel, and in TAUDnCDRm of slave channel 1, set the number of interrupts from master channel to be ignored before slave channel 1 generates a real-time output trigger. Set duty width in TAUDnCDRm of slave channels 2 to 7.</p> <p>Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.</p>	Channel operation is stopped.

	Stop Operation	<p>Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.</p>	<p>TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.</p>

### 32.16.2.8 Specific Timing Diagrams

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.134 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 2

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The “Setting” symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

### 32.16.3 Complementary Modulation Output Function

#### 32.16.3.1 Overview

##### Summary

This function outputs a triangle PWM output signal, a high-level signal, or low-level signal from TAUDTTOUT<sub>m</sub> with dead time added, depending on the real-time output bit value (TAUDnTRO.TAUDnTRO<sub>m</sub>) and the modulation output bit value (TAUDnTME.TAUDnTME<sub>m</sub>) of a pair of slave channels, and an output level bit value (TAUDnTDL.TAUDnTDL<sub>m</sub>). Three pairs of channels are typically used.

##### Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (see **Table 32.251, Contents of the TAUDnCMOR<sub>m</sub> Register for the Master Channel of the Complementary Modulation Output Function**).
- The operating mode for slave channel 1 should be set to event count mode (see **Table 32.255, Contents of the TAUDnCMOR<sub>m</sub> Register for Slave Channel 1 of the Complementary Modulation Output Function**).
- The operating mode for slave channels 2, 4 and 6 should be set to count-up/-down mode (see **Table 32.258, Contents of the TAUDnCMOR<sub>m</sub> Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function**).
- The operating mode for slave channels 3, 5 and 7 should be set to one-count mode (see **Table 32.262, Contents of the TAUDnCMOR<sub>m</sub> Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function**).

In addition, as the number of occurrences of an interrupt for slave channels 3, 5 and 7 within the carrier cycle is not uniquely determined, do not use the interrupt as an interrupt source.

- The output mode for master channels should be set to independent channel output mode 1 (see **Section 32.7, Channel Output Modes**).
- This function does not use TAUDTTOUT<sub>m</sub> of slave channel 1 but TAUDnTRC.TAUDnTRC<sub>m</sub> should be set to 1 (see **Section 32.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with complementary modulation output (see **Section 32.7, Channel Output Modes**).

##### Functional description

- Master channel:  
The counter of the master channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTS<sub>m</sub>) to 1. This sets TAUDnTE.TAUDnTE<sub>m</sub> = 1, enabling count operation. The value of data register (TAUDnCDR<sub>m</sub>) of the master channel is loaded into the counter (TAUDnCNT<sub>m</sub>) and the counter starts to count down from this value.  
When the counter of master channel reaches 0000<sub>H</sub>, INTTAUDnIm is generated. This decrements the counter value of slave channel 1 by 1 and the counter of slave channel 2 starts to count in the opposite direction.
- Slave channel 1:  
When the counter reaches 0000<sub>H</sub>, slave channel 1 waits for the next interrupt from the master channel. And the TAUDnCDR<sub>m</sub> value is reloaded into TAUDnCNT<sub>m</sub> (slave 1) and INTTAUDnIm is generated.  
Slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRC<sub>m</sub> = 1). The value of real-time output bit (TAUDnTRO.TAUDnTRO<sub>m</sub>) of each channel is applied to the channel that detects the occurrence of an

interrupt on slave channel 1 by an interrupt. The real-time output bit value can be changed in any timing by application software but a new value is not applied until an interrupt occurs on slave channel 1.

- Slave channel 2:

When the slave channel 2 counter reaches 0001<sub>H</sub>, the slave channel 3 counter starts counting down. When the slave channel 3 counter reaches 0000<sub>H</sub>, an interrupt occurs.

- Slave channels 2 and 3:

The combined use of the master channel and slave channels 2 and 3 generates a PWM output signal. The master channel generates a PWM output cycle, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time.

- Slave channels 4 to 7:

Slave channels 4 and 6 operate like slave channel 2. Slave channels 5 and 7 operate like slave channel 3.

A signal that is output from TAUDTTOUT<sub>m</sub> depends on a real-time output bit value (TAUDnTRO.TAUDnTRO<sub>m</sub>), a modulation output bit value (TAUDnTME.TAUDnTME<sub>m</sub>), and an output level bit value (TAUDnTDL.TAUDnTDL<sub>m</sub>) of the slave channel, as described in **Table 32.250, TAUDTTOUT<sub>m</sub> Output (TAUDnTOL.TAUDnTOL<sub>m</sub> = 0) for a Pair of Slave Channels of Complementary Modulation Output Function.**

It is, however, prohibited that a high-level signal is output from both channel 2 and channel 3 (in order to prevent a motor driver short circuit).

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTT<sub>m</sub> of master and slave channels to 1. This sets TAUDnTE.TAUDnTE<sub>m</sub> to 0. TAUDnCNT<sub>m</sub> and TAUDTTOUT<sub>m</sub> of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTS<sub>m</sub> to 1.

### Conditions

- If TAUDnTME.TAUDnTME<sub>m</sub> of a pair of channels is set to 1 (TAUDnTOL.TAUDnTOL<sub>m</sub> = 0):
  - If TAUDnTRO.TAUDnTRO<sub>m</sub> of one channel is set to 1, TAUDTTOUT<sub>m</sub> outputs the corresponding PWM of the channel.
  - If TAUDnTRO.TAUDnTRO<sub>m</sub> of both channels is set to 0, TAUDTTOUT<sub>m</sub> of a pair outputs a low-level signal.
- If TAUDnTME.TAUDnTME<sub>m</sub> of a pair of channels is set to 0 (TAUDnTOL.TAUDnTOL<sub>m</sub> = 0):
  - If TAUDnTRO.TAUDnTRO<sub>m</sub> is set to 1, TAUDTTOUT<sub>m</sub> of the channel outputs a high-level signal.
  - If TAUDnTRO.TAUDnTRO<sub>m</sub> is set to 0, TAUDTTOUT<sub>m</sub> of the channel outputs a low-level signal.
- If TAUDnTOL.TAUDnTOL<sub>m</sub> is set to 1, high-level and low-level signals output from TAUDTTOUT<sub>m</sub> are inverted. The PWM signal is negative logic.

Table 32.250 TAUDTTOUT<sub>m</sub> Output (TAUDnTOL.TAUDnTOL<sub>m</sub> = 0) for a Pair of Slave Channels of Complementary Modulation Output Function

TAUDnTME.T AUDnTME02	TAUDnTME.T AUDnTME03	TAUDnTRO.T AUDnTRO02	TAUDnTRO.T AUDnTRO03	TAUDnTDL.T AUDnTDL02	TAUDnTDL.T AUDnTDL03	TAUDTTOUT2 Output	TAUDTTOUT3 Output

		1	1	X	X	Setting prohibited	Setting prohibited

## NOTES

- 
1. In the above table, PWM indicates a positive PWM signal and ~PWM indicates an inverted PWM signal (positive logic). PWM and ~PWM are set by TAUDnTDL.TAUDnTDLm.
  2. Any settings not listed above are prohibited.
- 
- If TAUDnTME.TAUDnTMEm is continuously set to 1 while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, full modulation is applied.
  - If TAUDnTME.TAUDnTMEm is set to 1 at the first half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, first-half modulation is applied.
  - If TAUDnTME.TAUDnTMEm is set to 1 at the second half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, second-half modulation is applied.
  - Whether dead time is added to a normal or reverse phase PWM signal when two channels become high-level signal outputs simultaneously depends on a TAUDnTDL.TAUDnTDLm bit value.
    - If TAUDnTDL.TAUDnTDLm = 0, dead time is added to a normal phase PWM signal.
    - If TAUDnTDL.TAUDnTDLm = 1, dead time is added to a reverse phase PWM signal.
    - The operation defined by a TAUDnTDL.TAUDnTDLm bit value should be conducted by application software during operation. To modify TAUDnTDL.TAUDnTDLm, rewrite it during the period when TAUDnTRO.TAUDnTROm is 00<sub>B</sub>.
  - The TAUDnCDRm value of slave channel 1 should be set to the value to generate INTTAUDnIm of slave channel 1 at a carrier cycle (peak interrupt timing).
  - If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7:
    - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOM is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
    - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOM is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.
  - If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7:
    - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOM is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.
    - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOM is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
  - This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.

### 32.16.3.2 Equations

Pulse period = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq \text{TAUDnCDRm (master)} < \text{FFFF}_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

For slave channels 2 and 3:

PWM signal width (positive phase) = [ (TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 – (TAUDnCDRm (slave 3) + 1) ] × count clock cycle

PWM signal width (negative phase) = [ (TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 + (TAUDnCDRm (slave 3) + 1) ] × count clock cycle

For slave channels 4 to 7:

Slave channels 4 and 6 are calculated in the same way as slave channel 2, whereas slave channels 5 and 7 are calculated as slave channel 3.

## 32.16.3.3 Block Diagram and General Timing Diagram

Figure 32.135 Block Diagram of Complementary Modulation Output Function

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channel 1: TAUDnCDRm = 0001<sub>H</sub>
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.136 General Timing Diagram of Complementary Modulation Output Function

### 32.16.3.4 Register Settings for the Master Channel

#### (1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.251 Contents of the TAUDnCMORm Register for the Master Channel of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated and TAUDTTOUTm is not toggled at the beginning of operation or at a restart time. 1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation.

#### (2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.252 Contents of the TAUDnCMURm Register for the Master Channel of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Channel Output Mode for the Master Channel

Table 32.253 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

### (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.254 Simultaneous Rewrite Settings for the Master Channel of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

#### NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 32.16.3.5 Register Settings for Slave Channel 1

#### (1) TAUDnCMORM for Slave Channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.255 Contents of the TAUDnCMORM Register for Slave Channel 1 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software. 011: Triggers simultaneous rewrite.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

#### (2) TAUDnCMURM for Slave Channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.256 Contents of the TAUDnCMURM Register for Slave Channel 1 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

**(3) Channel Output Mode**

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

**CAUTION**

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

**(4) Simultaneous Rewrite for Slave Channel 1**

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.257 Simultaneous Rewrite Settings for Slave Channel 1 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDsm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDsm = 0.

### 32.16.3.6 Register settings for slave channels 2, 4, and 6

#### (1) TAUDnCMORm for Slave Channels 2, 4, and 6

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.258 Contents of the TAUDnCMORm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	111: Up/down output trigger signal of master channel
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1001: Count-up/-down mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

#### (2) TAUDnCMURm for Slave Channels 2, 4, and 6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.259 Contents of the TAUDnCMURm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

### (3) Output mode for Slave Channels 2, 4, and 6

Table 32.260 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

#### CAUTION

At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

### (4) Simultaneous Rewrite for Slave Channels 2, 4, and 6

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.261 Simultaneous Rewrite Settings for Slave Channels 2, 4, and 6 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

### 32.16.3.7 Register settings for slave channels 3, 5, and 7

#### (1) TAUDnCMORm for Slave Channels 3, 5, and 7

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKs[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.262 Contents of the TAUDnCMORm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKs[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKs[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	110: Dead time trigger
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

#### (2) TAUDnCMURm for Slave Channels 3, 5, and 7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 32.263 Contents of the TAUDnCMURm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

**(3) Output Mode for Slave Channels 3, 5, and 7**

Table 32.264 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

**CAUTION**

At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from even channels.

**(4) Simultaneous Rewrite for Slave Channels 3, 5, and 7**

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.265 Simultaneous Rewrite Settings for Slave Channels 3, 5, and 7 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

### 32.16.3.8 Operating Procedure for Complementary Modulation Output Function

Table 32.266 Operating Procedure for Complementary Modulation Output Function

	Operation	TAUDn Status
Initial Channel Setting	<p>Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.16.3.4, Register Settings for the Master Channel.</b></p> <p>Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.16.3.5, Register Settings for Slave Channel 1.</b></p> <p>Slave channels 2, 4, and 6: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.16.3.6, Register settings for slave channels 2, 4, and 6.</b></p> <p>Slave channels 3, 5, and 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in <b>Section 32.16.3.7, Register settings for slave channels 3, 5, and 7.</b></p> <p>Set the value of TAUDnCDRm register of every channel. Set a pulse cycle using TAUDnCDRm of master channel, and an interrupt count of master channel to be ignored using TAUDnCDRm of slave channel 1. Also set a duty width in TAUDnCDRm of slave channels 2, 4, and 6, and a dead time delay on slave channels 3, 5, and 7.</p> <p>Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.</p>	Channel operation is stopped.

Table 32.266 Operating Procedure for Complementary Modulation Output Function

	Operation	TAUDn Status	
Restart Operation ↑	Start Operation	<p>Set TAUDnTS.TAUDnTSM of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSM is a trigger bit, which is automatically cleared to 0.</p>	<p>TAUDnTE.TAUDnTEM of master and slave channels is set to 1 and the counter starts counting down.</p>
	During Operation	<p>TAUDnCDRm, TAUDnTRO.TAUDnTROM, TAUDnTME.TAUDnTME m, and TAUDnTDL.TAUDnTDLm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time.</p> <p>TAUDnRDT.TAUDnRDTm can be changed during operation.</p>	<p>TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. TAUDnCDRm value of slave channel 1 is loaded and the counter waits for a master channel interrupt. When the counter of master channel reaches 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUDnIm is generated.</li> <li>• TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down.</li> <li>• TAUDnCNTm value of slave channel 1 decrements by 1 and the counter waits for the next master channel interrupt.</li> <li>• TAUDnCNTm of slave channels 2, 4, and 6 reloads the TAUDnCDRm value, or performs counting in opposite direction.</li> <li>• At the same timing when the TAUDnCDRm value of slave channels 2, 4, and 6 is loaded, the TAUDnTME.TAUDnTME m value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output.</li> <li>• The counter of slave channel 1 waits for the next interrupt from the master channel when reaching 0000<sub>H</sub>. When the interrupt is detected: <ul style="list-style-type: none"> <li>– TAUDnCDRm value is reloaded into TAUDnCNTm and the counter waits for the next master channel interrupt.</li> <li>– INTTAUDnIm is generated.</li> <li>– TAUDnTRO.TAUDnTROM is changeable.</li> </ul> </li> <li>• When the counter of slave channels 2, 4, and 6 reaches 0001<sub>H</sub>: <ul style="list-style-type: none"> <li>– INTTAUDnIm is generated.</li> <li>– PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is matched).</li> <li>– TAUDnCDRm value of slave channels 3, 5, and 7 is loaded into TAUDnCNTm to perform counting down.</li> </ul> </li> <li>• When the counter of slave channels 3, 5, and 7 reaches 0000<sub>H</sub>: <ul style="list-style-type: none"> <li>– INTTAUDnIm is generated.</li> <li>– PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is matched).</li> </ul> </li> </ul>
	Stop Operation	<p>Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.</p>	<p>TAUDnTE.TAUDnTEM is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.</p>

### 32.16.3.9 Specific Timing Diagrams

The following settings apply to the timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channel 1: TAUDnCDRm = 0001<sub>H</sub>
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.137 Specific Timing Diagram of Complementary Modulation Output Function

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEem bits of lower slave channels during operation.

A modulated PWM output signal and TAUDnTRO.TAUDnTROm bit value are output from slave channels 2 and 3.

TAUDnTME.TAUDnTMEem and TAUDnTDL.TAUDnTDLm settings are reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is specified by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

**NOTE**

---

Dead time is added to suppress simultaneous change of PWM edges of normal and reverse phases.

---

The “Setting” symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTME<sub>m</sub>, TAUDnTRO.TAUDnTRO<sub>m</sub>, and TAUDnTDL.TAUDnTDL<sub>m</sub> can be changed.

## Section 33 Timer Array Unit J (TAUJ)

This section contains a generic description of the timer array unit J (TAUJ).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of TAUJ.

### 33.1 Features of RH850/F1KH, RH850/F1KM TAUJ

#### 33.1.1 Number of Units and Channels

This microcontroller has the following number of TAUJ units and channels.

Table 33.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	4	4	4
Name	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)

Table 33.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	4	4	4	4	4
Name	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)

Table 33.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	4	4	4
Name	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)

Table 33.4 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	4	4	4	4
Name	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)	TAUJn (n = 0 to 3)

Table 33.5 TAUJn Unit Configurations and Channels (RH850/F1KH-D8)

Unit Name TAUJn	Number of Channels per Unit	RH850/F1KH-D8 176 Pins (16 ch)	RH850/F1KH-D8 233 Pins (16 ch)	RH850/F1KH-D8 324 Pins (16 ch)

Table 33.9 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual TAUJ units are identified by the index "n"; for example, TAUJnTOM is the TAUJn channel output mode register.
m	The TAUJ has 4 channels. Throughout this section, the individual channels are identified by the index "m", thus a certain channel is denoted as CHm (m = 0 to 3). The even numbered channels (m = 0, 2) are denoted as CHm_even. The odd numbered channels (m = 1, 3) are denoted as CHm_odd.

### 33.1.2 Register Base Addresses

TAUJn base addresses are listed in the following table.

TAUJn register addresses are given as offsets from the base addresses.

Table 33.10 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<TAUJ0_base>	FFE5 0000 <sub>H</sub>
<TAUJ1_base>	FFE5 1000 <sub>H</sub>
<TAUJ2_base>	FFE5 0100 <sub>H</sub>
<TAUJ3_base>	FFE5 1100 <sub>H</sub>

### 33.1.3 Clock Supply

The TAUJn clock supply is shown in the following table.

Table 33.11 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAUJ0	PCLK	CKSCLK_ATAUJ	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_ATAUJ	Bus clock
TAUJ1	PCLK	CKSCLK_IPERI1	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	Bus clock
TAUJ2	PCLK	CKSCLK_ATAUJ	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_ATAUJ	Bus clock
TAUJ3	PCLK	CKSCLK_IPERI1	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	Bus clock

### 33.1.4 Interrupt Requests

TAUJn interrupt requests are listed in the following table.

Table 33.12 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
TAUJ0			
INTTAUJ0I0	Channel 0 interrupt	80	21
INTTAUJ0I1	Channel 1 interrupt	81	80
INTTAUJ0I2	Channel 2 interrupt	82	81
INTTAUJ0I3	Channel 3 interrupt	83	22
TAUJ1			
INTTAUJ1I0	Channel 0 interrupt	168	46
INTTAUJ1I1	Channel 1 interrupt	169	100
INTTAUJ1I2	Channel 2 interrupt	170	47
INTTAUJ1I3	Channel 3 interrupt	171	101
TAUJ2			
INTTAUJ2I0	Channel 0 interrupt	277	103
INTTAUJ2I1	Channel 1 interrupt	278	104
INTTAUJ2I2	Channel 2 interrupt	279	105
INTTAUJ2I3	Channel 3 interrupt	280	106
TAUJ3			
INTTAUJ3I0	Channel 0 interrupt	281	107
INTTAUJ3I1	Channel 1 interrupt	282	108
INTTAUJ3I2	Channel 2 interrupt	283	109
INTTAUJ3I3	Channel 3 interrupt	284	110

### 33.1.5 Reset Sources

TAUJn reset sources are listed in the following table. TAUJn is initialized by these reset sources.

Table 33.13 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
TAUJ0	All reset sources except the transition to DeepSTOP mode (AWORES)
TAUJ1	All reset sources (ISORES)
TAUJ2	All reset sources except the transition to DeepSTOP mode (AWORES)
TAUJ3	All reset sources (ISORES)

### 33.1.6 External Input/Output Signals

External input/output signals of TAUJ<sub>n</sub> are listed below.

Table 33.14 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
<b>TAUJ0</b>		
TAUJTIN0, TAUJTIN1	Channel 0, 1 input	TAUJ0I0, TAUJ0I1
TAUJTIN2	Channel 2 input	TAUJ0I2 or RTCA0OUT* <sup>1</sup> or TAUJTOUT0 (TAUJ1)* <sup>1</sup>
TAUJTIN3	Channel 3 input	TAUJ0I3 or RTCA0OUT* <sup>1</sup> or TAUJTOUT0 (TAUJ1)* <sup>1</sup>
TAUJTOUT0 to TAUJTOUT3	Channel 0 to 3 output	TAUJ0O0 to TAUJ0O3
<b>TAUJ1</b>		
TAUJTIN0 to TAUJTIN3	Channel 0 to 3 input	TAUJ1I0 to TAUJ1I3
TAUJTOUT0 to TAUJTOUT3	Channel 0 to 3 output	TAUJ1O0 to TAUJ1O3
<b>TAUJ2</b>		
TAUJTIN0, TAUJTIN1	Channel 0, 1 input	TAUJ2I0, TAUJ2I1
TAUJTIN2	Channel 2 input	TAUJ2I2 or TAUJTOUT0(TAUJ3)* <sup>1</sup>
TAUJTIN3	Channel 3 input	TAUJ2I3 or TAUJTOUT0(TAUJ3)* <sup>1</sup>
TAUJTOUT0 to TAUJTOUT3	Channel 0 to 3 output	TAUJ2O0 to TAUJ2O3
<b>TAUJ3</b>		
TAUJTIN0 to TAUJTIN3	Channel 0 to 3 input	TAUJ3I0 to TAUJ3I3
TAUJTOUT0 to TAUJTOUT3	Channel 0 to 3 output	TAUJ3O0 to TAUJ3O3

Note 1. For details, see **Section 33.1.8, TAUJ0 / TAUJ2 Input Selection**.

### 33.1.7 Internal Input/Output Signals

The internal input/output signals of TAUJ<sub>n</sub> are listed below.

Table 33.15 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
TAUJnTSSTm* <sup>1</sup>	Simultaneous channel start trigger input	PIC

Note 1. n = 1 only. TAUJ0TSSTm is not connected to PIC.

### 33.1.8 TAUJ0 / TAUJ2 Input Selection

#### TAUJ0 Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

The 1-Hz pulse output (RTCA0OUT) from RTCA0 and the output (TAUJTOUT0) from TAUJ1 can be input to TAUJTTIN2 and TAUJTTIN3 as shown in the following figure.

Figure 33.1 Selection of Signals Input to TAUJ0

**TAUJ2 Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)**

The output from TAUJ3 (TAUJTTOUT0) can be input to TAUJTTIN2 and TAUJTTIN3 as shown in the following figure.

Figure 33.2 Selection of Signals Input to TAUJ2

The following table shows how to select signals input to the TAUJ.

Table 33.16 TAUJ0 Input Selections

Input Signal	Function	Settings			
		SELB_TAUJ0I3	SELB_TAUJ0I2	SELB_TAUJ0I1	SELB_TAUJ0I0
TAUJTTIN2	Port TAUJ0I2	—	—	—	0
	RTCA0OUT (Real-time clock 1-Hz output)	—	0	—	1
	TAUJTTOUT0 (TAUJ1)	—	1	—	1
TAUJTTIN3	Port TAUJ0I3	—	—	0	—
	RTCA0OUT (Real-time clock 1-Hz output)	0	—	1	—
	TAUJTTOUT0 (TAUJ1)	1	—	1	—

Table 33.17 TAUJ2 Input Selections

Input Signal	Function	Settings	
		SELB_TAUJ2I1	SELB_TAUJ2I0
TAUJTTIN2	Port TAUJ2I2	—	0
	TAUJTTOUT0 (TAUJ3)	—	1
TAUJTTIN3	Port TAUJ2I3	0	—
	TAUJTTOUT0 (TAUJ3)	1	—

### 33.1.8.1 List of Registers

Input signal selection register is listed in the following table.

Table 33.18 List of Registers

Module Name	Register Name	Symbol	Address
TAUJn input selection registers			
SL_TAUJn	TAUJTINm input signal selection register	SELB_TAUJ0I	FFE5 4000 <sub>H</sub>
	TAUJTINm input signal selection register	SELB_TAUJ2I	FFE5 4004 <sub>H</sub>

### 33.1.8.2 SELB\_TAUJ0I — TAUJTINm Input Signal Selection Register

This register selects the TAUJ0 input signals.

**Access:** This register can be read or written in 8-bit units.

**Address:** FFE5 4000<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SELB_TAUJ0I3	SELB_TAUJ0I2	SELB_TAUJ0I1	SELB_TAUJ0I0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.19 SELB\_TAUJ0I Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	SELB_TAUJ0I3	Selection of TAUJTIN3 input signal: 0: RTCA0OUT 1: TAUJTOUT0 (TAUJ1)
2	SELB_TAUJ0I2	Selection of TAUJTIN2 input signal: 0: RTCA0OUT 1: TAUJTOUT0 (TAUJ1)
1	SELB_TAUJ0I1	Selection of TAUJTIN3 input signal: 0: Port TAUJ0I3 1: Timer Input
0	SELB_TAUJ0I0	Selection of TAUJTIN2 input signal: 0: Port TAUJ0I2 1: Timer Input

### 33.1.8.3 SELB\_TAUJ2I — TAUJTTINm Input Signal Selection Register

This register selects the input signals to several TAUJ2 inputs.

**Access:** This register can be read or written in 8-bit units.

**Address:** FFE5 4004<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SELB_TAUJ2I1	SELB_TAUJ2I0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 33.20 SELB\_TAUJ2I Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	SELB_TAUJ2I1	Selection of TAUJTTIN3 input signal: 0: Port TAUJ2I3 1: TAUJTTOUT0 (TAUJ3)
0	SELB_TAUJ2I0	Selection of TAUJTTIN2 input signal: 0: Port TAUJ2I2 1: TAUJTTOUT0 (TAUJ3)

## 33.2 Overview

### 33.2.1 Functional Overview

The TAUJ has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUJ is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 4 channels, each equipped with a 32-bit counter  $TAUJnCNTm$  and a 32-bit data register  $TAUJnCDRm$  to hold the count start value or compare value.

It also contains several control and status registers.

#### Independent and synchronous operation

Every channel can operate in two operating modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels.

The synchronous operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

### 33.2.2 Terms

In this section, the following terms are used.

#### Independent channel operation function/synchronous operation channel operation function

TAUJ has 4 channels, and provides an independent channel operation function that individual channels operate independently and a synchronous channel operation function that is implemented by using a combination of channels.

- The independent channel operation function can be used any channel independently of all other channels.
- The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

#### Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

#### Upper/lower channel

Based on the channel number  $m$ , a channel with a smaller channel number or higher channel number can be referred to as “upper” or “lower” channel:

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

For instance, as to channel 2, channel 1 is an upper channel and channel 3 is a lower channel. Channel 0 is the highest channel and channel 3 is the lowest channel.

### 33.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 33.21 Functional List of TAUJ Operations

Operation Function	Example
Independent Channel Operation Functions	<b>Section 33.12</b>
Interval Timer Function	<b>Section 33.12.1</b>
TAUJTTINm Input Interval Timer Function	<b>Section 33.12.2</b>
TAUJTTINm Input Pulse Interval Measurement Function	<b>Section 33.12.3</b>
TAUJTTINm Input Signal Width Measurement Function	<b>Section 33.12.4</b>
TAUJTTINm Input Position Detection Function	<b>Section 33.12.5</b>
TAUJTTINm Input Period Count Detection Function	<b>Section 33.12.6</b>
Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)	<b>Section 33.12.7</b>
Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)	<b>Section 33.12.8</b>
Synchronous Channel Operation Functions	<b>Section 33.13</b>
PWM Output Function	<b>Section 33.13.1</b>

### 33.2.4 TAUJ I/O and Interrupt Request Signals

Figure 33.3 TAUJ I/O and Interrupt Request Signals

### 33.2.5 Block Diagram

The following figure shows the main components of the TAUJ.

Figure 33.4 Block Diagram of the TAUJ

The prefix “TAUJn” has been omitted from the register names for the sake of clarity in the above figure.

### 33.2.6 Description of Block Diagram

The following describes the functional blocks.

#### Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived by dividing PCLK in the prescaler division factor of  $2^0$  to  $2^{15}$ . The fourth count clock, CK3, is derived by dividing PCLK by a division factor that is not a power of 2 by using the baud rate generator.

#### Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source.

- One of CK0 to CK3 clocks (selected by the clock selector)

#### Controller

The controller controls the main operations of the counter.

- Operating mode (selected with the TAUJnCMORm.TAUJnMD[4:0] bits)
- Counter start enable (TAUJnTS.TAUJnTSM) and counter stop (TAUJnTT.TAUJnTTM)

When counter start is enabled, status flag TAUJnTE.TAUJnTEM is set.

#### Trigger selector

The counter starts automatically when it is enabled (TAUJnTE.TAUJnTEM = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

- Synchronous channel start trigger input TAUJnTSSTm
- Valid edge of the TAUJnTTINm input signal
- INTTAUJnIm from the master channel

#### Simultaneous rewrite controller

Simultaneous rewrite control is enabled in synchronous operating modes. The data registers of all channels in a channel group (TAUJnCDRm) can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

#### TAUJnTO controller

The output control of every channel enables the generation of various output signals such as PWM signals.

## 33.3 Registers

### 33.3.1 List of Registers

TAUJ registers are listed in the following table.

For details about <TAUJn\_base>, see **Section 33.1.2, Register Base Addresses**.

Table 33.22 List of Registers

Module Name	Register Name	Symbol	Address
TAUJn prescaler registers			
TAUJn	TAUJn prescaler clock select register	TAUJnTPS	<TAUJn_base> + 90 <sub>H</sub>
	TAUJn prescaler baud rate setting register	TAUJnBRS	<TAUJn_base> + 94 <sub>H</sub>
TAUJn control registers			
TAUJn	TAUJn channel data register	TAUJnCDRm	<TAUJn_base> + m × 4 <sub>H</sub>
	TAUJn channel counter register	TAUJnCNTm	<TAUJn_base> + 10 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUJn channel mode OS register	TAUJnCMORm	<TAUJn_base> + 80 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUJn channel mode user register	TAUJnCMURm	<TAUJn_base> + 20 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUJn channel status register	TAUJnCSRm	<TAUJn_base> + 30 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUJn channel status clear trigger register	TAUJnCSCm	<TAUJn_base> + 40 <sub>H</sub> + m × 4 <sub>H</sub>
	TAUJn channel start trigger register	TAUJnTS	<TAUJn_base> + 54 <sub>H</sub>
	TAUJn channel enable status register	TAUJnTE	<TAUJn_base> + 50 <sub>H</sub>
	TAUJn channel stop trigger register	TAUJnTT	<TAUJn_base> + 58 <sub>H</sub>
TAUJn output registers			
TAUJn	TAUJn channel output enable register	TAUJnTOE	<TAUJn_base> + 60 <sub>H</sub>
	TAUJn channel output register	TAUJnTO	<TAUJn_base> + 5C <sub>H</sub>
	TAUJn channel output mode register	TAUJnTOM	<TAUJn_base> + 98 <sub>H</sub>
	TAUJn channel output configuration register	TAUJnTOC	<TAUJn_base> + 9C <sub>H</sub>
	TAUJn channel output active level register	TAUJnTOL	<TAUJn_base> + 64 <sub>H</sub>
TAUJn reload data registers			
TAUJn	TAUJn channel reload data enable register	TAUJnRDE	<TAUJn_base> + A0 <sub>H</sub>
	TAUJn channel reload data mode register	TAUJnRDM	<TAUJn_base> + A4 <sub>H</sub>
	TAUJn channel reload data trigger register	TAUJnRDT	<TAUJn_base> + 68 <sub>H</sub>
	TAUJn channel reload status register	TAUJnRSF	<TAUJn_base> + 6C <sub>H</sub>
TAUJn emulation register			
TAUJn	TAUJn emulation register	TAUJnEMU	<TAUJn_base> + A8 <sub>H</sub>

### 33.3.2 Details of TAUJn Prescaler Registers

#### 33.3.2.1 TAUJnTPS — TAUJn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3\_PRE for all channels of the PCLK prescalers. CK3 is generated by dividing CK3\_PRE by the factor specified in TAUJnBRS.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAUJn\_base> + 90<sub>H</sub>

**Value after reset:** FFFF<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnPRS3[3:0]				TAUJnPRS2[3:0]				TAUJnPRS1[3:0]				TAUJnPRS0[3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 33.23 TAUJnTPS Register Contents

Bit Position	Bit Name	Function
15 to 12	TAUJnPRS3[3:0]	Specifies a CK3_PRE clock. The CK3_PRE clock is an input clock of the BRG unit which supplies CK3 operation clocks to all channels.
	TAUJnPRS3[3:0]	CK3_PRE Clock
	0000 <sub>B</sub>	PCLK/2 <sup>0</sup>
	0001 <sub>B</sub>	PCLK/2 <sup>1</sup>
	0010 <sub>B</sub>	PCLK/2 <sup>2</sup>
	0011 <sub>B</sub>	PCLK/2 <sup>3</sup>
	0100 <sub>B</sub>	PCLK/2 <sup>4</sup>
	0101 <sub>B</sub>	PCLK/2 <sup>5</sup>
	0110 <sub>B</sub>	PCLK/2 <sup>6</sup>
	0111 <sub>B</sub>	PCLK/2 <sup>7</sup>
	1000 <sub>B</sub>	PCLK/2 <sup>8</sup>
	1001 <sub>B</sub>	PCLK/2 <sup>9</sup>
	1010 <sub>B</sub>	PCLK/2 <sup>10</sup>
	1011 <sub>B</sub>	PCLK/2 <sup>11</sup>
	1100 <sub>B</sub>	PCLK/2 <sup>12</sup>
	1101 <sub>B</sub>	PCLK/2 <sup>13</sup>
	1110 <sub>B</sub>	PCLK/2 <sup>14</sup>
	1111 <sub>B</sub>	PCLK/2 <sup>15</sup>
The above bits are rewritable only when all the counters using CK3 are stopped (TAUJnTE.TAUJnTEm = 0).		

Table 33.23 TAUJnTPS Register Contents

Bit Position	Bit Name	Function	
11 to 8	TAUJnPRS2[3:0]	Specifies a CK2 clock.	
		TAUJnPRS2[3:0]	CK2 Clock
		0000 <sub>B</sub>	PCLK/2 <sup>0</sup>
		0001 <sub>B</sub>	PCLK/2 <sup>1</sup>
		0010 <sub>B</sub>	PCLK/2 <sup>2</sup>
		0011 <sub>B</sub>	PCLK/2 <sup>3</sup>
		0100 <sub>B</sub>	PCLK/2 <sup>4</sup>
		0101 <sub>B</sub>	PCLK/2 <sup>5</sup>
		0110 <sub>B</sub>	PCLK/2 <sup>6</sup>
		0111 <sub>B</sub>	PCLK/2 <sup>7</sup>
		1000 <sub>B</sub>	PCLK/2 <sup>8</sup>
		1001 <sub>B</sub>	PCLK/2 <sup>9</sup>
		1010 <sub>B</sub>	PCLK/2 <sup>10</sup>
		1011 <sub>B</sub>	PCLK/2 <sup>11</sup>
		1100 <sub>B</sub>	PCLK/2 <sup>12</sup>
		1101 <sub>B</sub>	PCLK/2 <sup>13</sup>
		1110 <sub>B</sub>	PCLK/2 <sup>14</sup>
1111 <sub>B</sub>	PCLK/2 <sup>15</sup>		
The above bits are rewritable only when all the counters using CK2 are stopped (TAUJnTE.TAUJnTEm = 0).			
7 to 4	TAUJnPRS1[3:0]	Specifies a CK1 clock.	
		TAUJnPRS1[3:0]	CK1 Clock
		0000 <sub>B</sub>	PCLK/2 <sup>0</sup>
		0001 <sub>B</sub>	PCLK/2 <sup>1</sup>
		0010 <sub>B</sub>	PCLK/2 <sup>2</sup>
		0011 <sub>B</sub>	PCLK/2 <sup>3</sup>
		0100 <sub>B</sub>	PCLK/2 <sup>4</sup>
		0101 <sub>B</sub>	PCLK/2 <sup>5</sup>
		0110 <sub>B</sub>	PCLK/2 <sup>6</sup>
		0111 <sub>B</sub>	PCLK/2 <sup>7</sup>
		1000 <sub>B</sub>	PCLK/2 <sup>8</sup>
		1001 <sub>B</sub>	PCLK/2 <sup>9</sup>
		1010 <sub>B</sub>	PCLK/2 <sup>10</sup>
		1011 <sub>B</sub>	PCLK/2 <sup>11</sup>
		1100 <sub>B</sub>	PCLK/2 <sup>12</sup>
		1101 <sub>B</sub>	PCLK/2 <sup>13</sup>
		1110 <sub>B</sub>	PCLK/2 <sup>14</sup>
1111 <sub>B</sub>	PCLK/2 <sup>15</sup>		
The above bits are rewritable only when all the counters using CK1 are stopped (TAUJnTE.TAUJnTEm = 0).			

Table 33.23 TAUJnTPS Register Contents

Bit Position	Bit Name	Function
3 to 0	TAUJnPRS0[3:0]	Specifies a CK0 clock.
	TAUJnPRS0[3:0]	CK0 Clock
	0000 <sub>B</sub>	PCLK/2 <sup>0</sup>
	0001 <sub>B</sub>	PCLK/2 <sup>1</sup>
	0010 <sub>B</sub>	PCLK/2 <sup>2</sup>
	0011 <sub>B</sub>	PCLK/2 <sup>3</sup>
	0100 <sub>B</sub>	PCLK/2 <sup>4</sup>
	0101 <sub>B</sub>	PCLK/2 <sup>5</sup>
	0110 <sub>B</sub>	PCLK/2 <sup>6</sup>
	0111 <sub>B</sub>	PCLK/2 <sup>7</sup>
	1000 <sub>B</sub>	PCLK/2 <sup>8</sup>
	1001 <sub>B</sub>	PCLK/2 <sup>9</sup>
	1010 <sub>B</sub>	PCLK/2 <sup>10</sup>

	1100 <sub>B</sub>	PCLK/2 <sup>12</sup>
	1101 <sub>B</sub>	PCLK/2 <sup>13</sup>
	1110 <sub>B</sub>	PCLK/2 <sup>14</sup>
	1111 <sub>B</sub>	PCLK/2 <sup>15</sup>
The above bits are rewritable only when all the counters using CK0 are stopped (TAUJnTE.TAUJnTEm = 0).		

## NOTE

TAUJn clock input PCLK is defined in the first part of this section, **Section 33.1.3, Clock Supply**.

### 33.3.2.2 TAUJnBRS — TAUJn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3\_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3\_PRE is specified in TAUJnTPS. TAUJnPRS3[3:0].

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn\_base> + 94<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Table 33.24 TAUJnBRS Register Contents

Bit Position	Bit Name	Function
7 to 0	TAUJnBRS[7:0]	Specifies a CK3_PRE clock division factor for generating CK3.
	TAUJnBRS[7:0]	CK3 Clock
	0000 0000 <sub>B</sub>	CK3_PRE / 1
	0000 0001 <sub>B</sub>	CK3_PRE / 2
	0000 0010 <sub>B</sub>	CK3_PRE / 3
	0000 0011 <sub>B</sub>	CK3_PRE / 4
	...	...
	1111 1110 <sub>B</sub>	CK3_PRE / 255
	1111 1111 <sub>B</sub>	CK3_PRE / 256

### 33.3.3 Details of TAUJn Control Registers

#### 33.3.3.1 TAUJnCDRm — TAUJn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUJnCMORm.TAUJnMD[4:1].

**Access:** This register can be read or written in 32-bit units.

- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

**Address:** <TAUJn\_base> + 0<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 0	TAUJnCDR[31:0]	Data register for capture/compare values

### 33.3.3.2 TAUJnCNTm — TAUJn Channel Counter Register

This is a channel m counter register.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <TAUJn\_base> + 10<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** FFFF FFFF<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 33.26 TAUJnCNTm Register Contents

Bit Position	Bit Name	Function
31 to 0	TAUJnCNT[31:0]	32-bit counter value

The read value depends on a counter, an operating mode change, or TAUJnTS.TAUJnTSm/TAUJnTT.TAUJnTTm bit value.

The initial counter read value depends on the operating mode and how the counter is stopped.

- By a reset
- By a counter stop trigger (TAUJnTT.TAUJnTTm = 1)

The following table lists the initial counter read values after the counter is stopped (TAUJnTE.TAUJnTEm = 0) and re-enabled (TAUJnTS.TAUJnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUJnTS.TAUJnTSm = 1) with the counter waiting for a start trigger.

Table 33.27 TAUJnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUJnCNTm		
		Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	FFFF FFFF <sub>H</sub>	Stop value	—
Capture mode	Count up	0000 0000 <sub>H</sub>	Stop value	—
One-count mode	Count down	FFFF FFFF <sub>H</sub>	Stop value	FFFF FFFF <sub>H</sub>
Capture and one-count mode	Count up	0000 0000 <sub>H</sub>	Stop value	Capture value + 1 (TAUJnCDRm)
Count capture mode	Count up	0000 0000 <sub>H</sub>	Stop value	—
Gate count mode	Count down	FFFF FFFF <sub>H</sub>	Stop value	Stop value
Capture and gate count mode	Count up	0000 0000 <sub>H</sub>	Stop value	Stop value

Note 1. The value set for TAUJnCNTm when operating mode is changed after a reset is deasserted

### 33.3.3.3 TAUJnCMORm — TAUJn Channel Mode OS Register

This register controls channel m operation.

**Access:** This register can be read or written in 16-bit units.  
Writable only when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

**Address:** <TAUJn\_base> + 80<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

		1	0	1	1	1/0	Count capture mode
		1	1	0	0	0	Gate count mode
		1	1	0	1	0	Capture and gate count mode
		Mode		Role of TAUJnMD0 Bit			
		Interval timer mode Capture mode Count capture mode		Specifies whether INTTAUJnIm is generated at the beginning of count operation (when a start trigger is entered) or not. 0: INTTAUJnIm is not generated. 1: INTTAUJnIm is generated.			
		One-count mode		Enables/disables start trigger detection during counting. 0: Disables detection. 1: Enables detection. <b>CAUTION:</b> In one-count mode, INTTAUJnIm signal is not output at the beginning of count operation.			
		Capture and one-count mode Gate count mode Capture and gate count mode		This bit should be set to 0. <b>CAUTION:</b> INTTAUJnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled.			

### 33.3.3.4 TAUJnCMURm — TAUJn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUJTTINm input.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn\_base> + 20<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 33.29 TAUJnCMURm Register Contents

Bit Position	Bit Name	Function	
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.	
1, 0	TAUJnTIS[1:0]	Specifies a valid edge of TAUJTTINm input signal.	
	TAUJnTIS1	TAUJnTIS0	Functional Description
	0	0	Falling edge
	0	1	Rising edge
	1	0	Detection of falling and rising edges (selection of low width measurement) Start trigger: Falling edge Stop trigger (capture): Rising edge
	1	1	Detection of falling and rising edges (selection of high width measurement) Start trigger: Rising edge Stop trigger (capture): Falling edge

Edge detection of TAUJTTINm input signal is based on the operation clock selected by TAUJnCMORm.TAUJnCKS[1:0].

### 33.3.3.5 TAUJnCSRm — TAUJn Channel Status Register

This register indicates the overflow status of channel m.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUJn\_base> + 30<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 0X<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnOVF
Value after reset	0	0	0	0	0	0	—	0
R/W	R	R	R	R	R	R	R	R

Table 33.30 TAUJnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	Reserved	When read, an undefined value is returned.
0	TAUJnOVF	Indicates the counter overflow status: 0: No overflow occurs 1: Overflow occurs This bit is used only in the following modes: <ul style="list-style-type: none"> <li>• Capture mode</li> <li>• Capture and one-count mode</li> </ul>

The function of this bit depends on the setting of control bits TAUJnCMORm.TAUJnCOS[1:0].

### 33.3.3.6 TAUJnCSCm — TAUJn Channel Status Clear Trigger Register

This register is a trigger register for clearing the overflow flag TAUJnCSRm.TAUJnOVF of channel m.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as 00<sub>H</sub>.

**Address:** <TAUJn\_base> + 40<sub>H</sub> + m × 4<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 33.31 TAUJnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUJnCLOV	0: No function 1: Clears the overflow flag TAUJnCSRm.TAUJnOVF

### 33.3.3.7 TAUJnTS — TAUJn Channel Start Trigger Register

This register enables the counter operation for each channel.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as 00<sub>H</sub>.

**Address:** <TAUJn\_base> + 54<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTS03	TAUJnTS02	TAUJnTS01	TAUJnTS00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 33.32 TAUJnTS Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnTSM	Enables the counter operation for channel m: 0: No function 1: Enables the counter operation and sets TAUJnTE.TAUJnTEm = 1.  Only the counter operation is enabled even if TAUJnTE.TAUJnTEm = 1. Whether the counter is started or not depends on the selected operating mode.

### 33.3.3.8 TAUJnTE — TAUJn Channel Enable Status Register

This register indicates whether a counter operation is enabled.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUJn\_base> + 50<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTE03	TAUJnTE02	TAUJnTE01	TAUJnTE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 33.33 TAUJnTE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	TAUJnTEm	Indicates whether channel m's counter operation is enabled. 0: Counter operation is disabled 1: Counter operation is enabled  This bit is set to 1 when trigger input of TAUJnTSSTm (synchronous channel start trigger signal) is detected or when TAUJnTS.TAUJnTSM is set to 1. This bit is reset to 0 when TAUJnTT.TAUJnTTm is set to 1.

### 33.3.3.9 TAUJnTT — TAUJn Channel Stop Trigger Register

This register stops the counter operation of each channel.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as 00<sub>H</sub>.

**Address:** <TAUJn\_base> + 58<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTT03	TAUJnTT02	TAUJnTT01	TAUJnTT00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 33.34 TAUJnTT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnTTm	Stops channel m's counter operation. 0: No function 1: Stops the counter operation and resets TAUJnTE.TAUJnTEm.  TAUJnCNTm, TAUJnTO.TAUJnTOm, and TAUJTTOUTm retain the values provided before the counter is stopped.

### 33.3.4 Details of TAUJn Simultaneous Rewrite Register

#### 33.3.4.1 TAUJnRDE — TAUJn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUJnCDRm. It also enables and disables simultaneous rewrite of the data register TAUJnTOLm for the PWM output function.

**Access:** This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

**Address:** <TAUJn\_base> + A0H

**Value after reset:** 00H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDE03	TAUJnRDE02	TAUJnRDE01	TAUJnRDE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.35 TAUJnRDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnRDEm	Enables/disables simultaneous rewrite of the data register of channel m: 0: Disables simultaneous rewrite 1: Enabled simultaneous rewrite

#### 33.3.4.2 TAUJnRDM — TAUJn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

**Access:** This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

**Address:** <TAUJn\_base> + A4H

**Value after reset:** 00H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDM03	TAUJnRDM02	TAUJnRDM01	TAUJnRDM00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.36 TAUJnRDM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnRDMm	Specifies when the signal that triggers simultaneous rewrite is generated: 0: When the master channel counter starts counting 1: No function

These bits only apply when TAUJnRDE.TAUJnRDEm = 1.

### 33.3.4.3 TAUJnRDT — TAUJn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

**Access:** This register is a write-only register that can be written in 8-bit units. It is always read as 00<sub>H</sub>.

**Address:** <TAUJn\_base> + 68<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDT03	TAUJnRDT02	TAUJnRDT01	TAUJnRDT00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 33.37 TAUJnRDT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnRDTm	Triggers the simultaneous rewrite enabling state. 0: No function 1: Simultaneous rewrite enabling state is triggered. The simultaneous rewrite enabling flag (TAUJnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger. These bits only apply when: • TAUJnRDE.TAUJnRDEm = 1

### 33.3.4.4 TAUJnRSF — TAUJn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <TAUJn\_base> + 6C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRSF03	TAUJnRSF02	TAUJnRSF01	TAUJnRSF00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 33.38 TAUJnRSF Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	TAUJnRSFm	Indicates the simultaneous rewrite status. 0: Indicates that simultaneous rewrite has been completed due to the generation of simultaneous rewrite trigger. 1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous rewrite enabling state (TAUJnRDTm = 1).

### 33.3.5 Details of TAUJn Output Registers

#### 33.3.5.1 TAUJnTOE — TAUJn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn\_base> + 60<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOE03	TAUJnTOE02	TAUJnTOE01	TAUJnTOE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.39 TAUJnTOE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOEm	Enables/disables independent channel output function: 0: Disables independent timer output function (controlled by software) 1: Enables independent timer output function

#### 33.3.5.2 TAUJnTO — TAUJn Channel Output Register

This register specifies and reads the level of TAUJTOUTm.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn\_base> + 5C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTO03	TAUJnTO02	TAUJnTO01	TAUJnTO00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.40 TAUJnTO Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOm	Specifies and reads the level of TAUJTOUTm: 0: Low 1: High
Only TAUJnTOm bits for which Independent Channel Output function is disabled (TAUJnTOEm = 0) can be written.		

### 33.3.5.3 TAUJnTOM — TAUJn Channel Output Mode Register

This register specifies the output mode of each channel.

**Access:** This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTE<sub>m</sub> = 0).

**Address:** <TAUJn\_base> + 98<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOM03	TAUJnTOM02	TAUJnTOM01	TAUJnTOM00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.41 TAUJnTOM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOM <sub>m</sub>	Specifies the channel output mode: 0: Independent channel output mode 1: Synchronous channel output mode  The output mode depends on the settings of channel output control (TAUJnTOE.TAUJnTOE <sub>m</sub> ) bits.

### 33.3.5.4 TAUJnTOC — TAUJn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUJnTOMm.

**Access:** This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

**Address:** <TAUJn\_base> + 9C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOC03	TAUJnTOC02	TAUJnTOC01	TAUJnTOC00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.42 TAUJnTOC Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOCm	Specifies the output mode: 0: Operation mode 1 (= Toggle mode) 1: No function

This bit must be set to 0 for all output modes except independent channel output mode controlled by software.

The output mode also depends on TAUJnTOM.TAUJnTOMm, as shown in the following table.

TAUJnTOMm	TAUJnTOCm	Functional Description
0	0	Toggle mode: Toggling proceeds when INTTAUJnIm occurs.
0	1	No function
1	0	Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel.
1	1	No function

### 33.3.5.5 TAUJnTOL — TAUJn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUJnTO.TAUJnTOm).

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAUJn\_base> + 64<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOL03	TAUJnTOL02	TAUJnTOL01	TAUJnTOL00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.43 TAUJnTOL Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOLm	Specifies the output logic of the channel m output bit (TAUJnTO.TAUJnTOm): 0: Positive logic (active high) 1: Negative logic (active low)

These bits apply in all channel output modes except independent channel output mode controlled by software and independent channel output mode 1.

### 33.3.6 TAUJn Emulation Register

#### 33.3.6.1 TAUJnEMU — TAUJn Emulation Register

This register controls operation by SVSTOP.

**Access:** This register can be read or written in 8-bit units.

A write should be performed when counters are stopped (TAUJnTE.TAUJnTEm = 0) and (EPC.SVSTOP = 0).

**Address:** <TAUJn\_base> + A8<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	TAUJnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 33.44 TAUJnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUJnSVSDIS	When EPC.SVSTOP bit = 0: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0). When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint). 1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

## 33.4 Operating Procedure

The following lists the general operation procedure for the TAUJn:

After a reset is deasserted, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUJTTOUTm is also initialized and outputs a low level.

1. Set the TAUJnTPS and TAUJnBRS registers to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUJn function:
  - Set the operation mode
  - Set any other control bits
3. Enable the counter by setting the TAUJnTS.TAUJnTSM bit to 1.  
The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUJnTT.TAUJnTTm bit to 1. The counter can be forcibly restarted by setting the TAUJnTS.TAUJnTSM bit to 1.
5. Stop the function by setting the TAUJnTT.TAUJnTTm bit to 1.

### NOTES

1. A detailed description of the required control bits and the operation of the individual functions are given in **Section 33.12, Independent Channel Operation Functions** and **Section 33.13, Synchronous Channel Operation Functions**.
2. The function can be changed while the counter is stopped (TAUJnTE.TAUJnTEm = 0).

## 33.5 Concepts of Synchronous Channel Operation Function

The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in **Section 33.5.1, Rules of Synchronous Channel Operation Function**.

The synchronous channel operation function are detailed in the following section.

- **Section 33.13, Synchronous Channel Operation Functions**

### 33.5.1 Rules of Synchronous Channel Operation Function

#### Number of master and slave channels

- Only even channels (CH0, CH2) can be set as master channels. Any channel other than CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.  
Example: If CH2 is a master channel, CH3 can be set as slave channel.
- If two master channels are used, slave channels cannot cross the master.  
Example: If CH0 and CH2 are master channels, CH1 can be set as slave channel for CH0, but CH3 cannot.

#### Operation clock

- The same operation clock should be set for the master channel and the synchronized slave channel. This is achieved by setting the same value in the TAUJnCMORm.TAUJnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 33.5, Grouping of Channels and Assignment of Operation Clocks**.

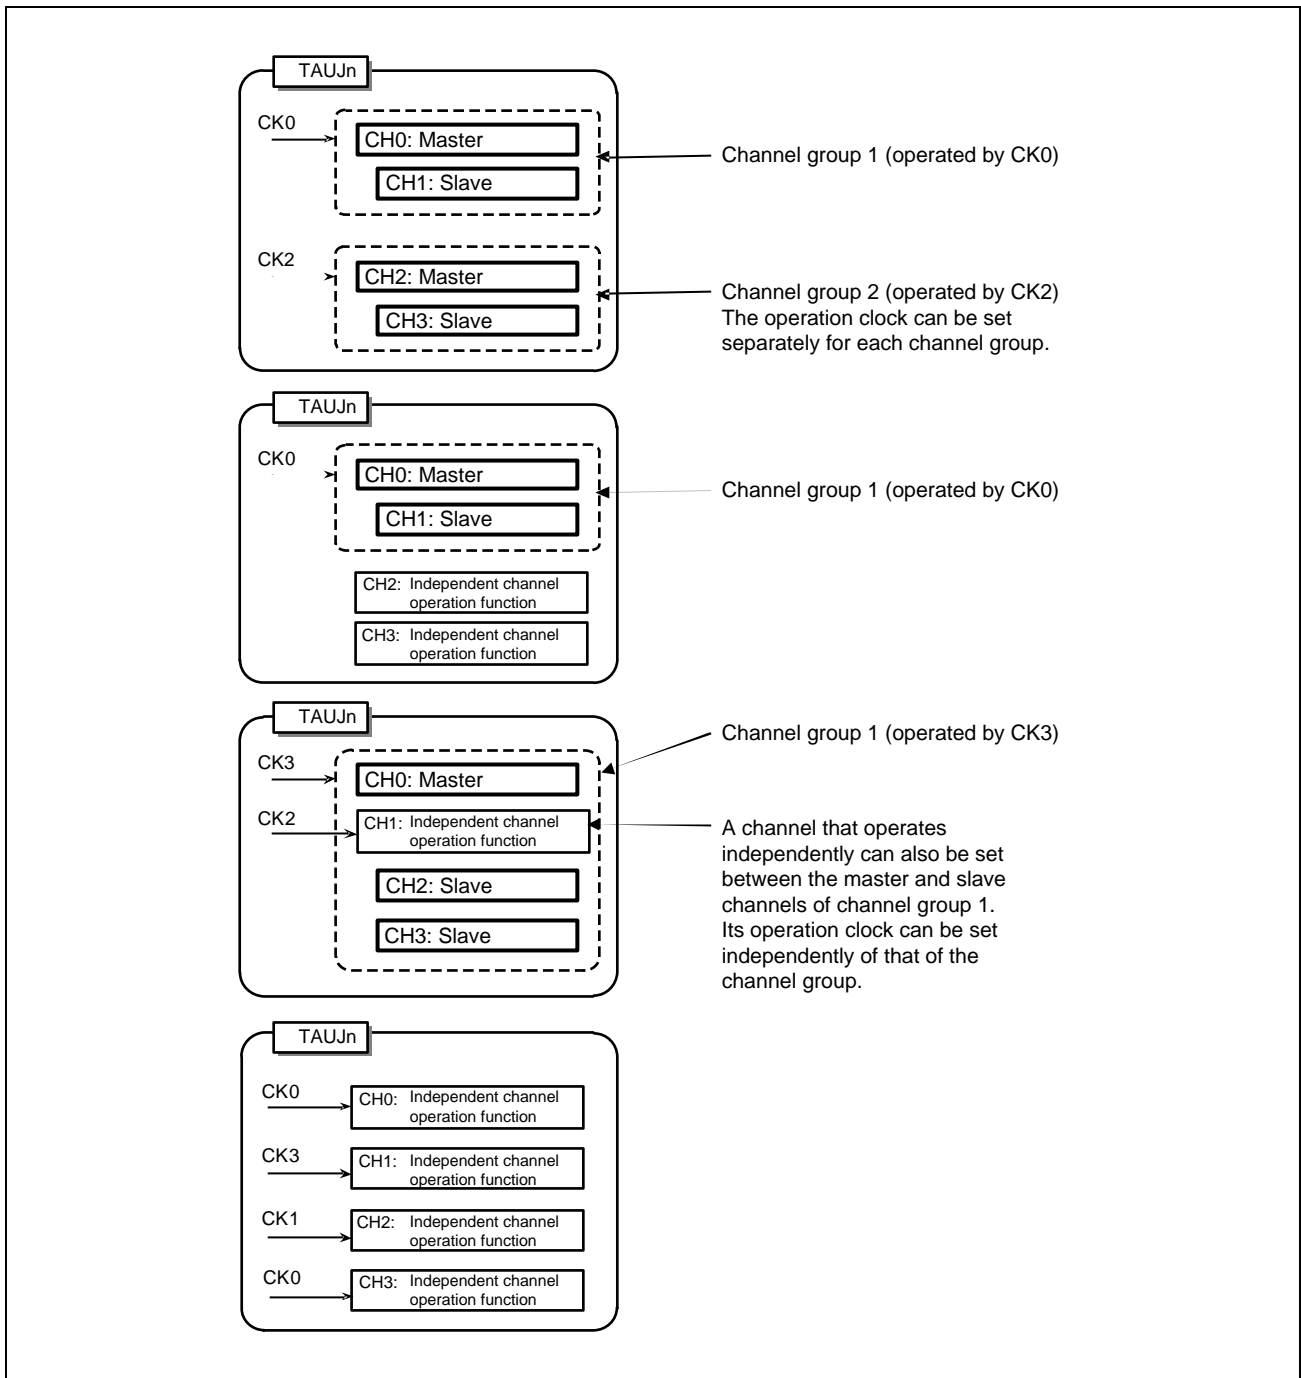

Figure 33.5 Grouping of Channels and Assignment of Operation Clocks

### 33.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously, both within a TAUJ unit and between TAUJ units.

#### 33.5.2.1 Simultaneous Start and Stop within a TAUJ Unit

- To simultaneously start synchronized channels, the TAUJnTS.TAUJnTSM bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUJnTT.TAUJnTTM bits of the channels should be set at the same time.

Setting 1 in the TAUJnTS.TAUJnTSM bits sets the corresponding TAUJnTE.TAUJnTEM bits to 1, enabling counting. The count start timing of the counter depends on the operating mode.

#### 33.5.2.2 Simultaneous Start between TAUJ Units

Counters in different TAUJ units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

For details about how to perform simultaneous start between the units, see **Section 36.8, Simultaneous Start Trigger Function**.

### 33.6 Simultaneous Rewrite

#### 33.6.1 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite. The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

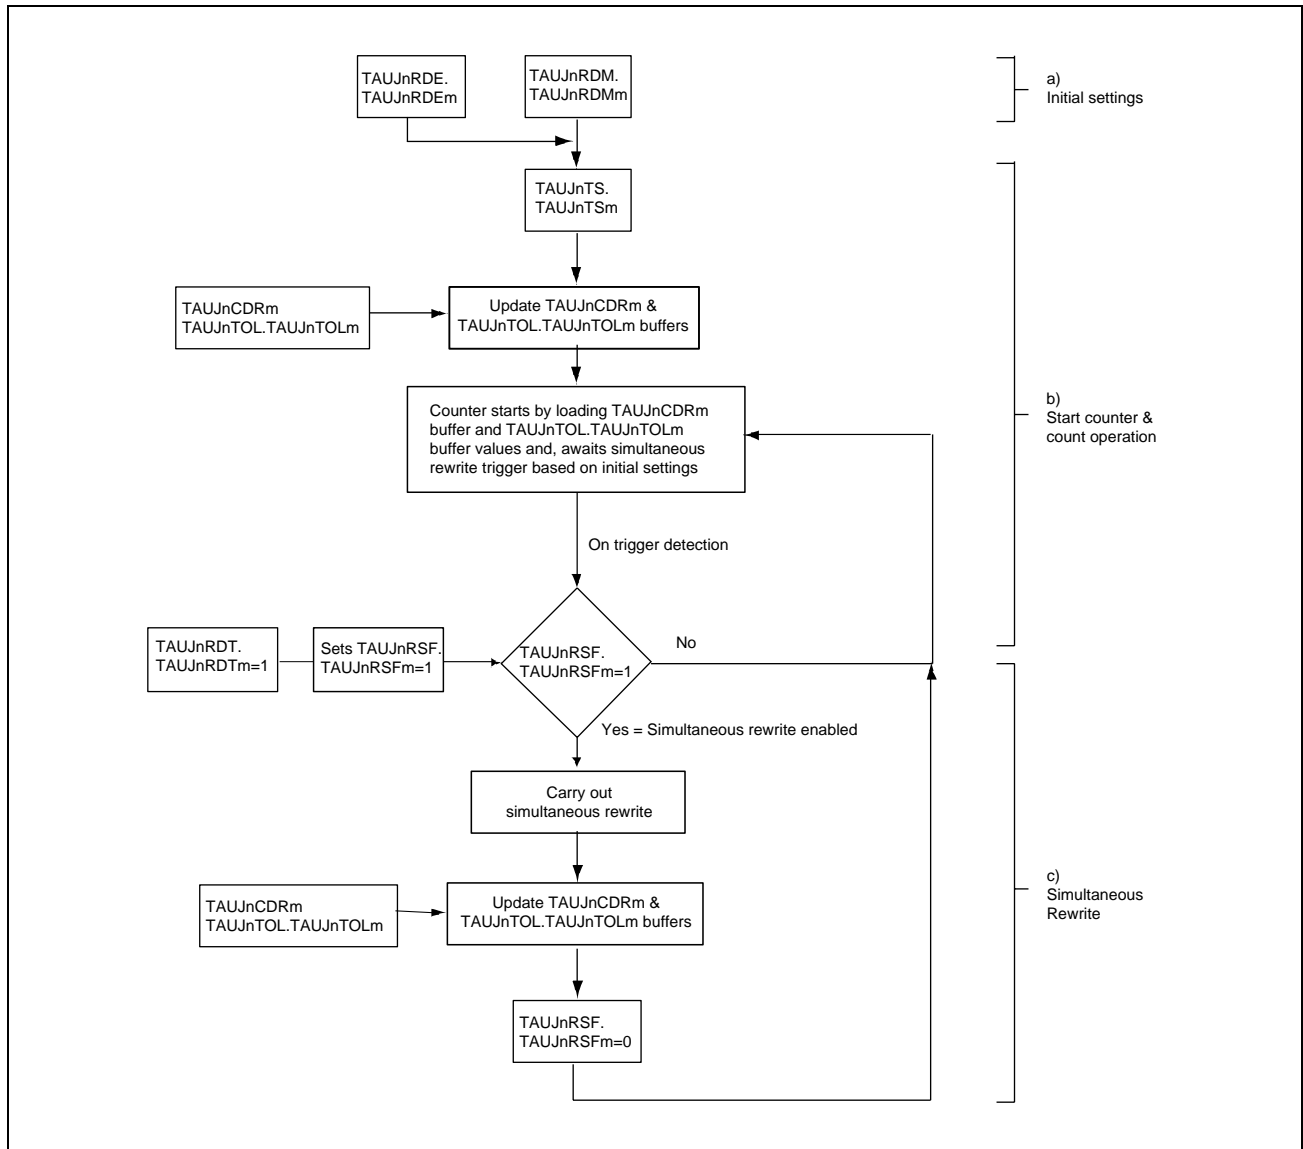

Figure 33.6 General Procedure for Simultaneous Rewrite

### 33.6.1.1 Initial Settings

- To enable simultaneous rewrite in channel m, set  $\text{TAUJnRDE.TAUJnRDEm} = 1$ .
- To select simultaneous rewrite when the master channel starts counting, set  $\text{TAUJnRDM.TAUJnRDMm}$ .

### 33.6.1.2 Start Counter and Count Operation

- To start all the  $\text{TAUJnCNTm}$  counters in the channel group, set the corresponding  $\text{TAUJnTS.TAUJnTSM}$  bits to 1. The values of  $\text{TAUJnTOL.TAUJnTOLm}$  and the data registers ( $\text{TAUJnCDRm}$ ) are loaded into the corresponding  $\text{TAUJnTOL.TAUJnTOLm}$  buffer ( $\text{TAUJnTOL.TAUJnTOLm}$  buf) and data buffer registers ( $\text{TAUJnCDRm}$  buf) and the counters start.
- Setting the reload data trigger bit ( $\text{TAUJnRDT.TAUJnRDTm}$ ) to 1 sets the reload flag ( $\text{TAUJnRSF.TAUJnRSFm}$ ) to 1, enabling simultaneous rewrite.  $\text{TAUJnRSF.TAUJnRSFm}$  remains set to 1 until simultaneous rewrite is completed.
- When a specified trigger for simultaneous rewrite is detected, the  $\text{TAUJnRSF.TAUJnRSFm}$  bit is checked to see if simultaneous rewrite is enabled ( $\text{TAUJnRSF.TAUJnRSFm} = 1$ ). If enabled, simultaneous rewrite is carried out. Otherwise simultaneous rewrite is not carried out and the system waits for detection of the next simultaneous rewrite trigger.

### 33.6.1.3 Simultaneous Rewrite

- When the simultaneous rewrite trigger is detected and simultaneous rewrite is enabled ( $\text{TAUJnRSF.TAUJnRSFm} = 1$ ), the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and the values are applied the next time the counter starts or restarts.
- When the simultaneous rewrite is complete, the  $\text{TAUJnRSF.TAUJnRSFm}$  bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

## 33.6.2 Other General Rules for Simultaneous Rewrite

The following rules also apply.

- $\text{TAUJnRDE.TAUJnRDEm}$  and  $\text{TAUJnRDM.TAUJnRDMm}$  cannot be changed while the counter is in operation ( $\text{TAUJnTE.TAUJnTEm} = 1$ ).
- $\text{TAUJnTOL.TAUJnTOLm}$  can be rewritten only during operation using the PWM output function. For all other functions,  $\text{TAUJnTOL.TAUJnTOLm}$  should be written before the counter starts. If it is rewritten while any other function is used,  $\text{TAUJTOUTm}$  outputs an invalid waveform.

### 33.6.3 Simultaneous Rewrite Procedure

The simultaneous rewrite procedure with PWM output function is described in the following figure.

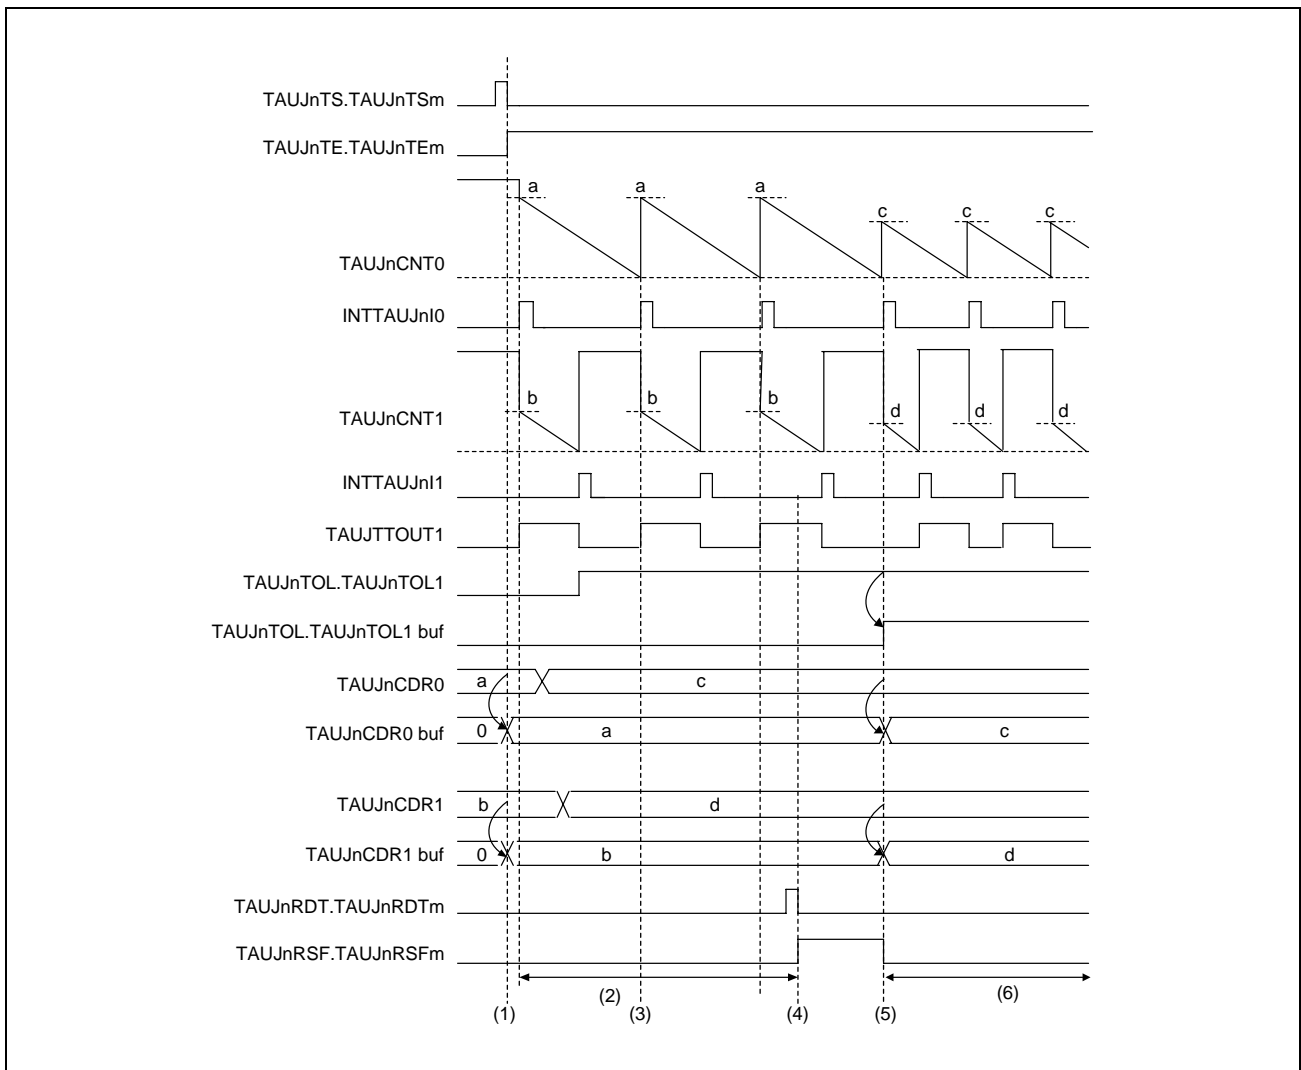

Figure 33.7 Simultaneous Rewrite with PWM Output Function

**Setting:**

CH0 is a master channel of PWM output function, and CH1 is a slave channel of PWM output function. Simultaneous rewrite is applied when the master channel starts counting.

**Description:**

- (1) When  $\text{TAUJnTS.TAUJnTSM} = 1$  is set, the value of  $\text{TAUJnCDRm}$  is copied to the  $\text{TAUJnCDRm}$  buffer and the value of  $\text{TAUJnTOL.TAUJnTOLm}$  is copied to the  $\text{TAUJnTOL.TAUJnTOLm}$  buffer.
- (2) The  $\text{TAUJnCDRm}$  and  $\text{TAUJnTOL.TAUJnTOLm}$  registers can be written at any time.
- (3)  $\text{CH0}$  restarts counting, but simultaneous rewrite does not occur because it is disabled ( $\text{TAUJnRSF.TAUJnRSFm} = 0$ ).
- (4) The reload data trigger bit ( $\text{TAUJnRDT.TAUJnRDTm}$ ) is set to 1 which sets the status flag ( $\text{TAUJnRSF.TAUJnRSFm} = 1$ ), enabling simultaneous rewrite.
- (5) Simultaneous rewrite is triggered when  $\text{CH0}$  restarts counting, because simultaneous rewrite is enabled. The  $\text{TAUJnCDRm}$  value is loaded into the  $\text{TAUJnCDRm}$  buffer and the  $\text{TAUJnTOL.TAUJnTOLm}$  value is loaded into the  $\text{TAUJnTOL.TAUJnTOLm}$  buffer.
- (6) The counters count down and await the next simultaneous rewrite trigger. The values of  $\text{TAUJnCDRm}$  and  $\text{TAUJnTOL.TAUJnTOLm}$  can be changed again.

### 33.7 Channel Output Modes

The output of the TAUJTOUT<sub>m</sub> pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUJnTOE.TAUJnTOEm = 0)  
When controlled by software, the value written in the output register bit (TAUJnTO.TAUJnTOm) is sent to the output pin (TAUJTOUT<sub>m</sub>).
- By TAUJ signals (TAUJnTOE.TAUJnTOEm = 1)  
When controlled by TAUJ signals, the output level of TAUJTOUT<sub>m</sub> is set or reset or toggled by internal signals. The value of TAUJnTO.TAUJnTOm is updated accordingly to reflect the value of TAUJTOUT<sub>m</sub>.
  - Independently (TAUJnTOM.TAUJnTOMm = 0)  
In case of independent operation, the output of the TAUJTOUT<sub>m</sub> pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUJnTOM.TAUJnTOMm = 0).
  - Synchronously (TAUJnTOM.TAUJnTOMm = 1)  
In case of synchronous operation, the output of the TAUJTOUT<sub>m</sub> pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUJnTOM.TAUJnTOMm = 1).

The TAUJnTO.TAUJnTOm bit can always be read to determine the current value of TAUJTOUT<sub>m</sub>, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

#### Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 33.45, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 33.7.2, Channel Output Modes Controlled Independently by TAUJn Signals**
- **Section 33.7.3, Channel Output Modes Controlled Synchronously by TAUJn Signals**

#### Batch operation of TAUJnTOm bit

Whether a set value is reflected to the TAUJnTOm bit or not is controlled by the TAUJnTOE.TAUJnTOEm bit.

The TAUJnTOm setting is written only to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 0 when a write to the TAUJnTO register is attempted. No TAUJnTOm setting is reflected to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 1.

#### NOTE

---

TAUJnTO.TAUJnTOm bit is placed so that its bit number corresponds to a channel number.

---

## Output logic

Positive logic or negative logic of the output is specified by control bit TAUJnTOL.TAUJnTOLm.

The value of TAUJnTOL.TAUJnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function. Otherwise, changes to TAUJnTOL.TAUJnTOLm result in an undefined TAUJTOUTm signal output.

See **Section 33.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 33.45, Channel Output Modes**.

Table 33.45 Channel Output Modes

Channel Output Mode	TAUJnTOE.TAUJnTOEm	TAUJnTOM.TAUJnTOMm
By software		
Independent channel output mode controlled by software	0	x
By TAUJ signals, independently		
Independent channel output mode 1	1	0
By TAUJ signals, synchronously		
Synchronous channel output mode 1	1	1

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

### NOTE

The following bits cannot be changed during count operation (TAUJnTE.TAUJnTEm = 1):

- TAUJnTOM.TAUJnTOMm
- TAUJnTOC.TAUJnTOCm

### 33.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUJTOUT<sub>m</sub> channel output mode. The prerequisite is that timer output operation is disabled (TAUJnTOE.TAUJnTOEm = 0).

- (1) Set TAUJnTO.TAUJnTOm to specify the initial level of the TAUJTOUT<sub>m</sub> output.
- (2) Set channel output mode according to **Table 33.45, Channel Output Modes**, and the output logic using the TAUJnTOL.TAUJnTOLm bit.
- (3) Start the counter (TAUJnTS.TAUJnTSm = 1).

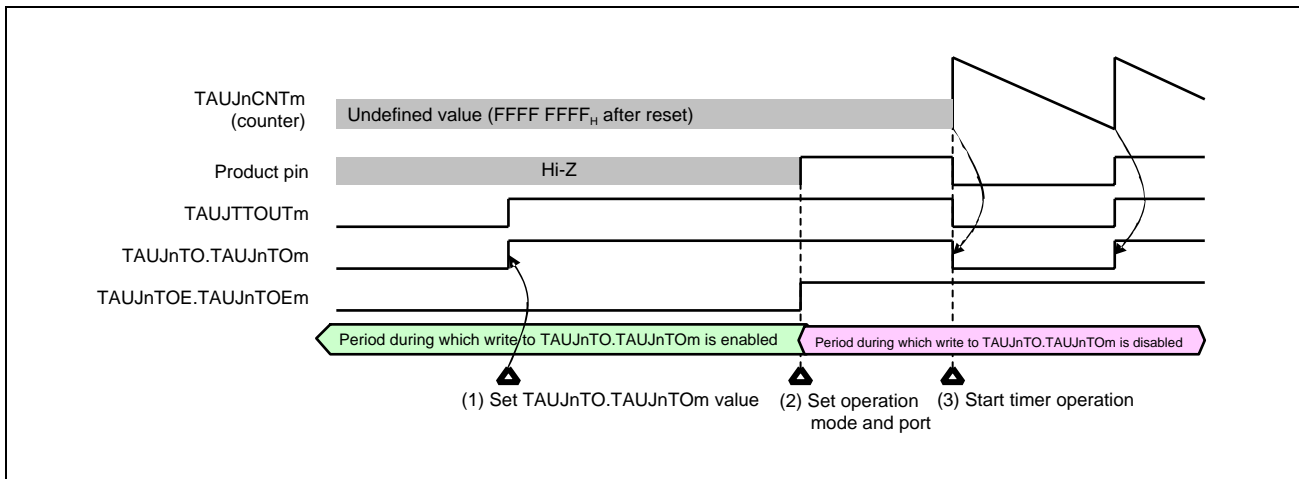

Figure 33.8 General Procedure for Specifying a TAUJTOUT<sub>m</sub> Channel Output Mode

### 33.7.2 Channel Output Modes Controlled Independently by TAUJn Signals

This section lists the channel output modes that are controlled independently by TAUJn signals. The control bits used to specify a mode are listed in **Table 33.45, Channel Output Modes**.

#### 33.7.2.1 Independent Channel Output Mode 1

##### Set/reset conditions

In this output mode, TAUJTOUTm toggles when INTTAUJnIm is detected. The value of TAUJnTOL.TAUJnTOLm is ignored.

##### Prerequisites

There are no prerequisites other than those shown in **Table 33.45, Channel Output Modes**.

### 33.7.3 Channel Output Modes Controlled Synchronously by TAUJn Signals

This section lists the channel output modes that are controlled synchronously by TAUJn signals. The control bits used to specify a mode are listed in **Table 33.45, Channel Output Modes**.

#### 33.7.3.1 Synchronous Channel Output Mode 1

##### Set/reset conditions

In this output mode, INTTAUJnIm of master channel serves as a set signal and INTTAUJnIm of the slave channel as a reset signal. If INTTAUJnIm of the master channel and INTTAUJnIm of the slave channel are generated at the same time, INTTAUJnIm of the slave channel (reset signal) has priority over INTTAUJnIm (set signal) of the master channel, i.e., the master channel is ignored.

##### Prerequisites

There are no prerequisites other than those shown in **Table 33.45, Channel Output Modes**.

### 33.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUJnTS.TAUJnTSM is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

#### CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

#### 33.8.1 Interval Timer Mode, Capture Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUJnTS.TAUJnTSM is set to 1. The value of data register is also loaded when the counter starts.

Figure 33.9 Start Timing in Interval Timer Mode, Capture Mode, and Count Capture Mode

### 33.8.2 Other Operating Modes

In other operating modes, count clock cycle is irrelevant to start of counter operation. The counter operation start timing is triggered only upon detection of a valid edge of TAUJTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which is irrelevant to start of counter operation, determine the frequency with which all operations take place.

Figure 33.10 Count Start Timing in Other Operating Modes

### 33.9 TAUJTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUJnIm is generated using the TAUJnCMORm.TAUJnMD0 bit. The generation of INTTAUJnIm when the TAUJnCMORm.TAUJnMD0 bit starts counting and the effect to TAUJTOUTm depend on the selected function. For details, refer to the description of TAUJnCMORm.TAUJnMD0 of each function.

Figure 33.11 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 0)

Figure 33.12 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 1)

## 33.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches  $FFFF\ FFFF_H$  and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operations in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches  $0000\ 0000_H$  at the same time as the first channel overflows ( $TAUJnCNTm = FFFF\ FFFF_H$ ).
- Set  $TAUJnCDRm$  of the second channel to  $FFFF\ FFFF_H$ .
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same  $TAUJTTINm$  input.
- The trigger detection settings ( $TAUJnCMORm.TAUJnSTS[2:0]$  and  $TAUJnCMURm.TAUJnTIS[1:0]$ ) must be identical for both channels.

### Result:

The down-counter of the second channel reaches  $0000\ 0000_H$  at exactly the same time as the up-counter of the first channel overflows ( $TAUJnCNTm = FFFF\ FFFF_H$ ). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

### 33.10.1 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

When the capture trigger is input simultaneously to TAUJTTINm of both channels, INTTAUJnIm of the interval timer function can detect the overflow when TAUJnCNTm of the TAUJTTINm input position detection function exceeds FFFF FFFF<sub>H</sub>.

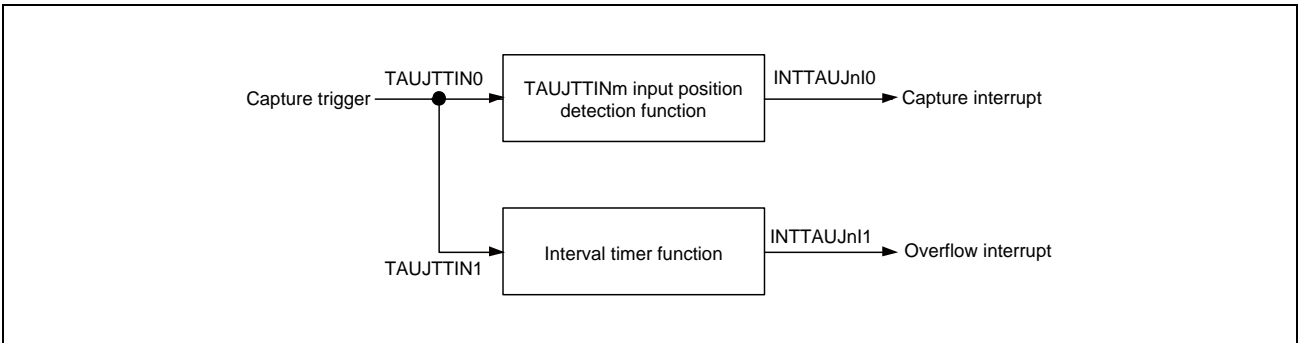

Figure 33.13 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

#### Timing diagram

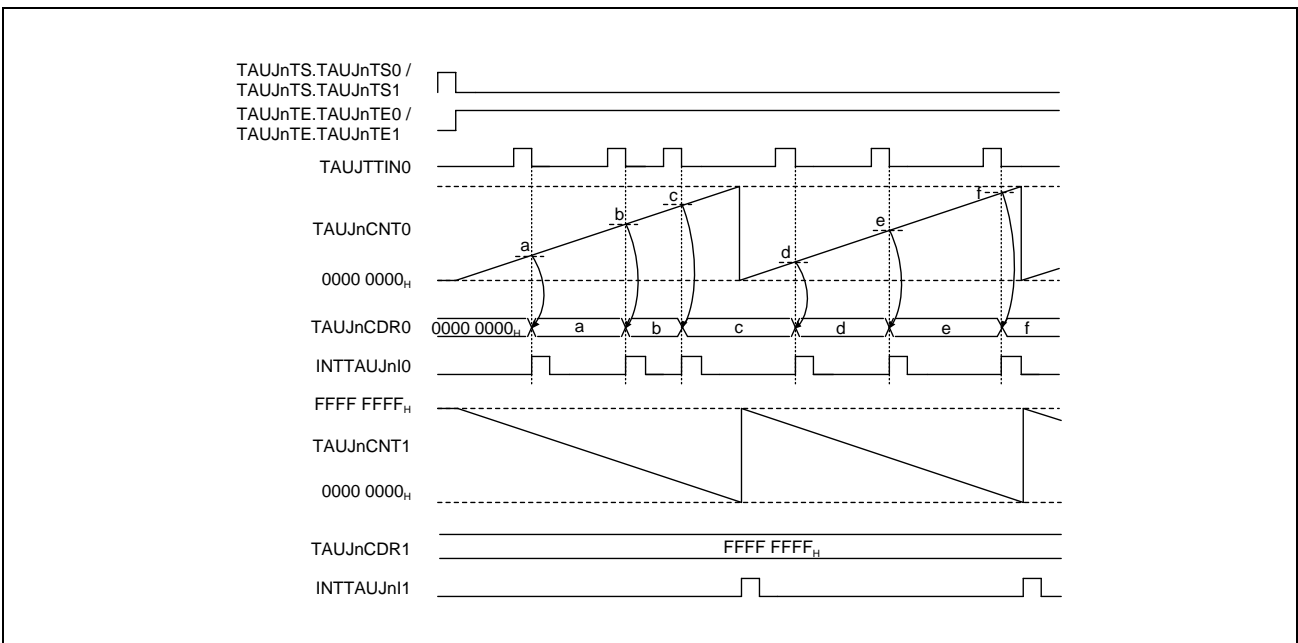

Figure 33.14 Interrupt Generation via Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

### 33.11 TAUJTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

Figure 33.15 Basic Edge Detection Timing

**Figure 33.15, Basic Edge Detection Timing** shows an image of operation timing. In the actual operation, delay time occurs due to noise filter and synchronization circuit between the TAUJnIm pin and TAUJn.

## 33.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUJ. For a general overview of independent channel operation functions, see **Section 33.2, Overview**.

### 33.12.1 Interval Timer Function

#### 33.12.1.1 Overview

##### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals. When an interrupt is generated, the TAUJTOUTm signal toggles, resulting in a square wave.

##### Functional description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSM) to 1. This in turn sets TAUJnTE.TAUJnTEM = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counter starts to count down from this value.

When the counter reaches 0000 0000<sub>H</sub>, INTTAUJnIm is generated and the TAUJTOUTm signal toggles. TAUJnCNTm then loads the TAUJnCDRm value and subsequently continues operation.

The value of TAUJnCDRm can be rewritten at any time, and the changed value of TAUJnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUJnTT.TAUJnTTM to 1, which in turn sets TAUJnTE.TAUJnTEM to 0. TAUJnCNTm and TAUJTOUTm stop but retain their values. The counter can be restarted by setting TAUJnTS.TAUJnTSM to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSM to 1 during operation.

##### Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUJTOUTm does not toggle. This results in a reverted TAUJTOUTm signal compared to when TAUJnCMORm.TAUJnMD0 is set to 1.

#### 33.12.1.2 Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTOUTm square wave cycle = count clock cycle × (TAUJnCDRm+1) × 2

33.12.1.3 Block Diagram and General Timing Diagram

Figure 33.16 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).

Figure 33.17 General Timing Diagram for Interval Timer Function

### 33.12.1.4 Register Settings

#### (1) TAUJnCMORm

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 33.47 Contents of the TAUJnCMURm register for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Not used, so set to 00.

### (3) Channel Output Mode

Table 33.48 Control Bit Settings in Independent Channel Output Mode 1

Bit name	Setting
TAUJnTOE.TAUJnTOEm	Write 1 <sub>B</sub> .
TAUJnTOM.TAUJnTOMm	Write 0 <sub>B</sub> .
TAUJnTOC.TAUJnTOCm	Write 0 <sub>B</sub> .
TAUJnTOL.TAUJnTOLm	Write 0 <sub>B</sub> .

#### NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTOUTm can then be controlled independently of the interrupts. For details see **Section 33.7, Channel Output Modes**.

### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the interval timer function. Therefore, these registers must be set to 0.

Table 33.49 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

### 33.12.1.5 Operating Procedure for Interval Timer Function

Table 33.50 Operating Procedure for Interval Timer Function

	Operation	Status of TAUJn
Restart operation ↑	Initial channel setting  Set the TAUJnCMORm and TAUJnCMURm registers as described in <b>Table 33.46, Contents of the TAUJnCMORm register for Interval Timer Function</b> and <b>Table 33.47, Contents of the TAUJnCMURm register for Interval Timer Function</b> .  Set the value of the TAUJnCDRm register.  Set the channel output mode by setting the control bits as described in <b>Table 33.48, Control Bit Settings in Independent Channel Output Mode 1</b> .	Channel operation is stopped.
	Start operation  Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCnTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTOUTm toggles.
	During operation  The TAUJnCDRm register value can be changed at any time. The TAUJnCnTm register can be read at all times.	TAUJnCnTm counts down. When the counter reaches 0000 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• TAUJnCnTm reloads the TAUJnCDRm value and continues count operation.</li> <li>• INTTAUJnIm is generated and TAUJTOUTm toggles.</li> </ul>
	Stop operation  Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCnTm and TAUJTOUTm stop and retain their current values.

### 33.12.1.6 Specific Timing Diagrams

#### (1) TAUJnCDRm = 0000 0000<sub>H</sub>, Count Clock = PCLK/2

Figure 33.18 TAUJnCDRm = 0000 0000<sub>H</sub>, Count Clock = PCLK/2

- If TAUJnCDRm = 0000 0000<sub>H</sub> and the count clock = PCLK/2, the TAUJnCDRm value is loaded to TAUJnCNTm every count clock, meaning that TAUJnCNTm is always 0000 0000<sub>H</sub>.
- INTTAUJnIm is generated every count clock, resulting in TAUJTOUTm toggling every count clock.

**(2) TAUJnCDRm = 0000 0000H, Count Clock = PCLK**

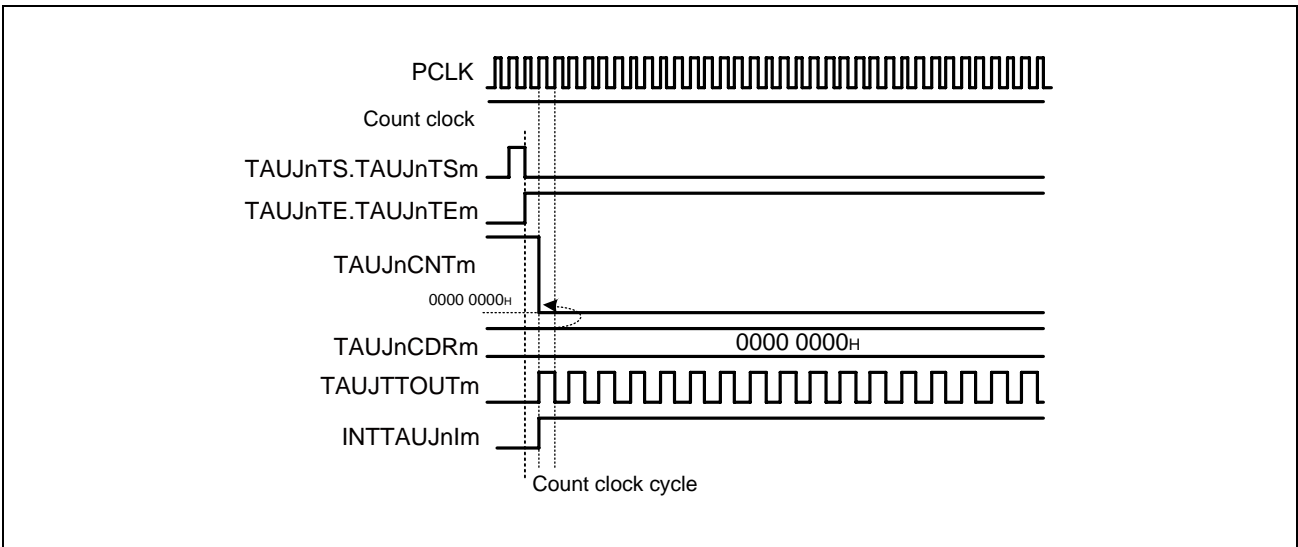

Figure 33.19 TAUJnCDRm = 0000 0000H, Count Clock = PCLK

- If TAUJnCDRm = 0000 0000H and the count clock = PCLK, the TAUJnCDRm value is loaded to TAUJnCNTm every PCLK clock, meaning that TAUJnCNTm is always 0000 0000H.
- INTTAUJnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated. TAUJTOUTm is toggled every PCLK clock.

**(3) Operation Stop and Restart**

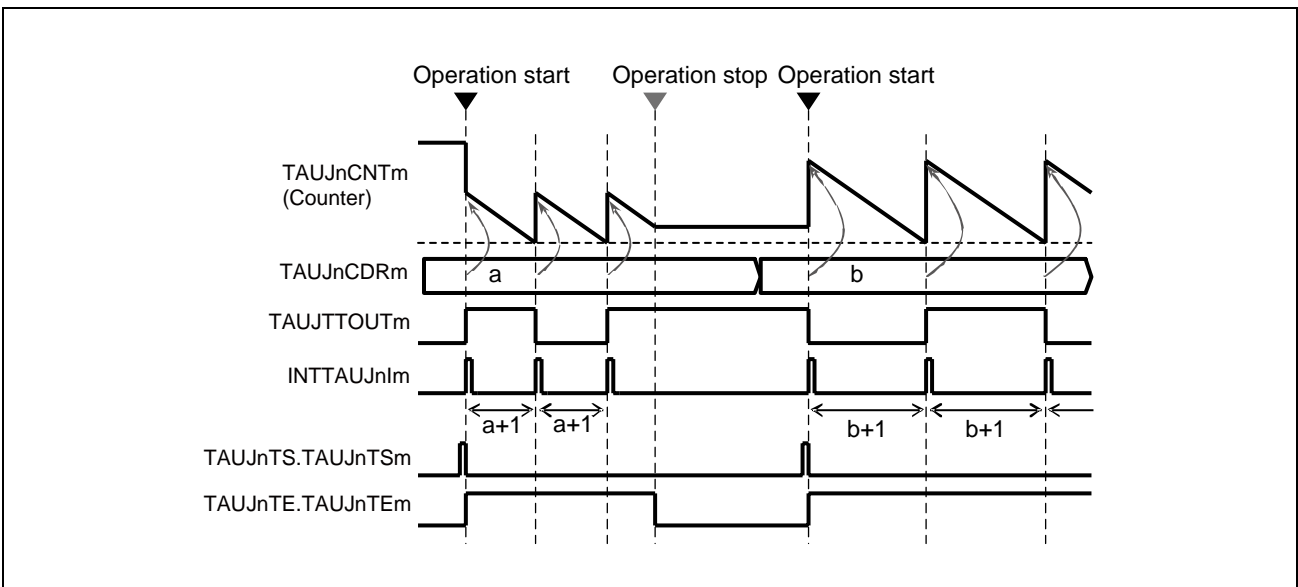

Figure 33.20 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 1)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTOUTm stop but retain their values.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1.

**(4) Forced Restart**

Figure 33.21 Forced Restart Operation (TAUJnCMORm.TAUJnMD0 = 1)

- The counter can be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.
- If the TAUJnCMORm.TAUJnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUJnCDRm value is reflected to TAUJnCNTm and counting starts. Execute a forced restart to reflect the changed TAUJnCDRm value immediately.

## 33.12.2 TAUJTTINm Input Interval Timer Function

### 33.12.2.1 Overview

#### Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals or when a valid TAUJTTINm input edge is detected. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave. Output of square waves is only supported for TAUJ0.

#### Description

This function operates in an identical manner to the interval timer function (see **Section 33.12.1, Interval Timer Function**), except that this function is restarted by a valid TAUJTTINm input edge. The type of edge used as the trigger is specified using the TAUJnCMURm.TAUJnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

### 33.12.2.2 Equations

$\text{INTTAUJnIm cycle} = \text{count clock cycle} \times (\text{TAUJnCDRm} + 1)$

$\text{TAUJTTOUTm square wave cycle} = \text{count clock cycle} \times (\text{TAUJnCDRm} + 1) \times 2$

### 33.12.2.3 Block Diagram and General Timing Diagram

Figure 33.22 Block Diagram for TAUJTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).
- Rising edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 01<sub>B</sub>)

Figure 33.23 General Timing Diagram for TAUJTTINm Input Interval Timer Function

### 33.12.2.4 Register Settings

1, 0	TAUJnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

### (3) Channel Output Mode

Table 33.53 Control Bit Settings for Independent Channel Output Mode 1

Bit name	Setting
TAUJnTOE.TAUJnTOEm	Write 1 <sub>B</sub> .
TAUJnTOM.TAUJnTOMm	Write 0 <sub>B</sub> .
TAUJnTOC.TAUJnTOCm	Write 0 <sub>B</sub> .
TAUJnTOL.TAUJnTOLm	Write 0 <sub>B</sub> .

#### NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details see **Section 33.7, Channel Output Modes**.

### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input interval timer function. Therefore, these registers must be set to 0.

Table 33.54 Simultaneous Rewrite Settings for TAUJTTINm Input Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

### 33.12.2.5 Operating Procedure for TAUJTTINm Input Interval Timer Function

Table 33.55 Operating Procedure for TAUJTTINm Input Interval Timer Function

	Operation	Status of TAUJn
Restart operation ↑	Initial channel setting	Channel operation is stopped.
	Start operation	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTOUTm toggles.
	During operation	TAUJnCNTm counts down. When the counter reaches 0000 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>TAUJnCNTm reloads the TAUJnCDRm value and continues count operation.</li> <li>INTTAUJnIm is generated and TAUJTOUTm toggles.</li> </ul> When a TAUJTTINm input valid edge is detected during count operation, TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. Afterwards, this procedure is repeated.
	Stop operation	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTOUTm stop and retain their current values.

### 33.12.2.6 Specific Timing Diagrams

The timing diagrams in **Section 33.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by a valid TAUJTTINm input edge.

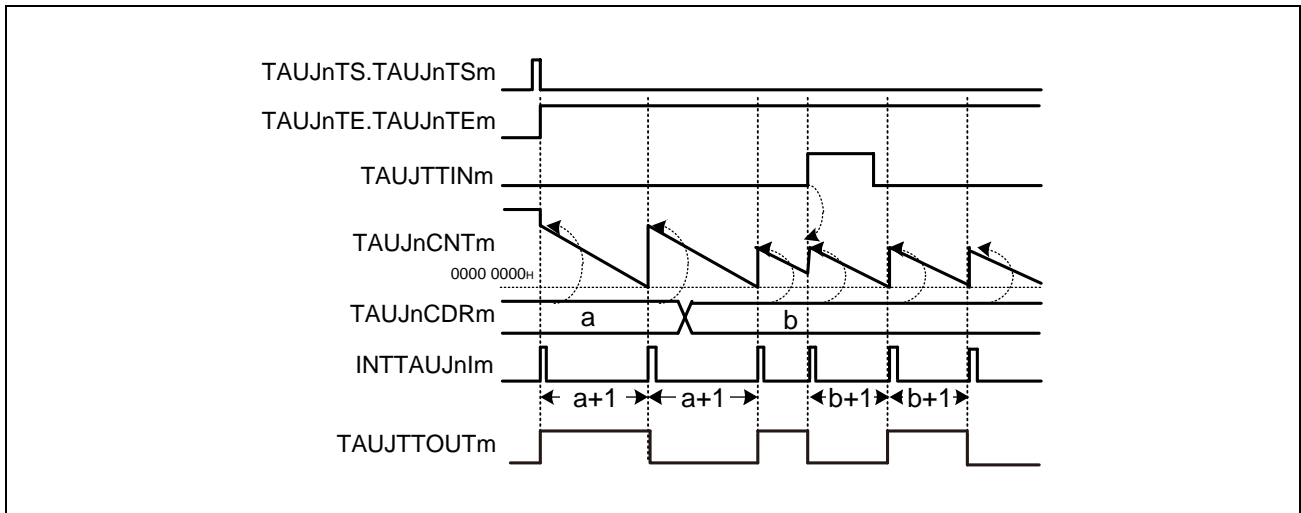

Figure 33.24 Counter Triggered by Rising TAUJTTINm Input Edge (TAUJnCMURm.TAUJnTIS[1:0] = 01<sub>B</sub>), TAUJnCMORM.TAUJnMD0 = 1

If a valid TAUJTTINm input edge is detected, an interrupt is generated which causes TAUJTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUJnCMURm.TAUJnTIS[1:0] = 01<sub>B</sub>).

### 33.12.3 TAUJTTINm Input Pulse Interval Measurement Function

#### 33.12.3.1 Overview

##### Summary

This function captures the count value and uses this value and the overflow bit TAUJnCSRm.TAUJnOVF to measure the interval of the TAUJTTINm input signals.

##### Prerequisites

TAUJTOUTm is not used for this function.

##### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter TAUJnCNTm starts counting up from 0000 0000<sub>H</sub>. When a valid TAUJTTINm edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter resets to 0000 0000<sub>H</sub> and subsequently continues operation.

If the counter reaches FFFF FFFF<sub>H</sub> before a valid TAUJTTINm edge is detected, it overflows to 0000 0000<sub>H</sub>. The counter is reset to 0000 0000<sub>H</sub> and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 33.56 Effects of an Overflow

TAUJnCMORm. TAUJnCOS[1:0]	When Overflow Occurs		When a Valid TAUJTTINm Input is then Detected	
	TAUJnCDRm	TAUJnCSRm. TAUJnOVF	TAUJnCDRm and TAUJnCNTm	TAUJnCSRm. TAUJnOVF
00	Unchanged	0	TAUJnCNTm loaded to TAUJnCDRm	1
01		1		
10	Set to FFFF FFFF <sub>H</sub>	0	TAUJnCNTm set to 0, TAUJnCDRm unchanged	Unchanged
11		1		

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV = 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the interval of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

The function can be stopped by setting TAUJnTT.TAUJnTTm = 1, which in turn sets TAUJnTE.TAUJnTEm = 0. TAUJnCNTm stops but retains its value. While the function is stopped, TAUJTTINm input valid edge detection and TAUJnCNTm capture are not performed.

##### Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 33.9, TAUJTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts.**

##### NOTE

When TAUJnCMORm.TAUJnCOS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

**33.12.3.2 Equations**

TAUJTTINm input pulse interval = count clock cycle × [(TAUJnCSRm.TAUJnOVF × (FFFF FFFF<sub>H</sub> + 1)) + TAUJnCDRm capture value + 1]

**33.12.3.3 Block Diagram and General Timing Diagram**

Figure 33.25 Block Diagram for TAUJTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00<sub>B</sub>)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = 00<sub>B</sub>).

1, 0	TAUJnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

#### (3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used by this function.

#### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input pulse interval measurement function. Therefore, these registers must be set to 0.

Table 33.59 Simultaneous Rewrite Settings for TAUJTTINm Input Pulse Interval Measurement Function

Bit name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

#### 33.12.3.5 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

Table 33.60 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

	Operation	Status of TAUJn
Restart operation	Initial channel setting Set the TAUJnCMORm and TAUJnCMURm registers as described in <b>Table 33.57, Contents of the TAUJnCMORm Register for TAUJTTINm Input Pulse Interval Measurement Function</b> and <b>Table 33.58, Contents of the TAUJnCMURm Register for TAUJTTINm Input Pulse Interval Measurement Function</b> .  The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
	Start operation Set TAUJnTS.TAUJnTSM to 1. TAUJnTS.TAUJnTSM is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEM is set to 1 and the counter starts. TAUJnCNTm is cleared to 0000 0000 <sub>H</sub> . INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
	During operation Detection of TAUJTTINm edges.  The values of the TAUJnCMURm.TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time. TAUJnCSCm.TAUJnCLOV bit can be written to 1. (TAUJnCSRm.TAUJnOVF bit is cleared to 0.)	TAUJnCNTm starts to count up from 0000 0000 <sub>H</sub> . When a TAUJTTINm valid edge is detected: <ul style="list-style-type: none"> <li>TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and returns to 0000 0000<sub>H</sub>.</li> <li>INTTAUJnIm is then generated.</li> </ul> Afterwards, this procedure is repeated.
	Stop operation Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEM is cleared to 0 and the counter stops. TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

### 33.12.3.6 Specific Timing Diagrams: Overflow Behavior

#### (1) TAUJnCMORm.TAUJnCOS[1:0] = 00<sub>B</sub>

Figure 33.27 TAUJnCMORm.TAUJnCOS[1:0] = 00<sub>B</sub>, TAUJnCMORm.TAUJnMD0 = 0,  
TAUJnCMURm.TAUJnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- If the next valid TAUJTTINm input edge is detected when no overflow occurs, TAUJnCSRm.TAUJnOVF is cleared to 0.

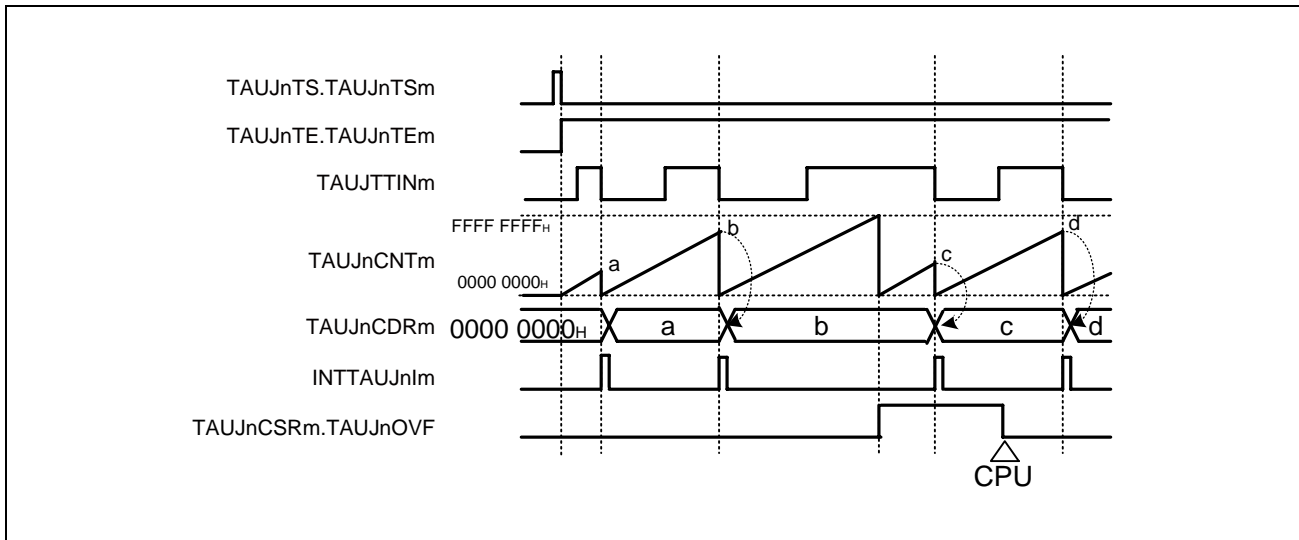

**(2) TAUJnCMORm.TAUJnCOS[1:0] = 01<sub>B</sub>**

Figure 33.28 TAUJnCMORm.TAUJnCOS[1:0] = 01<sub>B</sub>, TAUJnCMORm.TAUJnMD0 = 0,  
TAUJnCMURm.TAUJnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

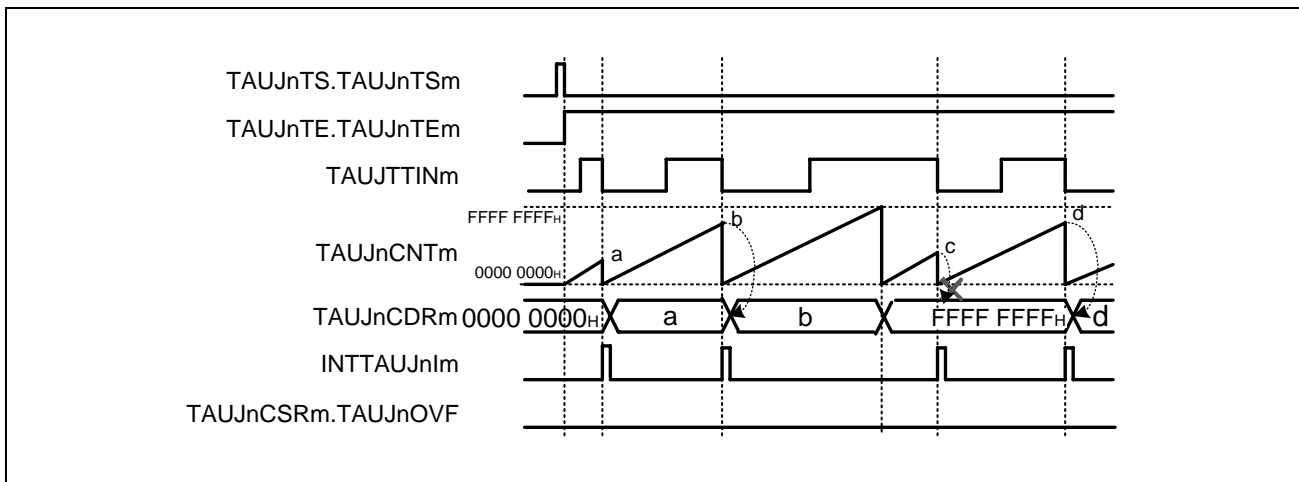

**(3) TAUJnCMORm.TAUJnCOS[1:0] = 10<sub>B</sub>**

Figure 33.29 TAUJnCMORm.TAUJnCOS[1:0] = 10<sub>B</sub>, TAUJnCMORm.TAUJnMD0 = 0,  
TAUJnCMURm.TAUJnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF<sub>H</sub> and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

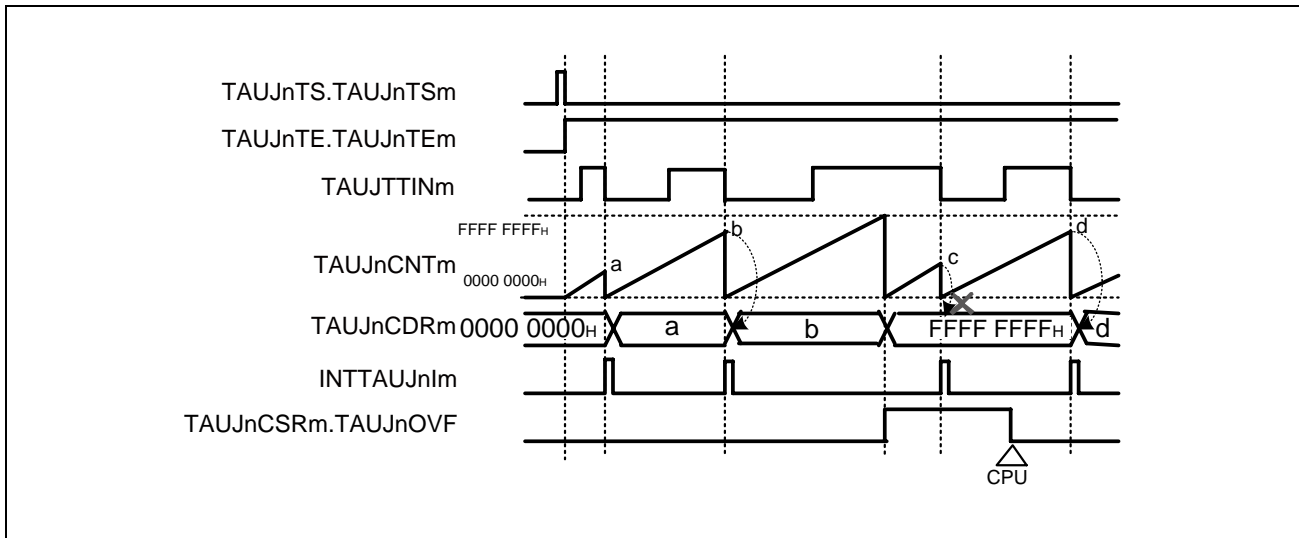

**(4) TAUJnCMORm.TAUJnCOS[1:0] = 11<sub>B</sub>**

Figure 33.30 TAUJnCMORm.TAUJnCOS[1:0] = 11<sub>B</sub>, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00<sub>B</sub>

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF<sub>H</sub>, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

### 33.12.4 TAUJTTINm Input Signal Width Measurement Function

#### 33.12.4.1 Overview

##### Summary

This function measures the width of a TAUJTTINm signal by starting counting on one edge of the TAUJTTINm signal and capturing the counter value on the opposite edge.

##### Prerequisites

TAUJTOUTm is not used for this function.

##### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSM) to 1. This in turn sets TAUJnTE.TAUJnTEM = 1, enabling count operation. When a valid TAUJTTINm start edge is detected, the counter TAUJnCNTm starts counting up from 0000 0000<sub>H</sub>. When a valid TAUJTTINm stop edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter retains its value and awaits the next valid TAUJTTINm input start edge.

If the counter reaches FFFF FFFF<sub>H</sub> before a valid TAUJTTINm stop edge is detected, it overflows. The counter is reset to 0000 0000<sub>H</sub> and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 33.61 Effects of an Overflow

TAUJnCMORm. TAUJnCOS[1:0]	When Overflow Occurs		When a Valid TAUJTTINm Input Stop Edge is Detected	
	TAUJnCDRm	TAUJnCSRm. TAUJnOVF	TAUJnCDRm and TAUJnCNTm	TAUJnCSRm. TAUJnOVF
00	Unchanged	0	TAUJnCNTm is loaded to TAUJnCDRm.	1
01		1		
10	Set to FFFF FFFF <sub>H</sub>	0	TAUJnCNTm stops counting, TAUJnCDRm unchanged	Unchanged
11		1		

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV to 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the width of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

This function cannot be forcibly restarted.

##### NOTE

When TAUJnCMORm.COS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

#### 33.12.4.2 Equations

TAUJTTINm input signal width = count clock cycle ×  
 $[(TAUJnCSRm.TAUJnOVF \times (FFFF\ FFFF_H + 1)) + TAUJnCDRm\ capture\ value + 1]$

33.12.4.3 Block Diagram and General Timing Diagram

Figure 33.31 Block Diagram for TAUJTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORM.TAUJnCOS[1:0] = 00<sub>B</sub>).

Figure 33.32 General Timing Diagram for TAUJTTINm Input Signal Width Measurement Function

### 33.12.4.4 Register Settings

0	TAUJnMD0	Write 0 <sub>B</sub> .

#### (2) TAUJnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 33.63 Contents of the TAUJnCMURm Register for TAUJTTINm Input Signal Width Measurement Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (low width measurement) 11: Rising and falling edge detection (high width measurement)

#### (3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

#### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input signal width measurement function. Therefore, these registers must be set to 0.

Table 33.64 Simultaneous Rewrite Settings for TAUJTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

#### 33.12.4.5 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

Table 33.65 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

	Operation	Status of TAUJn
Restart operation ↑	Initial channel setting Set the TAUJnCMORm and TAUJnCMURm registers as described in <b>Table 33.62, Contents of the TAUJnCMORm Register for TAUJTTINm Input Signal Width Measurement Function</b> and <b>Table 33.63, Contents of the TAUJnCMURm Register for TAUJTTINm Input Signal Width Measurement Function</b> . The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
	Start operation Set TAUJnTS.TAUJnTSM to 1. TAUJnTS.TAUJnTSM is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEM is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge. When a TAUJTTINm start edge is detected, TAUJnCNTm starts to count up.
	During operation The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time. The TAUJnCSCm.TAUJnCLOV bit can be set to 1.	TAUJnCNTm starts to count up from 0000 0000 <sub>H</sub> . When a TAUJTTINm valid edge is detected: <ul style="list-style-type: none"> <li>• TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and retains its value.</li> <li>• INTTAUJnIm is then generated.</li> <li>• Counting stops at the “value that transferred to TAUJnCDRm + 1” and TAUJnCNTm waits for detection of the TAUJTTINm start edge.</li> </ul> Afterwards, this procedure is repeated.
	Stop operation Set TAUJnTT.TAUJnTTM to 1. TAUJnTT.TAUJnTTM is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEM is cleared to 0 and the counter stops. TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

### 33.12.4.6 Specific Timing Diagrams: Overflow Behavior

#### (1) TAUJnCMORm.TAUJnCOS[1:0] = 00<sub>B</sub>

Figure 33.33 TAUJnCMORm.TAUJnCOS[1:0] = 00<sub>B</sub>, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge with no overflow occurring, TAUJnCSRm.TAUJnOVF is cleared to 0.

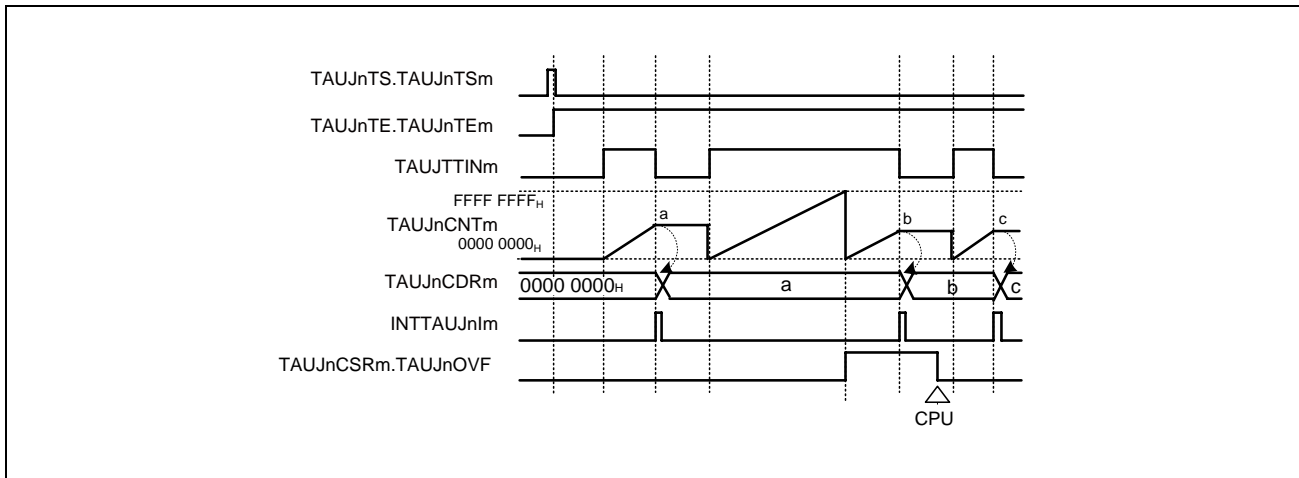

**(2) TAUJnCMORm.TAUJnCOS[1:0] = 01<sub>B</sub>**

Figure 33.34 TAUJnCMORm.TAUJnCOS[1:0] = 01<sub>B</sub>, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

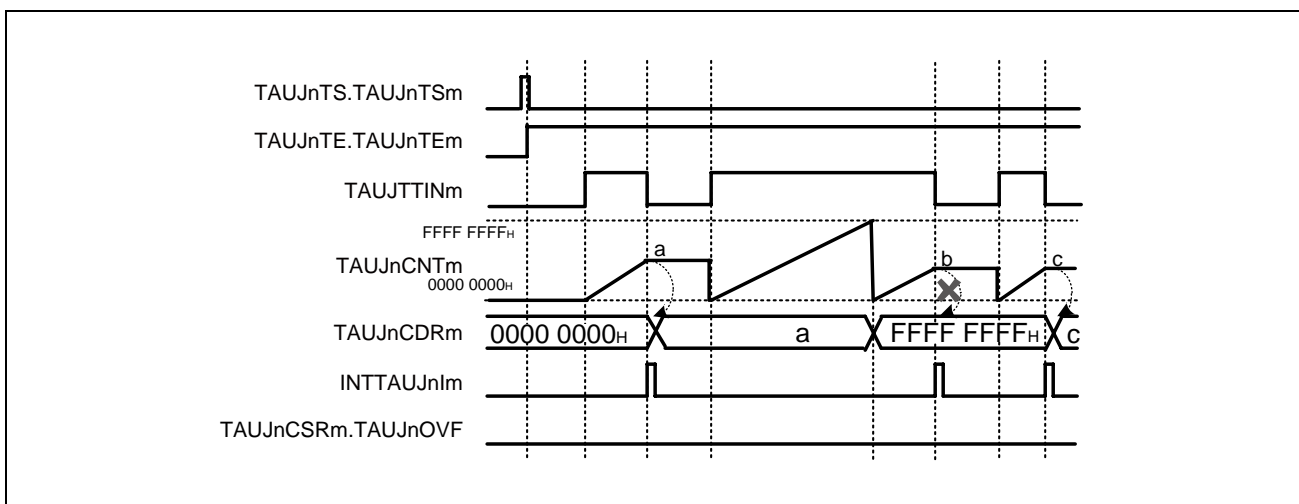

**(3) TAUJnCMORm.TAUJnCOS[1:0] = 10<sub>B</sub>**

Figure 33.35 TAUJnCMORm.TAUJnCOS[1:0] = 10<sub>B</sub>, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF<sub>H</sub> and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

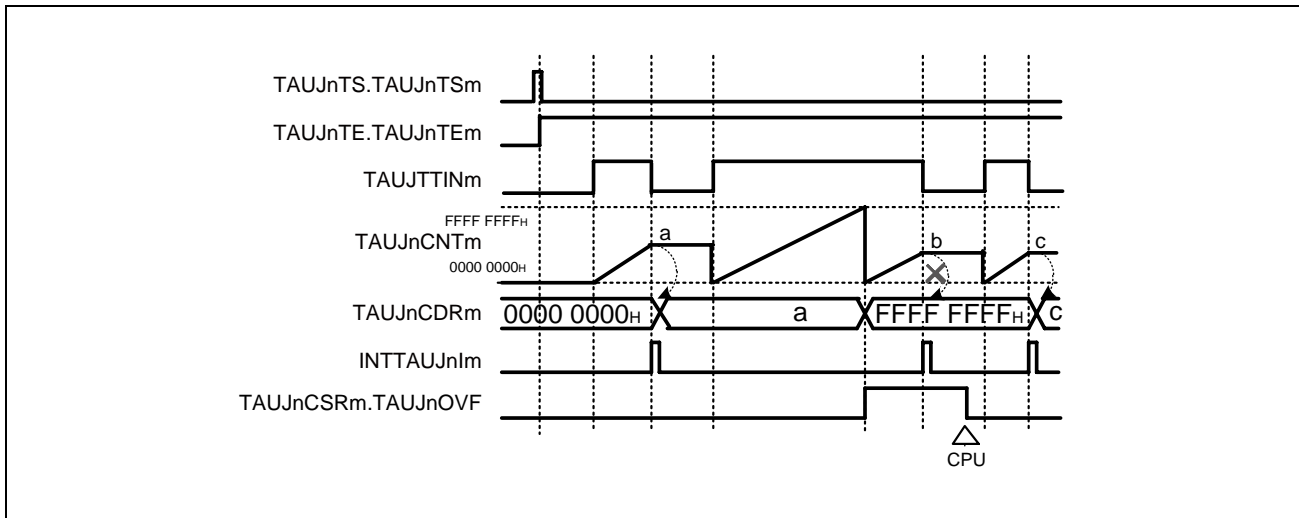

(4) TAUJnCMORm.TAUJnCOS[1:0] = 11<sub>B</sub>

Figure 33.36 TAUJnCMORm.TAUJnCOS[1:0] = 11<sub>B</sub>, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF<sub>H</sub>, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

## 33.12.5 TAUJTTINm Input Position Detection Function

### 33.12.5.1 Overview

#### Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUJTTINm signal.

#### Prerequisites

TAUJTOUTm is not used for this function

#### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSM) to 1. This in turn sets TAUJnTE.TAUJnTEM = 1, enabling count operation. The counter starts to count from 0000 0000<sub>H</sub>. When a valid TAUJTTINm input edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter continues to count.

When the counter reaches FFFF FFFF<sub>H</sub>, the counter restarts from 0000 0000<sub>H</sub>.

#### NOTE

The input TAUJTTINm is sampled at the frequency of the operation clock, specified by TAUJnCMORm.TAUJnCKS[1:0] bits.

#### Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated.

### 33.12.5.2 Equations

Function duration at a TAUJTTINm input pulse =  
 count clock cycle × (TAUJnCDRm capture value + 1)

33.12.5.3 Block Diagram and General Timing Diagram

Figure 33.37 Block Diagram of TAUJTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00<sub>B</sub>)

#### (3) Channel Output Mode

The channel output mode is not used by this function.

#### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input position detection function. Therefore, these registers must be set to 0.

Table 33.68 Simultaneous Rewrite Settings for TAUJTTINm Input Position Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

#### 33.12.5.5 Operating Procedure for TAUJTTINm Input Position Detection Function

Table 33.69 Operating Procedure for TAUJTTINm Input Position Detection Function

	Operation	Status of TAUJn
Restart operation ↑	Initial channel setting Set the TAUJnCMORm register and TAUJnCMURm registers as described in <b>Table 33.66, Contents of the TAUJnCMORm Register for TAUJTTINm Input Position Detection Function</b> and <b>Table 33.67, Contents of the TAUJnCMURm Register for TAUJTTINm Input Position Detection Function</b> . The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
	Start operation Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
	During operation The values of the TAUJnCMURm.TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time.	TAUJnCNTm starts to count up from 0000 0000 <sub>H</sub> . When a TAUJTTINm valid edge is detected: <ul style="list-style-type: none"> <li>• TAUJnCNTm transfers (captures) its value to TAUJnCDRm.</li> <li>• INTTAUJnIm is output.</li> <li>• The counter value is not cleared to 0000 0000<sub>H</sub> and TAUJnCNTm continues count operation.</li> </ul> Afterwards, this procedure is repeated. When TAUJnCNTm reaches FFFF FFFF <sub>H</sub> , the counter restarts from 0000 0000 <sub>H</sub> .
	Stop operation Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

### 33.12.5.6 Specific Timing Diagrams

#### (1) Operation Stop and Restart

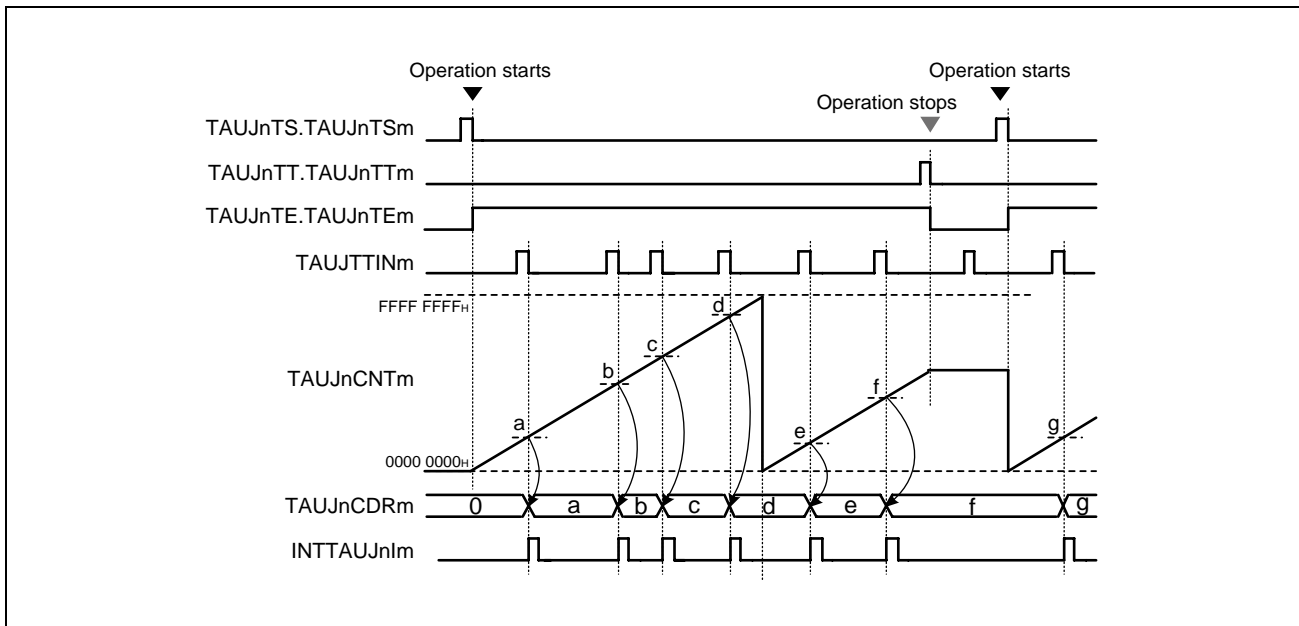

Figure 33.39 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00<sub>B</sub>)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJnTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSM to 1. TAUJnCNTm restarts to count from 0000 0000<sub>H</sub>.

## 33.12.6 TAUJTTINm Input Period Count Detection Function

### 33.12.6.1 Overview

#### Summary

This function measures the cumulative width of a TAUJTTINm input signal.

#### Prerequisites

TAUJTTOUTm is not used for this function.

#### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSM) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter awaits a valid TAUJTTINm input edge.

When a valid TAUJTTINm input start edge is detected, the counter starts to count from 0000 0000<sub>H</sub>.

When a valid TAUJTTINm input stop edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter stops and retains its value until the next valid TAUJTTINm input start edge is detected.

When the next valid TAUJTTINm input start edge is detected, the counter restarts counting from the stop value.

When the counter reaches FFFF FFFF<sub>H</sub>, the counter restarts from 0000 0000<sub>H</sub>.

This function cannot be forcibly restarted.

#### NOTE

The input TAUJTTINm signal is sampled at the frequency of the operation clock, specified by the TAUJnCMORm.TAUJnCKS[1:0] bits.

#### Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10<sub>B</sub>, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

### 33.12.6.2 Equations

Cumulative TAUJTTINm input width =  
count clock cycle × (TAUJnCDRm capture value + 1)

### 33.12.6.3 Block Diagram and General Timing Diagram

Figure 33.40 Block Diagram for TAUJTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>)

Figure 33.41 General Timing Diagram for TAUJTTINm Input Period Count Detection Function

1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (Low width measurement) 11: Rising and falling edge detection (High width measurement)

#### (3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

#### (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input period count detection function. Therefore, these registers must be set to 0.

Table 33.72 Simultaneous Rewrite Settings for TAUJTTINm Input Period Count Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

#### 33.12.6.5 Operating Procedure for TAUJTTINm Input Period Count Detection Function

Table 33.73 Operating Procedure for TAUJTTINm Input Period Count Detection Function

	Operation	Status of TAUJn
Restart operation ↑	Initial channel setting  Set the TAUJnCMORm and TAUJnCMURm registers as described in <b>Table 33.70, Contents of the TAUJnCMORm Register for TAUJTTINm Input Period Count Detection Function</b> and <b>Table 33.71, Contents of the TAUJnCMURm Register for TAUJTTINm Input Period Count Detection Function</b> .  The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
	Start operation  Set TAUJTS.TAUJnTSM to 1. TAUJnTS.TAUJnTSM is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEM is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge.
	During operation  TAUJTTINm edge detection  The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time.	When a TAUJTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUJnCNTm starts to count up from the stop value.  When TAUJnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUJnCDRm and INTTAUJnIm is generated.  Counting stops at the "value transferred to TAUJnCDRm + 1" and TAUJnCNTm waits for detection of the TAUJTTINm start edge.  When TAUJnCNTm reaches FFFF FFFF <sub>H</sub> , the counter restarts from 0000 0000 <sub>H</sub> .  Afterwards, this procedure is repeated.
	Stop operation  Set TAUJnTT.TAUJnTTM to 1. TAUJnTT.TAUJnTTM is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEM is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

### 33.12.6.6 Specific Timing Diagrams

#### (1) Operation Stop and Restart

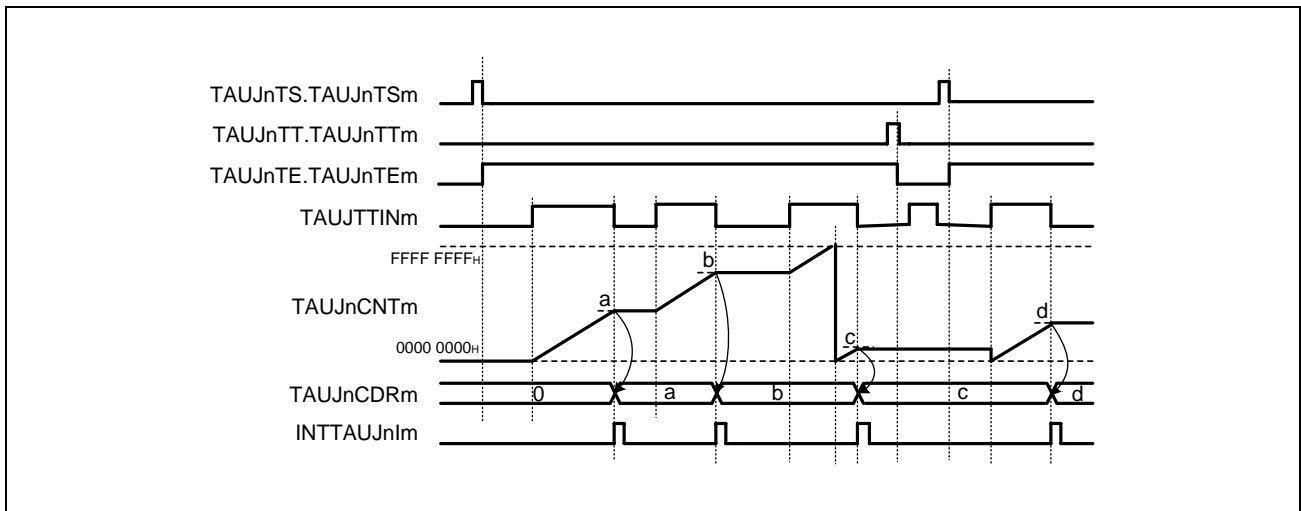

Figure 33.42 Operation Stop and Restart (TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>)

- The counter can be stopped by setting TAUJnTT.TAUJnTTM to 1, which in turn sets TAUJnTE.TAUJnTEM to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJnTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSM to 1. TAUJnCNTm restarts to count from 0000 0000<sub>H</sub>.

### 33.12.7 Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

#### 33.12.7.1 Overview

##### Summary

This function measures the width of an individual TAUJTTINm input signal. An interrupt is generated if the TAUJTTINm input width is longer than  $FFFF\ FFFF_H + 1$ .

##### Prerequisites

- TAUJTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to  $FFFF\ FFFF_H$ .

##### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSM) to 1. This in turn sets TAUJnTE.TAUJnTEM = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected.  $FFFF\ FFFF_H$  is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUJTTINm input start edge is detected, TAUJnCNTm loads  $FFFF\ FFFF_H$  and starts to count down.

If the counter reaches  $0000\ 0000_H$  before a stop edge is detected, an interrupt is generated.

##### Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] =  $10_B$ , the TAUJTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] =  $11_B$ , the TAUJTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

##### NOTE

The counter cannot be restarted during operation.

33.12.7.2 Block Diagram and General Timing Diagram

Figure 33.43 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>)

1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (Low width measurement) 11: Rising and falling edge detection (High width measurement)

#### (3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

**(4) Simultaneous Rewrite**

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the overflow interrupt output function (during TAUJTTINm width measurement). Therefore, these registers must be set to 0.

Table 33.76 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

Bit name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0

**33.12.7.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)**

Table 33.77 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

	Operation	Status of TAUJn
Restart operation ↑	Initial channel setting Set the TAUJnCMORm register and TAUJnCMURm registers as described in <b>Table 33.74, Contents of the TAUJnCMORm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)</b> and <b>Table 33.75, Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)</b> . Set the value of the TAUJnCDRm register to FFFF FFFF <sub>H</sub> .	Channel operation is stopped.
	Start operation Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUJTTINm start edge.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the start edge. When a start edge is detected, TAUJnCNTm loads the TAUJnCDRm value (FFFF FFFF <sub>H</sub> ).
	During operation The TAUJnCNTm register can be read at any time.	TAUJnCNTm counts down. When the counter reaches 0000 0000 <sub>H</sub> : • INTTAUJnIm is generated. When a reverse edge of TAUJTTINm is detected during count operation: • TAUJnCNTm stops counting and waits for a trigger. Afterwards, this procedure is repeated.
	Stop operation Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

## 33.12.8 Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

### 33.12.8.1 Overview

#### Summary

This function measures the cumulative width of a TAUJTTINm input signal. An interrupt is generated if the cumulative TAUJTTINm input width is longer than FFFF FFFF<sub>H</sub>, and an overflow interrupt can be output.

#### Prerequisites

- TAUJTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF FFFF<sub>H</sub>.

#### Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSM) to 1. This in turn sets TAUJnTE.TAUJnTEM = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF FFFF<sub>H</sub> is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUJTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000 0000<sub>H</sub> an interrupt is generated. FFFF FFFF<sub>H</sub> is loaded to TAUJnCNTm and the counter continues to count down until a TAUJTTINm input stop edge is detected.

#### Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10<sub>B</sub>, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

#### NOTE

The counter cannot be restarted during operation.

33.12.8.2 Block Diagram and General Timing Diagram

Figure 33.45 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11<sub>B</sub>)

Figure 33.46 General Timing Diagram For Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

Set the value of the TAUJnCDRm register to FFFF FFFF <sub>H</sub> .	Channel operation is stopped.
	Start operation Set TAUJnTS.TAUJnTSM to 1. TAUJnTS.TAUJnTSM is a trigger bit, so it is automatically cleared to 0.  Detection of TAUJTTINm start edge.	TAUJnTE.TAUJnTEM is set to 1 and TAUJnCNTm waits for detection of the start edge.  When a start edge is detected, the value of TAUJnCDRm (FFFF FFFF <sub>H</sub> ) is loaded to TAUJnCNTm.
	During operation  The TAUJnCNTm register can be read at all times	TAUJnCNTm counts down. When the counter reaches 0000 0000 <sub>H</sub> : <ul style="list-style-type: none"> <li>• INTTAUJnIm is generated.</li> <li>• TAUJnCNTm loads the TAUJnCDRm value (FFFF FFFF<sub>H</sub>) and continues to count down.</li> </ul> When a reverse edge of TAUJTTINm is detected during count operation: <ul style="list-style-type: none"> <li>• TAUJnCNTm stops and retains the stop value.</li> </ul> When a TAUJTTINm valid edge is detected while the counter is stopped: <ul style="list-style-type: none"> <li>• TAUJnCNTm counts down from the stop value.</li> </ul> Afterwards, this procedure is repeated.
	Stop operation Set TAUJnTT.TAUJnTTM to 1. TAUJnTT.TAUJnTTM is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEM is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

## 33.13 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the TAUJ. For a general overview of synchronous channel operation, see **Section 33.2, Overview**.

### 33.13.1 PWM Output Function

#### 33.13.1.1 Overview

##### Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty of the TAUJTOUT<sub>m</sub> to be set. The pulse cycle is set in the master channel. The duty is set in the slave channel.

##### Prerequisites

- Two channels
- The operation mode for the master channel should be set to the interval timer mode. (See **Table 33.82, Contents of the TAUJnCMOR<sub>m</sub> Register for the Master Channel of the PWM Output Function**.)
- The operation mode for the slave channel should be set to the one-count mode. (See **Table 33.85, Contents of the TAUJnCMOR<sub>m</sub> Register for the Slave Channel of the PWM Output Function**.)
- TAUJTOUT<sub>m</sub> is not used for the master channel of this function.
- The channel output mode for the slave channels should be set to synchronous channel output mode 1. (See **Section 33.7, Channel Output Modes**.)

##### Description

The counters are enabled by setting the channel trigger bits (TAUJnTS.TAUJnTS<sub>m</sub>) to 1. This in turn sets TAUJnTE.TAUJnTE<sub>m</sub> = 1, enabling count operation. The current value of TAUJnCDR<sub>m</sub> is loaded to TAUJnCNT<sub>m</sub> and the counters start to count down from these values. INTTAUJnIm is generated on the master channel and TAUJTOUT<sub>m</sub> (slave) is set or reset to realize the PWM output.

- Master channel:

When the counter of the master channel reaches 0000 0000<sub>H</sub> and pulse cycle time has elapsed, INTTAUJnIm is generated. The TAUJnCDR<sub>m</sub> value is loaded to TAUJnCNT<sub>m</sub>, and the counter counts down.

- Slave channel(s):

INTTAUJnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUJnCDR<sub>m</sub> (slave) is loaded to TAUJnCNT<sub>m</sub> (slave) and the counter starts to count down from this value. The TAUJTOUT<sub>m</sub> signal is set to the active level.

When the counter reaches 0000 0000<sub>H</sub>, i.e. duty time has elapsed, INTTAUJnIm is generated and the TAUJTOUT<sub>m</sub> signal is set to the inactive level. The counter returns to FFFF FFFF<sub>H</sub> and awaits the next INTTAUJnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUJnTT.TAUJnTT<sub>m</sub> to 1 for the master and slave channel(s), which in turn sets TAUJnTE.TAUJnTE<sub>m</sub> to 0. TAUJnCNT<sub>m</sub> and TAUJTOUT<sub>m</sub> of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUJnTS.TAUJnTS<sub>m</sub> to 1.

##### Conditions

Set Simultaneous rewrite with this function. Please see **Section 33.6, Simultaneous Rewrite**.

**33.13.1.2 Equations**

Pulse cycle = (TAUJnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUJnCDRm (slave)/(TAUJnCDRm (master) +1)) × 100

- Duty cycle = 0%  
TAUJnCDRm (slave) = 0000 0000<sub>H</sub>
- Duty cycle = 100%  
TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1

**33.13.1.3 Block Diagram and General Timing Diagram**

Figure 33.47 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUJnTOL.TAUJnTOLm = 0)

Figure 33.48 General Timing Diagram for PWM Output Function

NOTE

- The interval between the start of the count and an interrupt being generated is the value of corresponding TAUJnCDRm + 1.
- TAUJTTOUtm of the slave channel will rise with a delay of one count clock after the rising of INTTAUJnIm of the master channel.

Bit Position	Bit Name	Function
15, 14	TAUJnCKS[1:0]	Operation Clock Selection 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUJnCKS[1:0] bits of the master and slave channel(s) must be identical.
13, 12	TAUJnCCS[1:0]	Write 00 <sub>B</sub> .
11	TAUJnMAS	Write 0 <sub>B</sub> .
10 to 8	TAUJnSTS[2:0]	Write 100 <sub>B</sub> .
7, 6	TAUJnCOS[1:0]	Write 00 <sub>B</sub> .
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUJnMD[4:1]	Write 0100 <sub>B</sub> .
0	TAUJnMD0	Write 1 <sub>B</sub> .

#### (2) TAUJnCMURm for the Slave Channel(s)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
	R	R	R	R	R	R	R/W	R/W

Table 33.86 Contents of the TAUJnCMURm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Not used, so set to 00.

**(3) Channel Output Mode for the Slave Channel(s)**

Table 33.87 Control Bit Settings for Synchronous Channel Output Mode 1

Bit Name	Setting
TAUJnTOE.TAUJnTOEm	Write 1 <sub>B</sub> .
TAUJnTOM.TAUJnTOMm	Write 1 <sub>B</sub> .
TAUJnTOC.TAUJnTOCm	Write 0 <sub>B</sub> .
TAUJnTOL.TAUJnTOLm	0: Positive logic 1: Negative logic

**(4) Simultaneous Rewrite for the Slave Channel(s)**

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 33.88 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

Bit name	Setting
TAUJnRDE.TAUJnRDEm	1: Enables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting.

### 33.13.1.6 Operating Procedure for PWM Output Function

Table 33.89 Operating Procedure for PWM Output Function

	Operation	Status of TAUJn
Restart operation	<p>Initial channel setting</p> <p>Master channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in <b>Section 33.13.1.4, Register Settings for the Master Channel</b>.</p> <p>Slave channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in <b>Section 33.13.1.5, Register Settings for the Slave Channel(s)</b>.</p> <p>Set the values of the TAUJnCDRm registers of all channels.</p>	Channel operation is stopped.
	<p>Start operation</p> <p>Set TAUJnTS.TAUJnTSm of the master and slave channels to 1 simultaneously. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.</p>	<p>TAUJnTE.TAUJnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start.</p> <p>INTTAUJnIm is generated on the master channel and TAUJTTOUtm (slave) is set.</p>
	<p>During operation</p> <p>TAUJnCDRm can be changed at any time. TAUJnCNTm and TAUJnRSF.TAUJnRSFm can be read at any time.</p> <p>TAUJnRDT.TAUJnRDTm can be changed during operation.</p>	<p>TAUJnCNTm of the master channel loads TAUJnCDRm and counts down. When the counter reaches 0000 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUJnIm (master) is generated.</li> <li>• TAUJnCNTm (master) loads the TAUJnCDRm value and continues count operation.</li> <li>• TAUJnCNTm (slave) loads the TAUJnCDRm value and counts down.</li> <li>• TAUJTTOUtm (slave) is set to the active level.</li> </ul> <p>When TAUJnCNTm (slave) reaches 0000 0000<sub>H</sub>:</p> <ul style="list-style-type: none"> <li>• INTTAUJnIm (slave) is generated.</li> <li>• TAUJTTOUtm (slave) is set to the inactive level.</li> </ul>
	<p>Stop operation</p> <p>Set TAUJnTT.TAUJnTTm of the master and slave channels to 1 simultaneously. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.</p>	<p>TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops.</p> <p>TAUJnCNTm and TAUJTTOUtm stop and retain their current values.</p>

33.13.1.7 Specific Timing Diagrams

(1) Duty cycle = 0%

Figure 33.49 TAUJnCDRm (slave) = 0000 0000H, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- Every time the master channel generates an interrupt (INTTAUJnIm), 0000 0000H is loaded to TAUJnCNTm (slave). As a result, a slave channel interrupt (INTTAUJnIm) is generated at the same time and TAUJTOUTm remains inactive.
- The value of TAUJnCDRm is loaded into TAUJnCNTm (slave) to generate an interrupt.

(2) Duty cycle = 100%

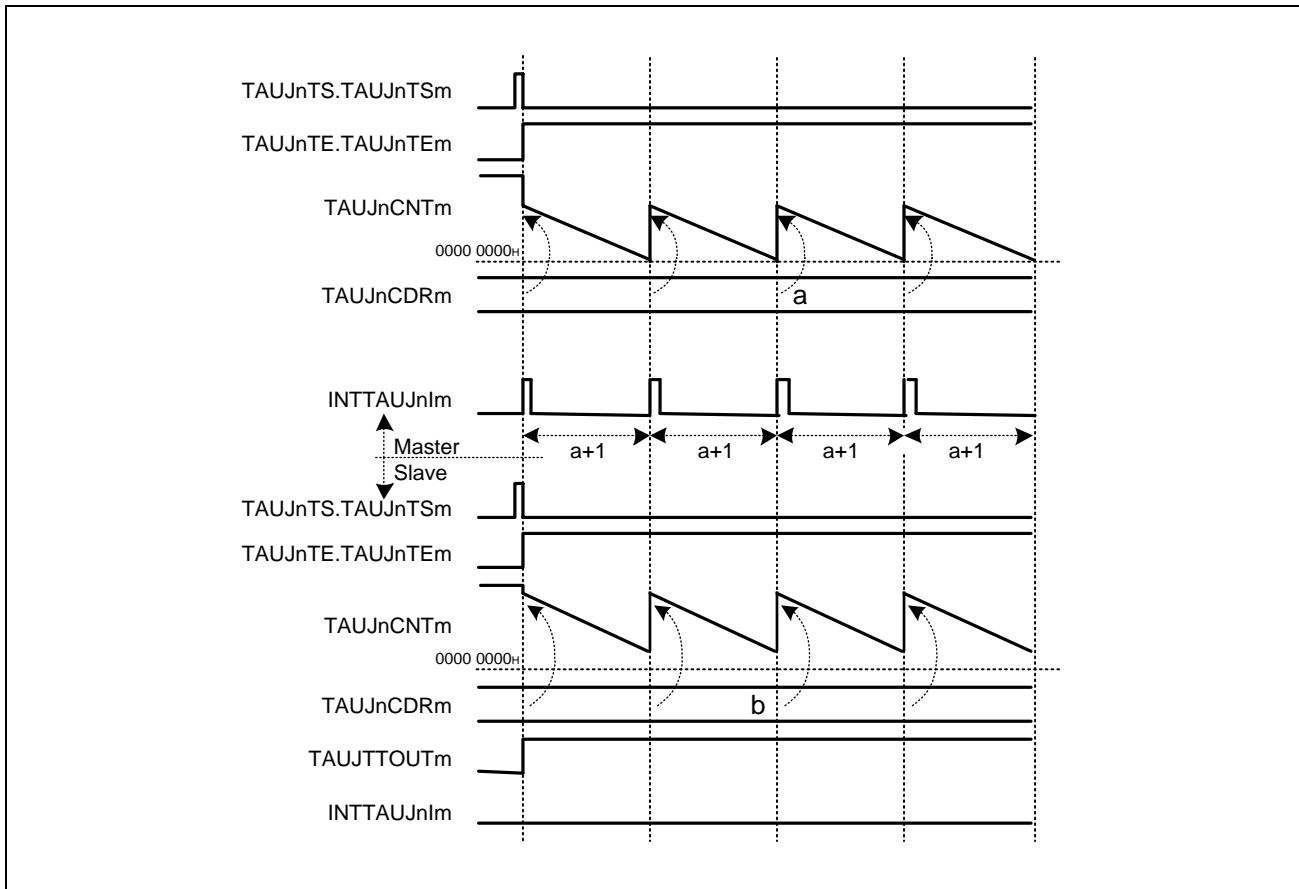

Figure 33.50 TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

If the TAUJnCDRm (slave) value is greater than the TAUJnCDRm (master) value, no interrupt occurs because the counter of the slave channel does not reach 0000 0000H. TAUJTTOUtm remains active.

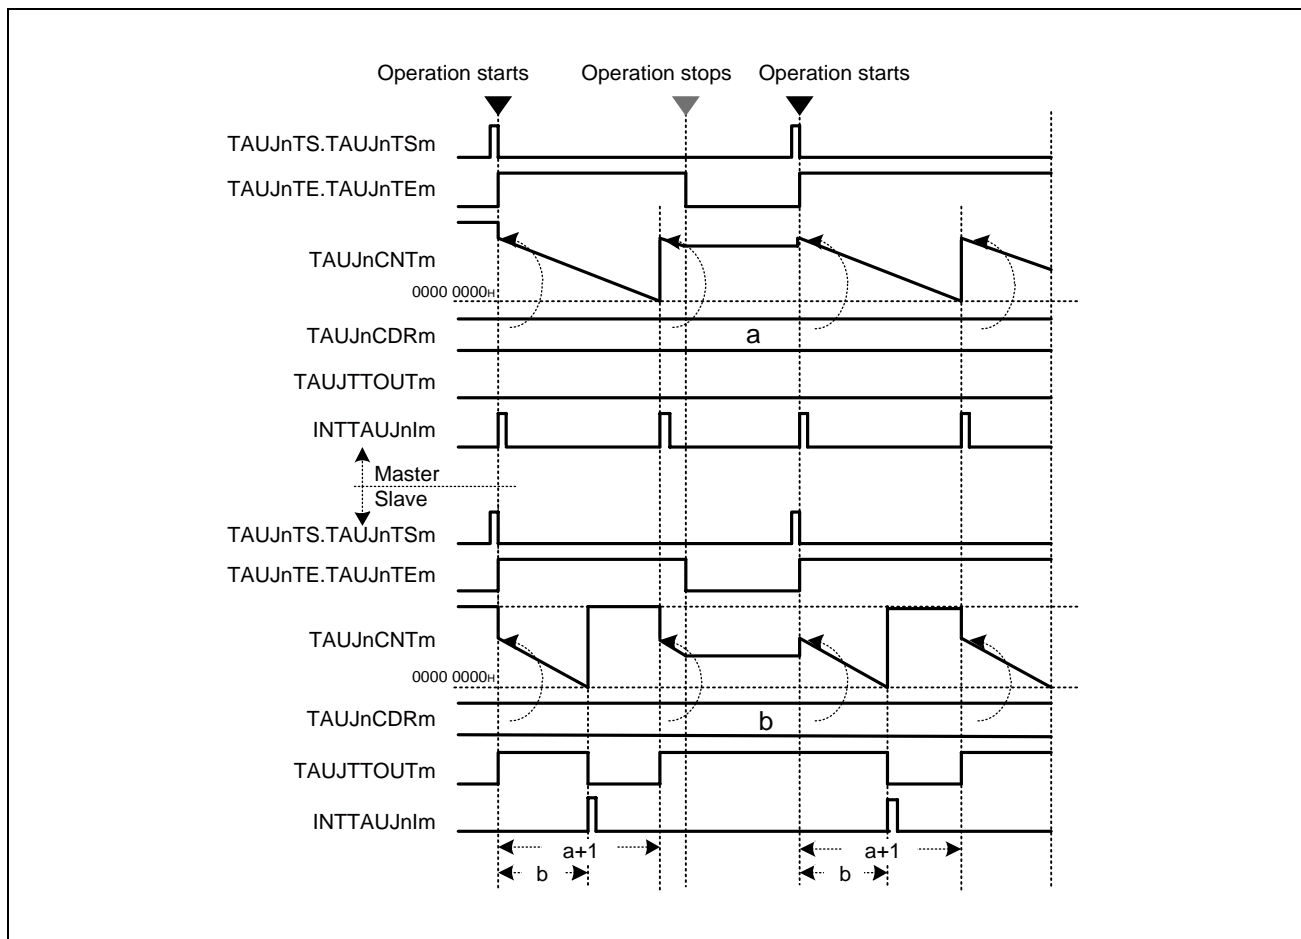

**(3) Operation Stop and Restart**

Figure 33.51 Operation Stop and Restart, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm of master and slave channels to 1. This sets TAUJnTE.TAUJnTEM to 0.
- TAUJnCNTm and TAUJTOUTm of every channel stop and retain their current values. No interrupt occurs.
- The counter can be restarted by setting TAUJnTS.TAUJnTSM of master and slave channels to 1. The TAUJnCDRm value of master and slave channels is loaded into TAUJnCNTm. The counter starts to count down from this value.

## Section 34 Real-Time Clock (RTCA)

This section contains a generic description of the Real-Time Clock (RTCA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RTCA.

### 34.1 Features of RH850/F1KH, RH850/F1KM RTCA

#### 34.1.1 Number of Units

This microcontroller has the following number of RTCA units.

Table 34.1 Number of Units (RH850/F1KH-D8)

	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)

Table 34.2 Number of Units (RH850/F1KM-S4)

	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)

Table 34.3 Number of Units (RH850/F1KM-S2)

	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	1	1	1
Name	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)

Table 34.4 Number of Units (RH850/F1KM-S1)

	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)	RTCA <sub>n</sub> (n = 0)

Table 34.5 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RTCA units are identified by the index "n"; for example, RTCA <sub>n</sub> CTL0 (n = 0) is the RTCA <sub>n</sub> control register 0.

### 34.1.2 Register Base Address

RTCA<sub>n</sub> base address is listed in the following table.

RTCA<sub>n</sub> register addresses are given as an offset from the base address.

Table 34.6 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<RTCA0_base>	FFE7 8000 <sub>H</sub>

### 34.1.3 Clock Supply

The RTCA<sub>n</sub> clock supply is shown in the following table.

Table 34.7 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RTCA <sub>n</sub>	RTCATCKI	CKSCLK_ARTCA	Macro clock
	PCLK	CPUCLK_L	Module clock
	Register access clock	CPUCLK_L	Bus clock

### 34.1.4 Interrupt Requests

RTCA<sub>n</sub> interrupt requests are listed in the following table.

Table 34.8 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RTCA0			
INTRTCA01S	1-second interval interrupt	209	—
INTRTCA0AL	Alarm interrupt	210	—
INTRTCA0R	Fixed interval interrupt	211	—

### 34.1.5 Reset Sources

RTCA<sub>n</sub> reset sources are listed in the following table. RTCA<sub>n</sub> is initialized by these reset sources.

Table 34.9 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
RTCA <sub>n</sub>	Power-up reset (PURES)

### 34.1.6 External Input/Output Signals

External input/output signals of RTCA<sub>n</sub> are listed below.

Table 34.10 External Input/Output Signal (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RTCA0		
RTCAT1HZ	1-Hz pulse output	RTCA0OUT*1

Note 1. RTCA0OUT is connected to TAUJ0. For details, see **Section 33, Timer Array Unit J (TAUJ)**.

**CAUTION**

When port P8\_6 is used as RTCA0OUT, port P8\_6 pin outputs a low-level  $\overline{\text{RESETOUT}}$  signal while a reset is asserted and continues to output a low level after the reset is deasserted.

For details, see **Section 2A.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  , **Section 2B.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  and **Section 2C.11.1.1, P8\_6:  $\overline{\text{RESETOUT}}$**  .

---

## 34.2 Overview

### 34.2.1 Functional Overview

The Real-Time Clock (RTCA) has the following features:

- Count clock selection from 32 kHz to 4 MHz
- Counters for years, months, day of the month, day of the week, hours, minutes, seconds, and a sub-counter. The calendar covers 99 years. Leap years are handled by hardware automatically.
- One Hz pulse output function
- Fixed interval interrupt function
- Alarm interrupt function
- Clock error correction function if a 32.768-kHz count clock is used

### 34.2.2 Block Diagram

The block diagram shows the main components of the RTCA.

Figure 34.1 Block Diagram of the RTCA

### 34.2.3 Description of Blocks

The Real-Time Clock RTCA provides information about the present time and date and can generate wake-up signals (interrupts, alarms). This information is derived from the count clock RTCATCKI.

#### Sub-counter

RTCATCKI is the input to the sub-counter RTCAnSUBC. The sub-counter counts up from 0 until it reaches the compare value. The compare value is always defined as the frequency of RTCATCKI – 1 (in Hz). Thus, the sub-counter overflows after one second. It is then reset to 0 and triggers the seconds counter RTCAnSECC (and, if specified, the interrupt INTRTCA01S).

The sub-counter can generate a fixed interval interrupt every 0.25 seconds, 0.5 seconds, or 1 second, and a 1-Hz output pulse.

#### Time and date counters

The counters for minutes, hours, day of the week, day of the month, months, and years also count up. They have their own overflow limits. If all the lower counters overflow, the upper counter counts up.

The overflow limit of the counter for the day of the month (RTCAnDAYC) depends on the present month (28, 30, or 31 days) and (in February) on the year counter RTCAnYEARC (years 0, 4, 8, 12, etc. are considered leap years).

The hours counter RTCAnHOURC can be switched between 12- and 24-hour formats.

The counters for seconds, minutes, hours, day of the month, and months can generate a fixed interval interrupt upon overflow (INTRTCA0R).

The counters for minutes, hours, and day of the week can also generate an alarm interrupt (INTRTCA0AL), e.g. every Tuesday and Thursday at 10:32.

#### Counter buffers

All counters can be read directly at any time. The clock signal used to access the read/write registers and the count clock are usually asynchronous. An overflow of the sub-counter during the read operation can make all read values obsolete. Therefore, reading the counters must be performed using a special procedure. For details, see

#### **Section 34.5.3, Reading Clock Counters.**

For reasons of synchronization, the counters cannot be written directly.

For reading and writing, all counters are accompanied by buffer registers. The buffer registers provide a synchronized way for reading the counters and for setting time and date. When they are used, the operation of the sub-counter must first be suspended and then re-activated (see also **Section 34.5.3, Reading Clock Counters** and **Section 34.5.2, Updating Clock Counters**).

The RTCAnTIMEC and RTCAnCALC registers and their corresponding buffer registers can be used to check and set the time (hours, minutes and seconds) or the date (day of the week, day of the month, month, and year) with one read/write operation.

## 34.3 Registers

### 34.3.1 List of Registers

RTCA registers are listed in the following table.

<RTCA<sub>n</sub>\_base> is defined in **Section 34.1.2, Register Base Address**.

Table 34.11 List of Registers

Module Name	Register Name	Symbol	Address
RTCA control registers			
RTCA <sub>n</sub>	RTCA control register 0	RTCA <sub>n</sub> CTL0	<RTCA <sub>n</sub> _base> + 00 <sub>H</sub>
	RTCA control register 1	RTCA <sub>n</sub> CTL1	<RTCA <sub>n</sub> _base> + 04 <sub>H</sub>
	RTCA control register 2	RTCA <sub>n</sub> CTL2	<RTCA <sub>n</sub> _base> + 08 <sub>H</sub>
RTCA sub-counter registers			
RTCA <sub>n</sub>	RTCA sub-count register	RTCA <sub>n</sub> SUBC	<RTCA <sub>n</sub> _base> + 0C <sub>H</sub>
	RTCA sub-count register read buffer	RTCA <sub>n</sub> SRBU	<RTCA <sub>n</sub> _base> + 10 <sub>H</sub>
	RTCA clock error correction register	RTCA <sub>n</sub> SUBU	<RTCA <sub>n</sub> _base> + 38 <sub>H</sub>
	RTCA sub-counter compare register	RTCA <sub>n</sub> SCMP	<RTCA <sub>n</sub> _base> + 3C <sub>H</sub>
RTCA clock counter and buffer registers			
RTCA <sub>n</sub>	RTCA seconds count register	RTCA <sub>n</sub> SECC	<RTCA <sub>n</sub> _base> + 4C <sub>H</sub>
	RTCA seconds count buffer register	RTCA <sub>n</sub> SEC	<RTCA <sub>n</sub> _base> + 14 <sub>H</sub>
	RTCA minutes count register	RTCA <sub>n</sub> MINC	<RTCA <sub>n</sub> _base> + 50 <sub>H</sub>
	RTCA minutes count buffer register	RTCA <sub>n</sub> MIN	<RTCA <sub>n</sub> _base> + 18 <sub>H</sub>
	RTCA hours count register	RTCA <sub>n</sub> HOURC	<RTCA <sub>n</sub> _base> + 54 <sub>H</sub>
	RTCA hours count buffer register	RTCA <sub>n</sub> HOUR	<RTCA <sub>n</sub> _base> + 1C <sub>H</sub>
	RTCA day of the week count register	RTCA <sub>n</sub> WEEKC	<RTCA <sub>n</sub> _base> + 58 <sub>H</sub>
	RTCA day of the week count buffer register	RTCA <sub>n</sub> WEEK	<RTCA <sub>n</sub> _base> + 20 <sub>H</sub>
	RTCA day of the month count register	RTCA <sub>n</sub> DAYC	<RTCA <sub>n</sub> _base> + 5C <sub>H</sub>
	RTCA day of the month count buffer register	RTCA <sub>n</sub> DAY	<RTCA <sub>n</sub> _base> + 24 <sub>H</sub>
	RTCA month count register	RTCA <sub>n</sub> MONC	<RTCA <sub>n</sub> _base> + 60 <sub>H</sub>
	RTCA month count buffer register	RTCA <sub>n</sub> MONTH	<RTCA <sub>n</sub> _base> + 28 <sub>H</sub>
	RTCA year count register	RTCA <sub>n</sub> YEARC	<RTCA <sub>n</sub> _base> + 64 <sub>H</sub>
	RTCA year count buffer register	RTCA <sub>n</sub> YEAR	<RTCA <sub>n</sub> _base> + 2C <sub>H</sub>
RTCA special counter and buffer registers			
RTCA <sub>n</sub>	RTCA time count register	RTCA <sub>n</sub> TIMEC	<RTCA <sub>n</sub> _base> + 68 <sub>H</sub>
	RTCA time count buffer register	RTCA <sub>n</sub> TIME	<RTCA <sub>n</sub> _base> + 30 <sub>H</sub>
	RTCA calendar count register	RTCA <sub>n</sub> CALC	<RTCA <sub>n</sub> _base> + 6C <sub>H</sub>
	RTCA calendar count buffer register	RTCA <sub>n</sub> CAL	<RTCA <sub>n</sub> _base> + 34 <sub>H</sub>
RTCA alarm time setting registers			
RTCA <sub>n</sub>	RTCA alarm minute setting register	RTCA <sub>n</sub> ALM	<RTCA <sub>n</sub> _base> + 40 <sub>H</sub>
	RTCA alarm hour setting register	RTCA <sub>n</sub> ALH	<RTCA <sub>n</sub> _base> + 44 <sub>H</sub>
	RTCA alarm day of the week setting register	RTCA <sub>n</sub> ALW	<RTCA <sub>n</sub> _base> + 48 <sub>H</sub>
RTCA emulation register			
RTCA <sub>n</sub>	RTCA emulation register	RTCA <sub>n</sub> EMU	<RTCA <sub>n</sub> _base> + 74 <sub>H</sub>

### 34.3.2 Details of RTCA Control Registers

#### 34.3.2.1 RTCAnCTL0 — RTCA Control Register 0

This register controls the count operation of the sub-counter RTCAnSUBC, the format (12-hour/24-hour) of the hours counter RTCAnHOURE and the alarm hour setting register RTCAnALH, and the operation mode.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** <RTCAn\_base> + 00H

**Value after reset:** 00H

Bit	7	6	5	4	3	2	1	0
	RTCAnCE	RTCAnCEST	RTCAnAMPM	RTCAnSLSB	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R	R	R	R

Table 34.12 RTCAnCTL0 Register Contents

Bit Position	Bit Name	Function
7	RTCAnCE	Starts/stops the sub-counter RTCAnSUBC operation. 0: Stops the sub-counter operation. All output pins and all status flags in control register RTCAnCTL2 are cleared. 1: Starts the sub-counter operation. The sub-counter counts up.
6	RTCAnCEST	Indicates the operation enabled/stopped status of the sub-counter: 0: Operation stopped status 1: Operation enabled status For details on how to use this status flag, see <b>Section 34.5.1, Initial Setting of the RTCA</b> .
5	RTCAnAMPM	Selects the format of the hours counter RTCAnHOURE and the alarm hour setting register RTCAnALH: 0: 12-hour format (1 to 12, am/pm) 1: 24-hour format (0 to 23, military time) For details on the format, see <b>Table 34.24, 12- and 24-Hour Format</b> .
4	RTCAnSLSB	Selects the operation mode: 0: 32.768 kHz mode*1 1: Frequency selection mode For details on the operation modes, see <b>Section 34.4, Operation</b> . The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1). For details on the initialization of RTCAn, see <b>Section 34.5.1, Initial Setting of the RTCA</b> .
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. This setting not supported in the RH850/F1KM-S4 100-pin products, RH850/F1KM-S2 100-pin product and RH850/F1KM-S1 all products.

### 34.3.2.2 RTCA<sub>n</sub>CTL1 — RTCA Control Register 1

This register controls the interrupt request generation and the 1-Hz pulse output.

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** <RTCA<sub>n</sub>\_base> + 04<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

111	Every month	Every 1 month first day 00 hours 00 minutes 00 seconds (i.e., every first midnight of a month)																													

If the settings of RTCA<sub>n</sub>CT[2:0] are changed while sub-counter operation is enabled (RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>CE = 1), a glitch may be output to INTRTCA0R. Implement appropriate interrupt mask processing procedures.

### 34.3.2.3 RTCAnCTL2 — RTCA Control Register 2

This register contains status information and controls the data transfer from the sub-counter RTCAnSUBC to the dedicated sub-counter read buffer RTCAnSRBU and the operation setting of the clock counters (RTCAnSECC to RTCAnYEARC).

**Access:** This register can be read or written in 8-bit or 1-bit units.

**Address:** <RTCAn\_base> + 08<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0

Table 34.14 RTCAnCTL2 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	RTCAnWUST	Indicates whether RTCAnSUBU write operation has been completed: 0: RTCAnSUBU write completed 1: RTCAnSUBU write in progress The write operation ends with the next sub-counter overflow. While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSUBU is completed, this bit is set to 1.  See <b>Section 34.5.5, Writing to RTCAnSUBU</b> , for details.
4	RTCAnWSST	Indicates whether RTCAnSCMP write operation has been completed: 0: RTCAnSCMP write completed 1: RTCAnSCMP write in progress The write operation ends with the next sub-counter overflow. While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSCMP is completed, this bit is set to 1.  See <b>Section 34.5.6, Writing to RTCAnSCMP</b> , for details.
3	RTCAnRSST	Indicates whether the value of the sub-counter (RTCAnSUBC) has been transferred to the sub-count register read buffer (RTCAnSRBU): 0: Transfer in progress, or waiting for a transfer trigger 1: Transfer completed This bit is cleared (transfer is triggered) by RTCAnRSUB=1. This bit is automatically set when the transfer is completed.  See <b>Section 34.5.4, Reading RTCAnSRBU</b> , for details.
2	RTCAnRSUB	Triggers transfer of the value of the sub-counter (RTCAnSUBC) to the dedicated read buffer (RTCAnSRBU) or clears the transfer state of the sub-counter: 0: Transfer status (RTCAnRSST) is cleared. 1: Transfer is triggered. This bit is used to read the value of RTCAnSRBU when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1). The value of RTCAnSUBC is synchronized with RTCATCKI and loaded to RTCAnSRBU.  For details, see <b>Section 34.5.4, Reading RTCAnSRBU</b> .

Table 34.14 RTCA<sub>n</sub>CTL2 Register Contents

Bit Position	Bit Name	Function
1	RTCA <sub>n</sub> WST	<p>Indicates the status of all clock counters (RTCA<sub>n</sub>SECC to RTCA<sub>n</sub>YEARC):</p> <p>0: All clock counters are running.</p> <p>1: All clock counters are stopped The sub-counter is still running.</p> <p>The clock counters must be stopped before reading or writing clock counter values during sub-counter operation (RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>CE = 1). To stop the clock counters, set RTCA<sub>n</sub>WAIT = 1.</p>
0	RTCA <sub>n</sub> WAIT	<p>Restarts/stops all clock counters (RTCA<sub>n</sub>SECC to RTCA<sub>n</sub>YEARC):</p> <p>0: Restarts all clock counters either immediately or immediately after the clock counter write operation finishes.</p> <p>1: Stops all clock counters temporarily. The sub-counter is still running.</p> <p>The clock counters must be stopped before reading or writing counter buffers during sub-counter operation (RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>CE = 1).</p> <p><b>CAUTION:</b> Only one overflow can be held internally. When two overflows occur, the seconds counter is incremented only by one when it is restarted. Thus, the procedure must be completed within one second.</p>

### 34.3.3 Details of RTCA Sub-Counter Registers

#### 34.3.3.1 RTCAnSUBC — RTCA Sub-Count Register

This counter counts the 1-second reference time. It operates using the count clock RTCATCKI.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RTCAn\_base> + 0C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

This register is initialized:

- When write operation is performed to the seconds count buffer register (RTCAnSEC) or to the time count buffer register (RTCAnTIME) and the value is reflected to the seconds count register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSUBC[21:16]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTCAnSUBC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 34.15 RTCAnSUBC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 0	RTCAnSUBC[21:0]	Sub-counter value The sub-counter only operates while RTCAnCTL0.RTCAnCEST = 1.

#### NOTES

- This sub-counter operates with RTCATCKI while the read operation is clocked by PCLK. Reading this sub-counter during operation (RTCAnCTL0.RTCAnCEST = 1) is asynchronous to RTCATCKI and can lead to wrong results. Use the sub-count register read buffer (RTCAnSRBU) to read the sub-counter value during operation. For details, see **Section 34.5.4, Reading RTCAnSRBU**.
- The count-operation of this sub-counter depends on the selected operation mode. See **Section 34.4, Operation**, for details.

### 34.3.3.2 RTCAnSRBU — RTCA Sub-Count Register Read Buffer

This register is the read buffer for the sub-counter RTCAnSUBC.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RTCAn\_base> + 10<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSRBU[21:16]

Table 34.16 RTCAnSRBU Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 0	RTCAnSRBU[21:0]	Sub-counter value at the time of the last RTCAnSUBC read.

When RTCAnCTL2.RTCAnRSUB is set to 1, the value of the RTCAnSUBC is loaded to the read buffer in synchronization with RTCATCKI.

#### NOTE

Perform RTCAnSRBU read according to the flow described in **Section 34.5.4, Reading RTCAnSRBU**.

### 34.3.3.3 RTCAnSUBU — RTCA Clock Error Correction Register

This register enables and specifies clock error correction. This register only applies in 32.768-kHz mode (RTCAnCTL0.RTCAnSLSB = 0).

For details on clock error correction, see **Section 34.4.4, Clock Error Correction**.

**Access:** This register can be read or written in 8-bit units.

Note the following when writing this register during sub-counter operation:

- Previous RTCAnSUBU write must be completed (RTCAnCTL2.RTCAnWUST = 0).
- The write operation ends with the next sub-counter overflow.

**Address:** <RTCAn\_base> + 38<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	RTCAnDEV	RTCAnF6	RTCAnF[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.17 RTCAnSUBU Register Contents

Bit Position	Bit Name	Function
7	RTCAnDEV	Specifies how often clock error correction is performed per minute: 0: Three times every minute (when RTCAnSECC equals 00, 20, and 40) 1: Once every minute (when RTCAnSECC equals 00)
6	RTCAnF6	Specifies whether the sub-counter value is incremented or decremented: 0: Incremented (+ correction) Incrementation value = (RTCAnF[5:0] value – 1) × 2 1: Decrementing (– correction) Decrementation value = (inverted data of RTCAnF[5:0] value + 1) × 2
5 to 0	RTCAnF[5:0]	Error correction value

#### NOTES

1. When RTCAnF[5:1] = 00000<sub>B</sub>, clock error correction is not performed.
2. Perform RTCAnSUBU write as described in
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.5, Writing to RTCAnSUBU**.

### 34.3.3.4 RTCAnSCMP — RTCA Sub-Counter Compare Register

This register sets the compare value of the sub-counter RTCAnSUBC in frequency selection mode (RTCAnCTL0.RTCAnSLSB = 1).

When the sub-counter values matches the value of this register, an overflow signal is output to the seconds counter RTCAnSECC and the sub-counter is cleared.

Set the value for this register according to the frequency of the input clock RTCATCKI.

**Access:** This register can be read or written in 32-bit units.

Note the following when writing this register during sub-counter operation:

- Previous RTCAnSCMP write must be completed (RTCAnCTL2.RTCAnWSST = 0).
- The write operation ends with the next sub-counter overflow.

**Address:** <RTCAn\_base> + 3C<sub>H</sub>

**Value after reset:** 0000 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSCMP[21:16]

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTCAnSCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.18 RTCAnSCMP Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 0	RTCAnSCMP[21:0]	Sub-counter compare value in frequency selection mode.

#### Example

The following example illustrates the setting of RTCAnSCMP:

- RTCATCKI = 4 MHz = 4,000,000 Hz
- RTCAnSCMP = 4,000,000 – 1 = 3,999,999 (decimal code) = 3D08FF<sub>H</sub>
- The seconds counter RTCAnSECC is triggered when the sub-counter value changes from 3D08FF<sub>H</sub> to 0<sub>H</sub>.

#### NOTES

1. The operation of the RTCA cannot be guaranteed if a value of 3198 (decimal code) or lower is set in this register.
2. Perform RTCAnSCMP write as described in **Section 34.5.1, Initial Setting of the RTCA** and **Section 34.5.6, Writing to RTCAnSCMP**.

### 34.3.4 Details of RTCA Clock Counter and Buffer Registers

#### 34.3.4.1 RTCAnSECC — RTCA Seconds Count Register

This register is the seconds counter. It counts seconds from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the sub-counter RTCAnSUBC.

If the sub-counter overflows while the seconds counter is stopped ( $\text{RTCAnCTL2.RTCAnWST} = 1$ ), the seconds counter behaves as follows:

- If one sub-counter overflow occurs while the seconds counter is stopped, the overflow is held internally. The seconds counter is incremented by one when it is restarted.
- If two or more overflows occur while the seconds counter is stopped, the overflow count cannot be held internally. The seconds counter is incremented by one when it is restarted.
- If the seconds counter was updated while the seconds counter is stopped, the sub-counter overflow(s) are ignored.

- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the minutes counter (RTCAnMINC).

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:**  $\langle \text{RTCAn\_base} \rangle + 4C_{\text{H}}$

**Value after reset:**  $00_{\text{H}}$

Bit	7	6	5	4	3	2	1	0
	—	RTCAnSECC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.19 RTCAnSECC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnSECC[6:0]	Seconds in BCD

#### NOTES

1. Perform RTCAnSECC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the seconds count buffer register RTCAnSEC or to the clock time setting register RTCAnTIME. See
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.2, Updating Clock Counters**

### 34.3.4.2 RTCAnSEC — RTCA Seconds Count Buffer Register

This register is a buffer register to read/write the seconds counter RTCAnSECC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn\_base> + 14H

**Value after reset:** 00H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnSEC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.20 RTCAnSEC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnSEC[6:0]	Seconds in BCD

#### NOTES

- When writing this register, only decimal values between 00 and 59 in BCD are allowed.
- Perform RTCAnSEC read/write as described in
  - Section 34.5.1, Initial Setting of the RTCA,
  - Section 34.5.2, Updating Clock Counters, and
  - Section 34.5.3, Reading Clock Counters.

### 34.3.4.3 RTCAnMINC — RTCA Minutes Count Register

This register is the minutes counter. It counts minutes from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the seconds counter RTCAnSECC.
- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the hours counter (RTCAnHOURC).

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn\_base> + 50<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	RTCAnMINC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.21 RTCAnMINC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnMINC[6:0]	Minutes in BCD

#### NOTES

1. Perform RTCAnMINC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the minutes count buffer register RTCAnMIN or to the time count buffer register RTCAnTIME. See
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.2, Updating Clock Counters**.

### 34.3.4.4 RTCA<sub>n</sub>MIN — RTCA Minutes Count Buffer Register

This register is a buffer register to read/write the minutes counter RTCA<sub>n</sub>MINC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCA<sub>n</sub>\_base> + 18<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	RTCA <sub>n</sub> MIN[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.22 RTCA<sub>n</sub>MIN Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCA <sub>n</sub> MIN[6:0]	Minutes in BCD

#### NOTES

- When writing this register, only decimal values between 00 and 59 in BCD are allowed.
- Perform RTCA<sub>n</sub>MIN read/write as described in
  - **Section 34.5.1, Initial Setting of the RTCA,**
  - **Section 34.5.2, Updating Clock Counters,** and
  - **Section 34.5.3, Reading Clock Counters.**

### 34.3.4.5 RTCAnHOURE — RTCA Hours Count Register

This register is the hours counter. It counts the hours in BCD. The count range depends on the selected hour format. See **Table 34.24, 12- and 24-Hour Format**.

This register counts as follows.

- It is triggered by every overflow of the minutes counter RTCAnMINC.
- It outputs an overflow signal when the value changes from 23 to 00 (in 24-hour format) or from 31 to 12 (in 12-hour format). The overflow signal triggers two counters:
  - Day of the week counter (RTCAnWEEKC)
  - Day of the month counter (RTCAnDAYC)

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn\_base> + 54<sub>H</sub>

**Value after reset:** 12<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnHOURE[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R

Table 34.23 RTCAnHOURE Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	RTCAnHOURE[5:0]	Hours in BCD. See <b>Table 34.24, 12- and 24-Hour Format</b> , for details.

#### NOTES

1. Perform RTCAnHOURE read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the hours count buffer register RTCAnHOUR or to the time count buffer register RTCAnTIME. See
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.2, Updating Clock Counters**.

## 12- or 24-hour format

The count values of RTCAnHOURE depend on the selected hour format.

If 12-hour format is selected (RTCAnCTL0.RTCAnAMPM = 0), bit 5 in the RTCAnHOURE register is the am/pm indicator:

- RTCAnHOURE[5] = 0: am
- RTCAnHOURE[5] = 1: pm

The following table shows the count range of RTCAnHOURE in both 12- and 24-hour format.

Table 34.24 12- and 24-Hour Format

12-Hour Format (RTCAnAMPM = 0)			24-Hour Format (RTCAnAMPM = 1)	
Time	RTCAnHOURE		Time	RTCAnHOURE
0 am	12 <sub>H</sub>		0	00 <sub>H</sub>
1 am	01 <sub>H</sub>		1	01 <sub>H</sub>
2 am	02 <sub>H</sub>		2	02 <sub>H</sub>
3 am	03 <sub>H</sub>		3	03 <sub>H</sub>
4 am	04 <sub>H</sub>		4	04 <sub>H</sub>
5 am	05 <sub>H</sub>		5	05 <sub>H</sub>
6 am	06 <sub>H</sub>		6	06 <sub>H</sub>
7 am	07 <sub>H</sub>		7	07 <sub>H</sub>
8 am	08 <sub>H</sub>		8	08 <sub>H</sub>
9 am	09 <sub>H</sub>		9	09 <sub>H</sub>
10 am	10 <sub>H</sub>		10	10 <sub>H</sub>
11 am	11 <sub>H</sub>		11	11 <sub>H</sub>
0 pm	32 <sub>H</sub>		12	12 <sub>H</sub>
1 pm	21 <sub>H</sub>	↓	13	13 <sub>H</sub>
2 pm	22 <sub>H</sub>	pm indicator in 12-hour format: RTCAnHOURE.RTCAnHOURE[5] = 1	14	14 <sub>H</sub>
3 pm	23 <sub>H</sub>		15	15 <sub>H</sub>
4 pm	24 <sub>H</sub>		16	16 <sub>H</sub>
5 pm	25 <sub>H</sub>		17	17 <sub>H</sub>
6 pm	26 <sub>H</sub>		18	18 <sub>H</sub>
7 pm	27 <sub>H</sub>		19	19 <sub>H</sub>
8 pm	28 <sub>H</sub>		20	20 <sub>H</sub>
9 pm	29 <sub>H</sub>		21	21 <sub>H</sub>
10 pm	30 <sub>H</sub>		22	22 <sub>H</sub>
11 pm	31 <sub>H</sub>		23	23 <sub>H</sub>

### 34.3.4.6 RTCA<sub>n</sub>HOUR — RTCA Hours Count Buffer Register

This register is a buffer register to read/write the hours counter RTCA<sub>n</sub>HOURC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCA<sub>n</sub>\_base> + 1C<sub>H</sub>

**Value after reset:** 12<sub>H</sub>

Bit	7	6	5	4	3	2	1	0	
	—	—	RTCA <sub>n</sub> HOUR[5:0]						
Value after reset	0	0	0	1	0	0	1	0	
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	

Table 34.25 RTCA<sub>n</sub>HOUR Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RTCA <sub>n</sub> HOUR[5:0]	Hours in BCD See <b>Table 34.24, 12- and 24-Hour Format</b> , for details.

#### NOTES

- When writing this register, only the following decimal values in BCD are allowed:
  - 12-hour format (RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>AMPM = 0):  
01 to 12 or 21 to 32
  - 24-hour format (RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>AMPM = 1):  
00 to 23
- Perform RTCA<sub>n</sub>HOUR read/write as described in
  - Section 34.5.1, Initial Setting of the RTCA,**
  - Section 34.5.2, Updating Clock Counters,** and
  - Section 34.5.3, Reading Clock Counters.**

### 34.3.4.7 RTCAnWEEKC — RTCA Day of the Week Count Register

This register is the day of the week counter. It counts from 0 to 6.

This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn\_base> + 58<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	RTCAnWEEKC[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.26 RTCAnWEEKC Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	RTCAnWEEKC[2:0]	Day of the week

#### NOTES

1. Perform RTCAnWEEKC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the day of the week count buffer register RTCAnWEEK or to the calendar count buffer register RTCAnCAL. See
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.2, Updating Clock Counters**.

### 34.3.4.8 RTCAnWEEK — RTCA Day of the Week Count Buffer Register

This register is a buffer register to read/write the day of the week counter RTCAnWEEKC.

There is no particular correspondence between the value of RTCAnWEEK and the day of the week. Set the correspondence according to the application to be used.

Example: 0 = Sunday, 1 = Monday, ..., 6 = Saturday

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn\_base> + 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	RTCAnWEEK[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 34.27 RTCAnWEEK Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	RTCAnWEEK[2:0]	Day of the week

#### NOTES

- When writing this register, only decimal values between 0 and 6 in BCD are allowed.
- Perform RTCAnWEEK read/write as described in
  - Section 34.5.1, Initial Setting of the RTCA,
  - Section 34.5.2, Updating Clock Counters, and
  - Section 34.5.3, Reading Clock Counters.

### 34.3.4.9 RTCAnDAYC — RTCA Day of the Month Count Register

This register is the day of the month counter. It counts from 01 to a maximum of 31 in BCD, depending on the value of the month counter (RTCAnMONC) and the year counter (RTCAnYEARC):

- 01 to 31 (January, March, May, July, August, October, December)
- 01 to 30 (April, June, September, November)
- 01 to 29 (February, leap year)
- 01 to 28 (February, non-leap year)

Years 0, 4, 8, 12, etc., are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.
- It outputs an overflow signal when the value changes from 28, 29, 30, or 31 to 01, depending on the current month and year. The overflow signal triggers the month counter (RTCAnMONC).

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn\_base> + 5C<sub>H</sub>

**Value after reset:** 01<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnDAYC[5:0]					
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 34.28 RTCAnDAYC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	RTCAnDAYC[5:0]	Day of the month in BCD

#### NOTES

1. Perform RTCAnDAYC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the day of the month count buffer register RTCAnDAY or to the calendar count buffer register RTCAnCAL. See
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.2, Updating Clock Counters**.

### 34.3.4.10 RTCAnDAY — RTCA Day of the Month Count Buffer Register

This register is a buffer register to read/write the day of the month counter RTCAnDAYC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn\_base> + 24H

**Value after reset:** 01H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnDAY[5:0]					
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.29 RTCAnDAY Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RTCAnDAY[5:0]	Day of the month in BCD

#### NOTES

- When writing this register, only decimal values between 01 and 31 in BCD are allowed:
  - 01 to 31 (January, March, May, July, August, October, December)
  - 01 to 30 (April, June, September, November)
  - 01 to 29 (February, leap year)
  - 01 to 28 (February, non-leap year)
- Perform RTCAnDAY read/write as described in
  - Section 34.5.1, Initial Setting of the RTCA,**
  - Section 34.5.2, Updating Clock Counters,** and
  - Section 34.5.3, Reading Clock Counters.**

### 34.3.4.11 RTCAnMONC — RTCA Month Count Register

This register is the month counter. It counts the month of the year, starting from 01 to 12 in BCD.

This register counts as follows.

- It is triggered by every overflow of the counter for the day of the month RTCAnDAYC.
- It outputs an overflow signal when the value changes from 12 to 01. The overflow signal triggers the year counter (RTCAnYEARC).

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn\_base> + 60<sub>H</sub>

**Value after reset:** 01<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	RTCAnMONC[4:0]				
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 34.30 RTCAnMONC Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned.
4 to 0	RTCAnMONC[4:0]	Month of the year in BCD

#### NOTES

1. Perform RTCAnMONC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the month count buffer register RTCAnMONTH or to the calendar count buffer register RTCAnCAL. See
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.2, Updating Clock Counters**.

### 34.3.4.12 RTCA<sub>n</sub>MONTH — RTCA Month Count Buffer Register

This register is a buffer register to read/write the month counter RTCA<sub>n</sub>MONC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCA<sub>n</sub>\_base> + 28<sub>H</sub>

**Value after reset:** 01<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	RTCA <sub>n</sub> MONTH[4:0]				
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 34.31 RTCA<sub>n</sub>MONTH Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	RTCA <sub>n</sub> MONTH[4:0]	Month of the year in BCD

#### NOTES

- When writing this register, only decimal values between 01 and 12 in BCD are allowed.
- Perform RTCA<sub>n</sub>MONTH read/write as described in
  - Section 34.5.1, Initial Setting of the RTCA,
  - Section 34.5.2, Updating Clock Counters, and
  - Section 34.5.3, Reading Clock Counters.

### 34.3.4.13 RTCAnYEARC — RTCA Year Count Register

This register is the year counter. It counts years from 00 to a maximum of 99 in BCD.

Years 00, 04, 08, ..., 92, and 96 (every four years) are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the month counter RTCAnMONC.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <RTCAn\_base> + 64<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	RTCAnYEARC[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.32 RTCAnYEARC Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEARC[7:0]	Year in BCD

#### NOTES

1. Perform RTCAnYEARC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the year count buffer register RTCAnYEAR or to the calendar count buffer register RTCAnCAL. See
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.2, Updating Clock Counters**.

### 34.3.4.14 RTCAnYEAR — RTCA Year Count Buffer Register

This register is a buffer register to read/write the year counter RTCAnYEARC.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn\_base> + 2C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	RTCAnYEAR[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.33 RTCAnYEAR Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEAR[7:0]	Year in BCD

#### NOTES

- When writing this register, only decimal values between 00 and 99 in BCD are allowed.
- Perform RTCAnYEAR read/write as described in
  - Section 34.5.1, Initial Setting of the RTCA,
  - Section 34.5.2, Updating Clock Counters, and
  - Section 34.5.3, Reading Clock Counters.

### 34.3.5 Details of RTCA Special Counter and Buffer Registers

#### 34.3.5.1 RTCAnTIMEC — RTCA Time Count Register

This register enables the RTCAnHOURLC, RTCAnMINC, and RTCAnSECC counters to be read simultaneously.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RTCAn\_base> + 68<sub>H</sub>

**Value after reset:** 0012 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnHOURLC[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 34.34 RTCAnTIMEC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 16	RTCAnHOURLC[5:0]	Hours in BCD. See <b>Table 34.24, 12- and 24-Hour Format</b> , for details.
15	Reserved	When read, the value after reset is returned.
14 to 8	RTCAnMINC[6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnSECC[6:0]	Seconds in BCD

#### NOTES

1. Perform RTCAnTIMEC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the time count buffer register RTCAnTIME. See
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.2, Updating Clock Counters**.

### 34.3.5.2 RTCAnTIME — RTCA Time Count Buffer Register

This register enables the RTCAnHOUR, RTCAnMIN, and RTCAnSEC buffer registers to be read/written simultaneously.

**Access:** This register can be read or written in 32-bit units.

**Address:** <RTCAn\_base> + 30<sub>H</sub>

**Value after reset:** 0012 0000<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	RTCAAnHOUR[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0

Table 34.35 RTCAnTIME Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 16	RTCAAnHOUR[5:0]	Hours in BCD See <b>Table 34.24, 12- and 24-Hour Format</b> , for details.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 8	RTCAAnMIN[6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAAnSEC[6:0]	Seconds in BCD

#### NOTE

Perform RTCAnTIME read/write as described in

- **Section 34.5.1, Initial Setting of the RTCA,**
- **Section 34.5.2, Updating Clock Counters,** and
- **Section 34.5.3, Reading Clock Counters.**

### 34.3.5.3 RTCA<sub>n</sub>CALC — RTCA Calendar Count Register

This register enables the RTCA<sub>n</sub>YEARC, RTCA<sub>n</sub>MONC, RTCA<sub>n</sub>DAYC, and RTCA<sub>n</sub>WEEKC counters to be read simultaneously.

**Access:** This register is a read-only register that can be read in 32-bit units.

**Address:** <RTCA<sub>n</sub>\_base> + 6C<sub>H</sub>

**Value after reset:** 0001 0100<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RTCA <sub>n</sub> YEARC[7:0]							—	—	—	RTCA <sub>n</sub> MONC[4:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

	—	—	RTCA <sub>n</sub> DAYC[5:0]					—	—	—	—	—	RTCA <sub>n</sub> WEEKC[2:0]			
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 34.36 RTCA<sub>n</sub>CALC Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCA <sub>n</sub> YEARC[7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned.
20 to 16	RTCA <sub>n</sub> MONC[4:0]	Month of the year in BCD
15, 14	Reserved	When read, the value after reset is returned.
13 to 8	RTCA <sub>n</sub> DAYC[5:0]	Day of the month in BCD
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	RTCA <sub>n</sub> WEEKC[2:0]	Day of the week in BCD

#### NOTES

1. Perform RTCA<sub>n</sub>CALC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the clock time setting register RTCA<sub>n</sub>CAL. See
  - **Section 34.5.1, Initial Setting of the RTCA**, and
  - **Section 34.5.2, Updating Clock Counters**.

### 34.3.5.4 RTCAnCAL — RTCA Calendar Count Buffer Register

This register enables the RTCAnYEAR, RTCAnMONTH, RTCAnDAY, and RTCAnWEEK buffer registers to be read/written simultaneously.

**Access:** This register can be read or written in 32-bit units.

**Address:** <RTCAn\_base> + 34<sub>H</sub>

**Value after reset:** 0001 0100<sub>H</sub>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RTCAnYEAR[7:0]							—	—	—	RTCAnMONTH[4:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	RTCAnDAY[5:0]					—	—	—	—	—	RTCAnWEEK[2:0]			
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Table 34.37 RTCAnCAL Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCAnYEAR[7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 16	RTCAnMONTH[4:0]	Month of the year in BCD
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	RTCAnDAY[5:0]	Day of the month in BCD
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	RTCAnWEEK[2:0]	Day of the week in BCD

#### NOTE

Perform RTCAnCAL read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.6 Details of RTCA Alarm Time Setting Registers

#### 34.3.6.1 RTCAnALM — RTCA Alarm Minute Setting Register

This register specifies the minute of the alarm interrupt.

For details and example settings, see **Section 34.4.3, Alarm Interrupt Function**.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn\_base> + 40<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	RTCAnALM[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.38 RTCAnALM Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnALM[6:0]	Minute of the alarm interrupt in BCD

#### NOTES

1. If decimal values outside the range of 00 to 59 in BCD are set, no alarm interrupt request will be generated.
2. When the setting of RTCAnALM is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to INTRTCA0AL. Implement appropriate interrupt mask processing procedures.

### 34.3.6.2 RTCAnALH — RTCA Alarm Hour Setting Register

This register specifies the hour of the alarm interrupt.

For details and example settings, see **Section 34.4.3, Alarm Interrupt Function**.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCAn\_base> + 44<sub>H</sub>

**Value after reset:** 12<sub>H</sub>

Bit	7	6	5	4	3	2	1	0	
	—	—	RTCAnALH[5:0]						
Value after reset	0	0	0	1	0	0	1	0	
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	

Table 34.39 RTCAnALH Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RTCAnALH[5:0]	Hour of the alarm interrupt in BCD

#### NOTES

- If decimal values outside the following range are set, no alarm interrupt request will be generated:
  - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0): 01 to 12 or 21 to 32
  - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1): 00 to 23
- When the setting of RTCAnALH is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to INTRTCA0AL. Implement appropriate interrupt mask processing procedures.

### 34.3.6.3 RTCA<sub>n</sub>ALW — RTCA Alarm Day of the Week Setting Register

This register specifies the day(s) of the week of the alarm interrupt.

**Access:** This register can be read or written in 8-bit units.

**Address:** <RTCA<sub>n</sub>\_base> + 48<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	RTCA <sub>n</sub> ALW[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.40 RTCA<sub>n</sub>ALW Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCA <sub>n</sub> ALW[6:0]	Specifies day of the week <i>m</i> ( <i>m</i> = 0 to 6) as a day, when an alarm interrupt request is generated: 0: No alarm interrupt request is generated on day <i>m</i> . 1: Alarm interrupt request is generated on day <i>m</i> at the time set using RTCA <sub>n</sub> ALM and RTCA <sub>n</sub> ALH. The bits of this register correspond to the count value of the day of the week counter (RTCA <sub>n</sub> WEEKC).

#### NOTE

When the setting of RTCA<sub>n</sub>ALW is changed during sub-counter operation (RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>CE = 1), a glitch may be output to INTRTCA0AL. Implement appropriate interrupt mask processing procedures.

#### Example

If Sunday is RTCA<sub>n</sub>WEEK = 0, Monday is RTCA<sub>n</sub>WEEK = 1, Tuesday is RTCA<sub>n</sub>WEEK = 2, ..., Saturday is RTCA<sub>n</sub>WEEK = 6:

- To set the alarm for Sunday, set RTCA<sub>n</sub>ALW = 0000 0001<sub>B</sub>.
- To set the alarm for Monday and Wednesday, set RTCA<sub>n</sub>ALW = 0000 1010<sub>B</sub>.
- To set the alarm for Tuesday, Thursday, and Saturday, set RTCA<sub>n</sub>ALW = 0101 0100<sub>B</sub>.

For more examples, see **Section 34.4.3, Alarm Interrupt Function**.

### 34.3.7 RTCA Emulation Register

#### 34.3.7.1 RTCAnEMU — RTCA Emulation Register

This register controls operation by SVSTOP.

**Access:** This register can be read or written in 8-bit or 1-bit units.

A write should be performed when EPC.SVSTOP = 0.

**Address:** <RTCAn\_base> + 74<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	RTCAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 34.41 RTCAnEMU Register Contents

Bit Position	Bit Name	Function
7	RTCAnSVSDIS	<p>When the EPC.SVSTOP bit is set to 0: Count clock is supplied when the debugger gains microcontroller control (at a breakpoint, etc.) regardless of the value of this bit.</p> <p>When the EPC.SVSTOP bit is set to 1: 0: Count clock is stopped when the debugger gains microcontroller control (as at a breakpoint). 1: Count clock continues to be supplied when the debugger gains microcontroller control (at a breakpoint, etc.).</p>
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

## 34.4 Operation

The RTCA provides two operation modes:

- Frequency selection mode
- 32.768-kHz mode

The operation mode that can be used depends on the available input clock RTCATCKI. The operation mode specifies the sub-counter compare value that is used to trigger the seconds counter and thus all subsequent counters. Clock error correction is only possible in 32.768-kHz mode.

The following table provides an overview of the properties of the two operation modes.

Table 34.42 RTCA Operation Mode Overview

	Frequency Selection Mode	32.768-kHz Mode	
		Clock Correction Disabled	Clock Correction Enabled
Allowed input clock RTCATCKI	Any frequency from 32 kHz to 4 MHz	32.768 kHz	Any frequency from 32.76180000 kHz to 32.77420000 kHz
Sub-counter RTCA <sub>n</sub> SUBC operation	<ul style="list-style-type: none"> <li>• Counter overflow at value of RTCA<sub>n</sub>SCMP</li> <li>• RTCA<sub>n</sub>SCMP must be set to RTCATCKI-1 (in Hz)</li> </ul>	Counter overflow at 7FFF <sub>H</sub>	Counter overflow at 7FFF <sub>H</sub> or Every 20 or 60 seconds: 7FFF <sub>H</sub> ±RTCA <sub>n</sub> SUBU.RTCA <sub>n</sub> F[5:0]

The operation mode is selected by control bit RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>SLSB. For details on how to set the operation mode during RTCA initialization, see **Section 34.5.1, Initial Setting of the RTCA**.

### CAUTIONS

1. The input clock RTCATCKI must not be outside the allowed frequency range.
2. The operation mode must not be changed while sub-counter operation is enabled (RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>CEST = 1).

### 34.4.1 Clock Counter Format

The clock counters (RTCAnSECC to RTCAnYEARC) operate on binary coded decimals (BCD): Each digit is represented by its own binary sequence.

Depending on the valid data range, the number of bits for a digit differs. For example, the tens digit of the month of the year counter has only one bit (for 0 and 1) whereas the tens digit of the minutes counter has 3 bits (for 0 to 5).

The following table lists the decimals 0 to 59 in binary and BCD.

Table 34.43 Example of BCD Code – Seconds or Minutes Counter (0 to 59)

Decimal	Binary	BCD
0	000000	000 0000
1	000001	000 0001
2	000010	000 0010
3	000011	000 0011
4	000100	000 0100
5	000101	000 0101
6	000110	000 0110
7	000111	000 0111
8	001000	000 1000
9	001001	000 1001
10	001010	001 0000
11	001011	001 0001
12	001100	001 0010
:	:	:
58	111010	101 1000
59	111011	101 1001

### 34.4.2 Fixed Interval Interrupt Function

Interrupt INTRTCA0R can be specified to occur after every 0.25 seconds, 0.5 seconds, 1 (full) second, 1 (full) minute, 1 (full) hour, 1 (full) day, or 1 (full) month.

The fixed interval interrupt function is controlled by bits RTCAnCTL1.RTCAnCT[2:0].

### 34.4.3 Alarm Interrupt Function

Interrupt INTRTCA0AL can be specified to occur at a certain time on one or several days of the week. This interrupt can be used as a wake-up signal.

The alarm interrupt function is enabled and disabled by bit RTCA<sub>n</sub>CTL1.RTCA<sub>n</sub>ENALM.

The alarm setting is specified by the following control registers:

- RTCA<sub>n</sub>ALW selects the weekday(s).

The allocation of bits to weekdays is defined by the day of the week count buffer register RTCA<sub>n</sub>WEEK.

- RTCA<sub>n</sub>ALH and RTCA<sub>n</sub>ALM specify the hour and minute in BCD.

#### Examples

The following tables show some exemplary settings of the alarm control registers for both 12-hour and 24-hour format.

In this example, Sunday is RTCA<sub>n</sub>WEEK = 0, Monday is RTCA<sub>n</sub>WEEK = 1, Tuesday is RTCA<sub>n</sub>WEEK = 2, ..., Saturday is RTCA<sub>n</sub>WEEK = 6:

Table 34.44 Alarm Setting in 12-Hour Format (RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>AMPM = 0)

Alarm Setting Time	RTCA <sub>n</sub> ALW	RTCA <sub>n</sub> ALH	RTCA <sub>n</sub> ALM
Sunday 7:00 am	01 <sub>H</sub>	07 <sub>H</sub>	00 <sub>H</sub>
Sunday, Monday 12:15 pm	03 <sub>H</sub>	32 <sub>H</sub>	15 <sub>H</sub>
Monday, Wednesday, Friday 5:30 pm	2A <sub>H</sub>	25 <sub>H</sub>	30 <sub>H</sub>
Daily, 10:45 pm	7F <sub>H</sub>	30 <sub>H</sub>	45 <sub>H</sub>

Table 34.45 Alarm Setting in 24-Hour Format (RTCA<sub>n</sub>CTL0.RTCA<sub>n</sub>AMPM = 1)

Alarm Setting Time	RTCA <sub>n</sub> ALW	RTCA <sub>n</sub> ALH	RTCA <sub>n</sub> ALM
Sunday 7:00	01 <sub>H</sub>	07 <sub>H</sub>	00 <sub>H</sub>
Sunday, Monday 12:15	03 <sub>H</sub>	12 <sub>H</sub>	15 <sub>H</sub>
Monday, Wednesday, Friday 17:30	2A <sub>H</sub>	17 <sub>H</sub>	30 <sub>H</sub>
Daily, 22:45	7F <sub>H</sub>	22 <sub>H</sub>	45 <sub>H</sub>

### 34.4.4 Clock Error Correction

#### CAUTION

This is not supported in the RH850/F1KM-S4 100-pin products, RH850/F1KM-S2 100-pin product and RH850/F1KM-S1 all products.

Clock error correction compensates for deviations of the oscillator from the nominal clock rate. With clock error correction input clock rates from 32.76180 kHz to 32.77420 kHz are possible.

The clock error correction function is only available in 32.768-kHz operation mode. In this operation mode, a nominal clock rate of 32.768 kHz is expected and the sub-counters overflow value is fixed to 7FFF<sub>H</sub>.

The following figures illustrate the clock error when the input clock rate deviates from the nominal clock.

#### RTCATCKI = 32.768 kHz

**Figure 34.2, RTCATCKI = 32.768 kHz, No Clock Error Correction Required** shows the timing diagram if RTCATCKI matches the nominal clock rate of 32.768 kHz. No clock error correction is required.

Counting from 0 to 32767 (0 to 7FFF<sub>H</sub>) with a 32.768-kHz clock is exactly equal to one second.

Figure 34.2 RTCATCKI = 32.768 kHz, No Clock Error Correction Required

#### RTCATCKI = 32.769 kHz

**Figure 34.3, RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled** shows the timing diagram if RTCATCKI deviates from the nominal clock rate of 32.768 kHz. In this example, RTCATCKI is connected to a 32.769-kHz oscillator. Clock error correction is not enabled.

Counting from 0 to 32767 (0 to 7FFF<sub>H</sub>) with a 32.769-kHz clock is equal to approximately 0.99997 seconds (32768/32769). A “+ error” (faster than 32.768-kHz) occurs. In one month, RTCA deviates approximately -79 seconds from the real time.

$$\text{Error} = (32768/32769 - 1) \times 60 \text{ (s)} \times 60 \text{ (min)} \times 24 \text{ (h)} \times 30 \text{ (d)}$$

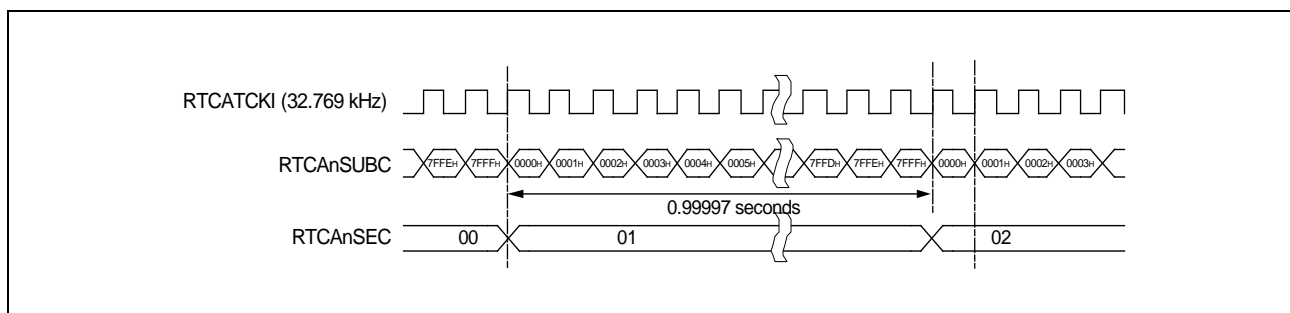

Figure 34.3 RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled

Clock error correction is performed by stretching/reducing the 1-second period of the sub-counter at regular intervals. The sub-counter's upper limit of  $7FFF_H$  is increased or decreased by setting the following parameters in register RTCAnSUBU:

- A correction value greater than one
- An operator (add/subtract)
- An interval (20 or 60 seconds)

The corrected overflow value becomes effective every 20 or 60 seconds, so that on the average RTCAnSECC is triggered exactly every second.

#### 34.4.4.1 Setting the Correction Value and the Operator

The correction value and operator are specified by the RTCAnF6, RTCAnF[5:0] bits of the RTCAnSUBU register:

- RTCAnF6 specifies whether the overflow value is incremented or decremented.
- RTCAnF[5:0] specifies the correction value.

The correction values are calculated as follows:

Table 34.46 Correction Value Settings

RTCAnF6	Increment/Decrement	Correction Value
0	Increment	$(\text{Value of RTCAnF[5:0]} - 1) \times 2$
1	Decrement	$(\text{Inverted value of RTCAnF[5:0]} + 1) \times 2$

Some examples are given in the following table:

Table 34.47 Correction Value Examples

RTCAnF6	RTCAnF[5:0]	Correction Value	Count Limit of RTCAnSUBC
0	$15_H$	$(15_H - 1) \times 2 = 40$	$32768 + 40 = 32808$
1	$15_H$	$(15_H + 1) \times 2$ $= (2A_H + 1) \times 2$ $= 86$	$32768 - 86 = 32682$

#### 34.4.4.2 Impact of the Repetition Interval

The correction value set by RTCAnF6, RTCAnF[5:0] does not change the count limit of RTCAnSUBC every second. The repetition interval at which the correction value becomes effective is specified by bit RTCAnDEV.

This bit also influences the size of the correctable frequency range and the correction accuracy.

The following table summarizes the RTCAnDEV settings.

Table 34.48 Setting of Bit RTCAnSUBU.RTCAnDEV

RTCAnDEV	Count Limit of RTCAnSUBC is Changed	Frequency Range that can be Corrected	Correction Accuracy
0	Every 20 seconds when RTCAnSECC = 00, 20, or 40	32.76180000 to 32.77420000 kHz	
1	Every 60 seconds when RTCAnSECC = 00	32.76593333 to 32.77006667 kHz	Three times higher than for RTCAnDEV = 0

### 34.4.4.3 Sample Settings

The frequencies that can be corrected, as well as the setting values of bits RTCAnDEV, RTCAnF6, and RTCAnF[5:0], are listed in the following table.

Table 34.49 Correctable Frequency Range when RTCAnDEV = 0

Input Clock Frequency	RTCAnF6	RTCAnF[5:0]	Correction Value of RTCAnSUBC
—	0	000000	No correction
—	0	000001	No correction
32.76810000 kHz	0	000010	Once every 20 s, RTCAnSUBC count value + 2
32.76820000 kHz	0	000011	Once every 20 s, RTCAnSUBC count value + 4
32.76830000 kHz	0	000100	Once every 20 s, RTCAnSUBC count value + 6
:	:	:	:
32.77400000 kHz	0	111101	Once every 20 s, RTCAnSUBC count value + 120
32.77410000 kHz	0	111110	Once every 20 s, RTCAnSUBC count value + 122
32.77420000 kHz (upper limit)	0	111111	Once every 20 s, RTCAnSUBC count value + 124
—	1	000000	No correction
—	1	000001	No correction
32.76180000 kHz (lower limit)	1	000010	Once every 20 s, RTCAnSUBC count value – 124
32.76190000 kHz	1	000011	Once every 20 s, RTCAnSUBC count value – 122
32.76200000 kHz	1	000100	Once every 20 s, RTCAnSUBC count value – 120
:	:	:	:
32.76770000 kHz	1	111101	Once every 20 s, RTCAnSUBC count value – 6
32.76780000 kHz	1	111110	Once every 20 s, RTCAnSUBC count value – 4
32.76790000 kHz	1	111111	Once every 20 s, RTCAnSUBC count value – 2

Table 34.50 Correctable Frequency Range when RTCAnDEV = 1

Input Clock Frequency	RTCAnF6	RTCAnF[5:0]	Correction Value of RTCAnSUBC
—	0	000000	No correction
—	0	000001	No correction
32.76803333 kHz	0	000010	Once every 60 s, RTCAnSUBC count value + 2
32.76806667 kHz	0	000011	Once every 60 s, RTCAnSUBC count value + 4
32.76810000 kHz	0	000100	Once every 60 s, RTCAnSUBC count value + 6
:	:	:	:
32.77000000 kHz	0	111101	Once every 60 s, RTCAnSUBC count value + 120
32.77003333 kHz	0	111110	Once every 60 s, RTCAnSUBC count value + 122
32.77006667 kHz (upper limit)	0	111111	Once every 60 s, RTCAnSUBC count value + 124
—	1	000000	No correction
—	1	000001	No correction
32.76593333 kHz (lower limit)	1	000010	Once every 60 s, RTCAnSUBC count value – 124
32.76596667 kHz	1	000011	Once every 60 s, RTCAnSUBC count value – 122
32.76600000 kHz	1	000100	Once every 60 s, RTCAnSUBC count value – 120
:	:	:	:
32.76790000 kHz	1	111101	Once every 60 s, RTCAnSUBC count value – 6
32.76793333 kHz	1	111110	Once every 60 s, RTCAnSUBC count value – 4
32.76796667 kHz	1	111111	Once every 60 s, RTCAnSUBC count value – 2

## 34.5 Procedures for Setup, Writing and Reading

The following subsections provide flow charts that illustrate the procedures for RTCA setup and for reading and writing the RTCA clock counters.

### 34.5.1 Initial Setting of the RTCA

The RTCA must be stopped before setting the initial setting value of each counter.

#### 34.5.1.1 RTCA Stop Procedure

Stop the RTCA according to the following flow.

Figure 34.4 RTCA Stop Procedure

### 34.5.1.2 RTCA Initialization Procedure

Perform the initial setting of the RTCA according to the following flow:

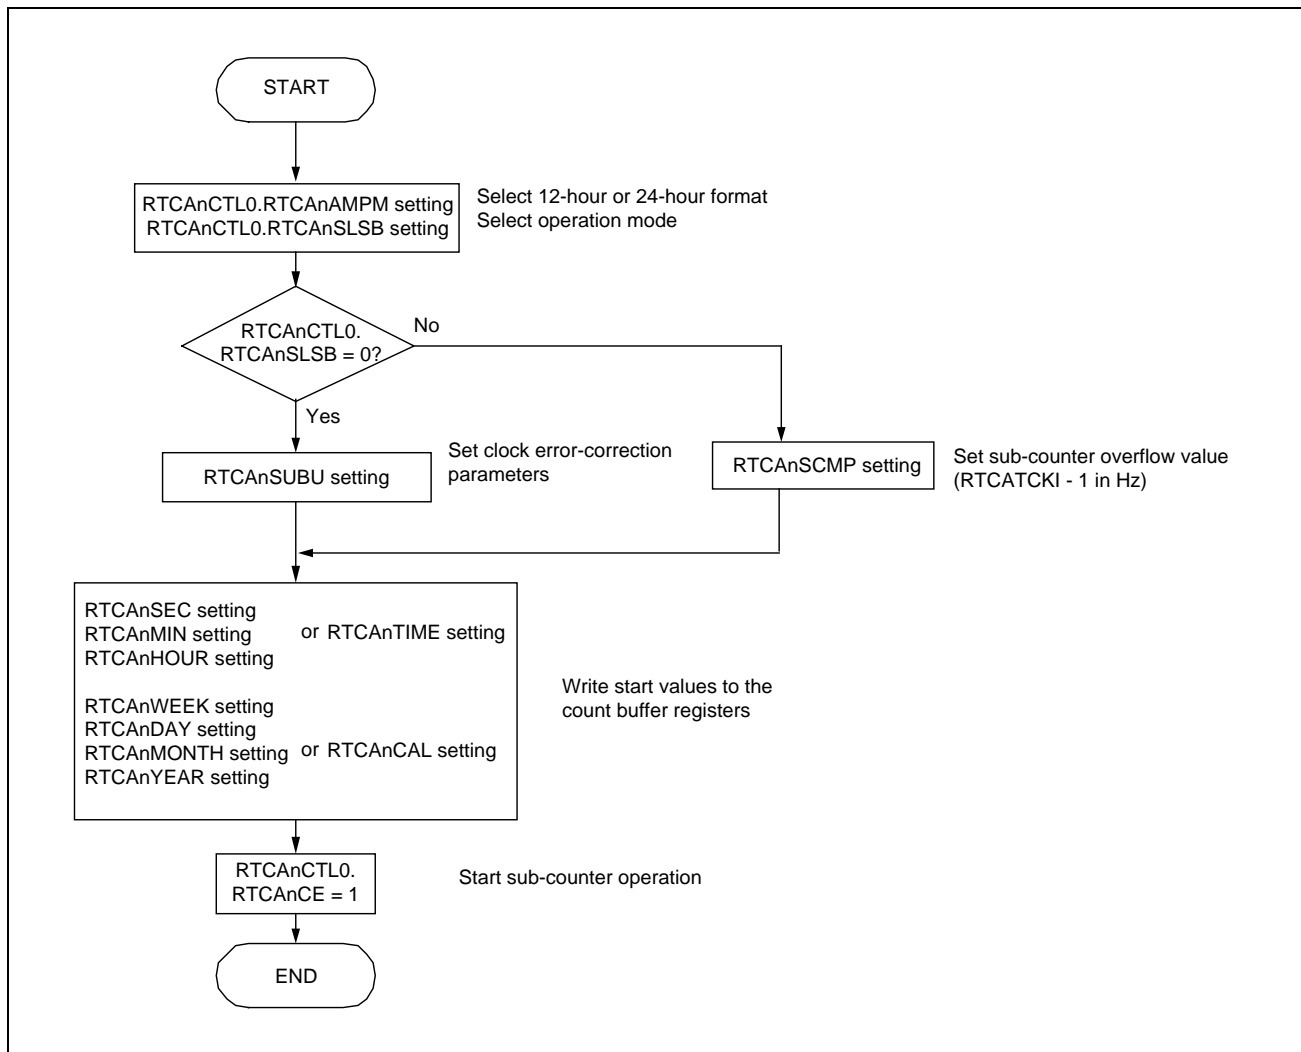

Figure 34.5 RTCA Initial Setup Procedure

#### CAUTION

The internal clock counter is synchronized with RTCATCKI.

In addition, two RTCATCKI periods are required before the clock counter starting behind END of the above flow.

Therefore, PCLK must be continuously supplied until the completion of the initial setting.

Check that RTCA nCTL0.RTCA nCEST = 1, when the supply of PCLK is stopped after setting the initial setting value of RTCA.

### 34.5.2 Updating Clock Counters

The clock counters RTCAnSECC to RTCAnYEARC can be stopped and updated while the sub-counter is running.

To update the clock counter when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

Figure 34.6 Updating Clock Counter Values

#### CAUTIONS

1. The internal clock counter is synchronized with RTCATCKI. In addition, two RTCATCKI periods are required before the clock counter updating behind END of the above flow. Therefore, PCLK must be continuously supplied until the completion of the clock counter updating. Check that RTCAnCTL2.RTCAnWST = 0 before stopping the supply of PCLK after the completion of clock counter updating.
2. The update procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more:

3. Only one sub-counter overflow can be held internally and increment the seconds counter after restarting the clock counters if the value is held.
4. If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.

### 34.5.3 Reading Clock Counters

There are two methods to read the clock counters while sub-counter operation is enabled:

- Reading count buffer registers
- Reading counter registers

The advantages and disadvantages of the two methods are summarized in the following table.

Table 34.51 Comparison of the Two Read Methods

	Advantage	Disadvantage
Reading count buffer registers	It is unnecessary to read clock counters several times because the clock counters are read synchronously.	A program wait state occurs between setting RTCA <sub>n</sub> CTL2.RTCA <sub>n</sub> WAIT = 1 and completion of data transfer.
Reading count registers	Program wait state does not occur.	If the sub-counter increments, the clock counters must be read several times because they are read asynchronously to RTCATCKI.

#### 34.5.3.1 Procedure for Reading Count Buffer Registers

The following operations are necessary:

1. Stop all clock counters (RTCA<sub>n</sub>CTL2.RTCA<sub>n</sub>WAIT = 1). The value of the clock counters is transferred to the corresponding count buffer registers.
2. Read the count buffer registers.

A program wait state occurs between setting RTCA<sub>n</sub>CTL2.RTCA<sub>n</sub>WAIT = 1 and completion of data transfer.

The maximum delay is three PCLK periods plus two RTCATCKI periods. For example, if the RTCA operates with PCLK = 40 MHz and RTCATCKI = 32.768 kHz, the delay is about 61 μs.

To read the count buffer register when the sub-counter operation is enabled ( $\text{RTCAnCTL0.RTCAnCEST} = 1$ ), follow the flowchart shown below.

Figure 34.7 Reading Clock Count Buffer Registers

### CAUTIONS

- The internal clock counter is synchronized with  $\text{RTCATCKI}$ . In addition, two  $\text{RTCATCKI}$  periods are required before resuming counter behind END of the above flow. Therefore,  $\text{PCLK}$  must be continuously supplied until the counter resuming. Check that  $\text{RTCAnCTL0.RTCAnCEST} = 1$  first to stop the supply of  $\text{PCLK}$  after count buffer register reading.
- The reading procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more.
- Only one sub-counter overflow can be held internally. If there is a value held internally when the clock counter restarts, the seconds counter will be incremented by 1.
- If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.

### 34.5.3.2 Procedure for Reading Counter Registers Directly

To ensure that the sub-counter did not overflow while reading the counters, the seconds counter RTCAnSECC must be read twice in the beginning and at the end of the procedure. The first read value is compared with the second read value.

- First read value = second read value:  
No overflow of sub-counter occurred during counter read operation.
- First read value  $\neq$  second read value:  
Overflow of the sub-counter occurred during counter read operation. The counters must be read again to get the current counter values.

To read the counter register directly when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

Figure 34.8 Reading Clock Counter Registers

#### NOTE

The procedure must be completed within one second.

### 34.5.4 Reading RTCAnSRBU

RTCAnSRBU is the read buffer register for the sub-counter.

When the sub-counter operation is enabled ( $\text{RTCAnCTL0.RTCAnCE} = 1$ ), read RTCAnSRBU according to the following flow.

Figure 34.9 Reading the RTCAnSRBU Register

### 34.5.5 Writing to RTCAnSUBU

RTCAnSUBU is the clock error correction register for the sub-counter.

When the sub-counter operation is enabled ( $\text{RTCAnCTL0.RTCAnCE} = 1$ ), write to RTCAnSUBU according to the flow described below.

Figure 34.10 Writing to the RTCAnSUBU Register

#### NOTE

While the sub-counter operation is enabled ( $\text{RTCAnCTL0.RTCAnCE} = 1$ ), the status flag  $\text{RTCAnCTL2.RTCAnWUST}$  is set when RTCAnSUBU is written to. It is cleared when the write operation to RTCAnSUBU is completed. This is synchronous with the next RTCAnSUBC overflow.

$\text{RTCAnCTL2.RTCAnWUST}$  can be set for up to one second. Be careful when performing polling (checking if  $\text{RTCAnCTL2.RTCAnWUST} = 1$  at the beginning of this flow).

### 34.5.6 Writing to RTCAnSCMP

RTCAnSCMP is the sub-counter compare register.

When the sub-counter operation is enabled ( $\text{RTCAnCTL0.RTCAnCE} = 1$ ), write to RTCAnSCMP according to the flow described below.

Figure 34.11 Writing the RTCAnSCMP Register

#### NOTE

While the sub-counter operation is enabled ( $\text{RTCAnCTL0.RTCAnCE} = 1$ ), the status flag  $\text{RTCAnCTL2.RTCAnWSST}$  is set when RTCAnSCMP is written to. It is cleared when the write operation to RTCAnSCMP is completed. This is synchronous with the next RTCAnSUBC overflow.

$\text{RTCAnCTL2.RTCAnWSST}$  can be set for up to one second. Be careful when performing polling (checking if  $\text{RTCAnCTL2.RTCAnWSST} = 1$  at the beginning of this flow).

## 34.6 Timing Diagrams

### 34.6.1 Timing of Counter Start

The following diagram illustrates the counter start after setting the time in the buffer registers.

Figure 34.12 Counter Start Timing

The timing diagram above shows the following:

- (1) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME = 0010 3045<sub>H</sub>. Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.
- (2) Sub-counter operation is started by setting RTCAnCTL0.RTCAnCE = 1.
- (3) When the second rising edge of RTCATCKI occurs, the buffer register values are loaded to the corresponding count registers.
- (4) When the next rising edge of RTCATCKI occurs, count up of the sub-counter starts.

### 34.6.2 Timing of Clock Counter Update while Counter Is Enabled

The following diagram illustrates the counter restart after setting the time in the buffer registers.

Figure 34.13 Clock Counter Update Timing

The timing diagram above shows the following:

- (1) Trigger the clock counters stop ( $\text{RTCAnCTL2.RTCAnWAIT} = 1$ ).
- (2)  $\text{RTCAnCTL2.RTCAnWST}$  is set to 1 after the second rising edge of  $\text{RTCATCKI}$  and the third rising edge of  $\text{PCLK}$ , and the counter clock stops. The sub-counter continues counting.
- (3)  $\text{RTCAnCTL2.RTCAnWST} = 1$  can be readable.
- (4) The initial setting value of the time count buffer is set to 10:30:45 by setting  $\text{RTCAnTIME}$  to  $0010\ 3045_{\text{H}}$ . Count buffer registers  $\text{RTCAnSEC}$ ,  $\text{RTCAnMIN}$ , and  $\text{RTCAnHOUR}$  are also automatically written.
- (5) Trigger the clock counters restart ( $\text{RTCAnCTL2.RTCAnWAIT} = 0$ ).
- (6) When the second rising edge of  $\text{RTCATCKI}$  occurs, the values of the buffer registers are loaded to the corresponding count registers. Write operation to  $\text{RTCAnSECC}$  is performed and  $\text{RTCAnSUBC}$  is cleared.
- (7) When the third rising edge of  $\text{PCLK}$  occurs,  $\text{RTCAnCTL2.RTCAnWST}$  is set to 0.
- (8) Clock counter operation is resumed.

### 34.6.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled

The following diagram illustrates the timing when reading the sub-counter read buffer RTCAnSRBU.

Figure 34.14 Timing when Reading the Sub-Counter Read Buffer Register Value

The timing diagram above shows the following:

- (1) Setting RTCAnRSUB = 1 triggers loading of the sub-counter value to RTCAnSRBU.
- (2) When the second rising edge of RTCATCKI occurs, the value of RTCAnSUBC is loaded to RTCAnSRBU.
- (3) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnRSST is set to 1 and RTCAnSRBU can be read.

## Section 35 Encoder Timer (ENCA)

This section contains a generic description of the Encoder Timer (ENCA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of ENCA.

### 35.1 Features of RH850/F1KH, RH850/F1KM ENCA

#### 35.1.1 Number of Units

This microcontroller has the following number of ENCA units.

Table 35.1 Number of Units (RH850/F1KH-D8)

	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)

Table 35.2 Number of Units (RH850/F1KM-S4)

	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)

Table 35.3 Number of Units (RH850/F1KM-S2)

	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
Number of Units	1	1	1
Name	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)

Table 35.4 Number of Units (RH850/F1KM-S1)

	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)	ENCA <sub>n</sub> (n = 0)

Table 35.5 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual ENCA units are identified by the index "n"; for example, ENCA <sub>n</sub> CTL (n = 0) is the ENCA <sub>n</sub> control register.

### 35.1.2 Register Base Address

ENCAn base address is listed in the following table.

ENCAn register addresses are given as an offset from the base address.

Table 35.6 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<ENCA0_base>	FFE8 0000 <sub>H</sub>

### 35.1.3 Clock Supply

The ENCAn clock supply is shown in the following table.

Table 35.7 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
ENCAn	PCLK	CKSCLK_IPER11	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPER11	Bus clock

### 35.1.4 Interrupt Requests

ENCAn interrupt requests are listed in the following table.

Table 35.8 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
ENCA0			
ENCATIOV	Overflow interrupt	85	—
ENCATIUD	Underflow interrupt	86	—
ENCATINT0	Capture/compare match interrupt 0	87	—
ENCATINT1	Capture/compare match interrupt 1	88	—
ENCATIEC	Encoder clear interrupt	89	—

### 35.1.5 Reset Sources

ENCAn reset sources are listed in the following table. ENCAn is initialized by these reset sources.

Table 35.9 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
ENCAn	All reset sources (ISORES)

### 35.1.6 External Input/Output Signals

External input/output signals of ENCA<sub>n</sub> are listed below.

Table 35.10 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
ENCA0		
ENCATTIN0	ENCA <sub>n</sub> capture trigger input 0* <sup>1</sup>	ENCA0TIN0
ENCATTIN1	ENCA <sub>n</sub> capture trigger input 1* <sup>1</sup>	ENCA0TIN1
ENCA <sub>n</sub> E0	ENCA <sub>n</sub> encoder input 0* <sup>1</sup>	ENCA0E0
ENCA <sub>n</sub> E1	ENCA <sub>n</sub> encoder input 1* <sup>1</sup>	ENCA0E1
ENCA <sub>n</sub> EC	ENCA <sub>n</sub> encoder clear input* <sup>1</sup>	ENCA0EC

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector** and **Section 2C.12, Noise Filter & Edge/Level Detector**.

### 35.1.7 Internal Input/Output Signals

Input/output signals to be connected between ENCA and PIC are listed below.

Table 35.11 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
ENCATSST	Simultaneous start trigger	PIC
ENCATTIN1	ENCA <sub>n</sub> capture trigger input 1	PIC

## 35.2 Overview

### 35.2.1 Functional Overview

- Generation of the counter control signal from the encoder input signal, and count operation in synchronization with PCLK
- Capture function for capturing the counter value with an external trigger signal
- Compare function for compare match judgment with the counter value
- Two capture/compare registers that can be set separately for capture operation and for compare operation
- Interrupt mask function for masking the interrupt request signal output as a result of compare match judgment during compare operation
- Function for loading the value of the capture/compare register to the counter upon underflow occurrence
- Encoder input signal can be used as the timer counter clear condition
- Edge or level can be selected for determining the presence of the encoder input signal that is used as the timer counter clear condition
- Detection of counter overflow and underflow and output of error flags and error occurrence interrupts
- Five interrupts: two capture/compare interrupts, one counter clear interrupt, one overflow interrupt, and one underflow interrupt

### 35.2.2 Block Diagram

Figure 35.1 ENCA Block Diagram

## 35.3 Registers

### 35.3.1 List of Registers

ENCA registers are listed in the following table.

<ENCA<sub>n</sub>\_base> is defined in **Section 35.1.2, Register Base Address**.

Table 35.12 List of Registers

Module Name	Register Name	Symbol	Address
ENCA <sub>n</sub>	ENCA <sub>n</sub> capture/compare register 0	ENCA <sub>n</sub> CCR0	<ENCA <sub>n</sub> _base>
	ENCA <sub>n</sub> capture/compare register 1	ENCA <sub>n</sub> CCR1	<ENCA <sub>n</sub> _base> + 04 <sub>H</sub>
	ENCA <sub>n</sub> counter register	ENCA <sub>n</sub> CNT	<ENCA <sub>n</sub> _base> + 08 <sub>H</sub>
	ENCA <sub>n</sub> status flag register	ENCA <sub>n</sub> FLG	<ENCA <sub>n</sub> _base> + 0C <sub>H</sub>
	ENCA <sub>n</sub> status flag clear register	ENCA <sub>n</sub> FGC	<ENCA <sub>n</sub> _base> + 10 <sub>H</sub>
	ENCA <sub>n</sub> timer enable status register	ENCA <sub>n</sub> TE	<ENCA <sub>n</sub> _base> + 14 <sub>H</sub>
	ENCA <sub>n</sub> timer start trigger register	ENCA <sub>n</sub> TS	<ENCA <sub>n</sub> _base> + 18 <sub>H</sub>
	ENCA <sub>n</sub> timer stop trigger register	ENCA <sub>n</sub> TT	<ENCA <sub>n</sub> _base> + 1C <sub>H</sub>
	ENCA <sub>n</sub> I/O control register 0	ENCA <sub>n</sub> IOC0	<ENCA <sub>n</sub> _base> + 20 <sub>H</sub>
	ENCA <sub>n</sub> control register	ENCA <sub>n</sub> CTL	<ENCA <sub>n</sub> _base> + 40 <sub>H</sub>
	ENCA <sub>n</sub> I/O control register 1	ENCA <sub>n</sub> IOC1	<ENCA <sub>n</sub> _base> + 44 <sub>H</sub>
	ENCA <sub>n</sub> emulation register	ENCA <sub>n</sub> EMU	<ENCA <sub>n</sub> _base> + 48 <sub>H</sub>

### 35.3.2 ENCA<sub>n</sub>CTL — ENCA<sub>n</sub> Control Register

This register is used to configure various operation settings of the Encoder Timer.

**Access:** This register can be read or written in 16-bit units.  
Writing to this register during operation is prohibited.

**Address:** <ENCA<sub>n</sub>\_base> + 40<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCA <sub>n</sub> CME	ENCA <sub>n</sub> MCS	—	—	—	—	ENCA <sub>n</sub> CRM1	ENCA <sub>n</sub> CRM0	ENCA <sub>n</sub> CTS	—	—	ENCA <sub>n</sub> LDE	ENCA <sub>n</sub> ECM1	ENCA <sub>n</sub> ECM0	ENCA <sub>n</sub> UDS [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Table 35.13 ENCA<sub>n</sub>CTL Register Contents

Bit Position	Bit Name	Function
15	ENCA <sub>n</sub> CME	Encoder Clear Mask Enable This bit is used to enable/disable masking of compare-match interrupt detection when the compare function is used. 0: Disables the compare-match interrupt (ENCA <sub>n</sub> TINT1) mask function for the ENCA <sub>n</sub> CCR1 register 1: Enables the compare-match interrupt (ENCA <sub>n</sub> TINT1) mask function for the ENCA <sub>n</sub> CCR1 register. This bit is valid only when ENCA <sub>n</sub> CRM1 = 0. When this bit is set to "1", setting ENCA <sub>n</sub> ECM1 to "1" is prohibited.
14	ENCA <sub>n</sub> MCS	Encoder Mask Clear Select This bit is used to select the trigger for cancelling masking of compare-match interrupt detection ENCA <sub>n</sub> TINT1 when the compare function is used. This bit is valid only when ENCA <sub>n</sub> CRM1 = 0. 0: Masking of compare-match interrupt detection is canceled when the ENCA <sub>n</sub> CCR1 register is written. 1: Masking of compare match interrupt detection is canceled when one of the following three operations is performed. – Timer counter clear operation accompanying encoder clear input – Timer counter clear operation upon compare-match between ENCA <sub>n</sub> CNT and ENCA <sub>n</sub> CCR0 when ENCA <sub>n</sub> ECM0 = 1 – Loading from ENCA <sub>n</sub> CCR0 to the timer counter upon underflow detection when ENCA <sub>n</sub> LDE = 1
13 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	ENCA <sub>n</sub> CRM1	ENCA <sub>n</sub> CCR1 Register Mode 0: ENCA <sub>n</sub> CCR1 used as compare register. 1: ENCA <sub>n</sub> CCR1 used as capture register.
8	ENCA <sub>n</sub> CRM0	ENCA <sub>n</sub> CCR0 Register Mode 0: ENCA <sub>n</sub> CCR0 used as compare register. 1: ENCA <sub>n</sub> CCR0 used as capture register.
7	ENCA <sub>n</sub> CTS	ENCA <sub>n</sub> CCR1 Capture Trigger Select This is a trigger selection bit for the capture operation to the ENCA <sub>n</sub> CCR1 register. This bit is valid only when ENCA <sub>n</sub> CRM1 = 1. 0: Uses ENCA <sub>n</sub> TINT1 of capture trigger 1 signal as the capture trigger for the ENCA <sub>n</sub> CCR1 register. 1: The counter clear signal selected with ENCA <sub>n</sub> SCE is used as the capture trigger for the ENCA <sub>n</sub> CCR1 register.
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 35.13 ENCACTL Register Contents

Bit Position	Bit Name	Function
4	ENCA <sub>n</sub> LDE	<p>ENCA<sub>n</sub> Counter Load Enable</p> <p>This bit is used to enable/disable setting value loading to the counter upon underflow occurrence.</p> <p>This bit is valid only when ENCA<sub>n</sub>CRM0 = 0.</p> <p>When ENCA<sub>n</sub>CRM0 = 1, loading of the ENCA<sub>n</sub>CCR0 register setting value to the counter upon occurrence of an underflow is not performed, regardless of the value of this bit.</p> <p>0: Disables loading of ENCA<sub>n</sub>CCR0 register setting value to counter upon occurrence of a counter underflow.</p> <p>1: Enables loading of ENCA<sub>n</sub>CCR0 register setting value to counter upon occurrence of a counter underflow.</p>
3	ENCA <sub>n</sub> ECM1	<p>Encoder Clear Mode 1</p> <p>This bit is used to set the counter clear operation upon match between the counter value and ENCA<sub>n</sub>CCR1 setting value.</p> <p>This bit is valid only when ENCA<sub>n</sub>CRM1 = 0.</p> <p>0: Does not clear the counter to 0000<sub>H</sub> upon match of timer counter value and ENCA<sub>n</sub>CCR1 setting value.</p> <p>1: Clears the counter to 0000<sub>H</sub> upon match of timer counter value and ENCA<sub>n</sub>CCR1 setting value if the next count is a down-count.</p>
2	ENCA <sub>n</sub> ECM0	<p>Encoder Clear Mode 0</p> <p>This bit is used to set the counter clear operation upon match between the counter value and ENCA<sub>n</sub>CCR0 setting value.</p> <p>This bit is valid only when ENCA<sub>n</sub>CRM0 = 0.</p> <p>0: Does not clear the counter to 0000<sub>H</sub> upon match of timer counter value and ENCA<sub>n</sub>CCR0 setting value.</p> <p>1: Clears the counter to 0000<sub>H</sub> upon match of timer counter value and ENCA<sub>n</sub>CCR0 setting value if the next count is an up-count.</p>
1, 0	ENCA <sub>n</sub> UDS[1:0]	<p>Up/down Count Selection 1 and 0</p> <p>These are the counter up/down control bits using ENCA<sub>n</sub>E0 and ENCA<sub>n</sub>E1.</p> <p>00: Upon detection of valid edge of ENCA<sub>n</sub>E0,  - down-count when ENCA<sub>n</sub>E1 = H,  - up-count when ENCA<sub>n</sub>E1 = L</p> <p>01: Upon detection of valid edge of ENCA<sub>n</sub>E0, up-count,  Upon detection of valid edge of ENCA<sub>n</sub>E1, down-count</p> <p>10: At rising edge of ENCA<sub>n</sub>E0, down-count  At falling edge of ENCA<sub>n</sub>E0, up-count  However, count operation is performed only when ENCA<sub>n</sub>E1 = L.</p> <p>11: Detection of both edges of ENCA<sub>n</sub>E0, ENCA<sub>n</sub>E1.  The count operation is determined based on the combination of the detected edge and level.</p>

### 35.3.3 ENCA<sub>n</sub>IOC0 — ENCA<sub>n</sub> I/O Control Register 0

This register is used to select the input edge of capture triggers 0 and 1 (ENCATTIN0, ENCATTIN1).

**Access:** This register can be read or written in 8-bit units.

**Address:** <ENCA<sub>n</sub>\_base> + 20<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	ENCA <sub>n</sub> TIS[3:2]		ENCA <sub>n</sub> TIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 35.14 ENCA<sub>n</sub>IOC0 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2	ENCA <sub>n</sub> TIS[3:2]	Input Edge Selection for Capture Trigger 1 These bits are valid only when ENCA <sub>n</sub> CTL.ENCA <sub>n</sub> CRM1 = 1 and ENCA <sub>n</sub> CTL.ENCA <sub>n</sub> CTS = 0. All other settings of ENCA <sub>n</sub> CRM1 and ENCA <sub>n</sub> CTS are invalid. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection
1, 0	ENCA <sub>n</sub> TIS[1:0]	Input Edge Selection for Capture Trigger 0 These bits are valid only when ENCA <sub>n</sub> CTL.ENCA <sub>n</sub> CRM0 = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

### 35.3.4 ENCAIOC1 — ENCA n I/O Control Register 1

This register is used to perform the clear condition setting and edge selection for input from the encoder.

**Access:** This register can be read or written in 8-bit units.  
Writing to this register during operation is prohibited.

**Address:** <ENCA<sub>n</sub>\_base> + 44<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	ENCA <sub>n</sub> SCE	ENCA <sub>n</sub> ZCL	ENCA <sub>n</sub> BCL	ENCA <sub>n</sub> ACL	ENCA <sub>n</sub> ECS[1:0]		ENCA <sub>n</sub> EIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 35.15 ENCAIOC1 Register Contents

Bit Position	Bit Name	Function
7	ENCA <sub>n</sub> SCE	Encoder Special-Clear Enable This is an encoder special clear enable bit. When setting this bit to 1, set ENCA <sub>n</sub> UDS1, ENCA <sub>n</sub> UDS0 to 10 <sub>B</sub> or 11 <sub>B</sub> . The operation is not guaranteed if this bit is set to 1 with ENCA <sub>n</sub> UDS1, ENCA <sub>n</sub> UDS0 set to 00 <sub>B</sub> or 01 <sub>B</sub> . 0: Clears the counter upon detection of ENCA <sub>n</sub> EC valid edge (set with ENCA <sub>n</sub> ECS1 and ENCA <sub>n</sub> ECS0). 1: Clears the counter upon detection of input level condition of ENCA <sub>n</sub> E0, ENCA <sub>n</sub> E1 and ENCA <sub>n</sub> EC (set with ENCA <sub>n</sub> ZCL bit, ENCA <sub>n</sub> BCL bit, and ENCA <sub>n</sub> ACL bit).
6	ENCA <sub>n</sub> ZCL	Input-Z Clear Condition Selection This bit is used to set the condition for clearing the encoder clear input (ENCA <sub>n</sub> EC) when using the encoder special clear function. This bit is valid only when ENCA <sub>n</sub> SCE = 1; it is invalid when ENCA <sub>n</sub> SCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
5	ENCA <sub>n</sub> BCL	Input-B Clear Condition Selection This bit is used to set the condition for clearing the encoder input 1 (ENCA <sub>n</sub> E1) when using the encoder special clear function. This bit is valid only when ENCA <sub>n</sub> SCE = 1; it is invalid when ENCA <sub>n</sub> SCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
4	ENCA <sub>n</sub> ACL	Input-A Clear Condition Selection This bit is used to set the condition for clearing the encoder input 0 (ENCA <sub>n</sub> E0) when using the encoder special clear function. This bit is valid only when ENCA <sub>n</sub> SCE = 1; it is invalid when ENCA <sub>n</sub> SCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
3, 2	ENCA <sub>n</sub> ECS[1:0]	Encoder Clear Input Edge Selection 1 and 0 These are the encoder clear input edge selection bits. These bits are valid only when ENCA <sub>n</sub> SCE = 0; they are invalid when ENCA <sub>n</sub> SCE = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

Table 35.15 ENCAIOC1 Register Contents

Bit Position	Bit Name	Function
1, 0	ENCAEIS[1:0]	Encoder Edge Input Selection 1 and 0 These are the encoder input edge selection bits. These bits are valid when ENCAAnUDS1, ENCAAnUDS0 = 00 <sub>B</sub> or 01 <sub>B</sub> , and are invalid when ENCAAnUDS1, ENCAAnUDS0 = 10 <sub>B</sub> or 11 <sub>B</sub> . 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

### 35.3.5 ENCA<sub>n</sub>FLG — ENCA<sub>n</sub> Status Flag Register

This register holds the status flags of the timer counter of ENCA<sub>n</sub>.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ENCA<sub>n</sub>\_base> + 0C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENCA <sub>n</sub> CSF	ENCA <sub>n</sub> UDF	ENCA <sub>n</sub> OVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 35.16 ENCA<sub>n</sub>FLG Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2	ENCA <sub>n</sub> CSF	Counter Status Flag This bit reflects the current timer counter operation. 0: Timer counter in up-count status 1: Timer counter in down-count status
1	ENCA <sub>n</sub> UDF	Underflow Flag This bit reflects the occurrence of an underflow during the timer counter operation. This bit is cleared to 0 at the start of count operation. 0: This flag is cleared upon any of the following events: – “1” is written to ENCA <sub>n</sub> FGC.ENCA <sub>n</sub> CLUD – The flag is cleared to 0 by setting ENCA <sub>n</sub> TS bit to “1” when ENCA <sub>n</sub> TE = 0 or by setting the simultaneous start trigger input (ENCATSST signal) to “High”. 1: This flag is set to “1” upon occurrence of an underflow during the encoder timer count operation.
0	ENCA <sub>n</sub> OVF	Overflow Flag This bit reflects the occurrence of an overflow during the timer counter operation. This bit is cleared to 0 at the start of count operation. 0: This flag is cleared upon any of the following events: – “1” is written to ENCA <sub>n</sub> FGC.ENCA <sub>n</sub> CLOV – The flag is cleared to 0 by setting ENCA <sub>n</sub> TS bit to “1” when ENCA <sub>n</sub> TE = 0 or by setting the simultaneous start trigger input (ENCATSST signal) to “High”. 1: This flag is set to “1” upon occurrence of an overflow during the encoder timer count operation.

### 35.3.6 ENCA<sub>n</sub>FGC — ENCA<sub>n</sub> Status Flag Clear Register

This register is used to clear the timer counter status flags of ENCA<sub>n</sub>FLG.

**Access:** This register is a write-only register that can be written in 8-bit units.

This register always returns 0 when read.

**Address:** <ENCA<sub>n</sub>\_base> + 10<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ENCA <sub>n</sub> CLUD	ENCA <sub>n</sub> CLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 35.17 ENCA<sub>n</sub>FGC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	ENCA <sub>n</sub> CLUD	Underflow Flag Clear This bit clears the underflow flag. 0: Writing is ignored. 1: Clears ENCA <sub>n</sub> UDF of the ENCA <sub>n</sub> FLG register (clears underflow detection).
0	ENCA <sub>n</sub> CLOV	Overflow Flag Clear This bit clears the overflow flag. 0: Writing is ignored. 1: Clears ENCA <sub>n</sub> OVF of the ENCA <sub>n</sub> FLG register (clears overflow detection).

### 35.3.7 ENCA<sub>n</sub>CCR0 — ENCA<sub>n</sub> Capture/Compare Register 0

This register is a 16-bit capture/compare register 0.

**Access:** This register can be read or written in 16-bit units.

When this register functions as a capture register, only reading is possible. Write operation is ignored.

When this register functions as a compare register, reading and writing is possible.

**Address:** <ENCA<sub>n</sub>\_base> + 00<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCA <sub>n</sub> CCR0[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 35.18 ENCA<sub>n</sub>CCR0 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCA <sub>n</sub> CCR0[15:0]	Capture/Compare Register 0 Upon occurrence of an underflow, the setting value of this register may be loaded to the counter according to the ENCA <sub>n</sub> CTL.ENCA <sub>n</sub> LDE setting. See the description of the ENCA <sub>n</sub> LDE bit in ENCA control register ENCA <sub>n</sub> CTL for details. <ul style="list-style-type: none"> <li>• If ENCA<sub>n</sub>CTL.ENCA<sub>n</sub>CRM0 = 0: ENCA<sub>n</sub>CCR0 is a compare register. Set the value to be compared with the timer counter value.</li> <li>• If ENCA<sub>n</sub>CTL.ENCA<sub>n</sub>CRM0 = 1: ENCA<sub>n</sub>CCR0 is a capture register. The captured timer counter value is stored.</li> </ul>

### 35.3.8 ENCA<sub>n</sub>CCR1 — ENCA<sub>n</sub> Capture/Compare Register 1

This register is a 16-bit capture/compare register 1.

**Access:** This register can be read or written in 16-bit units.

When this register functions as a capture register, only reading is possible. Write operation is ignored.

When this register functions as a compare register, reading and writing is possible.

**Address:** <ENCA<sub>n</sub>\_base> + 04<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCA <sub>n</sub> CCR1[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 35.19 ENCA<sub>n</sub>CCR1 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCA <sub>n</sub> CCR1[15:0]	Capture/Compare Register 1 During capture operation, the capture trigger to this register differs according to the ENCA <sub>n</sub> CTL.ENCA <sub>n</sub> CTS setting. See the description of the ENCA <sub>n</sub> CTS bit in ENCA control register ENCA <sub>n</sub> CTL for details. <ul style="list-style-type: none"> <li>• If ENCA<sub>n</sub>CTL.ENCA<sub>n</sub>CRM1 = 0: ENCA<sub>n</sub>CCR1 is a compare register. Set the value to be compared with the timer counter value.</li> <li>• If ENCA<sub>n</sub>CTL.ENCA<sub>n</sub>CRM1 = 1: ENCA<sub>n</sub>CCR1 is a capture register. The captured timer counter value is stored.</li> </ul>

### 35.3.9 ENCA<sub>n</sub>CNT — ENCA<sub>n</sub> Counter Register

This register is the 16-bit timer counter register.

**Access:** This register can be read or written in 16-bit units.  
This register can be written only when the operation is stopped.

**Address:** <ENCA<sub>n</sub>\_base> + 08<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCA <sub>n</sub> CNT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 35.20 ENCA<sub>n</sub>CNT Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCA <sub>n</sub> CNT[15:0]	Counter Register <ul style="list-style-type: none"> <li>• ENCA<sub>n</sub>TE.ENCA<sub>n</sub>TE status: 0 (initial setting): Count stop An arbitrary value can be set to timer counter.</li> <li>• ENCA<sub>n</sub>TE.ENCA<sub>n</sub>TE status: 0 → 1 (operation start): Count operation start Up/down count operation is started with the set arbitrary value.</li> <li>• ENCA<sub>n</sub>TE.ENCA<sub>n</sub>TE status: 1 (operating): Counting Up/down count operation is performed.</li> <li>• ENCA<sub>n</sub>TE.ENCA<sub>n</sub>TE status: 1 → 0 (stopped): Count stop The counter value immediately before the operation was stopped is held, and the count operation is stopped.</li> </ul>

### 35.3.10 ENCA<sub>n</sub>TE — ENCA<sub>n</sub> Timer Enable Status Register

This register indicates the operating status of ENCA<sub>n</sub>.

**Access:** This register is a read-only register that can be read in 8-bit units.

**Address:** <ENCA<sub>n</sub>\_base> + 14<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCA <sub>n</sub> TE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 35.21 ENCA<sub>n</sub>TE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	ENCA <sub>n</sub> TE	Timer Status Enable This is a status bit that indicates the operation enabled/stopped status of ENCA <sub>n</sub> . This bit is cleared to 0 when "1" is written to ENCA <sub>n</sub> TT.ENCA <sub>n</sub> TT. This bit is set to "1" when "1" is written to ENCA <sub>n</sub> TS.ENCA <sub>n</sub> TS, or when the input signal of ENCA <sub>n</sub> TSST is set to High level. 0: Operation stopped status 1: Operation enabled status

### 35.3.11 ENCA<sub>n</sub>TS — ENCA<sub>n</sub> Timer Start Trigger Register

This register provides the trigger bit for setting the ENCA<sub>n</sub> to the operation enabled state.

**Access:** This register is a write-only register that can be written in 8-bit units.  
It is always read as 00<sub>H</sub>. This register can be written only when ENCA<sub>n</sub>TE.ENCA<sub>n</sub>TE is 0.

**Address:** <ENCA<sub>n</sub>\_base> + 18<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCA <sub>n</sub> TS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 35.22 ENCA<sub>n</sub>TS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCA <sub>n</sub> TS	Timer Start Trigger This is the trigger bit that sets the ENCA <sub>n</sub> to the operation enabled state. 0: Writing is ignored. 1: The ENCA <sub>n</sub> is set to the operation enabled state by setting ENCA <sub>n</sub> TE.ENCA <sub>n</sub> TE = 1.

### 35.3.12 ENCA<sub>n</sub>TT — ENCA<sub>n</sub> Timer Stop Trigger Register

This register provides the trigger bit for setting the ENCA<sub>n</sub> to the operation stopped state.

**Access:** This register is a write-only register that can be written in 8-bit units.  
It is always read as 00<sub>H</sub>.

**Address:** <ENCA<sub>n</sub>\_base> + 1C<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCA <sub>n</sub> TT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 35.23 ENCA<sub>n</sub>TT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCA <sub>n</sub> TT	Timer Stop Trigger This is the trigger bit that sets the ENCA <sub>n</sub> to the operation stopped state. 0: Writing is ignored. 1: Clears ENCA <sub>n</sub> TE.ENCA <sub>n</sub> TE to "0", to set the ENCA <sub>n</sub> to the count operation stopped state.

### 35.3.13 ENCA<sub>n</sub>EMU — ENCA<sub>n</sub> Emulation Register

This register controls operations by SVSTOP.

**Access:** This register can be read or written in 8-bit units.

Writing to this register should be performed in the counter operation stopped status (ENCA<sub>n</sub>TE.ENCA<sub>n</sub>TE = 0 and EPC.SVSTOP = 0).

**Address:** <ENCA<sub>n</sub>\_base> + 48<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	ENCA <sub>n</sub> SVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 35.24 ENCA<sub>n</sub>EMU Register Contents

Bit Position	Bit Name	Function
7	ENCA <sub>n</sub> SVSDIS	<ul style="list-style-type: none"> <li>When EPC.SVSTOP bit = 0: The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.), regardless of the value of this bit (1 or 0).</li> <li>When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger assumes control of the microcontroller (at a break point, etc.). 1: The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.).</li> </ul>
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

## 35.4 Operation

The ENCA<sub>n</sub> operates the timer counter with counter up/down control and clear control by encoder inputs. The ENCA<sub>n</sub>CCR0 and ENCA<sub>n</sub>CCR1 registers can be used as dedicated compare registers or as dedicated capture registers.

### 35.4.1 Timer Counter Operation

The timer counter operations of the ENCA<sub>n</sub> are described below.

The figure below shows the operation phases. See the corresponding section with the section number for detailed descriptions on each operation.

Figure 35.2 Timer Counter Initial Value Setting/Start/Stop

#### (1) Timer Counter Initial Value Setting

The initial value of the ENCA<sub>n</sub> counter register (ENCA<sub>n</sub>CNT) can be set in the counter operation stopped status (ENCA<sub>n</sub>TE = 0).

#### (2) Timer Counter Startup

By writing “1” to the timer start trigger bit (ENCA<sub>n</sub>TS), the timer status enable bit (ENCA<sub>n</sub>TE) is set to “1”, the count operation is enabled, and counting operation is performed upon detection of the valid edge of the encoder input.

#### (3) Overflow Operation

An overflow occurs when up-counting is performed when the counter value is FFFF<sub>H</sub>. If the counter value changes from FFFF<sub>H</sub> to 0000<sub>H</sub>, an overflow interrupt (ENCA<sub>n</sub>IUD) is generated, and the overflow flag (ENCA<sub>n</sub>OVF) is set to “1”. The overflow flag (ENCA<sub>n</sub>OVF) is cleared to “0” when “1” is set to the overflow flag clear bit (ENCA<sub>n</sub>CLOV). For details about the operation, see **Section 35.6.1, Overflow Occurrence and Overflow Flag Clear Operation**.

**(4) Underflow Operation**

An underflow occurs when down-counting is performed when the counter value is 0000<sub>H</sub>. If the counter value changes from 0000<sub>H</sub> to FFFF<sub>H</sub>, an underflow interrupt (ENCATIUD) is generated, and the underflow flag (ENCAnUDF) is set to “1”. The underflow flag (ENCAnUDF) is cleared to “0” when “1” is set to the underflow flag clear bit (ENCAnCLUD). For details about the operation, see **Section 35.6.2, Underflow Occurrence and Underflow Flag Clear Operation**.

**(5) Timer Counter Stop**

By writing “1” to the timer stop trigger bit (ENCAnTT), the timer status enable bit (ENCAnTE) is cleared to “0”, and the count operation is stopped. At this time, the timer counter is not reset to 0000<sub>H</sub> and holds the value before count operation stop.

### 35.4.2 Up/Down Control of Timer Counter

Up/down control is performed by judging the phase of the encoder inputs (ENCA<sub>n</sub>E0, ENCA<sub>n</sub>E1) according to the settings of ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0.

#### 35.4.2.1 When the ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits in the ENCA<sub>n</sub>CTL Register = 00<sub>B</sub>

Table 35.25 When ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits = 00<sub>B</sub>

ENCA <sub>n</sub> UDS1	ENCA <sub>n</sub> UDS0	Operation Description		
		ENCA <sub>n</sub> E0 Pin	ENCA <sub>n</sub> E1 Pin	Count Operation
0	0	Rising edge	High level	Down
		Falling edge		
		Rising and falling edges		
		Rising edge	Low level	Up
		Falling edge		
		Rising and falling edges		

The valid edge for ENCA<sub>n</sub>E0 is specified by setting ENCA<sub>n</sub>EIS1, ENCA<sub>n</sub>EIS0.

Up/down count operation is performed when the valid edges and levels of ENCA<sub>n</sub>E0 and ENCA<sub>n</sub>E1 match.

The following timing chart shows the count operation when ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 bits = 00<sub>B</sub>.

Figure 35.3 Count Operation when the ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits in the ENCA<sub>n</sub>CTL Register = 00<sub>B</sub>

**35.4.2.2 When the ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits in the ENCA<sub>n</sub>CTL Register = 01<sub>B</sub>**

Table 35.26 When the ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits = 01<sub>B</sub>

ENCA <sub>n</sub> UDS1	ENCA <sub>n</sub> UDS0	Operation Description			
		ENCA <sub>n</sub> E0 Pin	ENCA <sub>n</sub> E1 Pin	Count Operation	
0	1	Low level	Rising edge	Down	
			Falling edge		
			Rising and falling edges		
		High level	Rising edge		
			Falling edge		
			Rising and falling edges		
		Rising edge	Low level	Up	
		Falling edge			
		Rising and falling edges			
		Rising edge	High level		
		Falling edge			
		Rising and falling edges			
		Simultaneous input			Hold

The valid edges for ENCA<sub>n</sub>E0 and ENCA<sub>n</sub>E1 are specified by setting ENCA<sub>n</sub>EIS1, ENCA<sub>n</sub>EIS0.

Up/down count operation is performed when the valid edges and levels of the ENCA<sub>n</sub>E0 and ENCA<sub>n</sub>E1 pins match, and the count is held when the valid edges overlap.

The following timing chart shows the count operation when ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 bits = 01<sub>B</sub>.

Figure 35.4 Count Operation when the ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits in the ENCA<sub>n</sub>CTL Register = 01<sub>B</sub>

**35.4.2.3 When the ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits in the ENCA<sub>n</sub>CTL Register = 10<sub>B</sub>**

Table 35.27 When the ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits = 10<sub>B</sub>

ENCA <sub>n</sub> UDS1	ENCA <sub>n</sub> UDS0	Operation Description		
		ENCA <sub>n</sub> E0 Pin	ENCA <sub>n</sub> E1 Pin	Count Operation
1	0	Rising edge	Low level	Down
		Rising edge	Falling edge	
		Falling edge	Low level	Up
		Falling edge	Falling edge	
		Low level	Rising edge	Hold
		Rising edge	Rising edge	
		High level	Rising edge	
		Falling edge	Rising edge	
		Low level	Falling edge	
		Rising edge	High level	
		High level	Falling edge	
		Falling edge	High level	

The valid edge specification for ENCA<sub>n</sub>E0 and ENCA<sub>n</sub>E1 (settings of ENCA<sub>n</sub>EIS1, ENCA<sub>n</sub>EIS0) is invalid.

The following timing chart shows the count operation when the ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 bits = 10<sub>B</sub>.

Figure 35.5 Count Operation when ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits in ENCA<sub>n</sub>CTL Register = 10<sub>B</sub>

### 35.4.2.4 When ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits in the ENCA<sub>n</sub>CTL Register = 11<sub>B</sub>

Table 35.28 When ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits = 11<sub>B</sub>

ENCA <sub>n</sub> UDS1	ENCA <sub>n</sub> UDS0	Operation Description			
		ENCA <sub>n</sub> E0 Pin	ENCA <sub>n</sub> E1 Pin	Count Operation	
1	1	Low level	Falling edge	Down	
		Rising edge	Low level		
		High level	Rising edge		
		Falling edge	High level		
		Rising edge	High level	Up	
		High level	Falling edge		
		Falling edge	Low level		
		Low level	Rising edge		
		Simultaneous input			Hold

Valid edge specification for ENCA<sub>n</sub>E0 and ENCA<sub>n</sub>E1 (settings of ENCA<sub>n</sub>EIS1, ENCA<sub>n</sub>EIS0) is invalid.

The counter value is held when the valid edges of ENCA<sub>n</sub>E0 and ENCA<sub>n</sub>E1 overlap.

The following timing chart shows the count operation when ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 bits = 11<sub>B</sub>.

Figure 35.6 Count Operation when ENCA<sub>n</sub>UDS1, ENCA<sub>n</sub>UDS0 Bits in the ENCA<sub>n</sub>CTL Register = 11<sub>B</sub>

### 35.4.3 Timer Counter Clear Control by Encoder Input

The timer counter is cleared to 0000<sub>H</sub> by encoder clear input (ENCA<sub>n</sub>EC).

Two types of clearing methods can be selected by controlling the ENCA<sub>n</sub>SCE, ENCA<sub>n</sub>ZCL, ENCA<sub>n</sub>BCL, ENCA<sub>n</sub>ACL, ENCA<sub>n</sub>ECS1, and ENCA<sub>n</sub>ECS0 bits of the ENCA<sub>n</sub>IOC1 register.

Table 35.29 Timer Counter Clear Control by Encoder Input

Clearing method	ENCA <sub>n</sub> SCE	ENCA <sub>n</sub> ZCL	ENCA <sub>n</sub> BCL	ENCA <sub>n</sub> ACL	ENCA <sub>n</sub> ECS1, ENCA <sub>n</sub> ECS0
(1)	0	Invalid	Invalid	Invalid	Valid
(2)	1	Valid	Valid	Valid	Invalid

#### 35.4.3.1 Clearing Method when ENCA<sub>n</sub>SCE = 0

- Upon detection of the valid edge of ENCA<sub>n</sub>EC, the timer counter is cleared to 0000<sub>H</sub> in synchronization with the operation clock.
- The valid edge of ENCA<sub>n</sub>EC is specified by the setting of the ENCA<sub>n</sub>ECS1 and ENCA<sub>n</sub>ECS0 bits.
- The settings of the ENCA<sub>n</sub>ZCL, ENCA<sub>n</sub>BCL, and ENCA<sub>n</sub>ACL bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

For details about clear operation when ENCA<sub>n</sub>SCE = 0, see the timing chart in **Section 35.6.19, Capture Operation Performed upon Clearing by ENCA<sub>n</sub>EC when ENCA<sub>n</sub>SCE = 0**.

#### 35.4.3.2 Clearing Method when ENCA<sub>n</sub>SCE = 1

- When the clear levels of the ENCA<sub>n</sub>EC, ENCA<sub>n</sub>E1, ENCA<sub>n</sub>E0 inputs are detected, the timer counter is cleared to 0000<sub>H</sub> in synchronization with the operating clock.
- Specify the clear levels of the ENCA<sub>n</sub>EC, ENCA<sub>n</sub>E1, ENCA<sub>n</sub>E0 inputs by the settings of the ENCA<sub>n</sub>ZCL, ENCA<sub>n</sub>BCL, and ENCA<sub>n</sub>ACL bits.
- The settings of the ENCA<sub>n</sub>ECS1 and ENCA<sub>n</sub>ECS0 bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

The clearing conditions of the timer counter according to the ENCA<sub>n</sub>ZCL, ENCA<sub>n</sub>BCL, and ENCA<sub>n</sub>ACL settings are listed in the table below.

Table 35.30 Clearing Conditions of the Timer Counter

Counter Clear Condition Setting			Encoder Pin Input Level		
ENCA <sub>n</sub> ZCL	ENCA <sub>n</sub> BCL	ENCA <sub>n</sub> ACL	ENCA <sub>n</sub> EC	ENCA <sub>n</sub> E1	ENCA <sub>n</sub> E0
0	0	0	Low	Low	Low
0	0	1	Low	Low	High
0	1	0	Low	High	Low
0	1	1	Low	High	High
1	0	0	High	Low	Low
1	0	1	High	Low	High
1	1	0	High	High	Low
1	1	1	High	High	High

### 35.4.4 Functions of ENCA<sub>n</sub>CCR0

#### 35.4.4.1 Compare Function

- When ENCA<sub>n</sub>CRM0 = 0, the ENCA<sub>n</sub>CCR0 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCA<sub>n</sub>CCR0 setting value, a compare 0 match interrupt (ENCATINT0) is output.
- When ENCA<sub>n</sub>ECM0 = 1, the timer counter is cleared to 0000<sub>H</sub> in synchronization with the operating clock upon compare match if the next count operation is up-count.

Table 35.31 Compare Function of ENCA<sub>n</sub>CCR0

ENCA <sub>n</sub> CCR0 Function	Compare Match Clear Control		Timer Counter Clearing Upon Compare Match with ENCA <sub>n</sub> CCR0
ENCA <sub>n</sub> CRM0	ENCA <sub>n</sub> ECM0	Next Count Operation	
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Clears timer counter to 0000 <sub>H</sub> .
		Down-count	Does not clear (continues count operation).

#### When ENCA<sub>n</sub>LDE = 1

- Upon occurrence of an underflow, the setting value of the ENCA<sub>n</sub>CCR0 register is loaded to the timer counter.
- An underflow interrupt (ENCATIUD) is output.

#### NOTE

For the timing chart when ENCA<sub>n</sub>LDE = 1, see **Section 35.6.8, Using the ENCA<sub>n</sub>LDE Function Immediately after Startup to Section 35.6.12, Up-count after Conflict between ENCA<sub>n</sub>LDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input.**

#### 35.4.4.2 Capture Function

- When ENCA<sub>n</sub>CRM0 = 1, the ENCA<sub>n</sub>CCR0 register functions as a dedicated capture register.
- Upon valid edge detection of the capture trigger input 0 (ENCATTIN0), the value of the timer counter is stored into ENCA<sub>n</sub>CCR0.
- A capture 0 interrupt (ENCATINT0) is output during capture operation.

#### NOTE

For details about capture operation for ENCA<sub>n</sub>CCR0, see the timing charts in **Section 35.6.14, Capture Operation between Count Clocks (ENCA<sub>n</sub>CCR0)** and **Section 35.6.17, Encoder Operation when Compare Match Clear Control is Disabled.**

## 35.4.5 Functions of ENCA<sub>n</sub>CCR1

### 35.4.5.1 Compare Function

- When ENCA<sub>n</sub>CRM1 = 0, the ENCA<sub>n</sub>CCR1 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCA<sub>n</sub>CCR1 setting value, a compare 1 match interrupt (ENCA<sub>n</sub>TINT1) is output.
- When ENCA<sub>n</sub>ECM1 = 1, the timer counter is cleared to 0000<sub>H</sub> in synchronization with the operating clock upon compare match if the next count operation is down-count.

Table 35.32 Compare Function of ENCA<sub>n</sub>CCR1

ENCA <sub>n</sub> CCR1 Function	Compare Match Clear Control	Next Count Operation	Timer Counter Clearing Upon Compare Match with ENCA <sub>n</sub> CCR1
ENCA <sub>n</sub> CRM1	ENCA <sub>n</sub> ECM1		
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Does not clear (continues count operation).
		Down-count	Clears timer counter to 0000 <sub>H</sub> .

### Compare match interrupt mask function

- When ENCA<sub>n</sub>CME = 1, the compare 1 match interrupt mask function is enabled. In this state, the compare 1 match interrupt is output upon the first match of the value of the timer counter and the ENCA<sub>n</sub>CCR1 setting value, and interrupts are then masked for the second and subsequent compare matches.
- When ENCA<sub>n</sub>CME = 1 and ENCA<sub>n</sub>MCS = 0, a compare 1 match interrupt is output once upon the first compare match by writing to the ENCA<sub>n</sub>CCR1 register (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCA<sub>n</sub>CME = 1 and ENCA<sub>n</sub>MCS = 1, a compare 1 match interrupt is output once upon the first compare match by a timer counter clear operation accompanying encoder clear input or by a timer counter clear operation upon match between the ENCA<sub>n</sub>CCR0 register value and the timer counter value (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCA<sub>n</sub>CME = 1, ENCA<sub>n</sub>MCS = 1 and ENCA<sub>n</sub>LDE = 1, a compare 1 match interrupt is output once upon the first compare match by a loading operation of the ENCA<sub>n</sub>CCR0 register to the timer counter upon underflow detection (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- Setting ENCA<sub>n</sub>ECM1 to “1” is prohibited when enabling the compare 1 match interrupt mask function.

Table 35.33 Compare Match Interrupt Mask Function of ENCA<sub>n</sub>CCR1

ENCA <sub>n</sub> CCR1 Function	Compare 1 Match Interrupt Mask	Interrupt Mask Cancel Trigger	Compare 1 Match Interrupt Output upon Compare Match with ENCA <sub>n</sub> CCR1
ENCA <sub>n</sub> CRM1	ENCA <sub>n</sub> CME	ENCA <sub>n</sub> MCS	
0 (Compare)	0 (Mask function disabled)	— (Setting invalid)	Outputs compare 1 match interrupt upon each compare match.
	1 (Mask function enabled)	0 (Write operation to ENCA <sub>n</sub> CCR1)	
			Outputs compare 1 match interrupt once upon the first compare match. (Interrupts are masked for the second and subsequent matches until the cancel trigger occurs.)

### 35.4.5.2 Capture Function

When ENCA<sub>n</sub>CRM1 = 1, the ENCA<sub>n</sub>CCR1 register functions as a dedicated capture register.

#### NOTE

For details about capture operation to ENCA<sub>n</sub>CCR1, see the timing chart in **Section 35.6.13, Capture Operation between Count Clocks (ENCA<sub>n</sub>CCR1)**.

The operations for each of the ENCA<sub>n</sub>CTS settings are shown in the table below.

Table 35.34 Operations for Each of the ENCA<sub>n</sub>CTS Settings

ENCA <sub>n</sub> CCR1 Function	Capture Trigger Selection	Capture Trigger Signal	Timer Counter Clearing	Interrupt Occurrence
ENCA <sub>n</sub> CRM1	ENCA <sub>n</sub> CTS			
1 (Capture)	0	Capture trigger 1 input (ENCATTIN1)	Does not clear timer counter.	(1) Capture 1 interrupt (ENCATINT1)
	1	Encoder clear input (set with ENCA <sub>n</sub> SCE)	Clears timer counter.	(1) Capture 1 interrupt (ENCATINT1) (2) Encoder clear interrupt (ENCATIEC)

#### NOTE

For details about the timing chart when ENCA<sub>n</sub>CTS = 0 or ENCA<sub>n</sub>CTS = 1, see the following:

**Section 35.6.3, Count Clearing and Capture Operation by Encoder Clear Input (ENCA<sub>n</sub>EC Pin), Section 35.6.4, Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCA<sub>n</sub>EC Pin), Section 35.6.5, Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCA<sub>n</sub>EC Pin), Section 35.6.11, Conflict between ENCA<sub>n</sub>LDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCA<sub>n</sub>EC Pin) and Section 35.6.12, Up-count after Conflict between ENCA<sub>n</sub>LDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input.**

### 35.4.5.3 Timer Counter Clearing upon Compare Register Match

Timer counter clearing upon compare match between the value of the timer counter and the ENCA<sub>n</sub>CCR0/1 setting value, according to the settings of the ENCA<sub>n</sub>ECM1 and ENCA<sub>n</sub>ECM0 bits in the ENCA<sub>n</sub>CTL register, is detailed in the following table.

Table 35.35 Timer Counter Clearing Operation upon Compare Register Match

ENCA <sub>n</sub> ECM1 and ENCA <sub>n</sub> ECM0	Next Count Operation	Timer Counter Clearing upon Compare Match with ENCA <sub>n</sub> CCR1	Timer Counter Clearing upon Compare Match with ENCA <sub>n</sub> CCR0
00	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
01	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000 <sub>H</sub> .
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
10	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Clears timer counter to 0000 <sub>H</sub> .	Does not clear (continues count operation).
11	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000 <sub>H</sub> .
	Down-count	Clears timer counter to 0000 <sub>H</sub> .	Does not clear (continues count operation).

## 35.4.6 Startup/Stop of Timer Counter

### 35.4.6.1 Startup of Timer

The timer operation can be started by setting the ENCA<sub>n</sub>TS bit to “1”.

PIC setting enables simultaneous start with other timers. For details, see **Section 36.8, Simultaneous Start Trigger Function**.

### 35.4.6.2 Stop of Timer

When the ENCA<sub>n</sub>TT bit is set to “1”, the ENCA<sub>n</sub>TE bit becomes “0” and the timer stops.

## 35.5 ENCA Setting Sequences

### 35.5.1 ENCA Setting Procedure

The ENCA setting procedure is described below.

Table 35.36 ENCA Setting Procedure

Initial Setting	Action	Setting status
Initial setting	Reset deassertion	Power-on status, operation stopped status. (Writing to each register is enabled)
ENCA initial setting	Perform the following initial settings. <ul style="list-style-type: none"> <li>Setting for counter</li> <li>Setting for counter clear</li> <li>Setting for ENCA<sub>n</sub>CCR0 register</li> <li>Setting for ENCA<sub>n</sub>CCR1 register</li> </ul> Perform the counter initial value settings. <ul style="list-style-type: none"> <li>Set any 16-bit value to ENCA<sub>n</sub>CNT register. (When, after setting this register, the ENCA<sub>n</sub>TS bit is set to "1", the counter operation starts from the set count value.)</li> </ul>	This is the count operation stopped status. The value of the ENCA <sub>n</sub> TE bit indicating the operating status is 0.  The set value is set as the initial value of the counter register.
Operation start	Perform the counter operation start setting. <ul style="list-style-type: none"> <li>Set the ENCA<sub>n</sub>TS bit to "1".</li> </ul>	This is the counter operation starts status. The value of the ENCA <sub>n</sub> TE bit indicating the operating status is 1, and the count clock is supplied to the internal circuit.
Operating	Only those registers whose setting can be changed during operation can be rewritten. <ul style="list-style-type: none"> <li>ENCA<sub>n</sub>CCR0 register setting.</li> <li>ENCA<sub>n</sub>CCR1 register setting.</li> <li>ENCA<sub>n</sub>IOC0 register setting.</li> </ul>	The count operation set with the initial setting is performed, and up/down counting is performed according to ENCA <sub>n</sub> E0 and ENCA <sub>n</sub> E1 pins.
Operation stop	Perform the counter operation stop setting during operation. <ul style="list-style-type: none"> <li>Set the ENCA<sub>n</sub>TT bit to "1".</li> </ul>	This is the counter operation stopped status. The value of the ENCA <sub>n</sub> TE bit indicating the operating status is 0.
ENCA stop	Reset	The setting registers are initialized.

#### 35.5.1.1 Initial Setting Procedure for the Counter

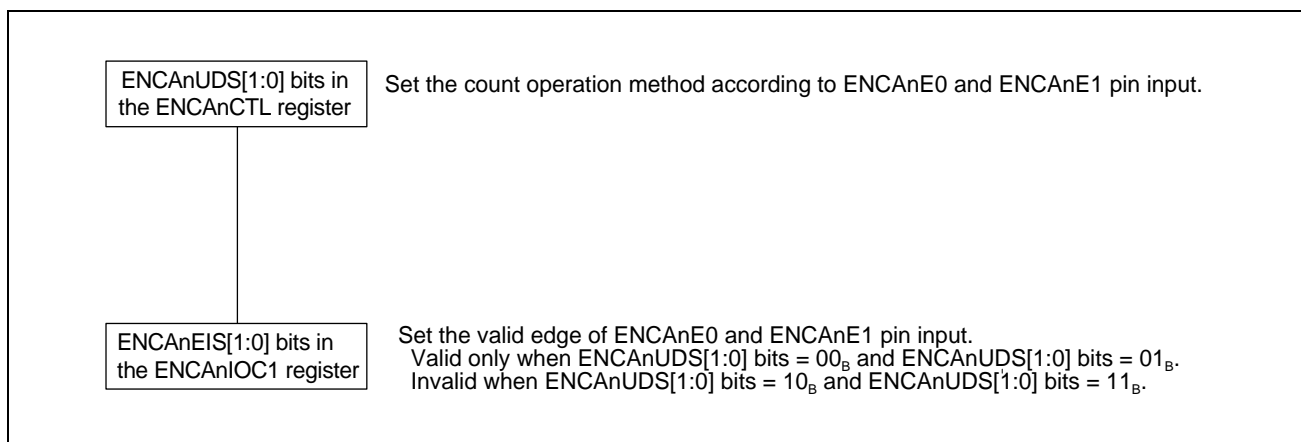

Figure 35.7 Initial Setting Procedure for the Counter

### 35.5.1.2 Initial Setting Procedure for Counter Clear

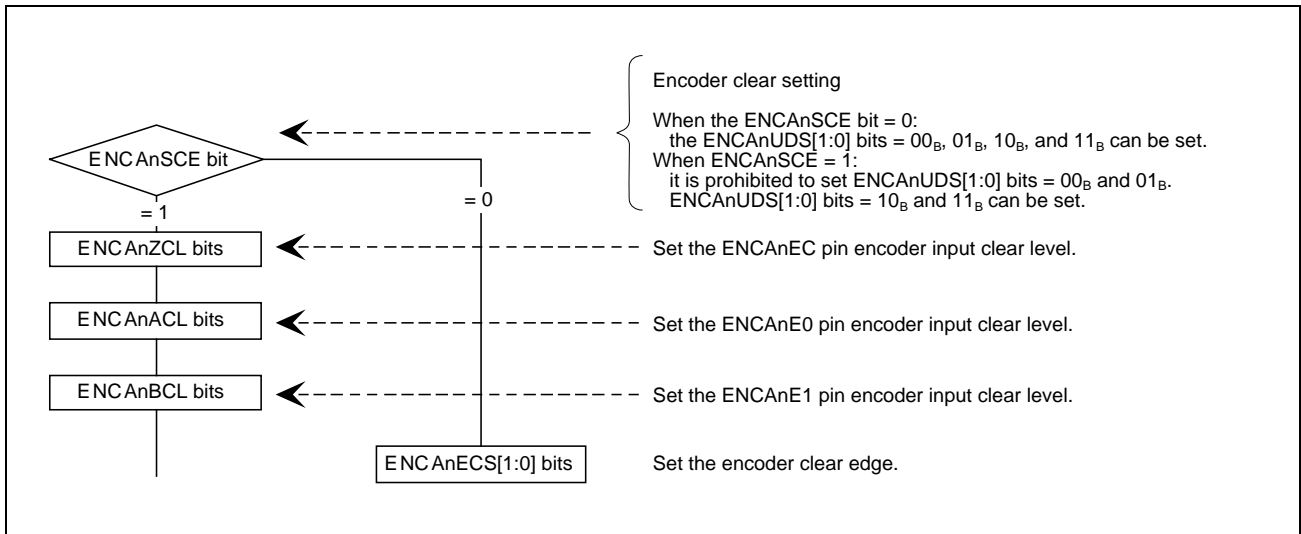

Figure 35.8 Initial Setting Procedure for Counter Clear

### 35.5.1.3 Setting Procedure for ENCAAnCCR0 Register

Figure 35.9 Setting Procedure for ENCAAnCCR0 Register

### 35.5.1.4 Setting Procedure for ENCA<sub>n</sub>CCR1 Register

Figure 35.10 Setting Procedure for ENCA<sub>n</sub>CCR1 Register

## 35.6 Timing Chart

### 35.6.1 Overflow Occurrence and Overflow Flag Clear Operation

An overflow occurs when up-counting is performed when the counter value is  $FFFF_H$ . Once an overflow occurs, an overflow interrupt (ENCATIOV) is output and the overflow flag (ENCAnOVF) is set to 1. When the overflow clear bit (ENCAnCLOV) is set to 1, the overflow flag (ENCAnOVF) is cleared to 0.

The operations of overflow occurrence and overflow flag clearing are described below.

Figure 35.11 Settings of Overflow Occurrence and Overflow Flag Clear

- (1) The count value is counted up from  $FFFE_H$  to  $FFFF_H$ .
- (2) When the count value changes from  $FFFF_H$  to  $0000_H$ , an overflow occurs. At the same time, an overflow interrupt is output and the overflow flag is set to 1.
- (3) By setting the ENCAncCLOV bit in the ENCAncFGC register to 1 by the overflow flag clearing method, the overflow flag is cleared to 0. The overflow flag is also cleared by setting the ENCAncTS bit in the ENCAncTS register to 1 when the ENCAncTE bit in the ENCAncTE register is 0, or setting the input signal of ENCATSST (simultaneous start trigger input) to "High".

### 35.6.2 Underflow Occurrence and Underflow Flag Clear Operation

An underflow occurs when down-counting is performed when the counter value is 0000<sub>H</sub>.

Once an underflow occurs, an underflow interrupt (ENCATIUD) is output and the underflow flag (ENCAnUDF) is set to 1. When the underflow clear bit (ENCAnCLUD) is set to 1, the underflow flag (ENCAnUDF) is cleared to 0.

The operations of underflow occurrence and underflow flag clearing are described below.

Figure 35.12 Settings of Underflow Occurrence and Underflow Flag Clear

- (1) The count value is counted down from 0001<sub>H</sub> to 0000<sub>H</sub>.
- (2) When the count value changes from 0000<sub>H</sub> to FFFF<sub>H</sub>, an underflow occurs. At the same time, an underflow interrupt is output and the underflow flag is set to 1.
- (3) By setting the ENCAncCLUD bit in the ENCAncFGC register to 1 by the underflow flag clearing method, the underflow flag is cleared to 0. The underflow flag is also cleared by setting the ENCAncTS bit in the ENCAncTS register to 1 when the ENCAncTE bit in the ENCAncTE register is 0, or by setting the input signal of ENCAncSST (simultaneous start trigger) to "High".

### 35.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

Figure 35.13 Timing Chart of Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

#### Setting conditions

- ENCA nCRM1 bit in the ENCA nCTL register = 1  
(Select the ENCA nCCR1 register as capture.)
- ENCA nCTS bit in the ENCA nCTL register = 1  
(Select the ENCA nEC pin input as capture trigger input.)
- ENCA nECS1 and ENCA nECS0 bits in the ENCA nIOC1 register = 01<sub>B</sub>  
(Select the ENCA nEC pin input as rising edge detection.)

- (1) Capture operation is performed by the rising edge of the ENCA nEC pin input trigger.
- (2) Clearing is performed by the ENCA nEC pin input and the count value is set to 0000<sub>H</sub>.
- (3) The counter value (0002<sub>H</sub>) is captured in the ENCA nCCR1 register by the rising edge of the ENCA nEC pin input.
- (4) At the same time, a clear interrupt (ENCA nTIEC) and capture interrupt (ENCA nTINT1) due to the ENCA nEC pin input are output.

### 35.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCA<sub>n</sub>EC Pin)

Figure 35.14 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCA<sub>n</sub>EC pin)

- (1) An up-count from FFFD<sub>H</sub> is continuously performed.
- (2) When an overflow occurs if the count value is FFFF<sub>H</sub>, and the rising edge of ENCA<sub>n</sub>EC is detected simultaneously, clear operation by the encoder clear input is performed. The counter value is cleared to 0000<sub>H</sub>.
- (3) When the counter value is cleared by the encoder clear input, a clear interrupt (ENCA<sub>n</sub>TIEC) by encoder clear input is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the overflow occurrence, an overflow interrupt is not output (An overflow does not occur. Clear operation is performed by the encoder clear input).
- (4) Because an overflow does not occur as is the case with step 3, the overflow flag is not set.

### 35.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCA<sub>n</sub>EC Pin)

Figure 35.15 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCA<sub>n</sub>EC Pin)

- (1) A down-count from 0002<sub>H</sub> is continuously performed.
- (2) When an underflow occurs if the count value is 0000<sub>H</sub>, and the rising edge of ENCA<sub>n</sub>EC is detected simultaneously, clear operation by the encoder clear input is performed. Even if the next clock signal is input during clear operation, the counter value remains at 0000<sub>H</sub>.
- (3) When the counter value is cleared by the encoder clear input, an encoder clear interrupt (ENCA<sub>n</sub>TIEC) is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the underflow occurrence, an underflow interrupt is not output (An underflow does not occur. Clear operation is performed by the encoder clear input).
- (4) Because an underflow does not occur as is the case with step 3, the underflow flag is not set.
- (5) When a further down-count is performed after the counter value changes to 0000<sub>H</sub> by clear operation by the encoder clear input, the counter value changes from 0000<sub>H</sub> to FFFF<sub>H</sub>, and an underflow occurs.

- (6) When an underflow occurs, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

### 35.6.6 Overflow Operation Immediately after Startup

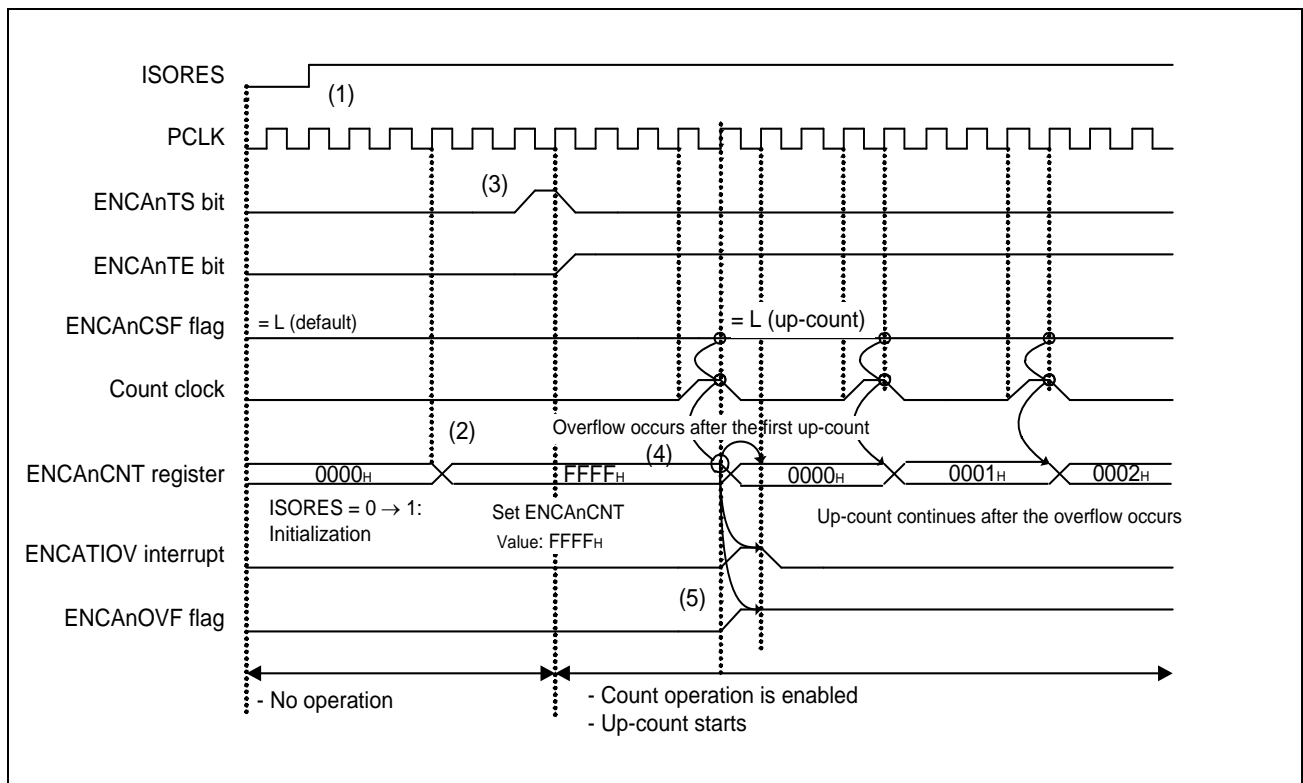

Figure 35.16 Overflow Operation Immediately after Startup

- (1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.
- (2) The timer counter is set to FFFF<sub>H</sub> as the initial value.
- (3) ENCAAnTS is set to “1”, and operation starts. ENCAAnTE changes to “1”, which indicates that operation is enabled.
- (4) When an up-count is performed from FFFF<sub>H</sub> which is the initially set count value, the counter value changes from FFFF<sub>H</sub> to 0000<sub>H</sub>, and an overflow occurs immediately after operation starts.
- (5) At the same time, by an overflow occurrence immediately after operation starts, an overflow interrupt (ENCAAnOV) is output, and the overflow flag (ENCAAnOV) is set.

### 35.6.7 Underflow Operation Immediately after Startup

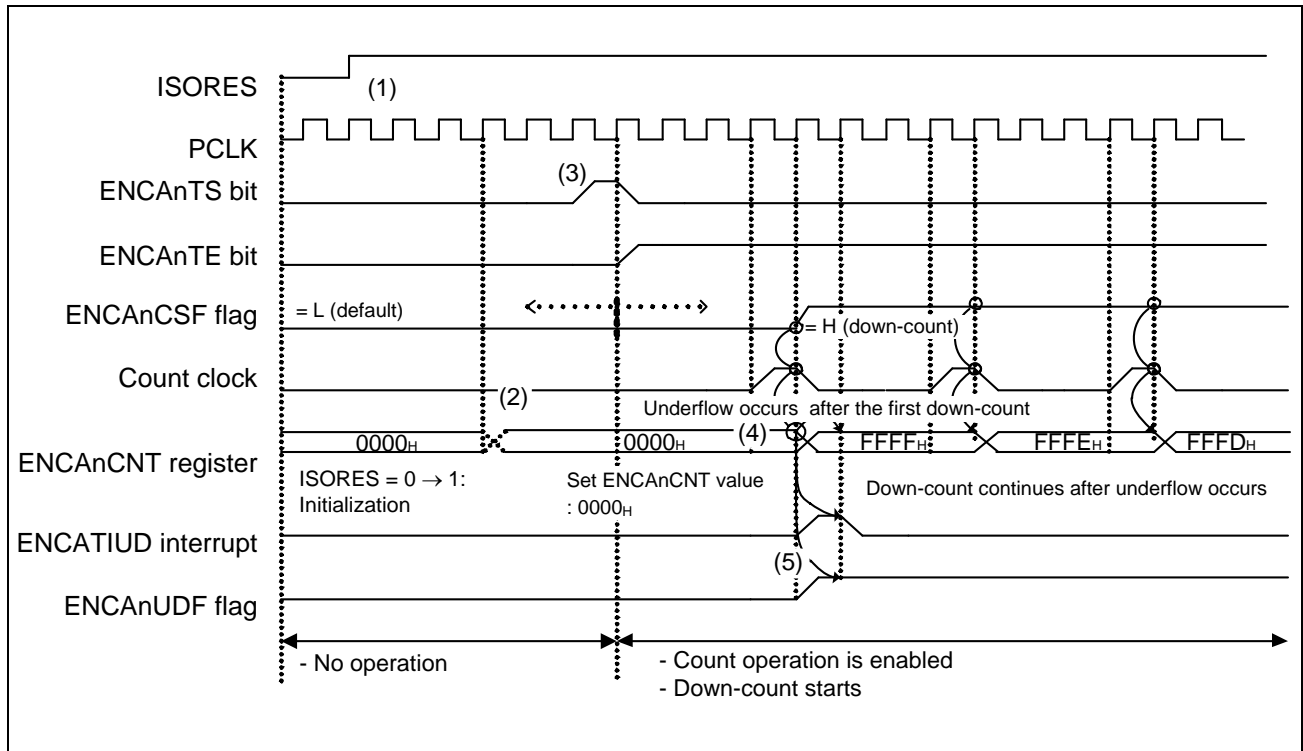

Figure 35.17 Underflow Operation Immediately after Startup

- (1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.
- (2) The timer counter is set to 0000<sub>H</sub> as the initial value.
- (3) ENCAAnTS is set to “1”, and operation starts. ENCAAnTE changes to “1”, which indicates that operation is enabled.
- (4) When a down-count is performed from 0000<sub>H</sub> which is the initially set count value, the counter value changes from 0000<sub>H</sub> to FFFF<sub>H</sub>, and an underflow occurs immediately after operation starts.
- (5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCAAnTIUD) is output, and the underflow flag (ENCAAnUDF) is set.

### 35.6.8 Using the ENCANLDE Function Immediately after Startup

Figure 35.18 Using the ENCANLDE Function Immediately after Startup

- (1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.
- (2) The load enable bit (ENCANLDE) is set to “1”, capture/compare register 0 (ENCANCCR0) is set to 3C5AH, and the timer counter is set to the initial value 0000H.
- (3) ENCANTS is set to “1”, and operation starts. ENCANTE changes to “1”, which indicates that operation is enabled.
- (4) When a down-count is performed from 0000H which is the initially set count value, an underflow occurs immediately after operation starts. Because ENCANLDE is set to “1”, the ENCANCCR0 value, 3C5AH, is loaded to the timer counter (ENCATINT0 is not output during loading).
- (5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCANUDF) is set (after an underflow occurs, down-count operation from the loaded value (3C5AH) continues).
- (6) After the ENCANCCR0 value is loaded to ENCANCNT, a match with ENCANCCR0 is detected, and ENCATINT0 is output.

### 35.6.9 ENCANLDE Function (Loading Count Value)

#### (1) <When ENCANLDE = 0>

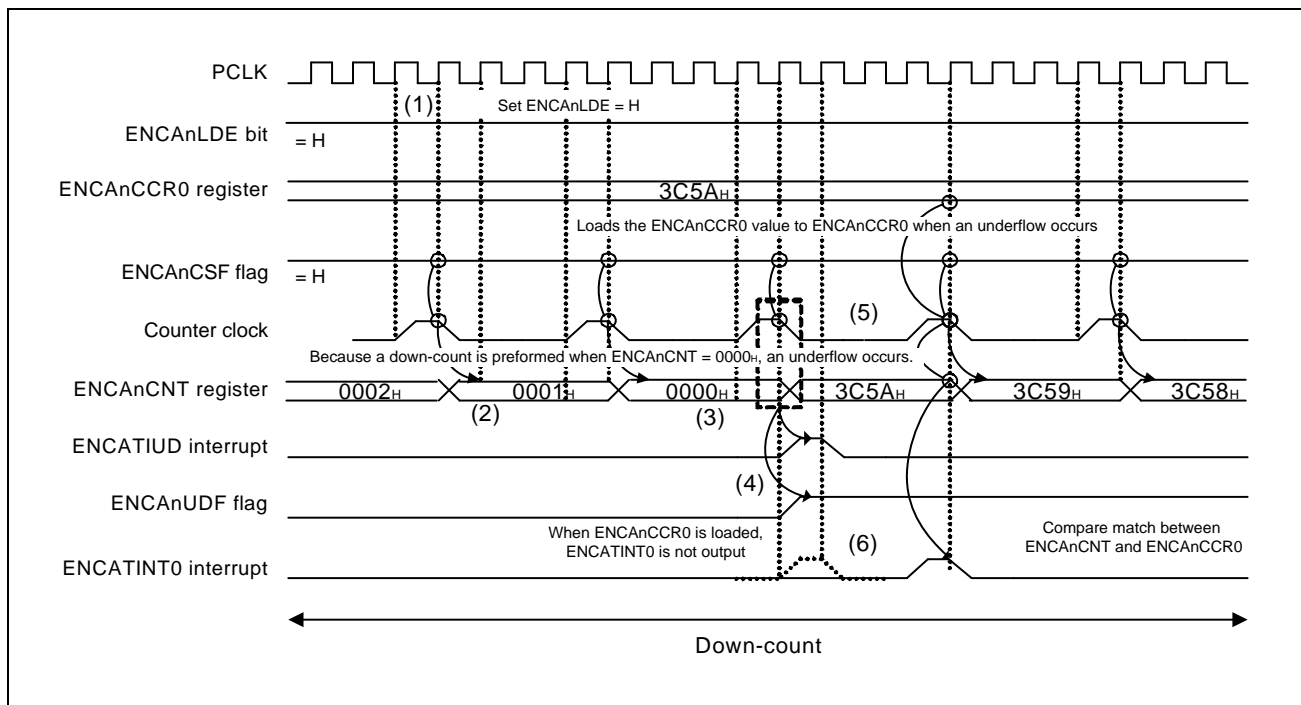

Figure 35.19 ENCANLDE Function (when ENCANLDE = 0)

- (1) ENCANLDE is set to "0" (even if an underflow occurs, the ENCANCCR0 value is not loaded).
- (2) A down-count is performed: 0002<sub>H</sub> → 0001<sub>H</sub> → 0000<sub>H</sub>
- (3) When a further down-count is performed after the counter value changes to 0000<sub>H</sub>, an underflow occurs.
- (4) Because ENCANLDE is set to "0", the setting value of the ENCANCCR0 register is not loaded to the counter even if an underflow occurs.
- (5) Operation changes to underflow operation (counter value: 0000<sub>H</sub> → FFFF<sub>H</sub>).
- (6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCANUDF) is set.

(2) <When ENCA<sub>n</sub>LDE = 1>Figure 35.20 ENCA<sub>n</sub>LDE Function (when ENCA<sub>n</sub>LDE = 1)

- (1) ENCA<sub>n</sub>LDE is set to "1" (if an underflow occurs, the ENCA<sub>n</sub>CCR0 value is loaded to the counter).
- (2) A down-count is performed: 0002<sub>H</sub> → 0001<sub>H</sub> → 0000<sub>H</sub>
- (3) When a further down-count is performed after the counter value changes to 0000<sub>H</sub>, an underflow occurs.
- (4) An underflow interrupt is output, and the underflow flag is set.
- (5) Because ENCA<sub>n</sub>LDE is set to "1", the setting value of the ENCA<sub>n</sub>CCR0 register is loaded to the counter if an underflow occurs. ENCA<sub>n</sub>CNT is set to 3C5A<sub>H</sub>.
- (6) After the ENCA<sub>n</sub>CCR0 value is set to ENCA<sub>n</sub>CNT, if the ENCA<sub>n</sub>CNT value matches the ENCA<sub>n</sub>CCR0 value on a count clock, a compare match interrupt (ENCA<sub>n</sub>TINT0) is output.

### 35.6.10 Conflict between ENCA<sub>n</sub>LDE Function (Loading Counter Value) and Rewrite of ENCA<sub>n</sub>CCR0 Register

Figure 35.21 Conflict between ENCA<sub>n</sub>LDE Function and Rewrite of ENCA<sub>n</sub>CCR0 Register

- (1) The ENCA<sub>n</sub>CCR0 register is currently set to 5555<sub>H</sub>.
- (2) ENCA<sub>n</sub>LDE is currently set to “1”.
- (3) A down-count is performed (0002<sub>H</sub> → 0001<sub>H</sub> → 0000<sub>H</sub>), and an underflow occurs.
- (4) An underflow interrupt (ENCA<sub>n</sub>TIUD) is output, and the underflow flag (ENCA<sub>n</sub>UDF) is set.
- (5) When an underflow occurs, the ENCA<sub>n</sub>CCR0 register value is changed from 5555<sub>H</sub> to AAAA<sub>H</sub>.
- (6) Additionally, when an underflow occurs, the ENCA<sub>n</sub>CCR0 value before the rewrite was performed (5555<sub>H</sub>) is set in ENCA<sub>n</sub>CNT.

### 35.6.11 Conflict between ENCA<sub>n</sub>LDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCA<sub>n</sub>EC Pin)

Figure 35.22 Conflict between ENCA<sub>n</sub>LDE Function and Clear Operation by Encoder Clear Input

- (1) The values are set as follows: ENCA<sub>n</sub>CTS = 0, ENCA<sub>n</sub>ECS[1:0] = 01<sub>B</sub>, ENCA<sub>n</sub>LDE = 1, and ENCA<sub>n</sub>CCR0 = 5555<sub>H</sub>.
- (2) A down-count is performed: 0002<sub>H</sub> → 0001<sub>H</sub> → 0000<sub>H</sub>.
- (3) When the count value becomes 0000<sub>H</sub>, the rising edge of ENCA<sub>n</sub>EC pin is detected, and clear operation by the encoder clear input is performed.
- (4) Because a count clear is performed when the count value reaches 0000<sub>H</sub>, a counter clear interrupt (ENCA<sub>n</sub>TIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when

the count value is 0000<sub>H</sub>. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

- (5) After the count value is cleared to 0000<sub>H</sub> by clear operation by the encoder clear input, a down-count is performed and an underflow occurs.
- (6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.
- (7) Because ENCANLDE = "1", if an underflow occurs, the ENCANCCR0 value is loaded to ENCANCNT.
- (8) After the ENCANCCR0 value is set to ENCANCNT, a compare match is detected according to the count clock. If the ENCANCNT value matches the ENCANCCR0 value, a compare match interrupt (ENCATINT0) is output.

### 35.6.12 Up-count after Conflict between ENCA<sub>n</sub>LDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input

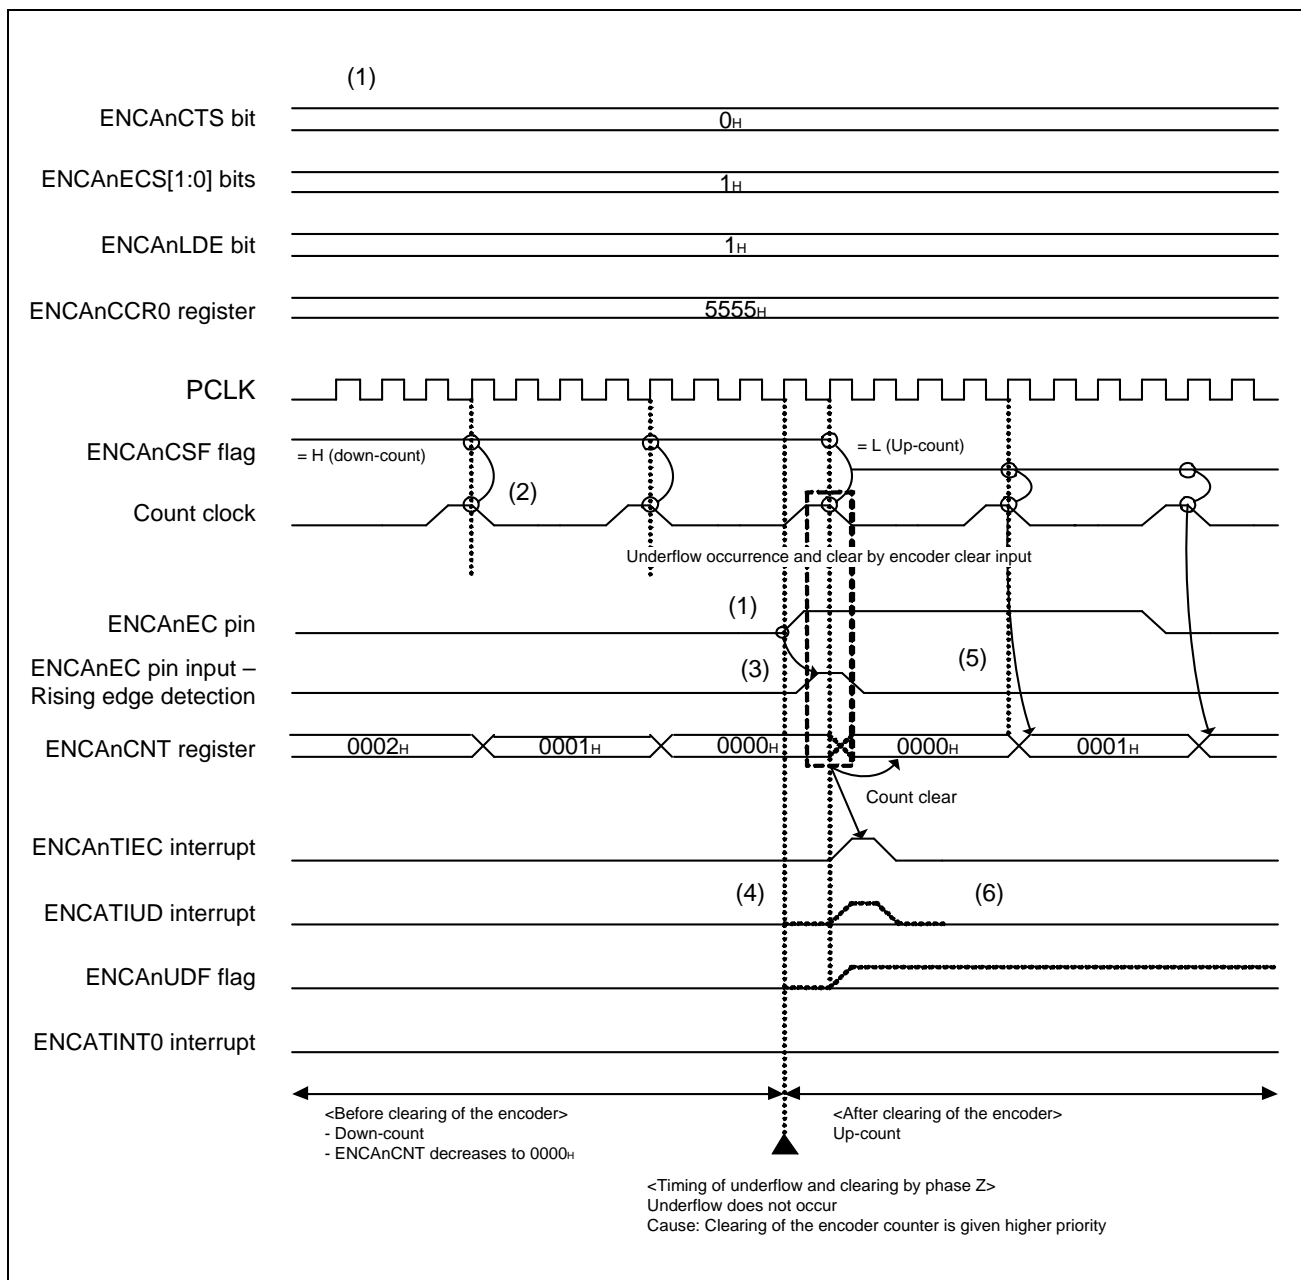

Figure 35.23 Up-count after Conflict between ENCA<sub>n</sub>LDE Function and Encoder Clear

- (1) The values are set as follows: ENCA<sub>n</sub>CTS = 0, ENCA<sub>n</sub>ECS[1:0] = 01<sub>B</sub>, ENCA<sub>n</sub>LDE = 1, and ENCA<sub>n</sub>CCR0 = 5555<sub>H</sub>.
- (2) A down-count is performed: 0002<sub>H</sub> → 0001<sub>H</sub> → 0000<sub>H</sub>
- (3) When the count value becomes 0000<sub>H</sub>, the rising edge of ENCA<sub>n</sub>EC pin is detected, and clear operation by the encoder clear input is performed.
- (4) Because a count clear is performed when the count value reaches 0000<sub>H</sub>, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when

the count value is 0000<sub>H</sub>. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

- (5) After the count value is cleared to 0000<sub>H</sub> by clear operation by the encoder clear input, an up-count is performed.
- (6) An underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

### 35.6.13 Capture Operation between Count Clocks (ENCA<sub>n</sub>CCR1)

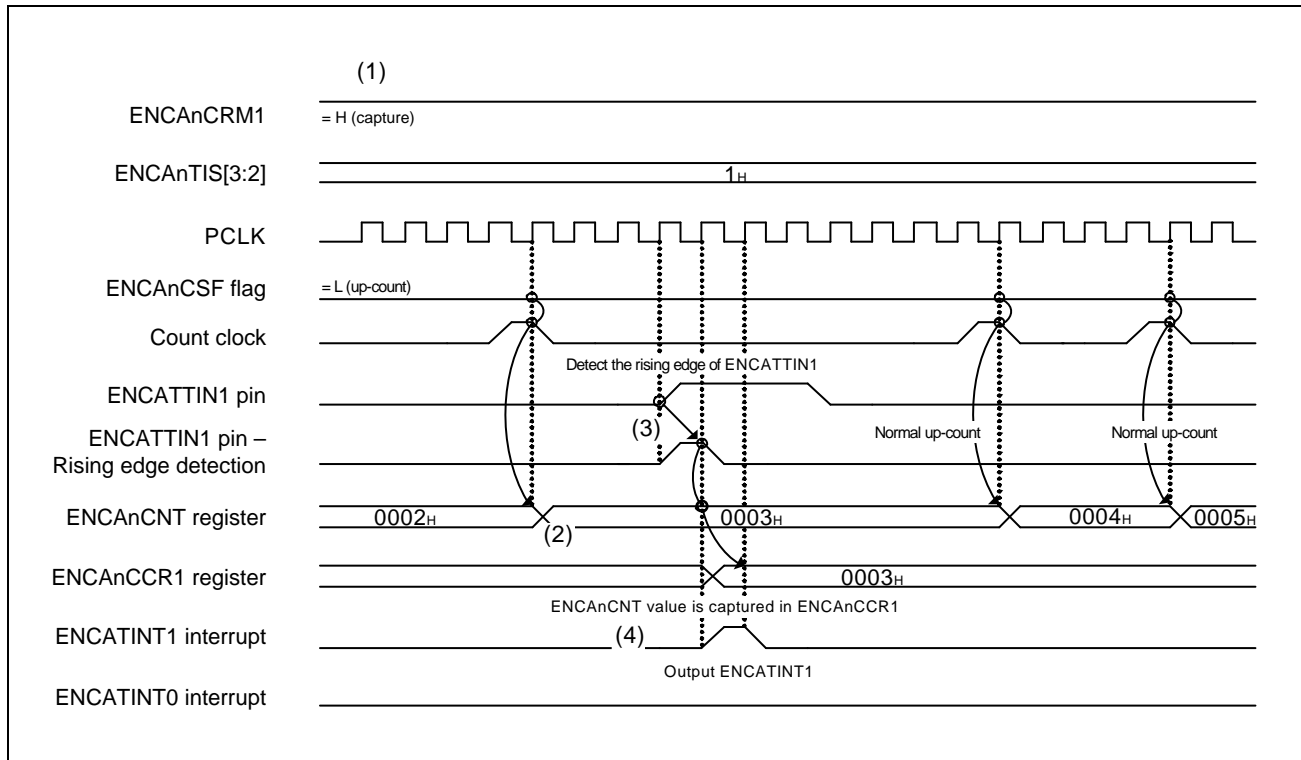

Figure 35.24 Capture Operation between Count Clocks (ENCA<sub>n</sub>CCR1)

- (1) The values are set as follows: ENCA<sub>n</sub>CRM1 = 1, and ENCA<sub>n</sub>TIS[3:2] = 01<sub>B</sub>.
- (2) An up-count is performed.
- (3) The rising edge of the ENCATTIN1 input is detected, and the count value is captured in ENCA<sub>n</sub>CCR1.
- (4) An interrupt (ENCA<sub>n</sub>TINT1) corresponding to the capture to the ENCA<sub>n</sub>CCR1 register is output.

### 35.6.14 Capture Operation between Count Clocks (ENCAnCCR0)

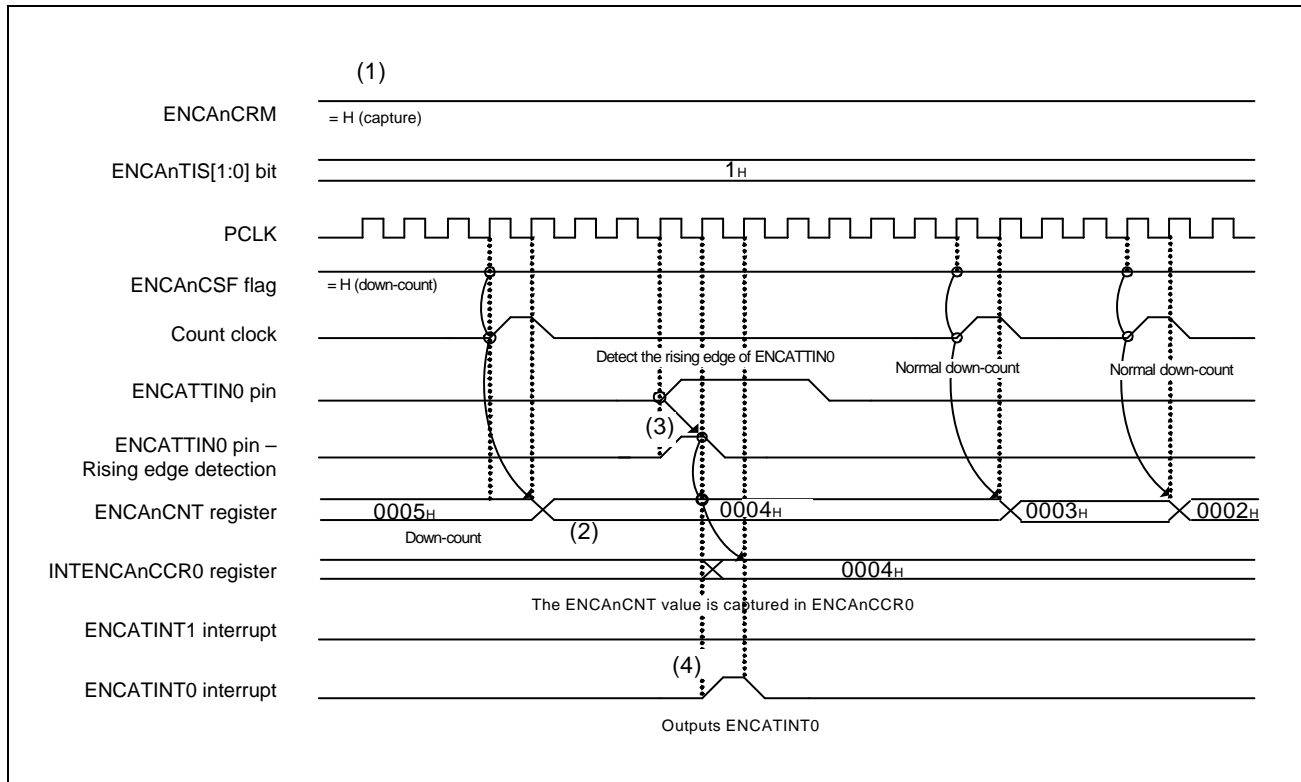

Figure 35.25 Capture Operation between Count Clocks (ENCAnCCR0)

- (1) The values are set as follows: ENCAAnCRM0 = 1, and ENCAAnTIS[1:0] = 01<sub>B</sub>.
- (2) A down-count is performed.
- (3) The rising edge of the ENCATTIN0 input is detected, and the count value is captured in ENCAAnCCR0.
- (4) An interrupt (ENCATINT0) corresponding to the capture to the ENCAAnCCR0 register is output.

### 35.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCA<sub>n</sub>CTS = 0

Figure 35.26 Encoder Operation when Compare Match Clear Control is Enabled and ENCA<sub>n</sub>CTS = 0

- (1) The values are set as follows: ENCA<sub>n</sub>CCR0 = 4444<sub>H</sub>, ENCA<sub>n</sub>CRM0 = 0, ENCA<sub>n</sub>CRM1 = 1, ENCA<sub>n</sub>ECM[1:0] = 01<sub>B</sub>, and ENCA<sub>n</sub>CTS = 0.
- (2) A down-count is performed.
- (3) The rising edge of the ENCA<sub>n</sub>TIN1 input is detected, and the ENCA<sub>n</sub>CNT value (4444<sub>H</sub>) is captured in the ENCA<sub>n</sub>CCR1 register.
- (4) An interrupt signal (ENCA<sub>n</sub>TINT1) corresponding to the capture to the ENCA<sub>n</sub>CCR1 register is output.
- (5) When a compare match occurs between ENCA<sub>n</sub>CNT (counted down from 4445<sub>H</sub> to 4444<sub>H</sub>) and ENCA<sub>n</sub>CCR0 (4444<sub>H</sub>), a compare match interrupt (ENCA<sub>n</sub>TINT0) with ENCA<sub>n</sub>CCR0 is output.
- (6) The count operation changes to up-count.
- (7) When ENCA<sub>n</sub>CNT is counted up from 4443<sub>H</sub> to 4444<sub>H</sub>, a compare match with ENCA<sub>n</sub>CCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCA<sub>n</sub>ECM1 and ENCA<sub>n</sub>ECM0 (01<sub>B</sub>), and the ENCA<sub>n</sub>CNT value changes to 0000<sub>H</sub>.
- (8) When ENCA<sub>n</sub>CNT changes to 4444<sub>H</sub>, a compare match interrupt (ENCA<sub>n</sub>TINT0) with ENCA<sub>n</sub>CCR0 is output.

### 35.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCA<sub>n</sub>CTS = 1

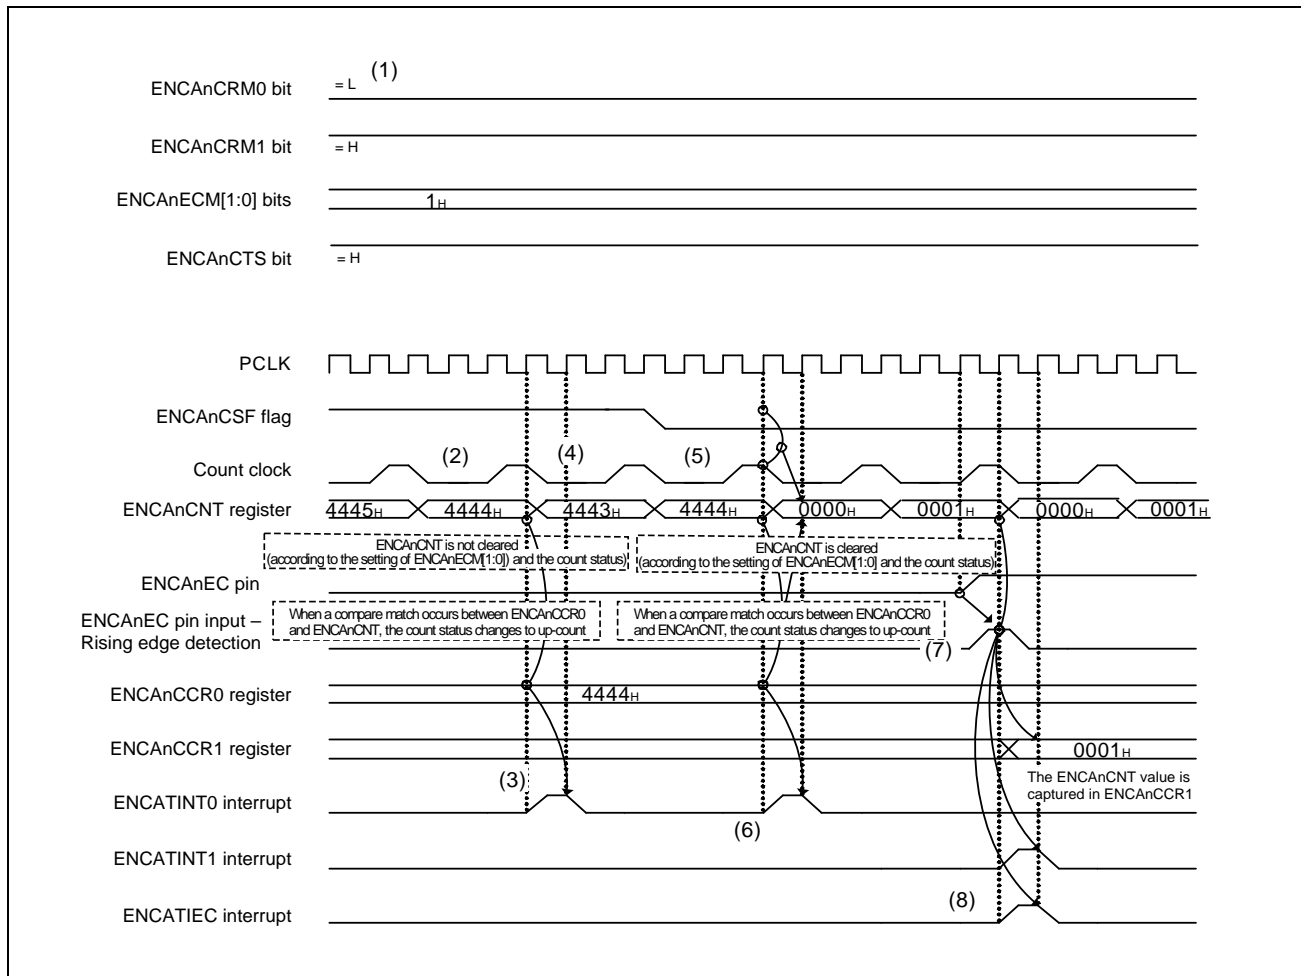

Figure 35.27 Encoder Operation when Compare Match Clear Control is Enabled and ENCA<sub>n</sub>CTS = 1

- (1) The values are set as follows: ENCA<sub>n</sub>CCR0 = 4444<sub>H</sub>, ENCA<sub>n</sub>CRM0 = 0, ENCA<sub>n</sub>CRM1 = 1, ENCA<sub>n</sub>ECM[1:0] = 01<sub>B</sub>, and ENCA<sub>n</sub>CTS = 1.
- (2) A down-count is performed.
- (3) When a compare match occurs between ENCA<sub>n</sub>CNT (counted down from 4445<sub>H</sub> to 4444<sub>H</sub>) and ENCA<sub>n</sub>CCR0 (4444<sub>H</sub>), a compare/capture interrupt (ENCA<sub>n</sub>TINT0) is output.
- (4) The count operation changes to up-count.
- (5) When ENCA<sub>n</sub>CNT is counted up from 4443<sub>H</sub> to 4444<sub>H</sub>, a compare match with ENCA<sub>n</sub>CCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCA<sub>n</sub>ECM1 and ENCA<sub>n</sub>ECM0 (01<sub>B</sub>), and the ENCA<sub>n</sub>CNT value changes to 0000<sub>H</sub>.
- (6) When ENCA<sub>n</sub>CNT changes to 4444<sub>H</sub>, a compare match interrupt (ENCA<sub>n</sub>TINT0) with ENCA<sub>n</sub>CCR0 is output.
- (7) After the count value is cleared, an up-count is performed, and the count value changes to 0001<sub>H</sub>. At this point, the ENCA<sub>n</sub>CNT value (0001<sub>H</sub>) is captured in ENCA<sub>n</sub>CCR1 by detecting the rising edge of the ENCA<sub>n</sub>EC signal, and the counter is cleared to 0000<sub>H</sub>.
- (8) An interrupt (ENCA<sub>n</sub>TINT1) corresponding to the capture to the ENCA<sub>n</sub>CCR1 register and a clear interrupt (ENCA<sub>n</sub>TIEC) by ENCA<sub>n</sub>EC are output.

### 35.6.17 Encoder Operation when Compare Match Clear Control is Disabled

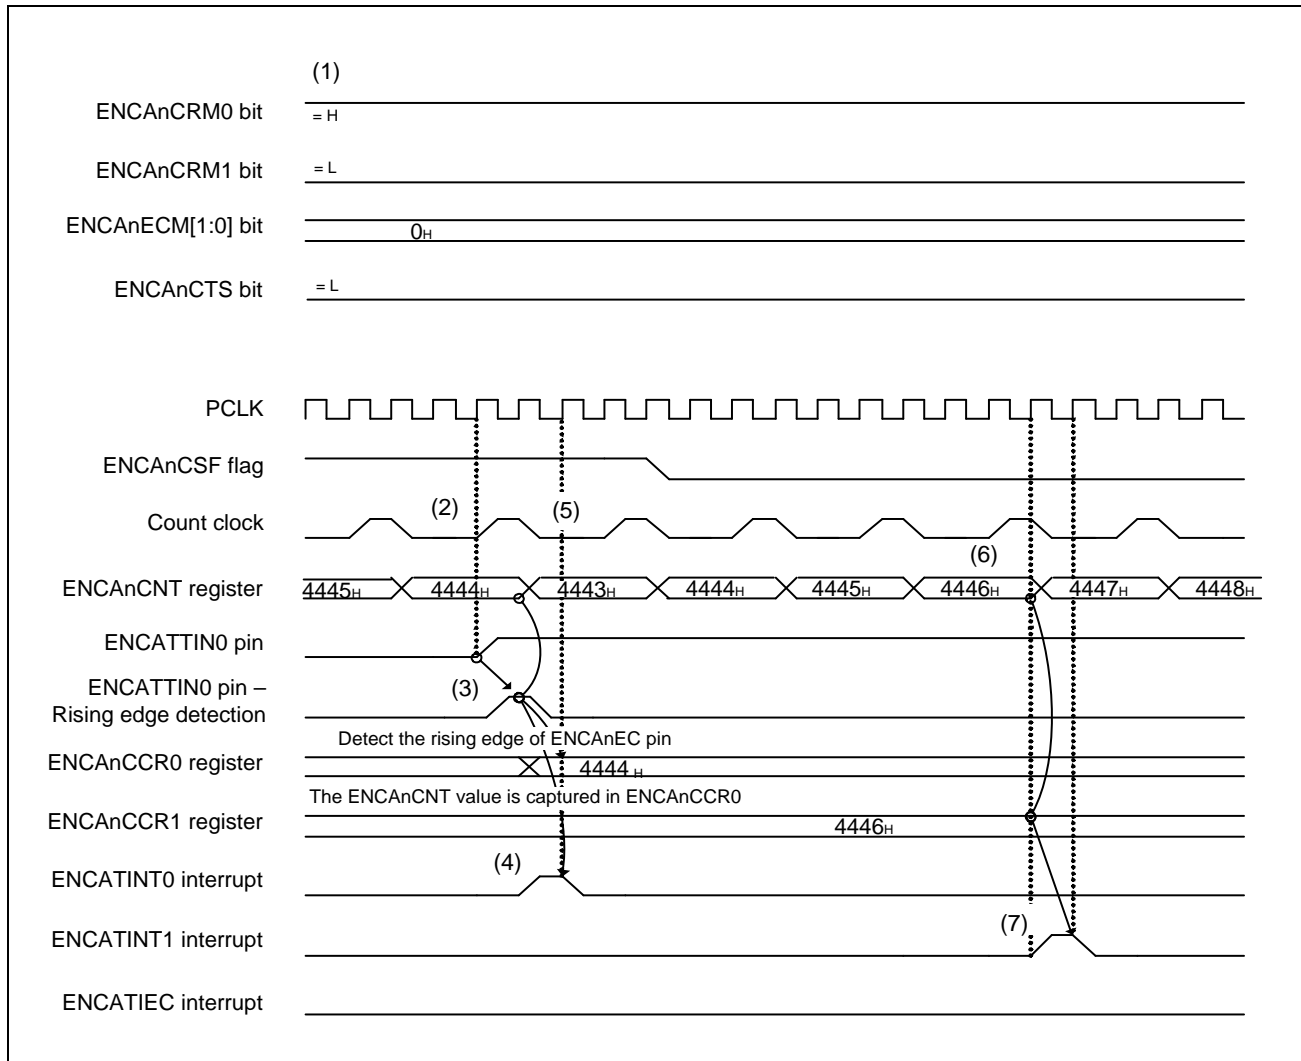

Figure 35.28 Encoder Operation when Compare Match Clear Control is Disabled

- (1) The values are set as follows: ENCAAnCCR1 = 4446<sub>H</sub>, ENCAAnCRM0 = 1, ENCAAnCRM1 = 0, ENCAAnECM[1:0] = 00<sub>B</sub>, and ENCAAnCTS = 0.
- (2) A down-count is performed.
- (3) When the rising edge of ENCAAnTIN0 is detected, the ENCAAnCNT value (4444<sub>H</sub>) is captured in ENCAAnCCR0.  
Detect the rising edge of ENCAAnEC pin  
The ENCAAnCNT value is captured in ENCAAnCCR0
- (4) An interrupt signal (ENCAAnTINT0) corresponding to the capture to the ENCAAnCCR0 register is output.
- (5) The count operation changes to up-count.
- (6) When ENCAAnCNT changes to 4446<sub>H</sub>, a compare match with ENCAAnCCR1 is detected.
- (7) A compare match interrupt (ENCAAnTINT1) with ENCAAnCCR1 is output.

### 35.6.18 Capture Operation Performed upon Clearing by ENCA<sub>n</sub>EC, ENCA<sub>n</sub>E0, ENCA<sub>n</sub>E1 when ENCA<sub>n</sub>SCE = 1

#### 35.6.18.1 Accompanying Capture Operation

Figure 35.29 Capture Operation Performed upon Clearing by ENCA<sub>n</sub>EC, ENCA<sub>n</sub>E0, ENCA<sub>n</sub>E1 when ENCA<sub>n</sub>SCE = 1

- (1) The values are set as follows: ENCA<sub>n</sub>SCE = 1, ENCA<sub>n</sub>CTS = 1, ENCA<sub>n</sub>UDS[1:0] = 11<sub>B</sub>, ENCA<sub>n</sub>ACL = 0, ENCA<sub>n</sub>BCL = 0, and ENCA<sub>n</sub>ZCL = 1.
- (2) An up-count is performed.
- (3) The count value is not cleared upon the rising edge of ENCA<sub>n</sub>EC.
- (4) When ENCA<sub>n</sub>E0, ENCA<sub>n</sub>E1 and ENCA<sub>n</sub>EC reach the set clear level, the count value is cleared. The count value is captured in ENCA<sub>n</sub>CCR1 at the time of the clearing.
- (5) At the time of the clearing, an interrupt (ENCA<sub>n</sub>TINT1) corresponding to the capture to the ENCA<sub>n</sub>CCR1 register and a clear interrupt (ENCA<sub>n</sub>TIEC) by ENCA<sub>n</sub>EC are output.

**35.6.18.2 When the Timing of the ENCA<sub>n</sub>EC Input is Later than that of the ENCA<sub>n</sub>E1 Input during Up-count (When ENCA<sub>n</sub>ACL = 1, ENCA<sub>n</sub>BCL = 0, ENCA<sub>n</sub>ZCL = 1, and ENCA<sub>n</sub>UDS[1:0] = 11<sub>B</sub>)**

Figure 35.30 Clearing Timing for when the Timing of the ENCA<sub>n</sub>EC Input is Later than that of the ENCA<sub>n</sub>E1 Input during Up-count

**35.6.18.3 When the Timing of the ENCA<sub>n</sub>EC Input is the Same as that of the ENCA<sub>n</sub>E1 Input during Up-count (When ENCA<sub>n</sub>ACL = 1, ENCA<sub>n</sub>BCL = 0, ENCA<sub>n</sub>ZCL = 1, and ENCA<sub>n</sub>UDS[1:0] = 11<sub>B</sub>)**

Figure 35.31 Clearing Timing for when the Timing of the ENCA<sub>n</sub>EC Input is the Same as that of the ENCA<sub>n</sub>E1 Input during Up-count

**35.6.18.4 When the Timing of the ENCA<sub>n</sub>EC Input is Earlier than that of the ENCA<sub>n</sub>E1 Input during Up-count (When ENCA<sub>n</sub>ACL = 1, ENCA<sub>n</sub>BCL = 0, ENCA<sub>n</sub>ZCL = 1, and ENCA<sub>n</sub>UDS[1:0] = 11<sub>B</sub>)**

Figure 35.32 Clearing Timing for when the Timing of the ENCA<sub>n</sub>EC Input is Earlier than that of the ENCA<sub>n</sub>E1 Input during Up-count

**35.6.18.5 When the Timing of the ENCA<sub>n</sub>EC Input is Later than that of the ENCA<sub>n</sub>E1 Input during Down-count (When ENCA<sub>n</sub>ACL = 1, ENCA<sub>n</sub>BCL = 0, ENCA<sub>n</sub>ZCL = 1, and ENCA<sub>n</sub>UDS[1:0] = 11<sub>B</sub>)**

Figure 35.33 Clearing Timing for when the Timing of the ENCA<sub>n</sub>EC Input is Later than that of the ENCA<sub>n</sub>E1 Input during Down-count

### 35.6.19 Capture Operation Performed upon Clearing by ENCA<sub>n</sub>EC when ENCA<sub>n</sub>SCE = 0

Figure 35.34 Capture Operation Performed upon Clearing by ENCA<sub>n</sub>EC when ENCA<sub>n</sub>SCE = 0

- (1) The values are set as follows: ENCA<sub>n</sub>SCE = 0, ENCA<sub>n</sub>CTS = 1, and ENCA<sub>n</sub>ECS[1:0] = 01<sub>B</sub>.
- (2) An up-count is performed.
- (3) The rising edge of the ENCA<sub>n</sub>EC input is detected, and the ENCA<sub>n</sub>CNT value (AA<sub>AB</sub>H) is captured in the ENCA<sub>n</sub>CCR1 register. Concurrently, clear operation by ENCA<sub>n</sub>EC is performed, and ENCA<sub>n</sub>CNT is cleared to 0000<sub>H</sub>.
- (4) A capture interrupt 1 (ENCA<sub>n</sub>TINT1) to the ENCA<sub>n</sub>CCR1 register and an encoder clear interrupt (ENCA<sub>n</sub>TIEC) by ENCA<sub>n</sub>EC are output.
- (5) After the count value is cleared, an up-count is performed, and the count value changes to 0001<sub>H</sub>.

## Section 36 Motor Control

This section contains a generic description of the Motor Control.

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the Motor Control.

### 36.1 Features of RH850/F1KH, RH850/F1KM Motor Control

#### 36.1.1 Number of Units

Motor control function comprises the timer motor control units (TAPA) and the peripheral interconnection unit (PIC) to connect the TAPA unit to peripheral timers, and generates motor control waveforms by using a combination of peripheral timers and A/D converters.

This microcontroller has the following number of TAPA and PIC units.

Table 36.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
TAPA			
Number of Units	1	1	1
Name	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)
PIC			
Number of Units	1	1	1
Name	PIC0	PIC0	PIC0

Table 36.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
TAPA					
Number of Units	1	1	1	1	1
Name	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)
PIC					
Number of Units	1	1	1	1	1
Name	PIC0	PIC0	PIC0	PIC0	PIC0

Table 36.3 Number of Units (RH850/F1KM-S2)

Product Name	RH850/F1KM-S2 100 Pins	RH850/F1KM-S2 144 Pins	RH850/F1KM-S2 176 Pins
TAPA

Table 36.5 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the unit of a timer and A/D converter used by TAPA and the motor control function is identified by the index "n"; for example, TAPAnCTL0 (n = 0) is TAPAn control register 0.
m	The channel of a used timer and A/D converter is identified by the index "m". For example, the TAUDn channel is described as CHm.
x	The scan group of an A/D converter is identified by the index "x" (x = 1 to 3).
j	The scan trigger number of an A/D converter is identified by the index "j" (j = 0 to 2).

The following table lists the values indicated by the indices of each product.

Table 36.6 Indices of Products (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Indices of Each Product	
All Products	
m = 0 to 15 (e.g. TAUDn)	
x = 1 to 3	
j = 0 to 2	

### 36.1.2 Register Base Addresses

Base addresses of TAPAn and PIC0 are listed in the following table.

Register addresses of TAPAn and PIC0 are given as offsets from the base addresses.

Table 36.7 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Base Address Name	Base Address
<TAPA0_base>	FFE9 0000 <sub>H</sub>
<PIC0_base>	FFDD 0000 <sub>H</sub>

### 36.1.3 Clock Supply

The TAPAn and PIC0 clock supplies are listed in the following table.

Table 36.8 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAPAn	PCLK	CKSCLK_IPER11	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPER11	Bus clock
PIC0	PCLK	CKSCLK_IPER11	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPER11	Bus clock

### 36.1.4 Interrupt Requests

TAPAn interrupt requests are listed in the following table.

Table 36.9 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
TAPA0			
INTTAPA0IPEK0	Peak interrupt 0	16, 116	—
INTTAPA0IVLY0	Valley interrupt 0	17, 117	—

### 36.1.5 Reset Sources

Reset sources of TAPAn and PIC0 are listed in the following table. TAPAn and PIC0 are initialized by these reset sources.

Table 36.10 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Name	Reset Source
TAPAn	All reset sources (ISOIRES)
PIC0	All reset sources (ISOIRES)

### 36.1.6 External Input/Output Signals

External output signals of TAPAn and PIC0 are listed below.

Table 36.11 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
PIC0		
TOUTU	Motor control output U phase (positive)	TAPA0UP
TOUTUB	Motor control output U phase (negative)	TAPA0UN
TOUTV	Motor control output V phase (positive)	TAPA0VP
TOUTVB	Motor control output V phase (negative)	TAPA0VN
TOUTW	Motor control output W phase (positive)	TAPA0WP
TOUTWB	Motor control output W phase (negative)	TAPA0WN
TAPA0		
TAPATHASIN	Motor control output Hi-Z control input	TAPA0ESO

#### CAUTION

For the port pins that are used as TAPA0UP, TAPA0UN, TAPA0VP, TAPA0VN, TAPA0WP and TAPA0WN, set the output driver strength to high (PDSCn\_m = 1).

### 36.1.7 Internal Output Signals

The internal output signals of TAPAn and PIC0 are listed below.

Table 36.12 Internal Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S2, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
TAPA0		
TAPATHZOUT0	TAPA0UP/TAPA0UN output buffers Hi-Z control output*1	Port
TAPATHZOUT1	TAPA0VP/TAPA0VN output buffers Hi-Z control output*1	Port
TAPATHZOUT2	TAPA0WP/TAPA0WN output buffers Hi-Z control output*1	Port
TAPATADOUT0	A/D trigger signal 0 output*2	ADCA0 hardware trigger expansion
TAPATADOUT1	A/D trigger signal 1 output*2	ADCA0 hardware trigger expansion
PIC0		
TAPATHASIN	TAPA0 asynchronous Hi-Z control signal*1,*3	TAPA0
TAPATSIM0	TAUD master channel interrupt signal (TAUD0: INTTAUD0I0, INTTAUD0I2, INTTAUD0I8)	TAPA0
TAPATUDCM0	TAUD master up/down signal (TAUD0: TAUD0UDC0, TAUD0UDC2, TAUD0UDC8)	TAPA0
TAPATCDENS0	TAUD slave 0 match detect*4 (ADCA0 hardware trigger expansion: ADOPA1ADCATTIN00)	TAPA0
TAPATCDENS1	TAUD slave 1 match detect*4 (ADCA0 hardware trigger expansion: ADOPA2ADCATTIN00)	TAPA0

Note 1. See **Section 36.4.6, TAPA0 Hi-Z Control Input Selection** for details.

Note 2. These signals can be used to as a trigger source to start the A/D converter. See **Table 38.84, List of A/D Conversion Hardware Triggers**.

Note 3. This input signal is passed through a noise filter. See **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector**, **Section 2C.12, Noise Filter & Edge/Level Detector**, **Section 2A.13, Description of Port Noise Filter & Edge/Level Detection**, **Section 2B.13, Description of Port Noise Filter & Edge/Level Detection**, and **Section 2C.13, Description of Port Noise Filter & Edge/Level Detection**.

Note 4. These signals are selected by the H/W trigger selection bit of the ADCA0 A/D converter. See **Table 38.84, List of A/D Conversion Hardware Triggers**.

## 36.2 Overview

### 36.2.1 Functional Overview

The motor control function provides the following functions by combining the motor control unit (TAPA) and Timer Array Unit D (TAUDn) or A/D (ADCAn):

- Asynchronous Hi-Z control function  
Hi-Z control for TAUDn output can be performed by using pin input or error signals.
- Interrupt signal output function  
Request signals for two types of interrupts, peak interrupts and valley interrupts, can be output by the INTn signals output by TAUDn.
- A/D conversion start trigger selection function  
An A/D conversion start trigger can be output by the INTn signals output by TAUDn.

Additionally, the motor control function provides also the following functions by combining the motor control unit (TAPA) and the peripheral interconnection (PIC):

- Timer simultaneous start trigger function  
The respective channels of TAUD0 and TAUJ1, and the ENCA<sub>n</sub> timer can be started simultaneously.
- Trigger and pulse width measuring function  
Measurement of trigger periods can be performed by inputting ENCA<sub>n</sub> interrupt signals to TAUDn or TAUJ1.
- A/D trigger encoder capture function  
The value of the ENCA<sub>n</sub> counter can be captured at the A/D conversion start trigger timing.
- Three-phase PWM output with dead time / High-accuracy triangle PWM output with dead time  
Three-phase PWM output with dead time can be performed by TAUDn.
- Delay pulse output with dead time  
Delay pulses (with dead time) for the cycle timing can be output.

### 36.2.2 Basic Structure of Motor Control

The peripheral block configuration of the motor control function is shown below.

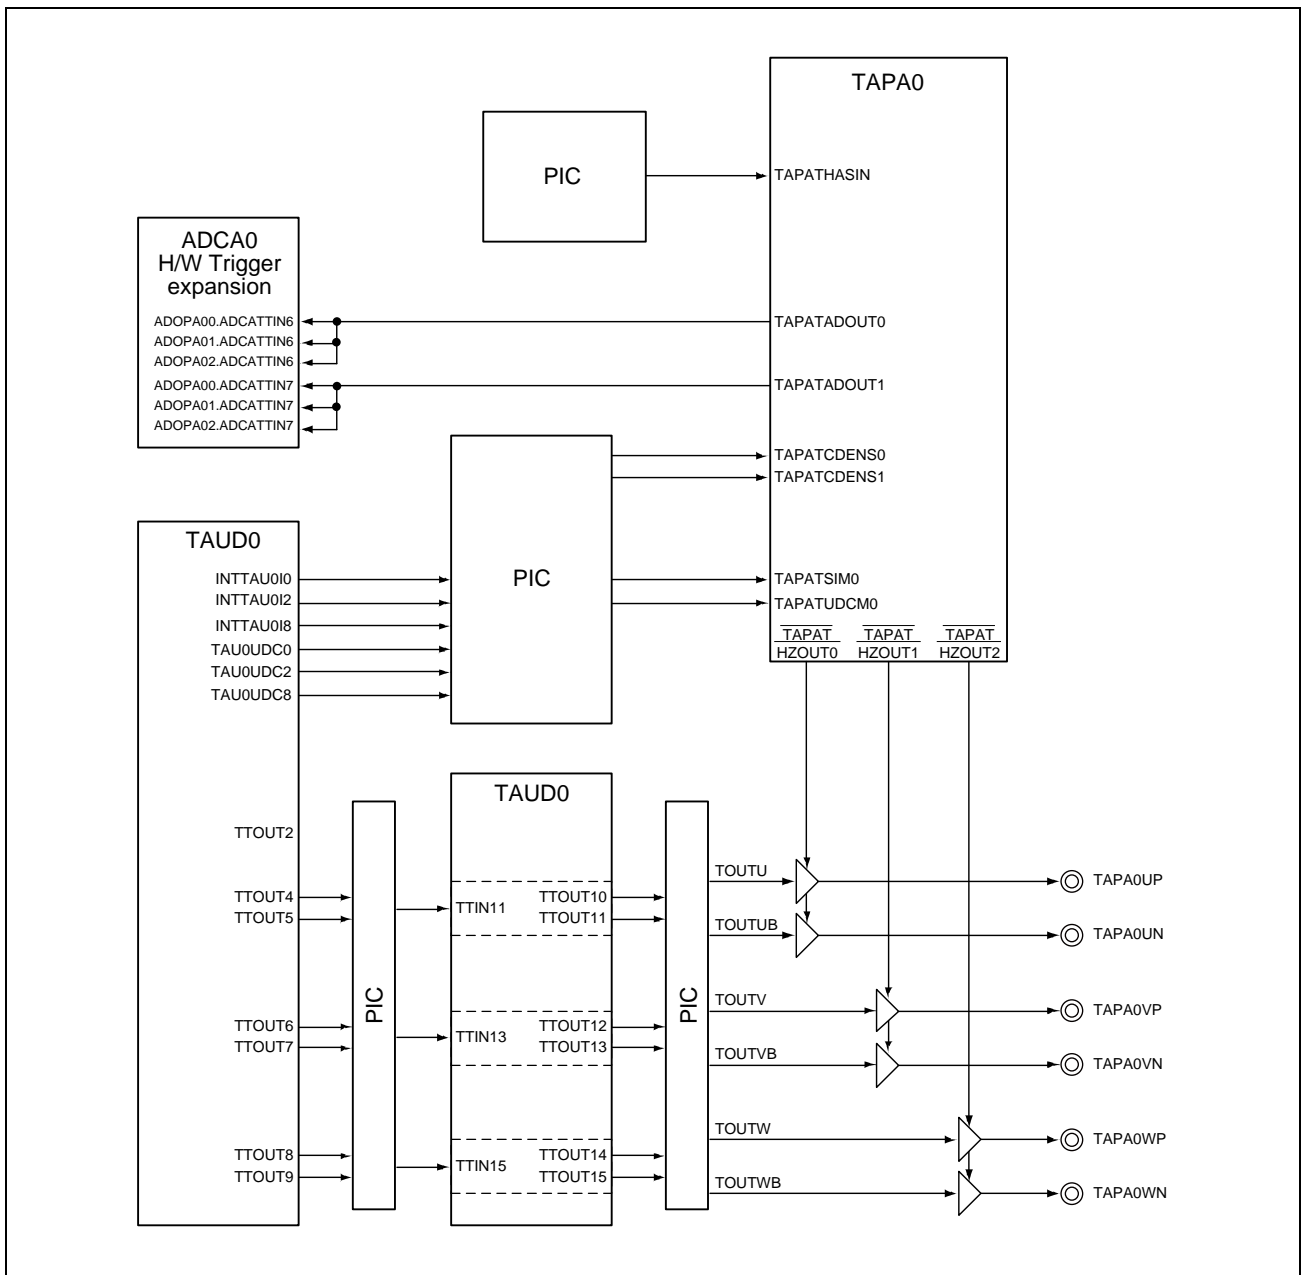

Figure 36.1 Configuration of Motor Control

TAUDn and PIC are used to generate the motor control output signals (three-phase PWM output signals with dead time).

The timer control unit (TAPA) performs Hi-Z control for the motor control output.

Additionally, PIC can provide functions specific to the motor by combining respective channels of TAUDn and TAUJ1, ENCA<sub>n</sub>, and TAPA.

### 36.2.3 Block Diagram

Figure 36.2 TAPA Peripheral Block Diagram

**NOTE**

For the PIC peripheral block diagram, see the respective section describing each function.

### 36.2.4 Definition of Terms

Peak and valley interrupts - Peak and valley of timer counter

In this document, the period from a TAUD counting-up status to generation of INT from the master channel is defined as a peak period, and this INT is defined as a peak interrupt.

In contrast, the period from a TAUD counting-down status to generation of INT from the master channel is defined as a valley period, and this INT is defined as a valley interrupt.

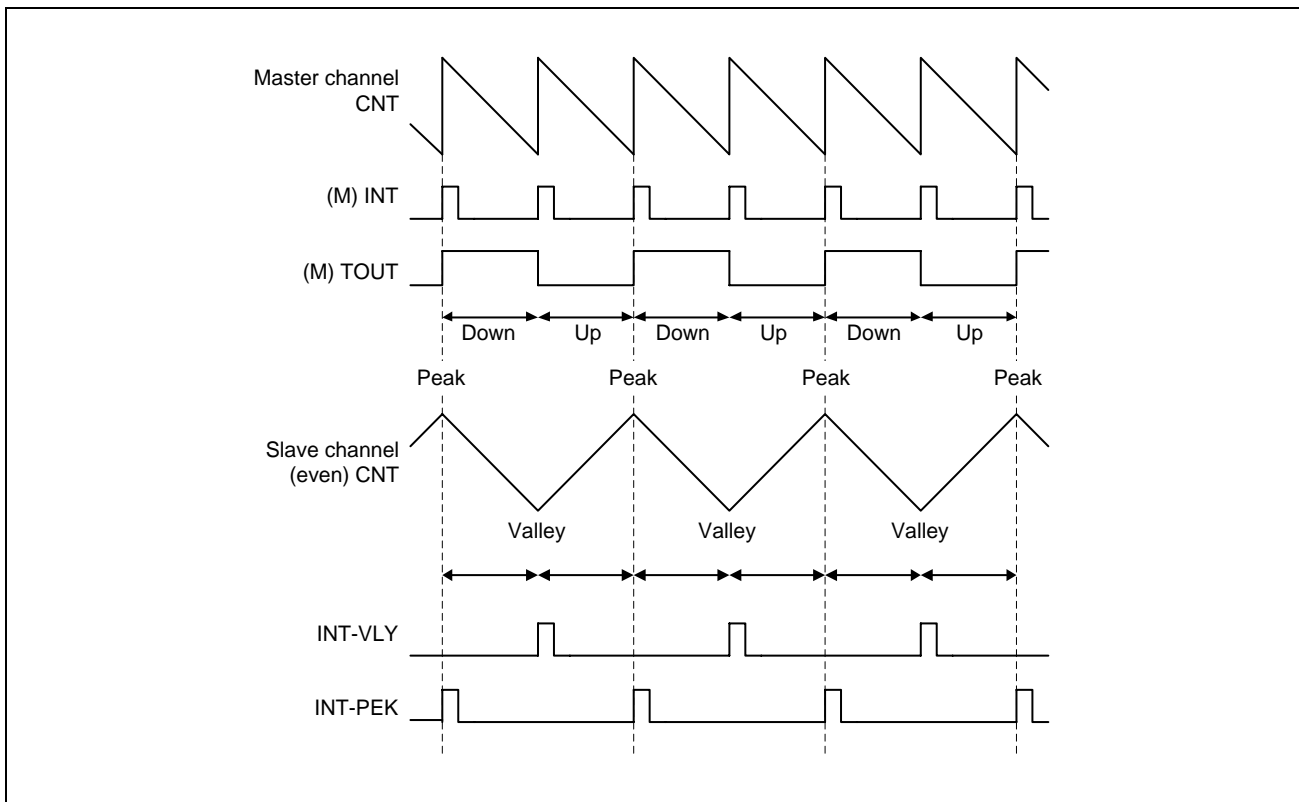

Figure 36.3 Peak and Valley Interrupts

## 36.3 Registers

### 36.3.1 List of Registers

The registers of TAPAn and PIC0 are listed in the following table.

For details about <TAPAn\_base> and <PIC0\_base>, see **Section 36.1.2, Register Base Addresses**.

Table 36.13 List of Registers

Module Name	Register Name	Symbol	Address
TAPAn	TAPA control register 0	TAPAnCTL0	<TAPAn_base> + 20 <sub>H</sub>
	TAPA control register 1	TAPAnCTL1	<TAPAn_base> + 24 <sub>H</sub>
	TAPA flag register	TAPAnFLG	<TAPAn_base> + 00 <sub>H</sub>
	TAPA asynchronous Hi-Z control write enable register	TAPAnACWE	<TAPAn_base> + 04 <sub>H</sub>
	TAPA asynchronous Hi-Z control start trigger register	TAPAnACTS	<TAPAn_base> + 08 <sub>H</sub>
	TAPA asynchronous Hi-Z control stop trigger register	TAPAnACTT	<TAPAn_base> + 0C <sub>H</sub>
	TAPA Hi-Z start trigger register	TAPAnOPHS	<TAPAn_base> + 14 <sub>H</sub>
	TAPA Hi-Z stop trigger register	TAPAnOPHT	<TAPAn_base> + 18 <sub>H</sub>
	TAPA emulation register	TAPAnEMU	<TAPAn_base> + 28 <sub>H</sub>
PIC0	Simultaneous start trigger control register	PIC0SST	<PIC0_base> + 04 <sub>H</sub>
	Simultaneous start control register 0	PIC0SSER0	<PIC0_base> + 10 <sub>H</sub>
	Simultaneous start control register 2	PIC0SSER2	<PIC0_base> + 18 <sub>H</sub>
	Hi-Z output control register 0	PIC0HIZCEN0	<PIC0_base> + 80 <sub>H</sub>
	A/D conversion trigger output control register 400	PIC0ADTEN400	<PIC0_base> + 90 <sub>H</sub>
	A/D conversion trigger output control register 401	PIC0ADTEN401	<PIC0_base> + 94 <sub>H</sub>
	A/D conversion trigger output control register 402	PIC0ADTEN402	<PIC0_base> + 98 <sub>H</sub>
	Timer I/O control register 200	PIC0REG200	<PIC0_base> + C0 <sub>H</sub>
	Timer I/O control register 201	PIC0REG201	<PIC0_base> + C4 <sub>H</sub>
	Timer I/O control register 202	PIC0REG202	<PIC0_base> + C8 <sub>H</sub>
	Timer I/O control register 203	PIC0REG203	<PIC0_base> + CC <sub>H</sub>
	Timer I/O control register 30	PIC0REG30	<PIC0_base> + E8 <sub>H</sub>
	Timer I/O control register 31	PIC0REG31	<PIC0_base> + EC <sub>H</sub>

#### NOTE

For details about PIC-related registers, see the respective section describing each function.

### 36.3.2 TAPAnCTL0 — TAPA Control Register 0

This register is used to set up the asynchronous Hi-Z control function.

The values of this register can be rewritten only when TAPAnFLG.TAPAnACE is 0 and TAUDnTEm for the corresponding TAUD's master channel is 0.

**Access:** This register can be read or written in 16-bit units.

**Address:** <TAPAn\_base> + 20<sub>H</sub>

**Value after reset:** 0000<sub>H</sub>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TAPAn DCM	TAPAn DCN	TAPAn DCP	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R

Table 36.14 TAPAnCTL0 Register Contents

Bit Position	Bit Name	Function															
15 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															
4	TAPAnDCM	Clear Condition Configuration This control bit specifies the clear conditions for Hi-Z control output. 0: Enables manipulation of TAPAnOPHT0 regardless of the TAPATHASIN signal input level. 1: Enables manipulation of TAPAnOPHT0 only if the TAPATHASIN signal input is inactive.															
3, 2	TAPAnDCN, TAPAnDCP	Hi-Z Input Edge Selection These are control bits that specify the valid edge of TAPATHASIN. <table border="1" data-bbox="539 1182 1423 1377"> <thead> <tr> <th>TAPAn DCN</th> <th>TAPAn DCP</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Does not detect valid edges.</td> </tr> <tr> <td>0</td> <td>1</td> <td>Detects a rising edge as the valid edge (active level = high).</td> </tr> <tr> <td>1</td> <td>0</td> <td>Detects a falling edge as the valid edge (active level = low).</td> </tr> <tr> <td>1</td> <td>1</td> <td>Setting prohibited</td> </tr> </tbody> </table>	TAPAn DCN	TAPAn DCP	Description	0	0	Does not detect valid edges.	0	1	Detects a rising edge as the valid edge (active level = high).	1	0	Detects a falling edge as the valid edge (active level = low).	1	1	Setting prohibited
TAPAn DCN	TAPAn DCP	Description															
0	0	Does not detect valid edges.															
0	1	Detects a rising edge as the valid edge (active level = high).															
1	0	Detects a falling edge as the valid edge (active level = low).															
1	1	Setting prohibited															
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															

### 36.3.3 TAPAnCTL1 — TAPA Control Register 1

This register is used to specify the A/D conversion trigger.

**Access:** This register can be read or written in 8-bit units.

**Address:** <TAPAn\_base> + 24<sub>H</sub>

**Value after reset:** 00<sub>H</sub>

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAPAnATS3	TAPAnATS2	TAPAnATS1	TAPAnATS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 36.15 TAPAnCTL1 Register Contents

Bit Position	Bit Name	Function															
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.															
3, 2	TAPAnATS3, TAPAnATS2	A/D Conversion Trigger 1 Selection These are control bits that specify A/D conversion trigger output 1 (TAPATADOUT1). <table border="1"> <thead> <tr> <th>TAPAn ATS3</th> <th>TAPAn ATS2</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>INT signal while the triangle wave is falling (counting down)</td> </tr> <tr> <td>0</td> <td>1</td> <td>INT signal while the triangle wave is rising (counting up)</td> </tr> <tr> <td>1</td> <td>0</td> <td>INT signal while the triangle wave is rising (counting up) or falling (counting down)</td> </tr> <tr> <td>1</td> <td>1</td> <td>INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt INTTAPA0IVLY0 signal</td> </tr> </tbody> </table>	TAPAn ATS3	TAPAn ATS2	Description	0	0	INT signal while the triangle wave is falling (counting down)	0	1	INT signal while the triangle wave is rising (counting up)	1	0	INT signal while the triangle wave is rising (counting up) or falling (counting down)	1	1	INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt INTTAPA0IVLY0 signal
TAPAn ATS3	TAPAn ATS2	Description															
0	0	INT signal while the triangle wave is falling (counting down)															
0	1	INT signal while the triangle wave is rising (counting up)															
1	0	INT signal while the triangle wave is rising (counting up) or falling (counting down)															
1	1	INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt INTTAPA0IVLY0 signal															
1, 0	TAPAnATS1, TAPAnATS0	A/D Conversion Trigger 0 Selection These are control bits that specify the A/D conversion trigger output 0 (TAPATADOUT0). <table border="1"> <thead> <tr> <th>TAPAn ATS1</th> <th>TAPAn ATS0</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>INT signal while the triangle wave is falling (counting down)</td> </tr> <tr> <td>0</td> <td>1</td> <td>INT signal while the triangle wave is rising (counting up)</td> </tr> <tr> <td>1</td> <td>0</td> <td>INT signal while the triangle wave is rising (counting up) or falling (counting down)</td> </tr> <tr> <td>1</td> <td>1</td> <td>INT signal and valley interrupt INTTAPA0IVLY0 signal while the triangle wave is rising (counting up) or falling (counting down)</td> </tr> </tbody> </table>	TAPAn ATS1	TAPAn ATS0	Description	0	0	INT signal while the triangle wave is falling (counting down)	0	1	INT signal while the triangle wave is rising (counting up)	1	0	INT signal while the triangle wave is rising (counting up) or falling (counting down)	1	1	INT signal and valley interrupt INTTAPA0IVLY0 signal while the triangle wave is rising (counting up) or falling (counting down)
TAPAn ATS1	TAPAn ATS0	Description															
0	0	INT signal while the triangle wave is falling (counting down)															
0	1	INT signal while the triangle wave is rising (counting up)															
1	0	INT signal while the triangle wave is rising (counting up) or falling (counting down)															
1	1	INT signal and valley interrupt INTTAPA0IVLY0 signal while the triangle wave is rising (counting up) or falling (counting down)															

### 36.3.4 TAPAnFLG — TAPA Flag Register

This flag register is for asynchronous Hi-Z control.

**Access:** This register is a read-only register that can be read in 16-bit units.

**Address:** <TAPAn\_base> + 00H

**Value after reset:** 0000H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TAPAn HOF2	TAPAn HOF1	TAPAn HOF0	—	—	—	—	—	—	—	TAPAn ACE
