

SN74GTLPH16612

18-BIT LVTTL-TO-GTLP UNIVERSAL BUS TRANSCEIVER

SCES326C – MARCH 2000 – REVISED AUGUST 2001

- Member of Texas Instruments' Widebus™ Family
- UBT™ Transceiver Combines D-Type Latches and D-Type Flip-Flops for Operation in Transparent, Latched, Clocked, or Clock-Enabled Mode
- OEC™ Circuitry Improves Signal Integrity and Reduces Electromagnetic Interference
- Bidirectional Interface Between GTLP Signal Levels and LVTTL Logic Levels
- LVTTL Interfaces are 5-V Tolerant
- Medium-Drive GTLP Outputs (34 mA)
- LVTTL Outputs (–32 mA/64 mA)
- GTLP Rise and Fall Times Designed for Optimal Data-Transfer Rate and Signal Integrity in Distributed Loads
- I_{off} Supports Partial-Power-Down Mode Operation
- Bus Hold on A-Port Inputs
- Distributed V_{CC} and GND Pins Minimize High-Speed Switching Noise
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22
 - 2000-V Human-Body Model (A114-A)
 - 200-V Machine Model (A115-A)
 - 1000-V Charged-Device Model (C101)

DGG OR DL PACKAGE
(TOP VIEW)

description

The SN74GTLPH16612 is a medium-drive, 18-bit UBT™ transceiver that provides LVTTL-to-GTLP and GTLP-to-LVTTL signal-level translation. It allows for transparent, latched, clocked, or clock-enabled modes of data transfer. This device provides a high-speed interface between cards operating at LVTTL logic levels and backplanes operating at GTLP signal levels. High-speed (about two times faster than standard LVTTL or TTL) backplane operation is a direct result of the reduced output swing (<1 V), reduced input threshold levels, and OEC™ circuitry. These improvements minimize bus-settling time and have been designed and tested using several backplane models.

GTLP is a TI™ derivative of the Gunning Transceiver Logic (GTL) JEDEC standard JESD 8-3. The ac specification of the SN74GTLPH16612 is given only at the preferred higher noise-margin GTLP, but the user has the flexibility of using this device at either GTL ($V_{TT} = 1.2$ V and $V_{REF} = 0.8$ V) or GTLP ($V_{TT} = 1.5$ V and $V_{REF} = 1$ V) signal levels.

The B port normally operates at GTLP levels, while the A-port and control inputs are compatible with LVTTL logic levels and are 5-V tolerant. V_{REF} is the reference input voltage for the B port.

To improve signal integrity, the SN74GTLPH16612 B-port output transition time is optimized for distributed backplane loads.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

OEC, TI, UBT, and Widebus are trademarks of Texas Instruments.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

SN74GTLPH16612

18-BIT LVTTL-TO-GTLP UNIVERSAL BUS TRANSCEIVER

SCES326C – MARCH 2000 – REVISED AUGUST 2001

description (continued)

V_{CC} (5 V) supplies the internal and GTLP circuitry, while V_{CC} (3.3 V) supplies the LVTTL output buffers.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Active bus-hold circuitry holds unused or undriven LVTTL data inputs at a valid logic state. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

This device is fully specified for partial-power-down applications using I_{off} . The I_{off} circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

functional description

The SN74GTLPH16612 is a medium-drive (34 mA), 18-bit UBT transceiver, containing D-type latches and D-type flip-flops to allow data flow in transparent, latched, clocked, and clock-enabled modes can replace any of the functions shown in Table 1. Data polarity is noninverting.

Table 1. SN74GTLPH16612 UBT Transceiver Replacement Functions

FUNCTION	8 BIT	9 BIT	10 BIT	16 BIT	18 BIT
Transceiver	'245, '623, '645	'863	'861	'16245, '16623	'16863
Buffer/driver	'241, '244, '541		'827	'16241, '16244, '16541	'16825
Latched transceiver	'543			'16543	'16472
Latch	'373, '573	'843	'841	'16373	'16843
Registered transceiver	'646, '652			'16646, '16652	'16474
Flip-flop	'374, '574		'821	'16374	
Standard UBT					'16500, '16501
Universal bus driver					'16835
Registered transceiver with clock enable	'2952			'16470, '16952	
Flip-flop with clock enable	'377	'823			'16823
Standard UBT with clock enable					'16600, '16601
SN74GTLPH16612 UBT transceiver replaces all above functions					

Data flow in each direction is controlled by the clock enables ($\overline{CEAB}$ and $\overline{CEBA}$), latch enables (LEAB and LEBA), clock (CLKAB and CLKBA), and output enables ($\overline{OEAB}$ and $\overline{OEBA}$).

For A-to-B data flow, when $\overline{CEAB}$ is low, the device operates on the low-to-high transition of CLKAB for the flip-flop and on the high-to-low transition of LEAB for the latch path, i.e., if $\overline{CEAB}$ and LEAB are low, the A data is latched, regardless of the state of CLKAB (high or low) and if LEAB is high, the device is in transparent mode. When $\overline{OEAB}$ is low, the outputs are active. When $\overline{OEAB}$ is high, the outputs are in the high-impedance state.

The data flow for B-to-A is similar to that of A-to-B, except that $\overline{CEBA}$, $\overline{OEBA}$, LEBA, and CLKBA are used.

SN74GTLPH16612

18-BIT LVTTL-TO-GTLP UNIVERSAL BUS TRANSCEIVER

SCES326C – MARCH 2000 – REVISED AUGUST 2001

FUNCTION TABLE[†]

INPUTS					OUTPUT B	MODE
CEAB	OEAB	LEAB	CLKAB	A		
X	H	X	X	X	Z	Isolation
L	L	L	H	X	B ₀ [‡]	Latched storage of A data
L	L	L	L	X	B ₀ [§]	
X	L	H	X	L	L	True transparent
X	L	H	X	H	H	
L	L	L	↑	L	L	Clocked storage of A data
L	L	L	↑	H	H	
H	L	L	X	X	B ₀ [§]	Clock inhibit

[†] A-to-B data flow is shown. B-to-A data flow is similar, but uses CEBA, OEBA, LEBA, and CLKBA. The condition when OEAB and OEBA are both low at the same time is not recommended.

[‡] Output level before the indicated steady-state input conditions were established, provided that CLKAB was high before LEAB went low.

[§] Output level before the indicated steady-state input conditions were established.

logic diagram (positive logic)

18-BIT LVTTL-TO-GTLP UNIVERSAL BUS TRANSCEIVER

SCES326C – MARCH 2000 – REVISED AUGUST 2001

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)[†]

Supply voltage range, V_{CC} : 3.3 V	–0.5 V to 4.6 V
5 V	–0.5 V to 7 V
Input voltage range, V_I (see Note 1): A port and control inputs	–0.5 V to 7 V
B port and V_{REF}	–0.5 V to 4.6 V
Voltage range applied to any output in the high-impedance or power-off state, V_O	
(see Note 1): A port	–0.5 V to 7 V
B port	–0.5 V to 4.6 V
Current into any output in the low state, I_O : A port	128 mA
B port	80 mA
Current into any A port output in the high state, I_O (see Note 2)	64 mA
Continuous current through each V_{CC} or GND	±100 mA
Input clamp current, I_{IK} ($V_I < 0$)	–50 mA
Output clamp current, I_{OK} ($V_O < 0$)	–50 mA
Package thermal impedance, θ_{JA} (see Note 3): DGG package	64°C/W
DL package	56°C/W
Storage temperature range, T_{stg}	–65°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
2. This current flows only when the output is in the high state and $V_O > V_{CC}$.
3. The package thermal impedance is calculated in accordance with JESD 51-7.

recommended operating conditions (see Notes 4 through 7)

			MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage	3.3 V	3.15	3.3	3.45	V
		5 V	4.75	5	5.25	
V _{TT}	Termination voltage	GTL	1.14	1.2	1.26	V
		GTLP	1.35	1.5	1.65	
V _{REF}	Reference voltage	GTL	0.74	0.8	0.87	V
		GTLP	0.87	1	1.1	
V _I	Input voltage	B port	V _{TT}			V
		Except B port	V _{CC} 5.5			
V _{IH}	High-level input voltage	B port	V _{REF} +50 mV			V
		Except B port	2			
V _{IL}	Low-level input voltage	B port	V _{REF} –50 mV			V
		Except B port	0.8			
I _{IK}	Input clamp current		–18			mA
I _{OH}	High-level output current	A port	–32			mA
I _{OL}	Low-level output current	A port	64			mA
		B port	34			
T _A	Operating free-air temperature		–40	85		°C

- NOTES: 4. All unused control inputs of the device must be held at V_{CC} or GND to ensure proper device operation. Refer to the TI application report *Implications of Slow or Floating CMOS Inputs*, literature number SCBA004.
5. Normal connection sequence is GND first, $V_{CC} = 5$ V second, and $V_{CC} = 3.3$ V, I/O, control inputs, V_{TT} , and V_{REF} (any order) last.
6. V_{TT} and R_{TT} can be adjusted to accommodate backplane impedances if the dc recommended I_{OL} ratings are not exceeded.
7. V_{REF} can be adjusted to optimize noise margins, but normally is two-thirds V_{TT} .

PARAMETER MEASUREMENT INFORMATION

TEST	S1
t_{PLH}/t_{PHL}	Open
t_{PLZ}/t_{PZL}	6 V
t_{PHZ}/t_{PZH}	GND

- NOTES: A. C_L includes probe and jig capacitance.
 B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
 C. All input pulses are supplied by generators having the following characteristics: $PRR \leq 10$ MHz, $Z_O = 50 \Omega$, $t_r \leq 2.5$ ns, $t_f \leq 2.5$ ns.
 D. The outputs are measured one at a time with one transition per measurement.

DISTRIBUTED-LOAD BACKPLANE SWITCHING CHARACTERISTICS

The previous switching characteristics table shows the switching characteristics of the device into a lumped load (Figure 1). However, the designer's backplane application probably is a distributed load. The physical representation is shown in Figure 2. This backplane, or distributed load, can be approximated closely to an RLC circuit, as shown in Figure 3. This device has been designed for optimum performance in this RLC circuit. The following switching characteristics table shows the switching characteristics of the device into the RLC load, to help the designer better understand the performance of the GTLP device in this typical backplane. See www.ti.com/sc/gtlp for more information.
