

DS55110A/DS75110A Dual Line Drivers

General Description

The DS55110A, DS75110A are dual line drivers with independent channels, common supply and ground terminals featuring constant current outputs. These drivers are designed for optimum performance when used with the DS55107/DS75107, DS55108/DS75108 line receivers.

The output current of the DS55110A, DS75110A is nominally 12 mA and may be switched to either of two output terminals with the appropriate logic levels at the driver input.

Separate or common control inputs are provided for increased logic versatility. These control or inhibit inputs allow the output current to be switched off (inhibited) by applying low logic levels to the control inputs. The output current in the inhibit mode, I_{OFF} , is specified so that minimum line loading is induced. This is highly desirable in system applications using party line data communications.

Features

- Improved stability over supply voltage and temperature ranges
- Constant current, high impedance outputs
- High speed: 15 ns max propagation delay
- Standard supply voltages
- Inhibitor available for driver selection
- High common mode output voltage range (-3.0V to 10V)
- TTL input compatibility
- Extended temperature range

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The tables of "Electrical Characteristics" provide conditions for actual device operation.

Note 2: Unless otherwise specified min/max limits apply across the -55°C to +125°C temperature range for the DS55110 and across the 0°C to +70°C range for the DS75110. All typicals are given for $V_{CC} = 5\text{V}$ and $T_A = 25^\circ\text{C}$.

Note 3: When using only one channel of the line drivers, the other channel should be inhibited and/or its outputs grounded.

Switching Characteristics $V_{CC} = \pm 5V, T_A = 25^\circ C$

Note 1: The pulse generators have the following characteristics:

$t_r = t_f = 10 \text{ ns} \pm 5.0 \text{ ns}$, $t_{w1} = 500 \text{ ns}$, $\text{PRR} = 1.0 \text{ MHz}$, $t_{w2} = 1.0 \mu\text{s}$, $\text{PRR} = 500 \text{ kHz}$, $Z_O = 50 \Omega$.

Note 2: C_L includes probe and jig capacitance.

Note 3: For simplicity, only one channel and the inhibitor connections are shown.

Note 1: All drivers are DS75110A or DS55110A. Receivers are DS75107 or DS75108. Twisted-pair or coaxial transmission line should be used for minimum noise and cross talk.

Note 2: When only one driver in a package is being used, the outputs of the other driver should either be grounded or inhibited to reduce power dissipation.
