AK4951**24bit Stereo CODEC with MIC/HP/SPK-AMP****1. General Description**

The AK4951 is a low power 24-bit stereo CODEC with a microphone, headphone and speaker amplifiers.

The AK4951 supports sampling frequency from 8kHz to 48kHz. It is suitable for a wide range of application from speech signal processing for narrowband, wideband and super wideband to sound signal processing for audio band.

The input circuits include a microphone amplifier, an automatic wind noise reduction filter of the proprietary algorithms and a high performance digital ALC (automatic level control) circuit, therefore the AK4951 can record with high-quality sound regardless of whether indoors or outdoors. In addition, the output circuits include a cap-less headphone amplifier with a negative voltage generated by charge pump circuit and a speaker amplifier with 1W output power. It is suitable for various products as well as portable applications with recording/playback function.

The AK4951 are available in a small 32-pin QFN (4mm x 4mm, 0.4mm pitch: AK4951EN) and a 32-pin BGA (3.5mm x 3.5mm, 0.5mm pitch: AK4951EG) packages saving mounting area on the board.

Maximum Power Dissipation (Note 7)	AK4951EN	Pd	-	840	mW
	AK4951EG	Pd	-	340	mW

Note 4. All voltages are with respect to ground. VSS1, VSS2 and VSS3 must be connected to the same analog ground plane.

Note 5. LIN1, RIN1, LIN2, RIN2, LIN3 and RIN3/BEEP pins

Note 6. PDN, CCLK/SCL, CSN/SDA, CDTIO/CAD0, SDTI, LRCK, BICK and MCKI pins

Pull-up resistors at the SDA and SCL pins must be connected to a voltage in the range from TVDD or more to 6V or less.

Note 7. This power is the AK4951 internal dissipation that does not include power dissipation of externally connected speakers. The maximum junction temperature is 125°C and θ_{ja} (Junction to Ambient) is 42°C/W at JEDEC51-9 (2p2s) for the AK4951EN and 80°C/W at JEDEC51-9 (2p2s) for the AK4951EG. When $P_d = 840\text{mW}$ and the θ_{ja} is 42°C/W for the AK4951EN, the junction temperature does not exceed 125°C. When $P_d = 340\text{mW}$ and the θ_{ja} is 80°C/W for the AK4951EG, the junction temperature does not exceed 125°C. In this case, the AK4951 will not be damaged by its internal power dissipation. Therefore, the AK4951EN should be used in the condition of $\theta_{ja} \leq 42^\circ\text{C/W}$, and the AK4951EG should be used in the condition of $\theta_{ja} \leq 80^\circ\text{C/W}$.

WARNING: Operation at or beyond these limits may result in permanent damage to the device.

Normal operation is not guaranteed at these extremes.

Note 8. The power-up sequence between AVDD, DVDD, TVDD and SVDD is not critical. The PDN pin must be “L” upon power up, and should be changed to “H” after all power supplies are supplied to avoid an internal circuit error.

Note 9. The minimum value is higher voltage between DVDD-0.2 and 1.6V.

*** When SVDD is powered ON and the PDN pin is “L”, AVDD, DVDD and TVDD can be powered ON/OFF. When TVDD is powered ON and the PDN pin is “L”, AVDD, DVDD and SVDD can be powered ON/OFF. The PDN pin must be set to “H” after all power supplies are ON, when the AK4951EN is powered-up from power-down state.**

Note 26. The passband and stopband frequencies scale with fs (sampling frequency).

Note 27. A calculating delay time which is induced by digital filtering. This time is from the input of an analog signal to the setting of 24-bit data of both channels to the ADC output register. For the DAC, this time is from setting the 24-bit data of a channel from the input register to the output of analog signal. For the signal through the programmable filters (Microphone Sensitivity Correction + Automatic Wind Noise Reduction Filter + 1st order HPF + 1st order LPF + Stereo Separation Emphasis + 4-band Equalizer + ALC + 1-band Equalizer), the group delay is increased by 4/fs from the value above in both recording and playback modes if there is no phase change by the IIR filter.
