Description

Harris' CD74FCT16652T and CD74FCT162652T are produced in an advanced 0.6 micron CMOS technology, achieving industry leading speed grades.

These devices are 16-bit registered transceivers organized as two independent 8-bit bus transceivers designed with three-state D-type flip-flops and control circuitry arranged for multiplexed transmission of data directly from the data bus or from the internal storage registers. Each 8-bit transceiver utilizes the enable controls ($\overline{xOEAB}$ and $\overline{xOEBA}$) to control the transceiver functions. The Select ($\overline{xSAB}$ and $\overline{xSBA}$) control pins are used to select either real-time or stored data transfer. The circuitry used for select control will eliminate the typical decoding glitch that occurs in a multiplexer during the transition between real-time and stored data. A low input level selects real-time data and a high selects stored data.

The CD74FCT16652T output buffers are designed with a Power-Off disable allowing "live insertion" of boards when used as backplane drivers.

The CD74FCT162652T has $\pm 24mA$ balanced output drivers. It is designed with current limiting resistors at its outputs to control the output edge rate resulting in lower ground bounce and undershoot. This eliminates the need for external terminating resistors for most interface applications.

Select control = H: clocks must be staggered in order to load both registers.
H = High Voltage Level
L = Low Voltage Level
X = Don't Care
↑ = LOW-to-HIGH transition
