

FEATURES

- Internal Hold Capacitors
- Low Droop Rate
- TTL/CMOS Compatible Logic Inputs
- Single or Dual Supply Operation
- Break-Before-Make Channel Addressing
- Compatible With CD4051 Pinout
- Low Cost

APPLICATIONS

- Multiple Path Timing Deskew for A.T.E.
- Memory Programmers
- Mass Flow/Process Control Systems
- Multichannel Data Acquisition Systems
- Robotics and Control Systems
- Medical and Analytical Instrumentation
- Event Analysis
- Stage Lighting Control

GENERAL DESCRIPTION

The SMP-08 is a monolithic octal sample-and-hold; it has eight internal buffer amplifiers, input multiplexer, and internal hold capacitors. It is manufactured in an advanced oxide isolated CMOS technology to obtain high accuracy, low droop rate, and

Manufactured under the following U.S. patent: 4,739,281

fast acquisition time. The SMP-08 has a typical linearity error of only 0.01% and can accurately acquire a 10-bit input signal to $\pm 1/2$ LSB in less than seven microseconds. The SMP-08's output swing includes the negative supply in both single and dual supply operation.

The SMP-08 was specifically designed for systems that use a calibration cycle to adjust a multiple of system parameters. The low cost and high level of integration makes the SMP-08 ideal for calibration requirements that have previously required an ASIC, or high cost multiple D/A converters.

The SMP-08 is also ideally suited for a wide variety of sample-and-hold applications including amplifier offset or VCA gain adjustments. One or more SMP-08s can be used with single or multiple DACs to provide multiple set points within a system.

The SMP-08 offers significant cost and size reduction over discrete designs. It is available in a 16-pin hermetic or plastic DIP, or surface mount SOIC package.

PACKAGE TYPE	θ_{JA} (Note 2)	θ_{JC}	UNITS
16-Pin Hermetic DIP (Q)	94	12	°C/W
16-Pin Plastic DIP (P)	76	33	°C/W
16-Pin SO (S)	92	27	°C/W

NOTES:

1. Absolute maximum ratings apply to both DICE and packaged parts, unless otherwise noted.
2. θ_{JA} is specified for worst case mounting conditions, i.e., θ_{JA} is specified for device in socket for CerDIP and P-DIP packages; θ_{JA} is specified for device soldered to printed circuit board for SO package.

CAUTION:

1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation at or above this specification is not implied. Exposure to the above maximum rating conditions for extended periods may affect device reliability.
2. Digital inputs and outputs are protected; however, permanent damage may occur on unprotected units from high-energy electrostatic fields. Keep units in conductive foam or packaging at all times until ready to use. Use proper anti-static handling procedures.
3. Remove power before inserting or removing units from their sockets.
