

Double channel high-side driver with CurrentSense analog feedback for automotive applications

PowerSSO-16

Features

Max transient supply voltage	V_{CC}	40 V
Operating voltage range	V_{CC}	4 to 28 V
Typ. on-state resistance (per Ch)	R_{ON}	50 mΩ
Current limitation (typ)	I_{LIMH}	40 A
Standby current (max)	I_{STBY}	0.5 μA
Minimum cranking supply voltage (V_{CC} decreasing)	$V_{USD_cranking}$	2.85 V

- AEC-Q100 qualified 
- Extreme low voltage operation for deep cold cranking applications (compliant with LV124, revision 2013)
- General
 - Double channel smart high-side driver with CurrentSense analog feedback
 - Very low standby current
 - Compatible with 3 V and 5 V CMOS outputs
- CurrentSense diagnostic functions
 - Analog feedback of load current with high precision proportional current mirror
 - Overload and short to ground (power limitation) indication
 - Thermal shutdown indication
 - OFF-state open-load detection
 - Output short to V_{CC} detection
 - Sense enable/disable
- Protections
 - Undervoltage shutdown
 - Overvoltage clamp
 - Load current limitation
 - Self limiting of fast thermal transients
 - Configurable latch-off on overtemperature or power limitation
 - Loss of ground and loss of V_{CC}
 - Reverse battery with external components
 - Electrostatic discharge protection

Product status	
VND7E050AJ	
Product summary	
Order code	VND7E050AJTR
Package	PowerSSO-16
Packing	Tape and reel

Applications

- Automotive resistive, inductive and capacitive loads
- Protected supply for ADAS systems: radars and sensors
- Automotive lamps

Description

The device is a dual channel high-side driver manufactured with proprietary ST VIPower® M0-7 technology, in a PowerSSO-16 package. The device is designed to drive 12 V automotive grounded loads through a 3 V and 5 V CMOS-compatible interface, providing protection and diagnostics.

The device integrates advanced protective functions such as load current limitation, overload active management by power limitation and overtemperature shutdown with configurable latch-off.

A $\overline{\text{FaultRST}}$ pin unlatches the output in case of fault or disables the latch-off functionality.

A multiplexed current sense pin delivers high precision proportional load current sense in addition to the detection of overload and short circuit to ground, short to V_{CC} and OFF-state open-load.

A sense enable pin allows OFF-state diagnosis to be disabled during the module low-power mode as well as external sense resistor sharing among similar devices.

1 Block diagram and pin description

Figure 1. Block diagram

Table 1. Pin functions

Name	Function
V _{CC}	Battery connection.
OUTPUT _{0,1}	Power outputs; all the pins must be connected together.
GND	Ground connection; must be reverse battery protected by an external diode / resistor network.
INPUT _{0,1}	Voltage controlled input pin with hysteresis, compatible with 3 V and 5 V CMOS outputs; controls output switch state.
CS	Analog current sense output pin; delivers a current proportional to the selected load current, supply voltage or chip temperature diagnostic.
SEn	Active high compatible with 3 V and 5 V CMOS outputs pin; enables the CS diagnostic pin.
SEL ₀	Active high compatible with 3 V and 5 V CMOS outputs pin; it addresses the CS multiplexer.
FaultRST	Active low compatible with 3 V and 5 V CMOS outputs pin; it unlatches the output in case of fault - if kept low, sets the outputs in auto-restart mode.

Figure 2. Configuration diagram (top view)

Table 2. Suggested connections for unused and not connected pins

Connection / pin	CS	N.C.	Output	Input	SEn, SELx, FaultRST
Floating	Not allowed	X ⁽¹⁾	X	X	X
To ground	Through 1 kΩ resistor	X	Not allowed	Through 15 kΩ resistor	Through 15 kΩ resistor

1. X: do not care.

2 Electrical specification

Figure 3. Current and voltage conventions

GADG2203170950PS

Note: $V_{Fn} = V_{OUTn} - V_{CC}$ during reverse battery condition.

2.1 Absolute maximum ratings

Forcing the device to operate above absolute maximum ratings may cause permanent damage.

These are stress ratings only and operation of the device at these or any other conditions outside those indicated in the operating sections of this specification is not implied. Exposure to the conditions in the table below for extended periods may affect device reliability.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	DC supply voltage	38	V
$-V_{CC}$	Reverse DC supply voltage	0.3	
V_{CCPK}	Maximum transient supply voltage (ISO 16750-2:2010 Test B clamped to 40 V; $R_L = 4 \Omega$)	40	V
V_{CCJS}	Maximum jump start voltage for single pulse short circuit protection	28	V
$-I_{GND}$	DC reverse ground pin current	200	mA
I_{OUT}	OUTPUT DC output current	internally limited	A
$-I_{OUT}$	Reverse DC output current	9	
I_{IN}	INPUT DC input current	-1 to 10	mA
I_{SEn}	SEn DC input current		
I_{SEL}	SEL ₀ DC input current		
I_{FR}	FaultRST DC input current	-1 to 1.5	mA
I_{SENSE}	CS pin DC output current ($V_{GND} = V_{CC}$ and $V_{SENSE} < 0$ V)	10	mA
	CS pin DC output current in reverse ($V_{CC} < 0$ V)	-20	
E_{MAX}	Maximum switching energy (single pulse) ($T_{DEMAG} = 0.4$ ms; $T_{jstart} = 150$ °C)	18	mJ

Symbol	Parameter	Value	Unit
V _{ESD}	JEDEC standard (Electrostatic discharge)	JEDEC 22A-114F	V
	INPUT	4000	
	CS, SEn	2000	
	SEL ₀ , $\overline{\text{FaultRST}}$	4000	
	OUTPUT _{0,1}	4000	
	V _{CC}	4000	
V _{ESD}	Charge device model (CDM-AEC-Q100-011)	750	V
T _j	Junction operating temperature range	-40 to 150	°C
T _{stg}	Storage temperature range	-55 to 150	

2.2 Thermal data

Table 4. Thermal data

Symbol	Parameter	Typ. value	Unit
R _{thj-board}	Thermal resistance junction-board (JEDEC JESD 51-5 / 51-8) ^{(1) (2)}	5.9	°C/W
R _{thj-amb}	Thermal resistance junction-ambient (JEDEC JESD 51-5) ⁽¹⁾⁽³⁾	57	
R _{thj-amb}	Thermal resistance junction-ambient (JEDEC JESD 51-7) ^{(1) (2)}	23.8	
R _{thj-top}	Thermal resistance junction-top (JEDEC JESD 51-7) ^{(1) (2)}	12.4	

1. One channel ON

3. Device mounted on two-layer 2s0p PCB with 2 cm² heatsink copper trace

2.3 Main electrical characteristics

7 V < V_{CC} < 28 V; -40 °C < T_j < 150 °C, unless otherwise specified.

All typical values refer to V_{CC} = 13 V; T_j = 25 °C, unless otherwise specified.

Table 5. Electrical characteristics during cranking

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V _{USD_Craking}	Minimum cranking supply voltage (V _{CC} decreasing)				2.85	V
R _{ON}	On-state resistance ⁽¹⁾	I _{OUT} = 0.4 A; V _{CC} = 2.85 V; V _{CC} decreasing			150	mΩ
T _{TSD} ⁽²⁾	Shutdown temperature (V _{CC} decreasing)	V _{CC} = 2.85 V	140			°C

1. For each channel

2. Parameter guaranteed by design and characterization; not subject to production test

Table 6. Power section

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{CC}	Operating supply voltage		4	13	28	V
V_{USD}	Undervoltage shutdown				2.85	V
$V_{USDReset}$	Undervoltage shutdown reset				5	V
$V_{USDhyst}$	Undervoltage shutdown hysteresis			0.3		V
$R_{ON}^{(1)}$	On-state resistance	$I_{OUT} = 1.5\text{ A}; T_j = 25^\circ\text{C}$		50		m Ω
		$I_{OUT} = 1.5\text{ A}; T_j = 150^\circ\text{C}$			105	
		$I_{OUT} = 1.5\text{ A}; V_{CC} = 4\text{ V}; T_j = 25^\circ\text{C}^{(2)}$			80	
V_{clamp}	Clamp voltage	$I_S = 20\text{ mA}; 25^\circ\text{C} < T_j < 150^\circ\text{C}$	41	46	52	V
		$I_S = 20\text{ mA}; T_j = -40^\circ\text{C}$	38			V
I_{STBY}	Supply current in standby at $V_{CC} = 13\text{ V}^{(3)}$	$V_{CC} = 13\text{ V};$ $V_{IN} = V_{OUT} = V_{FR} = V_{SEn} = 0\text{ V};$ $V_{SEL0} = 0\text{ V}; T_j = 25^\circ\text{C}$			0.5	μA
		$V_{CC} = 13\text{ V};$ $V_{IN} = V_{OUT} = V_{FR} = V_{SEn} = 0\text{ V};$ $V_{SEL0} = 0\text{ V}; T_j = 85^\circ\text{C}^{(4)}$			0.5	
		$V_{CC} = 13\text{ V};$ $V_{IN} = V_{OUT} = V_{FR} = V_{SEn} = 0\text{ V};$ $V_{SEL0} = 0\text{ V}; T_j = 125^\circ\text{C}$			3	
t_{D_STBY}	Standby mode blanking time	$V_{CC} = 13\text{ V};$ $V_{IN} = V_{OUT} = V_{FR} = V_{SEL0} = 0\text{ V};$ $V_{SEn} = 5\text{ V to } 0\text{ V}$	60	300	550	μs
$I_{S(ON)}$	Supply current	$V_{CC} = 13\text{ V}; V_{SEn} = V_{FR} = V_{SEL0} = 0\text{ V};$ $V_{IN0} = 5\text{ V}; V_{IN1} = 5\text{ V}; I_{OUT0} = 0\text{ A};$ $I_{OUT1} = 0\text{ A}$		5	8	mA
$I_{GND(ON)}$	Control stage current consumption in ON state. All channels active.	$V_{CC} = 13\text{ V}; V_{SEn} = 5\text{ V};$ $V_{FR} = V_{SEL0} = 0\text{ V}; V_{IN0} = 5\text{ V}; V_{IN1} = 5\text{ V};$ $I_{OUT0} = 1.5\text{ A}; I_{OUT1} = 1.5\text{ A}$			8	mA
$I_{L(off)}^{(3)}$	Off-state output current at $V_{CC} = 13\text{ V}$	$V_{IN} = V_{OUT} = 0\text{ V}; V_{CC} = 13\text{ V}; T_j = 25^\circ\text{C}$	0	0.01	0.5	μA
		$V_{IN} = V_{OUT} = 0\text{ V}; V_{CC} = 13\text{ V}; T_j = 125^\circ\text{C}$	0		3	
V_F	Output - V_{CC} diode voltage at $T_j = 150^\circ\text{C}$	$I_{OUT} = -1.5\text{ A}; T_j = 150^\circ\text{C}$			0.7	V

- For each channel
- Parameter guaranteed only at $V_{CC} = 4\text{ V}$ and $T_j = 25^\circ\text{C}$
- PowerMOS leakage included
- Parameter specified by design; not subject to production test.

Table 7. Switching

$V_{CC} = 13\text{ V}; -40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$, unless otherwise specified						
Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$t_{d(on)}^{(1)}$	Turn-on delay time at $T_j = 25^{\circ}\text{C}$	$R_L = 8.67\ \Omega$	10	65	120	μs
$t_{d(off)}^{(1)}$	Turn-off delay time at $T_j = 25^{\circ}\text{C}$		10	40	100

3 Protections

3.1 Power limitation

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing ΔT_j through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as ΔT_j exceeds the safety level of ΔT_{j_SD} . According to the voltage level on the $\overline{\text{FaultRST}}$ pin, the output MOSFET switches on and cycles with a thermal hysteresis according to the maximum instantaneous power which can be handled ($\overline{\text{FaultRST}} = \text{Low}$) or remains off ($\overline{\text{FaultRST}} = \text{High}$). The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue.

3.2 Thermal shutdown

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175°C), it automatically switches off and the diagnostic indication is triggered. According to the voltage level on the $\overline{\text{FaultRST}}$ pin, the device switches on again as soon as its junction temperature drops to T_R ($\overline{\text{FaultRST}} = \text{Low}$) or remains off ($\overline{\text{FaultRST}} = \text{High}$).

3.3 Current limitation

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (e.g. bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. Consequently, in case of short circuit, overload or during load power-up, the output current is clamped to a safety level, I_{LIMH} , by operating the output power MOSFET in the active region.

3.4 Negative voltage clamp

In case the device drives inductive load, the output voltage reaches a negative value during turn off. A negative voltage clamp structure limits the maximum negative voltage to a certain value, V_{DEMG} , allowing the inductor energy to be dissipated without damaging the device.

4 Application information

Figure 34. Application diagram

4.1 GND protection network against reverse battery

Figure 35. Simplified internal structure

4.1.1 Diode (DGND) in the ground line

A resistor (typ. $R_{\text{GND}} = 4.7 \text{ k}\Omega$) should be inserted in parallel to D_{GND} if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift (≈ 600 mV) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift does not vary if more than one HSD shares the same diode/resistor network.

4.2 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the V_{CC} pin, is tested in accordance with ISO7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in [Table 13. ISO 7637-2 - electrical transient conduction along supply line.](#)

Test pulses are applied directly to DUT (Device Under Test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), chapter 4. The DUT is intended as the present device only, without components and accessed through V_{CC} and GND terminals.

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: “The function does not perform as designed during the test but returns automatically to normal operation after the test”.

Table 13. ISO 7637-2 - electrical transient conduction along supply line

Test Pulse 2011(E)	Test pulse severity level with Status II functional performance status		Minimum number of pulses or test time	Burst cycle / pulse repetition time		Pulse duration and pulse generator internal impedance
	Level	U _S ⁽¹⁾		min	max	
1	III	-112 V	500 pulses	0.5 s		2 ms, 10 Ω

Test Pulse 2011(E)	Test pulse severity level with Status II functional performance status		Minimum number of pulses or test time	Burst cycle / pulse repetition time		Pulse duration and pulse generator internal impedance
	Level	U_S ⁽¹⁾		min	max	
2a ⁽³⁾	III	+55 V	500 pulses	0.2 s	5 s	50 μ s, 2 Ω
3a	IV	-220 V	1h	90 ms	100 ms	0.1 μ s, 50 Ω
3b	IV	+150 V	1h	90 ms	100 ms	0.1 μ s, 50 Ω
4 ⁽²⁾	IV	-7 V	1 pulse			100 ms, 0.01 Ω
Load dump according to ISO 16750-2:2010						
Test B ⁽³⁾		40 V	5 pulse	1 min		400 ms, 2 Ω

1. U_S is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E), chapter 5.6.

2. Test pulse from ISO 7637-2:2004(E).

3. With 40 V external suppressor referred to ground ($-40^\circ\text{C} < T_j < 150^\circ\text{C}$).

4.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line both to prevent the microcontroller I/O pins from latching-up and to protect the HSD inputs.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of microcontroller I/Os.

Equation

$$V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For $V_{CCpeak} = -150\text{ V}$; $I_{latchup} \geq 20\text{ mA}$; $V_{OH\mu C} \geq 4.5\text{ V}$

$$7.5\text{ k}\Omega \leq R_{prot} \leq 140\text{ k}\Omega.$$

Recommended values: $R_{prot} = 15\text{ k}\Omega$

4.4 CS - analog current sense

Diagnostic information on device and load status are provided by an analog output pin (CS) delivering the following signals:

- Current monitor: current mirror of channel output current

These signals are routed through an analog multiplexer which is configured and controlled through SELx and SEn pins according to the address map in Table 8.

Figure 36. CurrentSense and diagnostic – block diagram

GADG0504171037PS

4.4.1 Principle of CurrentSense signal generation

Figure 37. CurrentSense block diagram

Current sense

The output is able to provide:

- Current mirror proportional to the load current in normal operation, delivering current proportional to the load according to a known ratio named **K**
- Diagnostics flag in fault conditions delivering fixed voltage V_{SENSEH}

The current delivered by the current sense circuit, I_{SENSE} , can be easily converted into a voltage V_{SENSE} by using an external sense resistor, R_{SENSE} , allowing continuous load monitoring and abnormal condition detection.

Normal operation (channel ON, no fault, SEn active)

While device is operating in normal conditions (no fault intervention), V_{SENSE} calculation can be done using simple equations

Current provided by CS output: $I_{SENSE} = I_{OUT}/K$

Voltage on R_{SENSE} : $V_{SENSE} = R_{SENSE} \cdot I_{SENSE} = R_{SENSE} \cdot I_{OUT}/K$

Where:

- V_{SENSE} is the voltage measurable on R_{SENSE} resistor

- I_{SENSE} is the current provided from CS pin in current output mode
- I_{OUT} is the current flowing through output
- K factor represents the ratio between PowerMOS cells and SenseMOS cells; its spread includes geometric factor spread, current sense amplifier offset and process parameters spread of the overall circuitry, specifying the ratio between I_{OUT} and I_{SENSE} .

Failure flag indication

In case of power limitation/overtemperature, the fault is indicated by the CS pin which is switched to a "current limited" voltage source, V_{SENSEH} .

In any case, the current sourced by the CS in this condition is limited to I_{SENSEH} .

Figure 38. Analog HSD – open-load detection in off-state

GAPG1201151432CFT

Figure 39. Open-load / short to V_{CC} condition

Table 14. CurrentSense pin levels in off-state

Condition	Output	CS	SEn
Open-load	$V_{OUT} > V_{OL}$	Hi-Z	L
		V_{SENSEH}	H
	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H
Short to V_{CC}	$V_{OUT} > V_{OL}$	Hi-Z	L
		V_{SENSEH}	H
Nominal	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H

4.4.2 Short to V_{CC} and OFF-state open-load detection

Short to V_{CC}

A short circuit between V_{CC} and output is indicated by the relevant current sense pin set to V_{SENSEH} during the device off-state. Small or no current is delivered by the current sense during the on-state depending on the nature of the short circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R_{PU} connecting the output to a positive supply voltage V_{PU} .

It is preferable that V_{PU} is switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

R_{PU} must be selected in order to ensure $V_{OUT} > V_{OLmax}$ in accordance with the following equation:

Equation

$$R_{PU} < \frac{V_{PU} - 4}{I_{L(off2)min @ 4V}}$$

5 Maximum demagnetization energy ($V_{CC} = 16\text{ V}$)

Figure 41. Maximum turn off current versus inductance

Figure 42. Maximum turn off energy versus inductance

Note: Values are generated with $R_L = 0\text{ }\Omega$.

In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.
