1. Electrical Characteristics

1.1 Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

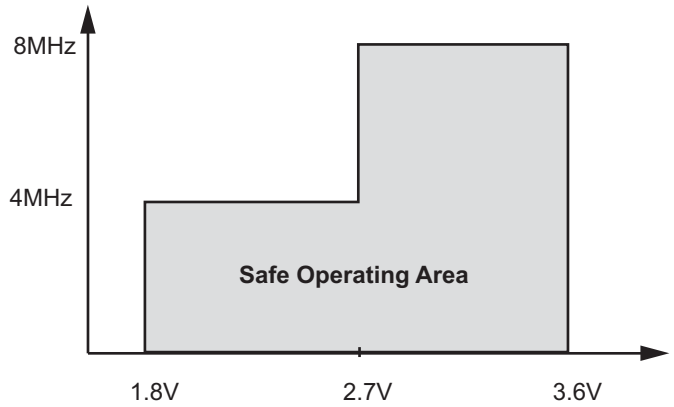
Notes:
1. “Max” means the highest value where the pin is guaranteed to be read as low
2. “Min” means the lowest value where the pin is guaranteed to be read as high
3. Although each I/O port can sink more than the test conditions (2mA at V_{CC} = 1.8V) under steady state conditions (non-transient), the following must be observed: (1) The sum of all I_{OL}, for all ports, should not exceed 50mA. If I_{OL} exceeds the test condition, V_{OL} may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test condition.
4. Although each I/O port can source more than the test conditions (0.5mA at VCC = 1.8V) under steady state conditions (non- transient), the following must be observed: (1) The sum of all I_{OL}, for ports B0 to B5, should not exceed 50mA. If I_{OL} exceeds the test condition, V_{OL} may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test condition.

1.3 Maximum Speed versus V_{CC}

Maximum frequency is dependent on $V_{CC.}$ As shown in Figure 1-1, the Maximum Frequency vs. V_{CC} curve is linear between $1.8V < V_{CC} < 3.6V$.

Figure 1-1. Maximum Frequency versus V_{CC}



1.4 Clock Characterizations

Table 1-1. Calibration Accuracy of Internal RC Oscillator

	Frequency	V_{CC}	Temperature	Accuracy
User Calibration	7.3MHz to 8.1MHz	1.8V to 3.6V	–40°C to +85°C	±25%

1.5 System and Reset Characterizations

Table 1-2. BODLEVEL Fuse Coding(1)

BODLEVEL	Min V_{BOT}	Typ V_{BOT}	Max V_{BOT}	Unit	Note
111	BOD Disabled				
110	1.7	1.8	2.0	V	A
001	1.7	1.9	2.1		C
000	1.8	2.0	2.2		C
010	2.0	2.2	2.4		C
011	2.1	2.3	2.5		C
101	2.5	2.7	2.9		A

*) Type means: A = 100% tested, C = Characterized on samples

Note: 1. V_{BOT} may be below nominal minimum operating voltage for some devices. For devices where this is the case, the device is tested down to $V_{CC} = V_{BOT}$ during the production test. This guarantees that a brown-out reset will occur before V_{CC} drops to a voltage where correct operation of the microcontroller is no longer guaranteed
