

GENERAL DESCRIPTION

The ICS853L022 is a Dual LVCMOS / LVTTTL-to-Differential 3.3V LVPECL translator and a member of the HiPerClocks™ family of High Performance Clocks Solutions from ICS. The ICS853L022 has single ended clock inputs. The single ended clock input accepts LVCMOS or LVTTTL input levels and translate them to LVPECL levels. The small outline 8-pin TSSOP package makes this device ideal for applications where space, high performance and low power are important.

FEATURES

- 2 differential LVPECL outputs
- LVCMOS/LVTTTL clock inputs
- Output frequency: 350MHz (typical)
- Part-to-part skew: 400 (maximum)
- Propagation Delay: 450ps (typical)
- Additive phase jitter, RMS: 0.03ps (typical)
- LVPECL mode operating voltage supply range:
 $V_{CC} = 3.0V$ to $3.8V$, $V_{EE} = 0V$
- ECL mode operating voltage supply range:
 $V_{CC} = 0V$, $V_{EE} = -3.8V$ to $-3.0V$
- $-40^{\circ}C$ to $85^{\circ}C$ ambient operating temperature
- Lead-Free package RoHS compliant

TERMINATION FOR 3.3V LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive

50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 1A and 1B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS853L022. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS853L022 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{CC} = 3.8V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{CC_MAX} * I_{EE_MAX} = 3.8V * 30mA = 114mW$
- Power (outputs)_{MAX} = **30.94mW/Loaded Output pair**
If all outputs are loaded, the total power is $2 * 30.94mW = 61.88mW$

Total Power_{MAX} (3.8V, with all outputs switching) = $114mW + 61.88mW = 175.88mW$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 1 meters per second and a multi-layer board, the appropriate value is 90.5°C/W per Table 4A below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$85^\circ C + 0.176W * 90.5^\circ C/W = 100.9^\circ C$. This is below the limit of 125°C.

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

NOTE: Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

3. Calculations and Equations.

LVPECL output driver circuit and termination are shown in Figure 4.

Figure 4. LVPECL Driver Circuit and Termination

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of $V_{CCO} - 2V$.

- For logic high, $V_{OUT} = V_{OH_MAX} = V_{CCO_MAX} - 0.935V$

$$(V_{CC_MAX} - V_{OH_MAX}) = 0.935V$$

- For logic low, $V_{OUT} = V_{OL_MAX} = V_{CCO_MAX} - 1.67V$

$$(V_{CCO_MAX} - V_{OL_MAX}) = 1.67V$$

$$Pd_H = [(V_{OH_MAX} - (V_{CCO_MAX} - 2V))/R_L] * (V_{CCO_MAX} - V_{OH_MAX}) = [(2V - (V_{CCO_MAX} - V_{OH_MAX}))/R_L] * (V_{CCO_MAX} - V_{OH_MAX}) = [(2V - 0.935V)/50\Omega] * 0.935V = 19.92mW$$

$$Pd_L = [(V_{OL_MAX} - (V_{CCO_MAX} - 2V))/R_L] * (V_{CCO_MAX} - V_{OL_MAX}) = [(2V - (V_{CCO_MAX} - V_{OL_MAX}))/R_L] * (V_{CCO_MAX} - V_{OL_MAX}) = [(2V - 1.67V)/50\Omega] * 1.67V = 11.02mW$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = 30.94mW$$
