

Precision Operational Amplifier

Features

- Low Offset Voltage $10\mu\text{V}$
- Low Offset Voltage Drift $0.4\mu\text{V}/^\circ\text{C}$
- Low Noise $9\text{nV}/\sqrt{\text{Hz}}$
- Open Loop Gain 140dB
- Unity Gain Bandwidth 2.5MHz
- All Bipolar Construction

Description

The Harris HA-5130/5135 are precision operational amplifiers manufactured using a combination of key technological advancements to provide outstanding input characteristics.

A Super Beta input stage is combined with laser trimming, dielectric isolation and matching techniques to produce $25\mu\text{V}$ (Maximum) input offset voltage and $0.4\mu\text{V}/^\circ\text{C}$ input offset voltage average drift. Other features enhanced by this process include $9\text{nV}/\sqrt{\text{Hz}}$ (Typ.) Input Noise Voltage, 1nA Input Bias Current and 140dB Open Loop Gain.

These features coupled with 120dB CMRR and PSRR make HA-5130/5135 an ideal device for precision DC

Applications

- High Gain Instrumentation
- Precision Data Acquisition
- Precision Integrators
- Biomedical Amplifiers
- Precision Threshold Detectors

instrumentation amplifiers. Excellent input characteristics in conjunction with 2.5MHz bandwidth and $0.8\text{V}/\mu\text{s}$ slew rate, makes this amplifier extremely useful for precision integrator and biomedical amplifier designs. These amplifiers are also well suited for precision data acquisition and for accurate threshold detector applications.

HA-5130/5135 is packaged in an 8 pin (TO-99) Metal Can and an 8 lead Cerdip and is pin compatible with many existing op amp configurations. It offers added features over the industry standard OP-07 in regards to bandwidth and slew rate specifications. For the military grade product, refer to the HA-5135/883 data sheet.

Schematic

Absolute Maximum Ratings (Note 1)

$T_A = +25^{\circ}\text{C}$ Unless Otherwise Stated
 Voltage Between V^+ and V^- Terminals 40.0V
 Differential Input Voltage $\pm 15.0\text{V}$
 Output Short Circuit Duration Indefinite
 Power Dissipation (Note 2) 300mW

Operating Temperature Ranges

HA-5130/5135-2 $-55^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$
 HA-5130/5135-5 $0^{\circ}\text{C} \leq T_A \leq +75^{\circ}\text{C}$
 Storage Temperature Range $-65^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$

Electrical Specifications $V^+ = +15\text{V}$, $V^- = -15\text{V}$

NOTES:

- Absolute maximum ratings are limiting values, applied individually beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
- Derate at 6.8mW/ $^{\circ}\text{C}$ for operation at ambient temperatures above $+75^{\circ}\text{C}$.
- Not tested, 90% of units meet or exceed these specifications.
- $V_{\text{OUT}} = \pm 10\text{V}$; $R_L = 2\text{K}$. Gain dB = $20 \log_{10} A_v$
 $\therefore 120\text{dB} = 1\text{MV/V}$
 $140\text{dB} = 10\text{MV/V}$
- $V_{\text{CM}} = \pm 10\text{V}$ DC
- $R_L = 600\Omega$
- $R_L = 2\text{K}$; Full power bandwidth guaranteed based on slew rate measurement using $\text{FPBW} = \frac{\text{SLEW RATE}}{2\pi V_{\text{PEAK}}}$
- $V_{\text{OUT}} = 10\text{V}$
- Output resistance measured under open loop conditions ($f = 100\text{Hz}$).
- Refer to test circuits section of the data sheet.
- Settling time is measured to 0.1% of final value for a 10V output step and $A_v = -1$.
- $V_{\text{SUPPLY}} = \pm 5\text{V}$ DC to $\pm 20\text{V}$ DC.

Test Circuits

SLEW RATE AND TRANSIENT RESPONSE TEST CIRCUIT

SMALL SIGNAL RESPONSE

Vertical Scale: (Volts: 50mV Div. Output)
 (Volts: 100mV Div. Input)
 Horizontal Scale: (Time: 1μs Div.)

LARGE SIGNAL RESPONSE

Vertical Scale: (Volts: 5V Div.)
 Horizontal Scale: (Time: 5μs Div.)

SETTLING TIME CIRCUIT

- $A_V = -1$
- Feedback and summing resistors should be 0.1% matched.
- Clipping diodes are optional. HP5082-2810 recommended.

- POWER SUPPLY DECOUPLING** Although not absolutely necessary, it is recommended that all power supply lines be decoupled with 0.01μF ceramic capacitors to ground. Decoupling capacitors should be located as near to the amplifier terminals as possible.
- CONSIDERATIONS FOR PROTOTYPING:** The following list of recommendations are suggested for prototyping.
 - Resolving low level signals requires minimizing leakage currents caused by external circuitry. Use of quality insulating materials, thorough cleaning of insulating surfaces and implementation of moisture barriers when required is suggested.
 - Error voltages generated by thermocouples formed between dissimilar metals in the presence of temperature gradients should be minimized. Isolation of low level circuitry from heat generating components is recommended.
 - Shielded cable input leads, guard rings and shield drivers are recommended for the most critical applications.
- When driving large capacitive loads (>500pF), a small value resistor (≈ 50Ω) should be connected in series with the output and inside the feedback loop.
- OFFSET VOLTAGE ADJUSTMENT:** A 20kΩ balance potentiometer is recommended if offset nulling is required. However, other potentiometer values such as 10kΩ, 50kΩ and 100kΩ may be used. The minimum adjustment range for given values is ±2mV.
- SATURATION RECOVER:** Input and output saturation recovery time is negligible in most applications. However care should be exercised to avoid exceeding the absolute maximum ratings of the device.
- DIFFERENTIAL INPUT VOLTAGES:** Inputs are shunted with back-to-back diodes for overvoltage protection. In applications where differential input voltages in excess of 1V are applied between the inputs, the use of limiting resistors at the inputs is recommended.

Applications

OFFSET NULLING CONNECTIONS

* Although R_p is shown equal to 20K, other values such as 50K, 100K and 1M may be used. Range of adjustment is approximately $\pm 2.5\text{mV}$. V_{OS} TC of the amplifier is optimized at minimal V_{OS} .
Tested Offset Adjustment is $|V_{OS} + 1\text{mV}|$ minimum referred to output.

PRECISION INTEGRATOR

The excellent inputs and gain characteristics of HA-5130 are well suited for precision integrator applications. Accurate integration over seven decades of frequency using HA-5130, virtually nullifies the need for more expensive chopper-type amplifiers.

ZERO CROSSING DETECTOR

Low V_{OS} coupled with high open loop Gain, high CMRR and high PSRR make HA-5130 ideally suited for precision detector applications.

* Optional for Output Swing Limiting

PRECISION INSTRUMENTATION AMPLIFIER ($A_V = 100$)
