

## SLIC Subscriber Line Interface Circuit

January 1997

### Features

- Pin For Pin Replacement For The HC-5502A
- Capable of 12V or 5V ( $V_B$ +) Operation
- Monolithic Integrated Device
- DI High Voltage Process
- Compatible With Worldwide PBX Performance Requirements
- Controlled Supply of Battery Feed Current for Short Loops (30mA)
- Internal Ring Relay Driver
- Low Power Consumption During Standby
- Switch Hook, Ground Key and Ring Trip Detection Functions
- Selective Denial of Power to Subscriber Loops

### Applications

- Solid State Line Interface Circuit for Analog and Digital PBX Systems
- Direct Inward Dial (DID) Trunks
- Voice Messaging PBXs
- Related Literature
  - AN549, The HC-5502S/4X Telephone Subscriber Line Interface Circuits (SLIC)
  - AN571, Using Ring Sync with HC-5502A and HC-5504 SLICs

### Description

The Harris SLIC incorporates many of the BORSHT functions on a single IC chip. This includes DC battery feed, a ring relay driver, supervisory and hybrid functions. This device is designed to maintain transmission performance in the presence of externally induced longitudinal currents. Using the unique Harris dielectric isolation process, the SLIC can operate directly with a wide range of station battery voltages.

The SLIC also provides selective denial of power. If the PBX system becomes overloaded during an emergency, the SLIC will provide system protection by denying power to selected subscriber loops.

The Harris SLIC is ideally suited for the design of new digital PBX systems, by eliminating bulky hybrid transformers.

### Ordering Information

| PART NUMBER | TEMP. RANGE (°C) | PACKAGE      | PKG. NO. |
|-------------|------------------|--------------|----------|
| HC1-5502B-5 | 0 to 75          | 24 Ld Cerdip | F24.6    |
| HC1-5502B-9 | -40 to 85        | 24 Ld Cerdip | F24.6    |
| HC3-5502B-5 | 0 to 75          | 24 Ld PDIP   | E24.6    |
| HC4P5502B-5 | 0 to 75          | 28 Ld PLCC   | N28.45   |
| HC9P5502B-5 | 0 to 75          | 24 Ld SOIC   | M24.3    |
| HC9P5502B-9 | -40 to 85        | 24 Ld SOIC   | M24.3    |

# Absolute Maximum Ratings (Note 1)

|                                        |             |
|----------------------------------------|-------------|
| Supply Voltage                         |             |
| (V <sub>B-</sub> )                     | -60 to 0.5V |
| (V <sub>B+</sub> )                     | -0.5 to 15V |
| (V <sub>B+</sub> - V <sub>B-</sub> )   | 75V         |
| Relay Drive Voltage (V <sub>RD</sub> ) | -0.5 to 15V |

# Operating Conditions

|                                            |                                  |
|--------------------------------------------|----------------------------------|
| Relay Driver Voltage (V <sub>RD</sub> )    | 5V to 12V                        |
| Positive Supply Voltage (V <sub>B+</sub> ) | 4.75V to 5.25V or 10.8V to 13.2V |
| Negative Supply Voltage (V <sub>B-</sub> ) | -42V to -58V                     |
| High Level Logic Input Voltage             | 2.4V                             |
| Low Level Logic Input Voltage              | 0.6V                             |
| Loop Resistance (R <sub>L</sub> )          | 200 to 1200Ω                     |
| Operating Temperature Range                |                                  |
| HC-5502B-5                                 | 0°C to 75°C                      |
| HC-5502B-9                                 | -40°C to 85°C                    |

# Thermal Information

|                                                 |                        |
|-------------------------------------------------|------------------------|
| Thermal Resistance (Typical, Note 2)            | θ <sub>JA</sub> (°C/W) |
| CERDIP Package                                  | 52                     |
| PDIP Package                                    | 65                     |
| SOIC Package                                    | 75                     |
| PLCC Package                                    | 65                     |
| Maximum Junction Temperature (Hermetic Package) | 175°C                  |
| Maximum Junction Temperature (Plastic Package)  | 150°C                  |
| Maximum Storage Temperature Range               | -65°C to 150°C         |
| Maximum Lead Temperature (Soldering 10s)        | 300°C                  |
| (PLCC and SOIC - Lead Tips Only)                |                        |

# Die Characteristics

|                     |                     |
|---------------------|---------------------|
| Transistor Count    | 183                 |
| Diode Count         | 33                  |
| Die Dimensions      | 137 mils x 102 mils |
| Substrate Potential | V <sub>B-</sub>     |
| Process             | Bipolar-DI          |

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

# NOTES:

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. θ<sub>JA</sub> is measured with the component mounted on an evaluation PC board in free air.

# Electrical Specifications

Unless Otherwise Specified, V<sub>B-</sub> = -48V, V<sub>B+</sub> = 12V and 5V, AG = BG = DG = 0V, Typical Parameters T<sub>A</sub> = 25°C. Min-Max Parameters are Over Operating Temperature Range

### NOTES:

- $I_{LONG}$  = Longitudinal Current
- These parameters are controlled by design or process parameters and are not directly tested. These parameters are characterised upon initial design release, upon design changes which would affect these characteristics, and at intervals to assure product quality and specification compliance.

# Pin Descriptions

| 28 PIN<br>PLCC | 24 PIN<br>DIP/SOIC | SYMBOL          | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                 |
|----------------|--------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2              | 1                  | TIP             | An analog input connected to the TIP (more positive) side of the subscriber loop through a 150Ω feed resistor and a ring relay contact. Functions with the Ring terminal to receive voice signals from the telephone and for loop monitoring process.                                                                                                       |
| 3              | 2                  | RING            | An analog input connected to the RING (more negative) side of the subscriber loop through a 150Ω feed resistor and a ring relay contact. Functions with the Tip terminal to receive voice signals from the telephone and for loop monitoring purposes.                                                                                                      |
| 4              | 3                  | V <sub>B+</sub> | Positive Voltage Source - Most positive supply. V <sub>B+</sub> is typically 12V or 5V.                                                                                                                                                                                                                                                                     |
| 5              | 4                  | C <sub>1</sub>  | Capacitor #1 - Optional Capacitor used to improve power supply rejection. This pin should be left open if unused.                                                                                                                                                                                                                                           |
| 6              | 5                  | C <sub>3</sub>  | Capacitor #3 - An external capacitor to be connected between this terminal and analog ground. Required for proper operation of the loop current limiting function, and for filtering V <sub>B-</sub> supply. Typical value is 0.3μF, 30V.                                                                                                                   |
| 7              | 6                  | DG<br>(Note 5)  | Digital Ground - To be connected to zero potential and serves as a reference for all digital inputs and outputs on the SLIC.                                                                                                                                                                                                                                |
| 9              | 7                  | RS              | Ring Synchronization Input - A TTL - compatible clock input. The clock should be arranged such that a positive transition occurs on the negative going zero crossing of the ring voltage source, ensuring that the ring relay is activated and deactivated when the instantaneous ring voltage is near zero. If synchronization is not required, tie to 5V. |
| 10             | 8                  | RD              | Relay Driver - A low active open collector logic output. When enabled, the external ring relay is energized.                                                                                                                                                                                                                                                |
| 11             | 9                  | TF              | Tip Feed - A low impedance analog output connected to the TIP terminal through a 150Ω feed resistor. Functions with the RF terminal to provide loop current, feed voice signals to the telephone set, and sink longitudinal current.                                                                                                                        |
| 12             | 10                 | RF              | Ring Feed - A low impedance analog output connected to the RING terminal through a 150Ω feed resistor. Functions with the TF terminal to provide loop current, feed voice signal to the telephone set, and sink longitudinal current.                                                                                                                       |
| 13             | 11                 | V <sub>B-</sub> | Negative Voltage Source - Most negative supply. V <sub>B-</sub> is typically -48V with an operational range of -42V to -58V. Frequently referred to as "battery".                                                                                                                                                                                           |
| 14             | 12                 | BG<br>(Note 1)  | Battery Ground - To be connected to zero potential. All loop current and some quiescent current flows into this ground terminal.                                                                                                                                                                                                                            |
| 16             | 13                 | SHD             | Switch Hook Detection - A low active LS TTL - compatible logic output. This output is enabled for loop currents exceeding 10mA and disabled for loop currents less than 5mA.                                                                                                                                                                                |
| 17             | 14                 | GKD             | Ground Key Detection - A low active LS TTL - compatible logic output. This output is enabled if the DC current into the ring lead exceeds the DC current out of the tip lead by more than 20mA, and disabled if this current difference is less than 10mA.                                                                                                  |
| 18             | 15                 | PD              | Power Denial - A low active TTL - Compatible logic input. When enabled the switch hook detect (SHD) and ground key detect (GKD) are not necessarily valid, and the relay driver (RD) output is disabled.                                                                                                                                                    |
| 19             | 16                 | RC              | Ring Command - A low active TTL - Compatible logic input. When enabled, the relay driver (RD) output goes low on the next rising edge of the ring sync (RS) input, as long as the SLIC is not in the power denial state (PD = 0) or the subscriber is not already off-hook (SHD = 0).                                                                       |
| 20             | 17                 | C <sub>2</sub>  | Capacitor #2 - An external capacitor to be connected between this terminal and digital ground. Prevents false ground key indications from occurring during ring trip detection. Typical value is 0.15μF, 10V. This capacitor is not used if ground key function is not required.                                                                            |
| 21             | 18                 | OUT             | The analog output of the spare operational amplifier.                                                                                                                                                                                                                                                                                                       |
| 23             | 19                 | -IN             | The inverting analog input of the spare operational amplifier.                                                                                                                                                                                                                                                                                              |

|-------------|-----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 24          | 20              | +IN            | The non-inverting analog input of the spare operational amplifier.                                                                                                                                                                                                                                                                                                                                                                                                            |
| 25          | 21              | RX             | Receive Input, 4-Wire Side - A high impedance analog input which is internally biased. Capacitive coupling to this input is required. AC signals appearing at this input differentially drive the Tip feed and Ring feed amplifiers, which in turn drive tip and ring through 300Ω of feed resistance on each side of the line.                                                                                                                                               |
| 26          | 22              | C <sub>4</sub> | Capacitor #4 - An external capacitor to be connected between this terminal and analog ground. This capacitor prevents false ground key indication and false ring trip detection from occurring when longitudinal currents are induced onto the subscriber loop from nearby power lines and other noise sources. This capacitor is also required for the proper operation of ring trip detection. Typical value is 0.5μF to 1.0μF, 20V. This capacitor should be nonpolarized. |
| 27          | 23              | AG<br>(Note 5) | Analog Ground - To be connected to zero potential and serves as a reference for the transmit output (TX) and receive input (RX) terminals.                                                                                                                                                                                                                                                                                                                                    |
| 28          | 24              | TX             | Transmit Output, 4-Wire Side - A low impedance analog output which represents the differential voltage across Tip and Ring. Transhybrid balancing must be performed (using the SLIC microcircuit's spare op amp) beyond this output to completely implement two to four wire conversion. This output is unbalanced and referenced to analog ground. Since the DC level of this output varies with loop current, capacitive coupling to the next stage is essential.           |
| 1, 8, 5, 22 |                 | NC             | No internal connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**NOTE:**

5. All grounds (AG, BG, and DG) must be applied before V<sub>B+</sub> or V<sub>B-</sub>. Failure to do so may result in premature failure of the part. If a user wishes to run separate grounds off a line card, the AG must be applied first.

## Overvoltage Protection and Longitudinal Current Protection

The SLIC device, in conjunction with an external protection bridge, will withstand high voltage lightning surges and power line crosses.

High voltage surge conditions are as specified in Table 1.

The SLIC will withstand longitudinal currents up to a maximum of 30mARMS, 15mARMS per leg, without any performance degradation

TABLE 1.

| PARAMETER                         | TEST CONDITION                                | PERFORMANCE (MAX) | UNITS             |

# Applications Diagram

FIGURE 1. TYPICAL LINE CIRCUIT APPLICATION WITH THE MONOLITHIC SLIC

## Typical Component Values

- $C_1 = 0.5\mu\text{F}$  (Note 6)
- $C_2 = 0.15\mu\text{F}$ , 10V
- $C_3 = 0.3\mu\text{F}$ , 30V
- $C_4 = 0.5\mu\text{F}$  to  $1.0\mu\text{F}$ , 10%, 20V (Should be nonpolarized)
- $C_5 = 0.5\mu\text{F}$ , 20V
- $C_6 = C_7 = 0.5\mu\text{F}$  (10% Match Required) (Note 7), 20V
- $C_8 = 0.01\mu\text{F}$ , 100V
- $C_9 = 0.01\mu\text{F}$ , 20V,  $\pm 20\%$

## NOTES:

6.  $C_1$  is an optional capacitor used to improve  $V_{B+}$  supply rejection. This pin must be left open if unused.
7. To obtain the specified transhybrid loss it is necessary for the three legs of the balance network,  $C_6$ - $R_1$  and  $R_2$  and  $C_7$ - $ZB$ - $R_3$ , to match in impedance to within 0.3%. Thus, if  $C_6$  and  $C_7$  are  $1\mu\text{F}$  each, a 20% match is adequate. It should be noted that the transmit output to  $C_6$  sees a -22V step when the loop is closed. Too large a value for  $C_6$  may produce an excessively long transient at the op amp output to the PCM Filter/CODEC.  
A  $0.5\mu\text{F}$  and  $100\text{k}\Omega$  gives a time constant of 50ms. The uncommitted op amp output is internally clamped to stay within  $\pm 5.5\text{V}$  and also has current limiting protection.
8. Secondary protection diode bridge recommended is a 2A, 200V type.
9. All grounds (AG, BG, and DG) must be applied before  $V_{B+}$  or  $V_{B-}$ . Failure to do so may result in premature failure of the part. If a user wishes to run separate grounds off a line card, the AG must be applied first
10. Pin numbers given for DIP/SOIC package.

- $R_1 = R_2 = R_3 = 100\text{k}\Omega$  (0.1% Match Required, 1% absolute value),  $ZB = 0$  for  $600\Omega$  Terminations (Note 7)
- $R_{B1} = R_{B2} = R_{B3} = R_{B4} = 150\Omega$  (0.1% Match Required, 1% absolute value)
- $R_S = 1\text{k}\Omega$ ,  $C_S = 0.1\mu\text{F}$ , 200V typically, depending on  $V_{RING}$  and line length.
- $Z_1 = 150\text{V}$  to  $200\text{V}$  transient protection. PTC used as ring generator ballast.
