## DESCRIPTION

The FCT16245 family of products are 16-bit transceivers ideal for bidirectional data buffering between two buses. These devices can be used as either two independent 8-bit transceivers or one 16-bit transceiver determined by the Direction and Output Enable controls. Easy board layout is facilitated by the use of flow-through pinouts and byte enable controls provide architectural flexibility for systems designers. All outputs have ground bounce suppression circuitry (see QSI Application Note AN-01) and many power and ground pins provide low ground bounce. To accommodate hot-plug or live insertion applications, both versions of this product were designed not to load an active bus when V<sub>CC</sub> is removed. In applications where bus signals are point-to-point or driving light capacitance loads, the balanced drive FCT162245 is recommended.
