

DM74LS962 (DM86LS62) Dual Rank 8-Bit TRI-STATE® Shift Register

General Description

These circuits are TRI-STATE, edge-triggered, 8-bit I/O registers in parallel with 8-bit serial shift registers which are capable of operating in any of the following modes: parallel load from I/O pins to register "A", parallel transfer down from register "A" to serial shift register "B", parallel transfer up from shift register "B" to register "A", serial shift of register "B", or exchange data between register "A" and shift register "B". Since the registers are edge-triggered by the positive transition of the clock, the control lines which determine the mode or operation are completely independent of the logic level applied to the clock. Designed for bus-oriented systems, these circuits have their TRI-STATE inputs and outputs on the same pins.

Features

- Registers are edge-triggered by the positive transition of the clock
- All inputs are PNP transistors
- Input disable dominates over output disable
- Output high impedance state does not impede any other mode of operation
- 8-bit I/O pins are TRI-STATE buffers
- Typical shift frequency is 36 MHz
- Typical power dissipation is 305 mW
- All control inputs are active when in an "L" logic state
- Devices can be cascaded into N-bit word

Pin Description

- DIS_O—Output disable
- I_S—Serial input
- DIS_I—Input disable
- DIS_{TU}—Transfer up disable
- DIS_{TD}—Transfer down disable
- DIS_S—Shift disable
- O_S—Serial output
- CLK—Clock
- GND—Ground
- I/O 1 ... I/O 8—8-bit I/O pins
- V_{CC}—Supply Voltage

Absolute Maximum Ratings (Note)

Supply Voltage	7V
Input Voltage	7V
Operating Free Air Temperature Range DM74LS/DM86LS	0°C to +70°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (Soldering, 10 seconds)	300°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Recommended Operating Conditions

		V _O = 0.4V			-20	μA

Note 1: For conditions shown as min or max, use the appropriate value specified under recommended operating conditions.

Note 2: All typical values are at V_{CC} = 5V, T_A = 25°C.

Note 3: Not more than one output should be shorted at a time, and the duration of the short circuit should not exceed one second.

Note 4: I_{CC} is measured with serial output open, the clock and shift disable input at 2.4V. All other control inputs and I/O pins grounded.

Note 5: T_A = 25°C and V_{CC} = 5V.

Switching Characteristics $V_{CC} = 5V$ and $T_A = 25^\circ C$

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
