

NB4L858M

2.5V/3.3V, 3 GHz Dual Differential Clock/Data 2x2 Crosspoint Switch with CML Output and Internal Termination

Description

The NB4L858M is a high-bandwidth low voltage fully differential dual 2 x 2 crosspoint switch with CML outputs that is suitable for applications such as SDH/SONET DWDM and high speed switching applications. Design technique minimizes jitter accumulation, crosstalk, and signal skew which make this device ideal for loop-through and protection channel switching application. Each 2 x 2 crosspoint switch can fan out and/or multiplex up to 3 Gb/s data and 3 GHz clock signals.

Differential inputs incorporate a pair of internal 50 Ω termination resistors in a center-tapped configuration (V_{TDx} Pins) and can accept LVPECL (Positive ECL) or CML input signal without any external component. This feature provides transmission line termination on-chip, at the receiver end, eliminating external components. Differential 16 mA CML output provides matching internal 50 Ω terminations, and 400 mV output swings when externally terminated, 50 Ω to V_{CC} .

The SELECT inputs are single-ended and can be driven with either LVCMOS or LVTTL input levels. The device is housed in a low profile 7 x 7 mm 32-pin LQFP package.

Features

- Maximum Input Clock Frequency 3 GHz
- Maximum Input Data Frequency 3 Gb/s
- 350 ps Typical Propagation Delay
- 80 ps Typical Rise and Fall Times
- 12 ps Channel to Channel Skew
- 0.5 ps RMS Jitter
- 5 ps Deterministic Jitter @ 2.5 Gb/s
- Operating Range: V_{CC} = 2.3V to 3.6 V with GND = 0 V
- CML Output Level (400 mV Peak-to-Peak Output), Differential Output
- These are Pb-Free Devices

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

- Measured by forcing V_{INPP} (MIN) from a 50% duty cycle clock source. All loading with an external $R_L = 50 \Omega$ to V_{CC} . Input edge rates 40 ps (20% – 80%).
- Worst-case difference between QA0 and QA1 from either DA0 or DA1 (or between QB0 and QB1 from either DB0 or DB1 respectively), when both outputs come from the same input.
- Worst-case difference between QA and QB outputs, when DA or DB inputs are shorted.
- Additive RMS jitter with 50% duty cycle input clock signal.
- Additive peak-to-peak data dependent jitter with input NRZ data signal.
- Device to device skew is measured between outputs under identical transition @ 0.5 GHz.
- LVTTL/LVCMOS input edge rate less than 1.5 ns
- Data taken on the same device under identical condition.
