description

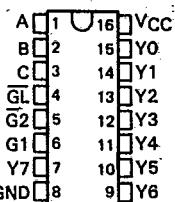

The 'HCT137 is a three-line to eight-line decoder/demultiplexer with latches on the three address inputs. When the latch-enable input (GL) is low, the 'HCT137 acts as a decoder/demultiplexer. When GL goes from low to high, the address present at the select inputs (A, B, and C) is stored in the latches. Further address changes are ignored as long as GL remains high. The output enable controls, G1 and $\bar{G}2$, control the outputs independently of the select or latch-enable inputs. All of the outputs are forced high if G1 is low or $\bar{G}2$ is high. The 'HCT137 is ideally suited for implementing glitch-free decoders in strobed (stored-address) applications in bus-oriented systems.

The SN54HCT137 is characterized for operation over the full military temperature range of -55°C to 125°C . The SN74HCT137 is characterized for operation from -40°C to 85°C .

^tStresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
