

4.0 ELECTRICAL SPECIFICATIONS

4.1 Absolute Maximum Ratings

Parameter	Maximum Rating
Storage Temperature	−65 °C to +150 °C
Case Temperature Under Bias ⁽²⁾	−40 °C to +125 °C
Supply Voltage wrt. V _{SS}	−0.5V to +6.5V
Voltage on Other pins wrt V _{SS}	−0.5V to V _{CC} + 0.5V

NOTICE: This data sheet contains information on products in the sampling and initial production phases of development. It is valid for the devices indicated in the revision history. The specifications are subject to change without notice.

**WARNING: Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.*

4.2. Operating Conditions

Operating Conditions (80960CF-33, -25, -16)

Symbol	Parameter		Min	Max	Units	Notes
V _{CC}	Supply Voltage	80960CF-30	4.75	5.25	V	
		80960CF-25	4.50	5.50		
		80960CF-16	4.50	5.50		
f _{CLK2x}	Input Clock Frequency (2-x Mode)	80960CF-30	0	60.6	MHz	
		80960CF-25	0	50	MHz	
		80960CF-16	0	32	MHz	
f _{CLK1x}	Input Clock Frequency (1-x Mode)	80960CF-30	8	30.3	MHz	(1)
		80960CF-25	8	25	MHz	
		80960CF-16	8	16	MHz	
T _C	Case Temperature Under Bias 80960CF-30, -25, -16	PGA Package	−40	+110	°C	

NOTES:

(1) When in the 1-x input clock mode, CLKIN is an input to an internal phase-locked loop and must maintain a minimum frequency of 8 MHz for proper processor operation. However, in the 1-x Mode, CLKIN may still be stopped when the processor either is in a reset condition or is reset. If CLKIN is stopped, the specified RESET low time must be provided once CLKIN restarts and has stabilized.

(2) Case temperatures are "Instant On".

4.3 Recommended Connections

Power and ground connections must be made to multiple V_{CC} and V_{SS} (GND) pins. Every 80960CF-based circuit board should include power (V_{CC}) and ground (V_{SS}) planes for power distribution. Every V_{CC} pin must be connected to the power plane, and every V_{SS} pin must be connected to the ground plane. Pins identified as "N.C." must not be connected in the system.

Liberal decoupling capacitance should be placed near the 80960CF. The processor can cause transient power surges when its numerous output buffers transition, particularly when connected to large capacitive loads.

Low inductance capacitors and interconnects are recommended for best high frequency electrical performance. Inductance can be reduced by shortening board traces between the processor and decoupling capacitors as much as possible. Capacitors specifically designed for PGA packages will offer the lowest possible inductance.

For reliable operation, always connect unused inputs to an appropriate signal level. In particular, any unused interrupt (XINT, NMI) or DMA (DREQ) input should be connected to V_{CC} through a pull-up resistor, as should BTERM if not used. Pull-up resistors should be in the range of 20 KΩ for each pin tied high. If READY or HOLD are not used, the unused input should be connected to ground. **N.C. pins must always remain unconnected.** Refer to the *i960 CA Microprocessor Reference Manual* for more information.

4.4. DC Specifications

DC Characteristics

(80960CF-30, -25, -16 under the conditions described in Section 4.2, Operating Conditions.)

Symbol	Parameter	Min	Max	Units	Notes
V_{IL}	Input Low Voltage for all pins except $\overline{\text{RESET}}$	-0.3	0.8	V	
V_{IH}	Input High Voltage for all pins except $\overline{\text{RESET}}$	2.0	$V_{CC} + 0.3$	V	
V_{OL}	Output Low Voltage		0.45	V	$I_{OL} = 5 \text{ mA}$
V_{OH}	Output High Voltage $I_{OH} = -1 \text{ mA}$ $I_{OH} = -200 \mu\text{A}$	2.4 $V_{CC} - 0.5$		V V	
V_{ILR}	Input Low Voltage for $\overline{\text{RESET}}$	-0.3	1.5	V	
V_{IHR}	Input High Voltage for $\overline{\text{RESET}}$	3.5	$V_{CC} + 0.3$	V	
I_{L1}	Input Leakage Current for each pin except: $\overline{\text{BTERM}}$, $\overline{\text{ONCE}}$, $\overline{\text{DREQ3:0}}$, $\overline{\text{STEST}}$, $\overline{\text{EOP3:0/TC3:0}}$, $\overline{\text{NMI}}$, $\overline{\text{XINT7:0}}$, $\overline{\text{READY}}$, $\overline{\text{HOLD}}$, $\overline{\text{BOFF}}$, $\overline{\text{CLKMODE}}$		± 15	μA	$0 \text{ V} \leq V_{IN} \leq V_{CC}$ (1)
I_{L2}	Input Leakage Current for: $\overline{\text{BTERM}}$, $\overline{\text{ONCE}}$, $\overline{\text{DREQ3:0}}$, $\overline{\text{STEST}}$, $\overline{\text{EOP3:0/TC3:0}}$, $\overline{\text{NMI}}$, $\overline{\text{XINT7:0}}$, $\overline{\text{BOFF}}$	0	-325	μA	$V_{IN} = 0.45 \text{ V}$ (2)
I_{L3}	Input Leakage Current for: $\overline{\text{READY}}$, $\overline{\text{HOLD}}$, $\overline{\text{CLKMODE}}$	0	500	μA	$V_{IN} = 2.4 \text{ V}$ (3)
I_{LO}	Output Leakage Current		± 15	μA	$0.45 \text{ V} \leq V_{OUT} \leq V_{CC}$
I_{CC}	Supply Current (80960CF-30) $I_{CC} \text{ Max}$ $I_{CC} \text{ Typ}$		1150 960	mA	(4) (5)
I_{CC}	Supply Current (80960CF-25) $I_{CC} \text{ Max}$ $I_{CC} \text{ Typ}$		950 775	mA	(4) (5)
I_{CC}	Supply Current (80960CF-16) $I_{CC} \text{ Max}$ $I_{CC} \text{ Typ}$		750 575	mA	(4) (5)
I_{ONCE}	$\overline{\text{ONCE}}$ -mode Supply Current		150	mA	
C_{IN}	Input Capacitance for: $\overline{\text{CLKIN}}$, $\overline{\text{RESET}}$, $\overline{\text{ONCE}}$, $\overline{\text{READY}}$, $\overline{\text{HOLD}}$, $\overline{\text{DREQ3:0}}$, $\overline{\text{BOFF}}$, $\overline{\text{XINT7:0}}$, $\overline{\text{NMI}}$, $\overline{\text{BTERM}}$, $\overline{\text{CLKMODE}}$	0	12	pF	$F_C = 1 \text{ MHz}$
C_{OUT}	Output Capacitance of each output pin		12	pF	$F_C = 1 \text{ MHz}$, (6)
$C_{I/O}$	I/O Pin Capacitance		12	pF	$F_C = 1 \text{ MHz}$

NOTES:

- (1) No Pull-up or pull-down.
- (2) These pins have internal pullup resistors.
- (3) These pins have internal pulldown resistors.
- (4) Measured at worst case frequency, V_{CC} and temperature, with device operating and outputs loaded to the test conditions described in Section 4.5.1, AC Test Conditions.
- (5) I_{CC} Typical is not tested.
- (6) Output Capacitance is the capacitive load of a floating output.
- (7) $\overline{\text{CLKMODE}}$ pin has a pulldown resistor only when $\overline{\text{ONCE}}$ pin is deasserted.

4.5 AC Specifications

AC Characteristics — 80960CF-30

(80960CF-30 only, under the conditions described in Section 4.2, Operating Conditions and Section 4.5.1, AC Test Conditions.) See notes which follow this table.

Symbol	Parameter	Min	Max	Units	Notes
INPUT CLOCK⁽¹⁰⁾					
T_F	CLKIN Frequency	0	60.6	MHz	(1)
T_C	CLKIN Period	In 1-x Mode (f_{CLK1x})	33	ns	(1,12)
		In 2-x Mode (f_{CLK2x})	16.5	∞	ns (1)
T_{CS}	CLKIN Period Stability	In 1-x Mode (f_{CLK1x})		$\pm 0.1\%$	Δ (1,13)
T_{CH}	CLKIN High Time	In 1-x Mode (f_{CLK1x})	6	62.5	ns (1,12)
		In 2-x Mode (f_{CLK2x})	6	∞	ns (1)
T_{CL}	CLKIN Low Time	In 1-x Mode (f_{CLK1x})	6	62.5	ns (1,12)
		In 2-x Mode (f_{CLK2x})	6	∞	ns (1)
T_{CR}	CLKIN Rise Time		0	6	ns (1)

T _{IH8}	$\overline{RESET}$ Input Hold (1x Clock Mode)	T/4 + 1		ns	(15)

NOTES:

- See **Section 4.5.2, AC Timing Waveforms** for waveforms and definitions.
- See Figure 22 for capacitive derating information for output delays and hold times.
- See Figure 23 for capacitive derating information for rise and fall times.
- Where N is the number of $\overline{NRAD}$, $\overline{NRDD}$, $\overline{NWAD}$, or $\overline{NWDD}$ wait states that are programmed in the Bus Controller Region Table. When there are no wait states in an access, WAIT never goes active.
- N = Number of wait states inserted with READY.
- Output Data and/or DT/ $\overline{R}$ may be driven indefinitely following a cycle if there is no subsequent bus activity.
- See Notes 1, 2 and 3.
- Since asynchronous inputs are synchronized internally by the 80960CF they have no required setup or hold times in order to be recognized and for proper operation. However, to guarantee recognition of the input at a particular edge of PCLK2:1 the setup times shown must be met. Asynchronous inputs must be active for at least two consecutive PCLK2:1 rising edges to be seen by the processor.
- These specifications are guaranteed by the processor.
- These specifications must be met by the system for proper operation of the processor.
- This timing is dependent upon the loading of PCLK2:1. Use the derating curves of **Section 4.5.3** to adjust the timing for PCLK2:1 loading.
- In the 1-x input clock mode, the maximum input clock period is limited to 125 ns while the processor is operating. When the processor is in reset, the input clock may stop even in 1-x mode.
- When in the 1-x input clock mode, these specifications assume a stable input clock with a period variation of less than $\pm 0.1\%$ between adjacent cycles.
- In 2x clock mode, $\overline{RESET}$ is an asynchronous input which has no required setup and hold time for proper operation. However, to guarantee the device exits reset synchronized to a particular clock edge, the $\overline{RESET}$ pin must meet setup and hold times to the falling edge of the CLKIN. (See Figure 28a.)
- In 1x clock mode, $\overline{RESET}$ is an asynchronous input which has no required setup and hold time for proper operation. However, to guarantee the device exits reset synchronized to a particular clock edge, the $\overline{RESET}$ pin must be deasserted while CLKIN is high and meet setup and hold times to the rising edge of the CLKIN. (See Figure 28b.)

AC Characteristics — 80960CF-25

(80960CF-25 only, under the conditions described in Section 4.2, Operating Conditions and Section 4.5.1, AC Test Conditions.)

T _{IS5}	RESET Input Setup (2x Clock Mode)	10		ns	(14)
T _{IH5}	RESET Input Hold (2x Clock Mode)	9		ns	(14)
T _{IS6}	$\overline{DREQ3:0}$ Input Setup	16		ns	(8)
T _{IH6}	$\overline{DREQ3:0}$ Input Hold	11		ns	(8)
T _{IS7}	$\overline{XINT7:0}$, NMI Input Setup	9		ns	(8)
T _{IH7}	$\overline{XINT7:0}$, NMI Input Hold	5		ns	(8)
T _{IS8}	RESET Input Setup (1x Clock Mode)	3		ns	(15)
T _{IH8}	RESET Input Hold (1x Clock Mode)	T/4 + 1		ns	(15)

NOTES:

- (1) See **Section 4.5.2, AC Timing Waveforms** for waveforms and definitions.
- (2) See Figure 22 for capacitive derating information for output delays and hold times.
- (3) See Figure 23 for capacitive derating information for rise and fall times.
- (4) Where N is the number of N_{RAD}, N_{RDD}, N_{WAD}, or N_{WDD} wait states that are programmed in the Bus Controller Region Table. When there are no wait states in an access, WAIT never goes active.
- (5) N = Number of wait state inserted with READY.
- (6) Output Data and/or DT/ $\overline{R}$ may be driven indefinitely following a cycle if there is no subsequent bus activity.
- (7) See Notes 1, 2 and 3.
- (8) Since asynchronous inputs are synchronized internally by the 80960CF they have no required setup or hold times in order to be recognized and for proper operation. However, to guarantee recognition of the input at a particular edge of PCLK2:1 the setup times shown must be met. Asynchronous inputs must be active for at least two consecutive PCLK2:1 rising edges to be seen by the processor.
- (9) These specifications are guaranteed by the processor.
- (10) These specifications must be met by the system for proper operation of the processor.
- (11) This timing is dependent upon the loading of PCLK2:1. Use the derating curves of Figure 22 to adjust the timing for PCLK2:1 loading.
- (12) In the 1-x input clock mode, the maximum input clock period is limited to 125 ns while the processor is operating. When the processor is in reset, the input clock may stop even in 1-x mode.
- (13) When in the 1-x input clock mode, these specifications assume a stable input clock with a period variation of less than $\pm 0.1\%$ between adjacent cycles.
- (14) In 2x clock mode, RESET is an asynchronous input which has no required setup and hold time for proper operation. However, to guarantee the device exits reset synchronized to a particular clock edge, the RESET pin must meet setup and hold times to the falling edge of the CLKIN. (See Figure 28a.)
- (15) In 1x clock mode, RESET is an asynchronous input which has no required setup and hold time for proper operation. However, to guarantee the device exits reset synchronized to a particular clock edge, the RESET pin must be deasserted while CLKIN is high and meet setup and hold times to the rising edge of the CLKIN. (See Figure 28b.)

4.5.1. AC TEST CONDITIONS

Figure 9. AC Test Load

The AC Specifications in Section 4.5 are tested with the 50 pf load shown in Figure 9. See Figure 16 to see how timings vary with load capacitance.

Specifications are measured at the 1.5V crossing point, unless otherwise indicated. Input waveforms are assumed to have a rise-and-fall time of ≤ 2 ns from 0.8V to 2.0V. See **Section 4.5.2, AC Timing Waveforms** for AC spec definitions, test points and illustrations.

4.5.2. AC TIMING WAVEFORMS

Figure 10a. Input and Output Clocks Waveform

Figure 10b. CLKIN Waveform

Figure 11. Output Delay and Float Waveform

Figure 12a. Input Setup and Hold Waveform

T_{OV} T_{OH}

— OUTPUT DELAY — The maximum output delay is referred to as the Output Valid Delay (T_{OV}). The minimum output delay is referred to as the Output Hold (T_{OH}).

T_{OF}

— OUTPUT FLOAT DELAY — The output float condition occurs when the maximum output current becomes less than I_{LO} in magnitude.

T_{IS} T_{IH}

— INPUT SETUP AND HOLD — The input setup and hold requirements specify the sampling window during which synchronous inputs must be stable for correct processor operation.
