

High Speed 64-Bit IEEE Floating-Point Multiplier

ADSP-3210

1.1 Scope.

This specification covers the detail requirements for a CMOS monolithic 32-bit and 64-bit IEEE Standard 754 format floating-point multiplier.

1.2 Part Number.

The complete part number per Table 1 of this specification is as follows:

Device	Part Number
-1	ADSP-3210SG/883B
-2	ADSP-3210TG/883B
-3	ADSP-3210UG/883B

1.2.3 Case Outline.

See Appendix 1 of General Specification ADI-M-1000: package outline: G-100A.

1.3 Absolute Maximum Ratings.

Supply Voltage	-0.3V to 7V
Input Voltage	-0.3V to V _{DD}
Output Voltage	-0.3V to V _{DD}
Operating Temperature Range (Ambient)	-55°C to + 125°C
Storage Temperature Range	-65°C to + 150°C
Lead Temperature (Soldering 10sec)	+ 300°C

1.5 Thermal Characteristics.

Maximum Thermal Resistance θ_{JC}: see MIL-M-38510, Appendix C.

NOTES

¹Indicates that a limit for this parameter has changed from REV. A.²T_A = + 25°C; V_{DD} = + 4.5V min to + 5.5V max (unless otherwise noted).³Input levels are GND and + 3.0V; V_{DD} = + 4.5V, and timing transitions per Figures 1 through 7, measured at + 1.5V.⁴Transitions measured per Figure 1.⁵3ns min.⁶Total latency = (data setup + processing + output delay of MSW) in Direct Operand Feed Mode.

3.2.4 Microcircuit Technology Group.

This microcircuit is covered by technology group (105).

4.2.1 Life Test/Burn-In Circuit.

Steady state life test is per MIL-STD-883 Method 1005. Burn-in is per MIL-STD-883 Method 1015 test condition (B).

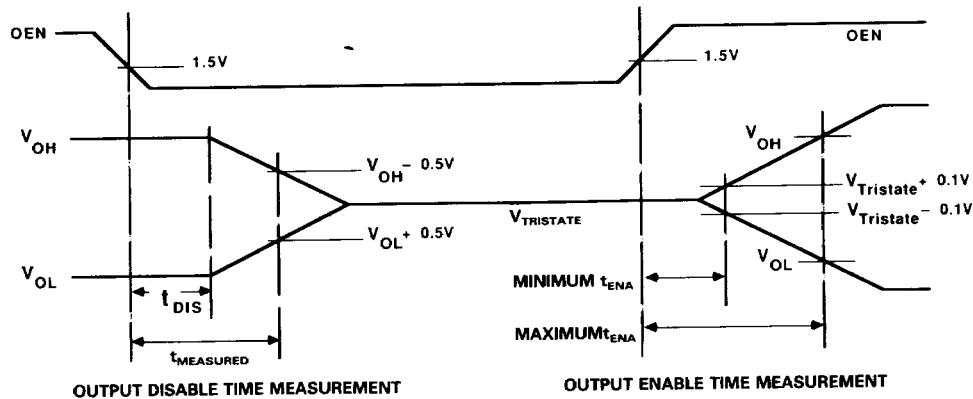

Figure 1. ADSP-3210 Three-State Disable and Enable Timing

Output disable time, t_{DIS} , is measured from the time the output enable control signal reaches 1.5 V to the time when all outputs have ceased driving. This is calculated by measuring the time, $t_{MEASURED}$, from the same starting point to when the output voltages have changed by 0.5 V toward +1.5 V. From the tester capacitive loading, C_L , and the measured current, i_L , the decay time, t_{DECAY} , can be approximated to first order by:

$$t_{DECAY} = \frac{C_L \cdot 0.5 V}{i_L}$$

from which

$$t_{DIS} = t_{MEASURED} - t_{DECAY}$$

is calculated. Disable times are longest at the highest specified temperature.

The minimum output enable time, minimum t_{ENA} , is the earliest that outputs begin to drive. It is measured from the control signal OEN reaching 1.5 V to the point at which the fastest outputs have changed by 0.1 V from $V_{TRISTATE}$ toward their final output voltages. Minimum enable times are shortest at the lowest specified temperature.

The maximum output enable time, maximum t_{ENA} , is also measured from output enable control signal at 1.5 V to the time when all outputs have reached TTL input levels (V_{OH} or V_{OL}). This could also be considered as "data valid." Maximum enable times are longest at the highest specified temperature.

Table 2. ADSP-3210 Instruction Set

5.0 Notation Used in the Tables Below:

RN	= Round to the Nearest Number	UNRM	= Unnormalized number. An Unnormal is an Underflowed and Wrapped Number.
RP	= Round toward Plus Infinity		An UNRM can result from a multiplication of 1 or 2 Wrapped Numbers.
RM	= Round toward Minus Infinity	NORM.MAX	= Maximum Normalized Number Representable in the Destination Format
RZ	= Round toward Zero	NORM.MIN	= Minimum Normalized Number Representable in the Destination Format
NORM	= Normalized number	OVF	= Overflowed Number
DNRM	= Denormalized number. A Denormalized number is treated as zero internally.	UNDF	= Underflowed Number
WNRM	= Wrapped number. A wrapped number is a number with a normalized fraction and an exponent that has been decremented through zero to take on a twos complement negative value.	INV	= Invalid Operand
		INF	= Infinity
		OK	= No Exception Status Generated

In the tables below, the first mnemonic in each box describes the flag that is set, the second is the result on the DOUT pins.
