Add Suffix L for 16-Pin dual in-line ceramic package (Case 620).
 Suffix P for 16-Pin dual in-line plastic package (Case 648).

Input Loading Factor = 1

Output Loading Factor = 10

Total Power Dissipation = 140 mW typ/pkg

Propagation Delay Time:

2 Logic Levels = 22 ns typ

3 Logic Levels = 23 ns typ

DC Noise Margin = 1.0 V typ

VCC = Pin 16
 Gnd = Pin 8

VCC = Pin 16
 Gnd = Pin 8

VCC = Pin 16
 Gnd = Pin 8

These decoders are constructed using low-level inverters and high-level NAND gates interconnected as shown by the logic diagrams. The inverter and gate schematics appear on the next page of this data sheet.

*Tested only at 25°C

†Only one output should be shorted at a time.

SWITCHING TIME TEST CIRCUIT AND VOLTAGE WAVEFORMS

$C_T = 15$ pF = total parasitic capacitance, which includes probe, wiring, and load capacitance.

*The coax delays from input to scope and output to scope must be matched. The scope must be terminated in 50-ohm impedance. The 950-ohm resistor and the scope termination impedance constitute a 20:1 attenuator probe.

TYPICAL APPLICATIONS

Two MC5442/7442 or MC9352/8352 decoders may be used to perform 4-line to 16-line decoding. Data inputs A, B, and C are paralleled to the two decoders, while input D is applied to one decoder and $\bar{D}$ to the other. (See Figure 1.)

The excess 3 code is similar to the BCD code except that 3 is added to each digit before coding. This code has the advantage of being self-complementing. If all zeros in a BCD number are changed to ones and all ones are changed to zeros, the nines complement of the decimal number is obtained. The ability to obtain the nines complement can reduce the hardware necessary to perform subtraction. (See Figure 2.)

All Gray codes have one basic characteristic in common. As the code is advanced from any number to the next, only one bit of the code will change at a time. When a non-Gray code such as straight binary is advanced from 3 to 4 (0011 to 0100) three bits of the code must change. Since in many applications the voltages on the three lines do not change simultaneously, a number of false outputs may be generated which last for a short time. These false outputs are easily accepted by the high-speed devices now in use. In contrast, the excess 3 Gray code of the MC5444/7444 would change from 0101 to 0100 to advance from 3 to 4.

Analog measuring devices require a converter for information fed to a digital system. These converters usually use a Gray code output. Gray codes are also useful in sequential circuitry because of the change of only one bit at a time.

Figure 3 shows the MC5444/7444, MC9354/8354 used for decoding 3-line binary-to-octal. The input to A, B, and D is the binary code ABC. The C input of the device is used as a strobe. Octal data is taken from Outputs Q1 through Q8 when the strobe is taken to logic "1". Outputs Q0 and Q9 are not used.

FIGURE 1 — BINARY-TO-DECIMAL DECODING USING MC5442/7442, MC9352/8352

*These decimal outputs are available from both decoders.
