
Low-voltage IR Receiver ASSP

DATASHEET

Features

- No external components except PIN diode
- Supply-voltage range: 2.7V to 5.5V
- Highest sensitivity due to automatic sensitivity adaption (AGC) and automatic strong signal adaption (ATC)
- Automatic supply voltage adaptation
- Highest immunity against disturbances from daylight and lamps
- Available for carrier frequencies between 30kHz to 56kHz; adjusted by zener-diode fusing $\pm 2.5\%$
- TTL and CMOS compatible

Applications

- Home entertainment applications (audio/video)
- Home appliances
- Remote control equipment

1. Description

The Atmel® IC T2526 is a complete IR receiver for data communication developed and optimized for use in carrier-frequency-modulated transmission applications. The IC offers highest sensitivity as well as highest suppression of noise from daylight and lamps. The Atmel T2526 is available with broadest range of frequencies (30, 33, 36, 37, 38, 40, 44, 56kHz) and 3 different noise suppression regulation types (standard, lamp, short burst) covering requirements of high-end remote control solutions (please refer to selection guide available for Atmel T2525/T2526). Atmel The T2526 operates in a supply voltage range of 2.7V to 5.5V.

The function of the Atmel T2526 can be described using the block diagram of Figure 1-1 on page 2. The input stage meets two main functions. First it provides a suitable bias voltage for the PIN diode. Secondly the pulsed photo-current signals are transformed into a voltage by a special circuit which is optimized for low noise applications. After amplification by a controlled gain amplifier (CGA) the signals have to pass a tuned integrated narrow bandpass filter with a center frequency f_0 which is equivalent to the chosen carrier frequency of the input signal. The demodulator is used first to convert the input burst signal to a digital envelope output pulse and to evaluate the signal information quality, i.e., unwanted pulses will be suppressed at the output pin. All this is done by means of an integrated dynamic feedback circuit which varies the gain as a function of the present environmental conditions (ambient light, modulated lamps etc.). Other special features are used to adapt to the current application to secure best transmission quality.

3. Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
