SDAS230 – D2825, DECEMBER 1983 – REVISED JANUARY 1986

- Functionally Equivalent to AMD's AM29821 and AM29822
- Provides Extra Data Width Necessary for Wider Address/Data Paths or Buses With Parity
- Outputs Have Undershoot Protection Circuitry
- Powerup High-impedance State
- Package Options Include Plastic Small Outline Packages, Both Plastic and Ceramic Chip Carriers, and Standard Plastic and Ceramic 300-mil DIPs
- Buffered Control Inputs to Reduce DC Loading Effects
- Dependable Texas Instruments Quality and Reliability

## description

These 10-bit flip-flops feature 3-state outputs designed specifically for driving highly-capacitive or relatively low-impedance loads. They are particularly suitable for implementing wider buffer registers, I/O ports, bidirectional bus drivers with parity, and working registers.

The ten flip-flops are edge-triggered D-type flip-flops. On the positive transition of the clock the Q outputs on the 'AS821 will be true, and on the 'AS822 will be complementary to the data input.

A buffered output-control input can be used to place the ten outputs in either a normal logic state (high or low levels) or a high-impedance state. In the high-impedance state, the outputs neither load nor drive the bus lines significantly. The high-impedance state and increased drive provide the capability to drive the bus lines in a bus-organized system without need for interface or pullup components. The output control ( $\overline{OC}$ ) does not affect the internal operation of the flip-flops. Old data can be retained or new data can be entered while the outputs are in the high-impedance state.

The SN54AS' family is characterized for operation over the full military temperature range of  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . The SN74AS' family is characterized for operation from  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$ .
