

## Device Overview

The 89HPES48H12AG2 is a member of the IDT PRECISE™ family of PCI Express® switching solutions. The PES48H12AG2 is a 48-lane, 12-port system interconnect switch optimized for PCI Express Gen2 packet switching in high-performance applications, supporting multiple simultaneous peer-to-peer traffic flows. Target applications include servers, storage, communications, embedded systems, and multi-host or intelligent I/O based systems with inter-domain communication.

## Features

### ◆ High Performance Non-Blocking Switch Architecture

- 48-lane 12-port PCIe switch
  - Six x8 ports switch ports each of which can bifurcate to two x4 ports (total of twelve x4 ports)
- Integrated SerDes supports 5.0 GT/s Gen2 and 2.5 GT/s Gen1 operation
- Delivers up to 48 GBps (384 Gbps) of switching capacity
- Supports 128 Bytes to 2 KB maximum payload size
- Low latency cut-through architecture
- Supports one virtual channel and eight traffic classes

### ◆ Standards and Compatibility

- PCI Express Base Specification 2.0 compliant
- Implements the following optional PCI Express features
  - Advanced Error Reporting (AER) on all ports
  - End-to-End CRC (ECRC)
  - Access Control Services (ACS)
  - Power Budgeting Enhanced Capability
  - Device Serial Number Enhanced Capability
  - Sub-System ID and Sub-System Vendor ID Capability
  - Internal Error Reporting ECN
  - Multicast ECN
  - VGA and ISA enable
  - L0s and L1 ASPM
  - ARI ECN

### ◆ Port Configurability

- x4 and x8 ports
  - Ability to merge adjacent x4 ports to create a x8 port
- Automatic per port link width negotiation (x8 → x4 → x2 → x1)
- Crosslink support
- Automatic lane reversal
- Autonomous and software managed link width and speed control
- Per lane SerDes configuration

- De-emphasis
- Receive equalization
- Drive strength

### ◆ Switch Partitioning

- IDT proprietary feature that creates logically independent switches in the device
- Supports up to 12 fully independent switch partitions
- Configurable downstream port device numbering
- Supports dynamic reconfiguration of switch partitions
  - Dynamic port reconfiguration — downstream, upstream
  - Dynamic migration of ports between partitions
  - Movable upstream port within and between switch partitions

### ◆ Initialization / Configuration

- Supports Root (BIOS, OS, or driver), Serial EEPROM, or SMBus switch initialization
- Common switch configurations are supported with pin strapping (no external components)
- Supports in-system Serial EEPROM initialization/programming

### ◆ Quality of Service (QoS)

- Port arbitration
  - Round robin
- Request metering
  - IDT proprietary feature that balances bandwidth among switch ports for maximum system throughput
- High performance switch core architecture
  - Combined Input Output Queued (CIOQ) switch architecture with large buffers

### ◆ Multicast

- Compliant to the PCI-SIG multicast ECN
- Supports arbitrary multicasting of Posted transactions
- Supports 64 multicast groups
- Multicast overlay mechanism support
- ECRC regeneration support

### ◆ Clocking

- Supports 100 MHz and 125 MHz reference clock frequencies
- Flexible port clocking modes
  - Common clock
  - Non-common clock
  - Local port clock with SSC and port reference clock input

### ◆ Hot-Plug and Hot Swap

- Hot-plug controller on all ports
  - Hot-plug supported on all downstream switch ports
- All ports support hot-plug using low-cost external I<sup>2</sup>C I/O expanders

- Direct package pin support for hot-plug on 5 ports
- Configurable presence detect supports card and cable applications
- GPE output pin for hot-plug event notification
  - *Enables SCI/SMI generation for legacy operating system support*
- Hot-swap capable I/O

#### ◆ Power Management

- Supports D0, D3hot and D3 power management states
- Active State Power Management (ASPM)
  - *Supports L0, L0s, L1, L2/L3 Ready and L3 link states*
  - *Configurable L0s and L1 entry timers allow performance/power-savings tuning*
- Supports PCI Express Power Budgeting Capability
- SerDes power savings
  - *Supports low swing / half-swing SerDes operation*
  - *SerDes optionally turned-off in D3hot*
  - *SerDes associated with unused ports are turned-off*
  - *SerDes associated with unused lanes are placed in a low power state*

#### ◆ 54 General Purpose I/O

#### ◆ Reliability, Availability and Serviceability (RAS)

- ECRC support
- AER on all ports
- SECDED ECC protection on all internal RAMs
- End-to-end data path parity protection
- Checksum Serial EEPROM content protected
- Autonomous link reliability (preserves system operation in the presence of faulty links)
- Ability to generate an interrupt (INTx or MSI) on link up/down transitions

#### ◆ Test and Debug

- On-chip link activity and status outputs available for several ports including the upstream ports
- Per port link activity and status outputs available using external I<sup>2</sup>C I/O expander for all remaining ports
- SerDes test modes
- Supports IEEE 1149.6 AC JTAG and IEEE 1149.1 JTAG

#### ◆ Power Supplies

- Requires only two power supply voltages (1.0 V and 2.5 V)  
Note that a 3.3V is preferred for V<sub>DD</sub>I/O
- No power sequencing requirements

#### ◆ Packaged in a 35mm x 35mm 1156-ball Flip Chip BGA with 1mm ball spacing

### Product Description

Utilizing standard PCI Express interconnect, the PES48H12AG2 provides the most efficient fan-out solution for applications requiring high throughput, low latency, and simple board layout with a minimum number of board layers. It provides 48 GBps (384 Gbps) of aggregated, full-duplex switching capacity through 48 integrated serial lanes, using proven and robust IDT technology. Each lane provides 5 GT/s of bandwidth in both directions and is fully compliant with PCI Express Base Specification, Revision 2.0.

The PES48H12AG2 is based on a flexible and efficient layered architecture. The PCI Express layer consists of SerDes, Physical, Data Link and Transaction layers in compliance with PCI Express Base specification Revision 2.0. The PES48H12AG2 can operate either as a store and forward or cut-through switch. It supports eight Traffic Classes (TCs) and one Virtual Channel (VC) with sophisticated resource management to enable efficient switching and I/O connectivity for servers, storage, and embedded processors with limited connectivity.

The PES48H12AG2 is a *partitionable* PCIe switch. This means that in addition to operating as a standard PCI express switch, the PES48H12AG2 ports may be partitioned into groups that logically operate as completely independent PCIe switches. [Figure 2](#) illustrates a three partition PES48H12AG2 configuration.

## SMBus Interface

The PES48H12AG2 contains two SMBus interfaces. The slave interface provides full access to the configuration registers in the PES48H12AG2, allowing every configuration register in the device to be read or written by an external agent. The master interface allows the default configuration register values of the PES48H12AG2 to be overridden following a reset with values programmed in an external serial EEPROM. The master interface is also used by an external Hot-Plug I/O expander.

Six pins make up each of the two SMBus interfaces. These pins consist of an SMBus clock pin, an SMBus data pin, and 4 SMBus address pins. In the slave interface, these address pins allow the SMBus address to which the device responds to be configured. In the master interface, these address pins allow the SMBus address of the serial configuration EEPROM from which data is loaded to be configured. The SMBus address is set up on negation of PERSTN by sampling the corresponding address pins. When the pins are sampled, the resulting address is assigned as shown in Table 1.

| Bit | Slave SMBus Address | Master SMBus Address |
|-----|---------------------|----------------------|
| 1   | SSMBADDR[1]         | MSMBADDR[1]          |
| 2   | SSMBADDR[2]         | MSMBADDR[2]          |
| 3   | SSMBADDR[3]         | MSMBADDR[3]          |
| 4   | 0                   | MSMBADDR[4]          |
| 5   | SSMBADDR[5]         | 1                    |
| 6   | 1                   | 0                    |
| 7   | 1                   | 1                    |

Table 1 Master and Slave SMBus Address Assignment

As shown in Figure 3, the master and slave SMBuses may only be used in a split configuration.

Figure 3 Split SMBus Interface Configuration

The switch's SMBus master interface does not support SMBus arbitration. As a result, the switch's SMBus master must be the only master in the SMBus lines that connect to the serial EEPROM and I/O expander slaves. In the split configuration, the master and slave SMBuses operate as two independent buses; thus, multi-master arbitration is not required.

## Hot-Plug Interface

The PES48H12AG2 supports PCI Express Hot-Plug on each downstream port. To reduce the number of pins required on the device, the PES48H12AG2 utilizes an external I/O expander, such as that used on PC motherboards, connected to the SMBus master interface. Following reset and configuration, whenever the state of a Hot-Plug output needs to be modified, the PES48H12AG2 generates an SMBus transaction to the I/O expander with the new value of all of the outputs. Whenever a Hot-Plug input changes, the I/O expander generates an interrupt which is received on the IOEXPINTN input pin (alternate function of GPIO) of the PES48H12AG2. In response to an I/O expander interrupt, the PES48H12AG2 generates an SMBus transaction to read the state of all of the Hot-Plug inputs from the I/O expander.

## General Purpose Input/Output

The PES48H12AG2 provides 54 General Purpose Input/Output (GPIO) pins that may be used by the system designer as bit I/O ports. Each GPIO pin may be configured independently as an input or output through software control. Some GPIO pins are shared with other on-chip functions. These alternate functions may be enabled via software, SMBus slave interface, or serial configuration EEPROM.

## Pin Description

The following tables list the functions of the pins provided on the PES48H12AG2. Some of the functions listed may be multiplexed onto the same pin. The active polarity of a signal is defined using a suffix. Signals ending with an "N" are defined as being active, or asserted, when at a logic zero (low) level. All other signals (including clocks, buses, and select lines) will be interpreted as being active, or asserted, when at a logic one (high) level.

| Signal                     | Type | Name/Description                                                                                                                                                                                         |

Table 5 General Purpose I/O Pins (Part 7 of 7)

| Signal       | Type | Name/Description                                                                                                                                                         |
|--------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLKMODE[2:0] |      | <b>Clock Mode.</b> These signals determine the port clocking mode used by ports of the device.                                                                           |
| GCLKFSEL     | I    | <b>Global Clock Frequency Select.</b> These signals select the frequency of the GCLKP and GCLKN signals.<br>0x0 100 MHz<br>0x1 125 MHz                                   |
| MSMBSMODE    | I    | <b>Master SMBus Slow Mode.</b> The assertion of this pin indicates that the master SMBus should operate at 100 KHz instead of 400 KHz. This value may not be overridden. |

Table 6 System Pins (Part 1 of 3)

| Signal      | Type | Name/Description                                                                                                                                                                                                                                                                                                                                              |
|-------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P01MERGEN   | I    | <b>Port 0 and 1 Merge.</b> P01MERGEN is an active low signal. It is pulled low internally. When this pin is low, port 0 is merged with port 1 to form a single x8 port. The Serdes lanes associated with port 1 become lanes 4 through 7 of port 0. When this pin is high, port 0 and port 1 are not merged, and each operates as a single x4 port.           |
| P23MERGEN   | I    | <b>Port 2 and 3 Merge.</b> P23MERGEN is an active low signal. It is pulled low internally. When this pin is low, port 2 is merged with port 3 to form a single x8 port. The Serdes lanes associated with port 3 become lanes 4 through 7 of port 2. When this pin is high, port 2 and port 3 are not merged, and each operates as a single x4 port.           |
| P45MERGEN   | I    | <b>Port 4 and 5 Merge.</b> P45MERGEN is an active low signal. It is pulled low internally. When this pin is low, port 4 is merged with port 5 to form a single x8 port. The Serdes lanes associated with port 5 become lanes 4 through 7 of port 4. When this pin is high, port 4 and port 5 are not merged, and each operates as a single x4 port.           |
| P67MERGEN   | I    | <b>Port 6 and 7 Merge.</b> P67MERGEN is an active low signal. It is pulled low internally. When this pin is low, port 6 is merged with port 7 to form a single x8 port. The Serdes lanes associated with port 7 become lanes 4 through 7 of port 6. When this pin is high, port 6 and port 7 are not merged, and each operates as a single x4 port.           |
| P89MERGEN   | I    | <b>Port 8 and 9 Merge.</b> P89MERGEN is an active low signal. It is pulled low internally. When this pin is low, port 8 is merged with port 9 to form a single x8 port. The Serdes lanes associated with port 9 become lanes 4 through 7 of port 8. When this pin is high, port 8 and port 9 are not merged, and each operates as a single x4 port.           |
| P1011MERGEN | I    | <b>Port 10 and 11 Merge.</b> P1011MERGEN is an active low signal. It is pulled low internally. When this pin is low, port 10 is merged with port 11 to form a single x8 port. The Serdes lanes associated with port 11 become lanes 4 through 7 of port 10. When this pin is high, port 10 and port 11 are not merged, and each operates as a single x4 port. |

Table 6 System Pins (Part 2 of 3)

| Signal      | Type | Name/Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PERSTN      | I    | <b>Global Reset.</b> Assertion of this signal resets all logic inside PES48H12AG2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| RSTHALT     | I    | <b>Reset Halt.</b> When this signal is asserted during a PCI Express fundamental reset, PES48H12AG2 executes the reset procedure and remains in a reset state with the Master and Slave SMBuses active. This allows software to read and write registers internal to the device before normal device operation begins. The device exits the reset state when the RSTHALT bit is cleared in the SWCTL register by an SMBus master.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SWMODE[3:0] | I    | <b>Switch Mode.</b> These configuration pins determine the PES48H12AG2 switch operating mode. <b>Note:</b> These pins should be static and not change following the negation of PERSTN.<br>0x0 - Single partition<br>0x1 - Single partition with Serial EEPROM initialization<br>0x2 through 0x7 - Reserved<br>0x8 - Single partition with port 0 selected as the upstream port (port 2 disabled)<br>0x9 - Single partition with port 2 selected as the upstream port (port 0 disabled)<br>0xA - Single partition with Serial EEPROM initialization and port 0 selected as the upstream port (port 2 disabled)<br>0xB - Single partition with Serial EEPROM initialization and port 2 selected as the upstream port (port 0 disabled)<br>0xC - Multi-partition<br>0xD - Multi-partition with Serial EEPROM initialization<br>0xE - Reserved<br>0xF - Reserved |

Table 6 System Pins (Part 3 of 3)

| Signal      | Type | Name/Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JTAG_TCK    | I    | <b>JTAG Clock.</b> This is an input test clock used to clock the shifting of data into or out of the boundary scan logic or JTAG Controller. JTAG_TCK is independent of the system clock with a nominal 50% duty cycle.                                                                                                                                                                                                                                                      |
| JTAG_TDI    | I    | <b>JTAG Data Input.</b> This is the serial data input to the boundary scan logic or JTAG Controller.                                                                                                                                                                                                                                                                                                                                                                         |
| JTAG_TDO    | O    | <b>JTAG Data Output.</b> This is the serial data shifted out from the boundary scan logic or JTAG Controller. When no data is being shifted out, this signal is tri-stated.                                                                                                                                                                                                                                                                                                  |
| JTAG_TMS    | I    | <b>JTAG Mode.</b> The value on this signal controls the test mode select of the boundary scan logic or JTAG Controller.                                                                                                                                                                                                                                                                                                                                                      |
| JTAG_TRST_N | I    | <b>JTAG Reset.</b> This active low signal asynchronously resets the boundary scan logic and JTAG TAP Controller. An external pull-up on the board is recommended to meet the JTAG specification in cases where the tester can access this signal. However, for systems running in functional mode, one of the following should occur:<br>1) actively drive this signal low with control logic<br>2) statically drive this signal low with an external pull-down on the board |

Table 7 Test Pins

| Signal               | Type | Name/Description                                                                                                                                                                                           |
|----------------------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REFRES00             | I/O  | <b>Port 0 External Reference Resistor.</b> Provides a reference for the Port 0 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES01             | I/O  | <b>Port 1 External Reference Resistor.</b> Provides a reference for the Port 1 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES02             | I/O  | <b>Port 2 External Reference Resistor.</b> Provides a reference for the Port 2 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES03             | I/O  | <b>Port 3 External Reference Resistor.</b> Provides a reference for the Port 3 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES04             | I/O  | <b>Port 4 External Reference Resistor.</b> Provides a reference for the Port 4 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES05             | I/O  | <b>Port 5 External Reference Resistor.</b> Provides a reference for the Port 5 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES06             | I/O  | <b>Port 6 External Reference Resistor.</b> Provides a reference for the Port 6 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES07             | I/O  | <b>Port 7 External Reference Resistor.</b> Provides a reference for the Port 7 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES08             | I/O  | <b>Port 8 External Reference Resistor.</b> Provides a reference for the Port 8 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES09             | I/O  | <b>Port 9 External Reference Resistor.</b> Provides a reference for the Port 9 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground.   |
| REFRES10             | I/O  | <b>Port 10 External Reference Resistor.</b> Provides a reference for the Port 10 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground. |
| REFRES11             | I/O  | <b>Port 11 External Reference Resistor.</b> Provides a reference for the Port 11 SerDes bias currents and PLL calibration circuitry. A 3 kOhm +/- 1% resistor should be connected from this pin to ground. |
| REFRESPLL            | I/O  | <b>PLL External Reference Resistor.</b> Provides a reference for the PLL bias currents and PLL calibration circuitry. A 3K Ohm +/- 1% resistor should be connected from this pin to ground.                |
| V <sub>DD</sub> CORE | I    | <b>Core V<sub>DD</sub>.</b> Power supply for core logic (1.0V).                                                                                                                                            |
| V <sub>DD</sub> I/O  | I    | <b>I/O V<sub>DD</sub>.</b> LVTTTL I/O buffer power supply (2.5V or preferred 3.3V).                                                                                                                        |
| V <sub>DD</sub> PEA  | I    | <b>PCI Express Analog Power.</b> Serdes analog power supply (1.0V).                                                                                                                                        |

Table 8 Power, Ground, and SerDes Resistor Pins (Part 1 of 2)

| Signal               | Type | Name/Description                                                                       |
|----------------------|------|----------------------------------------------------------------------------------------|
| V <sub>DD</sub> PEHA | I    | PCI Express Analog High Power. Serdes analog power supply (2.5V).                      |
| V <sub>DD</sub> PETA | I    | PCI Express Transmitter Analog Voltage. Serdes transmitter analog power supply (1.0V). |
| V <sub>SS</sub>      | I    | Ground.                                                                                |

Table 8 Power, Ground, and SerDes Resistor Pins (Part 2 of 2)

## Pin Characteristics

**Note:** Some input pads of the switch do not contain internal pull-ups or pull-downs. Unused SMBus and System inputs should be tied off to appropriate levels. This is especially critical for unused control signal inputs which, if left floating, could adversely affect operation. Also, any of these pins left floating can cause a slight increase in power consumption. Finally, unused Serdes (Rx and Tx) pins should be left floating.

| Function              | Pin Name    | Type | Buffer                         | I/O Type    | Internal Resistor <sup>1</sup> | Notes |
|-----------------------|-------------|------|--------------------------------|-------------|--------------------------------|-------|
| PCI Express Interface | PE00RN[3:0] | I    | PCIe differential <sup>2</sup> | Serial Link |                                |       |

Table 9 Pin Characteristics (Part 3 of 3)

<sup>1</sup>. Internal resistor values under typical operating conditions are 92K  $\Omega$  for pull-up and 91K  $\Omega$  for pull-down.

<sup>2</sup>. All receiver pins set the DC common mode voltage to ground. All transmitters must be AC coupled to the media.

<sup>3</sup>. Schmitt Trigger Input (STI).

## System Clock Parameters

Values based on systems running at recommended supply voltages and operating temperatures, as shown in Tables 14 and 15.

| Parameter                | Description                                                          | Condition    | Min   | Typical | Max              | Unit |
|--------------------------|----------------------------------------------------------------------|--------------|-------|---------|------------------|------|
| Refclk <sub>FREQ</sub>   | Input reference clock frequency range                                |              | 100   |         | 125 <sup>1</sup> | MHz  |
| T <sub>C-RISE</sub>      | Rising edge rate                                                     | Differential | 0.6   |         | 4                | V/ns |

**Table 13 JTAG AC Timing Characteristics**

<sup>1</sup> The JTAG specification, IEEE 1149.1, recommends that JTAG\_TMS should be held at 1 while the signal applied at JTAG\_TRST\_N changes from 0 to 1. Otherwise, a race may occur if JTAG\_TRST\_N is deasserted (going from low to high) on a rising edge of JTAG\_TCK when JTAG\_TMS is low, because the TAP controller might go to either the Run-Test/Idle state or stay in the Test-Logic-Reset state.

<sup>2</sup> The values for this symbol were determined by calculation, not by testing.

**Figure 5 JTAG AC Timing Waveform**

## Recommended Operating Supply Voltages

| Symbol         | Parameter                              | Minimum | Typical | Maximum | Unit |
|----------------|----------------------------------------|---------|---------|---------|------|
| $V_{DDCORE}$   | Internal logic supply                  | 0.9     | 1.0     | 1.1     | V    |
| $V_{DDI/O}$    | I/O supply except for SerDes           | 2.25    | 2.5     | 2.75    | V    |
|                |                                        | 3.125   | 3.3     | 3.465   | V    |
| $V_{DDPEA}^1$  | PCI Express Analog Power               | 0.95    | 1.0     | 1.1     | V    |
| $V_{DDPEHA}^2$ | PCI Express Analog High Power          | 2.25    | 2.5     | 2.75    | V    |
| $V_{DDPETA}^1$ | PCI Express Transmitter Analog Voltage | 0.95    | 1.0     | 1.1     | V    |
| $V_{SS}$       | Common ground                          | 0       | 0       | 0       | V    |

**Table 14 PES48H12AG2 Operating Voltages**

<sup>1</sup>  $V_{DDPEA}$  and  $V_{DDPETA}$  should have no more than 25mV<sub>peak-peak</sub> AC power supply noise superimposed on the 1.0V nominal DC value.

<sup>2</sup>  $V_{DDPEHA}$  should have no more than 50mV<sub>peak-peak</sub> AC power supply noise superimposed on the 2.5V nominal DC value.

## Power-Up/Power-Down Sequence

During power supply ramp-up,  $V_{DDCORE}$  must remain at least 1.0V below  $V_{DDI/O}$  at all times. There are no other power-up sequence requirements for the various operating supply voltages.

The power-down sequence can occur in any order.

## Recommended Operating Temperature

| Grade      | Temperature            |
|------------|------------------------|
| Commercial | 0°C to +70°C Ambient   |
| Industrial | -40°C to +85°C Ambient |

**Table 15 PES48H12AG2 Operating Temperatures**

## Power Consumption

Typical power is measured under the following conditions: 25°C Ambient, 35% total link usage on all ports, typical voltages defined in [Table 14](#) (and also listed below).

Maximum power is measured under the following conditions: 70°C Ambient, 85% total link usage on all ports, maximum voltages defined in [Table 14](#) (and also listed below).

| Number of Active Lanes per Port |       | Core Supply |          | PCIe Analog Supply |          | PCIe Analog High Supply |           | PCIe Transmitter Supply |          | I/O Supply |           | Total     |           |

Table 17 PES48H12AG2 Power Consumption — 3.3V I/O

**Note 1:** I/O supply of 3.3V is preferred.

**Note 2:** The above power consumption assumes that all ports are functioning at Gen2 (5.0 GT/S) speeds. Power consumption can be reduced by turning off unused ports through software or through boot EEPROM. Power savings will occur in  $V_{DDPEA}$ ,  $V_{DDPEHA}$ , and  $V_{DDPETA}$ . Power savings can be estimated as directly proportional to the number of unused ports, since the power consumption of a turned-off port is close to zero. For example, if 2 ports out of 12 are turned off, then the power savings for each of the above three power rails can be calculated quite simply as 2/12 multiplied by the power consumption indicated in the above table.

**Note 3:** Using a port in Gen1 mode (2.5GT/S) results in approximately 18% power savings for each power rail:  $V_{DDPEA}$ ,  $V_{DDPEHA}$ , and  $V_{DDPETA}$ .

## Thermal Considerations

This section describes thermal considerations for the PES48H12AG2 (35mm<sup>2</sup> FCBGA1156 package). The data in [Table 18](#) below contains information that is relevant to the thermal performance of the PES48H12AG2 switch.

| Symbol                   | Parameter                                         | Value | Units | Conditions                            |
|--------------------------|---------------------------------------------------|-------|-------|---------------------------------------|
| $T_{J(max)}$             | Junction Temperature                              | 125   | °C    | Maximum                               |
| $T_{A(max)}$             | Ambient Temperature                               | 70    | °C    | Maximum for commercial-rated products |
|                          |                                                   | 85    | °C    | Maximum for industrial-rated products |
| $\theta_{JA(effective)}$ | Effective Thermal Resistance, Junction-to-Ambient | 13.0  | °C/W  | Zero air flow                         |
|                          |                                                   | 6.8   | °C/W  | 1 m/S air flow                        |
|                          |                                                   | 5.8   | °C/W  | 2 m/S air flow                        |
| $\theta_{JB}$            | Thermal Resistance, Junction-to-Board             | 2.5   | °C/W  |                                       |
| $\theta_{JC}$            | Thermal Resistance, Junction-to-Case              | 0.15  | °C/W  |                                       |
| P                        | Power Dissipation of the Device                   | 12.44 | Watts | Maximum                               |

**Table 18 Thermal Specifications for PES48H12AG2, 35x35 mm FCBGA1156 Package**

**Note:** It is important for the reliability of this device in any user environment that the junction temperature not exceed the  $T_{J(max)}$  value specified in [Table 18](#). Consequently, the effective junction to ambient thermal resistance ( $\theta_{JA}$ ) for the worst case scenario must be maintained below the value determined by the formula:

$$\theta_{JA} = (T_{J(max)} - T_{A(max)})/P$$

Given that the values of  $T_{J(max)}$ ,  $T_{A(max)}$ , and P are known, the value of desired  $\theta_{JA}$  becomes a known entity to the system designer. How to achieve the desired  $\theta_{JA}$  is left up to the board or system designer, but in general, it can be achieved by adding the effects of  $\theta_{JC}$  (value provided in [Table 18](#)), thermal resistance of the chosen adhesive ( $\theta_{CS}$ ), that of the heat sink ( $\theta_{SA}$ ), amount of airflow, and properties of the circuit board (number of layers and size of the board). It is strongly recommended that users perform their own thermal analysis for their own board and system design scenarios.

## DC Electrical Characteristics

Values based on systems running at recommended supply voltages, as shown in [Table 14](#).

**Note:** See [Table 9](#), Pin Characteristics, for a complete I/O listing.

| I/O Type    | Parameter                               | Description                                                    | Gen1             |                  |                  | Gen2             |                  |                  | Unit | Condi-<br>tions |
|-------------|-----------------------------------------|----------------------------------------------------------------|------------------|------------------|------------------|------------------|------------------|------------------|------|-----------------|

Table 19 DC Electrical Characteristics (Part 2 of 2)

<sup>1</sup> Minimum, Typical, and Maximum values meet the requirements under PCI Specification 2.0.

## Absolute Maximum Voltage Rating

| Core Supply | PCIe Analog Supply | PCIe Analog High Supply | PCIe Transmitter Supply | I/O Supply |
|-------------|--------------------|-------------------------|-------------------------|------------|
| 1.5V        | 1.5V               | 4.6V                    | 1.5V                    | 4.6V       |

Table 20 PES48H12AG2 Absolute Maximum Voltage Rating

**Warning:** For proper and reliable operation in adherence with this datasheet, the device should not exceed the recommended operating voltages in Table 14. The absolute maximum operating voltages in Table 20 are offered to provide guidelines for voltage excursions outside the recommended voltage ranges. Device functionality is not guaranteed at these conditions and sustained operation at these values or any exposure to voltages outside the maximum range may adversely affect device functionality and reliability.

## SMBus Characterization

| Symbol                   | Parameter          | SMBus 2.0 Char. Data <sup>1</sup> |      |      | Unit |
|--------------------------|--------------------|-----------------------------------|------|------|------|
|                          |                    | 3V                                | 3.3V | 3.6V |      |
| DC Parameter for SDA Pin |                    |                                   |      |      |      |
| V <sub>IL</sub>          | Input Low          | 1.16                              | 1.26 | 1.35 | V    |
| V <sub>IH</sub>          | Input High         | 1.56                              | 1.67 | 1.78 | V    |
| V <sub>OL@350uA</sub>    | Output Low         | 15                                | 15   | 15   | mV   |
| I <sub>OL@0.4V</sub>     |                    | 23                                | 24   | 25   | mA   |
| I <sub>Pullup</sub>      | Current Source     | —                                 | —    | —    | μA   |
| I <sub>IL_Leak</sub>     | Input Low Leakage  | 0                                 | 0    | 0    | μA   |

## Revision History

**January 21, 2010:** Publication of Final datasheet.

**March 30, 2011:** In [Table 14](#), added  $V_{DD}PETA$  to footnote #1.

**November 28, 2011:** Added new Tables 21 and 22, SMBus Characterization and Timing.

**December 12, 2013:** Removed the Alt information for [AE25](#)-GPIO\_06.

## Ordering Information
